ISO TC184/SC4/WG3 /P19 N578

Date: 14 March 1997 **Supersedes SC4/ WG3 N 577 (P19)**

PRODUCT DATA REPRESENTATION AND EXCHANGE

Part: 214 **Title:** Application protocol: Core data for automotive mechanical design processes

Purpose of this document as it relates to the target document is:

X Primary Content
____ Issue Discussion
____ Alternate Proposal
____ Partial Content

Current Status: Committee draft

ABSTRACT:
This document defines an application protocol for Core Data for Automotive Mechanical Design Processes

KEYWORDS:
application protocol, automotive

Comments to Reader

This document is the complete AP214 document prepared for distribution as the second CD release version.

Note: Finite element analysis has been put out of scope based on ballot issues received in the first CD ballot. The relevant issues #703, #1173, and #1251 are documented in the issue log ISO TC184/SC4/WG3 N575.

Foreword

The International Organization for Standardization (ISO) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75% of the member bodies casting a vote.

International Standard ISO 10303–214 was prepared by Technical Committee ISO/TC 184, *Industrial automation systems and integration,* Subcommittee SC4, *Industrial data.*

ISO 10303 consists of the following parts under the general title *Industrial automation systems and integration – Product data representation and exchange:*

- Part 1, Overview and fundamental principles;
- Part 11, Description methods: The EXPRESS language reference manual;
- Part 12, Description method: The EXPRESS-I language reference manual;
- Part 21, Implementation methods: Clear text encoding of the exchange structure;
- Part 22, Implementation method: Standard data access interface specification;
- Part 23, Implementation method: C++ language binding to the standard data access interface;
- Part 24, Implementation method: C language binding to the standard data access interface;
- Part 26, Implementation method: Interface definition language binding to the standard data access interface;
- Part 31, Conformance testing methodology and framework: General concepts;
- Part 32, Conformance testing methodology and framework: Requirements on testing laboratories and clients;
- Part 33, Conformance testing methodology and framework: Structure and use of abstract test suites;
- Part 34, Conformance testing methodology and framework: Abstract test methods;

– Part 35, Conformance testing methodology and framework: Abstract test methods for SDAI implementations;

– Part 41, Integrated generic resources: Fundamentals of product description and support;

– Part 42, Integrated generic resources: Geometric and topological representation;

– Part 43, Integrated generic resources: Representation structures;

– Part 44, Integrated generic resources: Product structure configuration;

– Part 45, Integrated generic resource: Materials;

– Part 46, Integrated generic resources: Visual presentation;

– Part 47, Integrated generic resource: Shape variation tolerances;

– Part 49, Integrated generic resource: Process structure and properties;

– Part 101, Integrated application resource: Draughting;

– Part 104, Integrated application resource: Finite element analysis;

– Part 105, Integrated application resource: Kinematics;

– Part 106, Integrated application resource: Building construction core model;

– Part 201, Application protocol: Explicit draughting;

– Part 202, Application protocol: Associative draughting;

– Part 203, Application protocol: Configuration controlled design;

– Part 204, Application protocol: Mechanical design using boundary representation;

– Part 205, Application protocol: Mechanical design using surface representation;

– Part 207, Application protocol: Sheet metal die planning and design;

– Part 208, Application protocol: Life cycle management - Change process;

– Part 209, Application protocol: Composite and metallic structural analysis and related design;

– Part 210, Application protocol: Electronic assembly, interconnect, and packaging design;

– Part 212, Application protocol: Electrotechnical design and installation;

- Part 213, Application protocol: Numerical control process plans for machined parts;
- Part 214, Application protocol: Core data for automotive mechanical design processes;
- Part 215, Application protocol: Ship arrangement;
- Part 216, Application protocol: Ship moulded forms;
- Part 217, Application protocol: Ship piping;
- Part 218, Application protocol: Ship structures;
- Part 220, Application protocol: Process planning, manufacture, and assembly of layered electronic products;
- Part 221, Application protocol: Functional data and their schematic representation for process plant;
- Part 222, Application protocol: Exchange of product data for composite structures;
- Part 223, Application protocol: Exchange of design and manufacturing product information for casting parts;
- Part 224, Application protocol: Mechanical product definition for process plans using machining features;
- Part 225, Application protocol: Building elements using explicit shape representation;
- Part 226, Application protocol: Ship mechanical systems;
- Part 227, Application protocol: Plant spatial configuration;
- Part 228, Application protocol: Building services: Heating, ventilation, and air conditioning;
- Part 229, Application protocol: Exchange of design and manufacturing product information for forged parts;
- Part 230, Application protocol: Building structural frame: Steelwork;
- Part 231, Application protocol: Process engineering data: Process design and process specification of major equipment;
- Part 232, Application Protocol: Technical data packaging core information and exchange;
- Part 301, Abstract test suite: Explicit draughting;

– Part 302, Abstract test suite: Associative draughting;

– Part 303, Abstract test suite: Configuration controlled design;

– Part 304, Abstract test suite: Mechanical design using boundary representation;

– Part 305, Abstract test suite: Mechanical design using surface representation;

– Part 307, Abstract test suite: Sheet metal die planning and design;

– Part 308, Abstract test suite: Life cycle management - Change process;

– Part 309, Abstract test suite: Composite and metallic structural analysis and related design;

– Part 310, Abstract test suite: Electronic assembly, interconnect, and packaging design;

– Part 312, Abstract test suite: Electrotechnical design and installation;

– Part 313, Abstract test suite: Numerical control process plans for machined parts;

– Part 314, Abstract test suite: Core data for automotive mechanical design;

– Part 315, Abstract test suite: Ship arrangement;

– Part 316, Abstract test suite: Ship moulded forms;

– Part 317, Abstract test suite: Ship piping;

– Part 318, Abstract test suite: Ship structures;

– Part 320, Abstract test suite: Process planning, manufacture, and assembly of layered electronic products;

– Part 321, Abstract test suite: Functional data and their schematic representation for process plant;

– Part 322, Abstract test suite: Exchange of product data for composite structures;

– Part 323, Abstract test suite: Exchange of design and manufacturing product information for casting parts;

– Part 324, Abstract test suite: Mechanical product definition for process plans using machining features;

– Part 325, Abstract test suite: Building elements using explicit shape representation;

- Part 326, Abstract test suite: Ship mechanical systems;

- Part 327, Abstract test suite: Plant spatial configuration;

- Part 328, Abstract test suite: Building services: Heating, ventilation, and air conditioning;

- Part 329, Abstract test suite: Exchange of design and manufacturing product information for forged parts;

- Part 330, Abstract test suite: Building structural frame: Steelwork;

- Part 331, Abstract test suite: Process engineering data: Process design and process specification of major equipment;

- Part 332, Abstract test suite: Technical data packaging core information and exchange;

- Part 501, Application interpreted construct: Edge-based wireframe;

- Part 502, Application interpreted construct: Shell-based wireframe;

- Part 503, Application interpreted construct: Geometrically bounded 2D wireframe;

- Part 504, Application interpreted construct: Draughting annotation;

- Part 505, Application interpreted construct: Drawing structure and administration;

- Part 506, Application interpreted construct: Draughting elements;

- Part 507, Application interpreted construct: Geometrically bounded surface;

- Part 508, Application interpreted construct: Non-manifold surface;

- Part 509, Application interpreted construct: Manifold surface;

- Part 510, Application interpreted construct: Geometrically bounded wireframe;

- Part 511, Application interpreted construct: Topologically bounded surface;

- Part 512, Application interpreted construct: Faceted boundary representation;

- Part 513, Application interpreted construct: Elementary boundary representation;

- Part 514, Application interpreted construct: Advanced boundary representation;

- Part 515, Application interpreted construct: Constructive solid geometry;

- Part 517, Application interpreted construct: Mechanical design geometric presentation;
- Part 518, Application interpreted construct: Mechanical design shaded representation.

The structure of this International Standard is described in ISO 10303-1. The numbering of the parts of this International Standard reflects its structure:

- Parts 11 to 13 specify the description methods,
- Parts 21 to 26 specify the implementation methods,
- Parts 31 to 35 specify the conformance testing methodology and framework,
- Parts 41 to 49 specify the integrated generic resources,
- Parts 101 to 106 specify the integrated application resources,
- Parts 201 to 232 specify the application protocols,
- Parts 301 to 332 specify the abstract test suites, and
- Parts 501 to 518 specify the application interpreted constructs.

Should further parts of ISO 10303 be published, they will follow the same numbering pattern.

Annexes A, B, C, D, and E are an integral part of this part of ISO 10303. Annexes F, G, H, J, K, and L are for information only.

Introduction

ISO 10303 is an International Standard for the computer-interpretable representation and exchange of product data. The objective is to provide a neutral mechanism capable of describing product data throughout the life cycle of a product independent from any particular system. The nature of this description makes it suitable not only for neutral file exchange, but also as a basis for implementing and sharing product databases and archiving.

This International Standard is organized as a series of parts, each published separately. The parts of ISO 10303 fall into one of the following series: description methods, integrated resources, application interpreted constructs, application protocols, abstract test suites, implementation methods, and conformance testing. The series are described in ISO 10303–1. This part of ISO 10303 is a member of the application protocol series.

This part of ISO 10303 specifies an application protocol (AP) for automotive mechanical design processes. This application protocol defines the context, scope, and information requirements for various development stages during the design of a vehicle and specifies the integrated resources necessary to satisfy these requirements. This application protocol addresses the requirements of the automotive industry covering cars, trucks, busses, and motorcycles.

NOTE 1 – This application protocol may also be applicable to other forms of vehicles, such as rail, agricultural, and construction vehicles.

A typical vehicle consists of the body, power train, chassis, and interior parts.

The body describes the body shell and the body in white.

EXAMPLE 1 – Typical constituents of the body are frame, doors, roof, engine hood, windshield, or bumpers.

The power train includes the engine, transmission, and drive line.

EXAMPLE 2 – Typical constituents of the power train are gear box, pistons, and exhaust pipe.

The chassis includes all parts which are responsible for the vehicles handling.

EXAMPLE 3 – Typical constituents of the chassis are the front axle, rear axle, steering, suspension, wheels, shock absorbers, and brakes.

Interior parts include parts that are built into the interior of the vehicle and not related to the power train.

EXAMPLE 4 – Typical interior parts are seats, instrument panel, door panels, the mechanism for power windows, air conditioning system, or stereo equipment.

Only the mechanical aspects of a vehicle and its components are covered by this AP; the functional aspects, such as electronic, hydraulic, and pneumatic, are not covered.

EXAMPLE 5 – For a battery or a switch, product characteristics such as shape, material, or mass are covered but the electrical functionality is not covered.

Finite element analysis (FEA) is not supported by this AP.

NOTE 2 – Finite element analysis has been put out ouf scope based on ballot issues received in the first CD ballot. The decision to take FEA out of scope was mainly based on the fact that only two nations had an active interest in this topic.

Figure 1 shows the processes included in the development of a vehicle. For further explanation of the processes some examples of significant activities or data are given. The illustrations are

taken from car body development. The application activity model given in annex F provides a further detailed graphical representation of the processes and information flows.

These processes include:

- product definition;
- styling;
- design;
- evaluation;
- production planning;
- tool design;
- tool manufacturing;
- quality control.

Application protocols provide the basis for developing implementations of ISO 10303 and abstract test suites for the conformance testing of AP implementations.

Clause 1 defines the scope of the application protocol and summarizes the functionality and data covered by the AP. Clause 3 lists the words defined in this part of ISO 10303 and gives pointers to words defined elsewhere. An application activity model that is the basis for the definition of the scope is provided in annex F. The information requirements of the application are specified in clause 4 using terminology appropriate to the application. A graphical representation of the information requirements, referred to as the application reference model, is given in annex G.

Resource constructs are interpreted to meet the information requirements. This interpretation produces the application interpreted model (AIM). This interpretation, given in 5.1, shows the correspondence between the information requirements and the AIM[1)]. The short listing of the AIM specifies the interface to the integrated resources and is given in 5.2. Note that the definitions and EXPRESS provided in the the integrated resources for constructs used in the AIM may include select list items and subtypes which are not imported into the AIM. The expanded listing given in annex A contains the complete EXPRESS for the AIM without annotation. A graphical representation of the AIM is given in annex H. Additional requirements for specific implementation methods are given in annex D.

[1)]For the interpretation process the New Editions of parts 41, 43, and 44 and the new AICs for associative draughting elements and for geometric tolerances as balloted as New Work Items in spring 1997 are used.

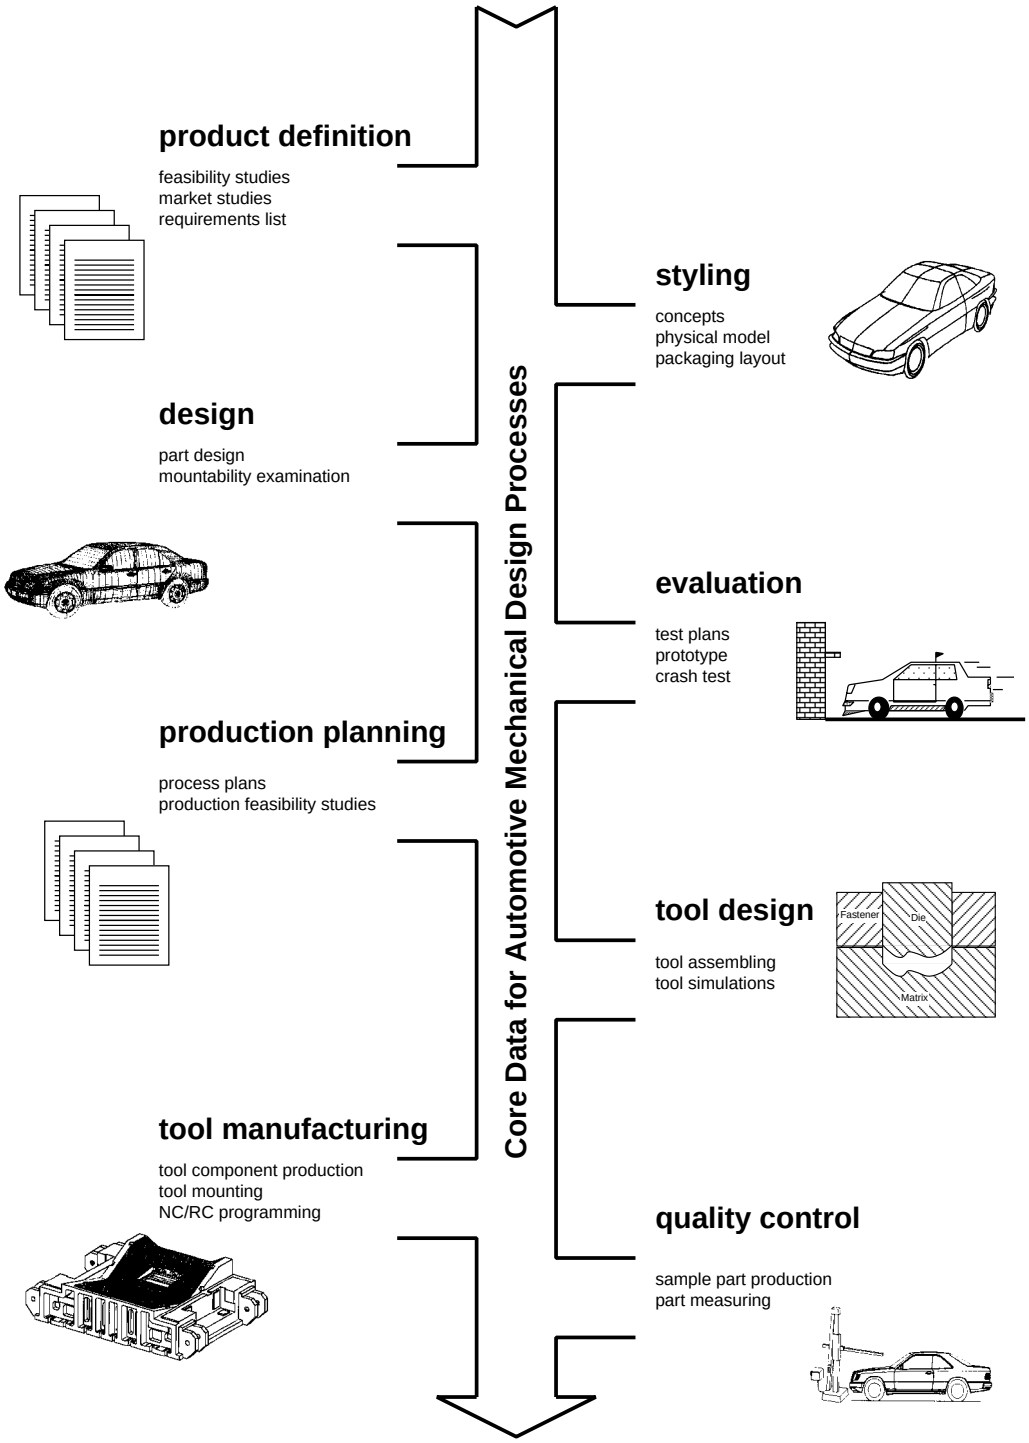

Figure 1 – Automotive mechanical design processes

Industrial automation systems and integration — Product data representation and exchange — Part 214: Application protocol: Core data for automotive mechanical design processes

1 Scope

This part of ISO 10303 specifies the use of the integrated resources necessary for the scope and information requirements for the exchange of information between various applications which support the development process of the mechanical aspects of a vehicle.

NOTE – The application activity model in annex F provides a graphical representation of the processes and information flows which are the basis for the definition of the scope of this part of ISO 10303.

The following are within the scope of this part of ISO 10303:

a) products of automotive manufacturers and suppliers that include parts, assemblies of parts, tools, and assemblies of tools. The parts include the constituents of the car body, power train, chassis, and interior. The tools include those specific to the product produced and used by various manufacturing technologies, such as shaping, transforming, separating, coating, or fitting;

EXAMPLE 6 – Typical technologies for primary shaping are molding or casting, for transforming are bending or stamping, for separating are milling or lathing, for coating are painting or surface coating, and for fitting are welding or riveting.

b) process plan information to manage the relationships between parts and the tools used to manufacture them and to manage the relationships between intermediate stages of parts or tools, referred to as in-process parts;

c) product definition data and configuration control data pertaining to the design phase of a product's development;

d) changes of a design, including tracking of the versions of a product and data related to the documentation of the change process;

e) identification of alternate representations of parts and tools during the design phase;

f) identification of standard parts, based on international, national, or industrial standards, and of library parts, based on company or project conventions;

g) release and approval data for various kinds of product data;

h) data that identify the supplier of a product and any related contract information;

i) any of eight types of representation of the shape of a part or tool:

1) 2D–wireframe representation;

2) 3D–wireframe representation;

3) geometrically bounded surface representation;

4) topologically bounded surface representation;

5) faceted–boundary representation;

6) boundary representation;

7) compound shape representation;

8) constructive solid geometry representation.

j) shape representation of parts or tools that is a combination of any two or more of these eight types of shape representation;

k) data that pertains to the presentation of the shape of the product;

l) representation of portions of the shape of a part or a tool by form features;

m) product documentation represented by explicit and associative draughting;

n) references to product documentation represented in a form or format other than that specified by ISO 10303;

EXAMPLE 7 – Other forms or formats include physical clay models, digital data in other standard formats such as NC–data according to ISO 6983 [6], or text data according to ISO/IEC 8879 (SGML) [8].

o) simulation data for the description of kinematic structures and configurations of discrete tasks;

EXAMPLE 8 – The simulation data for a windshield wiper includes the geometry of the windshield as well as the kinematic structure of the wiper including all necessary links and joints.

p) properties of parts or tools;

q) surface conditions;

r) dimensional and geomterical tolerance data.

The following are outside the scope of this part of ISO 10303:

a) product definition data pertaining to any life cycle phase of a product not related to design;

b) business or financial data for the management of a design project;

c) a general parametric representation of the shape of the part or tool;

d) data describing the pneumatic, hydraulic, electric, or electronic functions of a product;

e) continuous kinematics simulations over time;

f) data describing the input or output of finite element analysis.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO 10303. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO 10303 are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. 3 Definitions and abbreviations

For the purpose of this part of ISO 10303, the following definitions and abbreviations apply.

3.1 Terms defined in ISO 10303–1

This part of ISO 10303 makes use of the following terms defined in ISO 10303–1:

- application;
- application activity model (AAM);
- application interpreted model (AIM);
- application object;
- application protocol (AP);
- application reference model (ARM);
- assembly;
- component;
- conformance class;
- conformance requirements;
- data;
- data exchange;
- generic resource;
- implementation method ;
- information;
- information model;
- integrated resource;
- PICS proforma;
- presentation;

- product;
- product data;
- product information;
- resource construct;
- structure;
- unit of functionality (UoF).

3.2 Terms defined in ISO 10303–31

This part of ISO 10303 makes use of the following terms defined in ISO 10303–31:

- preprocessor;
- postprocessor.

3.3 Terms defined in ISO 10303–42

This part of ISO 10303 makes use of the following terms defined in ISO 10303–42:

- arcwise connected;
- bounds;
- boundary;
- boundary representation solid model (B-Rep);
- closed curve;
- closed surface;
- connected;
- constructive solid geometry (CSG);
- coordinate space;
- curve;
- cycle;
- dimensionality;

- domain;
- extent;
- finite;
- geometric coordinate system;
- geometrically founded;
- geometrically related;
- inside;
- interior;
- list;
- model space;
- open curve;
- open surface;
- orientable;
- overlap;
- parameter range;
- parameter space;
- placement coordinate system;
- self–intersect;
- set;
- space dimensionality;
- surface;
- topological sense.

3.4 Terms defined in ISO 10303–44

This part of ISO 10303 makes use of the following terms defined in ISO 10303–44:

- bill-of-material structure (BOM);
- constituent;
- form, fit and function of a product;
- lot.

3.5 Terms defined in ISO 10303–45

This part of ISO 10303 makes use of the following terms defined in ISO 10303–45:

- material;
- material property.

3.6 Terms defined in ISO 10303–46

This part of ISO 10303 makes use of the following terms defined in ISO 10303–46:

- annotation;
- layer;
- picture;
- planar;
- presentation information;
- symbol;
- visualization.

3.7 Terms defined in ISO 10303–47

This part of ISO 10303 makes use of the following terms defined in ISO 10303–47:

- form tolerance;
- profile tolerance;
- toleranced feature.

3.8 Terms defined in ISO 10303–105

This part of ISO 10303 makes use of the following terms in ISO 10303–105:

- base;
- frame;
- joint;
- link;
- mechanism;
- motion;
- pair;
- placement;
- world coordinate system.

3.9 Terms defined in ISO 10303–202

This part of ISO 10303 makes use of the following terms defined in ISO 10303–202:

- application interpreted construct (AIC);
- externally defined;
- predefined.

3.10 Terms defined in ISO 13584–42

This part of ISO 10303 makes use of the following terms defined in ISO 13584–42:

- basic semantic unit (BSU);

3.11 Other definitions

For the purpose of this part of ISO 10303, the following definitions apply.

3.11.1 body in white: Parts of the vehicle body that form the body shell and ensure its stability.

3.11.2 vehicle: Land conveyance for the transportation of goods or passengers.

EXAMPLE 9 – A cart, a lorry, a motor-car, or a bus are examples for a vehicle.

3.12 Abbreviations

For the purpose of this part of ISO 10303, the following abbreviations apply:

C1	surface_condition UoF
CAD	Computer Aided Design
CAM	Computer Aided Manufacturing
CSG	Constructive Solid Geometry
D1	explicit_draughting UoF
D2	associative_annotation UoF
E1	external_reference_mechanism UoF
FF1	user_defined_feature UoF
FF2	included_feature UoF
FF3	generative_featured_shape UoF
G1	wireframe_model_2d UoF
G2	wireframe_model_3d UoF
G3	connected_surface_model UoF
G4	faceted_b_rep_model UoF
G5	b_rep_model UoF
G6	compound_model UoF
G7	csg_model UoF
G8	geometrically_bounded_surface_model UoF
K1	kinematics UoF
LMC	Least Material condition
MD1	measured_data UoF

S5	work_management UoF
S6	classification UoF
S7	specification_control UoF
S8	process_plan UoF
T1	dimension_tolerance UoF
T2	geometric_tolerance UoF

4 Information requirements

This clause specifies the information required for core data for automotive mechanical design processes.

The information requirements are specified as a set of units of functionality, application objects, and application assertions. These assertions pertain to individual application objects and to relationships between application objects. The information requirements are defined using the terminology of the subject area of this application protocol.

NOTES

1 – A graphical representation of the information requirements is given in annex G.

2 – The information requirements correspond to those of the activities identified as being within the scope of this application protocol in annex F.

3 – The mapping table specified in 5.1 shows how the integrated resources and application interpreted constructs are used to meet the information requirements of this application protocol.

4.1 Units of functionality

This subclause specifies the units of functionality for the Core Data for Automotive Mechanical Design Processes application protocol.

NOTE 1 – One or more UoFs, grouped together, provide a solution to identified data flows derived from the AAM (see annex F). The grouping of the UoFs is documented in clause 6.

This part of ISO 10303 specifies the following units of functionality:

NOTE 2 – Following the name of each UoF, its abbreviation is shown in brackets. The abbreviations consist of one or two letters and a number. The letters indicate a logical group to which the UoF belongs. The logical groups identified are shown in table 1.

Figure 66 gives an overview for the UoFs, their logical groups, and the interdependencies among the UoFs and the logical groups.

Table 1 – Logical grouping of UoFs

Information type	Abbreviation
surface condition	C
draughting	D
external reference	E
form features	FF
geometry	G
kinematics	K
measured data	MD
property	PR
presentation	P
product structure	S
tolerance	T

- surface_condition (C1);
- explicit_draughting (D1);
- associative_annotation (D2);
- external_reference_mechanism (E1);
- user_defined_feature (FF1);

- included_feature (FF2);
- generative_featured_shape (FF3);
- wireframe_model_2d (G1);
- wireframe_model_3d (G2);
- connected_surface_model (G3);
- faceted_b_rep_model (G4);
- b_rep_model (G5);
- compound_model (G6);
- csg_model (G7);
- geometrically_bounded_surface_model (G8);
- kinematics (K1);
- measured_data (MD1);
- item_property (PR1);
- geometric_presentation (P1);
- annotated_presentation (P2);
- shaded_presentation (P3);
- product_management_data (S1);
- element_structure (S2);
- item_definition_structure (S3);
- effectivity (S4);
- work_management (S5);
- classification (S6);
- specification_control (S7);
- process_plan (S8);

- dimension_tolerance (T1);
- geometric_tolerance (T2).

The units of functionality and a description of the functions that each UoF supports are given below. The application objects included in the UoFs are defined in 4.2.

4.1.1 surface_condition (C1)

This unit of functionality provides the capability to represent surface properties and surface treatments of a material. It covers surface characteristics which may be defined by a designer to achieve the required functionality of a part.

The definition of the presentation of the surface characteristics information is dealt with in the associative_annotation UoF (D2).

The following application objects are used by the surface_condition UoF:

- Coating_layer;
- Coating_layer_relationship;
- Contact_ratio;
- Default_roughness;
- Default_setting_association;
- Hardness;
- Roughness;
- Surface_condition;
- Tactile_appearance;
- Treatment_result;
- Value_with_unit;
- Visual_appearance.

4.1.2 explicit_draughting (D1)

This unit of functionality specifies the representation of annotation elements in an explicit form used in technical drawings. Additionally it defines the organizational structure and management data for technical drawings.

This UoF is based on ISO 10303–201 and establishes the information requirements for the exchange of part definition data in the form of CAD–drawings with explicit annotation. Annotation elements are either defined in a two-dimensional coordinate system, related to the area or view, or in the same coordinate system as the geometry which may be two- or three-dimensional. The annotation elements themselves are always planar.

This UoF also provides for the management of drawing sheets, drawing views, symbols, and dimensioning.

The following application objects are used by the explicit_draughting UoF:

- Annotation_curve;
- Detailed_element;
- Dimension;
- Dimension_callout;
- Dimension_curve;
- Dimension_sequence_pair;
- Drawing;
- Drawing_assignment;
- Drawing_sequence;
- Drawing_sheet;
- Projection_curve;
- View_area_assignment.

4.1.3 associative_annotation (D2)

This unit of functionality specifies the representation of annotation elements in an associative form, i.e., with an association to the annotated geometry.

This unit of functionality is based on ISO 10303–202 and allows the exchange of drawings that maintain an association between the annotation and the geometric shape of a part. Associated annotation elements are either defined in a two-dimensional coordinate system, related to the area or view, or in the same coordinate system as the geometry which may be two- or three-dimensional. The annotation elements themselves are always planar. In the case of associated dimensions the associativity is maintained between the calculated value of the size or distance, the presentation of the value, and the elements from which this value is calculated.

This UoF also allows a reference to tolerance information within geometric dimensions (see UoF T1).

The following application objects are used by the associative_annotation UoF:

- Associated_annotation_symbol;
- Associated_fill_area;
- Associated_leader;
- Associated_projection_curve;
- Detailed_element;
- Dimension_callout;
- Geometric_tolerance_symbol;
- Surface_condition_symbol.

4.1.4 external_reference_mechanism (E1)

This unit of functionality provides a reference mechanism to specify external documents that are associated with objects defined in this part of ISO 10303. These documents may contain data that are not in scope of this part of ISO 10303. This includes conventional non-digital data and digital data in other computer interpretable formats.

EXAMPLE 10 – Technical drawings on paper, standards documents, or handwritten documents are examples of non-digital data referenced by the external reference mechanism.

EXAMPLE 11 – CAD data in a system's native format, text documents in SGML [8], or NC-data in ISO 6983 [6] are examples of digital data referenced by the external reference mechanism.

The following application objects are used by the external_reference_mechanism UoF:

- Archived_document;
- Digital_document;
- Document_relationship;
- Document_type;
- External_document;
- External_document_assignment;
- External_document_version;
- External_library_reference;
- External_model;

- Physical_model.

4.1.5 user_defined_feature (FF1)

This unit of functionality provides the capability to categorize an area of interest in a shape as a feature and to associate parameters as additional information – not intended for shape generation – with the identified aspect of the shape. Using this mechanism multiple aspects of the shape that are identified as features may be combined into a compound general feature.

The following application objects are used by the user_defined_feature UoF:

- Feature_occurrence;
- Feature_parameter;
- General_compound_feature;
- General_feature;
- General_feature_parameter;
- Included_feature;
- Value_with_unit.

4.1.6 included_feature (FF2)

This unit of functionality provides the capability to identify areas of interest on an already designed shape as a particular kind of feature whose type and defining parameters are specified in this part of ISO 10303.

NOTE 1 – These features usually have a certain meaning to the user, such as a correspondence to a manufacturing process operation managed or manageable by the user.

The feature definitions in this part of ISO 10303 distinguishes between form features for sheet type of parts or tools and form features for solid type of parts or tools. Among these features are hole, pocket, boss, slot, rib, thread, bead and joggle as well as transition features such as fillet, edge round, and chamfer. A feature replication mechanism with various patterns as well as a compound feature mechanism are also included.

Within this UoF the specification of parameters on these features does not mean that a variation of these parameters is intended in order to change the shape of the part the feature is applied to.

NOTE 2 – The parameters may be used to specify the areas of interest in a more appropriate way, e.g., to support manufacturing planning.

The following application objects are used by the included_feature UoF:

- Angle_specification;

- Angle_taper;
- Bead_end_type;
- Bead_feature;
- Boss_feature;
- Boss_top_condition;
- Catalog_thread;
- Chamfer;

4.1.7 generative_featured_shape (FF3)

This unit of functionality provides the capability to use a subset of those features specified within the included_feature UoF in a way that the application of the features on a base shape results in a modified shape. Within this UoF the identification of feature parameters is related to the intent to study the consequences of a variation of these parameters on the resulting shape.

Additionally this UoF supports the definition of sequences of 'operations', i.e. the application of one or more features to a base shape with the possibility to represent the resulting shapes at the various intermediate stages.

The following application objects are used by the generative_featured_shape UoF:

- Feature_occurrence;
- Feature_placement;
- Featured_shape;
- Placed_feature.

4.1.8 wireframe_model_2d (G1)

This unit of functionality provides the capability to represent geometry as a two-dimensional wireframe model, i.e., of two-dimensional points and curves. The difference between 3D and 2D geometric elements is specified by the presence or absence of a third coordinate value, respectively.

Composite curves for the geometric representation of paths and loops are included in this UoF. The types of points and curves excluded from this UoF are point on surface and curve on surface. All unbounded curves in this UoF are explicitly trimmed unless they are closed.

Surface data and all topological information are outside the scope of this UoF.

The following application objects are used by the wireframe_model_2d UoF:

- B_spline_curve;
- Cartesian_point;
- Circle;
- Composite_curve;
- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Curve;
- Curve_set_2d;
- Detailed_element;
- Detailed_geometric_model_element;
- Detailed_model_element;
- Ellipse;
- Geometric_model;
- Geometric_model_relationship;
- Geometric_model_version;
- Hyperbola;
- Line;
- Offset_curve;
- Parabola;
- Point;
- Point_on_curve;
- Polyline;
- Trimmed_curve;

- Wireframe_model_2d.

4.1.9 wireframe_model_3d (G2)

This unit of functionality provides the capability to represent geometry as a three-dimensional geometrically bounded wireframe model. The difference between 3D and 2D geometric elements is specified by the presence or absence of a third coordinate value, respectively. All application objects of the wireframe_model_2d UoF (G1) are included for the 3D case in the wireframe_model_3d UoF (G2).

Composite curves for the geometric representation of paths and loops are included in this UoF. The types of points and curves excluded from this UoF are point on surface and curve on surface. All unbounded curves in this UoF are explicitly trimmed unless they are closed.

Surface data and all topological information are outside the scope of this UoF.

The following application objects are used by the wireframe_model_3d UoF:

- B_spline_curve;
- Cartesian_point;
- Circle;
- Composite_curve;
- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Curve;
- Curve_set_3d;
- Detailed_element;
- Detailed_geometric_model_element;
- Detailed_model_element;
- Ellipse;
- Geometric_model;
- Geometric_model_relationship;
- Geometric_model_version;

- Hybrid_geometric_model_3d;
- Hyperbola;
- Line;
- Offset_curve;
- Parabola;
- Point;
- Point_on_curve;
- Polyline;
- Trimmed_curve;
- Wireframe_model_3d.

4.1.10 connected_surface_model (G3)

This unit of functionality provides the capability to represent geometry as a surface model that is topologically bounded.

Topological relationships are modeled explicitly by using objects, i.e., face, loop, edge, and vertex. The bounded surfaces in this UoF are connected. A model shall be manifold. A facility to associate transition information with a pair of adjacent faces or with a pair of adjacent edges is provided. Trimming and composition of curves and surfaces are represented by applying topological objects, i.e., vertex, edge, loop, and face.

This unit of functionality contains the geometrical representation of points, curves, and surfaces of the wireframe_model_3D UoF (G2) and of the geometrically_bounded_surface_model UoF (G8). The connected_surface_model UoF has the additional functionality of representing points and curves in the parameter space of curves and surfaces, respectively.

EXAMPLE 12 – Examples for curves represented in the parameter space of surfaces are intersection curves or seam curves.

The following application objects are used by the connected_surface_model UoF:

- B_spline_curve;
- B_spline_surface;
- Cartesian_point;
- Circle;
- Conical_surface;

- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Curve;
- Curve_on_surface;
- Cylindrical_surface;
- Detailed_element;
- Detailed_geometric_model_element;
- Detailed_model_element;
- Edge_loop;
- Edge_transition;
- Ellipse;
- Face;
- Face_bound;
- Face_transition;
- Geometric_model;
- Geometric_model_relationship;
- Geometric_model_version;
- Hybrid_geometric_model_3d;
- Hyperbola;
- Line;
- Offset_surface;
- Oriented_edge_curve;
- Parabola;

- Plane;
- Point;
- Point_on_curve;
- Point_on_surface;
- Polyline;
- Shell;
- Spherical_surface;
- Surface;
- Surface_model;
- Surface_of_linear_extrusion;
- Surface_of_revolution;
- Toroidal_surface;
- Vertex_loop;
- Vertex_point.

4.1.11 faceted_b_rep_model (G4)

This unit of functionality provides the capability to represent geometry as a B-rep model with planar faces and implicit topology.

The faceted B-rep model is represented by an outer shell and an arbitrary number of internal voids, each of which is represented by a closed shell. A requirement, included to provide internal consistency checks, is that each face shall be associated with a plane surface. All the face boundaries are implicitly defined by poly loops. One of these poly loops shall be designated the outer boundary. The edges are all straight lines but are not explicitly defined. The edge information can be deduced from the poly loop definitions.

This UoF shares the basic geometric definitions of point, line, and plane with the UoFs G3 and G5. It also shares the definition of a manifold solid B-rep and the topological concepts of closed shell and face with UoF G5.

NOTE – A faceted B-rep model, as defined in this UoF would not be considered to be a valid example of a B-rep model in the UoF G5; it could however be converted to such a model by explicitly creating lines, edges and vertices and converting the face bounding poly loops in UoF G4 to edge loops as required by UoF G5.

The following application objects are used by the faceted_b_rep_model UoF:

- Cartesian_point;
- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Detailed_element;
- Detailed_geometric_model_element;
- Detailed_model_element;
- Faceted_b_rep;
- Faceted_b_rep_model;
- Faceted_closed_shell;
- Faceted_face;
- Geometric_model;
- Geometric_model_relationship;
- Geometric_model_version;
- Hybrid_geometric_model_3d;
- Plane;
- Point;
- Poly_loop.

4.1.12 b_rep_model (G5)

This unit of functionality provides the capability to represent geometry as B-rep model with a consistent topological structure and directly defined geometry for faces and edges.

The B-rep model is represented by one or more B-rep solids. Each B-rep solid consists of a single closed shell, which represents its exterior, and an arbitrary number of closed shells corresponding to internal voids. Each shell consists of a collection of faces. Each face is defined by a surface and by loops of edges bounding the surface. The edges meet at vertices and have their geometry

defined by curves. The geometry of the curves and surfaces can be complex but is required to be directly defined. Constraints ensure that the B-rep model is defined in the simplest and most direct manner consistent with the requirement to provide a complete geometric representation.

All the geometry defined in this UoF is shared with the connected_surface_model UoF (G3), the topological definitions of vertex, edge, path, loop, and face are also common between the UoFs G3 and G5.

NOTE – Any B-rep model defined in UoF G5 could be represented in UoF G3 as a collection of faces with no loss of geometric precision but losing the information of a solid model, e.g., inner and outer domain of the B-rep solid.

The following application objects are used by the b_rep_model UoF:

- B_rep;
- B_rep_model;
- B_spline_curve;
- B_spline_surface;
- Cartesian_point;
- Circle;
- Closed_shell;
- Conical_surface;
- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Curve;
- Curve_on_surface;
- Cylindrical_surface;
- Detailed_element;
- Detailed_geometric_model_element;
- Detailed_model_element;
- Edge_loop;

- Edge_transition;
- Ellipse;
- Face;
- Face_bound;
- Face_transition;
- Geometric_model;
- Geometric_model_relationship;
- Geometric_model_version;
- Hybrid_geometric_model_3d;
- Hyperbola;
- Line;
- Oriented_edge_curve;
- Parabola;
- Plane;
- Point;
- Polyline;
- Spherical_surface;
- Surface;
- Surface_of_linear_extrusion;
- Surface_of_revolution;
- Toroidal_surface;
- Vertex_loop;
- Vertex_point.

4.1.13 compound_model (G6)

This unit of functionality provides the capability to represent geometry as a topologically connected geometric model consisting of solid, surface, or wireframe data. This geometric model deals with mixed dimensionality (solids, surfaces, and wireframes) and non-manifold topology.

Only shape models with complete topological description, i.e., in boundary representation are supported. Since the topology is not restricted to be manifold, the models can have more than two faces sharing one edge and have faces shared by two adjacent shells. A compound representation collects several geometric items of the same or of different type and joins them into one topologically connected model.

NOTE – This UoF should be used wherever portions of the model have to be distinguished.

EXAMPLE 13 – Examples for distinguishing portions of the model are material zones with different heat treatment, structures welded together, meshing macros for finite element analysis, and shape representation of varying dimensionality, e.g., surfaces and solids.

This UoF includes all application objects of UoF b_rep_model (G5) and connected_surface_model (G3).

The following application objects are used by the compound_model UoF:

- B_spline_curve;
- B_spline_surface;
- Cartesian_point;
- Circle;
- Compound_model;
- Conical_surface;
- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Curve;
- Curve_on_surface;
- Cylindrical_surface;
- Detailed_element;
- Detailed_geometric_model_element;

- Detailed_model_element;
- Edge_loop;
- Edge_transition;
- Ellipse;
- Face;
- Face_bound;
- Face_transition;
- Geometric_model;
- Geometric_model_relationship;
- Geometric_model_version;
- Hybrid_geometric_model_3d;
- Hyperbola;
- Line;
- Offset_surface;
- Oriented_edge_curve;
- Parabola;
- Plane;
- Point;
- Point_on_curve;
- Point_on_surface;
- Polyline;
- Spherical_surface;
- Surface;
- Surface_of_linear_extrusion;

- Surface_of_revolution;
- Topologically_connected_set;
- Toroidal_surface;
- Vertex_loop;
- Vertex_point.

4.1.14 csg_model (G7)

This unit of functionality provides the capability to represent geometry as a solid model using Constructive Solid Geometry (CSG).

A CSG shape is the evaluation of a CSG tree which has solid objects at the leaves and boolean operations at the nodes. This model provides geometric functionality for building solids using boolean operations on predefined simple parameterized solid shapes, manifold solid B-rep shapes in faceted or exact form, and half space solids.

The following application objects are used by the csg_model UoF:

- B_rep;
- B_rep_model;
- B_spline_curve;
- B_spline_surface;
- Block;
- Boolean_result;
- Cartesian_point;
- Circle;
- Closed_shell;
- Conical_surface;
- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Csg_model;

- Csg_primitive;
- Curve;
- Curve_on_surface;
- Cylindrical_surface;
- Detailed_element;
- Detailed_geometric_model_element;
- Detailed_model_element;
- Edge_loop;
- Edge_transition;
- Ellipse;
- Face;
- Face_bound;
- Face_transition;
- Faceted_b_rep;
- Faceted_b_rep_model;
- Faceted_closed_shell;
- Faceted_face;
- Geometric_model;
- Geometric_model_relationship;
- Geometric_model_version;
- Half_space_solid;
- Hybrid_geometric_model_3d;
- Hyperbola;
- Line;

- Oriented_edge_curve;
- Parabola;
- Plane;
- Point;
- Poly_loop;
- Polyline;
- Right_angular_wedge;
- Right_circular_cone;
- Right_circular_cylinder;
- Solid_of_linear_extrusion;
- Solid_of_revolution;
- Solid_replica;
- Sphere;
- Spherical_surface;
- Surface;
- Surface_of_linear_extrusion;
- Surface_of_revolution;
- Swept_face_solid;
- Toroidal_surface;
- Torus;
- Vertex_loop;
- Vertex_point.

4.1.15 geometrically_bounded_surface_model (G8)

This unit of functionality provides the capability to represent geometry as a surface model that is geometrically bounded.

This UoF provides basic geometric constructs, such as three-dimensional points, curves, and surfaces. It includes both elementary and sculptured surfaces. Points and curves can be represented in the parameter space of curves or surfaces, respectively, by objects such as point on curve and parametric curve. The replication of the geometric objects is not included in this UoF.

The basic geometric constructs are used for the definition of complex geometric objects, i.e., geometrically bounded surfaces without connectivity. They are also used within the connected_surface_model UoF (G3) and b_rep_model UoF (G5) for the definition of topologically bounded surfaces with topological connections.

NOTE – This UoF does not contain any topological information. Therefore the geometrically bounded surfaces cannot be connected by topology.

The following application objects are used by the geometrically_bounded_surface_model UoF:

- B_spline_curve;
- B_spline_surface;
- Cartesian_point;
- Circle;
- Composite_curve;
- Conical_surface;
- Constructive_geometric_element;
- Constructive_geometry;
- Constructive_geometry_association;
- Curve;
- Curve_on_surface;
- Cylindrical_surface;
- Ellipse;
- Geometric_model;
- Geometric_model_relationship;

- Geometric_model_version;
- Geometric_set_3d;
- Geometrically_bounded_surface_model;
- Hyperbola;
- Line;
- Offset_curve;
- Offset_surface;
- Parabola;
- Plane;
- Point;
- Point_on_curve;
- Point_on_surface;
- Polyline;
- Spherical_surface;
- Surface;
- Surface_of_linear_extrusion;
- Surface_of_revolution;
- Toroidal_surface;
- Trimmed_curve;
- Trimmed_surface.

4.1.16 kinematics (K1)

This unit of functionality provides the capability to represent kinematic aspects of a mechanical product as required for the communication between CAD systems and kinematic analysis systems, including robotic simulation systems, as well as between dissimilar kinematic analysis systems.

A mechanism as described using this UoF is regarded as being composed of rigid links mating in the following types of joints:

- cylindrical pair;
- gear pair;
- planar pair;
- point on surface pair;
- prismatic pair;
- rack and pinion pair;
- revolute pair;
- rolling curve pair;
- rolling surface pair;
- screw pair;
- sliding curve pair;
- sliding surface pair;
- spherical pair;
- universal pair.

The mechanism may contain open or closed kinematic chains. This information is implicitly defined by the topology of the kinematic structure. A mechanism may be connected to another mechanism. Both planar and 3D mechanisms can be defined. The rigid links may be described by a 3D geometric shape description. A link may have additional frames attached to it, to allow application specific kinematic forward analysis to be performed.

The following application objects are used by the kinematics UoF:

- Actuator;
- Ground_representation;
- Initial_configuration;
- Interpolated_configuration_sequence;
- Kinematic_configuration_definition;
- Kinematic_configuration_interpolation;

- Kinematic_joint;
- Kinematic_link;
- Kinematic_link_representation;
- Kinematic_mechanism;
- Kinematic_pair;
- Kinematic_structure;
- Kinematic_transformation_result;
- Pair_value;
- Path_approximation;
- Simple_pair_range;
- Simulation_information;
- Tool_attachment_point_frame;
- Tool_center_point_frame;
- Transformation_to_reference_frame.

4.1.17 measured_data (MD1)

This unit of functionality specifies the representation of scanned data resulting from a measurement process of a physical part. These data are represented by a sequence of measured points, potentially with associated vector information for the measured surface normal direction. This data representation may also be used for manufacturing processes, e.g., to represent tool paths for NC programming with the vector information indicating the tool direction.

The following application objects are used by the measured_data UoF:

- Point_direction;
- Point_direction_model;
- Point_direction_sequence;
- Point_sequence.

4.1.18 item_property (PR1)

This unit of functionality specifies various properties for a part, such as material, recyclability, mass, and general properties.

The information about recyclability is required to describe whether and how material or component parts may be reused. The costs as planned or calculated for a part as well as a quality measure property to keep track of the results of some processes, e.g., prototype building, may be specified. The mass is required to express the weight of a part. Mass properties that are rotation and translation invariant such as the centre of mass and the moments of inertia may also be specified.

The general properties are required to define property data which are not covered by one of the other UoFs, and, due to their variety, cannot be specified all by explicit application objects.

> EXAMPLE 14 – Noise development of an engine, maintenance intervals of parts, and heat or noise absorption of insulating parts between the engine and passenger compartment are examples for general properties.

The following application objects are used by the item_property UoF:

- Centre_of_mass;
- Data_environment;
- Default_setting_association;
- Default_thickness;
- General_item_property;
- Item_cost_property;
- Item_property;
- Item_quality_property;
- Mass;
- Material;
- Material_property;
- Material_property_representation;
- Material_side_specification;
- Moments_of_inertia;
- Property;

- Property_change;
- Property_relationship;
- Property_value;
- Recyclability;
- Shape_dependent_property;
- Thickness;
- Value_with_unit.

4.1.19 geometric_presentation (P1)

This unit of functionality specifies the presentation of point, vector, curve, and surface geometry with attributes, such as colour, line thickness, or line font. The association of these attributes to geometric elements is defined either directly or through a context.

EXAMPLE 15 – The following are examples for a context: drawing sheet, layer, group, model view, template, view, or view area.

The curve appearance is restricted to unscaled curve fonts only. The viewing mechanism with one or more views onto the geometric shape model is also provided.

The following application objects are used by the geometric_presentation UoF:

- Appearance_assignment;
- Context_dependent_appearance_assignment;
- Curve_appearance;
- Model_image;
- Point_appearance;
- Styled_element;
- Styled_geometric_model;
- Styled_model;
- Styled_model_element;
- Styled_model_relationship;
- Styled_model_version;

- Surface_appearance;
- Surface_appearance_element;
- Vector_appearance;
- View;
- View_area.

4.1.20 annotated_presentation (P2)

This unit of functionality specifies the presentation of annotations and a view layout with multiple views, including annotations. The curve appearance is unrestricted in this UoF.

EXAMPLE 16 – Sketches can be represented with this UoF.

The organizational definitions of technical drawings is not included in this UoF but in the Explicit_draughting UoF.

The following application objects are used by the annotated_presentation UoF:

- Annotation_curve;
- Annotation_element;
- Annotation_model;
- Annotation_subfigure;
- Annotation_symbol;
- Area_placed_annotation;
- Detailed_element;
- Draughting_callout;
- Fill_area;
- Hatching;
- Leader;
- Solid_fill_area;
- Text;
- Text_appearance;

- Tiling;
- View_area_relationship;
- View_placed_annotation;
- View_relationship.

4.1.21 shaded_presentation (P3)

This unit of functionality specifies advanced presentation capabilities for three-dimensional geometry. This includes hidden line and hidden surface presentation and definitions which enable the creation of shaded images, such as light source definitions. Enhanced surface appearance definitions are also included.

EXAMPLE 17 – Examples of enhanced surface appearance definitions are transparency and reflection rates of surfaces.

The following application objects are used by the shaded_presentation UoF:

- Curve_appearance;
- Hidden_element_handling;
- Light_source;
- Surface_appearance;
- Surface_appearance_element.

4.1.22 product_management_data (S1)

This unit of functionality provides the capability to represent product management information. It includes information about items that are either raw materials, parts, or tools, about versions and views of items, about persons and dates, and about information resulting from release and approval processes.

Additionally this unit of functionality provides the capability to represent descriptive information about objects in different languages and to assign alias identifiers to objects.

The following application objects are used by the product_management_data UoF:

- Alias_identification;
- Application_context;
- Approval;
- Approval_relationship;

- Approval_status;
- Date_and_person_assignment;
- Date_and_person_or_organization;
- Date_time;
- Date_time_assignment;
- Design_discipline_item_definition;
- Item;
- Item_classification;
- Item_version;
- Multi_language_string;
- Organization;
- Person;
- Person_in_organization;
- Person_or_organization_assignment;
- Security_classification;
- Security_level;
- Specific_classification;
- String_with_language.

4.1.23 element_structure (S2)

This unit of functionality provides the capability to associate items with shape or to identify aspects of the shape. Additionally this UoF contains elements that are needed to build up structures of data elements.

The data elements that can be structured are geometric elements, annotation elements, and kinematic elements. The supported structures are groups, layers, and templates for multiple instances of the same definition.

Group structures and template structures may be nested. Layers can not be nested but may be related.

The following application objects are used by the element_structure UoF:

- Accuracy;
- Axis_placement;
- Cartesian_coordinate_space;
- Cartesian_coordinate_space_2d;
- Cartesian_coordinate_space_3d;
- Geometric_model_relationship_with_transformation;
- Group;
- Group_relationship;
- Item_shape;
- Layer;
- Model_change;
- Shape_aspect;
- Shape_aspect_relationship;
- Shape_description_association;
- Structuring_method_hierarchy;
- Template_instance;
- Transformation;
- Transformation_2d;
- Transformation_3d.

4.1.24 item_definition_structure (S3)

This unit of functionality provides the capability to represent relationships between items to build up various kinds of structures.

The structures are defined for design discipline item definitions, for item instances that are particular occurrences of design discipline item definitions or between design discipline item definitions and item instances.

Among these structures is a hierarchical assembly structure to represent the relationships among constituents and the assembly.

The following application objects are used by the item_definition_structure UoF:

- Assembly_component_relationship;
- Assembly_definition;
- Assembly_substitute_relationship;
- General_item_definition_instance_relationship;
- General_item_definition_relationship;
- General_item_instance_relationship;
- Geometrical_relationship;
- Item_definition_instance_relationship;
- Item_definition_relationship;
- Item_instance;
- Item_instance_relationship;
- Next_higher_assembly;
- Promissory_usage;
- Quantified_instance;
- Selected_instance;
- Single_instance;
- Value_with_unit.

4.1.25 effectivity (S4)

This unit of functionality provides the capability to represent information concerning the validity of data.

The validity of data can be expressed by effectivities that specify time ranges within which data may be used and by retention periods that specify how long data have to kept and when they may or have to be deleted.

Both concepts can make use of explicit dates or of dates expressed by events in order to represent the relevant points in time.

The following application objects are used by the effectivity UoF:

- Effectivity;
- Effectivity_relationship;
- Event_reference;
- Retention_period;
- Value_with_unit.

4.1.26 work_management (S5)

This unit of functionality provides the capability to represent activity, project, and contract related information.

Activities may be initiated by work requests and may be authorized by work orders. Activities may result in changes of models or properties; such changes can also be represented in this UoF.

The following application objects are used by the work_management UoF:

- Activity;
- Activity_element;
- Activity_method;
- Activity_relationship;
- Alternate_item_relationship;
- Change;
- Contract;
- Element_delivery;
- Item_version_relationship;
- Organization_in_contract;
- Organization_relationship;
- Project;
- Project_relationship;

- Simultaneous_activity;
- Value_with_unit;
- Work_order;
- Work_request.

4.1.27 classification (S6)

This unit of functionality provides the capability to classify items into specific categories.

EXAMPLE 18 – Examples are the classification as raw material, parts, or tools, or as safety or in-process items.

Additionally items may be classified by their attributes.

EXAMPLE 19 – Examples for categories of attribute based classification are screws, bolts, nuts, shafts, or brackets.

The following application objects are used by the classification UoF:

- Classification_attribute;
- Classification_system;
- General_classification;
- General_classification_hierarchy;
- Item_classification;
- Specific_classification.

4.1.28 specification_control (S7)

This unit of functionality provides the capability to describe automotive products with a large number of variants.

EXAMPLE 20 – Examples for automotive products are passenger cars, trucks, busses, or engines or other components of these products.

Because of the large number of variants there is no unique identification for each of the variants that could be produced. The main concepts that are used to handle this large number of variants are the following:

- product classes are used to identify sets of similar products to be offered to the market;
- specifications are used to describe characteristics of the products;
- specification categories are used to group similar characteristics of the products;

– specification expressions are used to control the usage of a part within a product and to represent conditions for product classes;

– product functions are used to describe the functional requirements for products and components of products;

– product components are used to describe the common decomposition structure of all products of a product class;

– item solutions are used to describe the variants for a product component;

– item instances are used to identify elements of an item solution.

The following application objects are used by the specification_control UoF:

– Class_category_association;

– Class_condition_association;

– Class_function_association;

– Class_inclusion_association;

– Class_specification_association;

– Collected_item_association;

– Collection_definition;

– Configuration;

– Dated_configuration;

– Descriptive_specification;

– Design_constraint;

– Design_constraint_association;

– Design_constraint_relationship;

– Design_constraint_version;

– Final_item_solution;

– Function_component_association;

– Instance_placement;

- Item_solution;

4.1.29 process_plan (S8)

This unit of functionality provides the capability to represent process related data. This includes process plans, versions of process plans with version tracking, process operations and properties of processes.

A process plan is decomposed into one or more process operations. Process plans and process operations establish relationships among raw materials, in-process parts, and final parts, as well as the relationship between the parts and the tools used to manufacture them.

Additionally, the representation of the connection of parts in various kinds of matings is part of this UoF.

The following application objects are used by the process_plan UoF:

- Exclusive_process_operation;
- General_process_property;
- Make_from_relationship;
- Mated_item_association;
- Mated_item_relationship;
- Mating_definition;
- Process_cost_property;
- Process_operation;
- Process_operation_input_or_output;
- Process_operation_relationship;
- Process_operation_resource;
- Process_operation_resource_assignment;
- Process_plan;
- Process_plan_operation_assignment;
- Process_plan_relationship;
- Process_plan_version;

- Process_property;
- Process_quality_property;
- Process_state;
- Same_time_machining_relationship;
- Simultaneous_process_operation;
- Tool_part_relationship.

4.1.30 dimension_tolerance (T1)

This unit of functionality specifies the representation of geometric dimensions and of tolerances limiting geometric dimensions. Tolerances for geometric dimensions are characterized by plus-minus-tolerances, limits and fits, dimension ranges, or dimension limits and describe the allowable deviation range.

The definition of the presentation of the Tolerance information is dealt with in the associative_-annotation UoF (D2).

The following application objects are used by the dimension_tolerance UoF:

- Angular_location_dimension;
- Angular_size_dimension;
- Curved_distance_dimension;
- Default_setting_association;
- Derived_geometry;
- Dimension_tolerance;
- General_tolerance_table;
- General_tolerances;
- Geometric_dimension;
- Limits_and_fits;
- Linear_distance_dimension;
- Location_dimension;
- Plus_minus_tolerance;

- Plus_minus_toleranced_datum;
- Significant_number_of_digits;
- Size_dimension;
- Tolerance_table_cell;
- Upper_lower_limit;
- Upper_lower_toleranced_datum;
- Value_limit;
- Value_range.

4.1.31 geometric_tolerance (T2)

This unit of functionality specifies the representation of geometric tolerances with a datum reference, such as parallelism or perpendicularity, and also geometric tolerances without a datum reference, such as straightness or flatness.

This UoF allows the definition of up to three datum references that are either single datums, compound datums, or datum targets and additionally the specification of tolerance zones.

The definition of the presentation of the Tolerance information is dealt with in the associative_-annotation UoF (D2).

The following application objects are used by the geometric_tolerance UoF:

- Angularity_tolerance;
- Circular_runout_tolerance;
- Circularity_tolerance;
- Compound_datum;
- Concentricity_tolerance;
- Cylindricity_tolerance;
- Datum;
- Datum_feature;
- Datum_target;
- Datum_target_set;

- Derived_geometry;
- Flatness_tolerance;
- Geometric_tolerance;
- Geometric_tolerance_precedence;
- Linear_profile_tolerance;
- Material_condition;
- Parallelism_tolerance;
- Perpendicularity_tolerance;
- Placed_target;
- Position_tolerance;
- Projection;
- Reference_plane;
- Straightness_tolerance;
- Surface_profile_tolerance;
- Symmetry_tolerance;
- Target_area;
- Target_circle;
- Target_line;
- Target_point;
- Target_rectangle;
- Tolerance_zone;
- Tolerance_zone_definition;
- Total_runout_tolerance.

4.2 Application objects

This subclause specifies the application objects for the Core Data for Automotive Mechanical Design Processes application protocol. Each application object is an atomic element that embodies a unique application concept and contains attributes specifying the data elements of the object. The application objects and their definitions are given below.

NOTE 1 – The following conventions apply for the definition text:

– lower case terms refer to the concept known in the application environment, e.g., 'circle' refers to the concept of a round plane figure whose circumference is everywhere equidistant from its centre;

– upper case terms refer to the application objects as defined in this part of ISO 10303, e.g., 'Circle' refers to the application object as defined in the geometric UoFs.

The attribute names 'id', 'name', and 'description' imply the following meanings:

- id: a computer interpretable identifier;
- name: human readable information;
- description: descriptive text.

NOTE 2 – The id is not a system generated identifier used by an implementation to distinguish between the various objects but is an identifier that has a certain meaning in an application and that may be meaningful to a human being as well.

In this clause a permissive list approach for attributes with suffix '_type' or with name 'role' is used consistently, i.e. there is a list of standardized values with the specific semantics defined. Other non-standardized values are allowed as well.

NOTE 3 – Especially many relationship objects are defined in a general way where the attribute 'relation_type' defines the standardized usages with a definition of the meaning of the other attributes, like 'relating' and 'related'.

4.2.1 Accuracy

An Accuracy is the information about the geometrical accuracy of the product data contained in a model.

The data associated with an Accuracy are the following:

- angular_accuracy_value;
- curvature_accuracy_value;
- distance_accuracy_value;
- is_defined_for.

4.2.1.1 angular_accuracy_value

The angular_accuracy_value specifies the maximum value for the absolute angle between two curve tangents or two surface normals for which the creating system assumes curve tangents or surface normals being identical.

NOTE – The angular_accuracy_value can be used to determine the accuracy range for tangent continuous curve or surface connections.

The angular_accuracy_value need not be specified for a particular Accuracy.

4.2.1.2 curvature_accuracy_value

The curvature_accuracy_value specifies the maximum value for the term

$$\frac{2\|R_1 - R_2\|}{\|R_1\| + \|R_2\|}$$

for which the creating system assumes the two radii of curvature R_1 and R_2 to be identical.

NOTE – Terms surrounded by the || symbols represent the absolute values of these terms.

The curvature_accuracy_value is used to determine the accuracy range for curvature continuous curve or surface connections.

The curvature_accuracy_value need not be specified for a particular Accuracy.

4.2.1.3 distance_accuracy_value

The distance_accuracy_value specifies the allowable maximum value of all possible minimal distances between a point of the concerned geometric element and all points that are assumed to be identical.

The distance_accuracy_value defined for a Geometric_model (see 4.2.211) is valid for all geometric elements of the Geometric_model.

EXAMPLE 21 – In the case of a Vertex_point (see 4.2.489) the distance_accuracy_value is the allowable distance between a point and a point that is assumed to be identical. In the case of an Oriented_edge_curve (see 4.2.297) the distance_accuracy_value is the allowable maximum value of all possible minimal distances between a point on an Oriented_edge_curve and an Oriented_edge_curve that is assumed to be identical.

4.2.1.4 is_defined_for

The is_defined_for specifies the description that the Accuracy is associated to.

See 4.3.1, 4.3.2, 4.3.3, and 4.3.4 for the application assertions.

There shall be at least one object that the Accuracy is_defined_for.

4.2.2 Activity

An Activity is the fact of achieving or accomplishing an action.

The data associated with an Activity are the following:

- activity_type;
- actual_end_date;
- actual_start_date;
- chosen_method;
- concerned_organization;
- description;
- id;
- planned_end_date;
- planned_start_date;
- requestor;
- resolved_request;
- status;
- supplying_organization.

4.2.2.1 activity_type

The activity_type specifies the kind of the Activity. Where applicable the following values shall be used:

- 'amendment': An activity to add information to product data;
- 'analysis': An activity to determine the behaviour of an item version under certain physical circumstances;
- 'cancellation': An activity to delete an item from the bill of material or to cancel the whole bill of material;
- 'delivery change': An activity to change an element delivery;
- 'design change': An activity to change the design or data like geometry, master data or properties of an item or an assembly;
- 'design': An activity concerning the development of a design of an item or a product;
- 'mock-up creation': An activity to create an experimental model or replica of an item;

– 'prototype building': An activity to manufacture a preliminary version of an item or product;

– 'rectification': An activity to correct the data, documentation or structure belonging to an item;

– 'restructuring': An activity to create a new structure or position within a bill of material without changing the data of the items;

– 'spare part creation': An activity to design a spare part or to classify an item as a spare part;

– 'stop notice': An activity to stop the manufacturing process of an item;

– 'testing': An activity to test an item or a product.

4.2.2.2 actual_end_date

The actual_end_date specifies the date when the Activity was actually finished.

See 4.3.7 for the application assertion.

The actual_end_date need not be specified for a particular Activity.

4.2.2.3 actual_start_date

The actual_start_date specifies the date when the Activity was actually started.

See 4.3.7 for the application assertion.

The actual_start_date need not be specified for a particular Activity.

4.2.2.4 chosen_method

The chosen_method specifies the Activity_method (see 4.2.4) used to carry out the Activity.

See 4.3.5 for the application assertion.

The chosen_method need not be specified for a particular Activity.

4.2.2.5 concerned_organization

The concerned_organization specifies the Organization (see 4.2.294) that is affected by the result of the Activity.

EXAMPLE 22 – The production site that has to change the process due to a design change activity is an example for concerned_organization.

See 4.3.10 for the application assertion.

4.2.2.6 description

The description specifies additional information about the Activity.

See 4.3.9 for the application assertion.

The description need not be specified for a particular Activity.

If present, there shall be exactly one object that defines the description for an Activity.

4.2.2.7 id

The id specifies the identifier of the Activity.

4.2.2.8 planned_end_date

The planned_end_date specifies the date when the Activity is or was supposed to be finished.

See 4.3.7, 4.3.8, and 4.3.11 for the application assertions.

The planned_end_date need not be specified for a particular Activity.

If present, there shall be exactly one object that defines the planned_end_date for an Activity.

4.2.2.9 planned_start_date

The planned_start_date specifies the date when the Activity is or was supposed to be started.

See 4.3.7 and 4.3.8 for the application assertions.

The planned_start_date need not be specified for a particular Activity.

If present, there shall be exactly one object that defines the planned_start_date for an Activity.

4.2.2.10 requestor

The requestor specifies the Person (see 4.2.307) or Organization (see 4.2.294) that requested the Activity and the date the request was submitted.

See 4.3.6 for the application assertion.

The requestor need not be specified for a particular Activity.

4.2.2.11 resolved_request

The resolved_request specifies the Work_request (see 4.2.501) that is resolved by the Activity.

See 4.3.12 for the application assertion.

4.2.2.12 status

The status specifies the level of completion of the Activity.

EXAMPLE 23 – 'open' would be an example for status.

NOTE – The values and sequence of status are company specific.

The status need not be specified for a particular Activity.

4.2.2.13 supplying_organization

The supplying_organization specifies the Organization (see 4.2.294) that carries out the work.

See 4.3.10 for the application assertion.

4.2.3 Activity_element

An Activity_element is an item of work that is part of an Activity (see 4.2.2).

The data associated with an Activity_element are the following:

- activity;
- element;
- role.

4.2.3.1 activity

The activity specifies the Activity (see 4.2.2) the Activity_element belongs to.

See 4.3.13 for the application assertion.

4.2.3.2 element

The element specifies the piece of product data that is under work.

See 4.3.14, 4.3.15, 4.3.16, 4.3.17, 4.3.18, 4.3.19, 4.3.20, 4.3.21, 4.3.22, 4.3.23, 4.3.24, 4.3.25, 4.3.26, 4.3.27, 4.3.28, 4.3.29, 4.3.30, 4.3.31, 4.3.32, 4.3.33, 4.3.34, 4.3.35, 4.3.36, 4.3.37, 4.3.38, 4.3.39, 4.3.40, 4.3.41, 4.3.42, 4.3.43, 4.3.44, 4.3.45, 4.3.46, 4.3.47, and 4.3.48 for the application assertions.

There shall be exactly one object that defines the element for an Activity_element.

4.2.3.3 role

The role specifies the function that is performed by the Activity_element in the context of the concerned Activity. Where applicable the following values shall be used:

- 'input': The referenced element serves as initial data for the Activity;
- 'output': The referenced element is a result of the Activity.

4.2.4 Activity_method

An Activity_method is a procedure that may be used to solve a problem.

The data associated with an Activity_method are the following:

- consequence;
- description;
- name.

4.2.4.1 consequence

The consequence specifies the expected positive or negative effects of the application of a particular Activity_method.

The consequence need not be specified for a particular Activity_method.

4.2.4.2 description

The description specifies additional information that explicates the Activity_method in terms of nature of the Activity_method and/or in terms of means and methods to implement it.

See 4.3.49 for the application assertion.

There shall be exactly one object that defines the description for an Activity_method.

4.2.4.3 name

The name specifies the word or group of words by which the Activity_method is referred to.

See 4.3.49 for the application assertion.

There shall be exactly one object that defines the name for an Activity_method.

4.2.5 Activity_relationship

An Activity_relationship is a relationship between two Activity (see 4.2.2) objects.

The data associated with an Activity_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.5.1 description

The description specifies additional information about the Activity_relationship.

See 4.3.51 for the application assertion.

The description need not be specified for a particular Activity_relationship.

If present, there shall be exactly one object that defines the description for an Activity_-relationship.

4.2.5.2 related

The related specifies the second of the two Activity (see 4.2.2) objects related by an Activity_-relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.50 for the application assertion.

4.2.5.3 relating

The relating specifies the first of the two Activity (see 4.2.2) objects related by an Activity_-relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.50 for the application assertion.

4.2.5.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

– 'decomposition': The application object defines a relationship where the related Activity (see 4.2.2) is one of the components into which the relating Activity is broken down;

– 'derivation': The application object defines a relationship where the related Activity is derived from the relating Activity;

EXAMPLE 24 – An Activity controlled by a Work_order with work order type 'manufacturing release' may be derived (is based on) from another Activity controlled by another Work_order with work order type 'design release'.

– 'sequence': The application object defines a relationship where the relating Activity shall be completed before the related Activity starts;

– 'precedence': The application object defines a relationship where the related Activity has higher priority than the relating Activity.

4.2.6 Actuator

An Actuator is the motivation of a Kinematic_pair (see 4.2.258) that causes its operation.

The data associated with an Actuator are the following:

- is_applied_to;
- name.

4.2.6.1 is_applied_to

The is_applied_to specifies the Kinematic_pair (see 4.2.258) that the Actuator is actuating.

See 4.3.52 for the application assertion.

4.2.6.2 name

The name specifies the word or group of words by which the Actuator is referred to.

See 4.3.53 for the application assertion.

There shall be exactly one object that defines the name for an Actuator.

4.2.7 Alias_identification

An Alias_identification is a mechanism to associate an object with an additional identifier that is used to identify the object of interest in a different context, either in another Organization (see 4.2.294), or in some other context. The scope of the Alias_identification shall be specified either by the attribute 'alias_scope' or by the attribute 'description'.

EXAMPLE 25 – An External_document (see 4.2.162) (e.g. a book) may have a unique document id (ISBN) and an Alias_identification as inventory number in the context of the inventory of a company.

The data associated with an Alias_identification are the following:

- alias_id;
- alias_scope;
- alias_version_id;
- description;
- is_applied_to.

4.2.7.1 alias_id

The alias_id specifies the identifier used in the context specified by the alias_scope, by the description, or by both.

4.2.7.2 alias_scope

The alias_scope specifies the Organization (see 4.2.294) in which the Alias_identification is valid.

See 4.3.62 for the application assertion.

The alias_scope need not be specified for a particular Alias_identification.

4.2.7.3 alias_version_id

The alias_version_id specifies the version of the object as known in the context of the Alias_identification. Alias_version_id only applies if 'version_id' is an attribute of the object of interest.

The alias_version_id need not be specified for a particular Alias_identification.

4.2.7.4 description

The description specifies the kind of the Alias_identification.

EXAMPLE 26 – The description may be e.g. 'inventory number'.

See 4.3.61 for the application assertion.

The description need not be specified for a particular Alias_identification.

If present, there shall be exactly one object that defines the description for an Alias_identification.

4.2.7.5 is_applied_to

The is_applied_to specifies the object that has an Alias_identification.

NOTE – The Item_version (see 4.2.248) is not included here. The alias of an Item_version is covered by Item_version_relationship (see 4.2.249).

See 4.3.54, 4.3.55, 4.3.56, 4.3.57, 4.3.58, 4.3.59, 4.3.60, 4.3.63, 4.3.64, 4.3.65, 4.3.66, 4.3.67, 4.3.68, 4.3.69, and 4.3.70 for the application assertions.

There shall be exactly one object that the Alias_identification is_applied_to.

4.2.8 Alternate_item_relationship

An Alternate_item_relationship is the relationship between two Item (see 4.2.236) objects specifying that all versions of the two related Item objects are interchangeable independent from their usage.

NOTE – Interchangeability usually refers to form, fit, function, and quality. Additional properties such as performance, noise, endurance, or reliability may also be considered as a prerequisite for the interchangeability. The two Item objects are interchangeable in both directions.

The data associated with an Alternate_item_relationship are the following:

- alternate;
- base;

– fulfilled_requirements.

4.2.8.1 alternate

The alternate specifies the Item (see 4.2.236) that may be used in place of the base Item.

See 4.3.71 for the application assertion.

4.2.8.2 base

The base specifies the Item (see 4.2.236) for which another Item may be used as an alternate.

See 4.3.71 for the application assertion.

4.2.8.3 fulfilled_requirements

The fulfilled_requirements specifies the word or group of words describing the requirements that are covered by both the base and the alternate and therefore are the basis for the statement of interchangeability.

See 4.3.72 for the application assertion.

There shall be exactly one object that defines the fulfilled_requirements for an Alternate_item_-relationship.

4.2.9 Angle_specification

An Angle_specification is an angle value and the specification of the element the angle is measured from.

EXAMPLE 27 – Figure 2 shows two examples of the use of an Angle_specification for the definition of a Form_feature_in_panel (see 4.2.188).

The data associated with an Angle_specification are the following:

– angle;

– angle_reference.

4.2.9.1 angle

The angle specifies the Feature_parameter (see 4.2.177) that represents the angle.

NOTE – Depending on the direction of the vector that serves as the reference for the angle measurement positive or negative values according to the definition of Angle_taper (see 4.2.10) should be used.

See 4.3.73 for the application assertion.

4.2.9.2 angle_reference

The angle_reference is the element the angle is measured from. The following values shall be used:

- 'punch direction': The angle is measured from the punch direction that is specified for the Process_feature_in_panel (see 4.2.334);
- 'profile normal': The angle is measured from a direction normal to the profile plane;
- 'surface normal': The angle is measured from the actual surface normals.

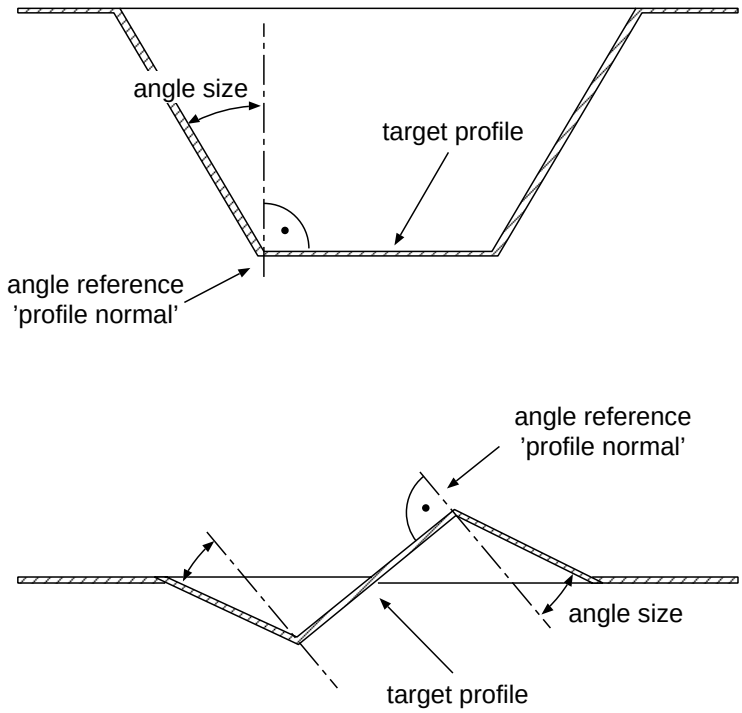

Figure 2 – Form features in panel defined by target boundaries and wall angles

4.2.10 Angle_taper

An Angle_taper is an angular deviation from a linear path. The Angle_taper is measured from the Linear_path (see 4.2.268) that is the sweep path of the feature the Angle_taper is applied to. The start of the Linear_path is the start of the taper.

EXAMPLE 28 – Figure 3 illustrates the application of an Angle_taper.

NOTE – Tapers are applied after general end conditions are applied.

The data associated with an Angle_taper are the following:

– angle.

The angle specifies the amount of grade from the start of an Angle_taper to the end of an Angle_taper. An angle between 0 and 90 degrees or between -90 and -180 degrees indicates that the profile grows larger along the sweep path. An angle between 0 and -90 degrees or between 90 and 180 degrees indicates that the profile grows smaller along the sweep path.

See 4.3.74 for the application assertion.

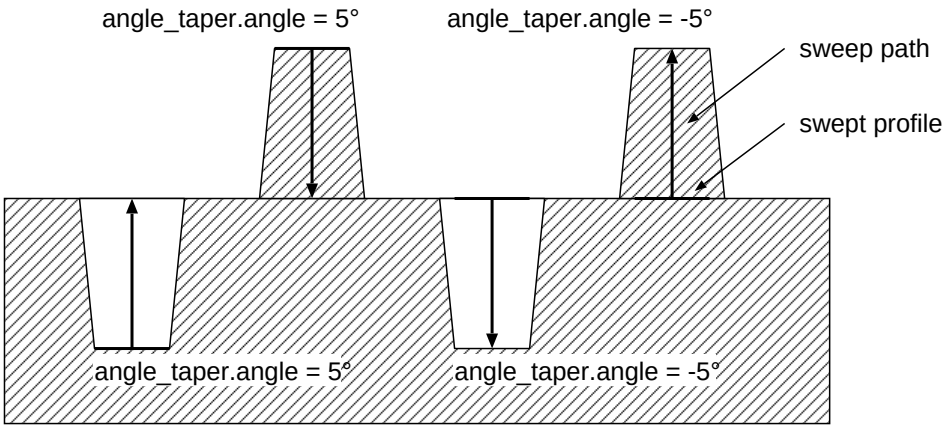

Figure 3 – Angle_taper

4.2.11 Angular_location_dimension

An Angular_location_dimension is the representation of an angular constraint concerning the position of two elements.

EXAMPLE 29 – Figure 4 illustrates the application of the attributes of an Angular_location_dimension.

An Angular_location_dimension is a type of Location_dimension (see 4.2.270).

The data associated with an Angular_location_dimension are the following:

– major_angle;

– mirror_target;

– origin_determination.

4.2.11.1 major_angle

The major_angle specifies a Boolean value that indicates the way the dimension is defined. A value of 'true' specifies the angle to be the larger of the two angles formed by the two elements that are referred to by the Angular_location_dimension. This attribute is used in combination with the other attributes to determine the angle that is constrained.

4.2.11.2 mirror_target

The mirror_target specifies a Boolean value that indicates whether the element that defines the target of the limitation is to be mirrored in order to define the angle whose dimension is specified. A value of 'true' indicates that the target object is mirrored about a plane orthogonal to it.

4.2.11.3 origin_determination

The origin_determination specifies the method used to identify the first of the two elements that form the angle. The following values shall be used:

- 'unchanged': The Angular_location_dimension is measured from the origin as identified;

- 'mirror': The Angular_location_dimension is measured from the origin that is mirrored about a plane orthogonal to it through the intersection point of origin and target;

- 'normal': The Angular_location_dimension is measured from a line or plane that is normal to the identified origin through the intersection point of origin and target.

4.2.12 Angular_size_dimension

An Angular_size_dimension is a dimension representing an angular size of an aspect of a part.

EXAMPLE 30 – Figure 5 shows the difference between an Angular_size_dimension and an Angular_location_dimension (see 4.2.11).

An Angular_size_dimension is a type of Size_dimension (see 4.2.405).

The data associated with an Angular_size_dimension are the following:

- full;

- major_angle.

4.2.12.1 full

The full specifies the method used to establish the Angular_size_dimension. A value of 'true' specifies the angle is established between the two sides of the angular element. A value of 'false' specifies the angle is established between the bisector line and the angular element.

4.2.12.2 major_angle

The major_angle specifies which one of the two possible angles is meant. A value of 'true' specifies the angle to be the larger of the two angles formed by the angular element.

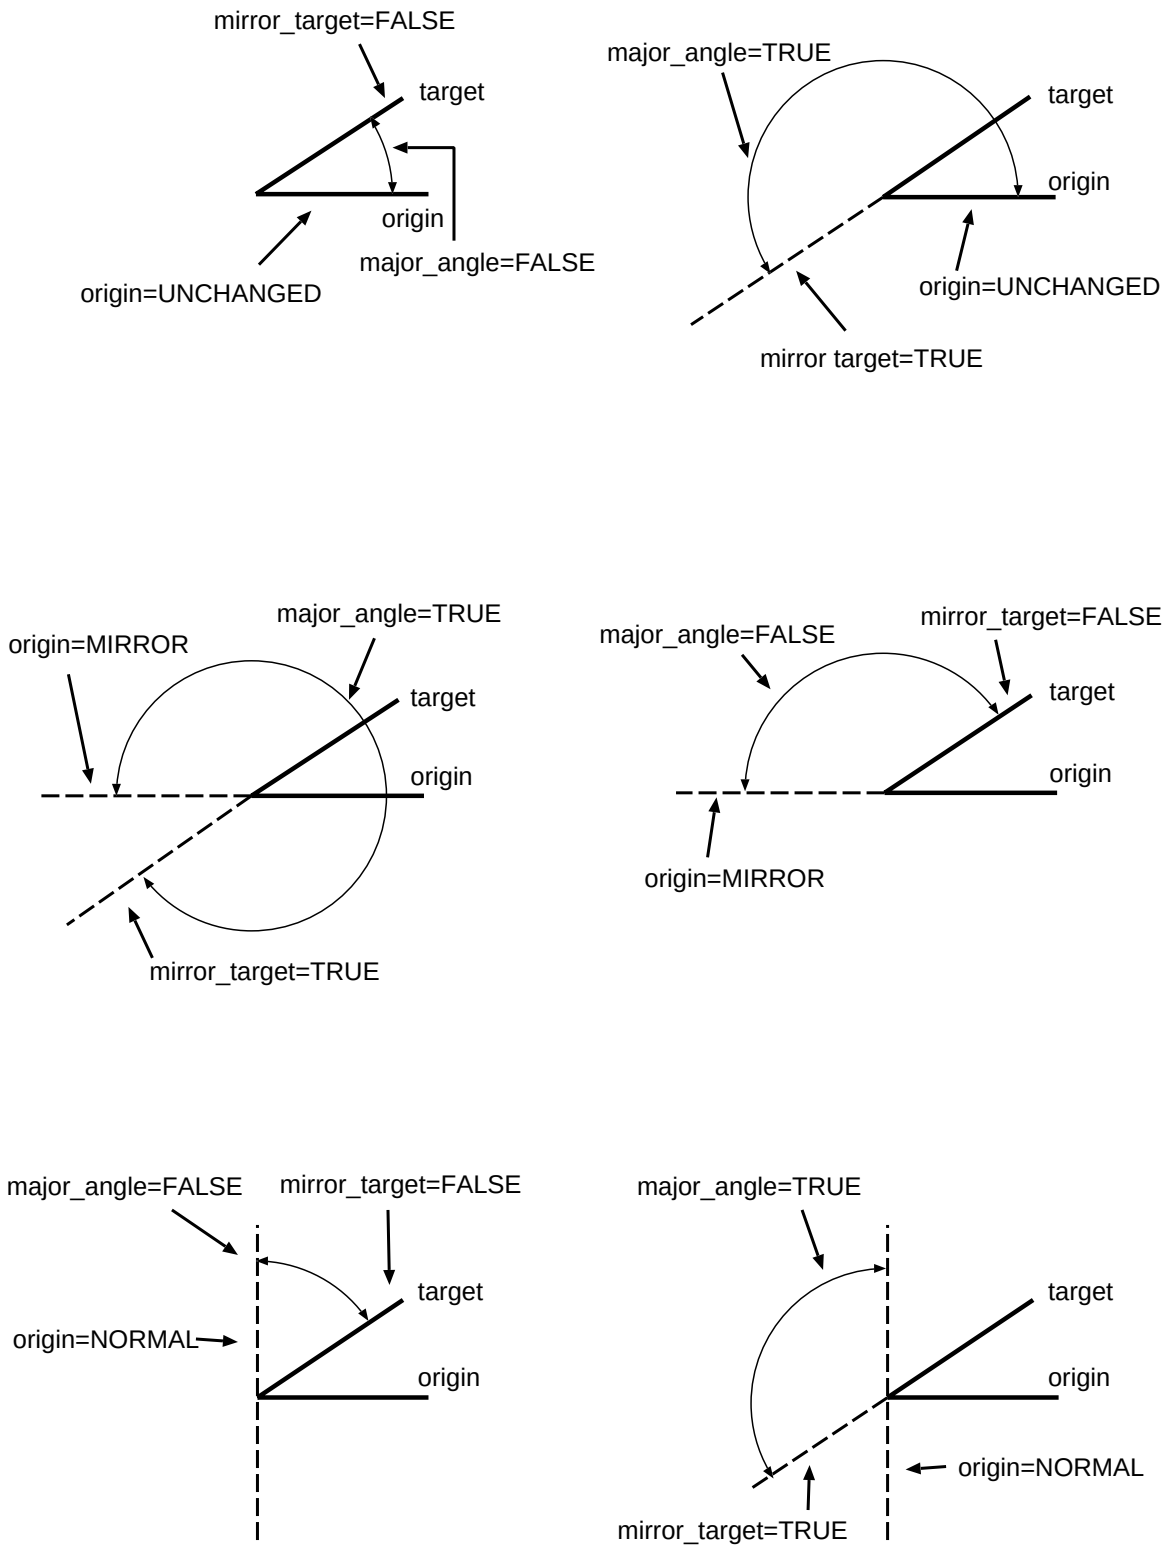

Figure 4 – Angular_location_dimension

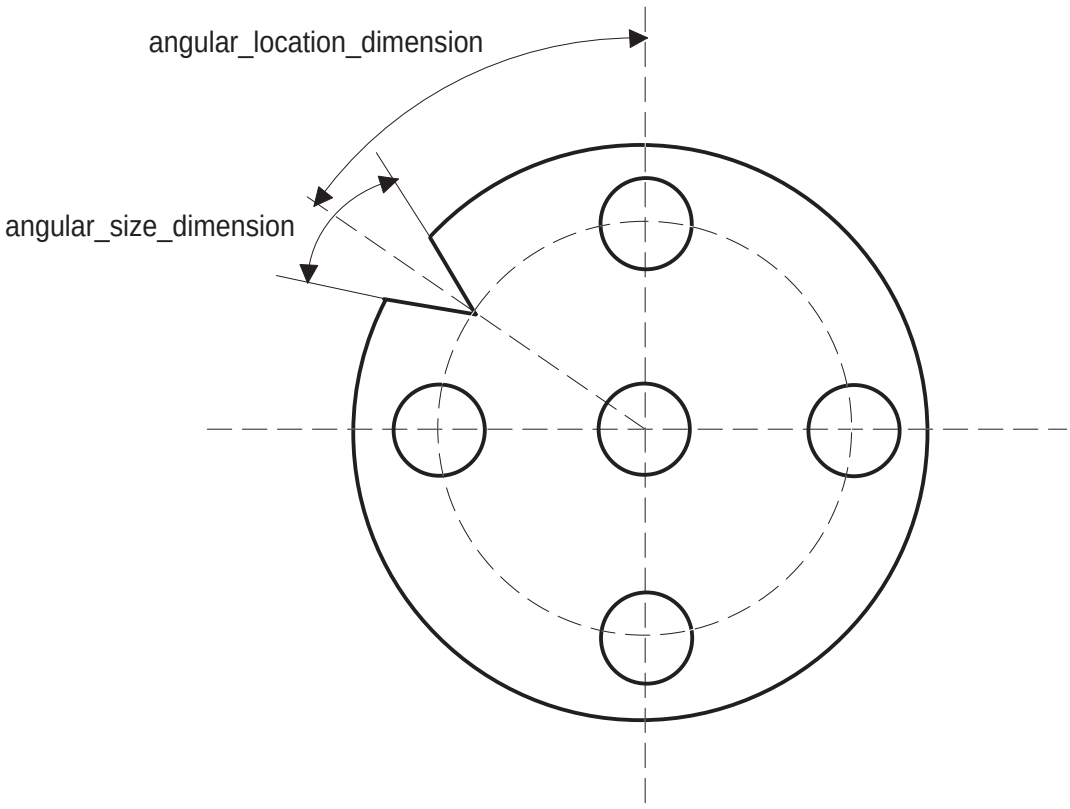

Figure 5 – Angular_location_dimension versus angular_size_dimension

4.2.13 Angularity_tolerance

An Angularity_tolerance is a tolerance for the condition of a surface or axis at a specified angle (other than 90 degrees) from a datum plane or axis. An Angularity_tolerance specifies one of the following:

- a tolerance zone defined by two parallel planes at the specified basic angle from a datum plane or axis within which the surface of the considered feature must lie;

- a tolerance zone defined by two parallel planes at the specified basic angle from a datum plane or axis within which the axis of the considered feature must lie.

An Angularity_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with an Angularity_tolerance are the following:

- datum;

- segment_size.

4.2.13.1 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.75 for the application assertion.

4.2.13.2 segment_size

The segment_size specifies the length (or the edge length) of a segment if the geometric tolerance is not applied to the total length/area of an axis/surface but on a unit base (e.g. to each segment with a length of 20 mm).

The segment_size need not be specified for a particular Angularity_tolerance.

4.2.14 Annotation_curve

An Annotation_curve is a two-dimensional trimmed curve that is used to annotate a drawing or a shape model.

An Annotation_curve is a type of Annotation_element (see 4.2.15).

Each Annotation_curve may be one of the following: a Projection_curve (see 4.2.359), a Dimension_curve (see 4.2.142), or a Leader (see 4.2.262).

The data associated with an Annotation_curve are the following:

- annotation_curve_type.

The annotation_curve_type specifies the kind of annotation curve related to its usage.

EXAMPLE 31 – 'centre line' is an example for annotation_curve_type.

The annotation_curve_type need not be specified for a particular Annotation_curve.

4.2.15 Annotation_element

An Annotation_element is Styled_element (see 4.2.427) that represents annotation.

An Annotation_element is a type of Styled_element (see 4.2.427).

Each Annotation_element is either a Text (see 4.2.454), a Dimension (see 4.2.140), an Annotation_subfigure (see 4.2.17), an Annotation_curve (see 4.2.14), an Annotation_symbol (see 4.2.18), a Draughting_callout (see 4.2.148), or a Fill_area (see 4.2.180).

4.2.16 Annotation_model

An Annotation_model is a set of annotation elements.

An Annotation_model is a type of Styled_model (see 4.2.429).

The data associated with an Annotation_model are the following:

- is_defined_in.

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) the Annotation_model is defined in.

NOTE – An Annotation_model is defined in its own coordinate space since it does not refer to a Geometric_model (see 4.2.211) that has a coordinate space that could be shared.

See 4.3.76 for the application assertion.

4.2.17 Annotation_subfigure

An Annotation_subfigure is the occurrence of a template that contains annotation elements. An Annotation_subfigure is located within the coordinate system of a Drawing_sheet (see 4.2.152), a Styled_model (see 4.2.429), or another Annotation_subfigure, View_area (see 4.2.491), or View (see 4.2.490).

EXAMPLE 32 – Figure 6 depicts the Annotation_subfigure.

An Annotation_subfigure is a type of Annotation_element (see 4.2.15).

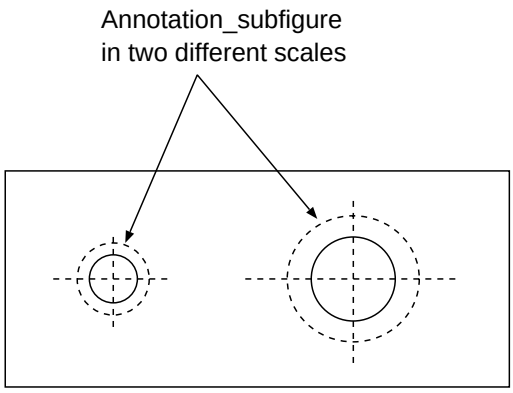

Figure 6 – Annotation_subfigure for a hole on a technical drawing

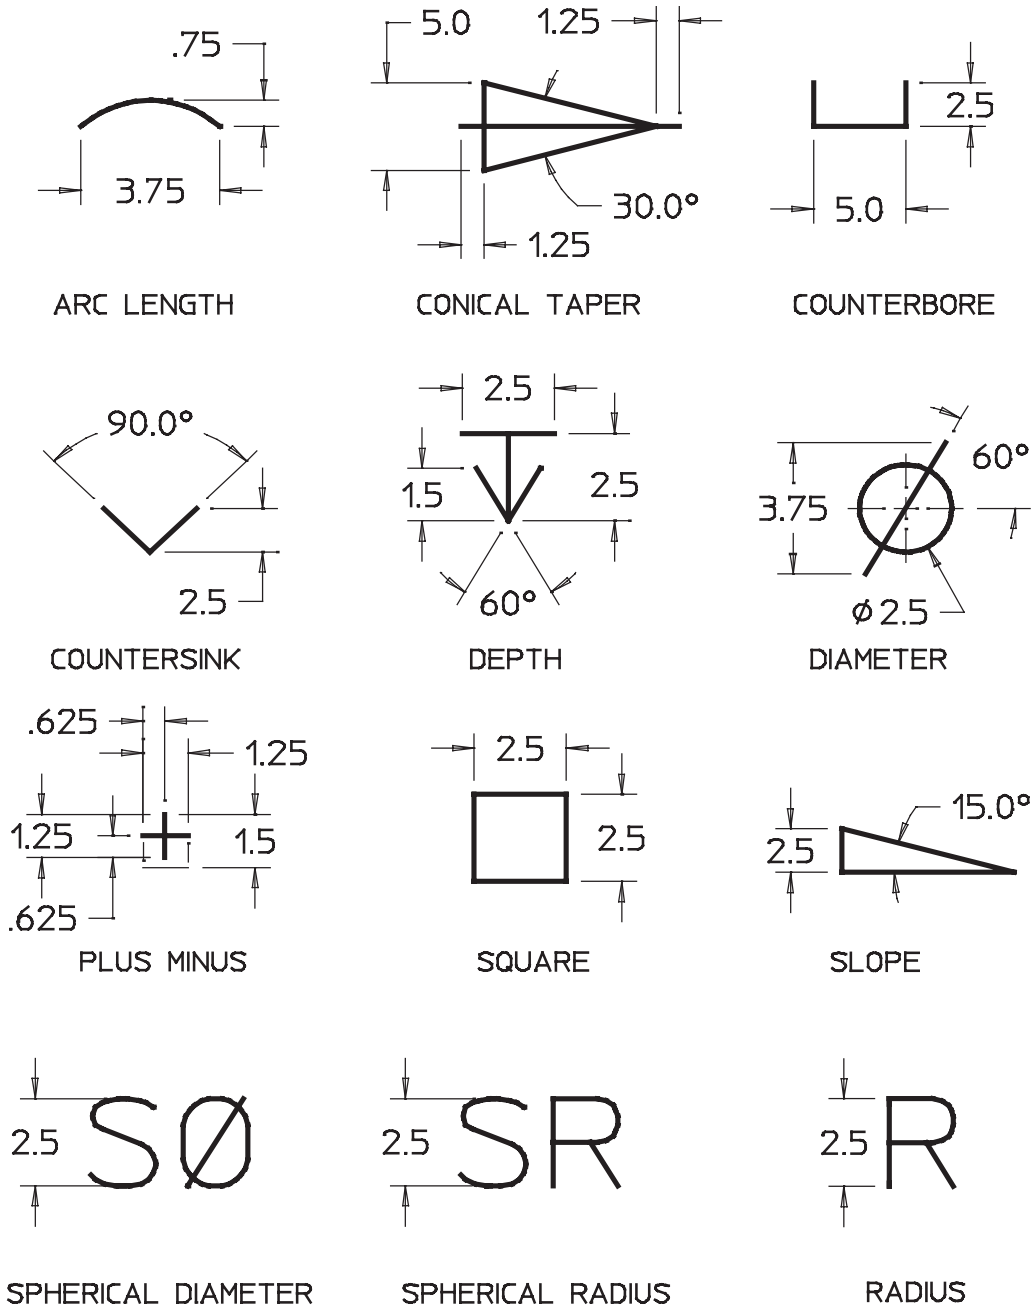
4.2.18 Annotation_symbol

An Annotation_symbol is a combination of annotation elements that, as collection, represents a recognized annotation concept. Annotation_symbol objects are dimension symbols, geometrical tolerance symbols, surface condition symbols, or terminator symbols and they are either user defined, externally defined, or predefined. The set of predefined symbols comprises the symbols for geometrical tolerances as defined in ISO 7083 as well as the dimension symbols shown in figure 7 and the terminator symbols shown in figure 8.

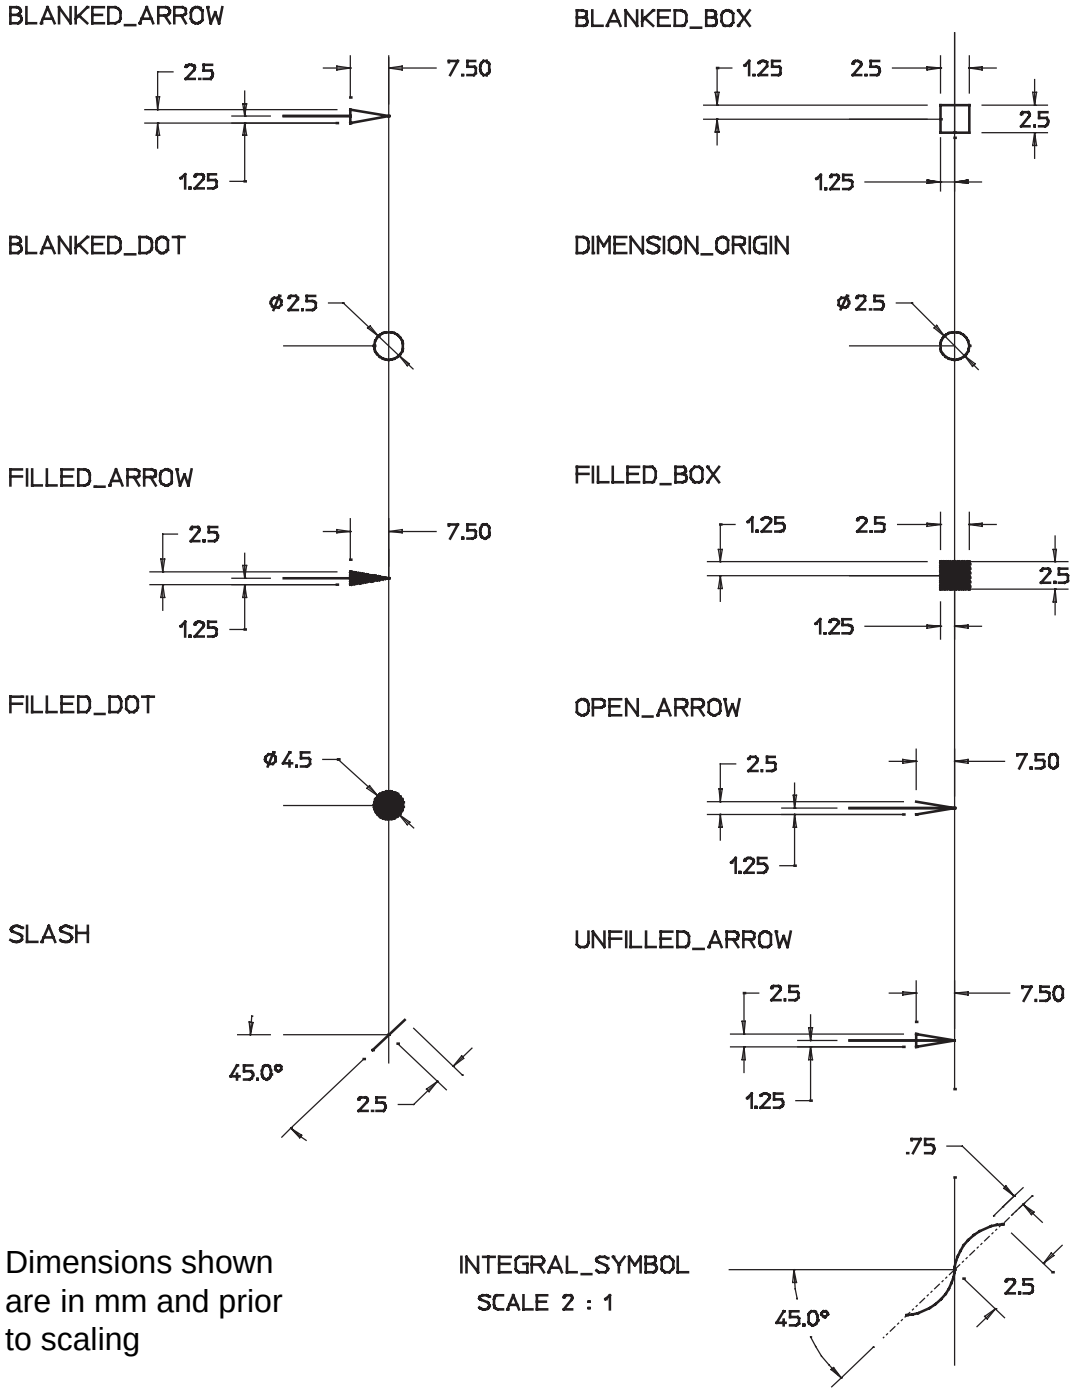
An Annotation_symbol is a type of Annotation_element (see 4.2.15).

Each Annotation_symbol may be an Associated_annotation_symbol (see 4.2.29).



(Dimensions shown are in mm and prior to scaling)

Figure 7 – Predefined dimension symbols



Dimensions shown are in mm and prior to scaling

Figure 8 – Predefined terminator symbols

4.2.19 Appearance_assignment

An Appearance_assignment governs the visual appearance of geometric elements and annotation. The appearance can be defined explicitly for each represented element or for a context in which the elements are represented.

The different kinds of the context dependent appearance are Model_image (see 4.2.284), View (see 4.2.490), View_area (see 4.2.491), Drawing_sheet (see 4.2.152), Group (see 4.2.222) and Layer (see 4.2.261). Several appearance components for the representation of the different kinds of elements can be associated with the Appearance_assignment.

Each Appearance_assignment may be a Context_dependent_appearance_assignment (see 4.2.98).

The data associated with an Appearance_assignment are the following:

- component.

The component specifies the various appearance components to define the appearance of geometric and annotation objects.

See 4.3.77, 4.3.78, 4.3.79, 4.3.80, 4.3.81, 4.3.82, 4.3.83, and 4.3.84 for the application assertions.

There shall be at least one object that defines the component for an Appearance_assignment.

4.2.20 Application_context

An Application_context is a shared universe of discourse.

The data associated with an Application_context are the following:

- application_domain;
- description;
- life_cycle_stage.

4.2.20.1 application_domain

The application_domain is the identification of the applications for which an object may be relevant.

EXAMPLE 33 – The application_domain may be e.g., 'electrical design' or 'engineering analysis'.

4.2.20.2 description

The description specifies additional information about the Application_context.

See 4.3.85 for the application assertion.

The description need not be specified for a particular Application_context.

If present, there shall be exactly one object that defines the description for an Application_context.

4.2.20.3 life_cycle_stage

The life_cycle_stage is the specification of the general stage in the product life cycle to which the concerned items belong.

EXAMPLE 34 – 'The life_cycle_stage may be e.g., 'preliminary design', or 'pre-series'.

4.2.21 Approval

An Approval is a judgement concerning the quality of those product data that are subject of the Approval. An Approval represents a statement made by technical personnel or management personnel if certain requirements are met.

The data associated with an Approval are the following:

- actual_date;
- approval_status;
- description;
- is_applied_to;
- is_approved_by;
- nominal_date.

4.2.21.1 actual_date

The actual_date specifies the date when the Approval was actually performed. If this attribute is absent, the approval has not yet occurred, i.e. it is pending.

See 4.3.98 for the application assertion.

The actual_date need not be specified for a particular Approval.

4.2.21.2 approval_status

The approval_status specifies the judgement made about the product data that is the subject of this Approval.

See 4.3.89 for the application assertion.

4.2.21.3 description

The description specifies additional information about the Approval.

See 4.3.111 for the application assertion.

The description need not be specified for a particular Approval.

If present, there shall be exactly one object that defines the description for an Approval.

4.2.21.4 is_applied_to

The is_applied_to specifies the object to which the Approval is assigned.

See 4.3.86, 4.3.87, 4.3.88, 4.3.90, 4.3.91, 4.3.92, 4.3.93, 4.3.94, 4.3.95, 4.3.96, 4.3.99, 4.3.100, 4.3.101, 4.3.102, 4.3.103, 4.3.104, 4.3.105, 4.3.106, 4.3.107, 4.3.108, 4.3.109, 4.3.110, 4.3.112, 4.3.113, 4.3.114, 4.3.115, 4.3.116, 4.3.117, 4.3.118, 4.3.119, 4.3.120, 4.3.121, 4.3.122, 4.3.123, 4.3.124, 4.3.125, and 4.3.126 for the application assertions.

There shall be at least one object that the Approval is_applied_to.

4.2.21.5 is_approved_by

The is_approved_by specifies the person or organization responsible for an Approval and the dates of the Approval.

See 4.3.97 for the application assertion.

4.2.21.6 nominal_date

The nominal_date specifies the date when the Approval is or was supposed to be performed.

See 4.3.98 for the application assertion.

The nominal_date need not be specified for a particular Approval.

4.2.22 Approval_relationship

An Approval_relationship is a relationship between two Approval (see 4.2.21) objects.

The data associated with an Approval_relationship are the following:

- related;
- relating;
- relation_type.

4.2.22.1 related

The related specifies the second of the two Approval (see 4.2.21) objects related by the Approval_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.127 for the application assertion.

4.2.22.2 relating

The relating specifies the first of the two Approval (see 4.2.21) objects related by the Approval_-relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.127 for the application assertion.

4.2.22.3 relation_type

The relation_type specifies the meaning of the relationship.

4.2.23 Approval_status

An Approval_status is the state of acceptance of some product data.

NOTE – The values of Approval_status are company specific.

The data associated with an Approval_status are the following:

- name;
- used_classification_system.

4.2.23.1 name

The name specifies the word or abbreviation which is used to refer to the Approval_status.

4.2.23.2 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.70) that contains the information about how to interpret the Approval_status.

See 4.3.128 for the application assertion.

The used_classification_system need not be specified for a particular Approval_status.

4.2.24 Archived_document

An Archived_document is a piece of product data that is archived in a non-digital form.

EXAMPLE 35 – Paper plots of technical drawings, microfiche, or paper documents such as calculations or test reports are examples for an Archived_document.

An Archived_document is a type of External_document (see 4.2.162).

The data associated with an Archived_document are the following:

- archiving_format;
- found_in.

4.2.24.1 archiving_format

The archiving_format specifies the storage medium.

EXAMPLE 36 – 'paper plot A0' and 'microfiche' are examples for the archiving_format.

4.2.24.2 found_in

The found_in specifies the information necessary to access the Archived_document.

EXAMPLE 37 – In case of a paper plot, this information may be the organizational address of the cabinet where the plot is stored. It may also be the name and address of the responsible person.

4.2.25 Area_placed_annotation

An Area_placed_annotation is a two-dimensional annotation element that is defined in the two-dimensional coordinate space of a View_area (see 4.2.491) or Drawing_sheet (see 4.2.152).

EXAMPLE 38 – The drawing title box or drawing frame are examples for Area_placed_annotation objects on a drawing sheet.

The data associated with an Area_placed_annotation are the following:

- appearance;
- element;
- invisible;
- reference_area.

4.2.25.1 appearance

The appearance specifies the presentation characteristics for the Annotation_element (see 4.2.15) that is placed.

See 4.3.130 for the application assertion.

4.2.25.2 element

The element specifies the presented Annotation_element (see 4.2.15).

See 4.3.129 for the application assertion.

4.2.25.3 invisible

The invisible specifies if the Area_placed_annotation is invisible.

4.2.25.4 reference_area

The reference_area specifies the View_area (see 4.2.491) or Drawing_sheet (see 4.2.152) where the Annotation_element (see 4.2.15) is located.

See 4.3.131 and 4.3.132 for the application assertions.

There shall be exactly one object that defines the reference_area for an Area_placed_annotation.

4.2.26 Assembly_component_relationship

An Assembly_component_relationship is the relation between an Assembly_definition (see 4.2.27) and an Item_instance (see 4.2.241) representing a constituent of the assembly.

NOTE – The constituent may also be an assembly.

An Assembly_component_relationship is a type of Item_definition_instance_relationship (see 4.2.239).

Each Assembly_component_relationship may be one of the following: a Next_higher_assembly (see 4.2.287), a Promissory_usage (see 4.2.360), or a Specified_higher_usage (see 4.2.419).

The data associated with an Assembly_component_relationship are the following:

- relating;
- transformation.

4.2.26.1 relating

The relating specifies the Assembly_definition (see 4.2.27) that has subordinate constituents.

See 4.3.133 for the application assertion.

4.2.26.2 transformation

The transformation specifies the Geometric_model_relationship_with_transformation (see 4.2.213) or the Template_instance (see 4.2.453) that has the Transformation (see 4.2.472) information which is used to locate and orient the constituent in the coordinate space of the Assembly_definition (see 4.2.27). In the case of a Template_instance (see 4.2.453) the scale factor shall be omitted or set to 1.0.

See 4.3.134 and 4.3.135 for the application assertions.

The transformation need not be specified for a particular Assembly_component_relationship.

If present, there shall be exactly one object that defines the transformation for an Assembly_component_relationship.

4.2.27 Assembly_definition

An Assembly_definition is a definition of an Item_version (see 4.2.248) that contains other subordinate Item_version objects.

An Assembly_definition is a type of Design_discipline_item_definition (see 4.2.134).

The data associated with an Assembly_definition are the following:

- assembly_type.

The assembly_type specifies the kind of the Assembly_definition.

EXAMPLE 39 – 'functional assembly','manufacturing assembly','design assembly' are examples of an assembly_type.

4.2.28 Assembly_substitute_relationship

An Assembly_substitute_relationship is a relationship that indicates that one Assembly_component_relationship (see 4.2.26) may substitute another Assembly_component_relationship. The subject of the substitution are the related item instance objects of both Assembly_component_relationship (see 4.2.26) objects. The relating Assembly_definition (see 4.2.27) shall be the same in both Assembly_substitute_relationship objects.

The data associated with an Assembly_substitute_relationship are the following:

- base;
- description;
- substitute.

4.2.28.1 base

The base specifies the Assembly_component_relationship (see 4.2.26) that is replaceable.

See 4.3.136 for the application assertion.

4.2.28.2 description

The description specifies additional information about the Assembly_substitute_relationship.

See 4.3.137 for the application assertion.

The description need not be specified for a particular Assembly_substitute_relationship.

If present, there shall be exactly one object that defines the description for an Assembly_substitute_relationship.

4.2.28.3 substitute

The substitute specifies the Assembly_component_relationship (see 4.2.26) that may be used instead of the base Assembly_component_relationship.

See 4.3.136 for the application assertion.

4.2.29 Associated_annotation_symbol

An Associated_annotation_symbol is an Annotation_symbol (see 4.2.18) that is associated to a geometric element, an annotation curve, a fill area, a text, an annotation subfigure, or another annotation symbol.

An Associated_annotation_symbol is a type of Annotation_symbol (see 4.2.18).

Each Associated_annotation_symbol may be one of the following: a Geometric_tolerance_symbol (see 4.2.218) or a Surface_condition_symbol (see 4.2.438).

The data associated with an Associated_annotation_symbol are the following:

- is_associated_to.

The is_associated_to specifies the element where the Associated_annotation_symbol is associated to.

See 4.3.138, 4.3.139, 4.3.140, 4.3.141, 4.3.142, and 4.3.143 for the application assertions.

4.2.30 Associated_fill_area

An Associated_fill_area is a bounded area containing colouring, hatching, or tiling that indicate its extent and content. The boundary of the Associated_fill_area is defined by closed annotation curves. The annotation curves defining the boundary of the Associated_fill_area are derived from geometric elements of the shape model or other annotation curves.

An Associated_fill_area is a type of Fill_area (see 4.2.180).

The data associated with an Associated_fill_area are the following:

- is_derived_from.

The is_derived_from specifies the geometric elements or annotation curves from which the boundary curves of the Associated_fill_area are derived.

See 4.3.144 and 4.3.145 for the application assertions.

There shall be at least one object that the Associated_fill_area is_derived_from.

4.2.31 Associated_leader

An Associated_leader is a leader that is associated with a Detailed_geometric_model_element (see 4.2.136) or with another Annotation_element (see 4.2.15).

An Associated_leader is a type of Leader (see 4.2.262).

The data associated with an Associated_leader are the following:

- target.

The target specifies the associated element.

See 4.3.146, 4.3.147, 4.3.148, 4.3.149, 4.3.150, and 4.3.151 for the application assertions.

There shall be exactly one object that defines the target for an Associated_leader.

4.2.32 Associated_projection_curve

An Associated_projection_curve is a projection curve that is associated with a Detailed_geometric_-model_element (see 4.2.136) or with another Annotation_element (see 4.2.15).

An Associated_projection_curve is a type of Projection_curve (see 4.2.359).

The data associated with an Associated_projection_curve are the following:

- is_projected_to.

The is_projected_to specifies the associated element.

See 4.3.152, 4.3.153, 4.3.154, 4.3.155, 4.3.156, and 4.3.157 for the application assertions.

There shall be exactly one object that the Associated_projection_curve is_projected_to.

4.2.33 Axis_placement

An Axis_placement is the representation of three orthogonal axes defined in a reference coordinate system.

4.2.34 B_rep

A B_rep is defined by exactly one outer Closed_shell (see 4.2.73) and zero or more inner Closed_-shell objects.

A B_rep is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a B_rep are the following:

- outer;
- void.

4.2.34.1 outer

The outer specifies a Closed_shell (see 4.2.73) defining the exterior boundary of the B_rep.

See 4.3.158 for the application assertion.

4.2.34.2 void

The void specifies a Closed_shell (see 4.2.73) that represents an internal cavity of the B_rep.

NOTE – This shell has a normal pointing into the empty space inside.

See 4.3.158 for the application assertion.

4.2.35 B_rep_model

A B_rep_model is a collection of B_rep (see 4.2.34) objects.

A B_rep_model is a type of Geometric_model (see 4.2.211).

The data associated with a B_rep_model are the following:

– element.

The element specifies a set of B_rep (see 4.2.34) objects that form the B_rep_model.

See 4.3.159 for the application assertion.

4.2.36 B_spline_curve

A B_spline_curve is a general polynomial or a rational parametric sculptured curve of various degrees and segments, defined in terms of control points, associated basic functions, weights, and knots. Representing a uniform polynomial parametric curve a B_spline_curve is defined by a list of control points and the associated basis functions. The knot values can be derived and the weights are equal. To represent a general rational parametric curve, the B_spline_curve is defined by a list of control points and the associated basis functions as well, but additionally weights and multiplicities of knots have to be defined. In this case the B_spline_curve describes a NURBS-curve, i.e., Non Uniform Rational B-Spline. In case of equal weights and a non-uniform knot vector, the B_spline_curve would represent a non uniform polynomial parametric curve.

EXAMPLE 40 – A circle is an example for a general rational parametric curve.

A B_spline_curve is a type of Curve (see 4.2.102).

4.2.37 B_spline_surface

A B_spline_surface is a bounded surface that is used to represent a wide variety of sculptured surfaces. With appropriate attribute values it is capable of representing single span or spline surfaces of explicit polynomial, rational Bézier, or B-spline types, such as NURBS. A B_spline_surface is defined in terms of control points, associated basis functions, weights, and knots. A B_spline_surface shall not self-intersect.

A B_spline_surface is a type of Surface (see 4.2.434).

4.2.38 Bead_end_type

A Bead_end_type is the definition of a kind of end that characterizes a Bead_feature (see 4.2.39).

Each Bead_end_type is either a Linear_bead_end_type (see 4.2.266), an Open_bead_end_type (see 4.2.291), or a Radiused_bead_end_type (see 4.2.366).

The data associated with a Bead_end_type are the following:

– is_applied_to.

The is_applied_to specifies to which extremity of the path the Bead_end_type applies. The following values shall be used:

– 'start': The Bead_end_type is applied to the extremity of the Bead_feature (see 4.2.39) that corresponds to the start of the defining Path (see 4.2.304);

– 'end': The Bead_end_type is applied to the extremity of the Bead_feature that corresponds to the end of the defining Path.

4.2.39 Bead_feature

A Bead_feature is a feature that is applied to panel parts to increase the stiffness of the part.

EXAMPLE 41 – Figure 9 shows a Bead_feature and illustrates the results of the application of various Bead_end_type (see 4.2.38) conditions.

A Bead_feature is a type of Process_feature_in_panel (see 4.2.334).

The data associated with a Bead_feature are the following:

– base_radius;

– bead_profile;

– end_condition;

– maximum_depth;

– profile_placement;

– sweep_path.

4.2.39.1 base_radius

The base_radius specifies the blend radius where the Bead_feature meets the panel surface.

See 4.3.161 for the application assertion.

The base_radius need not be specified for a particular Bead_feature.

4.2.39.2 bead_profile

The bead_profile specifies the profile that determines the cross section of the Bead_feature.

See 4.3.162 for the application assertion.

4.2.39.3 end_condition

The end_condition specifies the Bead_end_type (see 4.2.38) objects that define the types of the bead's ends. End condition applies to both ends of the Bead_feature.

See 4.3.160 for the application assertion.

4.2.39.4 maximum_depth

The maximum_depth specifies the distance in the punch direction from the path to the farthest point of contact at the bottom of the Bead_feature.

The maximum_depth need not be specified for a particular Bead_feature.

4.2.39.5 profile_placement

The profile_placement specifies a geometric Transformation (see 4.2.472) that may be used to place the defining Open_profile (see 4.2.292) in the Bead_feature's coordinate space.

See 4.3.164 for the application assertion.

The profile_placement need not be specified for a particular Bead_feature.

4.2.39.6 sweep_path

The sweep_path specifies the course along which the bead_profile is swept.

See 4.3.163 for the application assertion.

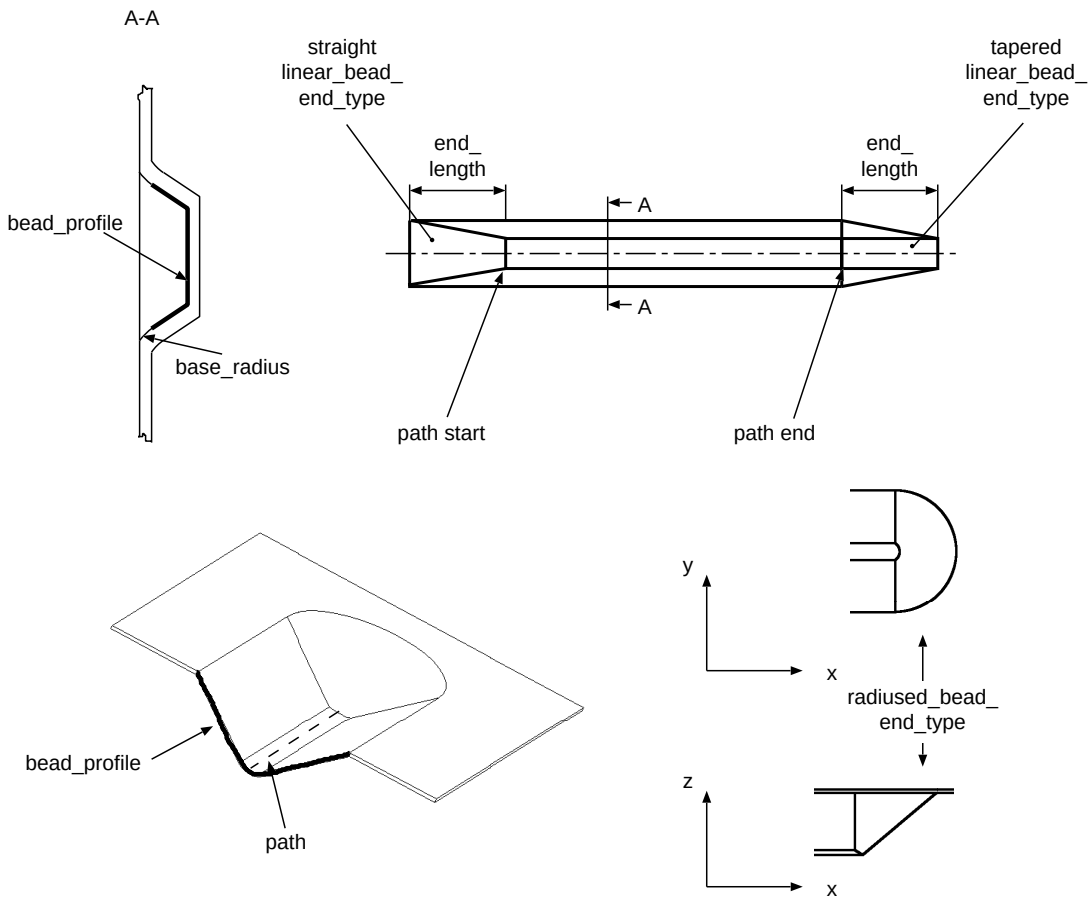


Figure 9 – Bead_feature

4.2.40 Block

A Block is a solid rectangular parallelepiped defined by a location and placement coordinate system. The Block is specified by the positive lengths x, y, and z along the axes of the placement coordinate system, and has one vertex at the origin of the placement coordinate system.

A Block is a type of Csg_primitive (see 4.2.101).

4.2.41 Boolean_result

A Boolean_result is the result of a regularised operation on two solids to create a new solid.

NOTE – A Boolean_result may create a new solid with more than one solid body.

A Boolean_result is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Boolean_result are the following:

- boolean_operation;
- first_operand;
- second_operand.

4.2.41.1 boolean_operation

The boolean_operation specifies the type of operation that is applied on the two solids. The operation types permitted are: The following values shall be used:

- 'union': creates a new solid that contains all the points that are either in the first operand or in the second operand or both;
- 'intersection': creates a new solid that is the regularisation of the set of all points that are in both the first operand and the second operand;
- 'difference': creates a new solid that is the regularisation of the set of all points, which are in the first operand but not in the second operand.

4.2.41.2 first_operand

The first_operand specifies the the first solid for the Boolean operation.

See 4.3.165, 4.3.166, 4.3.167, 4.3.168, 4.3.169, 4.3.170, and 4.3.171 for the application assertions.

There shall be exactly one object that defines the first_operand for a Boolean_result.

4.2.41.3 second_operand

The second_operand specifies the second solid for the Boolean operation.

See 4.3.165, 4.3.166, 4.3.167, 4.3.168, 4.3.169, 4.3.170, and 4.3.171 for the application assertions.

There shall be exactly one object that defines the second_operand for a Boolean_result.

4.2.42 Boss_feature

A Boss_feature is an enclosed shape that protrudes from a part's surface in the direction of the sweep path. The intersection of the Boss_feature and the part's surface may but need not have radius shaped blend between them.

A Boss_feature is a type of Process_feature_in_solid (see 4.2.335).

Each Boss_feature is either a Circular_boss (see 4.2.56), a Rectangular_boss (see 4.2.368), or a General_boss (see 4.2.190).

The data associated with a Boss_feature are the following:

- fillet_radius;
- profile_placement;
- sweep_path;
- taper;
- top_condition.

4.2.42.1 fillet_radius

The fillet_radius specifies a radius shape blend between a Boss_feature and the surrounding surface at its base. The fillet is applied after the Boss_feature (see 4.2.42) itself is placed on the part and after a potential taper is applied.

For the creation of a fillet the following rules apply:

If R_f is the fillet radius to be created at the bottom of the boss and C the path along which the centre of a sphere S defining the fillet is moving then

- the fillet is created by rolling the sphere S with radius R_f along the boss with a constant contact on the surface on which the boss is placed;
- C shall be such that in any point of C the area of contact between S and the boss is either a point or an arc wise connected set of points.

See 4.3.176 for the application assertion.

The fillet_radius need not be specified for a particular Boss_feature.

4.2.42.2 profile_placement

The profile_placement specifies a geometric Transformation (see 4.2.472) that may be used to place the defining Closed_profile (see 4.2.71) in the Boss_feature's coordinate space.

See 4.3.178 for the application assertion.

The profile_placement need not be specified for a particular Boss_feature.

4.2.42.3 sweep_path

The sweep_path specifies the Linear_path (see 4.2.268) that is used to sweep the Closed_profile (see 4.2.71).

See 4.3.177 for the application assertion.

4.2.42.4 taper

The taper specifies a variation of the size of the Boss_feature. If present the variation shall be specified either by an Angle_taper (see 4.2.10) or by a Directed_taper (see 4.2.145) or in the case of a Circular_boss (see 4.2.56) by a Diameter_taper (see 4.2.138). If no taper is specified the cross section at the start of the sweep path and at the end of the sweep path shall be of identical shape.

See 4.3.172, 4.3.174, and 4.3.175 for the application assertions.

The taper need not be specified for a particular Boss_feature.

If present, there shall be exactly one object that defines the taper for a Boss_feature.

4.2.42.5 top_condition

The top_condition specifies the shape at the top of the Boss_feature (see 4.2.42).

See 4.3.173 for the application assertion.

4.2.43 Boss_top_condition

A Boss_top_condition is the definition of a kind of top that characterizes a Boss_feature (see 4.2.42).

Each Boss_top_condition is either a Planar_top_condition (see 4.2.316) or a General_top_condition (see 4.2.209).

The data associated with a Boss_top_condition are the following:

- is_applied_to.

The is_applied_to specifies to which end of the path the Boss_top_condition applies. The following values shall be used:

- 'start': The Boss_top_condition is applied to that extremity of the Boss_feature (see 4.2.42) that corresponds to the start of the defining Linear_path (see 4.2.268);

- 'end': The Boss_top_condition is applied to that extremity of the Boss_feature that corresponds to the end of the defining Linear_path.

4.2.44 Cartesian_coordinate_space

A Cartesian_coordinate_space is the coordinate space where geometric and annotation elements are defined in. It is either two-dimensional or three-dimensional. An origin for coordinate values is implicitly defined. Cartesian Transformation (see 4.2.472) objects are used to specify the relationships between coordinate spaces. The units applicable to the coordinate values of elements defined in the Cartesian_coordinate_space are specified.

Each Cartesian_coordinate_space is either a Cartesian_coordinate_space_3d (see 4.2.46) or a Cartesian_coordinate_space_2d (see 4.2.45).

The data associated with a Cartesian_coordinate_space are the following:

- unit.

The unit specifies the various kinds of unit in that any values are measured. In the case where geometric elements are defined in the Cartesian_coordinate_space there shall be at least two units specified, the length unit and the plane angle unit. The same length unit is applied to each coordinate direction. Only one unit of a kind shall be specified.

NOTE – If elements with different units are required they have to be separated into different models with their own Cartesian_coordinate_space.

EXAMPLE 42 – A length measure unit measured in inches and an angle measure unit measured in degrees are examples for two attributes 'unit' assigned to the same Cartesian_coordinate_space.

There may be more than two unit attributes for a Cartesian_coordinate_space.

4.2.45 Cartesian_coordinate_space_2d

A Cartesian_coordinate_space_2d is a coordinate space defined in two-dimensional space only.

NOTE – Each two-dimensional geometric and annotation element is defined in a Cartesian_coordinate_space_2d.

EXAMPLE 43 – The annotation elements associated in a View_area (see 4.2.491) are defined in a Cartesian_coordinate_space_2d.

A Cartesian_coordinate_space_2d is a type of Cartesian_coordinate_space (see 4.2.44).

4.2.46 Cartesian_coordinate_space_3d

A Cartesian_coordinate_space_3d is a coordinate space defined in three-dimensional space.

NOTE – Each three-dimensional geometric data is defined in a Cartesian_coordinate_space_3d.

A Cartesian_coordinate_space_3d is a type of Cartesian_coordinate_space (see 4.2.44).

4.2.47 Cartesian_point

A Cartesian_point is a point that is defined by its coordinates in a rectangular Cartesian coordinate system.

A Cartesian_point is a type of Point (see 4.2.322).

4.2.48 Catalog_thread

A Catalog_thread is a thread that is specified by a document containing the specification of the thread.

A Catalog_thread is a type of Thread_specification (see 4.2.458).

The data associated with a Catalog_thread are the following:

- is_specified_in.

The is_specified_in specifies the External_document (see 4.2.162) or the External_library_reference (see 4.2.165) that contains the thread specification.

See 4.3.179 and 4.3.180 for the application assertions.

There shall be exactly one object that the Catalog_thread is_specified_in.

4.2.49 Centre_of_mass

A Centre_of_mass is the centre of the mass of a body. The relative position of the Centre_of_mass within the body is an invariant datum relative to rotation and translation.

NOTE – Usually the Centre_of_mass is derivable from the shape representation. An example where this application object is additionally needed is the following: Sometimes the Centre_of_mass is calculated in some system at some point of time. But there are cases where the information (e.g. the Centre_of_mass of a die) is transferred into a following stage (e.g. feasibility check) where there is only a simplified shape representation that does not allow to calculate the exact Centre_of_mass. Yet in this stage the information about the Centre_of_mass is needed (e.g. to check whether the transport of a die with a crane works out).

A Centre_of_mass is a type of Shape_dependent_property (see 4.2.396).

The data associated with a Centre_of_mass are the following:

- centre_point;
- description;
- is_defined_in;
- value_interpretation.

4.2.49.1 centre_point

The centre_point specifies a point in three-dimensional space that defines the location of a Centre_of_mass in the Cartesian_coordinate_space (see 4.2.44).

4.2.49.2 description

The description specifies additional information about the Centre_of_mass.

See 4.3.182 for the application assertion.

The description need not be specified for a particular Centre_of_mass.

If present, there shall be exactly one object that defines the description for a Centre_of_mass.

4.2.49.3 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) the Centre_of_mass is defined in.

See 4.3.181 for the application assertion.

4.2.49.4 value_interpretation

The value_interpretation specifies information on how the Centre_of_mass shall be interpreted. Where applicable the following values shall be used:

- 'required': The value_interpretation specifies the actual centre of mass is expected to be located at the given centre point;

- 'calculated': The value_interpretation specifies that the given centre point is calculated from a computerized description of the product;

- 'measured': The value_interpretation specifies that the given centre point is a statistical result of measurements made on actual products;

- 'estimated': The value_interpretation specifies that the given centre point is the result of an approximate judgement by a human being.

NOTE – The Centre_of_mass may be specified in the design stage of a product but it may also be documented as determined by measurements on prototypes.

4.2.50 Chamfer

A Chamfer is a transition between corresponding edges of two joining non-coplanar faces, having a linear cross section perpendicular to the intersection of the faces.

EXAMPLE 44 – Figure 10 depicts a Chamfer.

A Chamfer is a type of Transition_feature (see 4.2.476).

The data associated with a Chamfer are the following:

- is_defined_by.

The is_defined_by specifies the Chamfer_definition (see 4.2.52) that has the information defining the Chamfer.

See 4.3.183 for the application assertion.

4.2.51 Chamfer_angle

A Chamfer_angle is the definition of an angle used to specify a Chamfer (see 4.2.50).

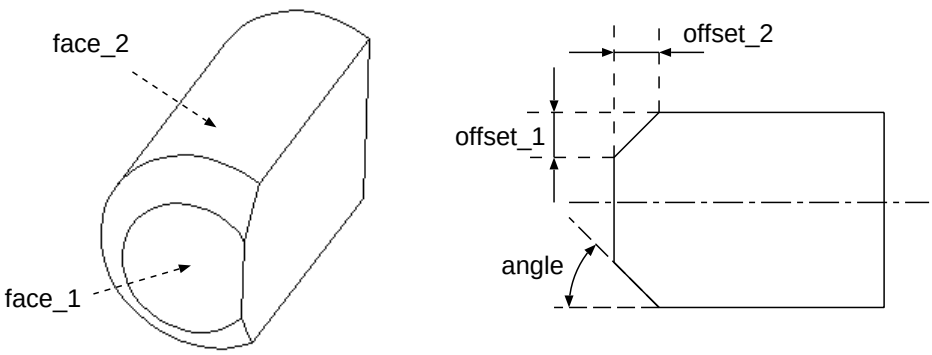

Figure 10 – Chamfer

The data associated with a Chamfer_angle are the following:

– angle.

The angle specifies the value of the angle. It is measured between a tangent of the concerned surface and a linear cross section where the plane on which both lines are lying is perpendicular to the intersection line of the faces and the point of tangency is lying on the intersection line.

See 4.3.184 for the application assertion.

4.2.52 Chamfer_definition

A Chamfer_definition is the set of parameters specifying a Chamfer (see 4.2.50).

The data associated with a Chamfer_definition are the following:

– offset_1;

– value_2.

4.2.52.1 offset_1

The offset_1 specifies the amount of offset measured from the intersection of the two faces along the first face.

NOTE – If the Chamfer_definition is used by a Round_hole (see 4.2.387) or by a Flat_with_chamfer_bottom (see 4.2.185) the second face is the face of the hole.

See 4.3.186 for the application assertion.

4.2.52.2 value_2

The value_2 specifies the second value that is necessary to define a Chamfer (see 4.2.50). In the case where the value_2 is a Chamfer_angle (see 4.2.51) the angle is measured from the second faces. In the case where the value_2 is a Chamfer_offset (see 4.2.53) the offset is measured from the intersection of the two faces along the second faces.

NOTE – If the Chamfer_definition is used by a Round_hole (see 4.2.387) or by a Flat_with_chamfer_bottom (see 4.2.185) the second face is the face of the hole.

See 4.3.185 and 4.3.186 for the application assertions.

There shall be exactly one object that defines the value_2 for a Chamfer_definition.

4.2.53 Chamfer_offset

A Chamfer_offset is the definition of an offset used to specify a Chamfer (see 4.2.50). The offset is measured as an arc length from the intersection curve of the two faces on the concerned face. The curve along which the arc length is measured is the intersection of a plane that is normal to the intersection curve of the two faces and the concerned face.

The data associated with a Chamfer_offset are the following:

- offset.

The offset specifies the value of the Chamfer_offset.

See 4.3.187 for the application assertion.

4.2.54 Change

A Change is a mechanism to collect the Model_change (see 4.2.283) objects and the Property_change (see 4.2.362) obects that describe the differences between the two objects referenced by the described relationship.

The data associated with a Change are the following:

- described_change;
- description.

4.2.54.1 described_change

The described_change specifies the relationship object that references a modified object and the corresponding original object.

See 4.3.188, 4.3.189, 4.3.191, 4.3.192, 4.3.193, 4.3.194, 4.3.195, 4.3.196, and 4.3.197 for the application assertions.

There shall be at least one object that defines the described_change for a Change.

4.2.54.2 description

The description specifies additional information about the Change.

See 4.3.190 for the application assertion.

The description need not be specified for a particular Change.

If present, there shall be exactly one object that defines the description for a Change.

4.2.55 Circle

A Circle is a planar unbounded curve where all points are equidistant from the centre of the Circle.

A Circle is a type of Curve (see 4.2.102).

4.2.56 Circular_boss

A Circular_boss is a protrusion feature that is specified by an enclosed volume bounded by a cylinder.

EXAMPLE 45 – Figure 11 illustrates a Circular_boss.

A Circular_boss is a type of Boss_feature (see 4.2.42).

The data associated with a Circular_boss are the following:

– boundary.

The boundary specifies the Circular_closed_profile (see 4.2.57) that defines the cross section of the Circular_boss.

See 4.3.198 for the application assertion.

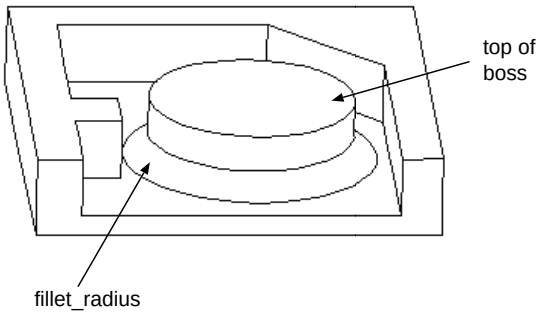

Figure 11 – Circular_boss

4.2.57 Circular_closed_profile

A Circular_closed_profile is specified by a circle that bounds an enclosed area.

EXAMPLE 46 – Figure 12 depicts a Circular_closed_profile.

A Circular_closed_profile is a type of Closed_profile (see 4.2.71).

The data associated with a Circular_closed_profile are the following:

– diameter.

The diameter specifies the distance across the Circular_closed_profile.

See 4.3.199 for the application assertion.

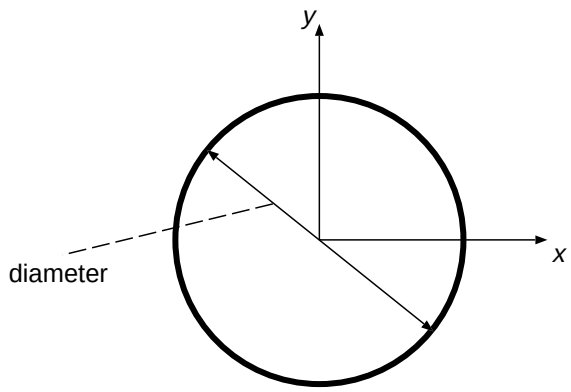

Figure 12 – Circular_closed_profile

4.2.58 Circular_offset_pattern

A Circular_offset_pattern is a modification of the placement of a particular occurrence of the base feature in a Circular_pattern (see 4.2.61) relative to its expected placement.

EXAMPLE 47 – Figure 13 depicts a Circular_offset_pattern.

The data associated with a Circular_offset_pattern are the following:

- angular_offset;
- index.

4.2.58.1 angular_offset

The angular_offset specifies the amount of offset from the expected feature location to the actual feature location along the diameter of the Circular_pattern (see 4.2.61) as an angular measurement.

4.2.58.2 index

The index specifies the number of the feature that has an offset.

4.2.59 Circular_omit_pattern

A Circular_omit_pattern is an omission of a particular occurrence of the base feature in a Circular_pattern (see 4.2.61).

EXAMPLE 48 – Figure 14 depicts a Circular_omit_pattern.

The data associated with a Circular_omit_pattern are the following:

- index.

The index specifies the number of the feature that is omitted.

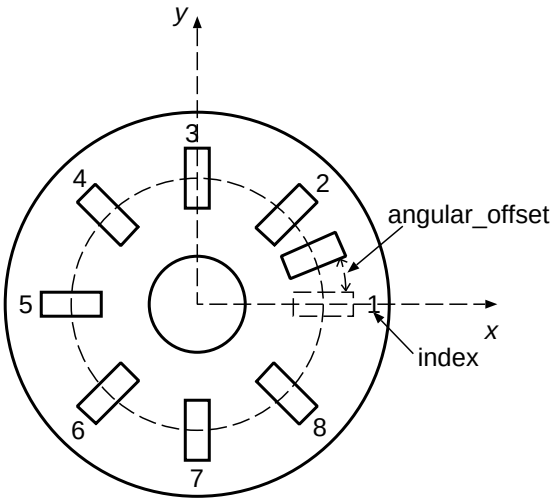

Figure 13 – Circular_offset_pattern

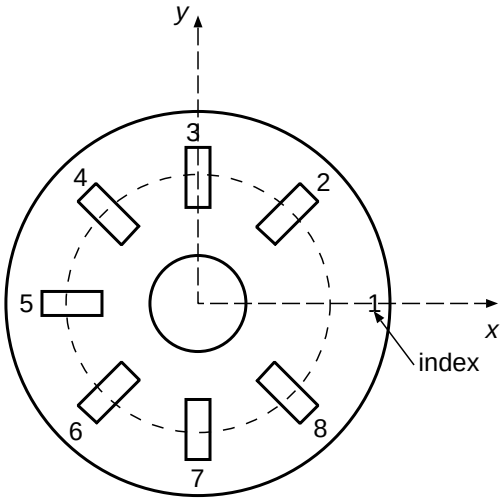

Figure 14 – Circular_omit_pattern

4.2.60 Circular_path

A Circular_path is specified by a direction of travel along an arc of constant radius around an axis.

A Circular_path is a type of Path (see 4.2.304).

Each Circular_path is either a Complete_circular_path (see 4.2.78) or a Partial_circular_path (see 4.2.302).

The data associated with a Circular_path are the following:

- radius;
- rotation_axis_defined_by.

4.2.60.1 radius

The radius specifies the radius of the Circular_path.

See 4.3.201 for the application assertion.

4.2.60.2 rotation_axis_defined_by

The rotation_axis_defined_by specifies an Axis_placement (see 4.2.33) that defines the location and orientation of the rotation axis which is the z-axis of the Axis_placement.

In the case where the Circular_path is used to define the sweep path of a profile, the x-z-plane of the Axis_placement shall coincide with the x-y-plane of the profile that is swept.

See 4.3.200 for the application assertion.

4.2.61 Circular_pattern

A Circular_pattern is specified by replications of a base feature where the replications are generated about a rotation axis. In the case where the Circular_pattern is applied as a Placed_feature (see 4.2.313) the rotation axis is the local z-axis. In the case the case where the Circular_pattern is applied as an Included_feature (see 4.2.232) the rotation axis is the z-axis of the Axis_placement (see 4.2.33) representing location and orientation of the pattern. The base feature's origin or the transformed base feature's origin is located at a distance from the local z-axis that equals half the diameter of the Circular_pattern.

NOTE – The base feature or the transformed base feature is the first instance of the Circular_pattern.

A Circular_pattern is a type of Replicate_feature (see 4.2.380).

The data associated with a Circular_pattern are the following:

- angular_spacing;
- diameter;

- missing_feature;
- number_of_features;
- relocated_feature;
- rotation.

4.2.61.1 angular_spacing

The angular_spacing specifies the angle between two instances in the Circular_pattern.

See 4.3.204 for the application assertion.

4.2.61.2 diameter

The diameter specifies twice the distance between the centre of the Circular_pattern and the location of the base feature.

NOTE – Usually the diameter can be determined from the location of the Circular_pattern and the location of the base feature. The attribute diameter may be instantiated e.g., to support process planning which may require the diameter value explicitly.

See 4.3.204 for the application assertion.

The diameter need not be specified for a particular Circular_pattern.

4.2.61.3 missing_feature

The missing_feature specifies those instances that are omitted in the Circular_pattern.

See 4.3.203 for the application assertion.

4.2.61.4 number_of_features

The number_of_features specifies the number of features used in the Circular_pattern.

4.2.61.5 relocated_feature

The relocated_feature specifies those instances that are relocated in the Circular_pattern.

See 4.3.202 for the application assertion.

4.2.61.6 rotation

The rotation specifies the angular measurement to rotate one feature with respect to the position of the previous feature in the Circular_pattern.

EXAMPLE 49 – Figure 15 depicts a Circular_pattern with a rotation specified that equals the negative angular_spacing of the Circular_pattern.

See 4.3.204 for the application assertion.

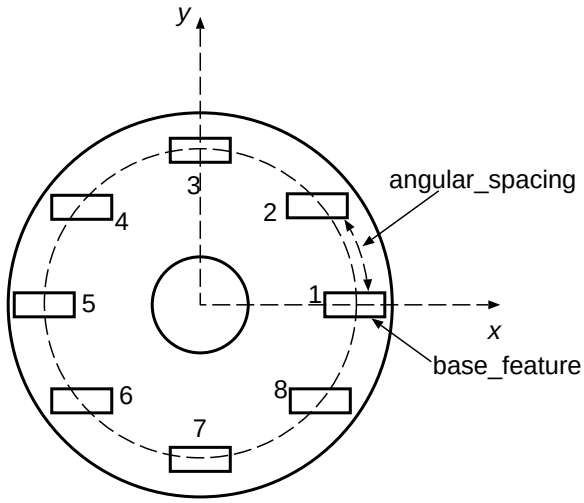

Figure 15 – Circular_pattern with rotation of base feature

4.2.62 Circular_runout_tolerance

A Circular_runout_tolerance is a mechanism to control circular elements of a part to a datum axis the part is rotated about. The tolerance is applied independently at any circular measuring position as the part is rotated 360 degrees. Where applied to surfaces constructed around a datum axis, Circular_runout_tolerance may be used to control the cumulative variations of circularity and coaxiality. Where applied to surfaces constructed at right angles to the datum axis, Circular_runout_tolerance controls circular elements of a plane surface.

A Circular_runout_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Circular_runout_tolerance are the following:

- angle;
- datum.

4.2.62.1 angle

The angle specifies the direction a runout tolerance is controlled in. If the angle is specified the runout tolerance applies in this angle which is fixed with respect to the datum axis. If the angle is not specified the runout tolerance applies normal to the feature surface.

The angle need not be specified for a particular Circular_runout_tolerance.

4.2.62.2 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that define the reference for this type of geometric tolerance.

See 4.3.205 for the application assertion.

4.2.63 Circularity_tolerance

A Circularity_tolerance is the limitation of the amount of deviation points of a surface of revolution lying within the same plane perpendicular to a common axis may have from being equidistant from the axis. It defines a tolerance zone bounded by two concentric circles within which each element of the surface must lie. The Circularity_tolerance applies independently at any plane perpendicular to the common axis.

A Circularity_tolerance is a type of Geometric_tolerance (see 4.2.216).

4.2.64 Class_category_association

A Class_category_association is the assignment of a Specification_category (see 4.2.416) to a Product_class (see 4.2.348). Additionally this assignment specifies if the usage of one or more Specification (see 4.2.415) objects belonging to this Specification_category is mandatory or optional for all products of that Product_class.

NOTE 1 – In the case of a strict familiy concept for Specification_category objects this Class_category_association specifies that the usage of one Specification of this Specification_category is mandatory for all products of that Product_class. If no strict familiy concept for Specification_category objects is used this Class_category_association specifies that the usage of one or more Specification objects of this Specification_category is mandatory or optional for products of that Product_class.

NOTE 2 – The assignment of a Specification_category to a Product_class can not replace the association of single members of the Specification_category to the Product_class.

The data associated with a Class_category_association are the following:

- category;
- mandatory;
- product_class.

4.2.64.1 category

The category specifies the Specification_category (see 4.2.416) that is associated with the Product_class (see 4.2.348).

See 4.3.207 for the application assertion.

4.2.64.2 mandatory

The mandatory specifies whether one or more Specification (see 4.2.415) objects of the associated Specification_category (see 4.2.416) have to be used or may be used (optional) for products within the referenced Product_class (see 4.2.348).

EXAMPLE 50 – The specification category 'radio' may be associated 'optional' to the product class of a car; the specification category 'engine' is an example for a 'mandatory' association.

4.2.64.3 product_class

The product_class specifies the Product_class (see 4.2.348) for which the Specification_category (see 4.2.416) is valid.

See 4.3.206 for the application assertion.

4.2.65 Class_condition_association

A Class_condition_association is a relationship between a Specification_expression (see 4.2.417) and a Product_class (see 4.2.348). This relationship contains the information that a particular Specification_expression is valid for all products of that Product_class.

The data associated with a Class_condition_association are the following:

- condition;
- condition_type;
- description;
- product_class.

4.2.65.1 condition

The condition specifies the Specification_expression (see 4.2.417) that is assigned to the Product_class (see 4.2.348).

See 4.3.210 for the application assertion.

4.2.65.2 condition_type

The condition_type specifies the meaning of the association. The following values shall be used where applicable:

- 'part usage': The Specification_expression (see 4.2.417) specifies a condition for the usage of the components of an Item_solution (see 4.2.246) in the products of the associated Product_class (see 4.2.348). In this case the Class_condition_association shall be referenced by at least one Configuration (see 4.2.89) object;

– 'identification': The Specification_expression specifies a condition that enables to distinguish the associated Product_class from other Product_class objects. For a top level node in a hierarchy of Product_class objects this value is not applicable. This identification is part of the identification of all sub classes of this Product_class;

– 'validity': The Specification_expression (see 4.2.417) specifies a condition that is used to verify a given set of Specification (see 4.2.415) objects for the associated Product_class. That means that the Specification_expression evaluates to true if the set of Specification objects is valid; otherwise it evaluates to false.

4.2.65.3 description

The description specifies additional information about the Class_condition_association.

See 4.3.208 for the application assertion.

The description need not be specified for a particular Class_condition_association.

If present, there shall be exactly one object that defines the description for a Class_condition_association.

4.2.65.4 product_class

The product_class specifies the Product_class (see 4.2.348) for which the Specification_expression (see 4.2.417) is valid.

See 4.3.209 for the application assertion.

4.2.66 Class_function_association

A Class_function_association is a relationship between a Product_function (see 4.2.352) and a Product_class (see 4.2.348).

NOTE – The semantic of this relationship is specified by the attribute relation_type.

The data associated with a Class_function_association are the following:

– description;

– product_class;

– product_function;

– relation_type.

4.2.66.1 description

The description specifies additional information about the Class_function_association.

See 4.3.211 for the application assertion.

The description need not be specified for a particular Class_function_association.

If present, there shall be exactly one object that defines the description for a Class_function_-association.

4.2.66.2 product_class

The product_class specifies the Product_class (see 4.2.348) that is associated with the Product_-function (see 4.2.352).

See 4.3.212 for the application assertion.

4.2.66.3 product_function

The product_function specifies the Product_function (see 4.2.352) that is associated with the Product_class (see 4.2.348).

See 4.3.213 for the application assertion.

4.2.66.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'possibility': Performing the Product_function (see 4.2.352) has to be considered for at least some products of the Product_class (see 4.2.348);

- 'main function': The Product_function is one of the primary functions performed by each product that is a member of the Product_class.

4.2.67 Class_inclusion_association

A Class_inclusion_association is the assignment of a Specification_inclusion (see 4.2.418) to a Product_class (see 4.2.348). This assignment contains the information that a particular Specification_inclusion applies for all products of that Product_class.

The data associated with a Class_inclusion_association are the following:

- description;

- inclusion;

- product_class.

4.2.67.1 description

The description specifies additional information about the Class_inclusion_association.

See 4.3.214 for the application assertion.

The description need not be specified for a particular Class_inclusion_association.

If present, there shall be exactly one object that defines the description for a Class_inclusion_association.

4.2.67.2 inclusion

The inclusion specifies the Specification_inclusion (see 4.2.418) that is associated with the Product_class (see 4.2.348).

See 4.3.216 for the application assertion.

4.2.67.3 product_class

The product_class specifies the Product_class (see 4.2.348) for which the Specification_inclusion (see 4.2.418) is valid.

See 4.3.215 for the application assertion.

4.2.68 Class_specification_association

A Class_specification_association is a relationship between a Specification (see 4.2.415) and a Product_class (see 4.2.348). This Specification serves as a potential characteristic of all products belonging to the Product_class.

The data associated with a Class_specification_association are the following:

- association_type;
- product_class;
- specification.

4.2.68.1 association_type

The association_type specifies the kind of availability of a particular Specification in a Product_class (see 4.2.348). Where applicable the following values shall be used:

- 'replaceable standard': The Specification is a default characteristic of the products belonging to the Product_class as long as no other specification of the same Specification_category is chosen;

  EXAMPLE 51 – 'power brake' is a 'replaceable standard' for Golf; it can be replaced by 'ABS' which is another specification of the same specification category 'brake system'.

- 'non replaceable standard': The Specification is a characteristic of any product belonging to the Product_class;

  EXAMPLE 52 – 'South East Asia climate zone' is a 'non replaceable standard' for a Sunny with market context 'Japan'.

– 'availability': The Specification is a potential characteristic of any product belonging to a high level Product_class. It is not specified if this is an option or a standard;

EXAMPLE 53 – 'front wheel drive' or 'four wheel drive' are available for a product class 'Voyager'.

– 'identification': The Specification is a characteristic that enables to distinguish the associated Product_class from other Product_class objects. This is a kind of 'non replaceable standard'. For a top level node in a hierarchy of Product_class objects this value shall not be applied. This identification is part of the identification of all sub classes of this Product_class;

EXAMPLE 54 – The car body type 'limousine' is identifying for product class 'S40'.

– 'option': The Specification is a characteristic of a product if explicitly chosen. The Specification replaces another Specification of the same specification category if the replaced Specification is associated with the Product_class as 'replaceable standard';

EXAMPLE 55 – 'sun roof' or 'radio with CD' are common options proposed to the customer.

4.2.68.2 product_class

The product_class specifies the Product_class (see 4.2.348) for which the Specification (see 4.2.415) is valid.

See 4.3.217 for the application assertion.

4.2.68.3 specification

The specification specifies the Specification (see 4.2.415) that is associated with the Product_class (see 4.2.348).

See 4.3.218 for the application assertion.

4.2.69 Classification_attribute

A Classification_attribute is a characteristic used to classify an Item (see 4.2.236) associated with the corresponding General_classification (see 4.2.192).

The data associated with a Classification_attribute are the following:

– attribute_source;

– attribute_value;

– description;

– id;

– name.

4.2.69.1 attribute_source

The attribute_source specifies the External_document (see 4.2.162) or the External_library_-reference (see 4.2.165) that contains the specification of the Classification_attribute. The External_library_reference (see 4.2.165) specifies the unique identification of a property, i.e. a property_BSU according to ISO 13584–42, for an ISO 13584 compliant library.

See 4.3.219 and 4.3.220 for the application assertions.

The attribute_source need not be specified for a particular Classification_attribute.

If present, there shall be exactly one object that defines the attribute_source for a Classification_-attribute.

4.2.69.2 attribute_value

The attribute_value specifies the Property_value (see 4.2.364) that represents the value of the Classification_attribute. The combination of 'name' and 'value_interpretation' of the referenced Property_value shall be unique within the scope of a Classification_attribute.

See 4.3.222 for the application assertion.

4.2.69.3 description

The description specifies additional information about the Classification_attribute.

See 4.3.221 for the application assertion.

The description need not be specified for a particular Classification_attribute.

If present, there shall be exactly one object that defines the description for a Classification_-attribute.

4.2.69.4 id

The id specifies the identifier of the Classification_attribute that shall be unique within the scope of the associated General_classification (see 4.2.192).

EXAMPLE 56 – 'a' or 'b' for length or width attributes or 'r' for radius attributes are examples for identifiers of Classification_attribute objects. The meaning of such ids is usually specified in external sources.

4.2.69.5 name

The name specifies the word or group of words by which the Classification_attribute is referred to.

EXAMPLE 57 – 'length', 'width', or 'radius' are examples for the name of a Classification_attribute.

See 4.3.221 for the application assertion.

The name need not be specified for a particular Classification_attribute.

If present, there shall be exactly one object that defines the name for a Classification_attribute.

4.2.70 Classification_system

A Classification_system is a method for classifying objects

NOTE – Each object that is assigned to a Classification_system is one element of the Classification_system. The complete set of possible values is usually described in an external source.

The data associated with a Classification_system are the following:

- classification_system_source;
- description;
- id;
- name.

4.2.70.1 classification_system_source

The classification_system_source specifies the External_document (see 4.2.162) or the External_library_reference (see 4.2.165) that contains the specification for the Classification_system. The External_library_reference specifies the unique identification of a supplier or class, i.e. a supplier_BSU or class_BSU according to ISO 13584–42, for an ISO 13584 compliant library.

See 4.3.223 and 4.3.224 for the application assertions.

The classification_system_source need not be specified for a particular Classification_system.

If present, there shall be exactly one object that defines the classification_system_source for a Classification_system.

4.2.70.2 description

The description specifies additional information about the Classification_system.

See 4.3.225 for the application assertion.

The description need not be specified for a particular Classification_system.

If present, there shall be exactly one object that defines the description for a Classification_system.

4.2.70.3 id

The id specifies the identifier of the Classification_system.

The id need not be specified for a particular Classification_system.

4.2.70.4 name

The name specifies the word or group of words by which the Classification_system is referred to.

See 4.3.225 for the application assertion.

There shall be exactly one object that defines the name for a Classification_system.

4.2.71 Closed_profile

A Closed_profile is specified by an outline that bounds an enclosed area with no opening.

A Closed_profile is a type of Profile (see 4.2.355).

Each Closed_profile is either a Ngon_profile (see 4.2.288), a Rectangular_closed_profile (see 4.2.370), a General_closed_profile (see 4.2.194), or a Circular_closed_profile (see 4.2.57).

4.2.72 Closed_profile_usage

A Closed_profile_usage is the identification of a Closed_profile (see 4.2.71) and possibly of a geometric Transformation (see 4.2.472) used to place the Closed_profile in a reference coordinate space.

The data associated with a Closed_profile_usage are the following:

- placement;
- profile.

4.2.72.1 placement

The placement specifies the geometric Transformation (see 4.2.472) that locates and orients the Closed_profile in the reference coordinate space.

See 4.3.227 for the application assertion.

The placement need not be specified for a particular Closed_profile_usage.

4.2.72.2 profile

The profile specifies the Closed_profile (see 4.2.71) that is used.

See 4.3.226 for the application assertion.

4.2.73 Closed_shell

A Closed_shell is a collection of at least one Face (see 4.2.167) that bounds a region in the three-dimensional space. The topological normal of the shell is defined as being directed from the finite to the infinite region. A void is represented by an interior shell that builds a "hole"

inside an outer shell. For such an interior shell the topological normal will point into the solid material. A Closed_shell shall not self-intersect.

The data associated with a Closed_shell are the following:

- shell_boundary.

The shell_boundary specifies the Face (see 4.2.167) that represents the boundary of a Closed_shell (see 4.2.73).

See 4.3.228 for the application assertion.

4.2.74 Coating_layer

A Coating_layer is one layer of covering applied to a surface

A Coating_layer is a type of Surface_condition (see 4.2.437).

The data associated with a Coating_layer are the following:

- thickness;
- used_material.

4.2.74.1 thickness

The thickness specifies the thickness of the Coating_layer.

See 4.3.230 for the application assertion.

The thickness need not be specified for a particular Coating_layer.

4.2.74.2 used_material

The used_material specifies the material that is used for the Coating_layer.

See 4.3.229 for the application assertion.

4.2.75 Coating_layer_relationship

A Coating_layer_relationship is the relationship between two Coating_layer (see 4.2.74) objects that are applied to the same surface. A sequence of the coating layers can be built up by using multiple Coating_layer_relationship objects.

The data associated with a Coating_layer_relationship are the following:

- description;
- following_layer;
- id;
- preceding_layer;

– purpose.

4.2.75.1 description

The description specifies any technical conditions or dependencies that have to be considered if the coating layers are applied in the defined sequence.

EXAMPLE 58 – Two coating layers of paint might be specified in a sequence with the condition that the first layer has to be dried out for at least 20 minutes before the second layer of paint can be applied.

See 4.3.232 for the application assertion.

The description need not be specified for a particular Coating_layer_relationship.

If present, there shall be exactly one object that defines the description for a Coating_layer_-relationship.

4.2.75.2 following_layer

The following_layer specifies the coating layer that is applied subsequently, i.e., the coating layer that is applied to the surface after the preceding_layer has been applied.

See 4.3.231 for the application assertion.

4.2.75.3 id

The id specifies the identifier of the Coating_layer_relationship.

4.2.75.4 preceding_layer

The preceding_layer specifies the coating layer that is applied previously, i.e., the coating layer that has been applied to the surface before the following_layer is applied.

See 4.3.231 for the application assertion.

4.2.75.5 purpose

The purpose specifies the rationale of the Coating_layer_relationship.

See 4.3.232 for the application assertion.

The purpose need not be specified for a particular Coating_layer_relationship.

If present, there shall be exactly one object that defines the purpose for a Coating_layer_-relationship.

4.2.76 Collected_item_association

A Collected_item_association is a mechanism to associate Item_instance (see 4.2.241) objects with a Collection_definition (see 4.2.77).

A Collected_item_association is a type of Item_definition_instance_relationship (see 4.2.239).

The data associated with a Collected_item_association are the following:

- relating.

The relating specifies the Collection_definition (see 4.2.77) that collects the Design_discipline_item_definition (see 4.2.134) objects.

See 4.3.233 for the application assertion.

4.2.77 Collection_definition

A Collection_definition is the definition of an Item_version (see 4.2.248) that serves as a collector for Item_instance (see 4.2.241) objects that are mounted in the same vehicle but may not be assembled together.

EXAMPLE 59 – Brake pads on left and right front brake from same supplier, locks and keys of the car all from one supplier, wooden panels in interior from same supplier (to ensure common structure of the wood) are examples for collections.

A Collection_definition is a type of Design_discipline_item_definition (see 4.2.134).

The data associated with a Collection_definition are the following:

- purpose.

The purpose specifies the rationale behind the Collection_definition.

See 4.3.234 for the application assertion.

The purpose need not be specified for a particular Collection_definition.

If present, there shall be exactly one object that defines the purpose for a Collection_definition.

4.2.78 Complete_circular_path

A Complete_circular_path is specified by a direction of travel that begins and ends at the same point on the arc.

EXAMPLE 60 – Figure 16 illustrates a Complete_circular_path.

A Complete_circular_path is a type of Circular_path (see 4.2.60).

4.2.79 Composite_curve

A Composite_curve is a curve that is composed of a number of curves which join end to end. A Composite_curve may be closed and self-intersecting.

A Composite_curve is a type of Curve (see 4.2.102).

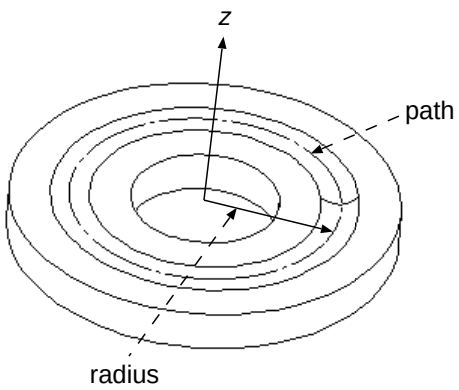

Figure 16 – Complete_circular_path

4.2.80 Compound_datum

A Compound_datum is a set of two or more Datum_feature (see 4.2.117) objects of equal importance which are used to establish a single datum plane or axis.

A Compound_datum is a type of Datum (see 4.2.116).

The data associated with a Compound_datum are the following:

– is_made_up_by.

The is_made_up_by specifies the set of Datum_feature (see 4.2.117) objects that form the Compound_datum.

See 4.3.235 for the application assertion.

4.2.81 Compound_feature_in_panel

A Compound_feature_in_panel is a union of Process_feature_in_panel (see 4.2.334) objects that allows the definition of complex features based on existing Process_feature_in_panel definitions.

In the case where the Compound_feature_in_panel is applied as a Placed_feature (see 4.2.313) all of its elements except for Transition_feature (see 4.2.476) objects shall be defined in their own local coordinate spaces and then transformed into the coordinate space of the Compound_feature_in_panel. In the case where the Compound_feature_in_panel is applied as an Included_feature (see 4.2.232) the Compound_feature_in_panel as well as all of its elements shall be defined in the part's coordinate space.

A Compound_feature_in_panel is a type of Process_feature_in_panel (see 4.2.334).

The data associated with a Compound_feature_in_panel are the following:

– feature_type.

The feature_type specifies the kind of Compound_feature_in_panel.

4.2.82 Compound_feature_in_panel_element

A Compound_feature_in_panel_element is a feature element that is used in the definition of a Compound_feature_in_panel (see 4.2.81).

The data associated with a Compound_feature_in_panel_element are the following:

- element_placement;
- feature;
- is_element_for.

4.2.82.1 element_placement

The element_placement specifies the geometric Transformation (see 4.2.472) that is used to place the Compound_feature_in_panel_element in the coordinate space of the Compound_feature_in_panel (see 4.2.81) in the case where the Compound_feature_in_panel is applied as a Placed_feature (see 4.2.313). In the case where the Compound_feature_in_panel is applied as an Included_feature (see 4.2.232) the element_placement shall not be instantiated.

See 4.3.238 for the application assertion.

The element_placement need not be specified for a particular Compound_feature_in_panel_element.

4.2.82.2 feature

The feature specifies the Process_feature_in_panel (see 4.2.334) that is the feature definition of the Compound_feature_in_panel_element.

See 4.3.237 and 4.3.239 for the application assertions.

There shall be exactly one object that defines the feature for a Compound_feature_in_panel_element.

4.2.82.3 is_element_for

The is_element_for specifies the Compound_feature_in_panel (see 4.2.81) the Compound_feature_in_panel_element is a component of.

See 4.3.236 for the application assertion.

4.2.83 Compound_feature_in_panel_element_relationship

A Compound_feature_in_panel_element_relationship is a mechanism to define the sequence in which the Compound_feature_in_panel_element (see 4.2.82) elements are applied in the Compound_feature_in_panel (see 4.2.81).

NOTE – The sequence defined by the Compound_feature_in_panel_element_relationship need not be the same as the manufacturing sequence of the Compound_feature_in_panel.

The data associated with a Compound_feature_in_panel_element_relationship are the following:

- predecessor;
- successor.

4.2.83.1 predecessor

The predecessor specifies the Compound_feature_in_panel_element (see 4.2.82) that is preceding the other feature in the Compound_feature_in_panel_element_relationship.

See 4.3.240 for the application assertion.

4.2.83.2 successor

The successor specifies the Compound_feature_in_panel_element (see 4.2.82) that is succeeding the other feature in the Compound_feature_in_panel_element_relationship.

See 4.3.240 for the application assertion.

4.2.84 Compound_feature_in_solid

A Compound_feature_in_solid is a union of Process_feature_in_solid (see 4.2.335) objects that allows the definition of complex features based on existing Process_feature_in_solid definitions.

In the case where the Compound_feature_in_solid is applied as a Placed_feature (see 4.2.313) all of its elements except for Transition_feature (see 4.2.476) or Thread_feature (see 4.2.457) objects shall be defined in their own local coordinate spaces and then transformed into the coordinate space of the Compound_feature_in_solid. In the case where the Compound_feature_in_solid is applied as an Included_feature (see 4.2.232) the Compound_feature_in_solid as well as all of its elements shall be defined in the part's coordinate space.

A Compound_feature_in_solid is a type of Process_feature_in_solid (see 4.2.335).

The data associated with a Compound_feature_in_solid are the following:

- feature_type.

The feature_type specifies the kind of Compound_feature_in_solid.

EXAMPLE 61 – 'counterbore hole' or 'countersunk hole' are examples for feature_type.

4.2.85 Compound_feature_in_solid_element

A Compound_feature_in_solid_element is the feature element that is used in the definition of a Compound_feature_in_solid (see 4.2.84). When the Compound_feature_in_solid_element is a Thread_feature (see 4.2.457) there shall be a Compound_feature_in_solid_element_relationship (see 4.2.86) that references the Compound_feature_in_solid_element representing the Thread_feature as successor and a Compound_feature_in_solid_element representing either a Circular_boss (see 4.2.56) or a Round_hole (see 4.2.387) as predecessor.

The data associated with a Compound_feature_in_solid_element are the following:

- element_placement;
- feature;
- is_element_for.

4.2.85.1 element_placement

The element_placement specifies the geometric Transformation (see 4.2.472) that is used to place the Compound_feature_in_solid_element in the coordinate space of the Compound_feature_in_solid (see 4.2.84) in the case where the Compound_feature_in_solid is applied as a Placed_feature (see 4.2.313); the element_placement shall not be used if the Compound_feature_in_solid_element is a Thread_feature (see 4.2.457) or a Transition_feature (see 4.2.476). In the case where the Compound_feature_in_solid is applied as an Included_feature (see 4.2.232) the element_placement shall not be instantiated.

See 4.3.244 for the application assertion.

The element_placement need not be specified for a particular Compound_feature_in_solid_element.

4.2.85.2 feature

The feature specifies the Process_feature_in_solid (see 4.2.335) that is the feature definition of the Compound_feature_in_solid_element.

See 4.3.242, 4.3.243, and 4.3.245 for the application assertions.

There shall be exactly one object that defines the feature for a Compound_feature_in_solid_element.

4.2.85.3 is_element_for

The is_element_for specifies the Compound_feature_in_solid_element (see 4.2.85) the Compound_feature_in_solid_element is a component of.

See 4.3.241 for the application assertion.

4.2.86 Compound_feature_in_solid_element_relationship

A Compound_feature_in_solid_element_relationship is a mechanism to define the sequence in which the Compound_feature_in_solid_element (see 4.2.85) elements are applied in the Compound_feature_in_solid (see 4.2.84).

NOTE – The sequence defined by the Compound_feature_in_solid_element_relationship need not be the same as the manufacturing sequence of the Compound_feature_in_solid.

The data associated with a Compound_feature_in_solid_element_relationship are the following:

- predecessor;
- successor.

4.2.86.1 predecessor

The predecessor specifies the Compound_feature_in_solid_element (see 4.2.85) that is preceding the other feature in the Compound_feature_in_solid_element_relationship.

See 4.3.246 for the application assertion.

4.2.86.2 successor

The successor specifies the Compound_feature_in_solid_element (see 4.2.85) that is succeeding the other feature in the Compound_feature_in_solid_element_relationship.

See 4.3.246 for the application assertion.

4.2.87 Compound_model

A Compound_model is a model where elements of different dimensionality such as wireframes or surface model are topologically connected. The topology of a Compound_model may be non-manifold.

NOTE – A Compound_model may include non-manifold surface models as well as topologically bounded three-dimensional wireframe models.

A Compound_model is a type of Geometric_model (see 4.2.211).

The data associated with a Compound_model are the following:

- element.

The element specifies the topologically connected elements that form the Compound_model.

See 4.3.247 for the application assertion.

4.2.88 Concentricity_tolerance

A Concentricity_tolerance is a mechanism to control the condition where the axes of all cross-sectional elements of a surface of revolution are common to the axis of a datum feature. It specifies a cylindrical tolerance zone whose axis coincides with a datum axis and within which all cross-sectional axes of the feature being controlled must lie.

A Concentricity_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Concentricity_tolerance are the following:

- datum.

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.248 for the application assertion.

4.2.89 Configuration

A Configuration is the association of a Specification_expression (see 4.2.417) or a Specification (see 4.2.415) with an Item_solution (see 4.2.246) or with a Process_operation (see 4.2.336) in the context of a certain Product_class (see 4.2.348). The association may be limited by time, by serial number or by lot size.

Each Configuration may be one of the following: a Serial_configuration (see 4.2.393), a Lot_-configuration (see 4.2.272), or a Dated_configuration (see 4.2.115).

The data associated with a Configuration are the following:

- is_solution_for;
- usage.

4.2.89.1 is_solution_for

The is_solution_for specifies the characteristic or combination of characteristics for which the Item_solution (see 4.2.246) provides a technical solution or which is needed to control a Process_-operation (see 4.2.336). These characteristics are defined by a Class_specification_association (see 4.2.68) and combinations of characteristics are defined by a Class_condition_association (see 4.2.65) where the attribute 'condition type' is 'part usage'.

See 4.3.249 and 4.3.250 for the application assertions.

There shall be exactly one object that the Configuration is_solution_for.

4.2.89.2 usage

The usage specifies an Item_solution (see 4.2.246) or a Process_operation (see 4.2.336) that is controlled by a Configuration.

See 4.3.251 and 4.3.252 for the application assertions.

There shall be exactly one object that defines the usage for a Configuration.

4.2.90 Conical_bottom

A Conical_bottom is a hole bottom that is shaped like a cone. A Conical_bottom is characterized by a constant decrease in the hole diameter until the diameter is zero or until the surface becomes tangent to a specified tip_radius.

A Conical_bottom is a type of Hole_bottom_condition (see 4.2.228).

The data associated with a Conical_bottom are the following:

- tip_angle;
- tip_radius.

4.2.90.1 tip_angle

The tip_angle specifies the opening angle of the cone. The tip_angle shall have a value greater than 0 degrees and smaller than 180 degrees.

See 4.3.253 for the application assertion.

4.2.90.2 tip_radius

The tip_radius specifies the radius at the tip of the cone.

See 4.3.253 for the application assertion.

The tip_radius need not be specified for a particular Conical_bottom.

4.2.91 Conical_surface

A Conical_surface is a surface that could be produced by revolving a line in three-dimensional geometric space about any intersecting line. The angle between the axis and the revolved line must be between and not equal to 0 and 90 degrees. A Conical_surface shall be trimmed to a finite extension if used in a Surface_model (see 4.2.439) or a Geometrically_bounded_surface_-model (see 4.2.220).

A Conical_surface is a type of Surface (see 4.2.434).

4.2.92 Constant_radius_edge_round

A Constant_radius_edge_round is an Edge_round (see 4.2.154) with a constant radius.

A Constant_radius_edge_round is a type of Edge_round (see 4.2.154).

The data associated with a Constant_radius_edge_round are the following:

- first_offset;
- radius;
- second_offset.

4.2.92.1 first_offset

The first_offset specifies the amount of offset from the first Face (see 4.2.167) that defines the location of tangency.

EXAMPLE 62 – Figure 17 illustrates the use of offsets with a Constant_radius_edge_round.

NOTE – The use of offsets causes the location of tangency to be 'outside the material' and not on the part's surface.

See 4.3.254 for the application assertion.

The first_offset need not be specified for a particular Constant_radius_edge_round.

4.2.92.2 radius

The radius specifies the amount of curvature for a convex transition representing a Constant_-radius_edge_round.

See 4.3.254 for the application assertion.

4.2.92.3 second_offset

The second_offset specifies the amount of offset from the second Face (see 4.2.167) that defines the location of tangency.

See 4.3.254 for the application assertion.

The second_offset need not be specified for a particular Constant_radius_edge_round.

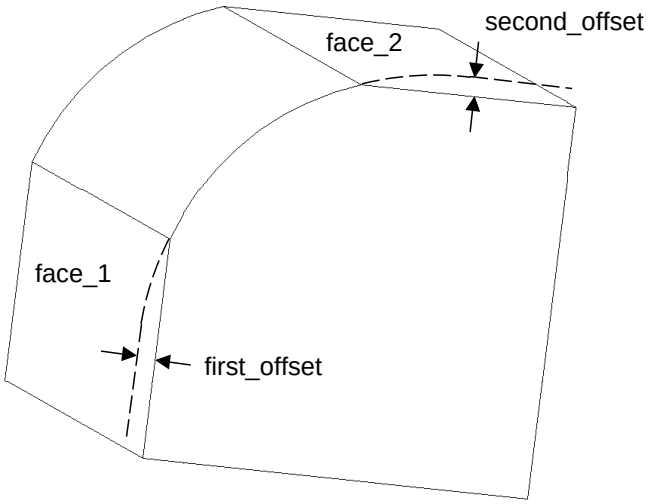

Figure 17 – Constant_radius_edge_round with offsets

4.2.93 Constant_radius_fillet

A Constant_radius_fillet is a Fillet (see 4.2.181) with a constant radius.

A Constant_radius_fillet is a type of Fillet (see 4.2.181).

The data associated with a Constant_radius_fillet are the following:

- first_offset;
- radius;
- second_offset.

4.2.93.1 first_offset

The first_offset specifies the amount of offset from the first Face (see 4.2.167) that defines the location of tangency.

EXAMPLE 63 – Figure 18 illustrates the use of offsets with a Constant_radius_fillet.

NOTE – The use of offsets causes the location of tangency to be 'inside the material' and not on the part's surface.

See 4.3.255 for the application assertion.

The first_offset need not be specified for a particular Constant_radius_fillet.

4.2.93.2 radius

The radius specifies the amount of curvature for a concave transition representing a Constant_-radius_fillet.

See 4.3.255 for the application assertion.

4.2.93.3 second_offset

The second_offset specifies the amount of offset from the second Face (see 4.2.167) that defines the location of tangency.

See 4.3.255 for the application assertion.

The second_offset need not be specified for a particular Constant_radius_fillet.

4.2.94 Constructive_geometric_element

A Constructive_geometric_element is an element of a Constructive_geometry (see 4.2.95).

The data associated with a Constructive_geometric_element are the following:

- description;
- element.

4.2.94.1 description

The description specifies the meaning of the Constructive_geometric_element.

EXAMPLE 64 – The description may be e.g., 'rotation axis' or 'mirroring plane'.

The description need not be specified for a particular Constructive_geometric_element.

4.2.94.2 element

The element specifies the geometric element that serves as a Constructive_geometric_element.

See 4.3.256, 4.3.257, 4.3.258, 4.3.259, 4.3.260, 4.3.261, and 4.3.262 for the application assertions.

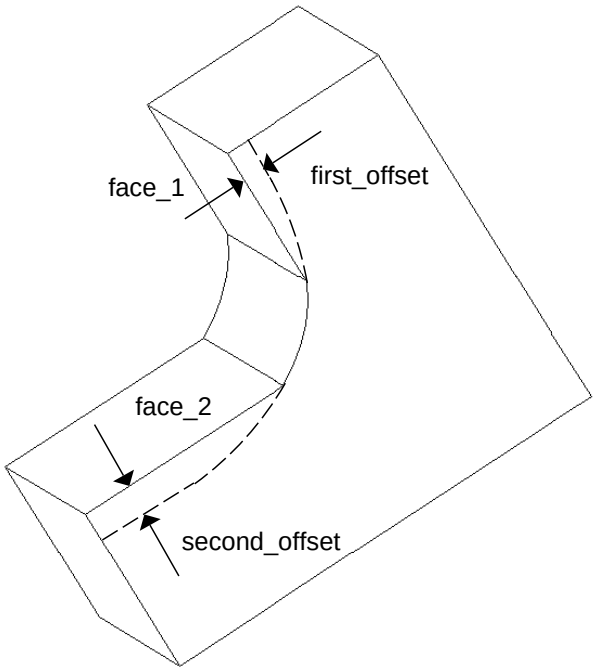

Figure 18 – Constant_radius_fillet with offsets

There shall be exactly one object that defines the element for a Constructive_geometric_element.

4.2.95 Constructive_geometry

A Constructive_geometry is a collection of non-shape geometry that is used to support the definition of the geometry that is representing the shape of the part.

The data associated with a Constructive_geometry are the following:

- element.

The element specifies the Constructive_geometric_element (see 4.2.94) objects that the Constructive_geometry consists of.

See 4.3.263 for the application assertion.

4.2.96 Constructive_geometry_association

A Constructive_geometry_association is a mechanism to associate the geometry representing the part's shape with the constructive geometry which was used for its definition.

The data associated with a Constructive_geometry_association are the following:

- base_geometry;

- constructive_geometry;

- description.

4.2.96.1 base_geometry

The base_geometry specifies the Geometric_model (see 4.2.211) the Constructive_geometry (see 4.2.95) is used in.

See 4.3.264 and 4.3.265 for the application assertions.

There shall be exactly one object that defines the base_geometry for a Constructive_geometry_-association.

4.2.96.2 constructive_geometry

The constructive_geometry specifies the Constructive_geometry (see 4.2.95) that supports the definition of the geometry representing the shape of the part.

See 4.3.264 for the application assertion.

4.2.96.3 description

The description specifies additional information about the Constructive_geometry_association.

See 4.3.266 for the application assertion.

The description need not be specified for a particular Constructive_geometry_association.

If present, there shall be exactly one object that defines the description for a Constructive_-geometry_association.

4.2.97 Contact_ratio

A Contact_ratio is the measure of the quality of contact of a shape on a reference surface. It is expressed as the ratio between the measure of the area of contact and the measure of the area of the reference surface.

A Contact_ratio is a type of Surface_condition (see 4.2.437).

The data associated with a Contact_ratio are the following:

- measuring_reference;
- ratio_value.

4.2.97.1 measuring_reference

The measuring_reference specifies a Physical_model (see 4.2.312) that serves as the reference for the determination of a Contact_ratio.

See 4.3.267 for the application assertion.

4.2.97.2 ratio_value

The ratio_value specifies a value between 0.0 and 1.0 that is the ratio between the measure of the area of contact and the measure of the area of the reference surface.

4.2.98 Context_dependent_appearance_assignment

A Context_dependent_appearance_assignment is the appearance of geometric elements and annotation with regard to a context in which these elements are represented. The context is defined by a Drawing_sheet (see 4.2.152), Group (see 4.2.222), Layer (see 4.2.261), Model_image (see 4.2.284), View (see 4.2.490), or View_area (see 4.2.491). The Context_dependent_appearance_assignment is overridden by appearances associated to elements by an Appearance_assignment (see 4.2.19).

A Context_dependent_appearance_assignment is a type of Appearance_assignment (see 4.2.19).

The data associated with a Context_dependent_appearance_assignment are the following:

- appearance_context.

The appearance_context specifies the context where the appearance components are valid.

See 4.3.268, 4.3.269, 4.3.270, 4.3.271, 4.3.272, and 4.3.273 for the application assertions.

There shall be exactly one object that defines the appearance_context for a Context_dependent_appearance_assignment.

4.2.99 Contract

A Contract is a binding agreement concerning the design of Item_version (see 4.2.248) objects and/or the carrying out of Activity (see 4.2.2) objects.

The data associated with a Contract are the following:

- contracted_element;
- id;
- ordered_price.

4.2.99.1 contracted_element

The contracted_element specifies the object that is subject of the Contract.

See 4.3.274 and 4.3.275 for the application assertions.

4.2.99.2 id

The id specifies the identifier of the Contract that shall be unique within the scope of an organization.

4.2.99.3 ordered_price

The ordered_price specifies the price for an Item_version (see 4.2.248) object or an Activity (see 4.2.2) object according to the underlying Contract.

The ordered_price need not be specified for a particular Contract.

4.2.100 Csg_model

A Csg_model is a collection of solids combined using regularised Boolean operations according to a tree (directed acyclic graph) with CSG primitives and non primitive solid models at the leaves and Boolean operations (and their associated Boolean results) at the nodes. A Csg_model is the root of the tree.

A Csg_model is a type of Geometric_model (see 4.2.211).

The data associated with a Csg_model are the following:

- tree_root_expression.

The tree_root_expression specifies the root of the CSG tree.

See 4.3.276, 4.3.277, 4.3.278, 4.3.279, 4.3.280, and 4.3.281 for the application assertions.

4.2.101 Csg_primitive

A Csg_primitive is a basic solid object that may be combined with other solid objects using regularized Boolean operations in order to create more complex solid geometric elements.

A Csg_primitive is a type of Detailed_geometric_model_element (see 4.2.136).

Each Csg_primitive is either a Right_circular_cylinder (see 4.2.385), a Right_angular_wedge (see 4.2.383), a Right_circular_cone (see 4.2.384), a Torus (see 4.2.470), a Block (see 4.2.40), or a Sphere (see 4.2.420).

4.2.102 Curve

A Curve is a path of a point moving in its coordinate space.

A Curve is a type of Detailed_geometric_model_element (see 4.2.136).

Each Curve is either a Hyperbola (see 4.2.231), a Parabola (see 4.2.300), a Trimmed_curve (see 4.2.478), an Offset_curve (see 4.2.289), an Ellipse (see 4.2.159), a Composite_curve (see 4.2.79), a Circle (see 4.2.55), a Line (see 4.2.265), a B_spline_curve (see 4.2.36), a Curve_on_surface (see 4.2.104), or a Polyline (see 4.2.331).

4.2.103 Curve_appearance

A Curve_appearance governs the visual appearance of geometric curves and annotation curves.

The data associated with a Curve_appearance are the following:

- colour;

- font;
- width.

4.2.103.1 colour

The colour specifies the colour of the visible segments of a curve. The colour is either userdefined or predefined. Figure 19 shows the predefined colours.

4.2.103.2 font

The font specifies the line font of a curve. The font determines the visible and invisible segments of a curve. Figure 20 shows the predefined curve fonts.

4.2.103.3 width

The width specifies the thickness of the visible segments of a curve measured perpendicular to the direction of the curve. The width is invariant to the scale of a Model_image (see 4.2.284).

Colour name	Red	Green	Blue
Black	0	0	0
Red	1.0	0	0
Green	0	1.0	0
Blue	0	0	1.0
Yellow	1.0	1.0	0
Magenta	1.0	0	1.0
Cyan	0	1.0	1.0
White	1.0	1.0	1.0

Figure 19 – Predefined colours

4.2.104 Curve_on_surface

A Curve_on_surface is a curve that lies on a parametric surface. This includes the cases of a 3D curve representation together with the basis surface, a 2D curve representation within the parameter space of the surface, and a combination of both.

A Curve_on_surface is a type of Curve (see 4.2.102).

Curve pattern name	Segment (mm)	Space (mm)	Segment (mm)	Space (mm)	Segment (mm)	Space (mm)	Number of Segments
Continuous							0
Dotted	1.0	1.0					2
Dashed	4.0	1.5					2
Chain	7.0	1.0	1.0	1.0			4
Chain double dash	7.0	1.0	1.0	1.0	1.0	1.0	6

Figure 20 – Predefined curve fonts

4.2.105 Curve_set_2d

A Curve_set_2d is a collection of a two-dimensional Curve (see 4.2.102) or Point (see 4.2.322) objects that establish a Wireframe_model_2d (see 4.2.497).

A Curve_set_2d is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Curve_set_2d are the following:

– element.

The element specifies the set of Curve (see 4.2.102) or Point (see 4.2.322) objects that form a Curve_set_2d.

See 4.3.282 and 4.3.283 for the application assertions.

There shall be at least one object that defines the element for a Curve_set_2d.

4.2.106 Curve_set_3d

A Curve_set_3d is a collection of three-dimensional Curve (see 4.2.102) or Point (see 4.2.322) objects that establish a Wireframe_model_3d (see 4.2.498).

A Curve_set_3d is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Curve_set_3d are the following:

– element.

The element specifies the set of Curve (see 4.2.102) or Point (see 4.2.322) objects that form a Curve_set_3d.

See 4.3.284 and 4.3.285 for the application assertions.

There shall be at least one object that defines the element for a Curve_set_3d.

4.2.107 Curved_distance_dimension

A Curved_distance_dimension is the chordal dimension or the arc length along a curve.

A Curved_distance_dimension is a type of Location_dimension (see 4.2.270).

The data associated with a Curved_distance_dimension are the following:

- path;
- with_curve_direction.

4.2.107.1 path

The path specifies the Shape_aspect (see 4.2.394) representing the curve.

See 4.3.286 for the application assertion.

4.2.107.2 with_curve_direction

The with_curve_direction specifies a Boolean value that indicates the direction along the element to apply the dimension. A value of 'true' indicates that the dimension is applied from the start point of the curve to the end point of the curve. A value of 'false' indicates that the direction does not matter.

4.2.108 Cylindrical_surface

A Cylindrical_surface is a surface at a constant distance from a line. A Cylindrical_surface shall be trimmed to a finite extension if used in a Surface_model (see 4.2.439) or a Geometrically_-bounded_surface_model (see 4.2.220).

A Cylindrical_surface is a type of Surface (see 4.2.434).

4.2.109 Cylindricity_tolerance

A Cylindricity_tolerance is the limitation of the amount of deviation points of a cylindrical surface may have from being equidistant from the cylinder axis. It defines a tolerance zone bounded by two concentric cylinders within which the surface must lie.

A Cylindricity_tolerance is a type of Geometric_tolerance (see 4.2.216).

4.2.110 Data_environment

A Data_environment is the specification of the conditions under which a Material_property_-representation (see 4.2.280) is valid.

EXAMPLE 65 – A Data_environment may have the name 'standard' and the description '20 degrees Celsius, 75% humidity'.

The data associated with a Data_environment are the following:

- description;
- name.

4.2.110.1 description

The description specifies additional information about the Data_environment.

See 4.3.287 for the application assertion.

There shall be exactly one object that defines the description for a Data_environment.

4.2.110.2 name

The name specifies the word or group of words by which the Data_environment is referred to.

4.2.111 Date_and_person_assignment

A Date_and_person_assignment is an object that associates a Date_and_person_or_organization (see 4.2.112) with an object.

The data associated with a Date_and_person_assignment are the following:

- assigned_date_and_person;
- is_applied_to;
- role.

4.2.111.1 assigned_date_and_person

The assigned_date_and_person specifies the Date_and_person_or_organization (see 4.2.112).

See 4.3.297 for the application assertion.

4.2.111.2 is_applied_to

The is_applied_to specifies the object with which the Date_and_person_assignment is associated.

See 4.3.288, 4.3.289, 4.3.290, 4.3.291, 4.3.292, 4.3.293, 4.3.294, 4.3.295, 4.3.296, 4.3.298, 4.3.299, 4.3.300, 4.3.301, 4.3.302, 4.3.303, 4.3.304, 4.3.305, 4.3.306, 4.3.307, 4.3.308, 4.3.309, 4.3.310, 4.3.311, 4.3.312, 4.3.313, 4.3.314, 4.3.315, 4.3.316, 4.3.317, 4.3.318, 4.3.319, 4.3.320, 4.3.321, 4.3.322, 4.3.323, 4.3.324, 4.3.325, 4.3.326, and 4.3.327 for the application assertions.

There shall be exactly one object that the Date_and_person_assignment is_applied_to.

4.2.111.3 role

The role specifies the relationship between the date/time and the person or organization in the Date_and_person_assignment. Where applicable the following values shall be used:

- 'creation': The assignment specifies that the referenced object has been created by the given person or organization at the given date and time;

– 'update': The assignment specifies that the referenced object has been altered by the given person or organization at the given date and time.

4.2.112 Date_and_person_or_organization

A Date_and_person_or_organization is a Date_time (see 4.2.113) and a Person (see 4.2.307) or an Organization (see 4.2.294).

The data associated with a Date_and_person_or_organization are the following:

– actual_date;

– person_or_organization.

4.2.112.1 actual_date

The actual_date specifies the date component of a Date_and_person_or_organization.

See 4.3.328 for the application assertion.

4.2.112.2 person_or_organization

The person_or_organization specifies the Organization (see 4.2.294), the Person (see 4.2.307), or the Person_in_organization (see 4.2.308) that is part of the Date_and_person_or_organization.

See 4.3.329, 4.3.330, and 4.3.331 for the application assertions.

There shall be exactly one object that defines the person_or_organization for a Date_and_person_-or_organization.

4.2.113 Date_time

A Date_time is the specification of a date and an optional time of day.

The data associated with a Date_time are the following:

– date;

– time.

4.2.113.1 date

The date specifies the calendar time conveying information about the year, the month, and the day in no specific order.

4.2.113.2 time

The time specifies a moment of occurrence measured by hour, minute, and second.

The time need not be specified for a particular Date_time.

4.2.114 Date_time_assignment

A Date_time_assignment is an association of Date_time (see 4.2.113) with some product data.

The data associated with a Date_time_assignment are the following:

- assigned_date_time;
- is_applied_to;
- role.

4.2.114.1 assigned_date_time

The assigned_date_time specifies the Date_time (see 4.2.113) that is associated with the product data.

See 4.3.341 for the application assertion.

4.2.114.2 is_applied_to

The is_applied_to specifies the object of product data with which the Date_time_assignment is associated. There shall be exactly one object to which the Date_time_assignment is applied to.

See 4.3.332, 4.3.333, 4.3.334, 4.3.335, 4.3.336, 4.3.337, 4.3.338, 4.3.339, 4.3.340, 4.3.342, 4.3.343, 4.3.344, 4.3.345, 4.3.346, 4.3.347, 4.3.348, 4.3.349, 4.3.350, 4.3.351, 4.3.352, 4.3.353, 4.3.354, 4.3.355, 4.3.356, 4.3.357, 4.3.358, 4.3.359, 4.3.360, 4.3.361, 4.3.362, 4.3.363, 4.3.364, 4.3.365, 4.3.366, 4.3.367, 4.3.368, 4.3.369, 4.3.370, and 4.3.371 for the application assertions.

There shall be exactly one object that the Date_time_assignment is_applied_to.

4.2.114.3 role

The role specifies the action associated with the Date_time_assignment. Where applicable the following values shall be used:

- 'creation': The assignment specifies that the referenced object was created at the given date and time;
- 'update': The assignment specifies that the referenced object was altered at the given date and time;
- 'production': The assignment specifies that the referenced object (e.g. a physical instance) was produced at a given date and time;
- 'installation': The assignment specifies that the referenced object (e.g. a physical instnace) was mounted in a product at a given date and time;
- 'registration': The assignment specifies that the referenced object (e.g. a property) was determined at a given date and time.

4.2.115 Dated_configuration

A Dated_configuration is a Configuration (see 4.2.89) that applies from a given date on.

A Dated_configuration is a type of Configuration (see 4.2.89).

4.2.116 Datum

A Datum is a theoretically exact point, line, axis, or plane which indicates the origin of a specified dimensional relationship between a toleranced element and a designated element on a part. A designated part element serves as the Datum_feature (see 4.2.117), whereas, its true counterpart establishes the datum plane or axis. A Datum may be controlled by a Material_condition (see 4.2.278). The concept of datums for tolerancing is defined in ISO 5459.

Each Datum is either a Datum_feature (see 4.2.117) or a Compound_datum (see 4.2.80).

The data associated with a Datum are the following:

- precedence.

The precedence the number of the Datum in a sequence of Datum objects.

4.2.117 Datum_feature

A Datum_feature is an actual part element which contacts, or is used to establish, a Datum (see 4.2.116).

A Datum_feature is a type of Datum (see 4.2.116).

The data associated with a Datum_feature are the following:

- is_controlled_by;
- is_defined_by;
- name.

4.2.117.1 is_controlled_by

The is_controlled_by specifies the Material_condition (see 4.2.278) that is associated with the application of the Datum_feature.

See 4.3.374 for the application assertion.

The is_controlled_by need not be specified for a particular Datum_feature.

4.2.117.2 is_defined_by

The is_defined_by specifies the Datum_target_set (see 4.2.119), the Derived_geometry (see 4.2.128), or the Shape_aspect (see 4.2.394) that represents the Datum_feature.

See 4.3.372, 4.3.373, and 4.3.375 for the application assertions.

There shall be exactly one object that the Datum_feature is_defined_by.

4.2.117.3 name

The name specifies the word or group of words by which the Datum_feature is referred to.

4.2.118 Datum_target

A Datum_target is a designated geometric element on the surface of a part used to locate the part in a datum reference frame.

Each Datum_target is either a Target_area (see 4.2.446) or a Placed_target (see 4.2.314).

The data associated with a Datum_target are the following:

- id.

The id specifies the identifier of the Datum_target.

4.2.119 Datum_target_set

A Datum_target_set is a set of Datum_target (see 4.2.118) objects which is used to define a datum reference frame for a part.

The data associated with a Datum_target_set are the following:

- rule_description;
- target.

4.2.119.1 rule_description

The rule_description specifies the type of datum that is formed by the Datum_target_set.

EXAMPLE 66 – The rule_description 'V-block' indicates that two Datum_target (see 4.2.118) objects on a cylindrical element are supposed to form the areas of contact in a V-shaped fixture.

See 4.3.377 for the application assertion.

The rule_description need not be specified for a particular Datum_target_set.

If present, there shall be exactly one object that defines the rule_description for a Datum_target_set.

4.2.119.2 target

The target specifies the set of Datum_target (see 4.2.118) objects that form the Datum_target_set.

See 4.3.376 for the application assertion.

4.2.120 Default_chamfer

A Default_chamfer is the definition of a chamfer that shall be applied to each non-tangent continuous, convex edge of a shape model that has no other chamfer or edge round specified. For a given context only one of Default_chamfer and Default_edge_round (see 4.2.122) shall be specified at a time. A Default_chamfer is applicable only to edges that do not change from convex to concave.

EXAMPLE 67 – During the creation of a 3D CAD model the explicit modelling of chamfers is often omitted to save on time and model size.

The data associated with a Default_chamfer are the following:

- description;
- offset_value.

4.2.120.1 description

The description specifies additional information about the Default_chamfer.

See 4.3.379 for the application assertion.

The description need not be specified for a particular Default_chamfer.

If present, there shall be exactly one object that defines the description for a Default_chamfer.

4.2.120.2 offset_value

The offset_value specifies the width of the chamfer with respect to the two faces where it is applied to.

See 4.3.378 for the application assertion.

4.2.121 Default_draft_angle

A Default_draft_angle is the definition of an angle that is applied to each surface of the part that corresponds to the draft direction.

NOTE 1 – For parts manufactured by casting, the draft angle is necessary to facilitate the extraction of the part out of the form after the casting.

NOTE 2 – There may be various draft directions depending on the actual shape of the part. The Default_draft_angle is therefore not necessarily meant to enable a system to create a resulting shape out of the application of the angle; in most cases this is additional information that has to be interpreted by human beings.

The data associated with a Default_draft_angle are the following:

- description;
- draft_angle_value.

4.2.121.1 description

The description specifies additional information about the Default_draft_angle.

See 4.3.381 for the application assertion.

The description need not be specified for a particular Default_draft_angle.

If present, there shall be exactly one object that defines the description for a Default_draft_angle.

4.2.121.2 draft_angle_value

The draft_angle_value specifies the value of the Default_draft_angle.

See 4.3.380 for the application assertion.

4.2.122 Default_edge_round

A Default_edge_round is the definition of an edge round that shall be applied to non-tangent continuous, convex edge of a shape model that has no other edge round or chamfer specified. For a given context only one of Default_edge_round and Default_chamfer (see 4.2.120) shall be specified at a time. A Default_edge_round is applicable only to edges that do not change from convex to concave.

EXAMPLE 68 – During the creation of a 3D CAD model the explicit modelling of edge rounds is often omitted to save on time and model size.

The data associated with a Default_edge_round are the following:

- description;
- radius_value.

4.2.122.1 description

The description specifies additional information about the Default_edge_round.

See 4.3.383 for the application assertion.

The description need not be specified for a particular Default_edge_round.

If present, there shall be exactly one object that defines the description for a Default_edge_round.

4.2.122.2 radius_value

The radius_value specifies the amount of curvature for a convex transition between two faces.

See 4.3.382 for the application assertion.

4.2.123 Default_fillet

A Default_fillet is the definition of a fillet that shall be applied to each non-tangent continuous, concave edge of a shape model that has no other fillet specified and that does not change its nature from concave to convex.

EXAMPLE 69 – During the creation of a 3D CAD model the explicit modelling of fillets is often omitted to save on time and model size.

The data associated with a Default_fillet are the following:

- description;
- radius_value.

4.2.123.1 description

The description specifies additional information about the Default_fillet.

See 4.3.385 for the application assertion.

The description need not be specified for a particular Default_fillet.

If present, there shall be exactly one object that defines the description for a Default_fillet.

4.2.123.2 radius_value

The radius_value specifies the amount of curvature for a concave transition between two faces.

See 4.3.384 for the application assertion.

4.2.124 Default_roughness

A Default_roughness is the definition of a roughness that shall be applied to each surface of a part that has no other roughness specified.

The data associated with a Default_roughness are the following:

- description;
- max_value;
- min_value.

4.2.124.1 description

The description specifies additional information about the Default_roughness.

See 4.3.386 for the application assertion.

The description need not be specified for a particular Default_roughness.

If present, there shall be exactly one object that defines the description for a Default_roughness.

4.2.124.2 max_value

The max_value specifies the maximum roughness value that shall apply as default.

See 4.3.387 for the application assertion.

4.2.124.3 min_value

The min_value specifies the minimum roughness value that shall apply as default.

See 4.3.387 for the application assertion.

The min_value need not be specified for a particular Default_roughness.

4.2.125 Default_setting_association

A Default_setting_association is the setting of default values for one or more particular contexts.

The data associated with a Default_setting_association are the following:

- default_context;
- default_value.

4.2.125.1 default_context

The default_context specifies the Drawing (see 4.2.149), the External_document (see 4.2.162), the Item_shape (see 4.2.245), or the View_area (see 4.2.491) in whose context the default settings apply.

See 4.3.394, 4.3.395, 4.3.397, and 4.3.398 for the application assertions.

There shall be exactly one object that defines the default_context for a Default_setting_association.

4.2.125.2 default_value

The default_value specifies defaults of various kinds. The quantity and units of the default values are defined by the particular case of default.

See 4.3.388, 4.3.389, 4.3.390, 4.3.391, 4.3.392, 4.3.393, and 4.3.396 for the application assertions.

There shall be at least one object that defines the default_value for a Default_setting_association.

4.2.126 Default_thickness

A Default_thickness is the value of thickness that is valid for all sheet like objects in the context defined by the Default_setting_association (see 4.2.125) if no thickness is assigned explicitly.

The data associated with a Default_thickness are the following:

- description;

– thickness_value.

4.2.126.1 description

The description specifies additional information about the Default_thickness.

See 4.3.399 for the application assertion.

The description need not be specified for a particular Default_thickness.

If present, there shall be exactly one object that defines the description for a Default_thickness.

4.2.126.2 thickness_value

The thickness_value specifies the actual value with the corresponding unit for the Default_-thickness. The thickness_value is measured normal to the surface.

See 4.3.400 for the application assertion.

4.2.127 Defined_thread

A Defined_thread is a thread where the shape of the thread is specified by the values of the attributes. A Defined_thread may be an internal or an external thread.

EXAMPLE 70 – Figure 21 depicts a Defined_thread.

A Defined_thread is a type of Thread_specification (see 4.2.458).

The data associated with a Defined_thread are the following:

– crest;

– density;

– fit_class;

– form;

– hand;

– major_diameter;

– minor_diameter;

– pitch_diameter.

4.2.127.1 crest

The crest specifies the distance between the opposing points of the thread. The crest is formed by the intersection of the sides of the thread if extended, if necessary, beyond the top of the thread.

See 4.3.401 for the application assertion.

4.2.127.2 density

The density specifies the number of threads per the axial unit of length of measure.

See 4.3.401 for the application assertion.

4.2.127.3 fit_class

The fit_class specifies the class of fit specification for the Defined_thread as defined in ISO 965/1. These classes are distinguished from each other by the amount of tolerance and allowance.

EXAMPLE 71 – Examples for fit class are '4e' or '2A'.

4.2.127.4 form

The form specifies one of the standard thread forms. Various forms of threads are used to hold parts together, to adjust parts with reference to each other, or to transmit power.

EXAMPLE 72 – Examples of form are 'metric', 'square', 'unified', 'sharp v', 'buttress', 'standard worm', and 'knuckle'.

4.2.127.5 hand

The hand whether the thread is right or left handed. When viewed toward an end, a right hand winds in a clockwise direction and a left hand winds in a counterclockwise direction.

4.2.127.6 major_diameter

The major_diameter specifies the dimension of the largest diameter of a Defined_thread.

NOTE – The major_diameter applies to both an internal and an external thread.

See 4.3.401 for the application assertion.

4.2.127.7 minor_diameter

The minor_diameter specifies the dimension of the smallest diameter of a Defined_thread.

NOTE – The minor_diameter applies to both an internal and an external thread.

See 4.3.401 for the application assertion.

4.2.127.8 pitch_diameter

The pitch_diameter specifies the dimension of an imaginary cylinder passing through the threads so as to make equal the widths of the threads and the widths of the spaces cut by the cylinder.

See 4.3.401 for the application assertion.

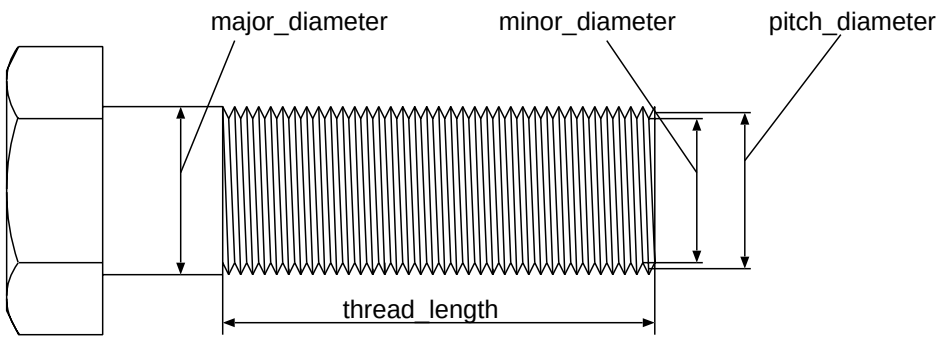

Figure 21 – Defined_thread

4.2.128 Derived_geometry

A Derived_geometry is the identification of a Constructive_geometric_element (see 4.2.94) that is derived from an existing aspect of the shape of a part for tolerancing purposes.

The data associated with a Derived_geometry are the following:

- geometry;
- is_derived_from;
- role.

4.2.128.1 geometry

The geometry specifies the Constructive_geometric_element (see 4.2.94) that is used for tolerancing.

See 4.3.402 for the application assertion.

4.2.128.2 is_derived_from

The is_derived_from specifies the Shape_aspect (see 4.2.394) from which the geometric element is derived.

See 4.3.403 for the application assertion.

4.2.128.3 role

The role specifies the function of the Constructive_geometric_element (see 4.2.94) that is used as Derived_geometry.

EXAMPLE 73 – 'symmetry plane' is an example for the role.

4.2.129 Descriptive_specification

A Descriptive_specification is a text description of characteristics to distinguish a final part from the corresponding neutral part.

The data associated with a Descriptive_specification are the following:

- description.

The description specifies the Descriptive_specification.

EXAMPLE 74 – The description may be e.g., 'arctic white' as description of a car body colour, 'chrome plated' as description of an exhaust pipe, or 'standard cloth' as description of the seat cover.

See 4.3.404 for the application assertion.

There shall be exactly one object that defines the description for a Descriptive_specification.

4.2.130 Design_constraint

A Design_constraint is a geometry based requirement that influences the design of an Item_solution (see 4.2.246).

EXAMPLE 75 – Ergonomic information like 'hip point' or 'forward driver vision' as well as 'door opening control lines', 'shipping critical dimensions', or 'stone throw zone' are examples for Design_constraint.

Each Design_constraint may be a Design_constraint_version (see 4.2.133).

The data associated with a Design_constraint are the following:

- constraint_id;
- description;
- is_valid_for;
- name.

4.2.130.1 constraint_id

The constraint_id specifies the identifier of the Design_constraint.

4.2.130.2 description

The description specifies additional information about the Design_constraint.

See 4.3.405 for the application assertion.

The description need not be specified for a particular Design_constraint.

If present, there shall be exactly one object that defines the description for a Design_constraint.

4.2.130.3 is_valid_for

The is_valid_for specifies a Product_class (see 4.2.348) that is affected by the Design_constraint.

See 4.3.406 for the application assertion.

4.2.130.4 name

The name specifies the word or group of words by which the Design_constraint is referred to.

See 4.3.405 for the application assertion.

The name need not be specified for a particular Design_constraint.

If present, there shall be exactly one object that defines the name for a Design_constraint.

4.2.131 Design_constraint_association

A Design_constraint_association is a mechanism to associate a Design_constraint (see 4.2.130) with a Product_component (see 4.2.350) or with an Item_solution (see 4.2.246).

The data associated with a Design_constraint_association are the following:

- is_based_on;
- is_constraining;
- name.

4.2.131.1 is_based_on

The is_based_on specifies the Design_constraint (see 4.2.130) that represents the constraint.

See 4.3.407 for the application assertion.

4.2.131.2 is_constraining

The is_constraining specifies the object that is affected by the Design_constraint (see 4.2.130).

See 4.3.408 and 4.3.410 for the application assertions.

There shall be exactly one object that the Design_constraint_association is_constraining.

4.2.131.3 name

The name specifies the word or group of words by which the Design_constraint_association is referred to.

See 4.3.409 for the application assertion.

The name need not be specified for a particular Design_constraint_association.

If present, there shall be exactly one object that defines the name for a Design_constraint_-association.

4.2.132 Design_constraint_relationship

A Design_constraint_relationship is a relationship between two Design_constraint (see 4.2.130) objects.

The data associated with a Design_constraint_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.132.1 description

The description specifies additional information about the Design_constraint_relationship.

See 4.3.412 for the application assertion.

The description need not be specified for a particular Design_constraint_relationship.

If present, there shall be exactly one object that defines the description for a Design_constraint_-relationship.

4.2.132.2 related

The related specifies the second of the two Design_constraint (see 4.2.130) objects related by the Design_constraint_relationship.

See 4.3.411 for the application assertion.

4.2.132.3 relating

The relating specifies the first of the two Design_constraint (see 4.2.130) objects related by the Design_constraint_relationship.

See 4.3.411 for the application assertion.

4.2.132.4 relation_type

The relation_type specifies the meaning of the relationship.Where applicable the following values shall be used:

– 'decomposition': The application object defines a relationship where the related Design_constraint (see 4.2.130) is one of the components into which the relating Design_constraint is broken down;

– 'precedence': The application object defines a relationship where the related Design_constraint has higher priority than the relating Design_constraint.

4.2.133 Design_constraint_version

A Design_constraint_version is a particular version of a Design_constraint (see 4.2.130).

A Design_constraint_version is a type of Design_constraint (see 4.2.130).

The data associated with a Design_constraint_version are the following:

– version_id.

The version_id specifies the identification of a particular version of a Design_constraint (see 4.2.130).

4.2.134 Design_discipline_item_definition

A Design_discipline_item_definition is a view of an Item_version (see 4.2.248) relevant for the requirements of one or more life cycle stages and application domains. This view collects product data for a specific task.

NOTE – The selection of data describing an Item may be different for assembly purposes, packing purposes or analysis purposes.

Each Design_discipline_item_definition may be one of the following: a Mating_definition (see 4.2.282), a Collection_definition (see 4.2.77), an Assembly_definition (see 4.2.27), or a Process_state (see 4.2.347).

The data associated with a Design_discipline_item_definition are the following:

– associated_item_version;

– id;

– is_relevant_for;

– name.

4.2.134.1 associated_item_version

The associated_item_version specifies the Item_version (see 4.2.248) for which the Design_discipline_item_definition is a view.

See 4.3.414 for the application assertion.

4.2.134.2 id

The id specifies the identifier of the Design_discipline_item_definition.

4.2.134.3 is_relevant_for

The is_relevant_for specifies the Application_context (see 4.2.20) in which the Design_discipline_item_definition has to be considered.

See 4.3.413 for the application assertion.

4.2.134.4 name

The name specifies the word or group of words used to refer to the Design_discipline_item_definition.

See 4.3.415 for the application assertion.

The name need not be specified for a particular Design_discipline_item_definition.

If present, there shall be exactly one object that defines the name for a Design_discipline_item_definition.

4.2.135 Detailed_element

A Detailed_element is a single element of a Geometric_model (see 4.2.211) or of a Styled_model (see 4.2.429) or a kinematic element.

Each Detailed_element is either a Detailed_model_element (see 4.2.137) or a Styled_element (see 4.2.427).

The data associated with a Detailed_element are the following:

- name.

The name specifies the word or group of words by which the Detailed_element is referred to.

See 4.3.416 for the application assertion.

The name need not be specified for a particular Detailed_element.

If present, there shall be exactly one object that defines the name for a Detailed_element.

4.2.136 Detailed_geometric_model_element

A Detailed_geometric_model_element is a geometric element that may be used to define a Geometric_model (see 4.2.211).

A Detailed_geometric_model_element is a type of Detailed_model_element (see 4.2.137).

Each Detailed_geometric_model_element is either a Geometric_set_3d (see 4.2.215), a Topologically_connected_set (see 4.2.468), a Point_direction (see 4.2.324), a Boolean_result (see 4.2.41), a Point_direction_sequence (see 4.2.326), a Half_space_solid (see 4.2.224), a Curve_set_2d (see

4.2.105), a B_rep (see 4.2.34), a Faceted_b_rep (see 4.2.171), a Point_sequence (see 4.2.329), a Face (see 4.2.167), a Curve_set_3d (see 4.2.106), a Shell (see 4.2.398), a Curve (see 4.2.102), a Csg_primitive (see 4.2.101), a Surface (see 4.2.434), a Swept_face_solid (see 4.2.443), a Point (see 4.2.322), or a Solid_replica (see 4.2.411).

4.2.137 Detailed_model_element

A Detailed_model_element is a single geometric element of a geometric model.

A Detailed_model_element is a type of Detailed_element (see 4.2.135).

Each Detailed_model_element is either a Kinematic_link (see 4.2.255), a Template_instance (see 4.2.453), a Detailed_geometric_model_element (see 4.2.136), a Kinematic_structure (see 4.2.259), or a Kinematic_joint (see 4.2.254).

4.2.138 Diameter_taper

A Diameter_taper is a taper that has the grade of the taper specified by the final (smaller) diameter. A Diameter_taper shall only be applied to features that are defined by a swept Circular_closed_profile (see 4.2.57). The final diameter is measured at the end of the sweep path.

NOTE – Tapers are applied after general end conditions are applied.

EXAMPLE 76 – Figure 22 illustrates a Diameter_taper.

The data associated with a Diameter_taper are the following:

– final_diameter.

The final_diameter specifies the diameter of the circle at the end of the taper.

NOTE – The diameter at the beginning of the taper is given by the referencing feature itself.

See 4.3.417 for the application assertion.

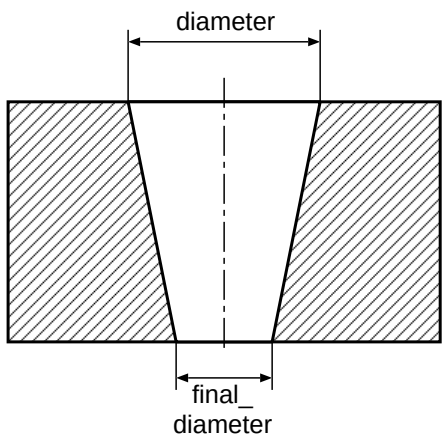

Figure 22 – Diameter_taper

4.2.139 Digital_document

A Digital_document is a piece of product data that is archived in a digital format.

A Digital_document is a type of External_document (see 4.2.162).

The data associated with a Digital_document are the following:

- application_domain;
- character_code;
- creating_interface;
- creating_system;
- file_name;
- operating_system;
- syntactical_format.

4.2.139.1 application_domain

The application_domain specifies the domain where the computer interpretable data belong to.

EXAMPLE 77 – 'numerical control', 'robotics control', 'measurement control', 'text', 'raster image', and 'vector image', 'audio' and 'video' are examples for application_domain.

4.2.139.2 character_code

The character_code specifies the character code used for the stored data.

EXAMPLE 78 – 'ASCII', 'ISO 646 IRV', 'ISO 8859-1', EBCDIC', or 'BINARY' are examples for character_code.

4.2.139.3 creating_interface

The creating_interface specifies the interface and the interface version that was used to create the data.

The creating_interface need not be specified for a particular Digital_document.

4.2.139.4 creating_system

The creating_system specifies the system and the system version that was used to create the data.

The creating_system need not be specified for a particular Digital_document.

4.2.139.5 file_name

The file_name specifies the information necessary to access the Digital_document.

NOTE – Usually this includes the complete path and file name.

The file_name need not be specified for a particular Digital_document.

4.2.139.6 operating_system

The operating_system specifies the operating system and the operating system version that was used to create the data.

The operating_system need not be specified for a particular Digital_document.

4.2.139.7 syntactical_format

The syntactical_format specifies the syntactical format used for the stored data.

NOTE – Syntactical formats may be proprietary, native formats, or defined in standardized documents.

4.2.140 Dimension

A Dimension is the graphical presentation of the dimension value, associated information, and the symbology necessary to accurately depict its area of application. This includes linear dimensions, angular dimensions, curve dimensions, diameter dimensions, ordinate dimensions, radius dimensions, and leader directed dimensions.

EXAMPLE 79 – Examples for the symbology are headers, projection curves, or dimension curves.

A Dimension is a type of Annotation_element (see 4.2.15).

The data associated with a Dimension are the following:

- composition_curve;
- id;
- primary_callout;
- secondary_callout.

4.2.140.1 composition_curve

The composition_curve specifies the annotation curves that compose the Dimension.

See 4.3.418 for the application assertion.

4.2.140.2 id

The id specifies the identifier of the Dimension.

4.2.140.3 primary_callout

The primary_callout specifies the dimension value, tolerance information, and any associated notes given in the primary unit of measure for the corresponding View (see 4.2.490), Drawing_sheet (see 4.2.152), or View_area (see 4.2.491).

See 4.3.419 for the application assertion.

4.2.140.4 secondary_callout

The secondary_callout specifies the dimension value, tolerance information, and any associated notes given in the secondary unit of measure for the corresponding View (see 4.2.490), Drawing_sheet (see 4.2.152), or View_area (see 4.2.491).

EXAMPLE 80 – The primary unit of measure used by primary_callout could be millimeters and the secondary unit of measure used by secondary_callout could be inches.

See 4.3.419 for the application assertion.

The secondary_callout need not be specified for a particular Dimension.

4.2.141 Dimension_callout

A Dimension_callout is the text and symbols in the presentation of a dimension that represent the dimension value, dimension units, tolerance information and any related notes.

The data associated with a Dimension_callout are the following:

- is_displaying.

The is_displaying specifies the Geometric_dimension (see 4.2.210) that is displayed by the Dimension_callout.

See 4.3.420 for the application assertion.

4.2.142 Dimension_curve

A Dimension_curve is used for the graphical representation of a dimension along with other symbology, if necessary, to show the extent of the dimension.

EXAMPLE 81 – Figure 23 shows the use of a Dimension_curve on a drawing.

A Dimension_curve is a type of Annotation_curve (see 4.2.14).

The data associated with a Dimension_curve are the following:

- terminator.

The terminator specifies the terminating symbol for a particular Dimension_curve.

See 4.3.421 for the application assertion.

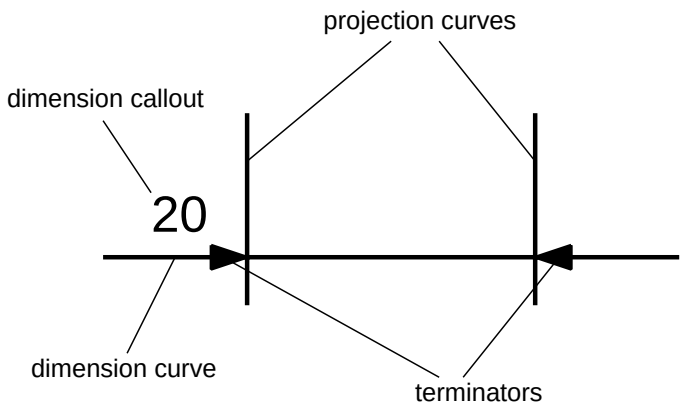

Figure 23 – Components of a dimension on a drawing

4.2.143 Dimension_sequence_pair

A Dimension_sequence_pair is the relationship between two adjacent dimensions that share a projection curve. This may be a chained or a parallel dimension pair.

The data associated with a Dimension_sequence_pair are the following:

- predecessor;
- successor.

4.2.143.1 predecessor

The predecessor specifies the draughting dimension that plays the role of a predecessor within a particular Dimension_sequence_pair (see 4.2.143).

See 4.3.422 for the application assertion.

4.2.143.2 successor

The successor specifies the draughting dimension that plays the role of a successor within a particular Dimension_sequence_pair (see 4.2.143).

See 4.3.422 for the application assertion.

4.2.144 Dimension_tolerance

A Dimension_tolerance is a mechanism to associate a Geometric_dimension (see 4.2.210) with a Limits_and_fits (see 4.2.264), a Plus_minus_tolerance (see 4.2.318), a Value_limit (see 4.2.482), or with a Value_range (see 4.2.483) or to associate a Feature_parameter (see 4.2.177) with a Limits_-and_fits or with a Plus_minus_tolerance. The Dimension_tolerance shall not be used to associate

a Feature_parameter with a Value_limit or with a Value_range. Besides the Dimension_tolerance adds information to the association that further specifies the application of the tolerance.

The data associated with a Dimension_tolerance are the following:

- envelope;
- is_defined_by;
- is_tolerancing;
- name;
- significant_digits;
- value_interpretation.

4.2.144.1 envelope

The envelope specifies whether each geometric constraint has to be fulfilled in itself or not. The envelope of the perfect shape corresponding to the maximum material shall not be larger than the specified dimension and tolerance. The envelope concept is defined in ISO 8015.

4.2.144.2 is_defined_by

The is_defined_by specifies the Limits_and_fits (see 4.2.264), the Plus_minus_tolerance (see 4.2.318), the Value_limit (see 4.2.482), or the Value_range (see 4.2.483) that is associated with the Feature_parameter (see 4.2.177) or with the Geometric_dimension (see 4.2.210).

See 4.3.425, 4.3.427, 4.3.428, and 4.3.429 for the application assertions.

There shall be exactly one object that the Dimension_tolerance is_defined_by.

4.2.144.3 is_tolerancing

The is_tolerancing specifies the Feature_parameter (see 4.2.177) or the Geometric_dimension (see 4.2.210) that is constrained by a tolerance.

See 4.3.423 and 4.3.424 for the application assertions.

There shall be exactly one object that the Dimension_tolerance is_tolerancing.

4.2.144.4 name

The name specifies the word or group of words by which the Dimension_tolerance is referred to.

See 4.3.426 for the application assertion.

The name need not be specified for a particular Dimension_tolerance.

If present, there shall be exactly one object that defines the name for a Dimension_tolerance.

4.2.144.5 significant_digits

The significant_digits specifies the number of decimal places indicating the required accuracy of the tolerance.

The significant_digits need not be specified for a particular Dimension_tolerance.

4.2.144.6 value_interpretation

The value_interpretation specifies information on how the Dimension_tolerance shall be interpreted.

NOTE – A Dimension_tolerance may be specified in the design stage of a product but it may also be documented as measured on a prototype.

EXAMPLE 82 – The value_interpretation may be e.g., 'required', 'designed', 'estimated', or 'measured'.

4.2.145 Directed_taper

A Directed_taper is a taper applied for drafting reasons that has the grade of the taper specified by an angle. The angle is measured from the specified draft_direction.

NOTE – Tapers are applied after general end conditions are applied.

The data associated with a Directed_taper are the following:

- draft_angle;
- draft_direction.

4.2.145.1 draft_angle

The draft_angle specifies the Feature_parameter (see 4.2.177) that represents the draft_angle. An angle between 0 and 90 degrees or between -90 and -180 degrees indicates that the profile grows larger along the draft direction. An angle between 0 and -90 degrees or between 90 and 180 degrees indicates that the profile grows smaller along the draft direction.

See 4.3.430 for the application assertion.

4.2.145.2 draft_direction

The draft_direction specifies the reference direction from which the taper angle is measured. The draft_direction is defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Process_feature_in_solid (see 4.2.335).

4.2.146 Document_relationship

A Document_relationship is a relationship between two External_document (see 4.2.162) objects.

The data associated with a Document_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.146.1 description

The description specifies additional information about the Document_relationship.

See 4.3.432 for the application assertion.

The description need not be specified for a particular Document_relationship.

If present, there shall be exactly one object that defines the description for a Document_relationship.

4.2.146.2 related

The related specifies the second of the two External_document (see 4.2.162) objects related by the Document_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.431 for the application assertion.

4.2.146.3 relating

The relating specifies the first of the two External_document (see 4.2.162) objects related by the Document_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.431 for the application assertion.

4.2.146.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'copy': The application object defines a relationship where the related External_document (see 4.2.162) is a copy of the relating External_document;

- 'derivation': The application object defines a relationship where the related External_document is derived from the relating External_document (e.g. a pixel image may be derived from 3D CAD model);

– 'decomposition': The application object defines a relationship where the related External_document is one of the sub documents of the relating External_document (e.g. a decomposition of a document into clauses or into several CAD model files as a digital document;

– 'sequence': The application object defines a logical sequence where the related External_document comes after the relating External_document (e.g. sequence of clauses);

– 'substitution': The application object defines a relationship where the related External_document replaces the relating External_document;

– 'version association': The application object defines where the related External_document is a version of the relating External_document. In this case the related External_document shall be an External_document_version (see 4.2.164);

– 'version sequence': The application object defines a version sequence where the relating External_document is the preceding version and the related External_document (see 4.2.162) is the following version. In this case both External_document objects shall be of type External_document_version.

4.2.147 Document_type

A Document_type is the representation of the kind of External_document (see 4.2.162) objects or of Drawing (see 4.2.149) objects.

EXAMPLE 83 – 'requirement specification', 'test report', 'CAD model', 'technical drawing', or 'legal regulation' are examples for Document_type.

The data associated with a Document_type are the following:

– id;

– used_classification_system.

4.2.147.1 id

The id specifies the identifier of the Document_type.

4.2.147.2 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.70) that contains the information about how to interpret the identifier of the Document_type.

See 4.3.433 for the application assertion.

The used_classification_system need not be specified for a particular Document_type.

4.2.148 Draughting_callout

A Draughting_callout is a combination of text, annotation curves, and symbology that conveys information about a specific element or area.

EXAMPLE 84 – Figure 24 shows typical Draughting_callout objects on a drawing.

A Draughting_callout is a type of Annotation_element (see 4.2.15).

4.2.149 Drawing

A Drawing is the presentation of product data in a human interpretable form wherein the physical and functional requirements for that product are presented by pictures or text.

The data associated with a Drawing are the following:

- drawing_id;
- drawing_revision_id;
- drawing_specification;
- drawing_type;
- language;
- title.

4.2.149.1 drawing_id

The drawing_id specifies the identifier of a particular Drawing. The drawing_id shall be unique within the scope of the referenced item.

4.2.149.2 drawing_revision_id

The drawing_revision_id specifies the identifier of the revision of the drawing.

4.2.149.3 drawing_specification

The drawing_specification specifies the identification of a standard that the drawing conforms to. This standard specifies the presentation forms used in the drawing.

There may be more than zero drawing_specification for a Drawing.

4.2.149.4 drawing_type

The drawing_type specifies the category of the Drawing (see 4.2.149) and may indicate the information content.

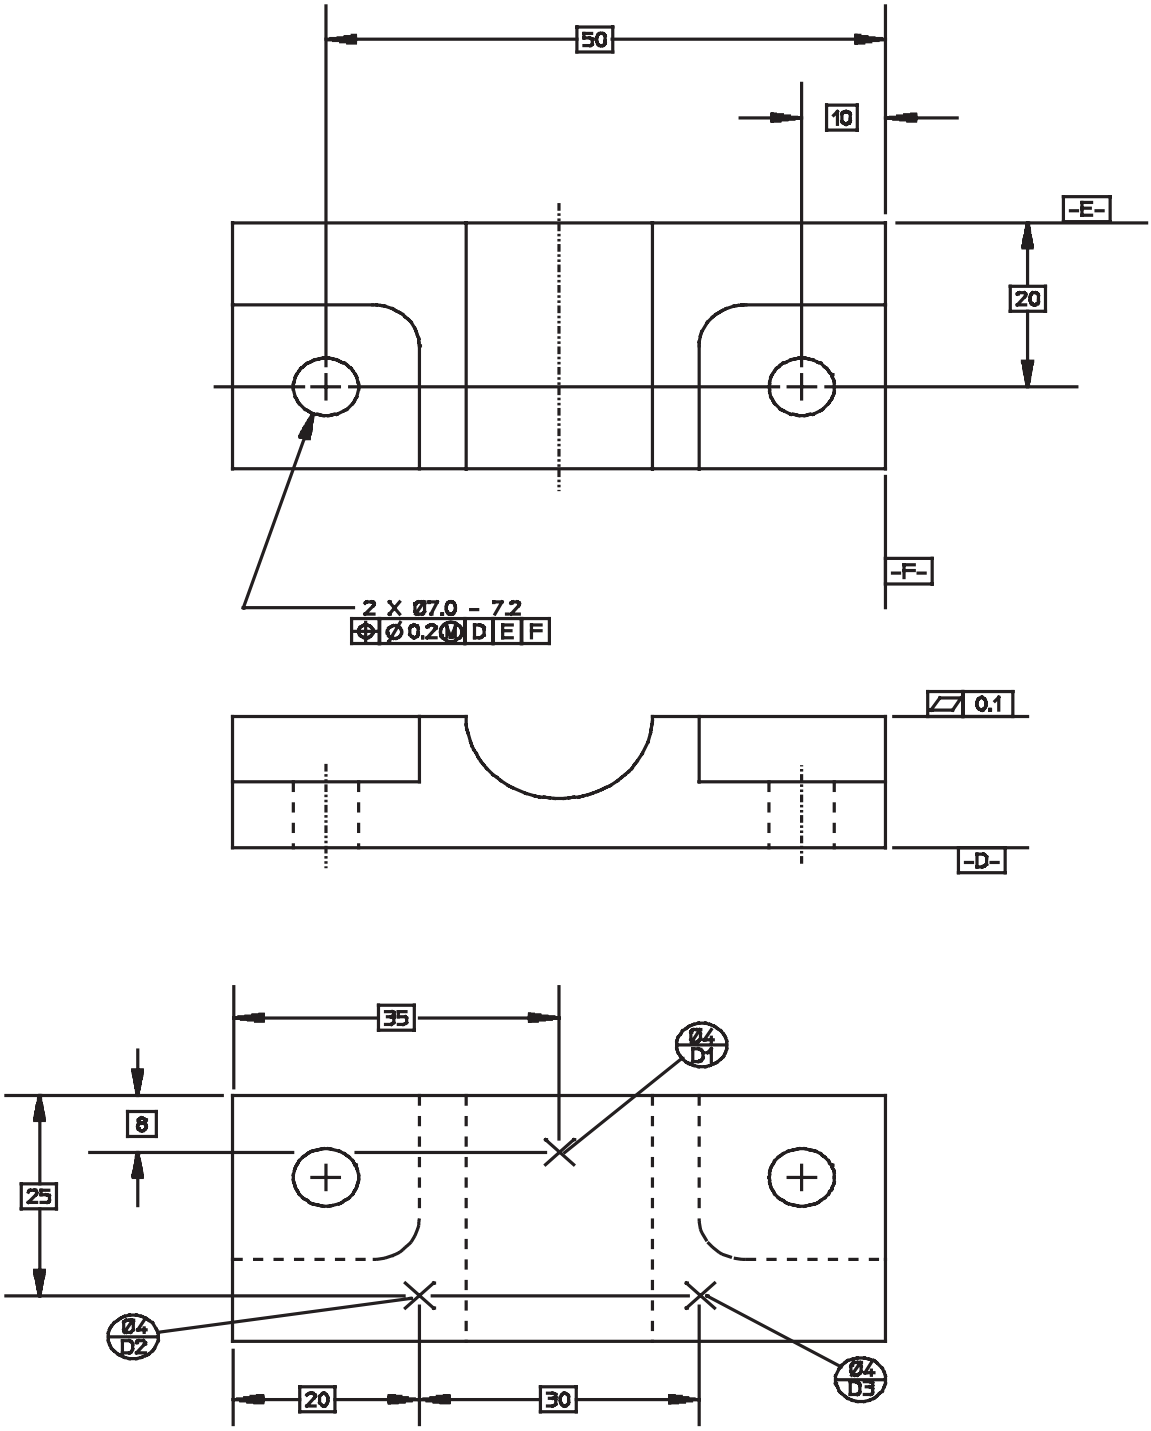

Figure 24 – Draughting callouts on a drawing

See 4.3.434 for the application assertion.

4.2.149.5 language

The language specifies the language that is used for text information on the Drawing.

There may be more than zero language for a Drawing.

4.2.149.6 title

The title specifies the description of the content or subject matter of the Drawing (see 4.2.149).

EXAMPLE 85 – 'fender' and 'assembly of engine' are examples for title.

See 4.3.435 for the application assertion.

The title need not be specified for a particular Drawing.

If present, there shall be exactly one object that defines the title for a Drawing.

4.2.150 Drawing_assignment

A Drawing_assignment is a mechanism to associate a Drawing (see 4.2.149) with the object that is presented on the Drawing.

The data associated with a Drawing_assignment are the following:

- drawing;
- is_describing.

4.2.150.1 drawing

The drawing specifies the Drawing (see 4.2.149) that is associated with the object.

See 4.3.439 for the application assertion.

4.2.150.2 is_describing

The is_describing specifies the object that is associated with the Drawing (see 4.2.149).

See 4.3.436, 4.3.437, 4.3.438, 4.3.440, 4.3.441, 4.3.442, 4.3.443, 4.3.444, 4.3.445, 4.3.446, 4.3.447, 4.3.448, 4.3.449, 4.3.450, and 4.3.451 for the application assertions.

There shall be exactly one object that the Drawing_assignment is_describing.

4.2.151 Drawing_sequence

A Drawing_sequence is a revision sequence between two Drawing (see 4.2.149) objects.

The data associated with a Drawing_sequence are the following:

- predecessor;
- successor.

4.2.151.1 predecessor

The predecessor specifies the old revision of the Drawing (see 4.2.149).

See 4.3.452 for the application assertion.

4.2.151.2 successor

The successor specifies the new revision of the Drawing (see 4.2.149).

See 4.3.452 for the application assertion.

4.2.152 Drawing_sheet

A Drawing_sheet is a logical division of a drawing into a two-dimensional area for the presentation of product data. These divisions correspond to sheet paper sizes for plotting.

The data associated with a Drawing_sheet are the following:

- associated_drawing;
- sheet_id;
- sheet_revision_id;
- sheet_space;
- size;
- title.

4.2.152.1 associated_drawing

The associated_drawing specifies the Drawing (see 4.2.149) that is valid for the Drawing_sheet.

See 4.3.454 for the application assertion.

4.2.152.2 sheet_id

The sheet_id specifies the page number for a particular Drawing_sheet.

4.2.152.3 sheet_revision_id

The sheet_revision_id specifies the identifier of the sheet revision.

4.2.152.4 sheet_space

The sheet_space specifies the Cartesian_coordinate_space_2d (see 4.2.45) that is valid for the drawing sheet.

See 4.3.453 for the application assertion.

4.2.152.5 size

The size specifies the width and the height of the Drawing_sheet.

4.2.152.6 title

The title specifies a description of the content or subject matter of the Drawing_sheet.

See 4.3.455 for the application assertion.

The title need not be specified for a particular Drawing_sheet.

If present, there shall be exactly one object that defines the title for a Drawing_sheet.

4.2.153 Edge_loop

An Edge_loop is a closed loop made up of a sequence of edges. In this sequence the start vertex of an edge coincides with the end vertex of its predecessors edge and the first vertex of the Edge_loop coincides with the last vertex.

The data associated with an Edge_loop are the following:

- edge.

The edge specifies the edges that compose the Edge_loop.

See 4.3.456 for the application assertion.

4.2.154 Edge_round

An Edge_round is a convex circular arc transition between two intersecting Face (see 4.2.167) objects without any constraints concerning changes of the radius along the Edge_round.

An Edge_round is a type of Transition_feature (see 4.2.476).

Each Edge_round may be a Constant_radius_edge_round (see 4.2.92).

4.2.155 Edge_transition

An Edge_transition is a state of geometric continuity for the intersection of two adjacent edges.

EXAMPLE 86 – Figure 25 depicts an Edge_transition.

The data associated with an Edge_transition are the following:

- edge_1;

- edge_2;
- transition;
- vertex_joint.

4.2.155.1 edge_1

The edge_1 specifies the first of the two adjacent Oriented_edge_curve (see 4.2.297) objects associated with the Edge_transition.

See 4.3.457 for the application assertion.

4.2.155.2 edge_2

The edge_2 specifies the second of the two Oriented_edge_curve (see 4.2.297) objects associated with the Edge_transition.

See 4.3.457 for the application assertion.

4.2.155.3 transition

The transition specifies the state of geometric continuity from the end vertex of the first edge to the start vertex of the second edge by a text description.

The following values shall be used:

- 'g0': G_0 continuity between two curves is a condition stating that the connected segments have common end/start points [9];
- 'g1': G_1 continuity between two curves is a condition set on the direction of the two tangents in the connection point between the curves; for true G_1 continuity no angular difference is allowed [9];
- 'g2': G_2 continuity between two curves is a condition set on the radius of curvature of the two curves in the connection point; for true G_2 continuity the radii in the connection point must be the same and the circles of curvature lie in the same plane [9].

4.2.155.4 vertex_joint

The vertex_joint specifies the vertex at the intersection of the two edges the continuity is described for.

See 4.3.458 for the application assertion.

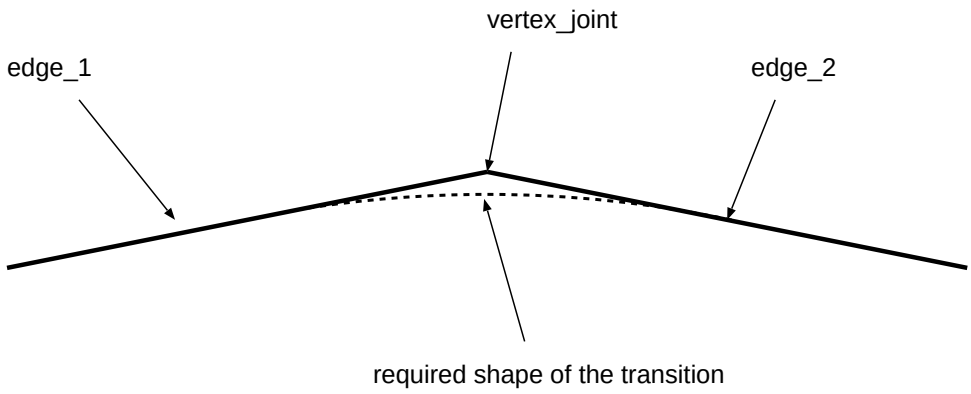

Figure 25 – Edge transition

4.2.156 Effectivity

An Effectivity is the identification of the valid use of an aspect of product data tracked by date. The Effectivity shall be specified either by one or both of the attributes 'start_definition' or 'end_definition' or by another 'master' Effectivity using an Effectivity_relationship (see 4.2.157).

The data associated with an Effectivity are the following:

- concerned_organization;
- description;
- effectivity_context;
- end_definition;
- is_applied_to;
- role;
- start_definition.

4.2.156.1 concerned_organization

The concerned_organization specifies the Organization (see 4.2.294) for which the Effectivity is valid.

EXAMPLE 87 – The Effectivity of the same item may be different in the various production sites of a car manufacturer.

See 4.3.481 for the application assertion.

The concerned_organization need not be specified for a particular Effectivity.

4.2.156.2 description

The description specifies additional information about the Effectivity.

See 4.3.480 for the application assertion.

The description need not be specified for a particular Effectivity.

If present, there shall be exactly one object that defines the description for an Effectivity.

4.2.156.3 effectivity_context

The effectivity_context specifies the life cycle stage for which the Effectivity is valid.

EXAMPLE 88 – The effectivity_context may be e.g., 'prototype building' in order to express that the Effectivity is valid for this life cycle stage of the concerned object.

The effectivity_context need not be specified for a particular Effectivity.

4.2.156.4 end_definition

The end_definition specifies the date or event or the period of time after the start_definition or after an event when the identified object is not effective any more.

EXAMPLE 89 – '15 years after end of production' is an example for an end_definition that can be expressed using an Event_reference (see 4.2.160) with offset.

See 4.3.465, 4.3.469, and 4.3.495 for the application assertions.

The end_definition need not be specified for a particular Effectivity.

If present, there shall be exactly one object that defines the end_definition for an Effectivity.

4.2.156.5 is_applied_to

The is_applied_to specifies the aspect of product data the Effectivity is associated with.

See 4.3.459, 4.3.460, 4.3.461, 4.3.462, 4.3.463, 4.3.464, 4.3.466, 4.3.467, 4.3.468, 4.3.470, 4.3.471, 4.3.472, 4.3.473, 4.3.474, 4.3.475, 4.3.476, 4.3.477, 4.3.478, 4.3.479, 4.3.482, 4.3.483, 4.3.484, 4.3.485, 4.3.486, 4.3.487, 4.3.488, 4.3.489, 4.3.490, 4.3.491, 4.3.492, 4.3.493, 4.3.494, and 4.3.496 for the application assertions.

There shall be at least one object that the Effectivity is_applied_to.

4.2.156.6 role

The role specifies the meaning of the Effectivity. Where applicable the following values shall be used:

- 'actual': The dates associated with the Effectivity are actual dates in the past;

- 'planned': The dates associated with the Effectivity are planned dates in the future concerning the point in time when the Effectivity is assigned;

- 'required': The dates associated with the Effectivity are due dates that have to be kept'.

4.2.156.7 start_definition

The start_definition specifies the date or the event when the identified object becomes effective.

See 4.3.465 and 4.3.469 for the application assertions.

The start_definition need not be specified for a particular Effectivity.

If present, there shall be exactly one object that defines the start_definition for an Effectivity.

4.2.157 Effectivity_relationship

An Effectivity_relationship is a relationship between two Effectivity (see 4.2.156) objects.

NOTE – Sometimes the effectivity is not dependent on particular dates but on the effectivity of other items. In this case the dates are not instantiated and there is an Effectivity_relationship to the reference Effectivity.

The data associated with an Effectivity_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.157.1 description

The description specifies additional information about the Effectivity_relationship.

See 4.3.498 for the application assertion.

The description need not be specified for a particular Effectivity_relationship.

If present, there shall be exactly one object that defines the description for an Effectivity_-relationship.

4.2.157.2 related

The related specifies the the second of the two Effectivity (see 4.2.156) objects related by the Effectivity_relationship.

NOTE – The semantic of this attribute is defined by the attribute 'relation_type'.

See 4.3.497 for the application assertion.

4.2.157.3 relating

The relating specifies the first of the two Effectivity (see 4.2.156) related by the Effectivity_-relationship.

NOTE – The semantic of this attribute is defined by the attribute 'relation_type'.

See 4.3.497 for the application assertion.

4.2.157.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'constraint': The time period between the start and end definition of the related Effectivity (see 4.2.156) shall be within the time period of the relating Effectivity;

- 'inheritance': The related Effectivity shall not have a 'start_definition' and 'end_definition' specified but inherits the effectivity dates from the relating Effectivity.

4.2.158 Element_delivery

An Element_delivery is the specification of the delivery of an Activity_element (see 4.2.3).

The data associated with an Element_delivery are the following:

- deliverable_element;

- destination;

- quantity.

4.2.158.1 deliverable_element

The deliverable_element specifies the Activity_element (see 4.2.3) that is subject to the delivery. This Activity_element shall be an Item_version (see 4.2.248), a Product_specification (see 4.2.354), or a Physical_instance (see 4.2.310).

See 4.3.499 for the application assertion.

4.2.158.2 destination

The destination specifies the Organization (see 4.2.294) the Activity_element (see 4.2.3) is to be delivered to.

See 4.3.500 for the application assertion.

4.2.158.3 quantity

The quantity specifies the number of Activity_element (see 4.2.3) objects to be delivered.

See 4.3.501 for the application assertion.

4.2.159 Ellipse

An Ellipse is a conic section defined by the lengths of the semi-major and semi-minor diameters and by the position (centre or mid point of the line joining the foci) and orientation of the curve.

An Ellipse is a type of Curve (see 4.2.102).

4.2.160 Event_reference

An Event_reference is the definition of a point in time established with respect to an event.

The data associated with an Event_reference are the following:

- event_context;
- event_type;
- offset.

4.2.160.1 event_context

The event_context specifies the piece of product data the Event_reference refers to.

EXAMPLE 90 – In the case of an Event_reference with event_type 'start of production' the event_-context would refer to the Item_version (see 4.2.248) that is subject to production.

See 4.3.502, 4.3.503, 4.3.504, 4.3.505, 4.3.506, 4.3.507, 4.3.508, 4.3.509, 4.3.510, 4.3.511, 4.3.512, 4.3.513, 4.3.514, 4.3.515, 4.3.516, 4.3.517, 4.3.518, 4.3.519, 4.3.520, 4.3.521, 4.3.522, 4.3.523, 4.3.524, 4.3.525, 4.3.526, 4.3.527, 4.3.528, 4.3.529, 4.3.530, 4.3.531, 4.3.532, 4.3.533, 4.3.534, 4.3.535, 4.3.536, 4.3.537, 4.3.538, 4.3.540, and 4.3.541 for the application assertions.

The event_context need not be specified for a particular Event_reference.

If present, there shall be exactly one object that defines the event_context for an Event_reference.

4.2.160.2 event_type

The event_type specifies the kind of event that serves as reference.

EXAMPLE 91 – 'start of production' or 'end of production' are examples for the event_type.

4.2.160.3 offset

The offset specifies the amount of time before or after the defined event that shall be used to calculate the actual Event_reference.

See 4.3.539 for the application assertion.

The offset need not be specified for a particular Event_reference.

4.2.161 Exclusive_process_operation

An Exclusive_process_operation is a mechanism to identify two or more Process_operation (see 4.2.336) objects that shall not have any overlap in time of execution.

The data associated with an Exclusive_process_operation are the following:

- element.

The element specifies the Process_operation (see 4.2.336) objects that shall not be executed at the same time.

See 4.3.542 for the application assertion.

4.2.162 External_document

An External_document is an externally defined reference that describes one or more objects.

Each External_document may be an External_document_version (see 4.2.164).

Each External_document may be one of the following: an Archived_document (see 4.2.24), a Digital_document (see 4.2.139), or a Physical_model (see 4.2.312).

The data associated with an External_document are the following:

- description;
- document_id;
- document_type;
- language;
- name.

4.2.162.1 description

The description specifies additional information about the External_document.

See 4.3.544 for the application assertion.

The description need not be specified for a particular External_document.

If present, there shall be exactly one object that defines the description for an External_-document.

4.2.162.2 document_id

The document_id specifies the identifier of the External_document.

4.2.162.3 document_type

The document_type specifies the kind of External_document.

See 4.3.543 for the application assertion.

The document_type need not be specified for a particular External_document.

4.2.162.4 language

The language specifies the language as defined in ISO 639–2 that is used for text information in the External_document.

There may be more than zero language for an External_document.

4.2.162.5 name

The name specifies the word or group of words by which the External_document is referred to.

See 4.3.544 for the application assertion.

The name need not be specified for a particular External_document.

If present, there shall be exactly one object that defines the name for an External_document.

4.2.163 External_document_assignment

An External_document_assignment is the assignment of an External_document (see 4.2.162) to an object that is described in this document.

The data associated with an External_document_assignment are the following:

- assigned_document;
- is_assigned_to;
- role.

4.2.163.1 assigned_document

The assigned_document specifies the External_document (see 4.2.162) that describes the object that is referenced by the External_document_assignment.

See 4.3.553 for the application assertion.

4.2.163.2 is_assigned_to

The is_assigned_to specifies the object that is described in the External_document (see 4.2.162).

See 4.3.545, 4.3.546, 4.3.547, 4.3.548, 4.3.549, 4.3.550, 4.3.551, 4.3.552, 4.3.554, 4.3.555, 4.3.556, 4.3.557, 4.3.558, 4.3.559, 4.3.560, 4.3.561, 4.3.562, 4.3.563, 4.3.564, 4.3.565, 4.3.566, 4.3.567, 4.3.568, 4.3.569, 4.3.570, 4.3.571, 4.3.572, 4.3.573, 4.3.574, 4.3.575, 4.3.576, and 4.3.577 for the application assertions.

There shall be exactly one object that the External_document_assignment is_assigned_to.

4.2.163.3 role

The role specifies the meaning of the External_document_assignment. Where applicable the following values shall be used:

- 'obligatory': The assigned product data shall conform to the content of the assigned External_document (see 4.2.162);
- 'informative': The assigned External_document may or may not be considered.

4.2.164 External_document_version

An External_document_version is a particular version of an External_document (see 4.2.162).

An External_document_version is a type of External_document (see 4.2.162).

The data associated with an External_document_version are the following:

- version_id.

The version_id specifies the identification of a particular version of an External_document (see 4.2.162).

4.2.165 External_library_reference

An External_library_reference is a mechanism to refer to an entry in an external library due to ISO 13584.

The data associated with an External_library_reference are the following:

- external_id.

The external_id specifies the unique identifier of the referenced entry in the external library. For an ISO 13584 compliant library this identification is a basic semantic unit according to ISO 13584–42.

4.2.166 External_model

An External_model is the identification of a model that is described in a Digital_document (see 4.2.139) and of the Cartesian_coordinate_space (see 4.2.44) that is needed to further process the externally described information.

The data associated with an External_model are the following:

- description;
- is_defined_as;
- is_defined_in;
- model_id;
- role.

4.2.166.1 description

The description specifies additional information about the External_model.

See 4.3.580 for the application assertion.

The description need not be specified for a particular External_model.

If present, there shall be exactly one object that defines the description for an External_model.

4.2.166.2 is_defined_as

The is_defined_as specifies the Digital_document (see 4.2.139) that contains the externally defined geometry information.

See 4.3.579 for the application assertion.

4.2.166.3 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) that defines the context for the externally described geometry.

See 4.3.578 for the application assertion.

4.2.166.4 model_id

The model_id specifies the identifier of the External_model.

4.2.166.5 role

The role specifies the function performed by the External_model. Where applicable the following values shall be used:

- 'design shape': The geometry in the External_model represents the shape of an item as designed;

- 'idealized shape': The geometry in the External_model represents a simplified shape for e.g., analysis purposes.

4.2.167 Face

A Face is a topological object corresponding to a piece of a surface bounded by loops. A Face may have holes, each hole bounded by a loop. Associated with a Face is always a geometric surface. A Face has a normal N, and the tangent to a loop is T. For a loop bounding a Face, the cross product N $\times$ T points towards the interior of the Face.

A Face is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Face are the following:

- bound;
- face_geometry.

4.2.167.1 bound

The bound specifies the loop objects representing the boundaries of the Face.

See 4.3.581 for the application assertion.

4.2.167.2 face_geometry

The face_geometry specifies the basis geometry of the Face that is represented by a geometrical surface.

See 4.3.582 for the application assertion.

4.2.168 Face_bound

A Face_bound is a loop object defining the boundary of a Face (see 4.2.167).

The data associated with a Face_bound are the following:

- loop;
- outer.

4.2.168.1 loop

The loop specifies an Edge_loop (see 4.2.153) or a Vertex_loop (see 4.2.488) representing a boundary of a Face (see 4.2.167).

See 4.3.583 and 4.3.584 for the application assertions.

There shall be exactly one object that defines the loop for a Face_bound.

4.2.168.2 outer

The outer specifies wheter the loop defines the outer boundary of the Face (see 4.2.167) or not.

4.2.169 Face_termination

A Face_termination is a condition specifying that a Joggle_feature (see 4.2.250) extends from the rim of a panel to the next face the Joggle_feature intersects with.

A Face_termination is a type of Joggle_termination (see 4.2.251).

4.2.170 Face_transition

A Face_transition is the minimum state of geometric continuity between one Face (see 4.2.167) and its neighbour Face along one common edge.

The data associated with a Face_transition are the following:

- edge_joint;
- face_1;
- face_2;
- transition.

4.2.170.1 edge_joint

The edge_joint specifies the edge at the intersection of the two faces for the that Face_transition is describing the continuity.

NOTE – There may be cases where the two faces have more than one edge in common. In such a case the edge_joint is needed to identify for which of the edges the Face_transition is defined.

See 4.3.586 for the application assertion.

4.2.170.2 face_1

The face_1 specifies the first of the two neighbouring Face (see 4.2.167) objects.

See 4.3.585 for the application assertion.

4.2.170.3 face_2

The face_2 specifies the second of the two neighbouring Face (see 4.2.167) objects.

See 4.3.585 for the application assertion.

4.2.170.4 transition

The transition specifies the minimum state of geometric continuity from the first face to the second face along the intersecting edge by either a textual description or the definition of the required shape.

The following values shall be used:

- 'g0': G_0 continuity between two surfaces is a condition stating that the connected patches have common boundary curves [9];
- 'g1': G_1 continuity between two surfaces is a condition set on the two surface normals (in the tangency planes) along the boundary between the surfaces; for true G_1 continuity no angular difference is allowed [9];

– 'g2': G_2 continuity between two curves is a condition set on the radii of curvature of the surfaces along the boundary between the surfaces; for true G_2 continuity the radii along the boundary must be equal [9].

4.2.171 Faceted_b_rep

A Faceted_b_rep is defined by exactly one outer Faceted_closed_shell (see 4.2.173) and zero or more inner Faceted_closed_shell objects.

A Faceted_b_rep is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Faceted_b_rep are the following:

– outer;

– void.

4.2.171.1 outer

The outer specifies a Faceted_closed_shell (see 4.2.173) that defines the outer boundary of the Faceted_b_rep.

See 4.3.587 for the application assertion.

4.2.171.2 void

The void specifies a set of Faceted_closed_shell (see 4.2.173) objects that define internal cavities of a Faceted_b_rep.

NOTE – These shells have a normal pointing into the empty space inside.

See 4.3.587 for the application assertion.

4.2.172 Faceted_b_rep_model

A Faceted_b_rep_model is a collection of Faceted_b_rep (see 4.2.171) objects.

A Faceted_b_rep_model is a type of Geometric_model (see 4.2.211).

The data associated with a Faceted_b_rep_model are the following:

– element.

The element specifies a set of Faceted_b_rep (see 4.2.171) objects that form the Faceted_b_rep_model.

See 4.3.588 for the application assertion.

4.2.173 Faceted_closed_shell

A Faceted_closed_shell is a collection of at least four Faceted_face (see 4.2.174) that bounds a region in the three-dimensional space. The topological normal of the shell is defined as being

directed from the finite to the infinite region. A void is represented by an interior shell that builds a "hole" inside an outer shell. For such an interior shell the topological normal will point into the solid material. A Faceted_closed_shell shall not self-intersect.

The data associated with a Faceted_closed_shell are the following:

- shell_boundary.

The shell_boundary specifies the planar faces that represent the boundary of a closed shell.

See 4.3.589 for the application assertion.

4.2.174 Faceted_face

A Faceted_face is a topological object corresponding to a piece of a planar surface bounded by Poly_loop (see 4.2.330) objects. A Faceted_face may have holes, whereby each hole is bounded by a Poly_loop.

The data associated with a Faceted_face are the following:

- bound;
- face_geometry.

4.2.174.1 bound

The bound specifies the Poly_loop (see 4.2.330) objects representing the boundaries of the Faceted_face.

See 4.3.591 for the application assertion.

4.2.174.2 face_geometry

The face_geometry specifies the geometric representation of a planar surface that is represented by a Plane (see 4.2.317).

See 4.3.590 for the application assertion.

4.2.175 Feature_definition

A Feature_definition is a set of parameters and type information representing a feature that is either defined as a component of a part (Included_feature (see 4.2.232)) or independently in its own coordinate space for multiple use (Placed_feature (see 4.2.313)).

Each Feature_definition is either a Process_feature_in_solid (see 4.2.335), a Process_feature_in_panel (see 4.2.334), or a Replicate_feature (see 4.2.380).

The data associated with a Feature_definition are the following:

- is_defined_in;
- location_and_orientation.

4.2.175.1 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space_3d (see 4.2.46) the feature is defined in. In the case where the Feature_definition is used for defining an Included_feature (see 4.2.232) this Cartesian_coordinate_space_3d is identical with the coordinate space the corresponding part is defined in. In the case where the Feature_definition is used for defining a Placed_feature (see 4.2.313) this Cartesian_coordinate_space_3d is the feature's own local coordinate space.

See 4.3.593 for the application assertion.

4.2.175.2 location_and_orientation

The location_and_orientation specifies the Axis_placement (see 4.2.33) that corresponds to the location and orientation of the feature. The location_and_orientation shall only be used if the Feature_definition is used to define a feature that is applied as an Included_feature (see 4.2.232). In this case the Axis_placement is defined in the part's coordinate space.

NOTE – This kind of information is e.g. needed if the Feature_definition is used in a Replicate_feature (see 4.2.380).

See 4.3.592 for the application assertion.

The location_and_orientation need not be specified for a particular Feature_definition.

4.2.176 Feature_occurrence

A Feature_occurrence is the identification of a feature that is applied on a part.

NOTE – If a Feature_occurrence has shape information attached by a Shape_description_association (see 4.2.397) the representing model is defined in the same coordinate space as the Item_shape (see 4.2.245) that is referenced as 'composition'.

A Feature_occurrence is a type of Shape_aspect (see 4.2.394).

Each Feature_occurrence is either an Included_feature (see 4.2.232) or a Placed_feature (see 4.2.313).

The data associated with a Feature_occurrence are the following:

- feature_function.

The feature_function specifies the rationale of the application of a feature.

EXAMPLE 92 – The feature_function performed by a particular slot may be e.g., 'guide channel'.

See 4.3.594 for the application assertion.

The feature_function need not be specified for a particular Feature_occurrence.

If present, there shall be exactly one object that defines the feature_function for a Feature_occurrence.

4.2.177 Feature_parameter

A Feature_parameter is the representation of a characteristic of a Feature_definition (see 4.2.175).

The data associated with a Feature_parameter are the following:

- parameter_name;
- specified_value.

4.2.177.1 parameter_name

The parameter_name specifies the character, abbreviation, or word by which the Feature_-parameter is referred to.

EXAMPLE 93 – 'a', 'b1', and 'r' are typical examples for the parameter_name.

The parameter_name need not be specified for a particular Feature_parameter.

4.2.177.2 specified_value

The specified_value specifies the Value_with_unit (see 4.2.485) that has the actual value of the represented characteristic.

See 4.3.595 for the application assertion.

4.2.178 Feature_placement

A Feature_placement is the information about a geometric Transformation (see 4.2.472) and about a Geometric_model (see 4.2.211) that has the reference coordinate space used to define the placement of a Placed_feature (see 4.2.313).

The data associated with a Feature_placement are the following:

- placement_reference;
- transformation.

4.2.178.1 placement_reference

The placement_reference specifies the Geometric_model (see 4.2.211) that has the information about the reference coordinate space.

NOTE – A Placed_feature (see 4.2.313) may be placed relative to an Item (see 4.2.236) that is represented by a Geometric_model or it may be placed relative to another Placed_feature.

See 4.3.596 and 4.3.597 for the application assertions.

There shall be exactly one object that defines the placement_reference for a Feature_placement.

4.2.178.2 transformation

The transformation specifies the geometric Transformation (see 4.2.472) that is used to place a Placed_feature (see 4.2.313) in a reference coordinate space.

See 4.3.598 for the application assertion.

4.2.179 Featured_shape

A Featured_shape is the shape of an Item (see 4.2.236) that includes features. There shall be at least one Feature_occurrence (see 4.2.176) that is associated with the Featured_shape.

NOTE – The Featured_shape may be used to create a sequence of Item_shape (see 4.2.245) objects where each single Item_shape defines the shape of the Item at a different stage of manufacturing.

EXAMPLE 94 – A sequence of Item_shape respectively Featured_shape objects may consist of the following: Block without feature – Block with pocket – Block with pocket and hole.

A Featured_shape is a type of Item_shape (see 4.2.245).

The data associated with a Featured_shape are the following:

- base_shape.

The base_shape specifies the Item_shape (see 4.2.245) that defines the shape of the Item (see 4.2.236) before the application of the Feature_occurrence (see 4.2.176) objects that are associated with the Featured_shape.

See 4.3.599 for the application assertion.

4.2.180 Fill_area

A Fill_area is a bounded area containing colouring, hatching, or tiling that indicate its extent and content. A Fill_area communicates some aspect of a physical part characteristic or distinguishes it from its surroundings.

EXAMPLE 95 – Figure 26 depicts some fill area styles.

A Fill_area is a type of Annotation_element (see 4.2.15).

Each Fill_area may be an Associated_fill_area (see 4.2.30).

The data associated with a Fill_area are the following:

- boundary;
- reference_point.

4.2.180.1 boundary

The boundary specifies the curve bounding a particular fill area. The curve shall be closed and shall not self-intersect and it shall represent a planar 2D or 3D curve of the geometric model.

See 4.3.600 for the application assertion.

4.2.180.2 reference_point

The reference_point specifies a point within the fill area used in the placement and initiation of the fill area appearance. The reference point is a point through that a line of a hatching pattern shall pass or at which the origin of a tile shall be located. The reference point also establishes

the point at which the first visible segment of a line font used as the curve appearance for a hatching pattern starts.

The reference_point need not be specified for a particular Fill_area.

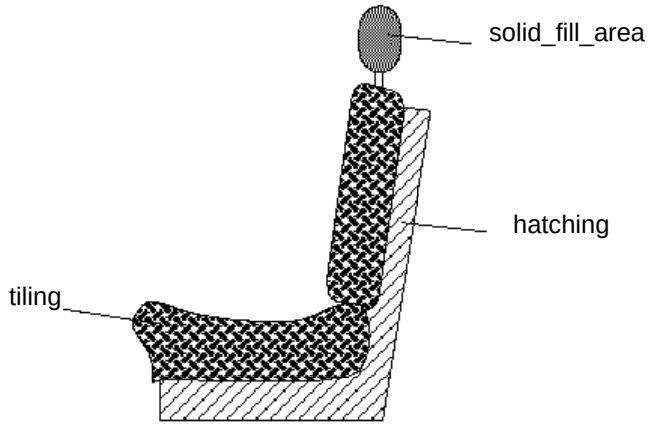

Figure 26 – Fill area styles

4.2.181 Fillet

A Fillet is a concave circular arc transition between two intersecting Face (see 4.2.167) objects without any constraints concerning changes of the radius along the Fillet.

A Fillet is a type of Transition_feature (see 4.2.476).

Each Fillet may be a Constant_radius_fillet (see 4.2.93).

4.2.182 Final_item_solution

A Final_item_solution is the specification of a set of Item_instance (see 4.2.241) objects that fulfill the same functional requirements as the neutral base element and have additional sensual characteristics.

EXAMPLE 96 – In the case of a car body the neutral parts are parts without paint; the final parts are the parts with paint. In the case of a seat the neutral part is the seat with unspecified cover material; the final part may be the seat covered with red leather.

A Final_item_solution is a type of Item_solution (see 4.2.246).

The data associated with a Final_item_solution are the following:

- final_item_status;
- final_specification.

4.2.182.1 final_item_status

The final_item_status specifies the level of completion between the neutral part and the final part.

EXAMPLE 97 – 'final for shipping overseas', 'final for transport by truck', or 'final for sale' are examples for the final_item_status.

4.2.182.2 final_specification

The final_specification specifies the means of finalization that is applied to the neutral part and which may either be a Descriptive_specification (see 4.2.129) or a Design_discipline_item_definition (see 4.2.134).

EXAMPLE 98 – The final_specification may be e.g., the Design_discipline_item_definition of a certain kind of paint.

NOTE – The Design_discipline_item_definition that is referenced here is not a view of the item that results from the finalization. The resulting, e.g. coloured, items may be identified by the Item_instance (see 4.2.241) objects that are associated with the Final_item_solution by the Solution_instance_association (see 4.2.413).

See 4.3.601 and 4.3.602 for the application assertions.

There shall be at least one object that defines the final_specification for a Final_item_solution.

4.2.183 Flat_bottom

A Flat_bottom is a hole bottom that is flat.

A Flat_bottom is a type of Hole_bottom_condition (see 4.2.228).

4.2.184 Flat_slot_end_type

A Flat_slot_end_type is an end condition of a slot that is a planar face normal to the sweep path at its start or end point respectively. The intersection of the slot wall surfaces and the end planar shape may but need not be blended by a radius.

EXAMPLE 99 – Figure 27 depicts a Flat_slot_end_type.

A Flat_slot_end_type is a type of Slot_end_type (see 4.2.406).

The data associated with a Flat_slot_end_type are the following:

- first_radius;
- second_radius.

4.2.184.1 first_radius

The first_radius specifies the constant amount of curvature of the first of two corners of the Flat_slot_end_type. The circle that defines the first radius is orientated normal to the first corner at

each point of the corner. The first corner of a Flat_slot_end_type is located where the slot wall intersects the slot end at a positive value on the x-axis of the defining Open_profile (see 4.2.292). The sum of the values of the two radii shall not exceed the smallest width of the Slot_feature (see 4.2.407).

NOTE – For this definition the profile and its x-axis is considered as 'moving' along the sweep path from one end of the slot to the other.

See 4.3.603 for the application assertion.

4.2.184.2 second_radius

The second_radius specifies the constant amount of curvature of the second of two corners of the Flat_slot_end_type. The circle that defines the first radius is orientated normal to the first corner at each point of the corner. The second corner of a Flat_slot_end_type is located where the slot wall intersects the slot end at a negative value on the x-axis of the defining Open_profile (see 4.2.292). The sum of the values of the two radii shall not exceed the smallest width of the Slot_feature (see 4.2.407).

NOTE – For this definition the profile and its x-axis is considered as 'moving' along the sweep path from one end of the slot to the other.

See 4.3.603 for the application assertion.

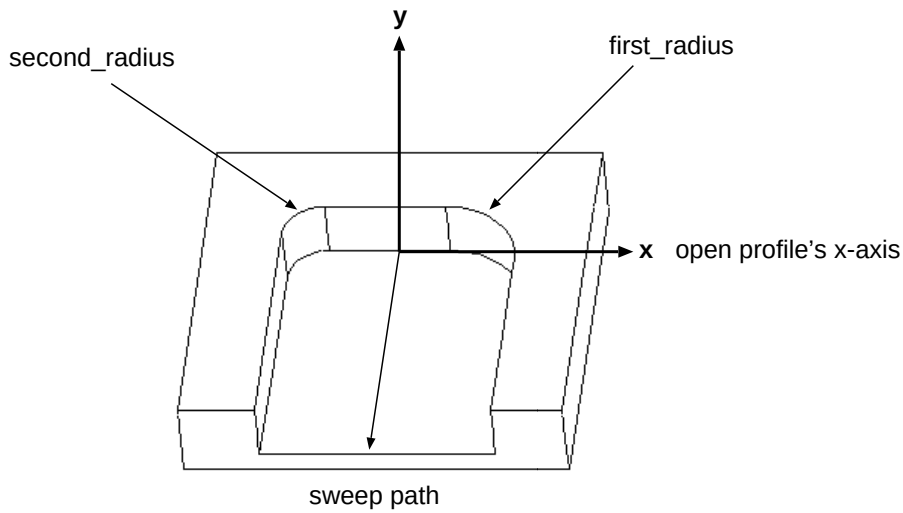

Figure 27 – Flat_slot_end_type

4.2.185 Flat_with_chamfer_bottom

A Flat_with_chamfer_bottom is a hole bottom that is flat and has a chamfer along the floor edge.

A Flat_with_chamfer_bottom is a type of Hole_bottom_condition (see 4.2.228).

The data associated with a Flat_with_chamfer_bottom are the following:

– chamfer.

The chamfer specifies the Chamfer_definition (see 4.2.52) that defines the chamfer of the hole bottom.

See 4.3.604 for the application assertion.

4.2.186 Flat_with_radius_bottom

A Flat_with_radius_bottom is a hole bottom that is flat and has a corner radius that is smaller than the radius of the concerned Round_hole (see 4.2.387).

A Flat_with_radius_bottom is a type of Hole_bottom_condition (see 4.2.228).

The data associated with a Flat_with_radius_bottom are the following:

– radius.

The radius specifies the corner radius between the side and the floor of the Round_hole (see 4.2.387).

See 4.3.605 for the application assertion.

4.2.187 Flatness_tolerance

A Flatness_tolerance is the limitation of the amount of deviation the elements of a surface may have from lying in one plane. It defines a tolerance zone that is two parallel planes within which the surface must lie. The Flatness_tolerance applies to the complete surface or to each segment of a defined size if the segment attribute is specified.

A Flatness_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Flatness_tolerance are the following:

– segment_size.

The segment_size specifies the length (or the edge length) of a segment if the geometric tolerance is not applied to the total length/area of an axis/surface but on a unit base (e.g. to each segment with a length of 20 mm).

The segment_size need not be specified for a particular Flatness_tolerance.

4.2.188 Form_feature_in_panel

A Form_feature_in_panel is the definition of a local modification in the shape of a panel that consists of a base boundary on the panel surface and of a target face that is a result of stamping the area that is enclosed by the base boundary. The Form_feature_in_panel is specified either by two Closed_profile_usage (see 4.2.72) objects or by a Closed_profile_usage and an Angle_specification (see 4.2.9). The use of two Angle_specification objects is not valid. In the case of a Form_feature_in_panel that has its base boundary defined by a Closed_profile (see 4.2.71) the placement of the feature shall be in a way that the base profile lies on the surface of the original panel.

The wall of the feature is a ruled surface for which the following rule applies: If P_b is a point on the base, P_t the corresponding point on the target, T_b the tangent to the base profile in P_b, and V the surface normal in P_b or the punch direction respectively, then the scalar product $(P_t - P_b) \cdot (V \times (T_b \times V))$ shall evaluate to zero.

A Form_feature_in_panel is a type of Process_feature_in_panel (see 4.2.334).

The data associated with a Form_feature_in_panel are the following:

- base_boundary_defined_by;
- base_fillet_radius;
- feature_type;
- target_boundary_defined_by;
- target_face;
- target_fillet_radius.

4.2.188.1 base_boundary_defined_by

The base_boundary_defined_by specifies either a Closed_profile_usage (see 4.2.72) that is a Closed_profile (see 4.2.71) on the panel surface or an Angle_specification (see 4.2.9) that defines the base boundary by applying an angle to the target boundary.

See 4.3.606 and 4.3.607 for the application assertions.

There shall be exactly one object that defines the base_boundary_defined_by for a Form_feature_in_panel.

4.2.188.2 base_fillet_radius

The base_fillet_radius specifies the blend of the edge where the Form_feature_in_panel meets the panel surface. The sum of the values of the base fillet radius and target fillet radius shall not exceed the minimum distance between the profile defining the base of the feature and the profile defining the target of the feature.

See 4.3.608 for the application assertion.

4.2.188.3 feature_type

The feature_type specifies the kind of Form_feature_in_panel that results from the application of the specified parameters. The feature_type shall be either 'pocket' or 'boss' or 'stairstep'.

NOTE – Usually a pocket in panel and a boss in panel don't differ in their shape but only in the function they perform.

4.2.188.4 target_boundary_defined_by

The target_boundary_defined_by specifies either a Closed_profile_usage (see 4.2.72) that corresponds to the boundary of the target face or an Angle_specification (see 4.2.9) that defines the target boundary by applying an angle to the base boundary.

See 4.3.606 and 4.3.607 for the application assertions.

There shall be exactly one object that defines the target_boundary_defined_by for a Form_feature_in_panel.

4.2.188.5 target_face

The target_face specifies the Surface (see 4.2.434) or the Shell (see 4.2.398) that defines that end of the Form_feature_in_panel that results from its application. The geometric elements representing the target shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the Form_feature_in_panel. In the case of a Form_feature_in_panel defined by a base profile and an Angle_specification (see 4.2.9) the target_face shall also be specified.

See 4.3.609 and 4.3.610 for the application assertions.

The target_face need not be specified for a particular Form_feature_in_panel.

If present, there shall be exactly one object that defines the target_face for a Form_feature_in_panel.

4.2.188.6 target_fillet_radius

The target_fillet_radius specifies the blend of the edge where the feature walls meet the target face. The sum of the values of the base fillet radius and target fillet radius shall not exceed the minimum distance between the profile defining the base of the feature and the profile defining the target of the feature.

See 4.3.608 for the application assertion.

4.2.189 Function_component_association

A Function_component_association is a mechanism to associate a Product_function (see 4.2.352) with a Product_component (see 4.2.350).

The data associated with a Function_component_association are the following:

- product_component;
- product_function.

4.2.189.1 product_component

The product_component specifies the Product_component (see 4.2.350) that fulfills a function defined by the Product_function (see 4.2.352).

See 4.3.611 for the application assertion.

4.2.189.2 product_function

The product_function specifies the Product_function (see 4.2.352) that is fulfilled by the Product_component (see 4.2.350).

See 4.3.612 for the application assertion.

4.2.190 General_boss

A General_boss is a volume adding feature that is specified by an enclosed volume bounded by an arbitrary shape.

EXAMPLE 100 – Figure 28 shows an example of a General_boss.

A General_boss is a type of Boss_feature (see 4.2.42).

The data associated with a General_boss are the following:

– boundary.

The boundary specifies the General_closed_profile (see 4.2.194) that is swept along a Linear_path (see 4.2.268) in order to create the General_boss.

See 4.3.613 for the application assertion.

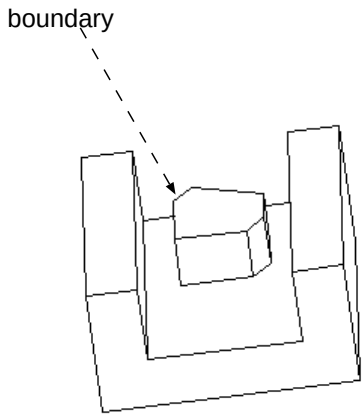

Figure 28 – General_boss

4.2.191 General_bottom_condition

A General_bottom_condition is a bottom of a Pocket_feature_in_solid (see 4.2.321) that is an enclosed area bounded by arbitrary non-planar shape.

A General_bottom_condition is a type of Pocket_bottom_condition (see 4.2.320).

The data associated with a General_bottom_condition are the following:

- floor_face;
- floor_radius.

4.2.191.1 floor_face

The floor_face specifies the Surface (see 4.2.434) or the Shell (see 4.2.398) that defines the bottom of the pocket. The geometric elements representing the floor shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Pocket_feature_in_solid (see 4.2.321).

See 4.3.615 and 4.3.616 for the application assertions.

There shall be exactly one object that defines the floor_face for a General_bottom_condition.

4.2.191.2 floor_radius

The floor_radius specifies the blend radius at the bottom edges of the Pocket_feature_in_solid (see 4.2.321).

See 4.3.614 for the application assertion.

The floor_radius need not be specified for a particular General_bottom_condition.

4.2.192 General_classification

A General_classification is a classification of an Item (see 4.2.236) which characterizes all items of the same kind independent from their usage.

EXAMPLE 101 – A fastener with subclasses, such as fastener with 2 or 3 fixture holes, a bracket with subclasses, e.g., with 90 or 100 degrees bending angle, or screws with subclasses such as metal screws or machine screws are examples for General_classification.

EXAMPLE 102 – For facilitating an effective part retrieval for slotted screws several General_classification objects to classify screws may be defined:

– A General_classification *1 with name 'slotted screws' and three subclasses with the names *2: 'slotted cheese head screws - product grade A', *3: 'slotted pan head screws - product grade A', and *4: 'slotted countersunk flat head screws - product grade A'.

– Each of the General_classification objects is based on a Classification_system (see 4.2.70) that further defines where the definition of the General_classification comes from. For General_classification *1 this is a company internal Classification_system for 'screw classes'. For the other General_classification objects these are ISO standardized Classification_system objects, namely for *2 'ISO 1207', for *3 'ISO 1580', and for *4 'ISO 2009'.

– The General_classification objects may be defined as well in an ISO 13584 compliant library (PLIB). In this case General_classification *1 references as a classification source an External_library_reference (see 4.2.165) that has an id corresponding to the class_BSU, i. e. a world wide unique identification of that class as defined according to ISO 13584–42. In another case the source of a General_classification may only be available as a document in paper form. In this case General_classification *4 references an Archived_document (see 4.2.24) with document id 'DIN EN ISO 2009' and name 'slotted countersunk flat head screws - product grade A'.

– The General_classification objects may be characterized further by Classification_attribute (see 4.2.69) objects. According to ISO 1207 the General_classification *2 has the attributes *11 with id 'd' and name 'thread', *12 with id 'l' and name 'nominal length', *13 with id 'mechanical properties' and name 'property class', etc. The possible values 'M1.6', 'M2', ..., 'M10' for Classification_attribute *11 may be specified through the set attribute values.

– To identify the designation 'Cheese head screw ISO 1207 - M5 x 20 x 4.8' a subclass of General_classification *2 is defined with the same name and classification source and the name 'slotted cheese head screws ISO 1207 -M5 x 20 x 4.8' but with the values for Classification_attribute corresponding to *11 restricted to 'M5' only, i.e. to get just the M5 screws, corresponding to *12 restricted to value '20' only, and corresponding to *13 restricted to value '4.8' only (for steel according to ISO 898–1).

A General_classification is a type of Item_classification (see 4.2.237).

The data associated with a General_classification are the following:

- attribute;
- classification_source;
- name;
- used_classification_system.

4.2.192.1 attribute

The attribute specifies the Classification_attribute (see 4.2.69) that represents one characteristic of the General_classification.

See 4.3.617 for the application assertion.

4.2.192.2 classification_source

The classification_source specifies the External_document (see 4.2.162) or the External_library_reference (see 4.2.165) that contains the specification of the General_classification. The External_library_reference (see 4.2.165) specifies the unique identification of a class, i. e. a class_BSU according to ISO 13584–42, for an ISO 13584 compliant library.

See 4.3.619 and 4.3.620 for the application assertions.

The classification_source need not be specified for a particular General_classification.

If present, there shall be exactly one object that defines the classification_source for a General_classification.

4.2.192.3 name

The name specifies the word or group of words by which the General_classification is referred to.

EXAMPLE 103 – 'fastener with 2 fixture holes' or 'bracket with 90 degrees bending angle' are examples for at.

See 4.3.621 for the application assertion.

There shall be exactly one object that defines the name for a General_classification.

4.2.192.4 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.70) that contains the information about how to interpret the name of the General_classification.

See 4.3.618 for the application assertion.

The used_classification_system need not be specified for a particular General_classification.

4.2.193 General_classification_hierarchy

A General_classification_hierarchy is used to build up hierarchical structures of General_classification (see 4.2.192) objects.

EXAMPLE 104 – With General_classification (see 4.2.192) part families such as screws can be classified. Additionally subclasses can be built and linked to the super-category screws, such as machine screw or self-tapping screw.

The data associated with a General_classification_hierarchy are the following:

- sub_classification;
- super_classification.

4.2.193.1 sub_classification

The sub_classification specifies the lower General_classification (see 4.2.192) in a General_classification_hierarchy that is included in the super class.

See 4.3.622 for the application assertion.

4.2.193.2 super_classification

The super_classification specifies the higher General_classification (see 4.2.192) in a General_classification_hierarchy that includes the sub class.

See 4.3.622 for the application assertion.

4.2.194 General_closed_profile

A General_closed_profile is a profile that is specified by an arbitrarily shaped enclosed area bounded by a of Curve (see 4.2.102). A General_closed_profile shall not have an additional Axis_placement (see 4.2.33) serving as parameter_reference. The set of Curve objects shall be

defined in the Cartesian_coordinate_space (see 4.2.44) that is referenced by the General_closed_-profile.

EXAMPLE 105 – Figure 29 illustrates a General_closed_profile.

A General_closed_profile is a type of Closed_profile (see 4.2.71).

The data associated with a General_closed_profile are the following:

– profile_shape.

The profile_shape specifies the Curve (see 4.2.102) that defines the closed profile shape.

See 4.3.623 for the application assertion.

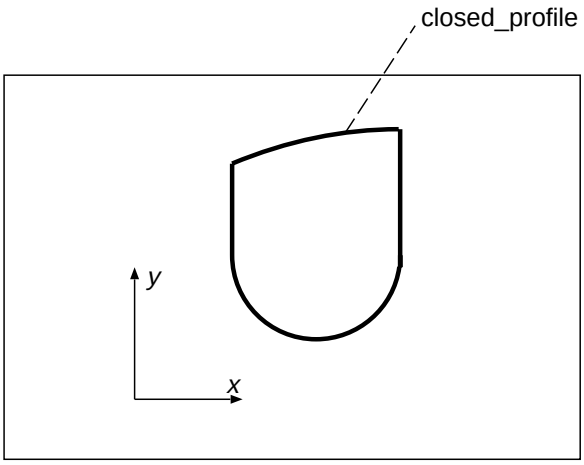

Figure 29 – General_closed_profile

4.2.195 General_compound_feature

A General_compound_feature is a General_feature (see 4.2.196) that is composed of several other features.

A General_compound_feature is a type of General_feature (see 4.2.196).

The data associated with a General_compound_feature are the following:

– elements.

The elements specifies the features that form the General_compound_feature.

See 4.3.624, 4.3.625, 4.3.626, and 4.3.627 for the application assertions.

There shall be at least two objects that defines the elements for a General_compound_feature.

4.2.196 General_feature

A General_feature is a type of feature that provides a mechanism to categorize an area of interest in a shape and to associate additional information, not intended for shape generation, with the identified aspect of the shape.

Each General_feature may be a General_compound_feature (see 4.2.195).

The data associated with a General_feature are the following:

- feature_category;
- feature_parameter;
- feature_type;
- location_and_orientation.

4.2.196.1 feature_category

The feature_category specifies the class to which the General_feature belongs.

NOTE – The values of feature_category are company specific.

EXAMPLE 106 – 'design feature', 'machining feature', and 'assembly feature' are examples for feature_category.

4.2.196.2 feature_parameter

The feature_parameter specifies a General_feature_parameter (see 4.2.197) that gives additional information about particular aspects of the General_feature.

See 4.3.629 for the application assertion.

4.2.196.3 feature_type

The feature_type specifies the kind of feature that is represented by the General_feature.

EXAMPLE 107 – 'planar feature' and 'logo feature' are examples for feature_type.

4.2.196.4 location_and_orientation

The location_and_orientation specifies an Axis_placement (see 4.2.33) that represents the location and the orientation of the General_feature in the part's coordinate space. Since the occurrence of a General_feature is an Included_feature (see 4.2.232) this Axis_placement as well as the shape representation of the General_feature is defined in the part's coordinate space.

NOTE – This Axis_placement is not a local coordinate system of the General_feature that might be used for geometric transformations.

See 4.3.628 for the application assertion.

The location_and_orientation need not be specified for a particular General_feature.

4.2.197 General_feature_parameter

A General_feature_parameter is a parameter describing a particular aspect of a General_feature (see 4.2.196).

The data associated with a General_feature_parameter are the following:

- parameter_role;
- parameter_value.

4.2.197.1 parameter_role

The parameter_role specifies the kind of parameter that is represented by the General_feature_-parameter.

EXAMPLE 108 – 'width', 'diameter', or 'font size' are examples for the parameter_role.

See 4.3.631 for the application assertion.

There shall be exactly one object that defines the parameter_role for a General_feature_parameter.

4.2.197.2 parameter_value

The parameter_value specifies the Feature_parameter (see 4.2.177) that has the value, the unit, and possibly a name of the General_feature_parameter.

See 4.3.630 for the application assertion.

4.2.198 General_item_definition_instance_relationship

A General_item_definition_instance_relationship is a relationship between a Design_discipline_-item_definition (see 4.2.134) and an Item_instance (see 4.2.241) whose meaning is defined by the attribute 'relation_type'.

EXAMPLE 109 – The relationship between the definition of a rubber gasket and the instances of the doors the gasket is used for is an example for a General_item_definition_instance_relationship. In this case the relationship gives information that the length of the gasket depends on the actual shape of each door.

A General_item_definition_instance_relationship is a type of Item_definition_instance_relationship (see 4.2.239).

The data associated with a General_item_definition_instance_relationship are the following:

- description;
- name;
- relation_type.

4.2.198.1 description

The description specifies additional information about the General_item_definition_instance_-relationship.

See 4.3.632 for the application assertion.

The description need not be specified for a particular General_item_definition_instance_relationship.

If present, there shall be exactly one object that defines the description for a General_item_definition_instance_relationship.

4.2.198.2 name

The name specifies the word or group of words by which the General_item_definition_instance_relationship is referred to.

See 4.3.632 for the application assertion.

There shall be exactly one object that defines the name for a General_item_definition_instance_relationship.

4.2.198.3 relation_type

The relation_type specifies the meaning of the relationship.

4.2.199 General_item_definition_relationship

A General_item_definition_relationship is a relationship between two Design_discipline_item_definition (see 4.2.134) objects whose meaning is defined by the attribute 'relation_type'.

EXAMPLE 110 – The functional dependency between that part of a door lock mounted on the door and the other part mounted on the car body is an example for a General_item_definition_relationship.

A General_item_definition_relationship is a type of Item_definition_relationship (see 4.2.240).

The data associated with a General_item_definition_relationship are the following:

- description;
- name;
- relation_type.

4.2.199.1 description

The description specifies additional information about the General_item_definition_relationship.

See 4.3.633 for the application assertion.

The description need not be specified for a particular General_item_definition_relationship.

If present, there shall be exactly one object that defines the description for a General_item_definition_relationship.

4.2.199.2 name

The name specifies the word or group of words by which the General_item_definition_relationship is referred to.

See 4.3.633 for the application assertion.

There shall be exactly one object that defines the name for a General_item_definition_relationship.

4.2.199.3 relation_type

The relation_type specifies the meaning of the relationship.

4.2.200 General_item_instance_relationship

A General_item_instance_relationship is a relationship between two Item_instance (see 4.2.241) objects whose meaning is defined by the attribute 'relation_type'.

EXAMPLE 111 – The relationship between a door and the adjacent parts of the car body (like A-column or roof) that defines the actual gap is an example for a General_item_instance_relationship.

A General_item_instance_relationship is a type of Item_instance_relationship (see 4.2.242).

The data associated with a General_item_instance_relationship are the following:

- description;
- name;
- relation_type.

4.2.200.1 description

The description specifies additional information about the General_item_instance_relationship.

See 4.3.634 for the application assertion.

The description need not be specified for a particular General_item_instance_relationship.

If present, there shall be exactly one object that defines the description for a General_item_instance_relationship.

4.2.200.2 name

The name specifies the word or group of words by which the General_item_instance_relationship is referred to.

See 4.3.634 for the application assertion.

There shall be exactly one object that defines the name for a General_item_instance_relationship.

4.2.200.3 relation_type

The relation_type specifies the meaning of the relationship.

4.2.201 General_item_property

A General_item_property is the definition of an item's property that is specified by the attribute 'property type'.

NOTE – The General_item_property allows to attach geometric information to an item; yet, this geometry is not supposed to represent the shape of the item.

EXAMPLE 112 – The noise emission of an engine, maintenance intervals, wheel base, and duration of parts, or electrical properties are examples for a General_item_property.

A General_item_property is a type of Item_property (see 4.2.243).

The data associated with a General_item_property are the following:

- description;
- property_type;
- property_value.

4.2.201.1 description

The description specifies additional information about the General_item_property.

See 4.3.637 for the application assertion.

The description need not be specified for a particular General_item_property.

If present, there shall be exactly one object that defines the description for a General_item_-property.

4.2.201.2 property_type

The property_type specifies the kind of property the General_item_property defines.

4.2.201.3 property_value

The property_value specifies the value of the General_item_property. The value of a General_-item_property is either a descriptive value, a numeric value, or a piece of geometry.

See 4.3.635, 4.3.636, 4.3.638, and 4.3.639 for the application assertions.

There shall be at least one object that defines the property_value for a General_item_property.

4.2.202 General_open_profile

A General_open_profile is a profile that is specified by an arbitrarily shaped open boundary. The area of interest is on the convex side of the General_open_profile (in the case of a removal feature the convex side is removed; in the case of a protrusion feature the convex side is added).

A General_open_profile shall not have an additional Axis_placement (see 4.2.33) serving as parameter_reference. The defining Curve is always defined in the Cartesian_coordinate_space (see 4.2.44) that is referenced by the General_open_profile as 'is_defined_in'.

EXAMPLE 113 – Figure 30 illustrates a General_open_profile.

A General_open_profile is a type of Open_profile (see 4.2.292).

The data associated with a General_open_profile are the following:

– profile_shape.

The profile_shape specifies the Curve (see 4.2.102) that defines the open profile shape.

See 4.3.640 for the application assertion.

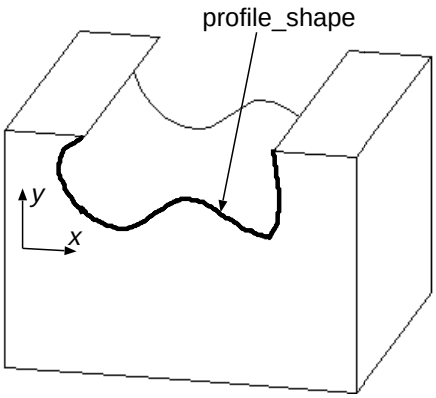

Figure 30 – General_open_profile

4.2.203 General_path

A General_path is a path that is specified by a direction of travel along an arbitrary shape.

EXAMPLE 114 – Figure 31 illustrates a General_path.

A General_path is a type of Path (see 4.2.304).

The data associated with a General_path are the following:

– path_geometry.

The path_geometry specifies the Curve (see 4.2.102) that defines the General_path. These Curve objects shall not intersect or duplicate themselves.

See 4.3.641 for the application assertion.

4.2.204 General_pattern

A General_pattern is a pattern that specifies a base shape component and a set of arbitrary placements to arrange identical copies of the base feature.

EXAMPLE 115 – Figure 32 depicts a General_pattern with a base shape and 5 added instances.

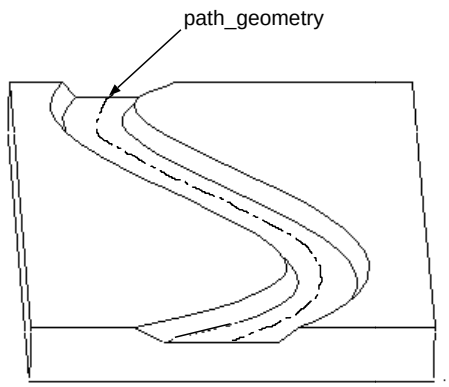

Figure 31 – General_path

A General_pattern is a type of Replicate_feature (see 4.2.380).

The data associated with a General_pattern are the following:

– added_instance.

The added_instance specifies the set of Axis_placement (see 4.2.33) objects that represent the locations and orientations of the additional instances of the base feature in the General_pattern.

The placement of the additional instances is performed by matching either the Axis_placement that serves as location for the Feature_definition (see 4.2.175) of the base feature (in the case of an Included_feature (see 4.2.232)) or its local coordinate system (in the case of a Placed_feature (see 4.2.313)) with the Axis_placement objects that identify the additional instances.

The Axis_placement objects are defined in the same Cartesian_coordinate_space (see 4.2.44) as the General_pattern.

NOTE – The base feature is the first instance in the pattern. In order to form a pattern one or more additional instances have to be specified.

See 4.3.642 for the application assertion.

4.2.205 General_pocket_in_solid

A General_pocket_in_solid is a pocket that is specified by a volume of arbitrary shape removed from the part.

EXAMPLE 116 – Figure 33 depicts examples of a General_pocket_in_solid.

A General_pocket_in_solid is a type of Pocket_feature_in_solid (see 4.2.321).

The data associated with a General_pocket_in_solid are the following:

– boundary.

The boundary specifies the enclosing bounds for the General_pocket_in_solid.

See 4.3.643 for the application assertion.

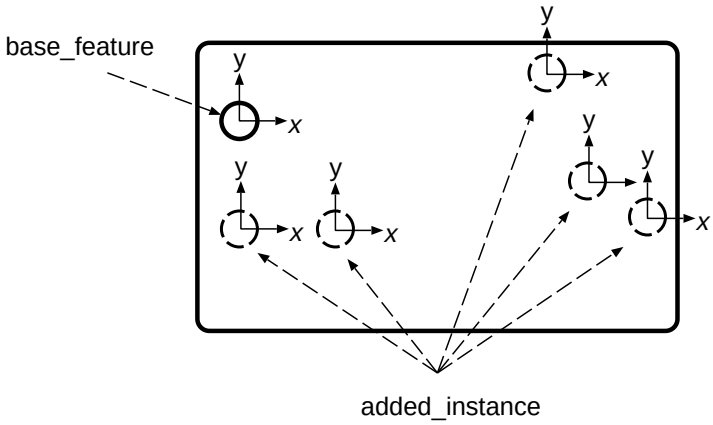

Figure 32 – General_pattern

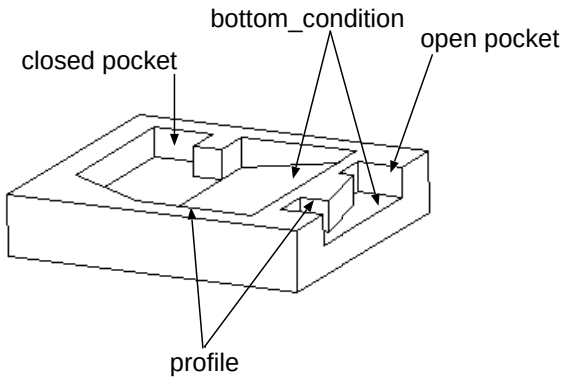

Figure 33 – General_pocket_in_solid

4.2.206 General_process_property

A General_process_property is the definition of a process's property that is specified by the attributes 'type'.

A General_process_property is a type of Process_property (see 4.2.345).

The data associated with a General_process_property are the following:

- description;
- property_type;
- property_value.

4.2.206.1 description

The description specifies additional information about the General_process_property.

See 4.3.646 for the application assertion.

The description need not be specified for a particular General_process_property.

If present, there shall be exactly one object that defines the description for a General_process_property.

4.2.206.2 property_type

The property_type specifies the kind of property the General_process_property defines.

4.2.206.3 property_value

The property_value specifies the value of the General_process_property. The value of a General_process_property is either a descriptive value, a numeric value, or a piece of geometry.

See 4.3.644, 4.3.645, 4.3.647, and 4.3.648 for the application assertions.

There shall be at least one object that defines the property_value for a General_process_property.

4.2.207 General_tolerance_table

A General_tolerance_table is a table containing information about General_tolerances (see 4.2.208).

The data associated with a General_tolerance_table are the following:

- tolerance_type.

The tolerance_type specifies the kind of the tolerance.

EXAMPLE 117 – Examples for tolerance_type are 'length dimensional tolerance', 'angular dimensional tolerance', or 'rectangularity'.

4.2.208 General_tolerances

A General_tolerances is a default value for length dimension and angular dimension tolerances. The default values are specified in a table form to select the correct tolerance type and values for a given dimension. These default values are overwritten by tolerances that are assigned explicitly to particular aspects of the shape. The concept of General_tolerances is defined in ISO 2768.

EXAMPLE 118 – The General_tolerances specifies, e.g., that for the tolerance class 'f' the tolerance value '±0.15' is applicable for length dimensions between 30 mm and 120 mm. Figure 34 depicts an example for General_tolerances.

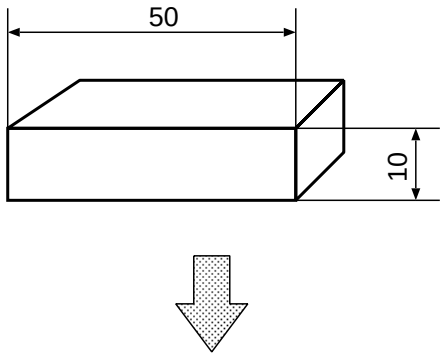
The data associated with a General_tolerances are the following:

- table_definition.

The table_definition specifies the contents of the General_tolerances that is defined either explicitly in a General_tolerance_table (see 4.2.207) or in an External_document (see 4.2.162).

See 4.3.649 and 4.3.650 for the application assertions.

There shall be exactly one object that defines the table_definition for a General_tolerances.



standard source: ISO 2768

length dimensional tolerance:

tolerance class	length nominal 0.5-3	3-6	6-30	30-120	120-400	etc.
f	0.05	0.05	0.1	0.15	0.2	
m	0.1	0.1	0.2	0.3	0.5	
c	0.2	0.3	0.5	0.8	1.2	
v	-	0.5	1.0	1.5	2.5	

tolerance ± mm

angular dimensional tolerance:

tolerance class	short angle length nominal 0-10	10-50	50-120	120-400	>400
f	1°	30'	20'	10'	5'
m	1°	30'	20'	10'	5'
c	1°30'	1°	30'	15'	10'
v	3°	2°	1°	30'	20'

tolerance ± o

rectangularity:

tolerance class	short angle length nominal 0-100	100-300	300-1000	1000-3000
H	0.2	0.3	0.4	0.5
K	0.4	0.6	0.8	1
L	0.6	1	1.5	2

tolerance ± mm

Figure 34 – General_tolerances

4.2.209 General_top_condition

A General_top_condition is a top condition of a boss that is bounded by arbitrary non-planar shape.

A General_top_condition is a type of Boss_top_condition (see 4.2.43).

The data associated with a General_top_condition are the following:

– top_face.

The top_face specifies the Surface (see 4.2.434) or the Shell (see 4.2.398) that defines the top of the boss. The geometric elements representing the top shall be defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Boss_feature (see 4.2.42).

See 4.3.651 and 4.3.652 for the application assertions.

There shall be exactly one object that defines the top_face for a General_top_condition.

4.2.210 Geometric_dimension

A Geometric_dimension is the representation of the size of an element or of the distance between two elements.

NOTE – A Geometric_dimension may be presented by a Dimension_callout (see 4.2.141) showing the dimension value and its relationship to the drafted geometry or annotation.

Each Geometric_dimension is either a Size_dimension (see 4.2.405) or a Location_dimension (see 4.2.270).

The data associated with a Geometric_dimension are the following:

- dimension_value;
- id;
- name.

4.2.210.1 dimension_value

The dimension_value specifies the value of the size of the element or the distance between the two elements. The dimension_value shall not be specified if the Geometric_dimension is associated with a Value_limit (see 4.2.482) or with a Value_range (see 4.2.483). In all other cases the dimension_value shall be specified.

The dimension_value need not be specified for a particular Geometric_dimension.

4.2.210.2 id

The id specifies the identifier of the Geometric_dimension.

4.2.210.3 name

The name specifies the word or group of words by which the Geometric_dimension is referred to.

See 4.3.653 for the application assertion.

The name need not be specified for a particular Geometric_dimension.

If present, there shall be exactly one object that defines the name for a Geometric_dimension.

4.2.211 Geometric_model

A Geometric_model is a representation of geometry. A Geometric_model that does not reference any Detailed_geometric_model_element (see 4.2.136) objects through one the subtypes directly shall reference at least one Template_instance (see 4.2.453) as 'additional_elements'.

Each Geometric_model may be a Geometric_model_version (see 4.2.214).

Each Geometric_model is either a Wireframe_model_3d (see 4.2.498), a Point_direction_model (see 4.2.325), a Wireframe_model_2d (see 4.2.497), a Hybrid_geometric_model_3d (see 4.2.230), a Geometrically_bounded_surface_model (see 4.2.220), a Surface_model (see 4.2.439), a Compound_model (see 4.2.87), a Csg_model (see 4.2.100), a B_rep_model (see 4.2.35), or a Faceted_b_rep_model (see 4.2.172).

The data associated with a Geometric_model are the following:

- additional_elements;
- description;
- is_defined_in;
- model_extent;
- model_id;
- role.

4.2.211.1 additional_elements

The additional_elements specifies the Template_instance (see 4.2.453) objects that are additionally imported into the Geometric_model using a Transformation (see 4.2.472). The additional_elements shall also of the same type as the referring Geometric_model.

See 4.3.656 for the application assertion.

4.2.211.2 description

The description specifies additional information about the Geometric_model.

See 4.3.655 for the application assertion.

The description need not be specified for a particular Geometric_model.

If present, there shall be exactly one object that defines the description for a Geometric_model.

4.2.211.3 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the Geometric_model is defined. The specified Cartesian_coordinate_space serves also as the reference coordinate space for the transformation of Template_instance (see 4.2.453) objects used as additional elements in the Geometric_model.

See 4.3.654 for the application assertion.

4.2.211.4 model_extent

The model_extent specifies the radius of a sphere that contains all elements of the model and whose centre is at the origin of the Cartesian_coordinate_space (see 4.2.44) of the Geometric_model.

The model_extent need not be specified for a particular Geometric_model.

4.2.211.5 model_id

The model_id specifies the identifier of the Geometric_model.

4.2.211.6 role

The role specifies the function performed by the Geometric_model. Where applicable the following values shall be used:

- 'design shape': The geometry in the Geometric_model represents the shape of an item as designed;
- 'idealized shape': The geometry in the Geometric_model represents a simplified shape for e.g., analysis purposes.

4.2.212 Geometric_model_relationship

A Geometric_model_relationship is a relationship between two Geometric_model (see 4.2.211) objects.

Each Geometric_model_relationship may be a Geometric_model_relationship_with_transformation (see 4.2.213).

The data associated with a Geometric_model_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.212.1 description

The description specifies additional information about the Geometric_model_relationship.

See 4.3.659 for the application assertion.

The description need not be specified for a particular Geometric_model_relationship.

If present, there shall be exactly one object that defines the description for a Geometric_model_relationship.

4.2.212.2 related

The related specifies the second of the two Geometric_model (see 4.2.211) objects related by the Geometric_model_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.657 and 4.3.658 for the application assertions.

There shall be exactly one object that the Geometric_model_relationship is related to.

4.2.212.3 relating

The relating specifies the first of the two Geometric_model (see 4.2.211) objects related by the Geometric_model_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.657 and 4.3.658 for the application assertions.

There shall be exactly one object that the Geometric_model_relationship is relating to.

4.2.212.4 relation_type

The relation_type specifies the meaning of the relationship.

EXAMPLE 119 – The relation_type may be e.g., 'basis for' if the relating Geometric_model (see 4.2.211) represents the design shape of an object and the related Geometric_model represents an idealized shape of the same object.

4.2.213 Geometric_model_relationship_with_transformation

A Geometric_model_relationship_with_transformation is a relationship between two Geometric_-model (see 4.2.211) objects with the additional information about a geometric Transformation (see 4.2.472) that defines the location and orientation of the related model relative to the relating model.

A Geometric_model_relationship_with_transformation is a type of Geometric_model_relationship (see 4.2.212).

The data associated with a Geometric_model_relationship_with_transformation are the following:

- transformation.

The transformation specifies the geometric Transformation (see 4.2.472) that places and orients the related model relative to the relating model.

See 4.3.660 for the application assertion.

4.2.214 Geometric_model_version

A Geometric_model_version is a particular version of a Geometric_model (see 4.2.211).

A Geometric_model_version is a type of Geometric_model (see 4.2.211).

The data associated with a Geometric_model_version are the following:

- version_id.

The version_id specifies the identification of a particular version of a Geometric_model (see 4.2.211).

4.2.215 Geometric_set_3d

A Geometric_set_3d is a set of Curve (see 4.2.102), Point (see 4.2.322), or Surface (see 4.2.434) objects that are part of a Geometrically_bounded_surface_model (see 4.2.220).

A Geometric_set_3d is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Geometric_set_3d are the following:

- element.

The element specifies the set of geometric elements that are are included in the Geometric_set_3d.

See 4.3.661, 4.3.662, and 4.3.663 for the application assertions.

There shall be at least one object that defines the element for a Geometric_set_3d.

4.2.216 Geometric_tolerance

A Geometric_tolerance is the allowable deviation of physical characteristics according to ISO 1101.

Each Geometric_tolerance is either a Cylindricity_tolerance (see 4.2.109), a Symmetry_tolerance (see 4.2.444), a Straightness_tolerance (see 4.2.424), a Flatness_tolerance (see 4.2.187), a Position_tolerance (see 4.2.332), a Circular_runout_tolerance (see 4.2.62), a Linear_profile_tolerance (see 4.2.269), a Circularity_tolerance (see 4.2.63), a Surface_profile_tolerance (see 4.2.442), a Total_runout_tolerance (see 4.2.471), a Parallelism_tolerance (see 4.2.301), a Perpendicularity_tolerance (see 4.2.306), a Concentricity_tolerance (see 4.2.88), or an Angularity_tolerance (see 4.2.13).

The data associated with a Geometric_tolerance are the following:

- is_applied_to;
- is_controlled_by;
- name;
- qualifying_note;
- significant_digits;
- tolerance_value;
- value_interpretation.

4.2.216.1 is_applied_to

The is_applied_to specifies the shape that the Geometric_tolerance is associated to.

See 4.3.664, 4.3.665, 4.3.666, and 4.3.669 for the application assertions.

There shall be exactly one object that the Geometric_tolerance is_applied_to.

4.2.216.2 is_controlled_by

The is_controlled_by specifies the Material_condition (see 4.2.278) that is associated with the application of the Geometric_tolerance.

See 4.3.667 for the application assertion.

The is_controlled_by need not be specified for a particular Geometric_tolerance.

4.2.216.3 name

The name specifies the word or group of words by which the Geometric_tolerance is referred to.

See 4.3.668 for the application assertion.

The name need not be specified for a particular Geometric_tolerance.

If present, there shall be exactly one object that defines the name for a Geometric_tolerance.

4.2.216.4 qualifying_note

The qualifying_note specifies additional constraints on the Geometric_tolerance.

EXAMPLE 120 – 'not concave' is an example for the qualifying_note.

See 4.3.668 for the application assertion.

The qualifying_note need not be specified for a particular Geometric_tolerance.

If present, there shall be exactly one object that defines the qualifying_note for a Geometric_-tolerance.

4.2.216.5 significant_digits

The significant_digits specifies the number of decimal places indicating the required accuracy of the tolerance.

The significant_digits need not be specified for a particular Geometric_tolerance.

4.2.216.6 tolerance_value

The tolerance_value specifies the tolerance magnitude expressed by a measure with unit.

4.2.216.7 value_interpretation

The value_interpretation specifies information on how the Geometric_tolerance shall be interpreted.

NOTE – A Geometric_tolerance may be specified in the design stage of a product but it may also be documented as measured on a prototype.

EXAMPLE 121 – The value_interpretation may be e.g., 'required', 'designed', 'estimated', or 'measured'.

4.2.217 Geometric_tolerance_precedence

A Geometric_tolerance_precedence is a relationship between two Geometric_tolerance (see 4.2.216) objects indicating that one of the Geometric_tolerance objects is of higher priority than the other one.

EXAMPLE 122 – A part may have a shape that has a Geometric_tolerance and that is he basic shape for a pattern that may also have a Geometric_tolerance. In this case the tolerance for the base shape usually has precedence over the tolerance for the pattern.

The data associated with a Geometric_tolerance_precedence are the following:

- primary_tolerance;
- secondary_tolerance.

4.2.217.1 primary_tolerance

The primary_tolerance specifies the Geometric_tolerance (see 4.2.216) that has precedence.

See 4.3.670 for the application assertion.

4.2.217.2 secondary_tolerance

The secondary_tolerance specifies the Geometric_tolerance (see 4.2.216) that is of lower priority.

See 4.3.670 for the application assertion.

4.2.218 Geometric_tolerance_symbol

A Geometric_tolerance_symbol is a combination of annotation elements that, as collection, presents a Geometric_tolerance (see 4.2.216).

A Geometric_tolerance_symbol is a type of Associated_annotation_symbol (see 4.2.29).

4.2.219 Geometrical_relationship

A Geometrical_relationship is the relationship between two Design_discipline_item_definition (see 4.2.134) objects specifying two parts that are geometrically related. Therefore the shape of the

related parts has to be represented only once and can be reused for the geometrically related situation. The two Design_discipline_item_definition objects that are related by this relationship shall belong to different Item_version (see 4.2.248) objects. Other properties except shape are not subject to this relationship and therefore not 'inherited' from the relating Design_discipline_item_definition to the related Design_discipline_item_definition.

EXAMPLE 123 – Figure 35 shows an example for a Geometrical_relationship: In this case the left mudguard of a car is symmetrical to the right mudguard. A given plane mirroring transformation specifies the location of the left mudguard regarding the location of the right mudguard.

A Geometrical_relationship is a type of Item_definition_relationship (see 4.2.240).

The data associated with a Geometrical_relationship are the following:

- description;
- name;
- transformation.

4.2.219.1 description

The description specifies additional information about the Geometrical_relationship.

See 4.3.672 for the application assertion.

The description need not be specified for a particular Geometrical_relationship.

If present, there shall be exactly one object that defines the description for a Geometrical_relationship.

4.2.219.2 name

The name specifies the word or group of words by which the Geometrical_relationship is referred to.

See 4.3.672 for the application assertion.

The name need not be specified for a particular Geometrical_relationship.

If present, there shall be exactly one object that defines the name for a Geometrical_relationship.

4.2.219.3 transformation

The transformation specifies the Geometric_model_relationship_with_transformation (see 4.2.213) or the Template_instance (see 4.2.453) that has the Transformation (see 4.2.472) to be applied to the relating Design_discipline_item_definition (see 4.2.134) in order to define the location and orientation of the related Design_discipline_item_definition. Translation, rotation, and mirroring, i.e., inversion, is included; scaling is not included. In the case of a Template_instance the scale factor shall be omitted or set to 1.0.

See 4.3.671 and 4.3.673 for the application assertions.

There shall be exactly one object that defines the transformation for a Geometrical_relationship.

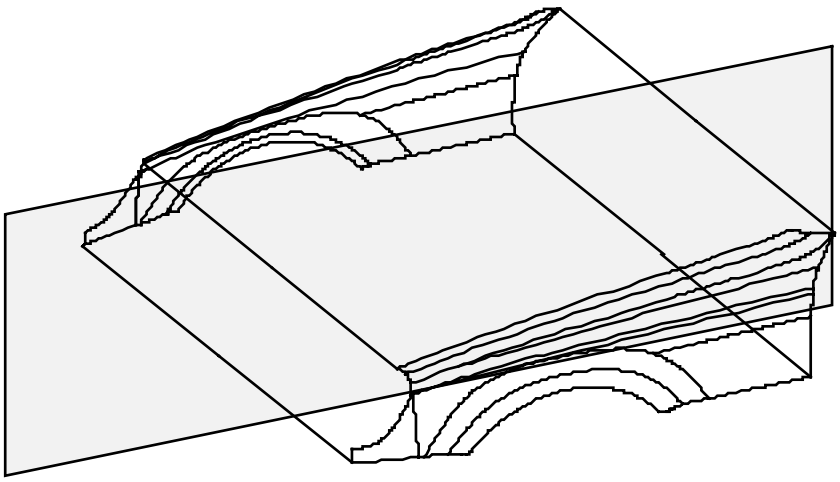

Figure 35 – Geometrical_relationship

4.2.220 Geometrically_bounded_surface_model

A Geometrically_bounded_surface_model is a surface model without topology. This model is formed by the use of points, curves and surfaces only. All unbounded curves and surfaces shall be explicitly trimmed.

A Geometrically_bounded_surface_model is a type of Geometric_model (see 4.2.211).

The data associated with a Geometrically_bounded_surface_model are the following:

- element.

The element specifies the set of Geometric_set_3d (see 4.2.215) objects that form the Geometrically_bounded_surface_model.

See 4.3.674 for the application assertion.

4.2.221 Ground_representation

A Ground_representation is the geometric representation of that part of the kinematic model that shall never move.

The data associated with a Ground_representation are the following:

- shape_description.

The shape_description specifies the shape model of the Ground_representation.

See 4.3.675 for the application assertion.

4.2.222 Group

A Group is a general structure for objects that can be nested, i.e., groups can contain other groups. The nesting shall be acyclic. In case of nesting, a Group need not contain elements.

EXAMPLE 124 – In a B-rep model several drilling holes are included. The objects defining the drilling holes including the two intersection curves and the faces of the hole may be grouped together with the purpose 'drilling hole'.

The data associated with a Group are the following:

- element;
- name;
- purpose.

4.2.222.1 element

The element specifies the Detailed_element (see 4.2.135) objects included in the Group.

See 4.3.676 for the application assertion.

4.2.222.2 name

The name specifies the word or group of words by which the Group is referred to.

See 4.3.677 for the application assertion.

There shall be exactly one object that defines the name for a Group.

4.2.222.3 purpose

The purpose specifies the rationale behind the grouping mechanism.

See 4.3.677 for the application assertion.

The purpose need not be specified for a particular Group.

If present, there shall be exactly one object that defines the purpose for a Group.

4.2.223 Group_relationship

A Group_relationship is a relationship between two Group (see 4.2.222) objects.

NOTE – The existence of a Group_relationship does not mean that the inclusion of an element in the related Group implies the inclusion of that element also in the relating Group.

The data associated with a Group_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.223.1 description

The description specifies additional information about the Group_relationship.

See 4.3.679 for the application assertion.

The description need not be specified for a particular Group_relationship.

If present, there shall be exactly one object that defines the description for a Group_relationship.

4.2.223.2 related

The related specifies the second of the two Group (see 4.2.222) objects that are related by the Group_relationship.

See 4.3.678 for the application assertion.

4.2.223.3 relating

The relating specifies the first of the two Group (see 4.2.222) objects that are related by the Group_relationship.

See 4.3.678 for the application assertion.

4.2.223.4 relation_type

The relation_type specifies the meaning of the relationship.

4.2.224 Half_space_solid

A Half_space_solid is the half space that is the regular subset of the domain that lies on one side of an unbounded surface. A Boolean flag shall be set to indicate whether the Half_space_solid is selected according to the normal direction of the surface. A Half_space_solid may participate in Boolean operations of the type 'intersection' or 'difference' as the second Boolean operand.

NOTE – Boxed half space solids are out of scope of this part of ISO 10303.

A Half_space_solid is a type of Detailed_geometric_model_element (see 4.2.136).

4.2.225 Hardness

A Hardness describes the hardness of a material on its surface. The hardness represents the resistance of a surface to deformation by external forces.

EXAMPLE 125 – Figure 36 gives examples for the specification of surface hardness on technical drawings. On the left side a surface hardness with the measuring method 'Vickers HV30' according to ISO 4516 [4], the hardness value '620', the hardness value tolerance '+160', the treatment type 'Rht' (surface layer hardening), the hardness limit '500', the hardening depth '0,8 mm', and the hardening depth tolerance '+0,8 mm' is specified. On the right side a surface hardness with the measuring method 'Rockwell HRC' according to ISO 6508 [5], the hardness value '57', the hardness

value tolerance '+6', the treatment type 'Eht' (case hardening), the hardening depth '1,2 mm', and the hardening depth tolerance '+0,7 mm' is specified.

A Hardness is a type of Surface_condition (see 4.2.437).

The data associated with a Hardness are the following:

- depth;
- description;
- environment_condition;
- hardness_value;
- measuring_method;
- measuring_position.

4.2.225.1 depth

The depth specifies the material depth measured from the part's surface into the material where the specified hardness applies.

EXAMPLE 126 – The depth of the hardened material after a high-frequency quenching process is an example for depth.

See 4.3.681 for the application assertion.

The depth need not be specified for a particular Hardness.

4.2.225.2 description

The description specifies additional information about the Hardness.

EXAMPLE 127 – 'depth is describing the total effective case depth' is an example for description.

See 4.3.680 for the application assertion.

The description need not be specified for a particular Hardness.

If present, there shall be exactly one object that defines the description for a Hardness.

4.2.225.3 environment_condition

The environment_condition specifies the conditions under that the specified hardness_value is valid.

There may be more than one environment_condition for a Hardness.

4.2.225.4 hardness_value

The hardness_value specifies the value with unit for the hardness where the actual values have to measured with the specified measuring method.

See 4.3.681 for the application assertion.

4.2.225.5 measuring_method

The measuring_method specifies the method for measuring hardness values.

NOTE – Standardized hardness measuring methods are Brinell, Rockwell, or Vickers.

4.2.225.6 measuring_position

The measuring_position specifies the position where the hardness is measured with respect to the treated part.

EXAMPLE 128 – 'core' or 'surface' are examples for measuring_position where 'core' is inside the hardened part, i.e., it is measured before a quenching process, and 'surface' is on the surface of a hardened part, i.e., it is measured after a quenching process.

The measuring_position need not be specified for a particular Hardness.

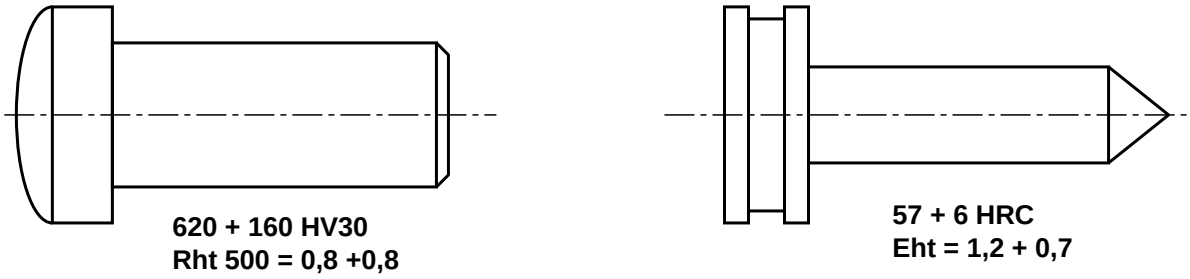

Figure 36 – Hardness

4.2.226 Hatching

A Hatching is a list of hatch patterns that are presented by single, uniformly spaced geometric pattern of lines. The basis of the hatching pattern is an infinite straight line that is repeated across the fill area and clipped to its boundaries. The Hatching may be defined by the user or may be externally defined.

4.2.227 Hidden_element_handling

A Hidden_element_handling is the definition how hidden elements are handled in a Model_image (see 4.2.284). The element types which may hide other elements are solid and surface type

geometric elements. The element types which may be hidden by these solids and surfaces are all geometric and annotation type elements.

The data associated with a Hidden_element_handling are the following:

- hidden_element_appearance;
- is_defined_for;
- switch.

4.2.227.1 hidden_element_appearance

The hidden_element_appearance specifies the appearance characteristics of hidden elements.

EXAMPLE 129 – A curve appearance with a dashed line type shows lines that are hidden in a dashed style instead of not showing them at all.

See 4.3.682 for the application assertion.

The hidden_element_appearance need not be specified for a particular Hidden_element_handling.

4.2.227.2 is_defined_for

The is_defined_for specifies the Model_image (see 4.2.284) that the Hidden_element_handling is applied to.

See 4.3.683 for the application assertion.

4.2.227.3 switch

The switch specifies the status of hiding for the hidden element handling. Valid values for switch are 'active' and 'inactive'. In the status 'inactive' all elements are displayed as usual. In the status 'active' the hidden elements are either not shown or visualized with a specialized appearance defined by the attribute hidden_element_appearance.

4.2.228 Hole_bottom_condition

A Hole_bottom_condition is the definition of a kind of end that characterizes a Round_hole (see 4.2.387).

EXAMPLE 130 – Figure 37 illustrates the various hole bottom conditions.

Each Hole_bottom_condition is either a Conical_bottom (see 4.2.90), a Through_hole_condition (see 4.2.460), a Flat_with_radius_bottom (see 4.2.186), a Flat_bottom (see 4.2.183), a Spherical_bottom (see 4.2.421), or a Flat_with_chamfer_bottom (see 4.2.185).

The data associated with a Hole_bottom_condition are the following:

- is_applied_to.

The is_applied_to specifies to which end of the path the Hole_bottom_condition applies. The following values shall be used:

– 'start': The Hole_bottom_condition is applied to that end of the Round_hole (see 4.2.387) that corresponds to the start of the defining Linear_path (see 4.2.268);

– 'end': The Hole_bottom_condition is applied to that end of the Round_hole that corresponds to the end of the defining Linear_path.

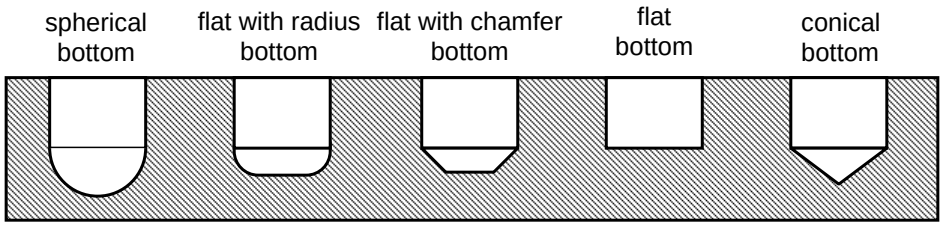

Figure 37 – Hole_bottom_condition

4.2.229 Hole_feature_in_panel

A Hole_feature_in_panel is a hole that is applied to a sheet like formed part.

A Hole_feature_in_panel is a type of Process_feature_in_panel (see 4.2.334).

Each Hole_feature_in_panel may be a Panel_hole_with_barring (see 4.2.299).

The data associated with a Hole_feature_in_panel are the following:

– hole_profile;

– hole_type;

– taper.

4.2.229.1 hole_profile

The hole_profile specifies a closed profile defining the shape of the Hole_feature_in_panel.

See 4.3.685 for the application assertion.

4.2.229.2 hole_type

The hole_type specifies the kind or shape of hole.

EXAMPLE 131 – 'circular' and 'rectangular' are examples for the hole_type.

The hole_type need not be specified for a particular Hole_feature_in_panel.

4.2.229.3 taper

The taper specifies a taper for the Hole_feature_in_panel.

See 4.3.684, 4.3.686, and 4.3.687 for the application assertions.

The taper need not be specified for a particular Hole_feature_in_panel.

If present, there shall be exactly one object that defines the taper for a Hole_feature_in_panel.

4.2.230 Hybrid_geometric_model_3d

A Hybrid_geometric_model_3d is a representation of geometry that consists of a set of Detailed_geometric_model_element (see 4.2.136) objects.

A Hybrid_geometric_model_3d is a type of Geometric_model (see 4.2.211).

The data associated with a Hybrid_geometric_model_3d are the following:

- element.

The element specifies a set of Detailed_geometric_model_element (see 4.2.136) that are part of the Hybrid_geometric_model_3d. In case this set is empty the Hybrid_geometric_model_3d shall reference at least one Template_instance (see 4.2.453) as 'additional_elements'.

See 4.3.688 for the application assertion.

4.2.231 Hyperbola

A Hyperbola is one branch of an open conic section defined by its radius, imaginary radius, the centre point and the direction of the line joining the centre to the focus.

A Hyperbola is a type of Curve (see 4.2.102).

4.2.232 Included_feature

An Included_feature is the identification of a feature as a component of a part. All geometric data defining the feature are defined in the part's coordinate space.

An Included_feature is a type of Feature_occurrence (see 4.2.176).

The data associated with an Included_feature are the following:

- definition.

The definition specifies the Feature_definition (see 4.2.175), the General_feature (see 4.2.196), the Transition_feature (see 4.2.476), or the Thread_feature (see 4.2.457) that has the information concerning the type of feature and parameters that describe the feature.

See 4.3.689, 4.3.690, 4.3.691, and 4.3.692 for the application assertions.

There shall be exactly one object that defines the definition for an Included_feature.

4.2.233 Initial_configuration

An Initial_configuration represents the initial values of the pair parameters of a Kinematic_mechanism (see 4.2.257). Some types of kinematic structures, e.g., four bar linkages, can not be uniquely only based on shape parameters.

EXAMPLE 132 – Link lengths are an example for shape parameters.

In those cases an Initial_configuration object provides pair parameter information that makes the configuration unique.

The data associated with an Initial_configuration are the following:

- initial_pair_values;
- is_applied_to.

4.2.233.1 initial_pair_values

The initial_pair_values specifies the initial value of the pair parameters of one or more Kinematic_pair (see 4.2.258) objects in a Kinematic_mechanism (see 4.2.257).

See 4.3.694 for the application assertion.

4.2.233.2 is_applied_to

The is_applied_to specifies the Kinematic_mechanism (see 4.2.257) that an Initial_configuration applies to.

See 4.3.693 for the application assertion.

4.2.234 Instance_placement

An Instance_placement is the information how to place a Single_instance (see 4.2.404) that is defined in its own Cartesian_coordinate_space (see 4.2.44) in the coordinate space of a superordinate Product_component (see 4.2.350).

The data associated with an Instance_placement are the following:

- placed_instance;
- product_component;
- transformation.

4.2.234.1 placed_instance

The placed_instance specifies the Single_instance (see 4.2.404) that is placed.

See 4.3.697 for the application assertion.

4.2.234.2 product_component

The product_component specifies the superordinate Product_component (see 4.2.350) that is defined in the reference coordinate space.

See 4.3.696 for the application assertion.

4.2.234.3 transformation

The transformation specifies the Geometric_model_relationship_with_transformation (see 4.2.213) or the Template_instance (see 4.2.453) that has the information about the geometric Transformation (see 4.2.472). In the case of Template_instance the scale for shall be omitted or set to 1.0.

See 4.3.695 and 4.3.698 for the application assertions.

There shall be exactly one object that defines the transformation for an Instance_placement.

4.2.235 Interpolated_configuration_sequence

An Interpolated_configuration_sequence is the motion (forward analysis) of a kinematic structure in terms of a set of configuration interpolations. These define the sequence of configuration definitions and the interpolation between them.

The data associated with an Interpolated_configuration_sequence are the following:

- interpolation.

The interpolation specifies the Kinematic_configuration_interpolation (see 4.2.253) for the Interpolated_configuration_sequence.

See 4.3.699 for the application assertion.

4.2.236 Item

An Item is either a single object or a unit in a group of objects. It collects the information that is common to all versions of the object.

NOTE – An Item may be either a single piece part, an assembly of arbitrary complexity, a raw material, or a tool.

EXAMPLE 133 – In the context of cars an Item may be the car as a whole, the assembly of the engine, the car body, a fender, the side window glass, grease, or stamping die.

The data associated with an Item are the following:

- description;
- id;
- name.

4.2.236.1 description

The description specifies additional information about the Item.

See 4.3.700 for the application assertion.

The description need not be specified for a particular Item.

If present, there shall be exactly one object that defines the description for an Item.

4.2.236.2 id

The id specifies the identifier of the Item. This identifier shall be unique.

NOTE – The scope of uniqueness is usually dependent on the form of implementation; it may be a physical file or data base.

4.2.236.3 name

The name specifies the word or group of words used to refer to the Item.

EXAMPLE 134 – 'Ford T', 'Fender 4XA', or '2CV front bumper' are examples for name.

See 4.3.700 for the application assertion.

There shall be exactly one object that defines the name for an Item.

4.2.237 Item_classification

An Item_classification is a classification of an Item (see 4.2.236) with respect to specific criteria.

NOTE – If an Item requires classification by more than one criterion, several Item_classification objects are associated to the same Item.

Each Item_classification is either a General_classification (see 4.2.192) or a Specific_classification (see 4.2.414).

The data associated with an Item_classification are the following:

- associated_item;
- description.

4.2.237.1 associated_item

The associated_item specifies the Item (see 4.2.236) with which a particular Item_classification (see 4.2.237) is associated.

NOTE – The set of associated items may be empty in the case of a high level classification that is further decomposed in a hierarchy.

See 4.3.701 for the application assertion.

4.2.237.2 description

The description specifies additional information about the Item_classification.

See 4.3.702 for the application assertion.

The description need not be specified for a particular Item_classification.

If present, there shall be exactly one object that defines the description for an Item_classification.

4.2.238 Item_cost_property

An Item_cost_property is an item related property that specifies the costs that are connected with it.

An Item_cost_property is a type of Item_property (see 4.2.243).

The data associated with an Item_cost_property are the following:

- cost_property_value.

The cost_property_value specifies the value of the Item_cost_property.

NOTE – The interpretation of this value, e.g., whether the value is required or calculated, is dependent on the semantics of the attribute 'value_interpretation' of the referenced Property_value.

See 4.3.703 for the application assertion.

4.2.239 Item_definition_instance_relationship

An Item_definition_instance_relationship is a relationship between a Design_discipline_item_definition (see 4.2.134) and an Item_instance (see 4.2.241).

NOTE – This relationship does not comprise inheritance of data from the relating Design_discipline_item_definition to the related Item_instance.

Each Item_definition_instance_relationship is either a Collected_item_association (see 4.2.76), a Mated_item_association (see 4.2.275), an Assembly_component_relationship (see 4.2.26), or a General_item_definition_instance_relationship (see 4.2.198).

The data associated with an Item_definition_instance_relationship are the following:

- related;
- relating.

4.2.239.1 related

The related specifies the Item_instance (see 4.2.241) that is part of the Item_definition_instance_relationship.

NOTE – The semantic of this attribute is defined by the specializations of Item_definition_instance_relationship.

See 4.3.705 for the application assertion.

4.2.239.2 relating

The relating specifies the Design_discipline_item_definition (see 4.2.134) that is part of the Item_definition_instance_relationship.

NOTE – The semantic of this attribute is defined by the specializations of Item_definition_instance_relationship.

See 4.3.704 for the application assertion.

4.2.240 Item_definition_relationship

An Item_definition_relationship is a relationship between two Design_discipline_item_definition (see 4.2.134) objects.

NOTE – This relationship does not comprise inheritance of data from the relating Design_discipline_item_definition to the related Design_discipline_item_definition.

Each Item_definition_relationship is either a Tool_part_relationship (see 4.2.467), a Replaced_definition_relationship (see 4.2.377), a Geometrical_relationship (see 4.2.219), a Make_from_relationship (see 4.2.273), or a General_item_definition_relationship (see 4.2.199).

The data associated with an Item_definition_relationship are the following:

- related;
- relating.

4.2.240.1 related

The related specifies the second of the Design_discipline_item_definition (see 4.2.134) objects that are part of the relationship.

NOTE – The semantic of this attribute is defined by the specializations of Item_definition_relationship.

See 4.3.706 for the application assertion.

4.2.240.2 relating

The relating specifies the first of the Design_discipline_item_definition (see 4.2.134) objects that are part of the relationship.

NOTE – The semantic of this attribute is defined by the specializations of Item_definition_relationship.

See 4.3.706 for the application assertion.

4.2.241 Item_instance

An Item_instance is the occurrence of an object that is defined either as a Design_discipline_item_definition (see 4.2.134) or as a Product_specification (see 4.2.354). An Item_instance shall be used at least once as an Item_solution (see 4.2.246) or in an Assembly_component_relationship (see 4.2.26).

EXAMPLE 135 – In the case of a car the Item (see 4.2.236) 'wheel' is defined once. This Design_discipline_item_definition (see 4.2.134) carries all the information defining the wheel (e.g. its shape) that is independent from its usage. Additionally there are 5 Item_instance objects for this wheel since there are 5 equal wheels used in a car: Front-left, front-right, rear-left, rear-right, and spare wheel. Each of these instances may carry additional information like placement.

Each Item_instance is either a Single_instance (see 4.2.404), a Quantified_instance (see 4.2.365), or a Selected_instance (see 4.2.392).

The data associated with an Item_instance are the following:

- definition;
- description;
- id.

4.2.241.1 definition

The definition specifies the Design_discipline_item_definition (see 4.2.134) or the Product_specification (see 4.2.354) that serves as a definition for this particular occurrence.

See 4.3.707 and 4.3.709 for the application assertions.

There shall be exactly one object that defines the definition for an Item_instance.

4.2.241.2 description

The description specifies additional information about the Item_instance.

See 4.3.708 for the application assertion.

The description need not be specified for a particular Item_instance.

If present, there shall be exactly one object that defines the description for an Item_instance.

4.2.241.3 id

The id specifies the identifier of the Item_instance.

4.2.242 Item_instance_relationship

An Item_instance_relationship is a relationship between two Item_instance (see 4.2.241) objects.

NOTE – This relationship does not comprise inheritance of data from the relating Item_instance to the related Item_instance.

Each Item_instance_relationship is either a General_item_instance_relationship (see 4.2.200), a Same_time_machining_relationship (see 4.2.389), or a Replaced_usage_relationship (see 4.2.378).

The data associated with an Item_instance_relationship are the following:

- related;
- relating.

4.2.242.1 related

The related specifies the second of the two objects related by the Item_instance_relationship.

NOTE – The semantic of this attribute is defined by the specializations of Item_instance_relationship.

See 4.3.710 for the application assertion.

4.2.242.2 relating

The relating specifies the first of the two objects related by the Item_instance_relationship.

NOTE – The semantic of this attribute is defined by the specializations of Item_instance_relationship.

See 4.3.710 for the application assertion.

4.2.243 Item_property

An Item_property is a characteristic of an item.

An Item_property is a type of Property (see 4.2.361).

Each Item_property is either a General_item_property (see 4.2.201), a Recyclability (see 4.2.375), an Item_cost_property (see 4.2.238), a Mass (see 4.2.274), a Material_property (see 4.2.279), or an Item_quality_property (see 4.2.244).

The data associated with an Item_property are the following:

- described_object.

The described_object specifies the object that the Item_property is associated to.

See 4.3.711, 4.3.712, 4.3.713, 4.3.714, 4.3.715, 4.3.716, 4.3.717, 4.3.718, 4.3.719, 4.3.720, 4.3.721, 4.3.722, 4.3.723, 4.3.724, 4.3.725, 4.3.726, 4.3.727, and 4.3.728 for the application assertions.

There shall be exactly one object that defines the described_object for an Item_property.

4.2.244 Item_quality_property

An Item_quality_property is a property that documents the results of any quality measure process.

EXAMPLE 136 – Within prototype building several alternate manufacturing technologies are tested. An Item_quality_property for the resulting parts, used tools, and the used process operations may document the level of reached quality for the parts.

An Item_quality_property is a type of Item_property (see 4.2.243).

The data associated with an Item_quality_property are the following:

- description;
- quality_property_value.

4.2.244.1 description

The description specifies additional information about the Item_quality_property.

See 4.3.729 for the application assertion.

The description need not be specified for a particular Item_quality_property.

If present, there shall be exactly one object that defines the description for an Item_quality_property.

4.2.244.2 quality_property_value

The quality_property_value specifies the value of the Item_quality_property.

NOTE – The interpretation of this value, e.g., whether the value is required or calculated, is dependent on the semantics of the attribute 'value_interpretation' of the referenced Property_value.

See 4.3.730 for the application assertion.

4.2.245 Item_shape

An Item_shape is the definition of the shape of an Item_version (see 4.2.248).

Each Item_shape may be a Featured_shape (see 4.2.179).

The data associated with an Item_shape are the following:

- described_object;
- description.

4.2.245.1 described_object

The described_object specifies the object that the Item_shape defines the shape for.

See 4.3.731, 4.3.732, 4.3.733, 4.3.734, and 4.3.735 for the application assertions.

There shall be exactly one object that defines the described_object for an Item_shape.

4.2.245.2 description

The description specifies additional information about the Item_shape.

See 4.3.736 for the application assertion.

The description need not be specified for a particular Item_shape.

If present, there shall be exactly one object that defines the description for an Item_shape.

4.2.246 Item_solution

An Item_solution is a solution to a functional requirement. It specifies a set of items that jointly fulfill the same functional requirements. The Item_solution objects for the same base represent the mutually exclusive alternatives. In the case where the attribute 'base element' refers to another Item_solution there shall not be an instance of Item_solution_relationship (see 4.2.247) relating these two Item_solution objects.

NOTE – An Item_solution may refer directly to the functional requirement that is represented as a Product_component (see 4.2.350) or to another Item_solution in which case it serves as a refinement of that Item_solution.

Each Item_solution is either a Technical_solution (see 4.2.451), a Final_item_solution (see 4.2.182), or a Supplier_solution (see 4.2.433).

The data associated with an Item_solution are the following:

- base_element;
- id;
- version_id.

4.2.246.1 base_element

The base_element specifies the object the Item_solution provides solutions for.

See 4.3.737 and 4.3.738 for the application assertions.

There shall be exactly one object that defines the base_element for an Item_solution.

4.2.246.2 id

The id specifies the identifier of the Item_solution.

4.2.246.3 version_id

The version_id specifies the identification of a particular version of an Item_solution.

The version_id need not be specified for a particular Item_solution.

4.2.247 Item_solution_relationship

An Item_solution_relationship is a relationship between two Item_solution (see 4.2.246) objects. The related Item_solution shall not refer to the relating Item_solution as 'base_element'.

The data associated with an Item_solution_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.247.1 description

The description specifies additional information about the Item_solution_relationship.

See 4.3.740 for the application assertion.

The description need not be specified for a particular Item_solution_relationship.

If present, there shall be exactly one object that defines the description for an Item_solution_relationship.

4.2.247.2 related

The related specifies the second of the two Item_solution (see 4.2.246) objects related by the Item_solution_relationship.

See 4.3.739 for the application assertion.

4.2.247.3 relating

The relating specifies the first of the two Item_solution (see 4.2.246) objects related by the Item_solution_relationship.

See 4.3.739 for the application assertion.

4.2.247.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'derivation': The application object defines a relationship where the related Item_solution is derived from the relating Item_solution;

- 'sequence': This type of Item_solution_relationship defines a version sequence where the relating Item_solution (see 4.2.246) is the preceding version and the related Item_solution is the following version.

EXAMPLE 137 – The relation_type 'derivation' may be used if the relating Item_solution serves as the base for the development of the related Item_solution (e.g. in the case of process planning).

4.2.248 Item_version

An Item_version is the identification of a physically realizable object. It collects the information defining this object.

NOTE 1 – An Item_version may be produced, consumed, used to produce other Item_version objects, or offered to the market.

NOTE 2 – The collection of defining information may be incomplete, i.e. not all of the defining Design_discipline_item_definition (see 4.2.134) objects are associated with an Item_version (see 4.2.248).

NOTE 3 – The set of Item_version objects of an Item represents the history of an Item within a particular life cycle stage or over the whole life cycle.

The data associated with an Item_version are the following:

- associated_item;

- description;

- id.

4.2.248.1 associated_item

The associated_item specifies the Item (see 4.2.236) with which the Item_version is associated.

See 4.3.741 for the application assertion.

4.2.248.2 description

The description specifies additional information about the Item_version.

See 4.3.742 for the application assertion.

The description need not be specified for a particular Item_version.

If present, there shall be exactly one object that defines the description for an Item_version.

4.2.248.3 id

The id specifies the identifier of the Item_version. The id shall be unique within the scope of the associated Item (see 4.2.236).

NOTE – A particular object is identified by the id of Item_version that serves to identify the particular version coupled with the id of the associated Item that serves to identify the generic object.

4.2.249 Item_version_relationship

An Item_version_relationship is a relationship between two Item_version (see 4.2.248) objects.

NOTE – There is no inheritance of data between the two related Item_version objects.

The data associated with an Item_version_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.249.1 description

The description specifies additional information about the Item_version_relationship.

See 4.3.744 for the application assertion.

The description need not be specified for a particular Item_version_relationship.

If present, there shall be exactly one object that defines the description for an Item_version_relationship.

4.2.249.2 related

The related specifies the second of the two Item_version (see 4.2.248) objects related by the Item_version_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.743 for the application assertion.

4.2.249.3 relating

The relating specifies the the first of the two Item_version (see 4.2.248) objects related by the Item_version_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.743 for the application assertion.

4.2.249.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

– 'hierarchy': The application object defines a hierarchical relationship where the related Item_version is a sub version of the relating Item_version (e.g. revision 1.1 and 1.2);

– 'sequence': The application object defines a version sequence where the relating Item_version is the preceding version and the related Item_version is the following version. For an Item_version there shall be at the most one Item_version_relationship of this relation_type as relating and at most one Item_version_relationship of this relation_type as related;

– 'derivation': The application object defines a deriving relationship where the related Item_version is based on the relating Item_version which is an earlier version of the same or of a different Item (see 4.2.236);

– 'alias': The application object defines a relationship where the related Item_version is an alias for the relating Item_version. In this case the Item associated with the two Item_version objects shall be different.

EXAMPLE 138 – Usually items that are provided by suppliers have a different id at the supplier's site than on the manufacturer's site: an item that is identified in a company by the identifier 'C425' and the version id 'V2.0' may correspond to an item the supplier identifies as '2X45' with the version id 'V3.2'.

NOTE – For Item_version the concept of Alias_identification (see 4.2.7) is not used. Instead the Item_version_relationship with relation type 'alias' is used. In the case of Item_version there is other information besides id and version id, such as the name or attached approval information, that may also be different.

4.2.250 Joggle_feature

A Joggle_feature is a change in elevation of a face along a rim designed to accommodate either clearance for the insertion of another part or a contact point for attachment of another part.

EXAMPLE 139 – Figure 38 illustrates the meaning of the various parameters defining a Joggle_-feature.

A Joggle_feature is a type of Process_feature_in_panel (see 4.2.334).

The data associated with a Joggle_feature are the following:

- defining_path;
- direction_angle_at_path_end;
- direction_angle_at_path_start;
- height;
- slope_angle_at_path_end;
- slope_angle_at_path_start;
- termination.

4.2.250.1 defining_path

The defining_path specifies the Linear_path (see 4.2.268) whose start and end point in combination with the angles at path start and path end define the location and orientation of the side walls of the Joggle_feature. The Linear_path shall be defined in the same Cartesian_coordinate_-space (see 4.2.44) as the Joggle_feature and shall be coplanar with the panel.

See 4.3.747 for the application assertion.

4.2.250.2 direction_angle_at_path_end

The direction_angle_at_path_end specifies an angle between 0 degrees and 90 degrees that is measured between the Linear_path (see 4.2.268) and a line starting at the end point of the Linear_path and being directed towards the rim of the panel that shall have the Joggle_feature. This line shall be coplanar with the panel, with the Linear_path and with one side wall of the Joggle_feature.

See 4.3.745 for the application assertion.

4.2.250.3 direction_angle_at_path_start

The direction_angle_at_path_start specifies an angle between 0 degrees and 90 degrees that is measured between the Linear_path (see 4.2.268) and a line starting at the start point of the

Linear_path and being directed towards the rim of the panel that shall have the Joggle_feature. This line shall be coplanar with the panel, with the Linear_path and with one side wall of the Joggle_feature.

See 4.3.745 for the application assertion.

4.2.250.4 height

The height specifies the distance between the panel surface and the top face of the Joggle_feature.

See 4.3.745 for the application assertion.

4.2.250.5 slope_angle_at_path_end

The slope_angle_at_path_end specifies the slope angle of that side wall of the Joggle_feature that is defined by the line starting at the end of the Linear_path (see 4.2.268).

See 4.3.745 for the application assertion.

4.2.250.6 slope_angle_at_path_start

The slope_angle_at_path_start specifies the slope angle of that side wall of the Joggle_feature that is defined by the line starting at the start of the Linear_path (see 4.2.268).

See 4.3.745 for the application assertion.

4.2.250.7 termination

The termination specifies the Joggle_termination (see 4.2.251) that defines the Joggle_feature's end condition.

See 4.3.746 for the application assertion.

4.2.251 Joggle_termination

A Joggle_termination is the end condition specifying the termination of a Joggle_feature (see 4.2.250).

Each Joggle_termination is either a Face_termination (see 4.2.169) or a Value_termination (see 4.2.484).

4.2.252 Kinematic_configuration_definition

A Kinematic_configuration_definition is a configuration of a kinematic structure in terms of pair parameter sets.

The data associated with a Kinematic_configuration_definition are the following:

- pair_values;

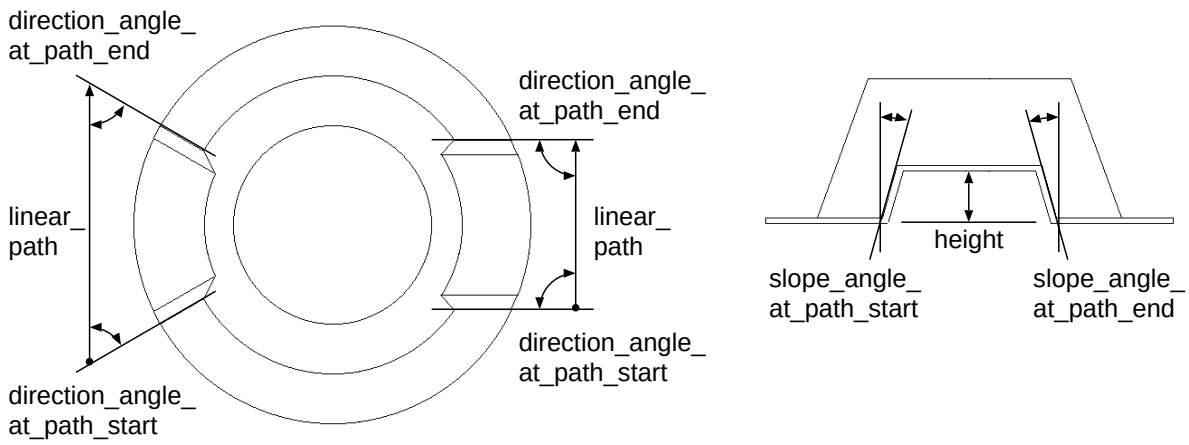

Figure 38 – Parameters defining a Joggle_feature

– t_parameter.

4.2.252.1 pair_values

The pair_values specifies the set of values applied to the pairs that specify a Kinematic_configuration_definition.

See 4.3.748 for the application assertion.

4.2.252.2 t_parameter

The t_parameter specifies the parameter associated to the Kinematic_configuration_definition.

See 4.3.749 for the application assertion.

4.2.253 Kinematic_configuration_interpolation

A Kinematic_configuration_interpolation is the specification of the interpolation of the configurations between two configuration definitions.

The data associated with a Kinematic_configuration_interpolation are the following:

– interpolation_type;

– next_definition;

– previous_definition.

4.2.253.1 interpolation_type

The interpolation_type specifies the type of interpolation from the previous configuration definition to the next.

4.2.253.2 next_definition

The next_definition specifies the Kinematic_configuration_definition (see 4.2.252) at which the interpolation ends.

See 4.3.750 for the application assertion.

4.2.253.3 previous_definition

The previous_definition specifies the Kinematic_configuration_definition (see 4.2.252) from which the interpolation starts.

See 4.3.750 for the application assertion.

4.2.254 Kinematic_joint

A Kinematic_joint is the topological aspect of an ordered connection between exactly two links. The orientation is always implicitly associated with a joint. This orientation points from the first link to the second link.

EXAMPLE 140 – In case of a rack and pinion pair the orientation of the Kinematic_joint would reflect the transformation to a link representing the pinion.

A Kinematic_joint is a type of Detailed_model_element (see 4.2.137).

The data associated with a Kinematic_joint are the following:

- first_link;
- pair;
- second_link.

4.2.254.1 first_link

The first_link specifies the first link of the ordered connection at the Kinematic_joint.

See 4.3.751 for the application assertion.

4.2.254.2 pair

The pair specifies the geometric constraints of the Kinematic_joint (see 4.2.254).

See 4.3.752 for the application assertion.

4.2.254.3 second_link

The second_link specifies the second link of the ordered connection at the Kinematic_joint.

See 4.3.751 for the application assertion.

4.2.255 Kinematic_link

A Kinematic_link is the topological information associated with a rigid part of a Kinematic_mechanism (see 4.2.257).

A Kinematic_link is a type of Detailed_model_element (see 4.2.137).

The data associated with a Kinematic_link are the following:

- representation.

The representation specifies the geometrical representation and the implicit link frame of the Kinematic_link.

See 4.3.753 for the application assertion.

4.2.256 Kinematic_link_representation

A Kinematic_link_representation is the description of the geometry of a Kinematic_link (see 4.2.255).

The data associated with a Kinematic_link_representation are the following:

- additional_reference_frame;
- physical_description.

4.2.256.1 additional_reference_frame

The additional_reference_frame specifies additional frames that are attached to the Kinematic_link_representation.

See 4.3.755 for the application assertion.

4.2.256.2 physical_description

The physical_description specifies the shape of the Kinematic_link_representation (see 4.2.256). The physical_description may also define the mass properties of the Kinematic_link_representation.

See 4.3.754 for the application assertion.

4.2.257 Kinematic_mechanism

A Kinematic_mechanism is a Kinematic_structure (see 4.2.259) and the position of this Kinematic_structure relative to the reference coordinate system of the parent object. A Kinematic_-

mechanism describes a mechanical product whose motion is constrained by joints.

The data associated with a Kinematic_mechanism are the following:

- base;
- base_placement;
- structure_definition.

4.2.257.1 base

The base specifies the Kinematic_link (see 4.2.255) relative to that all the other Kinematic_link objects may move. The base may be a part of another Kinematic_mechanism.

EXAMPLE 141 – A gripping tool attached to the end of a robot arm is an example for base.

This does not mean that Kinematic_mechanism objects are limited to those which have the same base at all times.

EXAMPLE 142 – In space applications, e.g., worm-like mechanisms have been designed that grab to a space-structure with one end, move on with the other end, fix themselves with an end-effector, and then loosen the original grip.

See 4.3.756 for the application assertion.

4.2.257.2 base_placement

The base_placement describes the rigid placement of the link frame of the base relative to the reference coordinate system of the parent object of the mechanism.

See 4.3.758 for the application assertion.

4.2.257.3 structure_definition

The structure_definition specifies the Kinematic_structure (see 4.2.259) that makes up the Kinematic_mechanism.

See 4.3.757 for the application assertion.

4.2.258 Kinematic_pair

A Kinematic_pair represents the kinematic restriction between two adjacent Kinematic_link (see 4.2.255) objects coinciding in a Kinematic_joint (see 4.2.254).

EXAMPLE 143 – Figure 39 shows an example for placement relationships between kinematic pair frames and mating links.

The data associated with a Kinematic_pair are the following:

- transformation_item_1;
- transformation_item_2.

4.2.258.1 transformation_item_1

The transformation_item_1 specifies the rigid placement of the pair frame relative to the link frame for the first Kinematic_link (see 4.2.255) referenced by the Kinematic_joint (see 4.2.254) associated with the Kinematic_pair.

See 4.3.759 for the application assertion.

4.2.258.2 transformation_item_2

The transformation_item_2 specifies the rigid placement of the pair frame relative to the link frame for the second Kinematic_link (see 4.2.255) referenced by the Kinematic_joint (see 4.2.254) associated with the Kinematic_pair.

See 4.3.759 for the application assertion.

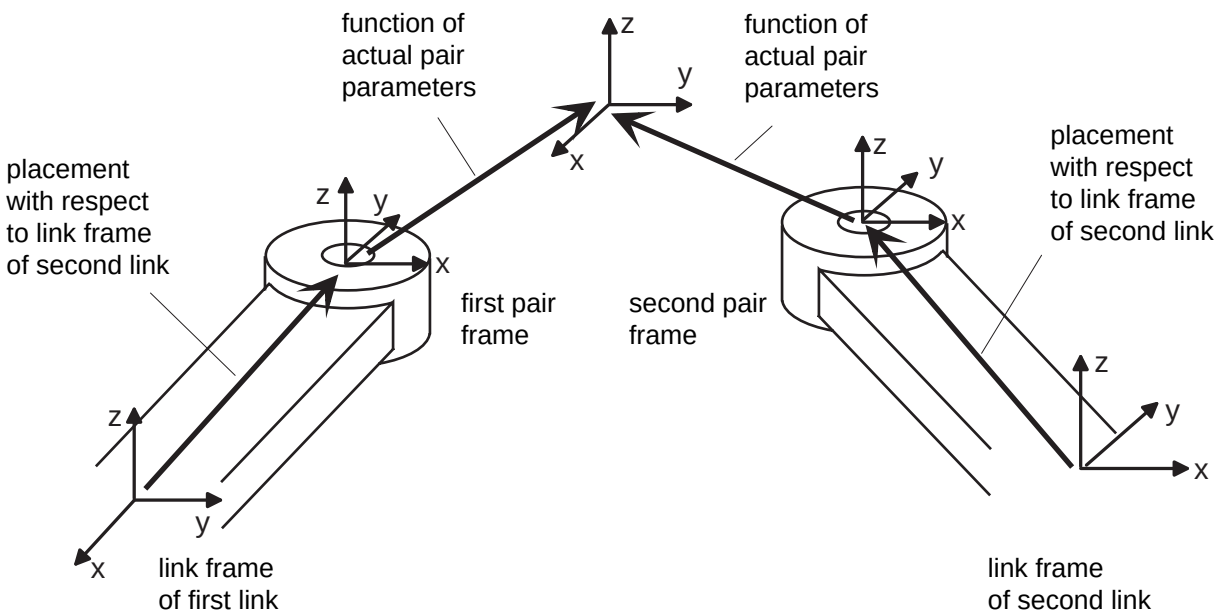

Figure 39 – Placement relationships kinematic pair frames and mating links

4.2.259 Kinematic_structure

A Kinematic_structure specifies the topological aspects of a kinematic representation. The topology of the Kinematic_structure is represented by means of kinematic joints, which in turn, establish a relationship between pairs of kinematic links.

A Kinematic_structure is a type of Detailed_model_element (see 4.2.137).

The data associated with a Kinematic_structure are the following:

- joint.

The joint specifies the Kinematic_joint (see 4.2.254) that is part of the Kinematic_structure (see 4.2.259).

See 4.3.760 for the application assertion.

4.2.260 Kinematic_transformation_result

A Kinematic_transformation_result is the result information of a kinematic simulation of a kinematic mechanism.

The data associated with a Kinematic_transformation_result are the following:

- is_applied_to;
- result.

4.2.260.1 is_applied_to

The is_applied_to specifies the mechanism whose motion produced the results.

See 4.3.762 for the application assertion.

4.2.260.2 result

The result specifies the result information of the Kinematic_transformation_result that is an interpolated configuration sequence defining the motion of a kinematic structure through interpolations.

See 4.3.761 for the application assertion.

4.2.261 Layer

A Layer is a general structure for the collection of geometric and annotation elements. Layers shall not be nested, i.e., a layer cannot be put on another layer.

EXAMPLE 144 – The design of a mechanical part as a B_rep_model (see 4.2.35) is performed in several steps:

- creation of wireframe elements;
- use the wireframe elements to design the surfaces;
- use the surfaces to design the B_rep_model.

The elements created in each stage are put on separate layers. After the creation of the B_rep_model the wireframe elements can be looked at as 'auxiliary geometry' that becomes the purpose of its layer. The visibility control of the layer is usually used to display only the B_rep_model or to display the auxiliary wireframe elements in addition, e.g., for design changes.

The data associated with a Layer are the following:

- description;
- element;
- id.

4.2.261.1 description

The description specifies additional information about the Layer.

See 4.3.764 for the application assertion.

The description need not be specified for a particular Layer.

If present, there shall be exactly one object that defines the description for a Layer.

4.2.261.2 element

The element specifies a piece of product data that is collected by a Layer.

NOTE – Although not explicitly modelled in the ARM, the element can be on various levels of granularity, e.g., a whole B-rep-model or a single Cartesian point.

See 4.3.763 for the application assertion.

4.2.261.3 id

The id specifies the identifier of the Layer.

4.2.262 Leader

A Leader directs a dimension, a note, or a symbol to the intended place or point on a geometric or annotation element that is part of a Drawing_sheet (see 4.2.152), a View (see 4.2.490), a View_area (see 4.2.491), or of a Geometric_model (see 4.2.211).

A Leader is a type of Annotation_curve (see 4.2.14).

Each Leader may be an Associated_leader (see 4.2.31).

The data associated with a Leader are the following:

- terminator.

The terminator specifies an annotation symbol that is applied to a leader and used to identify the endpoint or point of application of the directed annotation.

See 4.3.765 for the application assertion.

The terminator need not be specified for a particular Leader.

4.2.263 Light_source

A Light_source is a luminous source that affects the display of surfaces of three-dimensional geometric models within a defined Model_image (see 4.2.284).

The data associated with a Light_source are the following:

- colour;
- light_type;
- view.

4.2.263.1 colour

The colour specifies the colour of a light source that is defined by the intensities of red, green, and blue proportions. The colour is either userdefined or predefined. Figure 19 shows the predefined colours.

The colour need not be specified for a particular Light_source.

4.2.263.2 light_type

The light_type specifies the kind of Light_source, such as directional, positional, spot light, or ambient. Position and attenuation as well as additional characteristics of the Light_source are specified dependent on the kind of Light_source. The position of the Light_source, if needed to be specified, is defined in the Cartesian coordinate space of the shape model.

4.2.263.3 view

The view specifies the Model_image (see 4.2.284) that the Light_source is applied to.

See 4.3.766 for the application assertion.

4.2.264 Limits_and_fits

A Limits_and_fits contains the necessary information to express a tolerance of the limits-and-fits system standardized by ISO 286.

The data associated with a Limits_and_fits are the following:

- deviation;
- fitting_type;
- grade.

4.2.264.1 deviation

The deviation specifies the enumeration of limits and fits class descriptors by characters.

NOTE – The characters 'A' to 'CZ' for holes or 'a' to 'cz' for shafts according to the ISO 286 system 'limits-and-fits' may be used for deviation.

4.2.264.2 fitting_type

The fitting_type specifies whether a tolerance declaration within the limits and fits system relates to a shaft or a hole.

The fitting_type need not be specified for a particular Limits_and_fits.

4.2.264.3 grade

The grade specifies the quality or accuracy grade of a tolerance.

NOTE – The grade may be based on the international standard tolerance grade IT01 to IT18.

4.2.265 Line

A Line is an unbounded curve that is defined by a point and a vector. The positive direction of the line is in the direction of the vector and the magnitude of the vector controls the parametrization.

A Line is a type of Curve (see 4.2.102).

4.2.266 Linear_bead_end_type

A Linear_bead_end_type is an end condition of a bead feature that shall follow a linear path out of the material.

A Linear_bead_end_type is a type of Bead_end_type (see 4.2.38).

The data associated with a Linear_bead_end_type are the following:

- end_length;
- end_shape.

4.2.266.1 end_length

The end_length specifies the length of the Linear_bead_end_type.

4.2.266.2 end_shape

The end_shape specifies if the linear bead end is straight on the panel surface or tapered towards the end point.

4.2.267 Linear_distance_dimension

A Linear_distance_dimension is a dimension where the distance is calculated between two elements along a linear path.

A Linear_distance_dimension is a type of Location_dimension (see 4.2.270).

The data associated with a Linear_distance_dimension are the following:

- directed;
- orientation.

4.2.267.1 directed

The directed specifies a logical value designating the importance of direction for measuring a Linear_distance_dimension. If the value is 'true' the Linear_distance_dimension is measured from origin to target. A value of 'false' indicates that the direction for measuring Linear_distance_dimension is inconsequential.

4.2.267.2 orientation

The orientation specifies a point and a direction along which the Linear_distance_dimension is measured.

4.2.268 Linear_path

A Linear_path is a direction of travel along a line.

EXAMPLE 145 – Figure 40 illustrates a Linear_path.

A Linear_path is a type of Path (see 4.2.304).

The data associated with a Linear_path are the following:

- distance;
- is_defined_by.

4.2.268.1 distance

The distance specifies the length of the Linear_path.

See 4.3.768 for the application assertion.

4.2.268.2 is_defined_by

The is_defined_by specifies the Axis_placement (see 4.2.33) that defines the location of the start point and the direction of the Linear_path. The start point is the origin of the Axis_placement and the direction is the z-axis of the Axis_placement.

The Axis_placement is defined in the same Cartesian_coordinate_space (see 4.2.44) as the Linear_path. In the case where the Linear_path is used to define the sweep path of a profile the x-y-plane of the Axis_placement shall coincide with the x-y-plane of the profile.

See 4.3.767 for the application assertion.

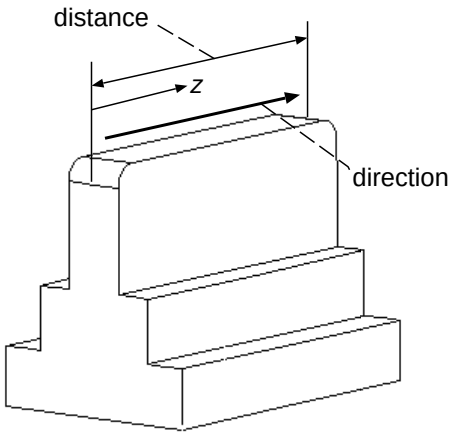

Figure 40 – Linear_path

4.2.269 Linear_profile_tolerance

A Linear_profile_tolerance is the definition of a uniform boundary along the true profile within which the elements of the surface must lie. The tolerance zone established by a Linear_profile_tolerance is two dimensional, extending along the length of the considered feature as a whole respectively along each segment of a defined size if the segment attribute is specified.

A Linear_profile_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Linear_profile_tolerance are the following:

- affected_plane;
- datum.

4.2.269.1 affected_plane

The affected_plane specifies the plane a certain type of geometric tolerance applies in. This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane attribute is not specified the tolerance applies in all directions which results in a cylindrical tolerance zone (on drawings indicated by the diameter symbol).

See 4.3.770 for the application assertion.

The affected_plane need not be specified for a particular Linear_profile_tolerance.

4.2.269.2 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.769 for the application assertion.

4.2.270 Location_dimension

A Location_dimension is a dimension characterized as the distance between two elements of geometry or annotation (origin and target).

A Location_dimension is a type of Geometric_dimension (see 4.2.210).

Each Location_dimension is either a Curved_distance_dimension (see 4.2.107), a Linear_distance_dimension (see 4.2.267), or an Angular_location_dimension (see 4.2.11).

The data associated with a Location_dimension are the following:

- origin;
- target.

4.2.270.1 origin

The origin specifies the geometric or annotation element which the Location_dimension is associated with as origin.

See 4.3.771, 4.3.772, 4.3.773, and 4.3.774 for the application assertions.

There shall be exactly one object that defines the origin for a Location_dimension.

4.2.270.2 target

The target specifies the geometric or annotation element which the Location_dimension is associated with as target.

See 4.3.771, 4.3.772, 4.3.773, and 4.3.774 for the application assertions.

There shall be exactly one object that defines the target for a Location_dimension.

4.2.271 Locator_feature

A Locator_feature is a conical impression in a panel used to locate the panel in the tooling.

NOTE – Locator_feature objects are usually created in early die strikes for further stamping.

A Locator_feature is a type of Process_feature_in_panel (see 4.2.334).

The data associated with a Locator_feature are the following:

- diameter;
- tip_angle;

- tip_radius.

4.2.271.1 diameter

The diameter specifies the diameter of the cone on the panel's surface.

See 4.3.775 for the application assertion.

4.2.271.2 tip_angle

The tip_angle specifies the opening angle of the cone.

See 4.3.775 for the application assertion.

4.2.271.3 tip_radius

The tip_radius specifies the radius of the rounded cone tip.

See 4.3.775 for the application assertion.

4.2.272 Lot_configuration

A Lot_configuration is a Configuration (see 4.2.89) that applies for a given production batch of a product.

A Lot_configuration is a type of Configuration (see 4.2.89).

The data associated with a Lot_configuration are the following:

- lot_id;
- lot_size.

4.2.272.1 lot_id

The lot_id specifies the identification of the batch for which the Lot_configuration applies.

4.2.272.2 lot_size

The lot_size specifies the size of the batch for which the Lot_configuration applies.

4.2.273 Make_from_relationship

A Make_from_relationship is a relationship between a Design_discipline_item_definition (see 4.2.134) defining raw material or semi finished parts (related) and a Design_discipline_item_definition defining the Item_version (see 4.2.248) manufactured out of that (relating).

NOTE – The inherited attribute related specifies the raw material or semi finished item, and the inherited attribute relating specifies the manufactured item.

A Make_from_relationship is a type of Item_definition_relationship (see 4.2.240).

The data associated with a Make_from_relationship are the following:

- description;
- name.

4.2.273.1 description

The description specifies additional information about the Make_from_relationship.

See 4.3.776 for the application assertion.

The description need not be specified for a particular Make_from_relationship.

If present, there shall be exactly one object that defines the description for a Make_from_relationship.

4.2.273.2 name

The name specifies the word or group of words by which the Make_from_relationship is referred to.

See 4.3.776 for the application assertion.

The name need not be specified for a particular Make_from_relationship.

If present, there shall be exactly one object that defines the name for a Make_from_relationship.

4.2.274 Mass

A Mass is a quantity of matter that an item contains.

A Mass is a type of Item_property (see 4.2.243).

The data associated with a Mass are the following:

- mass_property_value.

The mass_property_value specifies the value of the Mass.

NOTE – The interpretation of this value, e.g., whether the value is required or calculated, is dependent on the semantics of the attribute 'value_interpretation' of the referenced Property_value.

See 4.3.777 for the application assertion.

4.2.275 Mated_item_association

A Mated_item_association is a relationship between a Mating_definition (see 4.2.282) and an Item_instance (see 4.2.241) that is used within the Mating_definition.

A Mated_item_association is a type of Item_definition_instance_relationship (see 4.2.239).

The data associated with a Mated_item_association are the following:

- relating.

The relating specifies the Mating_definition (see 4.2.282) that is the result of the mating operation.

See 4.3.778 for the application assertion.

4.2.276 Mated_item_relationship

A Mated_item_relationship is a relationship between two Mated_item_association (see 4.2.275) objects. This relationship specifies additional information about the mating of two particular items that go into a Mating_definition (see 4.2.282). The two Mated_item_association objects that are referenced by the Mated_item_relationship shall refer to the same Mating_definition.

The data associated with a Mated_item_relationship are the following:

- mated_shape;
- mating_material;
- related;
- relating;
- transformation.

4.2.276.1 mated_shape

The mated_shape specifies the Shape_aspect_relationship (see 4.2.395) that relates the two Shape_aspect (see 4.2.394) objects that form the area of mating contact.

See 4.3.782 for the application assertion.

The mated_shape need not be specified for a particular Mated_item_relationship.

4.2.276.2 mating_material

The mating_material specifies the Material (see 4.2.277) used for the mounting.

See 4.3.781 for the application assertion.

4.2.276.3 related

The related specifies the second of the two Mated_item_association (see 4.2.275) objects related by the Mated_item_relationship.

See 4.3.780 for the application assertion.

4.2.276.4 relating

The relating specifies the first of the two Mated_item_association (see 4.2.275) objects related by the Mated_item_relationship.

See 4.3.780 for the application assertion.

4.2.276.5 transformation

The transformation specifies the Transformation (see 4.2.472) that shall be used to place the Geometric_model (see 4.2.211) representing the shape of the Item_instance (see 4.2.241) obtained by the related Mated_item_association relative to the Geometric_model representing the shape of the Item_instance obtained by the relating Mated_item_association.

In the case where the transformation is realized by a Template_instance (see 4.2.453) the scale factor of that Template_instance shall be omitted or set to 1.

See 4.3.779 and 4.3.783 for the application assertions.

The transformation need not be specified for a particular Mated_item_relationship.

If present, there shall be exactly one object that defines the transformation for a Mated_item_-relationship.

4.2.277 Material

A Material is the substance out of which an Item (see 4.2.236) is or can be made.

NOTE – For the specification of the raw material from which an Item is made the object Item is used with an attached Specific_classification (see 4.2.414) with classification type 'item role' and classification name 'raw material'. That object represents the material item with possibly additional information, like identification of supplier, quantity, size of the raw stock etc. and it can be used in corresponding relationships such as Make_from_relationship (see 4.2.273) or for a Process_operation (see 4.2.336).

The data associated with a Material are the following:

- described_object;
- material_property;
- name.

4.2.277.1 described_object

The described_object specifies the object a Material is applied to.

See 4.3.784, 4.3.785, 4.3.786, 4.3.787, 4.3.788, 4.3.789, 4.3.790, 4.3.791, 4.3.792, 4.3.793, 4.3.795, 4.3.796, 4.3.797, 4.3.798, 4.3.799, 4.3.800, 4.3.801, and 4.3.802 for the application assertions.

There shall be exactly one object that defines the described_object for a Material.

4.2.277.2 material_property

The material_property specifies a Material_property_representation (see 4.2.280) that describes the Material.

See 4.3.794 for the application assertion.

4.2.277.3 name

The name specifies the word or group of words by which the Material is referred to.

4.2.278 Material_condition

A Material_condition is the representation of a condition for a part surface wherein it contains the amount of material. The usage of material conditions is defined in ISO 2692.

NOTE – Tolerances of position are determined by a material condition of mating surfaces.

The data associated with a Material_condition are the following:

- condition.

The condition specifies the kind of Material_condition

EXAMPLE 146 – Maximum material condition (MMC) and least material condition (LMC) are examples for a Material_condition.

4.2.279 Material_property

A Material_property is a characteristic that depends on material aspects. The specification of the property is independent from the material definition for a part or tool.

A Material_property is a type of Item_property (see 4.2.243).

The data associated with a Material_property are the following:

- description;
- material_property_value;
- property_name.

4.2.279.1 description

The description specifies additional information about the Material_property.

EXAMPLE 147 – 'elastic modulus', 'yield point', 'wear rate', and 'corrosion behaviour' are examples for the description.

See 4.3.804 for the application assertion.

The description need not be specified for a particular Material_property.

If present, there shall be exactly one object that defines the description for a Material_property.

4.2.279.2 material_property_value

The material_property_value specifies the value for the Material_property.

See 4.3.803 for the application assertion.

4.2.279.3 property_name

The property_name specifies the kind of Material_property.

EXAMPLE 148 – 'EM1' is an example for a property_name that may be associated with a Material_property that is described as 'elastic modulus'.

4.2.280 Material_property_representation

A Material_property_representation is the representation of material related physical or technological properties and characteristics.

The data associated with a Material_property_representation are the following:

- environment_condition;
- property_value.

4.2.280.1 environment_condition

The environment_condition specifies the Data_environment (see 4.2.110) under which specific values are valid for particular properties.

See 4.3.805 for the application assertion.

4.2.280.2 property_value

The property_value specifies the Property_value (see 4.2.364) that represents the value for the Material_property_representation (see 4.2.280).

NOTE – The interpretation of this value, e.g., whether the value is required or calculated, is dependent on the semantics of the attribute 'value_interpretation' of the referenced Property_value.

See 4.3.806 for the application assertion.

4.2.281 Material_side_specification

A Material_side_specification is the information necessary to identify that side of a sheet like object where the material is.

The data associated with a Material_side_specification are the following:

- direction;
- is_defined_in;

– position.

4.2.281.1 direction

The direction specifies a vector that indicates the material direction.

4.2.281.2 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) in which the position and the direction of the Material_side_specification are defined.

NOTE – Usually this is the same instance of Cartesian_coordinate_space as that of the object that has the corresponding Thickness (see 4.2.456) property assigned to it.

See 4.3.807 for the application assertion.

4.2.281.3 position

The position specifies a point on the surface of the sheet like object used as a start point to specify the material direction.

See 4.3.808 for the application assertion.

4.2.282 Mating_definition

A Mating_definition is a view of an Item_version (see 4.2.248) defining the physical connection of two or more Item_instance (see 4.2.241) objects including technical information about the kind of connection. This information is independent from the hierarchical assembly structure.

A Mating_definition is a type of Design_discipline_item_definition (see 4.2.134).

The data associated with a Mating_definition are the following:

– mating_type.

The mating_type specifies the kind of mating, i.e., how the items shall be mated together. Where applicable the following values shall be used:

– 'bolted joint': Attachment of two or more parts that are screwed together using screws, bolt nuts, and washers;

– 'brazing': Attachment of two or more parts established by soldering or brazing;

– 'clasping': Attachment of two or more parts established by using a cramp at one common outer border;

– 'clinching': Attachment of two or more parts established by pressing these parts together and stamping texture at the the point of contact;

– 'clipping': Attachment of two or more parts established by a clip (e.g. fixing the inner door panel at the inner door plate);

– 'doweling': Attachment of two or more parts using a pin that is fit into each of the parts by pressing;

– 'flanging': Attachment of two or more parts by crimping a projected length of one part over the edge of the other part;

– 'foam injection': Attachment of two or more parts where foam is injected into a cavity to establish the connection;

– 'glueing': Attachment of two parts established by adhesion material;

– 'laser-welding': Attachment of two or more parts that are welded together using laser technique;

– 'press fit': Attachment of two or more parts obtained by forces resulting from the selected size tolerances;

– 'riveting': Attachment of two or more parts that are riveted together at a certain spot using a rivet;

– 'sewing': Attachment of two or more parts that are sewn together (e.g. upholstering cloth for seat pillow);

– 'spot welding': Attachment of two or more parts that are welded together at a certain welding spot;

– 'stapling': Attachment of two or more parts at a certain spot using a nail or a wire stitch to establish the connection;

– 'welding': Attachment of two or more parts by welding together with one weld bead.

4.2.283 Model_change

A Model_change is a mechanism to describe the differences between two objects concerning the models describing these objects.

The data associated with a Model_change are the following:

– added_element;

– change_description;

– deleted_element;

– description;

– id;

– is_describing.

4.2.283.1 added_element

The added_element specifies the Detailed_element (see 4.2.135) that has been added to the relating model of the described model relationship.

See 4.3.810 for the application assertion.

4.2.283.2 change_description

The change_description specifies the model relationship that identifies the original (relating) model and the changed (related) model.

See 4.3.811, 4.3.813, and 4.3.814 for the application assertions.

There shall be exactly one object that defines the change_description for a Model_change.

4.2.283.3 deleted_element

The deleted_element specifies the Detailed_element (see 4.2.135) that has been deleted from the relating model of the described model relationship and therefore do not exist in the related model.

See 4.3.810 for the application assertion.

4.2.283.4 description

The description specifies additional information about the Model_change.

See 4.3.812 for the application assertion.

There shall be exactly one object that defines the description for a Model_change.

4.2.283.5 id

The id specifies the identifier of the Model_change.

The id need not be specified for a particular Model_change.

4.2.283.6 is_describing

The is_describing specifies the Change (see 4.2.54) that collects the Model_change objects and the Property_change (see 4.2.362) objects.

See 4.3.809 for the application assertion.

4.2.284 Model_image

A Model_image is a mechanism to generate a two-dimensional picture from two-dimensional or three-dimensional geometric or annotation elements. The mechanism is defined by clipping, scaling, and projecting information.

The data associated with a Model_image are the following:

- clipping;
- is_displaying;
- is_presented_in;
- name;
- scale;
- view_projection;
- view_volume_placement.

4.2.284.1 clipping

The clipping specifies the mathematical information necessary to define a two-dimensional area (clipping box) or a three-dimensional volume (clipping volume) that encloses all viewable geometric or annotation elements of a Styled_model (see 4.2.429) or of an External_model (see 4.2.166). Only those elements, or portions of elements, that fall within this two-dimensional area or three-dimensional volume shall be displayed.

The clipping need not be specified for a particular Model_image.

4.2.284.2 is_displaying

The is_displaying specifies the Styled_model (see 4.2.429) or the External_model (see 4.2.166) that contains the information to be processed for display.

See 4.3.815 and 4.3.817 for the application assertions.

There shall be exactly one object that the Model_image is_displaying.

4.2.284.3 is_presented_in

The is_presented_in specifies the View (see 4.2.490) within a Drawing_sheet (see 4.2.152) or View_area (see 4.2.491) the picture defined by the Model_image is presented in.

See 4.3.818 for the application assertion.

4.2.284.4 name

The name specifies the word or group of words by which the Model_image is referred to.

See 4.3.816 for the application assertion.

The name need not be specified for a particular Model_image.

If present, there shall be exactly one object that defines the name for a Model_image.

4.2.284.5 scale

The scale specifies the ratio between the size of the elements as defined in the shape model and the size of the elements as presented in the view. The default value for scale is 1.0.

4.2.284.6 view_projection

The view_projection specifies the type of projection that shall be either 'central' or 'parallel'.

4.2.284.7 view_volume_placement

The view_volume_placement specifies the transformation of a geometric or annotation element that is defined in the coordinate space of the Styled_model (see 4.2.429) to a target element in the coordinated space of the View (see 4.2.490) in which the Styled_model is presented.

4.2.285 Moments_of_inertia

A Moments_of_inertia describes the law of inertia in the context of the rotation of a rigid body. The moments of inertia I are described with a symmetric second level tensor:

$$I = \begin{pmatrix} I_xx & -I_xy & -I_xz \\ -I_yx & I_yy & -I_yz \\ -I_zx & -I_zy & I_zz \end{pmatrix}$$

A Moments_of_inertia is a type of Shape_dependent_property (see 4.2.396).

The data associated with a Moments_of_inertia are the following:

- inertia_value;
- is_defined_in;
- value_interpretation.

4.2.285.1 inertia_value

The inertia_value specifies 9 Value_with_unit (see 4.2.485) objects that are the values in a symmetric second level tensor.

See 4.3.820 for the application assertion.

4.2.285.2 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) that the Moments_of_-inertia is defined in.

See 4.3.819 for the application assertion.

4.2.285.3 value_interpretation

The value_interpretation specifies information on how the Moments_of_inertia shall be interpreted.

NOTE – The Moments_of_inertia may be specified in the design stage of a product but it may also be documented as determined by measurements on prototypes.

EXAMPLE 149 – The value_interpretation may be e.g., 'required', 'designed', 'estimated', or 'measured'.

4.2.286 Multi_language_string

A Multi_language_string represents text information, stored in one or more languages, that is associated with objects.

The data associated with a Multi_language_string are the following:

– language_dependent_string.

The language_dependent_string specifies the String_with_language (see 4.2.425) that represents the text information in a particular language.

See 4.3.821 for the application assertion.

4.2.287 Next_higher_assembly

A Next_higher_assembly is a relationship where the attribute related specifies a constituent of an assembly and the attribute relating specifies the immediate parent assembly of the constituent. A constituent may be a single part or an assembly.

EXAMPLE 150 – The assembly carburettor may be assembled of single parts. The power train assembly is formed of assemblies.

A Next_higher_assembly is a type of Assembly_component_relationship (see 4.2.26).

4.2.288 Ngon_profile

A Ngon_profile is a profile that is specified by an enclosed area bounded by 3 or more connected straight lines. One side of the Ngon_profile is parallel to the x-axis of the local coordinate system of the profile respectively of the Axis_placement (see 4.2.33) serving as parameter_reference. This side intersects the y-axis at a negative value as shown in figure 41. The centre of the Ngon_profile is located in the origin.

A Ngon_profile is a type of Closed_profile (see 4.2.71).

The data associated with a Ngon_profile are the following:

- circumscribed_radius;
- corner_radius;
- number_of_sides.

4.2.288.1 circumscribed_radius

The circumscribed_radius specifies the radius of the circle circumscribing the Ngon_profile.

See 4.3.822 for the application assertion.

4.2.288.2 corner_radius

The corner_radius specifies the size of an arc blend between any two sides of the Ngon_profile. The corner_radius shall be smaller than $r \cdot cos(\frac{\pi}{n})$ where r is the circumscribed_radius and n is the number_of_sides.

See 4.3.822 for the application assertion.

The corner_radius need not be specified for a particular Ngon_profile.

4.2.288.3 number_of_sides

The number_of_sides specifies how many sides are needed for the Ngon_profile.

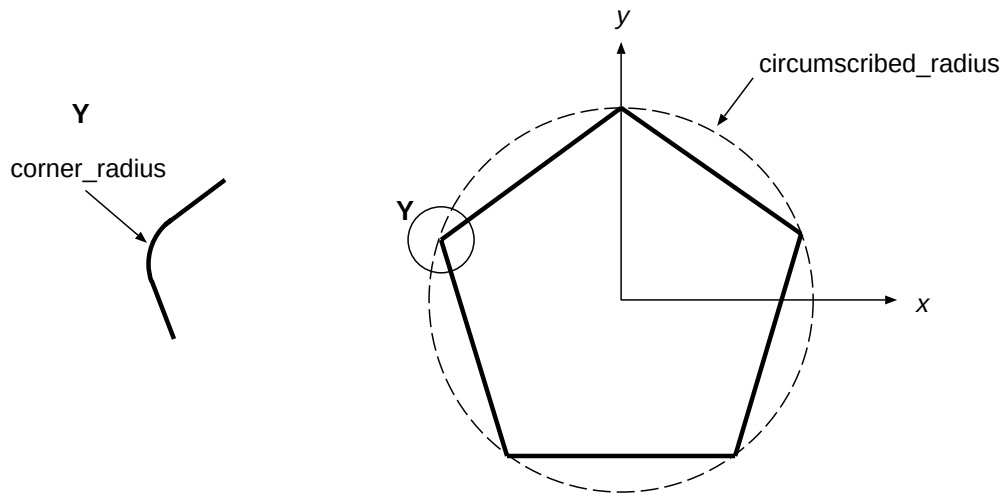

Figure 41 – Ngon_profile

4.2.289 Offset_curve

An Offset_curve is a curve in 2D or 3D space that is defined such that each point is at a fixed distance from the corresponding point on its basis curve. Furthermore the distance is perpendicular to the tangent vector at each point of the curve. The direction of the offset shall be defined. An Offset_curve shall not self-intersect and may reference any type of curve except another Offset_curve.

An Offset_curve is a type of Curve (see 4.2.102).

4.2.290 Offset_surface

An Offset_surface is a surface that is defined by offsetting a base surface by a distance along the surface normal of the basis surface.

An Offset_surface shall not self-intersect. The offset distance shall not exceed the radius of curvature in any direction at any point of the base surface, i.e., the surface shall not contain any ridge or singular point. The base surface shall not be a rectangular composite surface or another offset surface.

An Offset_surface is a type of Surface (see 4.2.434).

4.2.291 Open_bead_end_type

An Open_bead_end_type is an end condition of a bead that shall pass through the end of the part.

An Open_bead_end_type is a type of Bead_end_type (see 4.2.38).

4.2.292 Open_profile

An Open_profile is specified by an outline with two open ends.

An Open_profile is a type of Profile (see 4.2.355).

Each Open_profile is either a General_open_profile (see 4.2.202), a Tee_profile (see 4.2.452), a Vee_profile (see 4.2.487), a Square_u_profile (see 4.2.423), a Partial_circular_profile (see 4.2.303), or a Rounded_u_profile (see 4.2.388).

4.2.293 Open_slot_end_type

An Open_slot_end_type is an end condition of a slot specifying that the slot passes through the end of the shape of the part at this end.

An Open_slot_end_type is a type of Slot_end_type (see 4.2.406).

4.2.294 Organization

An Organization is a group of people involved in a particular business process.

The data associated with an Organization are the following:

- delivery_address;
- id;
- name;
- organization_type;
- postal_address;
- visitor_address.

4.2.294.1 delivery_address

The delivery_address specifies the address where to deliver goods to.

The delivery_address need not be specified for a particular Organization.

4.2.294.2 id

The id specifies the identifier of the Organization.

NOTE – The assignment of this attribute is usually controlled by a registration authority. The registration authority may be a public organization that assigns identifiers to corporations, or it may be the parent corporation that assigns component identifiers to its components.

EXAMPLE 151 – The Organization may be the code assigned to the Organization for a listing in a stock market, or it may be a department number.

4.2.294.3 name

The name specifies the word or group of words used to refer to the Organization.

4.2.294.4 organization_type

The organization_type specifies the type of the Organization.

EXAMPLE 152 – 'company', 'plant', or 'department' are examples for organization_type.

4.2.294.5 postal_address

The postal_address specifies the address for letter mail.

The postal_address need not be specified for a particular Organization.

4.2.294.6 visitor_address

The visitor_address specifies the address where the organization receives visitors.

The visitor_address need not be specified for a particular Organization.

4.2.295 Organization_in_contract

An Organization_in_contract is a mechanism to associate the person who is signing a contract and the organization which the person is signing for with a Contract (see 4.2.99).

The data associated with an Organization_in_contract are the following:

- contract;
- contracted_organization;
- role_of_organization;
- signature.

4.2.295.1 contract

The contract specifies the Contract (see 4.2.99) the Organization_in_contract participates in.

See 4.3.823 for the application assertion.

4.2.295.2 contracted_organization

The contracted_organization specifies the organization that participates in the contract.

See 4.3.826 for the application assertion.

4.2.295.3 role_of_organization

The role_of_organization specifies the function performed by the signing organization with respect to the contract.

EXAMPLE 153 – 'customer' or 'owner' are examples for role_of_organization.

See 4.3.825 for the application assertion.

There shall be exactly one object that defines the role_of_organization for an Organization_in_contract.

4.2.295.4 signature

The signature specifies the Date_and_person_or_organization (see 4.2.112) representing the person who signed the contract on behalf of the contracted organization and the date of the signature.

See 4.3.824 for the application assertion.

4.2.296 Organization_relationship

An Organization_relationship is a relationship between two organizations.

EXAMPLE 154 – A team belongs to a department which itself belongs to a company. This organizational structure may be built up using the Organization_relationship mechanism.

The data associated with an Organization_relationship are the following:

- related;
- relating;
- relation_type.

4.2.296.1 related

The related specifies the second Organization (see 4.2.294) in an Organization_relationship.

NOTE – The semantic of this attribute is defined by the attribute 'relation_type'.

See 4.3.827 for the application assertion.

4.2.296.2 relating

The relating specifies the one organization in an Organization_relationship.

NOTE – The semantic of this attribute is defined by the attribute 'relation_type'.

See 4.3.827 for the application assertion.

4.2.296.3 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'hierarchy': The related Organization (see 4.2.294) is a sub organization of the relating Organization;
- 'correspondance': The related Organization is actually the same as the relating Organization;
- 'succession': The related Organization is the successor of the relating Organization.

4.2.297 Oriented_edge_curve

An Oriented_edge_curve is a bounded segment of a curve. The Oriented_edge_curve is of finite length and is defined from the edge_start vertex to the edge_end vertex following the curve defined

by the edge_geometry. Additionally an Oriented_edge_curve has an associated orientation that specifies the mathematical sense of an Oriented_edge_curve. The Oriented_edge_curve shall not self-intersect.

The data associated with an Oriented_edge_curve are the following:

- edge_end;
- edge_geometry;
- edge_start.

4.2.297.1 edge_end

The edge_end specifies the second and last vertex of the edge. In the case of an edge that forms a close loop the edge_end will be identical to the edge_start.

See 4.3.836 for the application assertion.

4.2.297.2 edge_geometry

The edge_geometry specifies a curve that represents the shape of an edge. The extent of the edge is confined to that section of the curve between the start and end vertex.

See 4.3.828, 4.3.829, 4.3.830, 4.3.831, 4.3.832, 4.3.833, 4.3.834, and 4.3.835 for the application assertions.

There shall be exactly one object that defines the edge_geometry for an Oriented_edge_curve.

4.2.297.3 edge_start

The edge_start specifies the first vertex of an edge.

See 4.3.836 for the application assertion.

4.2.298 Pair_value

A Pair_value is one particular value of the pair parameter of a Kinematic_pair (see 4.2.258). A Pair_value shall represent either a cylindrical pair value, a gear pair value, a planar pair value, a prismatic pair value, a rack and pinion pair value, a revolute pair value, a rolling curve pair value, a rolling surface pair value, a screw pair value, a sliding curve pair value, a sliding surface pair value, a spherical pair value, or an universal pair value.

The data associated with a Pair_value are the following:

- is_applied_to.

The is_applied_to specifies the Kinematic_pair (see 4.2.258) that the Pair_value applies to.

See 4.3.837 for the application assertion.

4.2.299 Panel_hole_with_barring

A Panel_hole_with_barring is a hole in a panel where the material is not completely punched out but partially bended in the punch direction.

EXAMPLE 155 – Figure 42 shows an example of a Panel_hole_with_barring.

A Panel_hole_with_barring is a type of Hole_feature_in_panel (see 4.2.229).

The data associated with a Panel_hole_with_barring are the following:

– barring_profile.

The barring_profile specifies the Closed_profile (see 4.2.71) that represents that portion of the panel that is actually punched out.

NOTE – The difference in area between the barring_profile and the hole_profile is that portion of the panel that is bended at 90 degrees in punch direction.

See 4.3.838 for the application assertion.

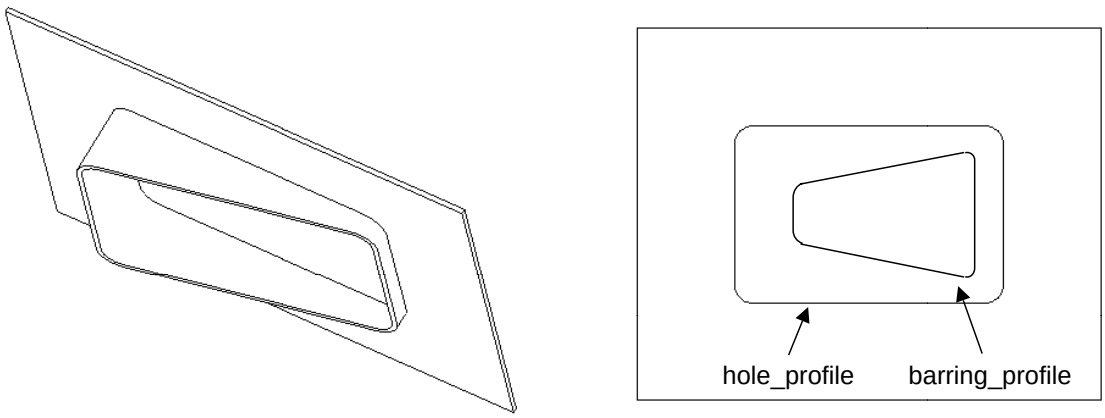

Figure 42 – Panel_hole_with_barring

4.2.300 Parabola

A Parabola is an open conic curve defined by its focal length (distance between focal point and apex), apex and the direction of the line joining the apex and focus.

A Parabola is a type of Curve (see 4.2.102).

4.2.301 Parallelism_tolerance

A Parallelism_tolerance is a tolerance for the condition of a surface equidistant at all points from a datum plane or of an axis equidistant along its length to a datum axis. A Parallelism_tolerance specifies one of the following:

– a tolerance zone by two planes or lines (if the attribute 'affected_plane' is specified) parallel to a datum plane, or axis, within which the line elements of the surface or axis of the considered feature must lie;

– a cylindrical tolerance zone whose axis is parallel to a datum axis within which the axis of the considered feature must lie.

A Parallelism_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Parallelism_tolerance are the following:

– affected_plane;

– datum;

– segment_size.

4.2.301.1 affected_plane

The affected_plane specifies the plane a certain type of geometric tolerance applies in. This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane attribute is not specified the tolerance applies in all directions which results in a cylindrical tolerance zone (on drawings indicated by the diameter symbol).

See 4.3.840 for the application assertion.

The affected_plane need not be specified for a particular Parallelism_tolerance.

4.2.301.2 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.839 for the application assertion.

4.2.301.3 segment_size

The segment_size specifies the length (or the edge length) of a segment if the geometric tolerance is not applied to the total length/area of an axis/surface but on a unit base (e.g. to each segment with a length of 20 mm).

The segment_size need not be specified for a particular Parallelism_tolerance.

4.2.302 Partial_circular_path

A Partial_circular_path is a path that is specified by a direction of travel along an arc of constant radius around an axis. The Partial_circular_path begins on the x-axis of the Axis_placement (see 4.2.33) and travels in positive direction around the z-axis.

EXAMPLE 156 – Figure 43 illustrates a Partial_circular_path.

A Partial_circular_path is a type of Circular_path (see 4.2.60).

The data associated with a Partial_circular_path are the following:

- sweep_angle.

The sweep_angle specifies the angle that defines the arc shaped path.

See 4.3.841 for the application assertion.

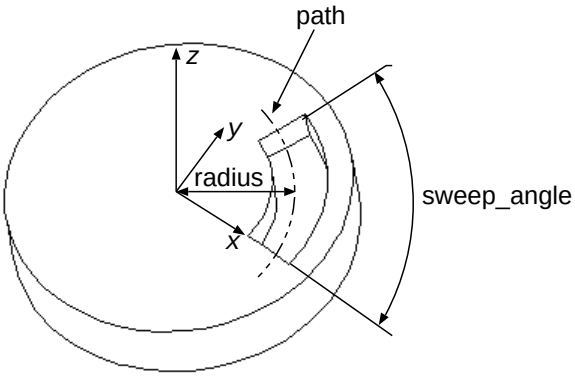

Figure 43 – Partial_circular_path

4.2.303 Partial_circular_profile

A Partial_circular_profile is a profile that is specified by a circular arc. The Partial_circular_profile starts at the reference x-axis and travels around the reference z-axis in positive direction.

EXAMPLE 157 – Figure 44 illustrates a Partial_circular_profile.

A Partial_circular_profile is a type of Open_profile (see 4.2.292).

The data associated with a Partial_circular_profile are the following:

- radius;
- sweep_angle.

4.2.303.1 radius

The radius specifies the radius of the arc to define a Partial_circular_profile.

See 4.3.842 for the application assertion.

4.2.303.2 sweep_angle

The sweep_angle specifies the size of the angle to define a Partial_circular_profile.

See 4.3.842 for the application assertion.

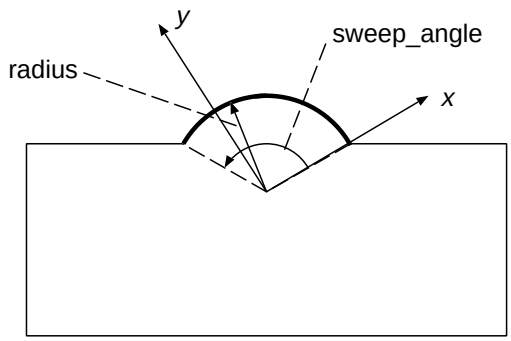

Figure 44 – Partial_circular_profile

4.2.304 Path

A Path is the representation of a continuous direction of travel.

Each Path is either a General_path (see 4.2.203), a Linear_path (see 4.2.268), or a Circular_path (see 4.2.60).

The data associated with a Path are the following:

– is_defined_in.

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) the Path is defined in. In the case where the Path is used to define an Included_feature (see 4.2.232) this coordinate space shall be the same as the part's coordinate space. In the case where the Path is used to define a feature that is applied as a Placed_feature (see 4.2.313) this coordinate space shall be the same as the feature's coordinate space.

See 4.3.843 for the application assertion.

4.2.305 Path_approximation

A Path_approximation is a motion parameter measure with or without units by which different discrete poses in the course of a kinematics motion are distinguished.

NOTE – In order to introduce time aspects the motion parameter may be defined with time units.

4.2.306 Perpendicularity_tolerance

A Perpendicularity_tolerance is a tolerance for the condition of a surface, median plane, or axis at a right angle to a datum plane or axis. A Perpendicularity_tolerance specifies one of the following:

– a tolerance zone defined by two parallel planes perpendicular to a datum plane, or axis, within which the surface or median plane of the considered feature must lie;

– a tolerance zone defined by two parallel planes perpendicular to a datum axis within which the axis of the considered feature must lie;

– a cylindrical tolerance zone (if the attribute 'affected_plane' is not specified) perpendicular to a datum plane within which the axis of the considered feature must lie;

– a tolerance zone defined by two parallel lines perpendicular to a datum plane, or axis, within which an element of the surface must lie.

A Perpendicularity_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Perpendicularity_tolerance are the following:

– affected_plane;

– datum;

– segment_size.

4.2.306.1 affected_plane

The affected_plane specifies the plane a certain type of geometric tolerance applies in. This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane attribute is not specified the tolerance applies in all directions which results in a cylindrical tolerance zone (on drawings indicated by the diameter symbol).

See 4.3.845 for the application assertion.

The affected_plane need not be specified for a particular Perpendicularity_tolerance.

4.2.306.2 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.844 for the application assertion.

4.2.306.3 segment_size

The segment_size specifies the length (or the edge length) of a segment if the geometric tolerance is not applied to the total length/area of an axis/surface but on a unit base (e.g. to each segment with a length of 20 mm).

The segment_size need not be specified for a particular Perpendicularity_tolerance.

4.2.307 Person

A Person is an individual human being who has some relationship to the product data. The Person shall always be identified in the context of one or more organizations.

The data associated with a Person are the following:

– address;

- id;
- name.

4.2.307.1 address

The address specifies the location of the office of the Person.

The address need not be specified for a particular Person.

4.2.307.2 id

The id specifies an identifier of the Person. The identifier shall be unique within the scope of an organization.

EXAMPLE 158 – The id may be a staff number or a user id in a computer system.

4.2.307.3 name

The name specifies the word or group of words used to refer to the Person.

NOTE – The name includes the first, middle, and last names as well as titles, if applicable.

The name need not be specified for a particular Person.

4.2.308 Person_in_organization

A Person_in_organization is the specification of a Person (see 4.2.307) in the context of an Organization (see 4.2.294).

The data associated with a Person_in_organization are the following:

- organization;
- person;
- role.

4.2.308.1 organization

The organization specifies the Organization (see 4.2.294) with which the Person (see 4.2.307) is associated.

See 4.3.846 for the application assertion.

4.2.308.2 person

The person specifies the Person (see 4.2.307).

See 4.3.847 for the application assertion.

4.2.308.3 role

The role specifies the relationship between the Person (see 4.2.307) and the Organization (see 4.2.294).

4.2.309 Person_or_organization_assignment

A Person_or_organization_assignment is an object that associateds an Organization (see 4.2.294) a Person (see 4.2.307), or a Person_in_organization (see 4.2.308) with an object.

The data associated with a Person_or_organization_assignment are the following:

- assigned_person_or_organization;
- is_applied_to;
- role.

4.2.309.1 assigned_person_or_organization

The assigned_person_or_organization specifies the concerned Organization (see 4.2.294), the Person (see 4.2.307), or the Person_in_organization (see 4.2.308).

See 4.3.870, 4.3.871, and 4.3.872 for the application assertions.

There shall be exactly one object that defines the assigned_person_or_organization for a Person_or_organization_assignment.

4.2.309.2 is_applied_to

The is_applied_to specifies the object with which the Person_or_organization_assignment is associated.

See 4.3.848, 4.3.849, 4.3.850, 4.3.851, 4.3.852, 4.3.853, 4.3.854, 4.3.855, 4.3.856, 4.3.857, 4.3.858, 4.3.859, 4.3.860, 4.3.861, 4.3.862, 4.3.863, 4.3.864, 4.3.865, 4.3.866, 4.3.867, 4.3.868, 4.3.869, 4.3.873, 4.3.874, 4.3.875, 4.3.876, 4.3.877, 4.3.878, 4.3.879, 4.3.880, 4.3.881, 4.3.882, 4.3.883, 4.3.884, 4.3.885, 4.3.886, 4.3.887, 4.3.888, and 4.3.889 for the application assertions.

There shall be exactly one object that the Person_or_organization_assignment is_applied_to.

4.2.309.3 role

The role specifies the responsibility of the assigned Person (see 4.2.307) or Organization (see 4.2.294) with respect to the object that it is applied to. Where applicable the following values shall be used:

- 'creator': The referenced object has been created by the Person or Organization;
- 'editor': The assigned Person or Organization is responsible for making any changes to any attribute of the referenced object;

– 'owner': The assigned Person or Organization owns the referenced object;

– 'customer': The assigned Person or Organization acts as a purchaser or consumer of the referenced object;

– 'custodian': The assigned Person or Organization is responsible for the existence and integrity of the referenced object.

4.2.310 Physical_instance

A Physical_instance is the denomination of a physically realized object that is identified either by a lot id or by a serial number.

The data associated with a Physical_instance are the following:

– description;

– is_based_on;

– lot_id;

– serial_number.

4.2.310.1 description

The description specifies additional information about the Physical_instance.

See 4.3.891 for the application assertion.

The description need not be specified for a particular Physical_instance.

If present, there shall be exactly one object that defines the description for a Physical_instance.

4.2.310.2 is_based_on

The is_based_on specifies the Product_specification (see 4.2.354) or the Item_version (see 4.2.248) that collects the information defining the Physical_instance.

See 4.3.890 and 4.3.892 for the application assertions.

There shall be exactly one object that the Physical_instance is_based_on.

4.2.310.3 lot_id

The lot_id specifies the identifier of the lot the Physical_instance is part of.

The lot_id need not be specified for a particular Physical_instance.

4.2.310.4 serial_number

The serial_number is an identifier that distinguishes one Physical_instance from another.

The serial_number need not be specified for a particular Physical_instance.

4.2.311 Physical_instance_usage

A Physical_instance_usage is a mechanism to relate one Physical_instance (see 4.2.310) as a component to another Physical_instance that plays the role of an assembly.

The data associated with a Physical_instance_usage are the following:

- physical_assembly;
- physical_component;
- role.

4.2.311.1 physical_assembly

The physical_assembly specifies the Physical_instance (see 4.2.310) that serves as the assembly in the physical structure.

See 4.3.894 for the application assertion.

4.2.311.2 physical_component

The physical_component specifies the Physical_instance (see 4.2.310) that serves as a component in the physical structure.

See 4.3.894 for the application assertion.

4.2.311.3 role

The role specifies the Item_instance (see 4.2.241) the physical component is the realization of.

See 4.3.893 for the application assertion.

4.2.312 Physical_model

A Physical_model is a model of the shape of a part made from, e.g., clay or wood in a specific scale.

> EXAMPLE 159 – A Physical_model may be used to get an impression of the future outlook of, e.g., a car or to use it, e.g., in a wind tunnel. Furthermore physical models are needed for cores of cast iron parts or for collision detection between parts or tools.

A Physical_model is a type of External_document (see 4.2.162).

The data associated with a Physical_model are the following:

- found_in;
- scale.

4.2.312.1 found_in

The found_in specifies information about the location where the Physical_model is kept.

EXAMPLE 160 – The found_in may be an address of an organization, e.g., of the storage where the Physical_model is stored, or an address of the person responsible for the Physical_model.

4.2.312.2 scale

The scale specifies the scale of the physical model.

EXAMPLE 161 – '2' which equals a ratio of 2:1 and '0,2' which equals a ratio of 1:5 are examples for scale.

4.2.313 Placed_feature

A Placed_feature is the identification of a feature that is defined in its own coordinate space and placed into a reference coordinate space by a Feature_placement (see 4.2.178) that carries a geometric Transformation (see 4.2.472).

NOTE 1 – A Placed_feature may or may not have shape representation.

NOTE 2 – A Placed_feature is supposed to have all information necessary to create the part's shape resulting from the application of the feature.

A Placed_feature is a type of Feature_occurrence (see 4.2.176).

The data associated with a Placed_feature are the following:

- definition;
- is_placed_by.

4.2.313.1 definition

The definition specifies the Feature_definition (see 4.2.175) that has all information (type and parameters) that is needed to modify the part's shape as a result from the application of the feature.

See 4.3.895 for the application assertion.

4.2.313.2 is_placed_by

The is_placed_by specifies the Feature_placement (see 4.2.178) that is used to place the feature in a reference coordinate space.

See 4.3.896 for the application assertion.

4.2.314 Placed_target

A Placed_target is a target that is described implicitly by parameters with reference to its parameter_reference.

A Placed_target is a type of Datum_target (see 4.2.118).

Each Placed_target is either a Target_circle (see 4.2.447), a Target_point (see 4.2.449), a Target_rectangle (see 4.2.450), or a Target_line (see 4.2.448).

The data associated with a Placed_target are the following:

- is_defined_in;
- parameter_reference.

4.2.314.1 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) that the Axis_placement (see 4.2.33) that serves as parameter_reference is defined in.

NOTE – A Placed_target is not defined in its own local and independent coordinate system.

See 4.3.898 for the application assertion.

4.2.314.2 parameter_reference

The parameter_reference specifies the Axis_placement (see 4.2.33) that the parameters or the Placed_target refer to.

See 4.3.897 for the application assertion.

4.2.315 Planar_bottom_condition

A Planar_bottom_condition is a bottom of a Pocket_feature_in_solid (see 4.2.321) that is flat.

A Planar_bottom_condition is a type of Pocket_bottom_condition (see 4.2.320).

The data associated with a Planar_bottom_condition are the following:

- floor_location;
- floor_normal;
- floor_radius.

4.2.315.1 floor_location

The floor_location specifies a Cartesian point that is defined in the same Cartesian_coordinate_space (see 4.2.44) as the concerned Pocket_feature_in_solid (see 4.2.321) and that shall be a point on the planar bottom.

4.2.315.2 floor_normal

The floor_normal specifies a direction vector that is defined in the same coordinate space as the concerned Pocket_feature_in_solid (see 4.2.321) and that indicates a direction normal to the planar bottom and pointing away from material.

4.2.315.3 floor_radius

The floor_radius specifies the blend radius at the bottom and the side edges of the Pocket_-feature_in_solid (see 4.2.321).

See 4.3.899 for the application assertion.

The floor_radius need not be specified for a particular Planar_bottom_condition.

4.2.316 Planar_top_condition

A Planar_top_condition is a top condition of a boss that is flat.

A Planar_top_condition is a type of Boss_top_condition (see 4.2.43).

The data associated with a Planar_top_condition are the following:

- top_location;
- top_normal.

4.2.316.1 top_location

The top_location specifies a Cartesian point that is defined in the same Cartesian_coordinate_-space (see 4.2.44) as the concerned Boss_feature (see 4.2.42) and that shall be a point on the planar top.

4.2.316.2 top_normal

The top_normal specifies a direction vector that is defined in the same coordinate space as the concerned Boss_feature (see 4.2.42) and that indicates a direction normal to the planar top and pointing away from material.

4.2.317 Plane

A Plane is an unbounded surface with a constant normal.

NOTE – A Plane is trimmed to a finite extension by applying a Face (see 4.2.167).

A Plane is a type of Surface (see 4.2.434).

4.2.318 Plus_minus_tolerance

A Plus_minus_tolerance is the specification of the allowable deviation from a theoretically exact geometric dimension. The Plus_minus_tolerance is represented by a delta value that is to be subtracted from the associated nominal value and by another delta value that is to be added to the associated nominal value.

The data associated with a Plus_minus_tolerance are the following:

- lower_bound;
- upper_bound.

4.2.318.1 lower_bound

The lower_bound specifies the value of the tolerance that shall be subtracted from the dimension value or from the feature parameter value to establish the minimum allowable deviation boundary.

4.2.318.2 upper_bound

The upper_bound specifies the value of the tolerance that shall be added to the dimension value or to the feature parameter value to establish the maximum allowable deviation boundary.

4.2.319 Plus_minus_toleranced_datum

A Plus_minus_toleranced_datum is an entry in a general tolerance table cell that is a plus minus tolerance range specified by a value with unit.

The data associated with a Plus_minus_toleranced_datum are the following:

- tolerance_value.

The tolerance_value specifies the value with unit that gives the tolerance range between the minus value and the plus value.

4.2.320 Pocket_bottom_condition

A Pocket_bottom_condition is the definition of a kind of bottom that characterizes a Pocket_feature_in_solid (see 4.2.321).

Each Pocket_bottom_condition is either a Through_bottom_condition (see 4.2.459), a Planar_bottom_condition (see 4.2.315), or a General_bottom_condition (see 4.2.191).

The data associated with a Pocket_bottom_condition are the following:

- is_applied_to.

The is_applied_to specifies to which end of the path the Pocket_bottom_condition applies. The following values shall be used:

– 'start': The Pocket_bottom_condition is applied to that end of the Pocket_feature_in_solid (see 4.2.321) that corresponds to the start of the defining Linear_path (see 4.2.268);

– 'end': The Pocket_bottom_condition is applied to that end of the Pocket_feature_in_solid that corresponds to the end of the defining Linear_path.

4.2.321 Pocket_feature_in_solid

A Pocket_feature_in_solid is a volume of defined shape to be removed from the part.

A Pocket_feature_in_solid is a type of Process_feature_in_solid (see 4.2.335).

Each Pocket_feature_in_solid is either a Rectangular_open_pocket_in_solid (see 4.2.373), a Rectangular_closed_pocket_in_solid (see 4.2.369), or a General_pocket_in_solid (see 4.2.205).

The data associated with a Pocket_feature_in_solid are the following:

– bottom_condition;

– profile_placement;

– sweep_path;

– taper.

4.2.321.1 bottom_condition

The bottom_condition specifies the Pocket_bottom_condition (see 4.2.320) that defines the type of the pocket bottom.

See 4.3.904 for the application assertion.

4.2.321.2 profile_placement

The profile_placement specifies a geometric Transformation (see 4.2.472) that may be used to place the defining Closed_profile (see 4.2.71) in the Pocket_feature_in_solid's coordinate space.

See 4.3.905 for the application assertion.

The profile_placement need not be specified for a particular Pocket_feature_in_solid.

4.2.321.3 sweep_path

The sweep_path specifies the Linear_path (see 4.2.268) that is used to sweep the Closed_profile (see 4.2.71).

See 4.3.903 for the application assertion.

4.2.321.4 taper

The taper specifies a variation of the size of the Pocket_feature_in_solid. The variation shall be specified either by an Angle_taper (see 4.2.10) or by a Directed_taper (see 4.2.145) but not by a Diameter_taper (see 4.2.138).

See 4.3.900, 4.3.901, and 4.3.902 for the application assertions.

The taper need not be specified for a particular Pocket_feature_in_solid.

If present, there shall be exactly one object that defines the taper for a Pocket_feature_in_solid.

4.2.322 Point

A Point is a location in a real Cartesian coordinate space.

A Point is a type of Detailed_geometric_model_element (see 4.2.136).

Each Point is either a Point_on_surface (see 4.2.328), a Point_on_curve (see 4.2.327), or a Cartesian_point (see 4.2.47).

4.2.323 Point_appearance

A Point_appearance governs the visual appearance of a point.

The data associated with a Point_appearance are the following:

- colour;
- marker.

4.2.323.1 colour

The colour specifies the colour of a point. The colour is either userdefined or predefined. Figure 19 shows the predefined colours.

4.2.323.2 marker

The marker specifies the point marker that shall be used to present a point. Figure 45 shows the predefined point markers.

4.2.324 Point_direction

A Point_direction is the location in space of a single axis.

EXAMPLE 162 – The Point_direction may be used to describe the position and orientation of a machining tool.

A Point_direction is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Point_direction are the following:

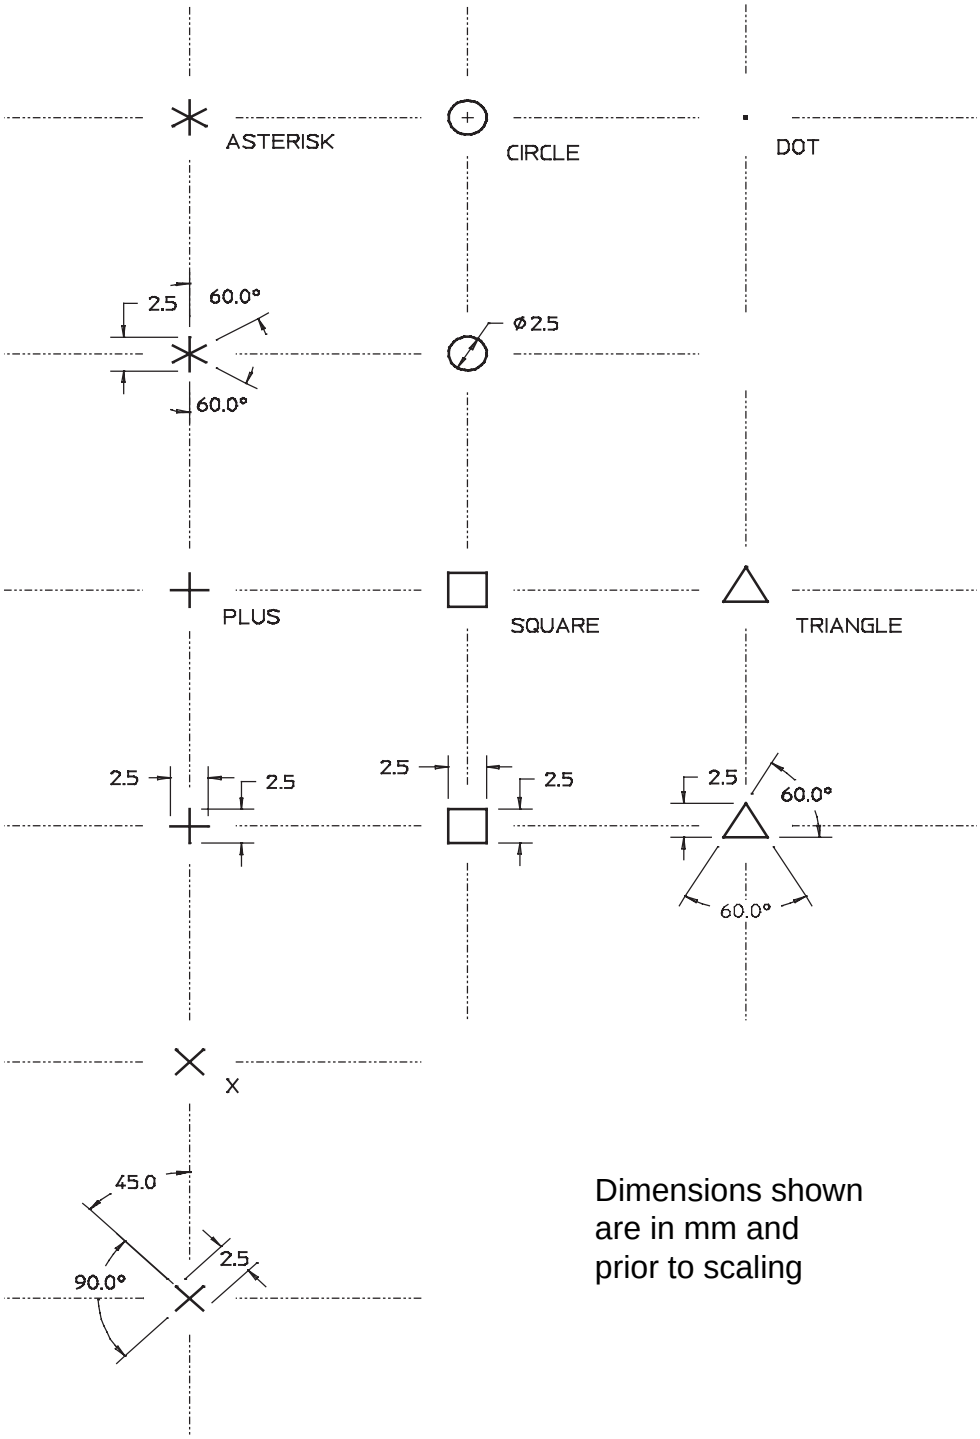

Figure 45 – Predefined point markers

- location;
- vector.

4.2.324.1 location

The location specifies the position of the Point_direction (see 4.2.324) in space.

See 4.3.906 for the application assertion.

4.2.324.2 vector

The vector specifies the direction of the Point_direction in space.

4.2.325 Point_direction_model

A Point_direction_model is a model in three dimensional space consisting only of ordered sequences of points or points with associated directions.

EXAMPLE 163 – For scanned data along planar intersections of a part, several point direction sequences can be used to specify the measured points together with the measured normal direction on the object's surface in their sequence along the planar intersection. Another example is the specification of a tool path where the sequence specifies the tool path as a polygon and the direction specifies the direction of the tool, e.g., a miller, in each point of the path.

A Point_direction_model is a type of Geometric_model (see 4.2.211).

The data associated with a Point_direction_model are the following:

- point;
- point_direction.

4.2.325.1 point

The point specifies the Point_sequence (see 4.2.329) elements of a Point_direction_model.

See 4.3.908 for the application assertion.

4.2.325.2 point_direction

The point_direction specifies the Point_direction_sequence (see 4.2.326) elements of a Point_direction_model.

See 4.3.907 for the application assertion.

4.2.326 Point_direction_sequence

A Point_direction_sequence is an ordered list of points and associated directions.

EXAMPLE 164 – A Point_direction_sequence may be used to represent the consecutive locations of a cutting tool during a machining operation.

A Point_direction_sequence is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Point_direction_sequence are the following:

– element.

The element specifies the Point_direction (see 4.2.324) objects or the Point_on_surface (see 4.2.328) objects that define the consecutive points and the appropriate axis directions. In the case of a Point_on_surface the direction is the cross product of the principal tangent vectors u and v.

See 4.3.909 and 4.3.910 for the application assertions.

There shall be at least one object that defines the element for a Point_direction_sequence.

4.2.327 Point_on_curve

A Point_on_curve is a point that is defined by evaluating a given curve at a specified parameter value.

A Point_on_curve is a type of Point (see 4.2.322).

4.2.328 Point_on_surface

A Point_on_surface is a point that is defined in the domain of a surface. Its location in 3D geometric space is found by evaluating the surface at a particular pair of parameter values.

NOTE – The object implicitly represents the topological relation between a point and a surface.

A Point_on_surface is a type of Point (see 4.2.322).

4.2.329 Point_sequence

A Point_sequence is an ordered list of points.

A Point_sequence is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Point_sequence are the following:

– element.

The element specifies the point elements that define the consecutive points.

See 4.3.911 for the application assertion.

4.2.330 Poly_loop

A Poly_loop is a loop with straight edges. It is represented by an ordered coplanar collection of Cartesian points forming the vertices of the Poly_loop. The loop is composed of straight line segments joining a point in the collection to the succeeding point in the collection. The closing

segment is from the last to the first point in the collection. The direction of the Poly_loop is in the direction of the line segments.

The data associated with a Poly_loop are the following:

- outer;
- polygon.

4.2.330.1 outer

The outer specifies whether the Poly_loop represents the outer boundary of the Faceted_face (see 4.2.174) or not.

4.2.330.2 polygon

The polygon specifies the points that are joined by line segments to form a Poly_loop (see 4.2.330).

See 4.3.912 for the application assertion.

4.2.331 Polyline

A Polyline is a curve that is represented by n-1 linear segments, defined by a list of n points, whereby two following points may be identical. A Polyline may be closed and may self-intersect.

A Polyline is a type of Curve (see 4.2.102).

4.2.332 Position_tolerance

A Position_tolerance is the definition of a zone within which the centre, axis, or centre plane of a feature of size is permitted to vary from true (theoretically exact) position. Basic dimensions establish the true position from specified datum features and between interrelated features. The concept of position tolerances is defined in ISO 5458.

A Position_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Position_tolerance are the following:

- affected_plane;
- datum.

4.2.332.1 affected_plane

The affected_plane specifies the plane a certain type of geometric tolerance applies in. This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane attribute is not specified the tolerance applies in all directions which results in a cylindrical tolerance zone (on drawings indicated by the diameter symbol).

EXAMPLE 165 – Figure 46 illustrates the meaning of the affected_plane in the case of a Position_-tolerance.

See 4.3.914 for the application assertion.

The affected_plane need not be specified for a particular Position_tolerance.

4.2.332.2 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.913 for the application assertion.

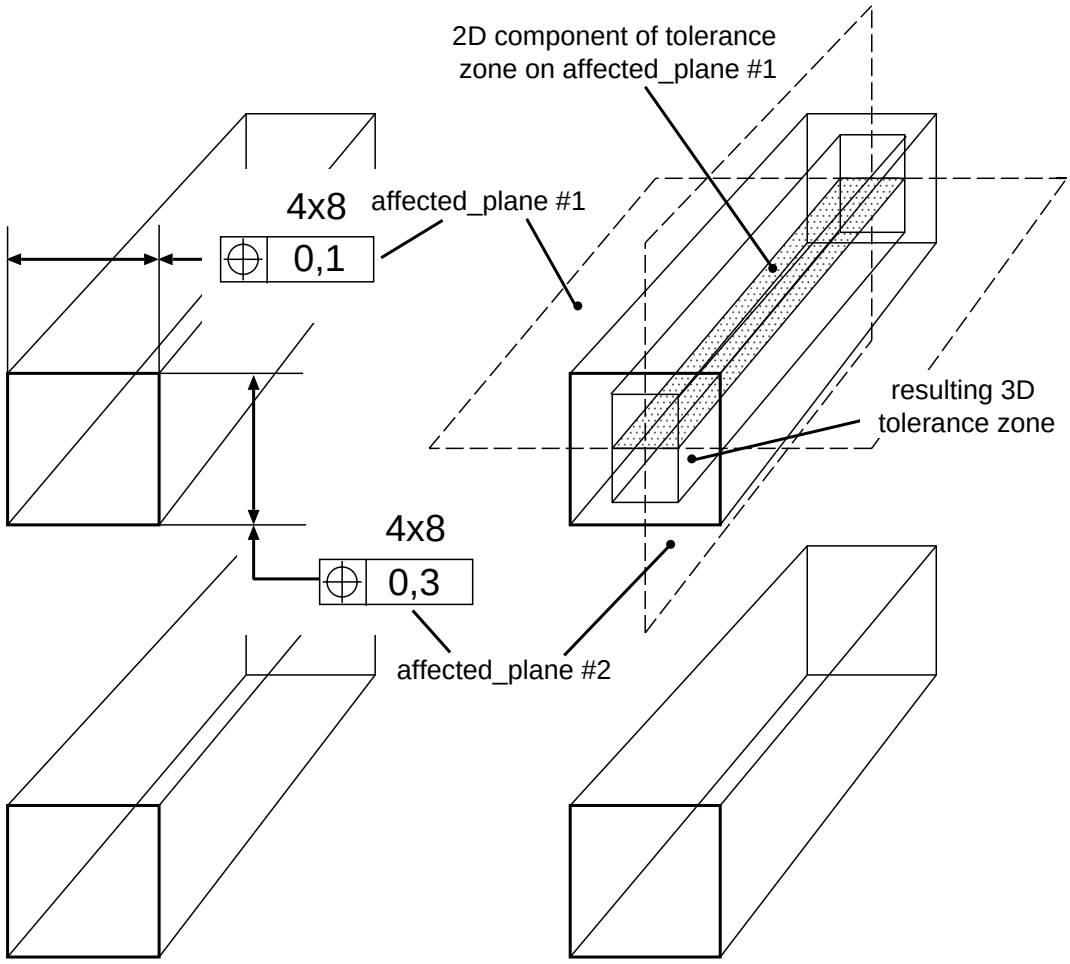

Figure 46 – Position tolerancing with affected planes

4.2.333 Process_cost_property

A Process_cost_property is a property of process related object that specifies the costs that are connected with it.

A Process_cost_property is a type of Process_property (see 4.2.345).

The data associated with a Process_cost_property are the following:

- cost_property_value.

The cost_property_value specifies the value of the Process_cost_property.

See 4.3.915 for the application assertion.

4.2.334 Process_feature_in_panel

A Process_feature_in_panel is a feature that is defined to be applied to a sheet like part.

A Process_feature_in_panel is a type of Feature_definition (see 4.2.175).

Each Process_feature_in_panel is either a Locator_feature (see 4.2.271), a Form_feature_in_panel (see 4.2.188), a Bead_feature (see 4.2.39), a Hole_feature_in_panel (see 4.2.229), a Compound_feature_in_panel (see 4.2.81), or a Joggle_feature (see 4.2.250).

The data associated with a Process_feature_in_panel are the following:

- punch_direction.

The punch_direction specifies the stamping direction when manufacturing the Process_feature_in_panel.

NOTE – Usually the punch_direction is the direction normal to the panel surface towards that side of the panel that shows the resulting Process_feature_in_panel.

The punch_direction need not be specified for a particular Process_feature_in_panel.

4.2.335 Process_feature_in_solid

A Process_feature_in_solid is a feature that is defined to be applied to a solid part. Each single Process_feature_in_solid (i.e. not a Compound_feature_in_solid (see 4.2.84)) is specified as a volume defined by a Profile (see 4.2.355) and a sweep Path (see 4.2.304); depending on the type of Process_feature_in_solid this volume is either added to or subtracted from the part.

In the case where the Process_feature_in_solid is defined to be applied as an Included_feature (see 4.2.232) the feature itself as well as the Path and the Profile shall be defined in the part's coordinate space. In the case where the Process_feature_in_solid is defined to be applied as a Placed_feature (see 4.2.313) the Process_feature_in_solid as well as the Profile shall be defined in their own local coordinate spaces; the Path shall be defined in the feature coordinate space. The spatial constraints between profile, feature, and part shall be specified by geometric Transformation (see 4.2.472) objects.

NOTE – The latter allows to re-use feature definitions for multiple occurrences of the feature.

A Process_feature_in_solid is a type of Feature_definition (see 4.2.175).

Each Process_feature_in_solid is either a Pocket_feature_in_solid (see 4.2.321), a Slot_feature (see 4.2.407), a Rib_feature (see 4.2.382), a Round_hole (see 4.2.387), a Boss_feature (see 4.2.42), or a Compound_feature_in_solid (see 4.2.84).

4.2.336 Process_operation

A Process_operation is a specific step in the manufacturing process of an Item_version (see 4.2.248). There may be descriptions associated to a Process_operation.

EXAMPLE 166 – In the case of a welding operation, the welding points as a part of a wireframe model can be associated to a process operation to describe the locations where the robot has to weld for a welding process operation.

The data associated with a Process_operation are the following:

- description;
- id;
- is_defined_in;
- location;
- name;
- process_duration;
- process_type.

4.2.336.1 description

The description specifies additional information about the Process_operation.

See 4.3.917 for the application assertion.

The description need not be specified for a particular Process_operation.

If present, there shall be exactly one object that defines the description for a Process_operation.

4.2.336.2 id

The id specifies the identifier of the Process_operation that shall be unique within the scope of the associated Process_plan_version (see 4.2.344).

4.2.336.3 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) of the Process_operation in case none of the tools associated by Process_operation_input_or_output (see 4.2.337) plays the role of a reference tool that has the reference coordinate space.

See 4.3.916 for the application assertion.

The is_defined_in need not be specified for a particular Process_operation.

4.2.336.4 location

The location specifies the manufacturing location this Process_operation is planned for.

EXAMPLE 167 – A Process_operation customized for a specific machine combination, e.g., in a production site in Paris may not be applicable to the production site in Frankfurt.

EXAMPLE 168 – In case of a part needs a special kind of heat treatment, the process operation 'heat treatment' of a particular process plan may be done at a supplier's location, where the appropriate equipment is available, and the other process operations of this process plan are done at the manufacturer's location.

See 4.3.918 for the application assertion.

The location need not be specified for a particular Process_operation.

4.2.336.5 name

The name specifies the word or group of words by which the Process_operation is referred to.

EXAMPLE 169 – 'operation Z10.114' is an example for name.

See 4.3.917 for the application assertion.

The name need not be specified for a particular Process_operation.

If present, there shall be exactly one object that defines the name for a Process_operation.

4.2.336.6 process_duration

The process_duration specifies the time which elapses between the start of the Process_operation and the completion of the Process_operation.

See 4.3.919 for the application assertion.

The process_duration need not be specified for a particular Process_operation.

4.2.336.7 process_type

The process_type specifies the type of the Process_operation.

EXAMPLE 170 – 'stamping', 'milling', 'drilling', 'welding', 'casting', and 'painting' are examples for process_type.

4.2.337 Process_operation_input_or_output

A Process_operation_input_or_output is the input or output respectively of a Process_operation (see 4.2.336).

The data associated with a Process_operation_input_or_output are the following:

- concerned_shape;
- description;
- element;
- operation;
- quantity;
- role;
- transformation.

4.2.337.1 concerned_shape

The concerned_shape specifies the set of Shape_aspect (see 4.2.394) objects that are affected by the Process_operation (see 4.2.336).

See 4.3.926 for the application assertion.

4.2.337.2 description

The description specifies additional information about the Process_operation_input_or_output.

See 4.3.924 for the application assertion.

The description need not be specified for a particular Process_operation_input_or_output.

If present, there shall be exactly one object that defines the description for a Process_operation_input_or_output.

4.2.337.3 element

The element specifies the element that plays the role of the input or the output for the particular Process_operation (see 4.2.336) in the context of a Process_plan (see 4.2.341).

See 4.3.920, 4.3.921, 4.3.922, and 4.3.923 for the application assertions.

There shall be exactly one object that defines the element for a Process_operation_input_or_output.

4.2.337.4 operation

The operation specifies the Process_operation (see 4.2.336) that the Process_operation_input_or_output is associated to.

See 4.3.925 for the application assertion.

4.2.337.5 quantity

The quantity specifies the quantity of elements that are identified as input or output for a particular Process_operation (see 4.2.336) in the context of a Process_plan (see 4.2.341). In case there is no quantity specified, the default value is one.

The quantity need not be specified for a particular Process_operation_input_or_output.

4.2.337.6 role

The role specifies whether the identified element plays the role of an input or an output for the particular Process_operation (see 4.2.336) in the context of a Process_plan (see 4.2.341).

4.2.337.7 transformation

The transformation specifies the geometrical Transformation (see 4.2.472) between the local coordinate system of the element acting as Process_operation_input_or_output and the reference coordinate system which is either the coordinate system of the reference tool (if present) for the concerned Process_operation (see 4.2.336) or (if no reference tool is present) the coordinate system of the Process_operation itself.

See 4.3.927 for the application assertion.

The transformation need not be specified for a particular Process_operation_input_or_output.

4.2.338 Process_operation_relationship

A Process_operation_relationship is a relationship between two Process_operation (see 4.2.336) objects.

NOTE – The relating Process_operation and the related Process_operation need not belong to the same Process_plan_version (see 4.2.344).

The data associated with a Process_operation_relationship are the following:

- condition;
- description;
- related;
- relating;
- relation_type;
- waiting_time.

4.2.338.1 condition

The condition specifies the condition under which the particular Process_operation_relationship becomes effective.

EXAMPLE 171 – There may be a Process_operation_relationship of type 'series' between a Process_operation (see 4.2.336) representing the manufacturing process of a part and a Process_operation representing the repair of a malproduced part. In this case the Process_operation_relationship may have a condition stating that this series becomes only effective if the output of the manufacturing process has certain properties that make a repairing process necessary.

The condition need not be specified for a particular Process_operation_relationship.

4.2.338.2 description

The description specifies additional information about the Process_operation_relationship.

See 4.3.928 for the application assertion.

The description need not be specified for a particular Process_operation_relationship.

If present, there shall be exactly one object that defines the description for a Process_operation_relationship.

4.2.338.3 related

The related specifies the second of the two Process_operation (see 4.2.336) objects related by a Process_operation_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.929 for the application assertion.

4.2.338.4 relating

The relating specifies the first of the two Process_operation (see 4.2.336) objects related by a Process_operation_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.929 for the application assertion.

4.2.338.5 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

– 'sequence': The application object defines a relationship where the relating Process_operation (see 4.2.336) shall be completed before the related Process_operation starts;

– 'alternative': The application object defines a relationship where the related Process_operation may be used alternatively instead of the relating Process_operation;

– 'decomposition': The application object defines a relationship where the related Process_operation is one of the components into which the relating Process_operation is broken up.

4.2.338.6 waiting_time

The waiting_time specifies the time which at least shall elapse between the completion of the relating Process_operation (see 4.2.336) and the start of the related Process_operation.

EXAMPLE 172 – The Process_operation 'polishing' must not be started less than 2 hours after the Process_operation 'painting' was finished.

See 4.3.930 for the application assertion.

The waiting_time need not be specified for a particular Process_operation_relationship.

4.2.339 Process_operation_resource

A Process_operation_resource is a resource that is used to perform a Process_operation (see 4.2.336).

EXAMPLE 173 – A hammer is an example for a Process_operation_resource.

NOTE – The concept of a Process_operation_resource shall be used for resources that are not described as an Item (see 4.2.236).

The data associated with a Process_operation_resource are the following:

– name.

The name specifies the word or group of words by which the Process_operation_resource is referred to.

See 4.3.931 for the application assertion.

The name need not be specified for a particular Process_operation_resource.

If present, there shall be exactly one object that defines the name for a Process_operation_resource.

4.2.340 Process_operation_resource_assignment

A Process_operation_resource_assignment is a mechanism to assign a Process_operation_resource (see 4.2.339) to a Process_operation (see 4.2.336).

The data associated with a Process_operation_resource_assignment are the following:

– operation;

– process_duration_for_resource;

– reason;

– reference_tool;

- resource;
- transformation.

4.2.340.1 operation

The operation specifies the Process_operation (see 4.2.336) that the Process_operation_resource (see 4.2.339) is assigned to.

See 4.3.934 for the application assertion.

4.2.340.2 process_duration_for_resource

The process_duration_for_resource specifies the time which elapses between the start of the use of the Process_operation_resource (see 4.2.339) and the completion of the use of the Process_operation_resource within a particular Process_operation (see 4.2.336).

See 4.3.936 for the application assertion.

The process_duration_for_resource need not be specified for a particular Process_operation_resource_assignment.

4.2.340.3 reason

The reason specifies the rationale behind the use of the Process_operation_resource (see 4.2.339) for a particular Process_operation (see 4.2.336).

See 4.3.933 for the application assertion.

The reason need not be specified for a particular Process_operation_resource_assignment.

If present, there shall be exactly one object that defines the reason for a Process_operation_resource_assignment.

4.2.340.4 reference_tool

The reference_tool specifies whether or not the resource identified by the Process_operation_resource_assignment plays the role of the reference tool for the particular Process_operation (see 4.2.336). In case the role is TRUE, all geometric transformations within the scope of the Process_operation are defined with respect to the local coordinate system of the resource identified by the Process_operation_resource_assignment. There must not be more than one resource playing the role of the reference tool for one Process_operation. In case the resource is of type Process_operation_resource (see 4.2.339), the value of the reference_tool shall be FALSE.

4.2.340.5 resource

The resource specifies the resource that is used to perform a Process_operation.

See 4.3.932 and 4.3.935 for the application assertions.

There shall be exactly one object that defines the resource for a Process_operation_resource_-assignment.

4.2.340.6 transformation

The transformation specifies the geometrical Transformation (see 4.2.472) between the local coordinate system of the Process_operation_resource_assignment and the reference coordinate system which is either the coordinate system of the reference tool (if present) for the concerned Process_operation (see 4.2.336) or (if no reference tool is present) the coordinate system of the Process_operation itself. In the case where the identified resource plays the role of the reference tool, no transformation shall be defined.

See 4.3.937 for the application assertion.

The transformation need not be specified for a particular Process_operation_resource_assignment.

4.2.341 Process_plan

A Process_plan is the manufacturing planning information necessary to realize or produce a particular verion of an Item (see 4.2.236).

Each Process_plan may be a Process_plan_version (see 4.2.344).

The data associated with a Process_plan are the following:

- description;
- location;
- name;
- plan_id;
- produced_output.

4.2.341.1 description

The description specifies additional information about the Process_plan.

See 4.3.939 for the application assertion.

The description need not be specified for a particular Process_plan.

If present, there shall be exactly one object that defines the description for a Process_plan.

4.2.341.2 location

The location specifies the location for which the Process_plan is defined.

EXAMPLE 174 – One Process_plan for manufacturing a particular mudguard is defined for a plant in Sweden and another Process_plan for the same part is defined for a plant in France. The attribute

location does not necessarily need to coincide with the attribute location of the associated process operations, since the main location of the Process_plan might be considered to be a plant in Sweden even if one of the process operations is performed at a supplier's site at Norway.

See 4.3.940 for the application assertion.

The location need not be specified for a particular Process_plan.

4.2.341.3 name

The name specifies the word or group of words by which the Process_plan is referred to.

EXAMPLE 175 – 'ABO Engine Cylinder block machining line' is an example for name.

See 4.3.939 for the application assertion.

The name need not be specified for a particular Process_plan.

If present, there shall be exactly one object that defines the name for a Process_plan.

4.2.341.4 plan_id

The plan_id specifies the identifier of the Process_plan that shall be unique within the scope of an organization.

4.2.341.5 produced_output

The produced_output specifies the resulting output of the Process_plan which the Process_plan was defined for.

See 4.3.938 for the application assertion.

The produced_output need not be specified for a particular Process_plan.

4.2.342 Process_plan_operation_assignment

A Process_plan_operation_assignment is the association of a Process_operation (see 4.2.336) and a Process_plan (see 4.2.341) that the particular Process_operation is part of.

NOTE – This mechanism allows the reuse of a Process_operation in the context of more than one Process_plan.

The data associated with a Process_plan_operation_assignment are the following:

- operation;
- plan.

4.2.342.1 operation

The operation specifies the Process_operation (see 4.2.336) which the Process_plan_operation_assignment is assigning to a particular Process_plan (see 4.2.341).

See 4.3.941 for the application assertion.

4.2.342.2 plan

The plan specifies the Process_plan (see 4.2.341) to which the Process_plan_operation_assignment is assigning a Process_operation (see 4.2.336).

See 4.3.942 for the application assertion.

4.2.343 Process_plan_relationship

A Process_plan_relationship is the relationship between two Process_plan (see 4.2.341) objects.

EXAMPLE 176 – If a Part shall be manufactured at two different manufacturing sites, e.g., one at Paris and the other at Bordeaux, there will be two different process plans, that may be related by a Process_plan_relationship.

The data associated with a Process_plan_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.343.1 description

The description specifies additional information about the Process_plan_relationship.

See 4.3.943 for the application assertion.

The description need not be specified for a particular Process_plan_relationship.

If present, there shall be exactly one object that defines the description for a Process_plan_relationship.

4.2.343.2 related

The related specifies the second of the two Process_plan (see 4.2.341) objects related by a Process_plan_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.944 for the application assertion.

4.2.343.3 relating

The relating specifies the first of the two Process_plan (see 4.2.341) objects related by a Process_plan_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.944 for the application assertion.

4.2.343.4 relation_type

The relation_type specifies the meaning of the relationship.

EXAMPLE 177 – 'alternate_location' is an example for relation_type.

4.2.344 Process_plan_version

A Process_plan_version is a particular version of a Process_plan (see 4.2.341).

A Process_plan_version is a type of Process_plan (see 4.2.341).

The data associated with a Process_plan_version are the following:

- version_id.

The version_id specifies the identification of a particular version of a Process_plan (see 4.2.341).

4.2.345 Process_property

A Process_property is a characteristic of a process related object.

A Process_property is a type of Property (see 4.2.361).

Each Process_property is either a General_process_property (see 4.2.206), a Process_cost_property (see 4.2.333), or a Process_quality_property (see 4.2.346).

The data associated with a Process_property are the following:

- described_object.

The described_object specifies the Process_operation (see 4.2.336) or the Process_plan (see 4.2.341) that has the specified property.

See 4.3.945 and 4.3.946 for the application assertions.

There shall be exactly one object that defines the described_object for a Process_property.

4.2.346 Process_quality_property

A Process_quality_property is a property that documents the result of any quality measure process.

A Process_quality_property is a type of Process_property (see 4.2.345).

The data associated with a Process_quality_property are the following:

- description;

- quality_property_value.

4.2.346.1 description

The description specifies additional information about the Process_quality_property.

See 4.3.947 for the application assertion.

The description need not be specified for a particular Process_quality_property.

If present, there shall be exactly one object that defines the description for a Process_quality_property.

4.2.346.2 quality_property_value

The quality_property_value specifies the value of the Process_quality_property.

See 4.3.948 for the application assertion.

4.2.347 Process_state

A Process_state is a view on an in-process-part definition of a particular version of an Item (see 4.2.236). It corresponds to an intermediate state for the considered Process_plan (see 4.2.341). The identifier of a Process_state shall be unique within the context of an Item_version (see 4.2.248) and a Process_plan_version (see 4.2.344).

A Process_state is a type of Design_discipline_item_definition (see 4.2.134).

The data associated with a Process_state are the following:

- related_item_definition.

The related_item_definition specifies the Design_discipline_item_definition (see 4.2.134) that defines the final part that the in process part is a preliminary stage of.

See 4.3.949 for the application assertion.

4.2.348 Product_class

A Product_class is the identification of a set of similar products to be offered to the market.

EXAMPLE 178 – Figure 47 depicts a detail of an example of a structure build up by Product_class and Product_class_hierarchy (see 4.2.349) objects.

NOTE – Product_class is the application object to which the definitions required for configuration control pertain.

The data associated with a Product_class are the following:

- description;
- id;
- level_type;
- name;

- root;
- version_id.

4.2.348.1 description

The description specifies additional information about the Product_class.

See 4.3.950 for the application assertion.

The description need not be specified for a particular Product_class.

If present, there shall be exactly one object that defines the description for a Product_class.

4.2.348.2 id

The id specifies the identifier of the Product_class that shall be unique.

NOTE – The scope of the uniqueness is usually dependent on the form of implementation; it may be e.g., a physical file or data base.

4.2.348.3 level_type

The level_type specifies the level or category of this Product_class in a hierarchical structure of Product_class objects.

EXAMPLE 179 – A high level Product_class (level type='enterprise') may be used to define all Specification_category (see 4.2.416) and Specification objects for all Product_class objects of an enterprise with several brands and companies.

A second level Product_class (level type='platform') may be used to group all products that are based on the same technical concept (platform); these products may belong to different brands.

A third level Product_class (level type='car family') may be used to group all products that have a common base and a fixed set of characteristics (specification categories).

A fourth level Product_class (level type='car type') may represent products that are offered to the market; this level of Product_class may be defined by the marketing department. A set of specifications sufficient to produce the car is associated with its Product_class. Within this association a distinction is made between standard characteristics (e.g. number of doors) and options that have to be chosen (e.g. outside colour) or that may be chosen by the customer (e.g. radio).

4.2.348.4 name

The name specifies the word or group of words by which the Product_class is referred to.

EXAMPLE 180 – '69 Buick Electra', 'Bugatti Royal', and 'Airbus A320' are examples for name.

See 4.3.950 for the application assertion.

The name need not be specified for a particular Product_class.

If present, there shall be exactly one object that defines the name for a Product_class.

4.2.348.5 root

The root specifies the Product_component (see 4.2.350) that is the top level element in a structure of Product_component objects. A Product_class that identifies a Product_component using root is the Product_class one wants to define a bill-of-material for.

NOTE – This entry is the entry into the bill-of-material of the products of that Product_class. The usage of this attribute reflects split into several bill-of-material structures within the organization.

See 4.3.951 for the application assertion.

The root need not be specified for a particular Product_class.

4.2.348.6 version_id

The version_id specifies the identification of a particular version of a Product_class.

The version_id need not be specified for a particular Product_class.

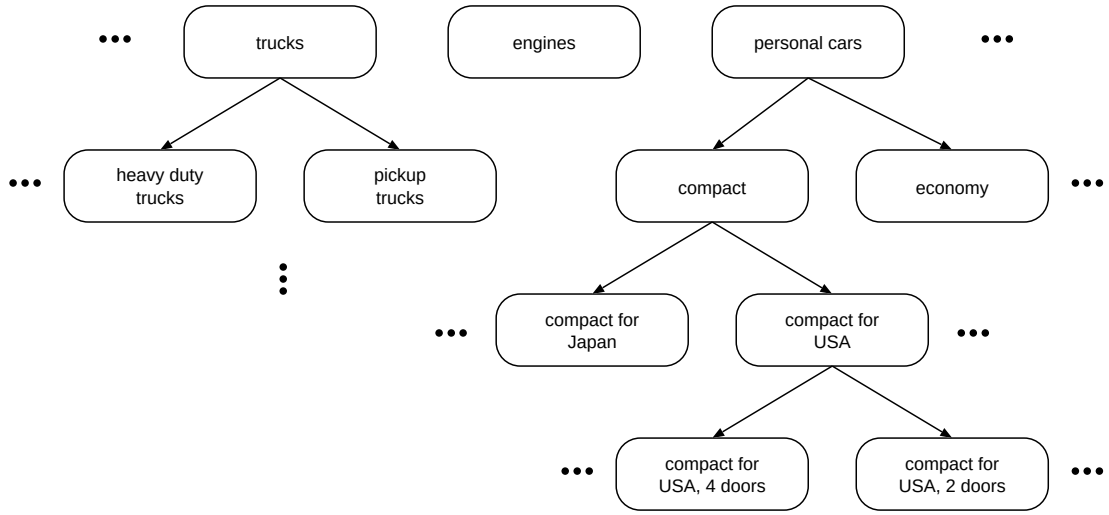

Figure 47 – Example structure of Product_class objects in a hierarchy

4.2.349 Product_class_hierarchy

A Product_class_hierarchy is a hierarchical relationship between two Product_class (see 4.2.348) objects. The set of products of the sub class is included in the set of products of the super class. The hierarchy of Product_class objects defined by the Product_class_hierarchy shall form an acyclic graph. Class_condition_association (see 4.2.65) objects and Class_inclusion_association (see 4.2.67) objects are inherited from the super class to the sub class.

NOTE 1 – At the sub class level other Class_condition_association objects and/or Class_inclusion_association objects may be added.

NOTE 2 – Class_specification_association (see 4.2.68) objects are not inherited but need to be stated explicitly on each level of Product_class objects using the corresponding association type.

The data associated with a Product_class_hierarchy are the following:

- sub_class;
- super_class.

4.2.349.1 sub_class

The sub_class specifies the Product_class (see 4.2.348) in a Product_class_hierarchy that is on a lower level in the hierarchical structure.

See 4.3.952 for the application assertion.

4.2.349.2 super_class

The super_class specifies the Product_class (see 4.2.348) in a Product_class_hierarchy that is on a higher level in the hierarchical structure.

See 4.3.952 for the application assertion.

4.2.350 Product_component

A Product_component is an element in the product decomposition structure. A Product_component is represented by a set of alternate Item_solution (see 4.2.246) objects with common functional requirements. The top level Product_component of the decomposition tree shall be associated to a Product_class (see 4.2.348) as root entry. The corresponding decomposition structure is identical for all variations of all products of that Product_class.

The data associated with a Product_component are the following:

- description;
- id;
- instance_required;
- is_influenced_by;
- is_relevant_for;
- name;
- version_id.

4.2.350.1 description

The description specifies additional information about the Product_component.

See 4.3.955 for the application assertion.

The description need not be specified for a particular Product_component.

If present, there shall be exactly one object that defines the description for a Product_component.

4.2.350.2 id

The id specifies the identifier of the Product_component.

4.2.350.3 instance_required

The instance_required specifies if the existance of a corresponding Item_instance (see 4.2.241) is required for the various Item_solution (see 4.2.246) objects of that Product_component.

NOTE – There are Product_component objects that are not realized by parts . In these cases no instance of an item is required.

EXAMPLE 181 – Trunk space or holes for wire harness are examples for Product_component objects that do not require instances.

4.2.350.4 is_influenced_by

The is_influenced_by specifies the Specification_category (see 4.2.416) objects that impact the design of a solution for the Product_component in the context of the Product_class (see 4.2.348) objects that are referred to by the Class_category_association (see 4.2.64). These Product_class objects shall belong to the set of Product_class objects the Product_component is valid for or shall be subclasses of these Product_class objects.

NOTE – All solutions for the Product_component (i.e. the design of these solutions) are influenced by the referenced Specification_category.

See 4.3.954 for the application assertion.

4.2.350.5 is_relevant_for

The is_relevant_for specifies the Application_context (see 4.2.20) in which the Product_component has to be considered.

See 4.3.953 for the application assertion.

4.2.350.6 name

The name specifies the word or group of words by which the Product_component is referred to.

See 4.3.955 for the application assertion.

The name need not be specified for a particular Product_component.

If present, there shall be exactly one object that defines the name for a Product_component.

4.2.350.7 version_id

The version_id specifies the identification of a particular version of a Product_component.

The version_id need not be specified for a particular Product_component.

4.2.351 Product_component_relationship

A Product_component_relationship is a relationship between two Product_component (see 4.2.350) objects.

The data associated with a Product_component_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.351.1 description

The description specifies additional information about the Product_component_relationship.

See 4.3.956 for the application assertion.

The description need not be specified for a particular Product_component_relationship.

If present, there shall be exactly one object that defines the description for a Product_component_relationship.

4.2.351.2 related

The related specifies the second of the two Product_component (see 4.2.350) objects referenced by the Product_component_relationship.

NOTE – The semantic of this attribute is specified by the attribute relation_type.

See 4.3.957 for the application assertion.

4.2.351.3 relating

The relating specifies the first of the two Product_component (see 4.2.350) objects referenced by the Product_component_relationship.

NOTE – The semantic of this attribute is specified by the attribute relation_type.

See 4.3.957 for the application assertion.

4.2.351.4 relation_type

The relation_type specifies the meaning of the Product_component_relationship. Where applicable the following values shall be used:

- 'decomposition': The application object defines a relationship where the related Product_component (see 4.2.350) is one of the components into which the relating Product_component is broken up.

4.2.352 Product_function

A Product_function is the mode of action or activity by which a product fulfils a certain purpose.

EXAMPLE 182 – The Product_function 'transportation' with subfunctions 'acceleration' and 'retardation' or the Product_function 'illumination' with subfunctions 'exterior illumination' and 'interior illumination' are examples for Product_function objects in a hierarchical structure.

The data associated with a Product_function are the following:

- description;
- id;
- is_relevant_for;
- name;
- version_id.

4.2.352.1 description

The description specifies additional information about the Product_function.

See 4.3.959 for the application assertion.

The description need not be specified for a particular Product_function.

If present, there shall be exactly one object that defines the description for a Product_function.

4.2.352.2 id

The id specifies the identifier of the Product_function.

4.2.352.3 is_relevant_for

The is_relevant_for specifies the Application_context (see 4.2.20) in which the Product_function has to be considered.

See 4.3.958 for the application assertion.

4.2.352.4 name

The name specifies the word or group of words by which the Product_function is referred to.

See 4.3.959 for the application assertion.

The name need not be specified for a particular Product_function.

If present, there shall be exactly one object that defines the name for a Product_function.

4.2.352.5 version_id

The version_id specifies the identification of a particular version of a Product_function.

The version_id need not be specified for a particular Product_function.

4.2.353 Product_function_relationship

A Product_function_relationship is a relationship between two Product_function (see 4.2.352) objects.

NOTE – A Product_function_relationship may be used to build up a hierarchical structure of Product_function objects on the same level of abstraction or to link a Product_function to another Product_function on a lower level of abstraction.

The data associated with a Product_function_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.353.1 description

The description specifies additional information about the Product_function_relationship.

See 4.3.960 for the application assertion.

The description need not be specified for a particular Product_function_relationship.

If present, there shall be exactly one object that defines the description for a Product_function_relationship.

4.2.353.2 related

The related specifies the second of the two Product_function (see 4.2.352) objects related by the Product_function_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.961 for the application assertion.

4.2.353.3 relating

The relating specifies the first of the two Product_function (see 4.2.352) objects related by the Product_function_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.961 for the application assertion.

4.2.353.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'specialization': The application object defines a relationship where the functional requirements for the related Product_function (see 4.2.352) are more specific than those for the relating Product_function;

- 'version sequence': The application object defines a version sequence where the relating Product_function is the preceding version and the related Product_function is the following version.

4.2.354 Product_specification

A Product_specification is the identification of a physically realizable object. It is defined by the Product_class (see 4.2.348) it is a member of and by a set of Specification (see 4.2.415) objects associated to the Product_class. This set of Specification objects shall be sufficient to access the definitional information necessary to manufacture the product, i.e., a Product_specification shall not include possible variations.

The data associated with a Product_specification are the following:

- explicit_product_version;

- name;

- product_class;

- specification;

- version_id.

4.2.354.1 explicit_product_version

The explicit_product_version specifies the Item_version (see 4.2.248) that corresponds to the Product_specification. Both the Product_specification and the Item_version identify the same product.

See 4.3.962 for the application assertion.

The explicit_product_version need not be specified for a particular Product_specification.

4.2.354.2 name

The name specifies the word or group of words by which the Product_specification is referred to.

See 4.3.963 for the application assertion.

The name need not be specified for a particular Product_specification.

If present, there shall be exactly one object that defines the name for a Product_specification.

4.2.354.3 product_class

The product_class specifies the Product_class (see 4.2.348) the Product_specification belongs to.

See 4.3.964 for the application assertion.

4.2.354.4 specification

The specification specifies the set of Specification (see 4.2.415) objects necessary to discriminate the Product_specification within its Product_class (see 4.2.348).

See 4.3.965 for the application assertion.

4.2.354.5 version_id

The version_id specifies the identification of a particular version of a Product_specification.

The version_id need not be specified for a particular Product_specification.

4.2.355 Profile

A Profile is a planar outline used for the definition of features. Each Profile shall lie in the x-y-plane that is either the x-y-plane of its own local coordinate system (in the case where the Profile is used to define a feature that is applied as a Placed_feature (see 4.2.313)) or the x-y-plane defined by the Axis_placement (see 4.2.33) that serves as parameter_reference (in the case where the Profile is used to define a feature that is applied as an Included_feature (see 4.2.232).

Profiles that are swept along a path shall not twist along the path; no twisting in this context means:

- The x-axis of the profile is always parallel to the plane that is the x-z-plane of the 'first occurrence' of the profile.

- The y-axis of the profile is always parallel to the plane that is the y-z-plane of the 'first occurrence' of the profile.

- The z-axis of the profile is always tangent to the path.

Profiles that are swept along a path shall be oriented normal to the path at any position along the path. The geometric transformation placing a profile shall be in a way that the profile plane coincides with the plane normal to the path at the path start or end respectively.

For Profiles that are swept along a path the following rules apply:

If C_1 is the path, C_2 the profile, P any point on C_1, T the tangent of C_1 at P, N the normal of C_1 at P, V the axis defined by P and N, R_c the curvature radius of C_1 at P, C_3 the curve resulting from a) positioning of C_2 in the coordinate space of the feature, b) sweeping of the curve, resulting from the previous step, along C_1 up to P, c) projection of the curve, resulting from the previous step, on the plane defined by P, T, and N, and D_{max} the maximum coordinate of C_3 along Vthen

- N shall exist in any point P of C_1 where $R_c < \infty$;
- $D_{max} \leq R_c$ in any point P of C_1 where $R_c < \infty$.

Each Profile is either an Open_profile (see 4.2.292) or a Closed_profile (see 4.2.71).

The data associated with a Profile are the following:

- is_defined_in;
- parameter_reference.

4.2.355.1 is_defined_in

The is_defined_in specifies the Cartesian_coordinate_space (see 4.2.44) the Profile is defined in. In the case where the Profile is used to define a feature that is applied as a Placed_feature (see 4.2.313) this is the Profile's own local coordinate space. In the case where the Profile is used to define a feature that is applied as an Included_feature (see 4.2.232) this is the part's coordinate space.

See 4.3.967 for the application assertion.

4.2.355.2 parameter_reference

The parameter_reference specifies the Axis_placement (see 4.2.33) to which the parameters of the Profile refer. The parameter_reference shall only be used if the Profile is used to define a feature that is applied as an Included_feature (see 4.2.232). In this case the Axis_placement is defined in the part's coordinate space.

NOTE – In the case of a profile that is used to define a Placed_feature (see 4.2.313) it is the Profile's local coordinate system that serves as reference for the Profile's parameters.

See 4.3.966 for the application assertion.

The parameter_reference need not be specified for a particular Profile.

4.2.356 Project

A Project is a unique process with a time limit, with a defined goal, with a defined budget, and with defined resources.

EXAMPLE 183 – For the development of a new car, a project is set up that is responsible for the development decisions as well as for the accounting of the costs.

The data associated with a Project are the following:

- actual_end_date;
- actual_start_date;
- affected_product_class;
- description;
- id;
- name;
- planned_end_date;
- planned_start_date;
- work_program.

4.2.356.1 actual_end_date

The actual_end_date specifies the date when the Project was actually finished.

See 4.3.969 for the application assertion.

The actual_end_date need not be specified for a particular Project.

4.2.356.2 actual_start_date

The actual_start_date specifies the date when the Project was actually started.

See 4.3.969 for the application assertion.

The actual_start_date need not be specified for a particular Project.

4.2.356.3 affected_product_class

The affected_product_class specifies the Product_class (see 4.2.348) that is affected by the work carried out within a Project.

See 4.3.972 for the application assertion.

4.2.356.4 description

The description specifies additional information about the Project.

See 4.3.971 for the application assertion.

The description need not be specified for a particular Project.

If present, there shall be exactly one object that defines the description for a Project.

4.2.356.5 id

The id specifies the identifier of the Project.

4.2.356.6 name

The name specifies the word or group of words by which the Project is referred to.

See 4.3.971 for the application assertion.

There shall be exactly one object that defines the name for a Project.

4.2.356.7 planned_end_date

The planned_end_date specifies the date when the Project is or was supposed to be finished.

See 4.3.969, 4.3.970, and 4.3.973 for the application assertions.

The planned_end_date need not be specified for a particular Project.

If present, there shall be exactly one object that defines the planned_end_date for a Project.

4.2.356.8 planned_start_date

The planned_start_date specifies the date when the Project is or was supposed to be started.

See 4.3.969 and 4.3.970 for the application assertions.

The planned_start_date need not be specified for a particular Project.

If present, there shall be exactly one object that defines the planned_start_date for a Project.

4.2.356.9 work_program

The work_program specifies the Activity (see 4.2.2) objects that are carried out within the Project.

See 4.3.968 for the application assertion.

4.2.357 Project_relationship

A Project_relationship is a relationship between two Project (see 4.2.356) objects.

The data associated with a Project_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.357.1 description

The description specifies additional information about the Project_relationship.

See 4.3.974 for the application assertion.

The description need not be specified for a particular Project_relationship.

If present, there shall be exactly one object that defines the description for a Project_relationship.

4.2.357.2 related

The related specifies the second of the two Project (see 4.2.356) objects related by a Project_-relationship.

See 4.3.975 for the application assertion.

4.2.357.3 relating

The relating specifies the first of the two Project (see 4.2.356) objects related by a Project_-relationship.

See 4.3.975 for the application assertion.

4.2.357.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'sequence': The application object defines a relationship where the relating Project (see 4.2.356) shall be completed before the related Project starts;
- 'decomposition': The application object defines a relationship where the related Project is one of the components into which the relating Project is broken down;
- 'dependency': The related Project is dependent of the relating Project;
- 'succession': The related Project is the successor of the relating Project.

4.2.358 Projection

A Projection is a condition where a Tolerance_zone (see 4.2.463) is projected from an element of a part. The projection is external to the part and made from one of the ends of the element for a specified length. The concept of projected tolerance zones is defined in ISO 10578.

The data associated with a Projection are the following:

- is_specifying;
- projection_end;
- projection_length.

4.2.358.1 is_specifying

The is_specifying specifies the Tolerance_zone (see 4.2.463) that results from the Projection.

See 4.3.977 for the application assertion.

4.2.358.2 projection_end

The projection_end specifies the Shape_aspect (see 4.2.394) from which the projection is done.

See 4.3.976 for the application assertion.

4.2.358.3 projection_length

The projection_length specifies the distance from the projection_end where the Geometric_-tolerance (see 4.2.216) shall be measured.

4.2.359 Projection_curve

A Projection_curve is the extension of a point, line, surface, or theoretical point of intersection to a location outside the part outline.

A Projection_curve is a type of Annotation_curve (see 4.2.14).

Each Projection_curve may be an Associated_projection_curve (see 4.2.32).

4.2.360 Promissory_usage

A Promissory_usage is a relationship between a constituent of an assembly and the assembly itself. The relationship describes the intention to use the constituent in an assembly. There is no geometric information required for the constituent or the assembly that are associated by a Promissory_usage.

EXAMPLE 184 – In early design stages the Promissory_usage may be used to create preliminary BOMs for prototyping.

A Promissory_usage is a type of Assembly_component_relationship (see 4.2.26).

4.2.361 Property

A Property is an attribute or a characteristic of an item, of a piece of product data, or of a process.

Each Property is either an Item_property (see 4.2.243), a Shape_dependent_property (see 4.2.396), or a Process_property (see 4.2.345).

4.2.362 Property_change

A Property_change is a mechanism to describe the differences between two objects concerning the properties of these objects.

The data associated with a Property_change are the following:

- added_property;
- deleted_property;
- description;
- id;
- is_describing.

4.2.362.1 added_property

The added_property specifies the Property (see 4.2.361) that has been added to the relating object of the relationship specified by the described Change (see 4.2.54).

See 4.3.980 for the application assertion.

4.2.362.2 deleted_property

The deleted_property specifies the Property (see 4.2.361) that has been deleted from the relating object of the relationship specified by the described Change (see 4.2.54).

See 4.3.980 for the application assertion.

4.2.362.3 description

The description specifies additional information about the Property_change.

See 4.3.979 for the application assertion.

There shall be exactly one object that defines the description for a Property_change.

4.2.362.4 id

The id specifies the identifier of the Property_change.

The id need not be specified for a particular Property_change.

4.2.362.5 is_describing

The is_describing specifies the Change (see 4.2.54) that collects the Property_change objects and the Model_change (see 4.2.283) objects.

See 4.3.978 for the application assertion.

4.2.363 Property_relationship

A Property_relationship is a relationship between two Property (see 4.2.361) objects.

The data associated with a Property_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.363.1 description

The description specifies additional information about the Property_relationship.

See 4.3.981 for the application assertion.

The description need not be specified for a particular Property_relationship.

If present, there shall be exactly one object that defines the description for a Property_relationship.

4.2.363.2 related

The related specifies the second of the two Property (see 4.2.361) objects related by the Property_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.982 for the application assertion.

4.2.363.3 relating

The relating specifies the first of the two Property (see 4.2.361) objects related by the Property_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.982 for the application assertion.

4.2.363.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

– 'dependency': The related Property (see 4.2.361) is dependent of the relating Property;

– 'hierachy': The application object defines a hierarchical relationship where the related Property is on a lower level than the relating Property.

4.2.364 Property_value

A Property_value is the representation of a characteristic of a Property (see 4.2.361).

The data associated with a Property_value are the following:

– lower_limit;

– name;

– specified_value;

– upper_limit;

– value_interpretation.

4.2.364.1 lower_limit

The lower_limit specifies the lower limit for the Property_value.

The lower_limit need not be specified for a particular Property_value.

4.2.364.2 name

The name specifies the word or group of words by which the Property_value is referred to.

EXAMPLE 185 – 'maximum length' or 'minimum volume' are examples for the name of a Property_value.

4.2.364.3 specified_value

The specified_value specifies the actual value of a Property_value. The specified_value is either a text description or a numerical measure.

See 4.3.983 and 4.3.984 for the application assertions.

There shall be exactly one object that defines the specified_value for a Property_value.

4.2.364.4 upper_limit

The upper_limit specifies the upper limit for the Property_value.

The upper_limit need not be specified for a particular Property_value.

4.2.364.5 value_interpretation

The value_interpretation specifies information on how the Property_value shall be interpreted.

NOTE – A Property_value may be specified in the design stage of a product but it may also be documented as measured on a prototype.

EXAMPLE 186 – The value_interpretation may be e.g., 'required', 'designed', 'estimated', or 'measured'.

4.2.365 Quantified_instance

A Quantified_instance is the identification of the quantified occurrence of an object that is defined either as a Design_discipline_item_definition (see 4.2.134) or as a Product_specification (see 4.2.354).

EXAMPLE 187 – In a Technical_solution (see 4.2.451) for the front left brake a certain screw is used four times.

A Quantified_instance is a type of Item_instance (see 4.2.241).

The data associated with a Quantified_instance are the following:

– quantity.

The quantity specifies a value and a unit specifying the quantity of occurrences.

NOTE – The quantity may be specified either as a count measure, as a mass measure, as a length measure, as an area measure, or as a volume measure.

See 4.3.985 for the application assertion.

4.2.366 Radiused_bead_end_type

A Radiused_bead_end_type is an end condition of a bead feature that is created by the rotation of the bead profile at the bead start or end about its y-axis.

A Radiused_bead_end_type is a type of Bead_end_type (see 4.2.38).

4.2.367 Radiused_slot_end_type

A Radiused_slot_end_type is an end condition of a slot feature that is created by the rotation of the slot profile at the slot start or end about its y-axis.

NOTE – The resulting radius equals half the width of the swept profile at each position along the y-axis of the swept profile.

EXAMPLE 188 – Figure 48 depicts a Radiused_slot_end_type.

A Radiused_slot_end_type is a type of Slot_end_type (see 4.2.406).

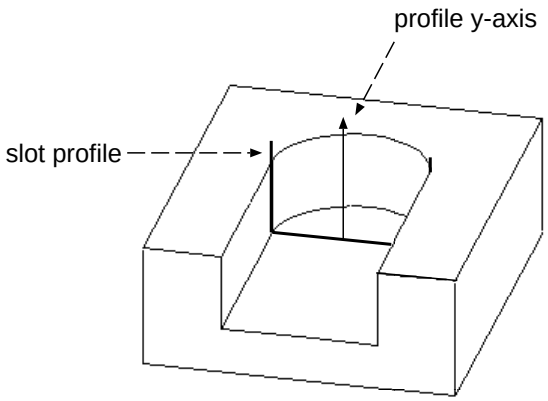

Figure 48 – Radiused_slot_end_type

4.2.368 Rectangular_boss

A Rectangular_boss is a volume adding feature that is specified by an enclosed volume bounded by a rectangular block.

A Rectangular_boss is a type of Boss_feature (see 4.2.42).

The data associated with a Rectangular_boss are the following:

- boundary.

The boundary specifies the Rectangular_closed_profile (see 4.2.370) that defines the cross section of the Rectangular_boss.

See 4.3.986 for the application assertion.

4.2.369 Rectangular_closed_pocket_in_solid

A Rectangular_closed_pocket_in_solid is a volume removal feature whose enclosed volume is characterized by opposite sides being equal in length.

A Rectangular_closed_pocket_in_solid is a type of Pocket_feature_in_solid (see 4.2.321).

The data associated with a Rectangular_closed_pocket_in_solid are the following:

- boundary.

The boundary specifies the Rectangular_closed_profile (see 4.2.370) that defines the cross section of the Rectangular_closed_pocket_in_solid.

See 4.3.987 for the application assertion.

4.2.370 Rectangular_closed_profile

A Rectangular_closed_profile is a closed profile that is specified by an enclosed area bounded by four sides with opposite sides equal in length.

EXAMPLE 189 – Figure 49 depicts a Rectangular_closed_profile.

A Rectangular_closed_profile is a type of Closed_profile (see 4.2.71).

The data associated with a Rectangular_closed_profile are the following:

- corner_radius;
- profile_length;
- profile_width.

4.2.370.1 corner_radius

The corner_radius specifies the size of an arc in all four corners of a Rectangular_closed_profile. For the corner_radius the following constraint applies: $r \leq min(\frac{a}{2}, \frac{b}{2})$ where r is the corner_radius, a is the profile_length, and b is the profile_width.

See 4.3.988 for the application assertion.

The corner_radius need not be specified for a particular Rectangular_closed_profile.

4.2.370.2 profile_length

The profile_length specifies the length of the longest side of a Rectangular_closed_profile. The longest side is oriented along the x-axis.

See 4.3.988 for the application assertion.

4.2.370.3 profile_width

The profile_width specifies the length of the shortest side of a Rectangular_closed_profile. The shortest side is oriented along the y-axis.

See 4.3.988 for the application assertion.

4.2.371 Rectangular_offset_pattern

A Rectangular_offset_pattern is the modification of the placement of a particular occurrence of the base feature in a Rectangular_pattern (see 4.2.374) relative to its expected placement.

EXAMPLE 190 – Figure 50 depicts a Rectangular_offset_pattern.

The data associated with a Rectangular_offset_pattern are the following:

- column_index;
- offset_direction;

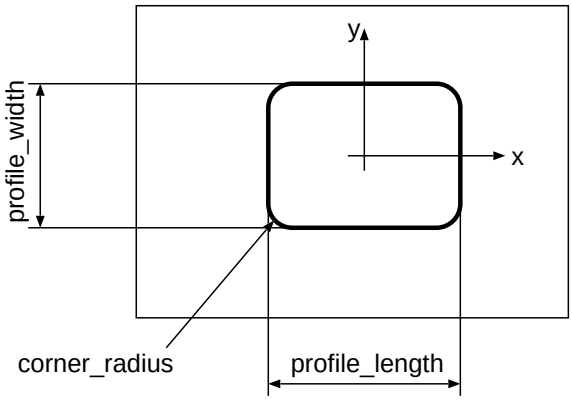

Figure 49 – Rectangular_closed_profile

- offset_distance;
- row_index.

4.2.371.1 column_index

The column_index specifies the index of the column of the Rectangular_offset_pattern.

4.2.371.2 offset_direction

The offset_direction specifies the offset direction of the Rectangular_offset_pattern.

The direction is defined in the same coordinate space as the Rectangular_offset_pattern and lies in a plane that is either parallel to the x-y-plane of this coordinate space (in the case where the Rectangular_offset_pattern is applied as a Placed_feature (see 4.2.313)) or parallel to the x-y-plane of the Axis_placement (see 4.2.33) that serves as the reference (in the casewhere the Rectangular_offset_pattern is applied as an Included_feature (see 4.2.232)).

4.2.371.3 offset_distance

The offset_distance specifies the offset distance of the Rectangular_offset_pattern.

See 4.3.989 for the application assertion.

4.2.371.4 row_index

The row_index specifies the index of the row of the Rectangular_offset_pattern.

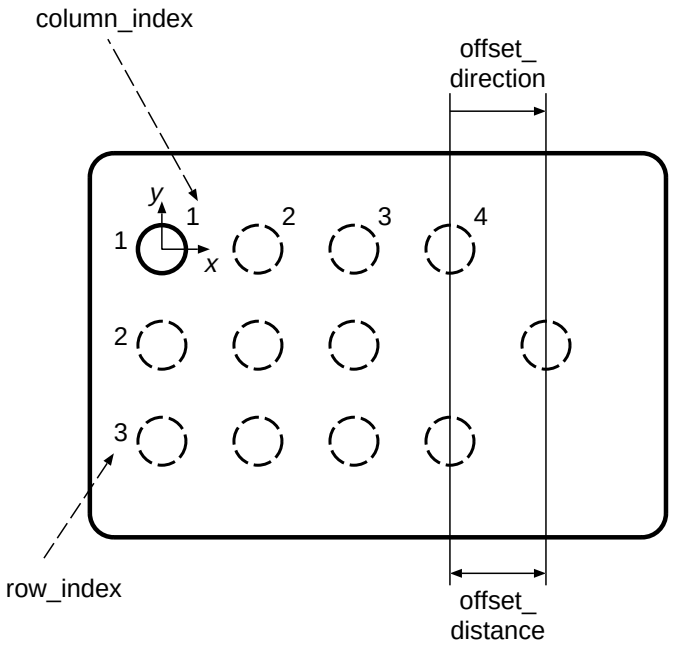

Figure 50 – Rectangular_offset_pattern

4.2.372 Rectangular_omit_pattern

A Rectangular_omit_pattern is an omission of a particular occurrence of the base feature in a Rectangular_pattern (see 4.2.374).

The data associated with a Rectangular_omit_pattern are the following:

- column_index;
- row_index.

4.2.372.1 column_index

The column_index specifies the index of the column of the Rectangular_omit_pattern.

4.2.372.2 row_index

The row_index specifies the index of the row of the Rectangular_omit_pattern.

4.2.373 Rectangular_open_pocket_in_solid

A Rectangular_open_pocket_in_solid is a volume removal feature with opposite sides being equal in length and one side that is not closed.

A Rectangular_open_pocket_in_solid is a type of Pocket_feature_in_solid (see 4.2.321).

The data associated with a Rectangular_open_pocket_in_solid are the following:

- boundary.

The boundary specifies the Square_u_profile (see 4.2.423) that defines the cross section of the Rectangular_open_pocket_in_solid.

See 4.3.990 for the application assertion.

4.2.374 Rectangular_pattern

A Rectangular_pattern is a pattern defined by a base feature arranged in a pattern of rows and columns that lie in the x-y-plane of either the local pattern coordinate space (in the case of a Placed_feature (see 4.2.313)) or of the Axis_placement (see 4.2.33) representing location and orientation of the pattern.

EXAMPLE 191 – Figure 51 illustrates a Rectangular_pattern.

A Rectangular_pattern is a type of Replicate_feature (see 4.2.380).

The data associated with a Rectangular_pattern are the following:

- column_layout_direction;
- column_spacing;
- columns;
- missing_feature;
- relocated_feature;
- row_layout_direction;
- row_spacing;
- rows.

4.2.374.1 column_layout_direction

The column_layout_direction specifies the direction of the column layout of the Rectangular_-pattern.

The direction is defined in the same coordinate space as the Rectangular_pattern and lies in a plane that is either parallel to the x-y-plane of this coordinate space (in the case where the Rectangular_pattern is applied as a Placed_feature (see 4.2.313)) or parallel to the x-y-plane of the Axis_placement (see 4.2.33) that serves as the reference (in the case where the Rectangular_-pattern is applied as an Included_feature (see 4.2.232)).

4.2.374.2 column_spacing

The column_spacing specifies the spacing of the columns of the Rectangular_pattern.

See 4.3.991 for the application assertion.

4.2.374.3 columns

The columns specifies the number of columns of the Rectangular_pattern.

4.2.374.4 missing_feature

The missing_feature specifies those instances that are missing in the Rectangular_pattern.

See 4.3.993 for the application assertion.

4.2.374.5 relocated_feature

The relocated_feature specifies those instances that are relocated in the Rectangular_pattern.

See 4.3.992 for the application assertion.

4.2.374.6 row_layout_direction

The row_layout_direction specifies the direction of the row layout of the Rectangular_pattern.

The direction is defined in the same coordinate space as the Rectangular_pattern and lies in a plane that is either parallel to the x-y-plane of this coordinate space (in the case where the Rectangular_pattern is applied as a Placed_feature (see 4.2.313)) or parallel to the x-y-plane of the Axis_placement (see 4.2.33) that serves as the reference (in the casewhere the Rectangular_-pattern is applied as an Included_feature (see 4.2.232)).

4.2.374.7 row_spacing

The row_spacing specifies the spacing of the rows of the Rectangular_pattern.

See 4.3.991 for the application assertion.

4.2.374.8 rows

The rows specifies the number of rows of the Rectangular_pattern.

4.2.375 Recyclability

A Recyclability is information concerning the ability to reuse objects or components of objects after their primarily intended usage.

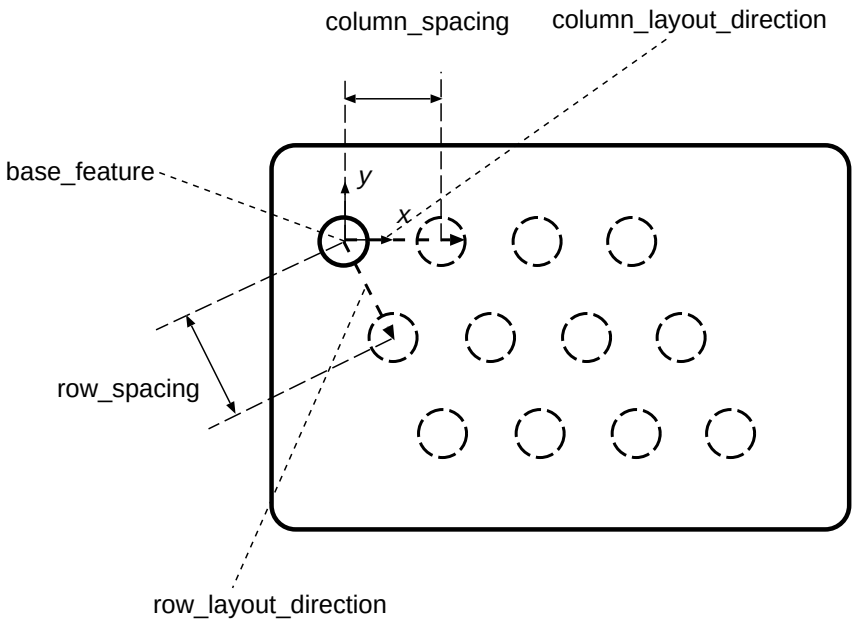

Figure 51 – Rectangular_pattern

A Recyclability is a type of Item_property (see 4.2.243).

The data associated with a Recyclability are the following:

- description;
- recycling_class_value.

4.2.375.1 description

The description specifies additional information about the Recyclability.

See 4.3.994 for the application assertion.

The description need not be specified for a particular Recyclability.

If present, there shall be exactly one object that defines the description for a Recyclability.

4.2.375.2 recycling_class_value

The recycling_class_value specifies the Property_value (see 4.2.364) that represents the value for the Recyclability.

NOTE – The interpretation of this value, e.g., whether the value is required or calculated, is dependent on the semantics of the attribute 'value_interpretation' of the referenced Property_value.

See 4.3.995 for the application assertion.

4.2.376 Reference_plane

A Reference_plane is the definition of a plane that is used to further specify the application of Geometric_tolerance (see 4.2.216) objects. In this plane the two-dimensional tolerance zone is spread from the ideal position of the toleranced element in both directions half the specified tolerance value.

The data associated with a Reference_plane are the following:

- plane_location;
- plane_normal.

4.2.376.1 plane_location

The plane_location specifies a Cartesian point that is defined in the same Cartesian_coordinate_space (see 4.2.44) as the toleranced element and that shall be a point on the plane serving as affected_plane for the Geometric_tolerance (see 4.2.216).

4.2.376.2 plane_normal

The plane_normal specifies a direction vector that is defined in the same Cartesian_coordinate_space (see 4.2.44) as the toleranced element and that indicates a direction normal to the Reference_plane.

4.2.377 Replaced_definition_relationship

A Replaced_definition_relationship is a relationship between two Design_discipline_item_definition (see 4.2.134) objects where the relating Design_discipline_item_definition is replaced by the related Design_discipline_item_definition.

Each Replaced_definition_relationship shall be referenced by an Effectivity (see 4.2.156) that defines the start of the validity of the replacement.

NOTE – A Replaced_definition_relationship may be used to build up version sequences of Design_discipline_item_definition objects.

A Replaced_definition_relationship is a type of Item_definition_relationship (see 4.2.240).

The data associated with a Replaced_definition_relationship are the following:

- description.

The description specifies additional information about the Replaced_definition_relationship.

See 4.3.996 for the application assertion.

The description need not be specified for a particular Replaced_definition_relationship.

If present, there shall be exactly one object that defines the description for a Replaced_definition_relationship.

4.2.378 Replaced_usage_relationship

A Replaced_usage_relationship is a relationship between two Item_instance (see 4.2.241) objects where the relating Item_instance is replaced by the related Item_instance.

Each Replaced_usage_relationship shall be referenced by an Effectivity (see 4.2.156) that defines the start of the validity of the replacement.

A Replaced_usage_relationship is a type of Item_instance_relationship (see 4.2.242).

The data associated with a Replaced_usage_relationship are the following:

- description.

The description specifies additional information about the Replaced_usage_relationship.

See 4.3.997 for the application assertion.

The description need not be specified for a particular Replaced_usage_relationship.

If present, there shall be exactly one object that defines the description for a Replaced_usage_relationship.

4.2.379 Replicate_base_assignment

A Replicate_base_assignment is a mechanism to associate a Replicate_feature (see 4.2.380) with the Feature_definition (see 4.2.175) that is the base feature to be replicated.

The data associated with a Replicate_base_assignment are the following:

- base_feature;
- transformation.

4.2.379.1 base_feature

The base_feature specifies the Feature_definition (see 4.2.175) representing the feature to be replicated.

See 4.3.998 for the application assertion.

4.2.379.2 transformation

The transformation specifies the geometric Transformation (see 4.2.472) used to place the base feature in the Replicate_feature (see 4.2.380)'s coordinate space. In the case of a Replicate_feature applied as a Placed_feature (see 4.2.313) the transformation is used to place the base feature in the local coordinate system of the Replicate_feature.

See 4.3.999 for the application assertion.

The transformation need not be specified for a particular Replicate_base_assignment.

4.2.380 Replicate_feature

A Replicate_feature is a feature that is specified by an existing base feature and the arrangement of identical copies of that feature.

A Replicate_feature is a type of Feature_definition (see 4.2.175).

Each Replicate_feature is either a Circular_pattern (see 4.2.61), a General_pattern (see 4.2.204), or a Rectangular_pattern (see 4.2.374).

The data associated with a Replicate_feature are the following:

- replicate_base.

The replicate_base specifies a Replicate_base_assignment (see 4.2.379) that has the information about the feature that is replicated and possibly about a transformation used to place the base feature in the Replicate_feature' coordinate space.

See 4.3.1000 for the application assertion.

4.2.381 Retention_period

A Retention_period is the definition of a period of time that product data needs to be maintained due to organizational policy or to legal requirements.

The data associated with a Retention_period are the following:

- earliest_end_definition;
- is_applied_to;
- latest_end_definition;
- retention_purpose;
- start_definition.

4.2.381.1 earliest_end_definition

The earliest_end_definition specifies the point in time at which any object the Retention_period is applied to may be deleted. In this context deletion applies to all subordinate objects that are not referenced by other objects.

See 4.3.1010, 4.3.1014, and 4.3.1041 for the application assertions.

There shall be exactly one object that defines the earliest_end_definition for a Retention_period.

4.2.381.2 is_applied_to

The is_applied_to specifies the objects whose existance is controlled by the Retention_period.

NOTE – The master document is the one for which earliest_end_definition and latest_end_definition are the same.

See 4.3.1001, 4.3.1002, 4.3.1003, 4.3.1004, 4.3.1005, 4.3.1006, 4.3.1007, 4.3.1008, 4.3.1009, 4.3.1011, 4.3.1012, 4.3.1013, 4.3.1015, 4.3.1016, 4.3.1017, 4.3.1018, 4.3.1019, 4.3.1020, 4.3.1021, 4.3.1022, 4.3.1023, 4.3.1024, 4.3.1026, 4.3.1027, 4.3.1028, 4.3.1029, 4.3.1030, 4.3.1031, 4.3.1032, 4.3.1033, 4.3.1034, 4.3.1035, 4.3.1036, 4.3.1037, 4.3.1038, 4.3.1039, 4.3.1040, 4.3.1042, and 4.3.1043 for the application assertions.

There shall be at least one object that the Retention_period is_applied_to.

4.2.381.3 latest_end_definition

The latest_end_definition specifies the point in time at which all objects the Retention_period is applied to shall be deleted. In this context deletion applies to all subordinate objects that are not used by other objects.

See 4.3.1010, 4.3.1014, and 4.3.1041 for the application assertions.

There shall be exactly one object that defines the latest_end_definition for a Retention_period.

4.2.381.4 retention_purpose

The retention_purpose specifies the rationale behind the Retention_period.

See 4.3.1025 for the application assertion.

The retention_purpose need not be specified for a particular Retention_period.

If present, there shall be exactly one object that defines the retention_purpose for a Retention_period.

4.2.381.5 start_definition

The start_definition specifies the point in time at which the Retention_period starts.

See 4.3.1010 and 4.3.1014 for the application assertions.

There shall be exactly one object that defines the start_definition for a Retention_period.

4.2.382 Rib_feature

A Rib_feature is a feature that is applied to solid parts to increase the stability of certain regions of a part.

EXAMPLE 192 – Figure 52 illustrates a Rib_feature.

A Rib_feature is a type of Process_feature_in_solid (see 4.2.335).

The data associated with a Rib_feature are the following:

- draft_taper;
- fillet_radius;
- profile_placement;

- rib_profile;
- shoulder_radius;
- sweep_path.

4.2.382.1 draft_taper

The draft_taper specifies a Directed_taper (see 4.2.145) that defines the size of an draft angle that is applied to the side walls of the Rib_feature and the draft direction.

See 4.3.1044 for the application assertion.

The draft_taper need not be specified for a particular Rib_feature.

4.2.382.2 fillet_radius

The fillet_radius specifies a radius shape blend between a Rib_feature and the surrounding faces.

NOTE – If different fillets are required for the various intersection between the Rib_feature and the part Transition_feature (see 4.2.476) objects have to be applied.

See 4.3.1045 for the application assertion.

The fillet_radius need not be specified for a particular Rib_feature.

4.2.382.3 profile_placement

The profile_placement specifies a geometric Transformation (see 4.2.472) that may be used to place the rib_profile in the Rib_feature's coordinate space.

See 4.3.1048 for the application assertion.

The profile_placement need not be specified for a particular Rib_feature.

4.2.382.4 rib_profile

The rib_profile specifies the Open_profile (see 4.2.292) that is swept along the Path (see 4.2.304). The Open_profile shall be shaped in a way that the resulting two sides of the Rib_feature are parallel (before the application of a Directed_taper (see 4.2.145)).

See 4.3.1046 for the application assertion.

4.2.382.5 shoulder_radius

The shoulder_radius specifies the blend radius at the shoulder of the Rib_feature.

See 4.3.1045 for the application assertion.

The shoulder_radius need not be specified for a particular Rib_feature.

4.2.382.6 sweep_path

The sweep_path specifies the Path (see 4.2.304) along which the Open_profile (see 4.2.292) is swept.

See 4.3.1047 for the application assertion.

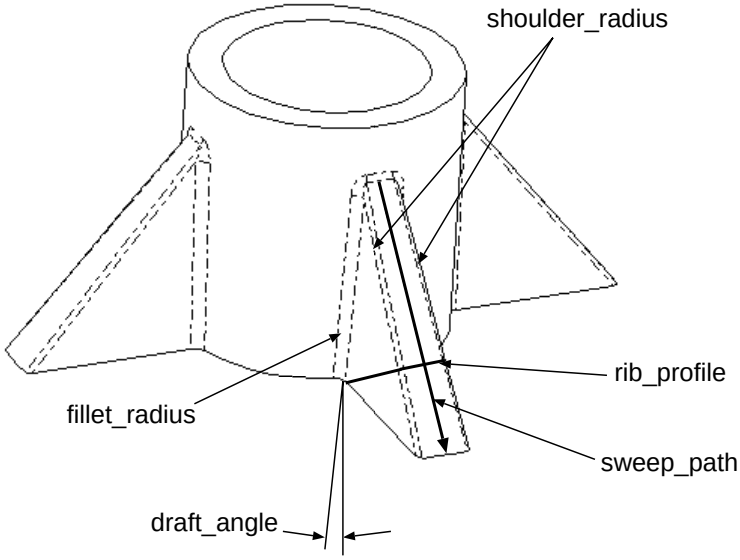

Figure 52 – Rib_feature

4.2.383 Right_angular_wedge

A Right_angular_wedge is a solid that can be envisioned as the result of intersecting a block with a plane perpendicular to one of its faces as shown in figure 53. The received face perpendicular to the cutting plane is triangular or trapezoidal. A Right_angular_wedge is defined by its position in space, by the triangular or trapezoidal face that is defined by three values, and by the depth of the solid.

A Right_angular_wedge is a type of Csg_primitive (see 4.2.101).

4.2.384 Right_circular_cone

A Right_circular_cone is a CSG primitive in the form of a cone that may be truncated. It is defined by an axis, a point on the axis, the semi-angle of the cone, and a distance giving the location in the negative direction along the axis from the point to the base of the cone. In addition, a radius gives the size and location of a truncated face of the cone.

A Right_circular_cone is a type of Csg_primitive (see 4.2.101).

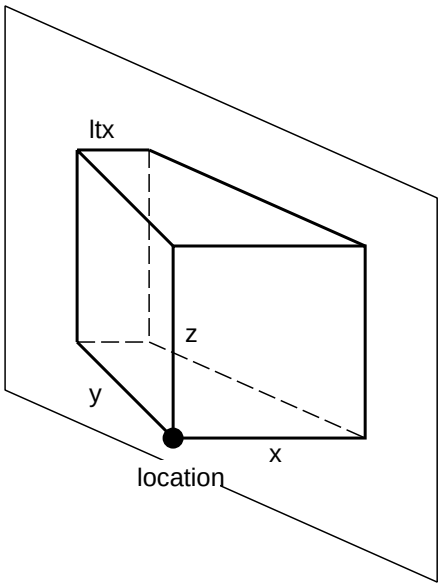

Figure 53 – Right_angular_wedge and its attributes

4.2.385 Right_circular_cylinder

A Right_circular_cylinder is a CSG primitive in the form of a solid cylinder of finite height. It is defined by an axis point at the centre of one planar circular face, an axis, a height, and a radius. The faces are perpendicular to the axis and are circular discs with the specified radius. The height is the distance from the first circular face centre in the positive direction of the axis to the second circular centre.

A Right_circular_cylinder is a type of Csg_primitive (see 4.2.101).

4.2.386 Roughness

A Roughness is a composition of the surface irregularities with relatively small spacing which usually include irregularities resulting from the method of manufacture being used [3]. In the context of this AP Roughness includes information about the method and parameters used to determine these irregularities.

A Roughness is a type of Surface_condition (see 4.2.437).

The data associated with a Roughness are the following:

- cutoff_value;
- measuring_direction;
- measuring_method;
- roughness_max_value;

- roughness_min_value;
- sampling_length.

4.2.386.1 cutoff_value

The cutoff_value specifies the minimal wavelength of the roughness that may be detected in the measuring process.

See 4.3.1050 for the application assertion.

The cutoff_value need not be specified for a particular Roughness.

4.2.386.2 measuring_direction

The measuring_direction specifies the direction in which the Roughness is measured on actual parts.

See 4.3.1049 for the application assertion.

The measuring_direction need not be specified for a particular Roughness.

4.2.386.3 measuring_method

The measuring_method specifies standard and/or the method that is used to determine the Roughness.

NOTE – Roughness values may be specified according to various international standards such as ISO 4287 or ISO 12085.

EXAMPLE 193 – 'Ra - ISO 4287', 'Wy - ISO 4287', 'AR - ISO 12085', or 'W - ISO 12085' are examples for the measuring_method that specify how to interpret the roughness value.

4.2.386.4 roughness_max_value

The roughness_max_value specifies the maximum value with unit for the surface roughness.

See 4.3.1050 for the application assertion.

4.2.386.5 roughness_min_value

The roughness_min_value specifies the minimum value with unit for the surface roughness.

See 4.3.1050 for the application assertion.

The roughness_min_value need not be specified for a particular Roughness.

4.2.386.6 sampling_length

The sampling_length specifies the length interval on a surface within which the surface irregularities are examined.

See 4.3.1050 for the application assertion.

The sampling_length need not be specified for a particular Roughness.

4.2.387 Round_hole

A Round_hole is a hole that is a removal of a volume of cylindrical shape from a solid part.

A Round_hole is a type of Process_feature_in_solid (see 4.2.335).

The data associated with a Round_hole are the following:

- bottom_condition;
- boundary;
- profile_placement;
- sweep_path;
- taper;
- top_chamfer.

4.2.387.1 bottom_condition

The bottom_condition specifies the Hole_bottom_condition (see 4.2.228) that defines the type of the hole bottom.

See 4.3.1056 for the application assertion.

4.2.387.2 boundary

The boundary specifies the Circular_closed_profile (see 4.2.57) that is swept along a Linear_path (see 4.2.268) in order to define the cylinder that is subtracted from the part.

See 4.3.1053 for the application assertion.

4.2.387.3 profile_placement

The profile_placement specifies a geometric Transformation (see 4.2.472) that may be used to place the defining Circular_closed_profile (see 4.2.57) in the Round_hole's coordinate space.

See 4.3.1058 for the application assertion.

The profile_placement need not be specified for a particular Round_hole.

4.2.387.4 sweep_path

The sweep_path specifies the Linear_path (see 4.2.268) that is used as sweep path.

See 4.3.1057 for the application assertion.

4.2.387.5 taper

The taper specifies a possible variation of the diameter of the Round_hole.

See 4.3.1051, 4.3.1054, and 4.3.1055 for the application assertions.

The taper need not be specified for a particular Round_hole.

If present, there shall be exactly one object that defines the taper for a Round_hole.

4.2.387.6 top_chamfer

The top_chamfer specifies a Chamfer_definition (see 4.2.52) that - if present - defines the chamfer at the intersection of Round_hole and part surface.

See 4.3.1052 for the application assertion.

The top_chamfer need not be specified for a particular Round_hole.

4.2.388 Rounded_u_profile

A Rounded_u_profile is an open profile that is specified by a shape bounded by two parallel lines and a semi circle. Each line begins at the end point of the semi circle. The lines are tangent to the circle and extend infinitely.

EXAMPLE 194 – Figure 54 depicts a Rounded_u_profile.

A Rounded_u_profile is a type of Open_profile (see 4.2.292).

The data associated with a Rounded_u_profile are the following:

– width.

The width specifies the distance across a Rounded_u_profile.

See 4.3.1059 for the application assertion.

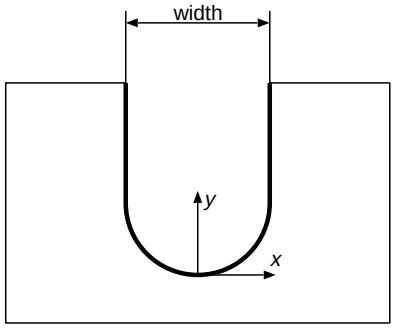

Figure 54 – Rounded_u_profile

4.2.389 Same_time_machining_relationship

A Same_time_machining_relationship is a relationship between two Item_instance (see 4.2.241) objects that specifies that those two objects shall be manufactured together within the same Process_operation (see 4.2.336).

EXAMPLE 195 – Figure 55 shows an example for this case.

A Same_time_machining_relationship is a type of Item_instance_relationship (see 4.2.242).

The data associated with a Same_time_machining_relationship are the following:

- description;
- name;
- transformation.

4.2.389.1 description

The description specifies additional information about the Same_time_machining_relationship.

See 4.3.1061 for the application assertion.

The description need not be specified for a particular Same_time_machining_relationship.

If present, there shall be exactly one object that defines the description for a Same_time_machining_relationship.

4.2.389.2 name

The name specifies the word or group of words by which the Same_time_machining_relationship is referred to.

See 4.3.1061 for the application assertion.

The name need not be specified for a particular Same_time_machining_relationship.

If present, there shall be exactly one object that defines the name for a Same_time_machining_relationship.

4.2.389.3 transformation

The transformation specifies the geometrical Transformation (see 4.2.472) between the local coordinate system of the related Item (see 4.2.236) with respect to the local coordinate system of the relating Item. The transformation is needed to position the related Item with respect to the relating Item for the same time machining process In the case where the transformation is realized by a Template_instance (see 4.2.453) the scale factor of that Template_instance shall be omitted or set to 1.

See 4.3.1060 and 4.3.1062 for the application assertions.

The transformation need not be specified for a particular Same_time_machining_relationship.

If present, there shall be exactly one object that defines the transformation for a Same_time_-machining_relationship.

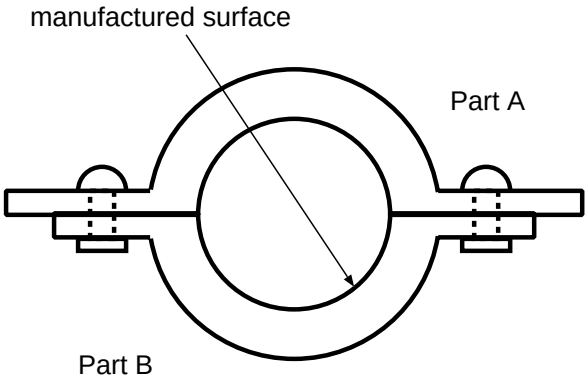

Figure 55 – Same_time_machining_relationship

4.2.390 Security_classification

A Security_classification is the level of confidentiality that is required in order to protect product data against unauthorized usage.

The data associated with a Security_classification are the following:

- is_applied_to;
- name;
- purpose;
- security_classification_level.

4.2.390.1 is_applied_to

The is_applied_to specifies the object with which the Security_classification is associated.

See 4.3.1063, 4.3.1064, 4.3.1065, 4.3.1066, 4.3.1067, 4.3.1068, 4.3.1069, 4.3.1070, 4.3.1071, 4.3.1072, 4.3.1073, 4.3.1074, 4.3.1075, 4.3.1077, 4.3.1078, 4.3.1079, 4.3.1080, 4.3.1081, 4.3.1082, 4.3.1083, 4.3.1084, 4.3.1086, 4.3.1087, 4.3.1088, 4.3.1089, 4.3.1090, 4.3.1091, and 4.3.1092 for the application assertions.

There shall be at least one object that the Security_classification is_applied_to.

4.2.390.2 name

The name specifies the word or group of words used to refer to the Security_classification.

4.2.390.3 purpose

The purpose specifies the rationale behind the Security_classification.

See 4.3.1076 for the application assertion.

There shall be exactly one object that defines the purpose for a Security_classification.

4.2.390.4 security_classification_level

The security_classification_level specifies the Security_level (see 4.2.391) associated with the object.

See 4.3.1085 for the application assertion.

4.2.391 Security_level

A Security_level is the specification of a level of security within some Security_classification (see 4.2.390).

NOTE – The values of Security_level are company specific.

The data associated with a Security_level are the following:

- name;
- used_classification_system.

4.2.391.1 name

The name specifies the word or abbreviation used to refer to the Security_level.

4.2.391.2 used_classification_system

The used_classification_system specifies the Classification_system (see 4.2.70) that contains the information about how to interpret the name of the Security_level.

See 4.3.1093 for the application assertion.

The used_classification_system need not be specified for a particular Security_level.

4.2.392 Selected_instance

A Selected_instance is the instance of an Item (see 4.2.236) whose occurrence depends on certain constraints.

EXAMPLE 196 – To minimize the concentricity error of a wheel weights are attached to the rim; this set of weights is a Selected_instance. The quantity as well as the position of these weights depends on the concentricity behaviour of each particular wheel as manufactured and tested.

A Selected_instance is a type of Item_instance (see 4.2.241).

The data associated with a Selected_instance are the following:

- maximum_quantity;
- minimum_quantity;
- selection_control.

4.2.392.1 maximum_quantity

The maximum_quantity specifies the maximum number of occurrences foreseen for the Selected_-instance.

See 4.3.1094 for the application assertion.

The maximum_quantity need not be specified for a particular Selected_instance.

4.2.392.2 minimum_quantity

The minimum_quantity specifies the minimum number of occurrences foreseen for the Selected_-instance.

See 4.3.1094 for the application assertion.

The minimum_quantity need not be specified for a particular Selected_instance.

4.2.392.3 selection_control

The selection_control specifies the constraint that has to be evaluated for the Selected_instance.

EXAMPLE 197 – 'balancing the wheel' is an example for a selection_control.

4.2.393 Serial_configuration

A Serial_configuration is a Configuration (see 4.2.89) that is planned to apply from a given serial number of the product for whose characteristic the Serial_configuration identifies a solution.

A Serial_configuration is a type of Configuration (see 4.2.89).

The data associated with a Serial_configuration are the following:

- serial_end_number;
- serial_start_number.

4.2.393.1 serial_end_number

The serial_end_number specifies the serial number of that instance of the product that is the last instance for which the Serial_configuration applies.

The serial_end_number need not be specified for a particular Serial_configuration.

4.2.393.2 serial_start_number

The serial_start_number specifies the serial number of that instance of the product that is the first instance for which the Serial_configuration applies.

4.2.394 Shape_aspect

A Shape_aspect is a portion of shape that has to be identified explicitly to be associated with other information.

EXAMPLE 198 – To identify a portion of one face of a shaft that shall have a surface coating applied to it, this portion is specified as a Shape_aspect. This sub-face is not needed to define the geometric shape of the shaft. Figure 56 shows this example.

Each Shape_aspect may be a Feature_occurrence (see 4.2.176).

The data associated with a Shape_aspect are the following:

- composition;
- description.

4.2.394.1 composition

The composition specifies the shape that the Shape_aspect is part of.

See 4.3.1095 for the application assertion.

4.2.394.2 description

The description specifies additional information about the Shape_aspect.

See 4.3.1096 for the application assertion.

The description need not be specified for a particular Shape_aspect.

If present, there shall be exactly one object that defines the description for a Shape_aspect.

4.2.395 Shape_aspect_relationship

A Shape_aspect_relationship is a relationship between two Shape_aspect (see 4.2.394) objects.

The data associated with a Shape_aspect_relationship are the following:

- description;
- related;
- relating;

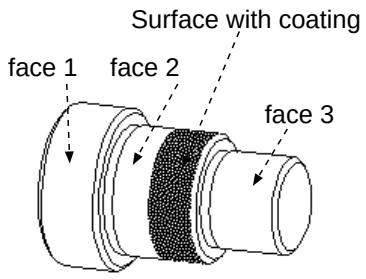

Figure 56 – Shape_aspect on a shaft

– relation_type.

4.2.395.1 description

The description specifies additional information about the Shape_aspect_relationship.

See 4.3.1097 for the application assertion.

The description need not be specified for a particular Shape_aspect_relationship.

If present, there shall be exactly one object that defines the description for a Shape_aspect_relationship.

4.2.395.2 related

The related specifies the second of the two Shape_aspect (see 4.2.394) objects related by a Shape_aspect_relationship.

See 4.3.1098 for the application assertion.

4.2.395.3 relating

The relating specifies the first of the two Shape_aspect (see 4.2.394) objects related by a Shape_aspect_relationship.

See 4.3.1098 for the application assertion.

4.2.395.4 relation_type

The relation_type specifies the meaning of the relationship.

EXAMPLE 199 – 'transition priority' may be a used to define the precedence between two intersecting Transition_feature (see 4.2.476) objects.

4.2.396 Shape_dependent_property

A Shape_dependent_property is a characteristic of an object that is closely related to the shape of the product.

NOTE – In the ideal case most of the Shape_dependent_property objects can be derived from the geometric shape representation. Yet, in many cases the used CAD models are (by intention) not detailed or accurate enough to compute the exact Centre_of_mass (see 4.2.49) or Moments_of_inertia (see 4.2.285) needed for further calculations. Therefore it is necessary to represent these values explicitly.

A Shape_dependent_property is a type of Property (see 4.2.361).

Each Shape_dependent_property is either a Centre_of_mass (see 4.2.49), a Thickness (see 4.2.456), or a Moments_of_inertia (see 4.2.285).

The data associated with a Shape_dependent_property are the following:

– described_object.

The described_object specifies the object that the Shape_dependent_property is associated to.

See 4.3.1099 and 4.3.1100 for the application assertions.

There shall be exactly one object that defines the described_object for a Shape_dependent_property.

4.2.397 Shape_description_association

A Shape_description_association is a mechanism to associate the definition of an Item_shape (see 4.2.245) with the geometric representation of the shape.

The data associated with a Shape_description_association are the following:

– defining_geometry;

– is_defining_shape_for.

4.2.397.1 defining_geometry

The defining_geometry specifies the Geometric_model (see 4.2.211) or the External_model (see 4.2.166) that contains the shape information.

See 4.3.1101 and 4.3.1104 for the application assertions.

There shall be exactly one object that defines the defining_geometry for a Shape_description_association.

4.2.397.2 is_defining_shape_for

The is_defining_shape_for specifies the Item_shape (see 4.2.245) the Shape_description_association is associated with.

See 4.3.1102, 4.3.1103, 4.3.1105, 4.3.1106, 4.3.1107, 4.3.1108, and 4.3.1109 for the application assertions.

There shall be exactly one object that the Shape_description_association is_defining_shape_for.

4.2.398 Shell

A Shell is a collection of Face (see 4.2.167) objects that establish a Surface_model (see 4.2.439).

A Shell is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Shell are the following:

- face.

The face specifies the set of Face (see 4.2.167) objects that form a Shell.

See 4.3.1110 for the application assertion.

4.2.399 Significant_number_of_digits

A Significant_number_of_digits is a limit specification for general tolerance table cells. A Significant_number_of_digits is used for a dimension specification of a part or tool. The number of digits used for the dimension determine which default tolerance entry in the general tolerance table is valid for this particular dimension

The data associated with a Significant_number_of_digits are the following:

- number_of_digits.

The number_of_digits specifies the significant number of digits used for a dimension specification of a part.

4.2.400 Simple_pair_range

A Simple_pair_range is the valid range of the pair parameters of a pair. A Simple_pair_range shall represent either a cylindrical pair range, a gear pair range, a planar pair range, a prismatic pair range, a rack and pinion pair range, a revolute pair range, a rolling curve pair range, a rolling surface pair range, a screw pair range, a sliding curve pair range, a sliding surface pair range, a spherical pair range, or an universal pair range.

The data associated with a Simple_pair_range are the following:

- is_applied_to.

The is_applied_to specifies the Kinematic_pair (see 4.2.258) that the Simple_pair_range applies to.

See 4.3.1111 for the application assertion.

4.2.401 Simulation_information

A Simulation_information is the set of information describing the simulation related properties of an object.

The data associated with a Simulation_information are the following:

- described_object;
- ground;
- mechanism.

4.2.401.1 described_object

The described_object specifies the object to which the Simulation_information belongs.

See 4.3.1112, 4.3.1114, 4.3.1115, 4.3.1116, 4.3.1117, 4.3.1118, 4.3.1120, 4.3.1121, and 4.3.1122 for the application assertions.

There shall be at least one object that defines the described_object for a Simulation_information.

4.2.401.2 ground

The ground specifies the environment with the coordinate space that is the reference for the kinematic data.

NOTE – A geometric description of those parts of a kinematic structure that are immobile may also be part of the ground representation.

See 4.3.1113 for the application assertion.

4.2.401.3 mechanism

The mechanism specifies the Kinematic_mechanism (see 4.2.257) objects that are part of the Simulation_information.

See 4.3.1119 for the application assertion.

4.2.402 Simultaneous_activity

A Simultaneous_activity is a set of two or more Activity (see 4.2.2) objects that shall be carried out simultaneously or shall be implemented together in order to ensure consistency and enhance efficiency.

The data associated with a Simultaneous_activity are the following:

- description;
- element.

4.2.402.1 description

The description specifies additional information about the Simultaneous_activity.

See 4.3.1124 for the application assertion.

The description need not be specified for a particular Simultaneous_activity.

If present, there shall be exactly one object that defines the description for a Simultaneous_activity.

4.2.402.2 element

The element specifies the Activity (see 4.2.2) objects that shall be handled simultaneously.

See 4.3.1123 for the application assertion.

4.2.403 Simultaneous_process_operation

A Simultaneous_process_operation is a set of two or more Process_operation (see 4.2.336) objects that shall be carried out simultaneously.

The data associated with a Simultaneous_process_operation are the following:

- cycle_time;
- element.

4.2.403.1 cycle_time

The cycle_time specifies the period of time within which both Process_operation (see 4.2.336) objects have to take place in order to be defined as 'simultaneous'.

The cycle_time need not be specified for a particular Simultaneous_process_operation.

4.2.403.2 element

The element specifies the Process_operation (see 4.2.336) objects that are performed at the same time.

See 4.3.1125 for the application assertion.

4.2.404 Single_instance

A Single_instance is one particular occurrence of an object that is defined either as a Design_discipline_item_definition (see 4.2.134) or as a Product_specification (see 4.2.354).

NOTE – A Single_instance may or may not be associated with placement information using an Instance_placement (see 4.2.234).

EXAMPLE 200 – In a Technical_solution (see 4.2.451) for the front left brake a brake disk is used that has a defined position specified by a geometric Transformation (see 4.2.472).

A Single_instance is a type of Item_instance (see 4.2.241).

4.2.405 Size_dimension

A Size_dimension is the representation of a dimension characterized as the size of an individual geometric or annotation element.

A Size_dimension is a type of Geometric_dimension (see 4.2.210).

Each Size_dimension may be an Angular_size_dimension (see 4.2.12).

The data associated with a Size_dimension are the following:

- dimension_type;
- is_applied_to.

4.2.405.1 dimension_type

The dimension_type specifies the kind of Size_dimension that is represented.

EXAMPLE 201 – 'diameter size', 'radial size', 'angular size', 'curve size', or 'linear size' are examples for the dimension_type.

4.2.405.2 is_applied_to

The is_applied_to specifies the geometric or annotation element which the Size_dimension is applied to.

See 4.3.1126, 4.3.1127, and 4.3.1128 for the application assertions.

There shall be exactly one object that the Size_dimension is_applied_to.

4.2.406 Slot_end_type

A Slot_end_type is the definition of a kind of end that characterizes a Slot_feature (see 4.2.407).

Each Slot_end_type is either a Radiused_slot_end_type (see 4.2.367), a Flat_slot_end_type (see 4.2.184), an Open_slot_end_type (see 4.2.293), or a Woodruff_slot_end_type (see 4.2.499).

The data associated with a Slot_end_type are the following:

- is_applied_to.

The is_applied_to specifies to which end of the path the Slot_end_type applies. The following values shall be used:

- 'start': The Slot_end_type is applied to that end of the Slot_feature (see 4.2.407) that corresponds to the start of the defining Path (see 4.2.304);
- 'end': The Slot_end_type is applied to that end of the Slot_feature that corresponds to the end of the defining Path.

4.2.407 Slot_feature

A Slot_feature is a channel or depression with a continuous course.

EXAMPLE 202 – Figure 57 illustrates examples of slots.

A Slot_feature is a type of Process_feature_in_solid (see 4.2.335).

The data associated with a Slot_feature are the following:

- end_condition;
- maximum_depth;
- profile_placement;
- slot_profile;
- sweep_path.

4.2.407.1 end_condition

The end_condition specifies the Slot_end_type (see 4.2.406) objects that define the types of the slot's ends. A Slot_feature that is defined with a Complete_circular_path (see 4.2.78) shall have two end conditions of type Open_slot_end_type (see 4.2.293).

See 4.3.1131 for the application assertion.

4.2.407.2 maximum_depth

The maximum_depth specifies some amount of distance from the bottom of a slot to a point that is outside of the slot feature. The maximum_depth places a limitation on the slot depth definition so not to interfere with other features that might be nearby.

NOTE – The maximum_depth is not feature definitional.

The maximum_depth need not be specified for a particular Slot_feature.

4.2.407.3 profile_placement

The profile_placement specifies a geometric Transformation (see 4.2.472) that may be used to place the defining Open_profile (see 4.2.292) in the Slot_feature's coordinate space.

See 4.3.1132 for the application assertion.

The profile_placement need not be specified for a particular Slot_feature.

4.2.407.4 slot_profile

The slot_profile specifies the Open_profile (see 4.2.292) that is swept along the sweep path.

See 4.3.1129 for the application assertion.

4.2.407.5 sweep_path

The sweep_path specifies the Path (see 4.2.304) that serves as a sweep path for a Slot_feature.

See 4.3.1130 for the application assertion.

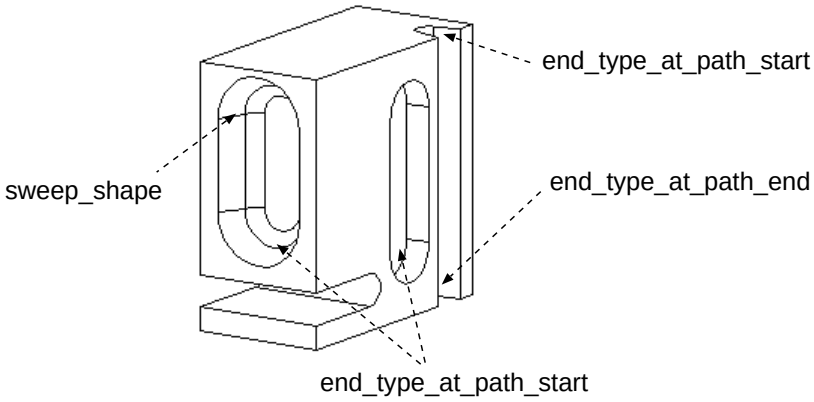

Figure 57 – Slot_feature

4.2.408 Solid_fill_area

A Solid_fill_area is a enclosed area that is uniformly filled by a single colour.

4.2.409 Solid_of_linear_extrusion

A Solid_of_linear_extrusion is a solid that can be formed by sweeping a planar Face (see 4.2.167) along a straight line in space about a specified depth.

A Solid_of_linear_extrusion is a type of Swept_face_solid (see 4.2.443).

4.2.410 Solid_of_revolution

A Solid_of_revolution is a solid formed by revolving a planar Face (see 4.2.167) about an axis. The axis shall be in the plane of the Face and shall not intersect the interior of the Face. The planar Face may have holes which will sweep into holes in the solid. The direction of revolution is clockwise if viewed along the axis in the positive direction.

A Solid_of_revolution is a type of Swept_face_solid (see 4.2.443).

4.2.411 Solid_replica

A Solid_replica is a copy of a solid within a CSG tree at a new location and orientation. Additionally, the received object may have been uniform resized or mirrored.

A Solid_replica is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Solid_replica are the following:

- replicated_solid.

The replicated_solid specifies the solid to be replicated.

See 4.3.1133, 4.3.1134, 4.3.1135, 4.3.1136, 4.3.1137, and 4.3.1138 for the application assertions.

There shall be exactly one object that defines the replicated_solid for a Solid_replica.

4.2.412 Solution_certification

A Solution_certification is a certificate for an Item_solution (see 4.2.246).

The data associated with a Solution_certification are the following:

- certification_date;
- certification_type;
- certified_solution;
- name;
- purpose.

4.2.412.1 certification_date

The certification_date specifies the Date_time (see 4.2.113) the Solution_certification was granted.

See 4.3.1139 for the application assertion.

4.2.412.2 certification_type

The certification_type specifies the kind of certification.

EXAMPLE 203 – 'supplier certificate' is an example for the certification_type.

4.2.412.3 certified_solution

The certified_solution specifies the Item_solution (see 4.2.246) the Solution_certification was granted for.

See 4.3.1140 for the application assertion.

4.2.412.4 name

The name specifies the word or group of words by which the Solution_certification is referred to.

See 4.3.1141 for the application assertion.

There shall be exactly one object that defines the name for a Solution_certification.

4.2.412.5 purpose

The purpose specifies the objective of the Solution_certification.

See 4.3.1141 for the application assertion.

There shall be exactly one object that defines the purpose for a Solution_certification.

4.2.413 Solution_instance_association

A Solution_instance_association is a mechanism to associate an Item_instance (see 4.2.241) as a solution element with an Item_solution (see 4.2.246).

The data associated with a Solution_instance_association are the following:

- instance;
- solution.

4.2.413.1 instance

The instance specifies the Item_instance (see 4.2.241) that is a solution element for the Item_solution (see 4.2.246).

See 4.3.1142 for the application assertion.

4.2.413.2 solution

The solution specifies the Item_solution (see 4.2.246) for which the Item_instance (see 4.2.241) is a solution element.

See 4.3.1143 for the application assertion.

4.2.414 Specific_classification

A Specific_classification is a classification of Item (see 4.2.236) objects according to a specific aspect specified in the classification_type attribute.

A Specific_classification is a type of Item_classification (see 4.2.237).

The data associated with a Specific_classification are the following:

- classification_name;
- classification_type.

4.2.414.1 classification_name

The classification_name specifies the level within the classification type.

EXAMPLE 204 – Within the classification_type 'service item' examples for the classification_name are 'repair' and 'maintenance'.

EXAMPLE 205 – Within the classification_type 'in process item' examples for the classification_name are 'raw material', 'fixing material', and 'final part'.

EXAMPLE 206 – Within the classification_type 'assembly item' examples for the classification_name are 'welding assembly' and 'mounting assembly'.

Within the classification_type 'item role' the following values shall be used where applicable:

– 'part': The item plays the role of a part;

– 'tool': The item plays the role of a tool;

– 'raw material': The item plays the role of raw material.

4.2.414.2 classification_type

The classification_type specifies the kind of classification. Where applicable the following values shall be used:

– 'item role': This type of classification is used for the primary classification of an Item;

– 'assembly item': In this case the attribute 'classification_name' specifies the rationale behind the creation of a specific assembly structure. The Specific_classification shall be applied to the Item (see 4.2.236) whose defining Design_discipline_item_definition (see 4.2.134) is the root of the assembly structure;

– 'completely knocked down item': This type of classification is used to indicate that an Item is used in a production site that has assembling facilities only;

EXAMPLE 207 – The 'completely knocked down' indicates that the decomposition or the delivery condition of an Item may be different as it is described in the BOM used for the serial production. Usually this is the case if the components are shipped to and assembled in a different country.

– 'in process item': This type of classification is used to indicate the state that the Item has in a manufacturing process;

– 'prototype building': This type of classification is used to indicate that an Item is intended for prototype building only; the Item is not intended for serial production;

– 'regulated item': This type of classification is used to indicate that for an Item certain regulations have to be considered;

– 'application control': This type of classification is used to indicate that an Item (see 4.2.236) shall be considered from certification aspects;

EXAMPLE 208 – Before releasing a new car to the market both function and quality of specific parts have to be certified by an authority (e.g. ministry of transportation). For such parts certification requirements have to be considered during the design phase.

– 'safety item': This type of classification is used to indicate that an Item is relevant for safety purposes;

– 'service item': This type of classification is used to indicate that an Item is relevant for service purposes.

NOTE – The classification of an Item as 'standard item' or as 'library item' can be done using the General_classification (see 4.2.192) with a reference to the corresponding Classification_system (see 4.2.70).

4.2.415 Specification

A Specification is a characteristic of a product. A Specification discriminates one product from other constituents of the same Product_class (see 4.2.348). A Specification refers to a Specification_category (see 4.2.416) that completes the semantic of the Specification.

NOTE 1 – A Specification may be a characteristic of the members of more than one Product_class using Class_specification_association (see 4.2.68) objects.

NOTE 2 – A Specification in combination with a Configuration (see 4.2.89) may be used to define under which conditions an Item (see 4.2.236) is used for a product of a Product_class.

EXAMPLE 209 – 'coupe', 'hatchback', or 'sedan' are examples for specifications belonging to the Specification_category of type 'car body'. 'radio 1 with CD player' and 'radio 2 without CD player' are examples for specifications belonging to the Specification_category of type 'radio equipment'. 'disk brake' and 'drum brake' are examples for specifications belonging to the Specification_category of type 'braking system'.

The data associated with a Specification are the following:

– category;

– description;

– id;

– name;

– package;

– version_id.

4.2.415.1 category

The category specifies the Specification_category (see 4.2.416) that completes the semantic of the Specification.

See 4.3.1145 for the application assertion.

4.2.415.2 description

The description specifies additional information about the Specification.

See 4.3.1144 for the application assertion.

The description need not be specified for a particular Specification.

If present, there shall be exactly one object that defines the description for a Specification.

4.2.415.3 id

The id specifies the identifier of the Specification that shall be unique within the scope of a Specification_category (see 4.2.416).

4.2.415.4 name

The name specifies the word or group of words by which the Specification is referred to.

See 4.3.1144 for the application assertion.

The name need not be specified for a particular Specification.

If present, there shall be exactly one object that defines the name for a Specification.

4.2.415.5 package

The package specifies whether this Specification represents a package of Specification objects or not. A package is a set of Specification objects that may be defined by the marketing department. A package combines those Specification objects that shall be offered to the market as a set. In the case where package is 'true' exactly one Specification_inclusion (see 4.2.418) shall refer to this Specification as if_condition.

EXAMPLE 210 – A sports package contains sports seats, a special steering wheel, special tyres and wheels. A winter package contains heated front seats, heated windshield washers, heated exterior mirrors, and special tyres.

NOTE – Usually the members of a package belong to distinct Specification_category (see 4.2.416) objects.

4.2.415.6 version_id

The version_id specifies the identification of a particular version of a Specification.

The version_id need not be specified for a particular Specification.

4.2.416 Specification_category

A Specification_category is the definition of a set of Specification (see 4.2.415) objects for the same purpose.

EXAMPLE 211 – The category 'kind of drive' for the Specification objects 'front wheel drive' and 'rear wheel drive' or the category 'level of equipment' for the Specification objects 'standard', 'comfortable', and 'luxurious' are examples for a Specification_category.

The data associated with a Specification_category are the following:

- description;
- id;
- implicit_exclusive_condition.

4.2.416.1 description

The description specifies information about the Specification_category.

EXAMPLE 212 – The description 'trim' characterizes a Specification_category for Specification (see 4.2.415) objects that controls the quality and colour of the interior parts including e.g., inner door panels and upholstery. Other examples are 'kind of drive', 'rear brake type', 'brake power regulator', 'radio equipment', or 'type of car body'.

See 4.3.1146 for the application assertion.

There shall be exactly one object that defines the description for a Specification_category.

4.2.416.2 id

The id specifies the identifier of the Specification_category that shall be unique.

NOTE – The scope of uniqueness is usually dependent on the form of implementation; it may be e.g., a physical file or a data base.

4.2.416.3 implicit_exclusive_condition

The implicit_exclusive_condition specifies whether the Specification objects within the Specification_category are mutually exclusive for the production of one particular product ('true') or not ('false').

EXAMPLE 213 – 'safety equipment' is an example for a non mutually exclusive Specification_category if e.g. ABS and airbag are Specification objects in this category. 'engine' is an example for a Specification_category with an implicit_exclusive_condition since usually only one engine can be mounted for power supply.

NOTE – More complex conditions can be handled using Specification_expression (see 4.2.417) objects.

4.2.417 Specification_expression

A Specification_expression is a combination of Specification (see 4.2.415) objects formed by Boolean operations.

The data associated with a Specification_expression are the following:

- description;
- operand;
- operation.

4.2.417.1 description

The description specifies additional information about the Specification_expression.

See 4.3.1147 for the application assertion.

The description need not be specified for a particular Specification_expression.

If present, there shall be exactly one object that defines the description for a Specification_expression.

4.2.417.2 operand

The operand specifies the operands of the Boolean operation that are either Specification (see 4.2.415) objects or other Specification_expression objects.

See 4.3.1148 and 4.3.1149 for the application assertions.

There shall be at least one object that defines the operand for a Specification_expression.

4.2.417.3 operation

The operation specifies the kind of Boolean operation. Four kinds of operations are permitted:

- 'and': all of the identified Specification (see 4.2.415) objects shall be used;
- 'or': a subset or all of the identified Specification objects shall be used;
- 'oneof': exactly one of the identified Specification objects shall be used;
- 'not': the identified Specification shall not be used.

4.2.418 Specification_inclusion

A Specification_inclusion is the representation of the statement that the application of a Specification (see 4.2.415) or of a Specification_expression (see 4.2.417) implies the inclusion of an additional Specification or Specification_expression.

NOTE 1 – The Specification_inclusion may apply for a certain Product_class (see 4.2.348) either directly through a Class_inclusion_association (see 4.2.67) or indirectly by inheritance through a Product_class_hierarchy (see 4.2.349).

NOTE 2 – The Specification_inclusion is intended to complete the set of Specification objects for a Product_specification in order to enable the manufacturing of the product on the basis of an initial set of Specification objects defined e.g., by a customer order.

The data associated with a Specification_inclusion are the following:

- description;
- if_condition;
- included_specification.

4.2.418.1 description

The description specifies additional information about the Specification_inclusion.

See 4.3.1150 for the application assertion.

The description need not be specified for a particular Specification_inclusion.

If present, there shall be exactly one object that defines the description for a Specification_-inclusion.

4.2.418.2 if_condition

The if_condition specifies the Specification (see 4.2.415) or the Specification_expression (see 4.2.417) that serves as the condition for the inclusion.

See 4.3.1151 and 4.3.1152 for the application assertions.

There shall be exactly one object that defines the if_condition for a Specification_inclusion.

4.2.418.3 included_specification

The included_specification specifies the Specification (see 4.2.415) or the Specification_expression (see 4.2.417) objects that are to be included.

NOTE 1 – In the case where the included_specification is a Specification_expression that is e.g., an OR expression, there may be several alternatives for Specification to be included.

NOTE 2 – In the case where more than one Specification objects are to be included a Specification_-expression of type AND shall be used.

See 4.3.1151 and 4.3.1152 for the application assertions.

There shall be exactly one object that defines the included_specification for a Specification_-inclusion.

4.2.419 Specified_higher_usage

A Specified_higher_usage is the relationship between a constituent and an assembly where the assembly is not the immediate parent for the constituent. The relationship shows the usage of a constituent in a high level assembly indicating also the path from the high level assembly to the constituent through recursive usage of Specified_higher_usage objects.

A Specified_higher_usage is a type of Assembly_component_relationship (see 4.2.26).

The data associated with a Specified_higher_usage are the following:

- next_usage;
- upper_usage.

4.2.419.1 next_usage

The next_usage specifies the Next_higher_assembly (see 4.2.287) of which the related Item_-instance (see 4.2.241) is a constituent.

NOTE – The next_usage specifies the next node in the path traversing the assembly structure tree from the bottom to the top.

See 4.3.1154 for the application assertion.

4.2.419.2 upper_usage

The upper_usage specifies the Assembly_component_relationship (see 4.2.26) that shows the path from the assembly specified by next_usage to the high level assembly. In case this is a path traversing several nodes, the upper_usage is another Specified_higher_usage object, otherwise it may be a single Next_higher_assembly (see 4.2.287) object.

See 4.3.1153 for the application assertion.

4.2.420 Sphere

A Sphere is a solid of spherical shape defined by a center point and a radius.

A Sphere is a type of Csg_primitive (see 4.2.101).

4.2.421 Spherical_bottom

A Spherical_bottom is a hole bottom that is defined by a hemisphere that is tangent to the sides of the hole Round_hole (see 4.2.387).

A Spherical_bottom is a type of Hole_bottom_condition (see 4.2.228).

The data associated with a Spherical_bottom are the following:

- radius.

The radius specifies the distance between the centre of the sphere and its surface.

See 4.3.1155 for the application assertion.

4.2.422 Spherical_surface

A Spherical_surface is a surface with a constant distance (the radius) from a central point.

A Spherical_surface is a type of Surface (see 4.2.434).

4.2.423 Square_u_profile

A Square_u_profile is an open profile that is bounded by three lines. One is the base line and has a defined length. The other two lines begin at the ends of the base line and extend infinitely at any angle that is equal or larger than a right angle. The corners of a Square_u_profile may be blended by a radius.

EXAMPLE 214 – Figure 58 depicts a Square_u_profile.

A Square_u_profile is a type of Open_profile (see 4.2.292).

The data associated with a Square_u_profile are the following:

- first_angle;
- first_radius;
- second_angle;
- second_radius;
- width.

4.2.423.1 first_angle

The first_angle specifies the size of an angle between the base and that side of the profile that intersects the x-axis at a positive value.

See 4.3.1156 for the application assertion.

4.2.423.2 first_radius

The first_radius specifies a radius shape blend between the base and that side of the profile that intersects the x-axis at a positive value.

See 4.3.1156 for the application assertion.

The first_radius need not be specified for a particular Square_u_profile.

4.2.423.3 second_angle

The second_angle specifies the size of an angle between the base and that side of the profile that intersects the x-axis at a negative value.

See 4.3.1156 for the application assertion.

4.2.423.4 second_radius

The second_radius specifies a radius shape blend between the base and that side of the profile that intersects the x-axis at a negative value.

See 4.3.1156 for the application assertion.

The second_radius need not be specified for a particular Square_u_profile.

4.2.423.5 width

The width specifies the size of the base line for a Square_u_profile.

See 4.3.1156 for the application assertion.

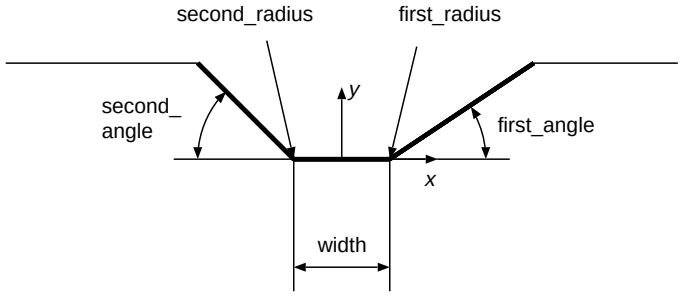

Figure 58 – Square_u_profile

4.2.424 Straightness_tolerance

A Straightness_tolerance is the limitation of the amount of deviation an element of a surface or an axis may have from being a straight line. It defines a tolerance zone within which the considered element or axis must lie. The Straightness_tolerance applies to the complete surface or axis or to each segment of a defined size if the segment attribute is specified.

A Straightness_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Straightness_tolerance are the following:

- affected_plane;
- segment_size.

4.2.424.1 affected_plane

The affected_plane specifies the plane a certain type of geometric tolerance applies in. This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane attribute is not specified the tolerance applies in all directions which results in a cylindrical tolerance zone (on drawings indicated by the diameter symbol).

See 4.3.1157 for the application assertion.

The affected_plane need not be specified for a particular Straightness_tolerance.

4.2.424.2 segment_size

The segment_size specifies the length (or the edge length) of a segment if the geometric tolerance is not applied to the total length/area of an axis/surface but on a unit base

EXAMPLE 215 – Figure 59 shows an example for a straightness tolerance callout with indication of a segment_size with a length of 200 mm.

The segment_size need not be specified for a particular Straightness_tolerance.

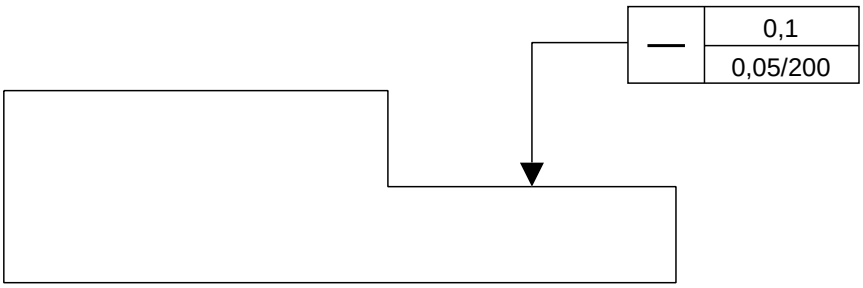

Figure 59 – Indication of segment_size in a tolerance callout

4.2.425 String_with_language

A String_with_language represents text information in a specific language together with an identification of the language used.

The data associated with a String_with_language are the following:

- contents;
- language;
- primary.

4.2.425.1 contents

The contents is text information stored in the language identified by the language attribute.

4.2.425.2 language

The language specifies the language of the text information in the Alpha-3 code specified in ISO 639–2.

EXAMPLE 216 – Possible values for language are 'eng' for English, 'fra' for French, 'rus' for Russian, or 'deu' for German.

4.2.425.3 primary

The primary specifies whether the identified language is the primarily language used or not.

NOTE – In the case where primary is 'false' the text may be a translation.

4.2.426 Structuring_method_hierarchy

A Structuring_method_hierarchy is a mechanism to build up a nesting of Group (see 4.2.222) objects in structuring methods.

NOTE – This mechanism facilitates e.g., the nesting of groups in other groups and the nesting of groups in a layer, but not the nesting of one layer in another layer or group.

The data associated with a Structuring_method_hierarchy are the following:

- related;
- relating.

4.2.426.1 related

The related specifies the Group (see 4.2.222) object to be nested.

See 4.3.1158 for the application assertion.

4.2.426.2 relating

The relating specifies the structuring method in that the Group (see 4.2.222) is nested.

See 4.3.1158 and 4.3.1159 for the application assertions.

There shall be exactly one object that the Structuring_method_hierarchy is relating to.

4.2.427 Styled_element

A Styled_element is a Detailed_element (see 4.2.135) that has presentation information.

A Styled_element is a type of Detailed_element (see 4.2.135).

Each Styled_element is either an Annotation_element (see 4.2.15) or a Styled_model_element (see 4.2.430).

The data associated with a Styled_element are the following:

- appearance;
- invisible.

4.2.427.1 appearance

The appearance specifies the associated presentation information.

See 4.3.1160 for the application assertion.

4.2.427.2 invisible

The invisible specifies if the Styled_element is invisible.

4.2.428 Styled_geometric_model

A Styled_geometric_model is a set of geometric elements that have presentation information.

NOTE – A Styled_geometric_model is defined in the Cartesian_coordinate_space (see 4.2.44) of the corresponding Geometric_model (see 4.2.211).

A Styled_geometric_model is a type of Styled_model (see 4.2.429).

The data associated with a Styled_geometric_model are the following:

- styled_geometry.

The styled_geometry specifies the Geometric_model (see 4.2.211) that contains the styled geometric elements.

See 4.3.1161 for the application assertion.

4.2.429 Styled_model

A Styled_model is a set of geometric or annotation elements that have presentation information.

Each Styled_model may be a Styled_model_version (see 4.2.432).

Each Styled_model is either a Styled_geometric_model (see 4.2.428) or an Annotation_model (see 4.2.16).

The data associated with a Styled_model are the following:

- additional_elements;
- description;
- element;
- model_id.

4.2.429.1 additional_elements

The additional_elements specifies the Template_instance (see 4.2.453) objects that are additionally imported into the Styled_model using a Transformation (see 4.2.472). The additional_elements shall also be of type Styled_model.

See 4.3.1164 for the application assertion.

4.2.429.2 description

The description specifies additional information about the Styled_model.

See 4.3.1162 for the application assertion.

The description need not be specified for a particular Styled_model.

If present, there shall be exactly one object that defines the description for a Styled_model.

4.2.429.3 element

The element specifies the set of Styled_element (see 4.2.427) objects that forms the Styled_model.

See 4.3.1163 for the application assertion.

4.2.429.4 model_id

The model_id specifies the identifier of the Styled_model.

4.2.430 Styled_model_element

A Styled_model_element is a Styled_element (see 4.2.427) that represents geometry.

A Styled_model_element is a type of Styled_element (see 4.2.427).

The data associated with a Styled_model_element are the following:

- element.

The element specifies the Detailed_model_element (see 4.2.137) the presentation information is attached to.

See 4.3.1165 for the application assertion.

4.2.431 Styled_model_relationship

A Styled_model_relationship is a relationship between two Styled_model (see 4.2.429) objects.

The data associated with a Styled_model_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.431.1 description

The description specifies additional information about the Styled_model_relationship.

See 4.3.1166 for the application assertion.

The description need not be specified for a particular Styled_model_relationship.

If present, there shall be exactly one object that defines the description for a Styled_model_relationship.

4.2.431.2 related

The related specifies the second of the two Styled_model (see 4.2.429) objects related by the Styled_model_relationship.

See 4.3.1167 for the application assertion.

4.2.431.3 relating

The relating specifies the first of the two Styled_model (see 4.2.429) objects related by the Styled_model_relationship.

See 4.3.1167 for the application assertion.

4.2.431.4 relation_type

The relation_type specifies the meaning of the relationship.

4.2.432 Styled_model_version

A Styled_model_version is a particular version of a Styled_model (see 4.2.429).

A Styled_model_version is a type of Styled_model (see 4.2.429).

The data associated with a Styled_model_version are the following:

- version_id.

The version_id specifies the identification of a particular version of a Styled_model (see 4.2.429).

4.2.433 Supplier_solution

A Supplier_solution is a solution where the supplier differs from other solutions for the same Product_component (see 4.2.350), for the same Technical_solution (see 4.2.451), or for the same Final_item_solution (see 4.2.182) (as base).

EXAMPLE 217 – The Product_component 'tyre' has a Technical_solution of a '225x50 VR17' type with suppliers A, B, or C. With each of these suppliers a Supplier_solution is associated.

A Supplier_solution is a type of Item_solution (see 4.2.246).

The data associated with a Supplier_solution are the following:

- probability_rate;
- supplier.

4.2.433.1 probability_rate

The probability_rate specifies the share that is assigned to a supplier in the context of the base element.

The probability_rate need not be specified for a particular Supplier_solution.

4.2.433.2 supplier

The supplier specifies the supplier for a Supplier_solution.

4.2.434 Surface

A Surface is a set of mathematical points which is the image of a continuous function defined over a connected subset of the plane R2. It can be envisioned as a set of connected points in 3-dimensional space which is always locally 2-dimensional, but need not be a manifold.

A Surface is a type of Detailed_geometric_model_element (see 4.2.136).

Each Surface is either an Offset_surface (see 4.2.290), a Spherical_surface (see 4.2.422), a Trimmed_surface (see 4.2.479), a B_spline_surface (see 4.2.37), a Surface_of_linear_extrusion (see 4.2.440), a Toroidal_surface (see 4.2.469), a Surface_of_revolution (see 4.2.441), a Plane (see 4.2.317), a Cylindrical_surface (see 4.2.108), or a Conical_surface (see 4.2.91).

4.2.435 Surface_appearance

A Surface_appearance is the definition of the visual appearance of a surface.

The data associated with a Surface_appearance are the following:

- element;
- side.

4.2.435.1 element

The element specifies the elements that belong to a particular Surface_appearance.

EXAMPLE 218 – Surface boundaries, parameter lines, rendering, or fill areas are examples for element.

See 4.3.1168 for the application assertion.

4.2.435.2 side

The side specifies the side of a surface that the Surface_appearance is applied to.

4.2.436 Surface_appearance_element

A Surface_appearance_element is a collection of various elements to be applied in the presentation of the identified side of a surface. The collection includes the appearances for the surface boundaries, parameter lines, rendering, silhouettes, segmentation curves, control grids, and fill areas.

The data associated with a Surface_appearance_element are the following:

- surface_condition.

The surface_condition specifies the surface condition that is presented by the Surface_appearance_element.

See 4.3.1169 for the application assertion.

The surface_condition need not be specified for a particular Surface_appearance_element.

4.2.437 Surface_condition

A Surface_condition is a definition of a characteristic or property of a surface of a part.

Each Surface_condition is either a Visual_appearance (see 4.2.496), a Coating_layer (see 4.2.74), a Tactile_appearance (see 4.2.445), a Treatment_result (see 4.2.477), a Roughness (see 4.2.386), a Contact_ratio (see 4.2.97), or a Hardness (see 4.2.225).

The data associated with a Surface_condition are the following:

- is_applied_to;
- is_caused_by;
- value_interpretation.

4.2.437.1 is_applied_to

The is_applied_to specifies the shape that the Surface_condition is applied to.

See 4.3.1170 and 4.3.1172 for the application assertions.

There shall be at least one object that the Surface_condition is_applied_to.

4.2.437.2 is_caused_by

The is_caused_by specifies the Process_operation (see 4.2.336) that is used to produce the Surface_condition.

See 4.3.1171 for the application assertion.

The is_caused_by need not be specified for a particular Surface_condition.

4.2.437.3 value_interpretation

The value_interpretation specifies information on how the Surface_condition shall be interpreted.

NOTE – A Surface_condition may be specified in the design stage of a product but it may also be documented as measured on a prototype.

EXAMPLE 219 – The value_interpretation may be e.g., 'required', 'designed', 'estimated', or 'measured'.

4.2.438 Surface_condition_symbol

A Surface_condition_symbol is a combination of annotation elements that, as collection, presents a Surface_condition (see 4.2.437).

EXAMPLE 220 – Figure 60 shows examples how a Surface_condition_symbol is presented on technical drawings.

A Surface_condition_symbol is a type of Associated_annotation_symbol (see 4.2.29).

Figure 60 – Presentation of Surface_conditions information on technical drawings

4.2.439 Surface_model

A Surface_model is the representation of geometry formed by a collection of Shell (see 4.2.398) objects.

A Surface_model shall not intersect with another Surface_model except at edges and vertices.

NOTE – Two Surface_model objects may share faces.

A Surface_model is a type of Geometric_model (see 4.2.211).

The data associated with a Surface_model are the following:

- element.

The element specifies the set of Shell (see 4.2.398) objects that form the Surface_model.

See 4.3.1173 for the application assertion.

4.2.440 Surface_of_linear_extrusion

A Surface_of_linear_extrusion is a surface that is defined by sweeping any curve in 3D geometric space in a given direction. In case of a parametric curve, its image shall be swept. The result is an infinite surface that shall be trimmed by applying a Face (see 4.2.167).

A Surface_of_linear_extrusion is a type of Surface (see 4.2.434).

4.2.441 Surface_of_revolution

A Surface_of_revolution is a surface that is defined by rotating any curve, i.e., for a parametric curve its image in three-dimensional geometric space, after a complete revolution about an axis.

A Surface_of_revolution is a type of Surface (see 4.2.434).

4.2.442 Surface_profile_tolerance

A Surface_profile_tolerance is the definition of a uniform boundary along the true profile within which the elements of the surface must lie. The tolerance zone established by a Surface_profile_-tolerance is three dimensional, extending along the length and width of the considered feature as a whole respectively along each segment of a defined size if the segment attribute is specified.

A Surface_profile_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Surface_profile_tolerance are the following:

- datum.

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.1174 for the application assertion.

4.2.443 Swept_face_solid

A Swept_face_solid is a solid that is defined by a sweep of a planar Face (see 4.2.167). A Swept_face_solid shall not self-intersect.

A Swept_face_solid is a type of Detailed_geometric_model_element (see 4.2.136).

Each Swept_face_solid is either a Solid_of_linear_extrusion (see 4.2.409) or a Solid_of_revolution (see 4.2.410).

The data associated with a Swept_face_solid are the following:

- face.

The face specifies the Face (see 4.2.167) that is swept.

See 4.3.1175 for the application assertion.

4.2.444 Symmetry_tolerance

A Symmetry_tolerance is the amount of deviation a surface may have from being symmetrical to a datum. A plane of the part must lie in a tolerance zone defined by two parallel planes, symmetrically located with respect to a datum plane of the centre.

A Symmetry_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Symmetry_tolerance are the following:

- affected_plane;
- datum.

4.2.444.1 affected_plane

The affected_plane specifies the plane a certain type of geometric tolerance applies in. This attribute covers information that is given on drawings implicitly by the drawing plane. If the affected_plane attribute is not specified the tolerance applies in all directions which results in a cylindrical tolerance zone (on drawings indicated by the diameter symbol).

See 4.3.1177 for the application assertion.

The affected_plane need not be specified for a particular Symmetry_tolerance.

4.2.444.2 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.1176 for the application assertion.

4.2.445 Tactile_appearance

A Tactile_appearance is the appearance of a surface of a part regarding the sense of touch.

NOTE – At least one of the attributes 'id' or 'name' shall be instantiated.

A Tactile_appearance is a type of Surface_condition (see 4.2.437).

The data associated with a Tactile_appearance are the following:

- depth;
- description;
- id;
- name.

4.2.445.1 depth

The depth specifies the extend of the Tactile_appearance in the normal direction of the surface.

NOTE – The interpretation of the depth depends on the definition of the Tactile_appearance.

See 4.3.1179 for the application assertion.

The depth need not be specified for a particular Tactile_appearance.

4.2.445.2 description

The description specifies additional information about the Tactile_appearance.

See 4.3.1178 for the application assertion.

The description need not be specified for a particular Tactile_appearance.

If present, there shall be exactly one object that defines the description for a Tactile_appearance.

4.2.445.3 id

The id specifies the identifier of the Tactile_appearance.

The id need not be specified for a particular Tactile_appearance.

4.2.445.4 name

The name specifies the word or group of words by which the Tactile_appearance is referred to.

See 4.3.1178 for the application assertion.

The name need not be specified for a particular Tactile_appearance.

If present, there shall be exactly one object that defines the name for a Tactile_appearance.

4.2.446 Target_area

A Target_area is an enclosed area bounded by an arbitrary shape. The shape of the Target_area is described explicitly by a set of curves with reference to the part coordinate system.

A Target_area is a type of Datum_target (see 4.2.118).

The data associated with a Target_area are the following:

- is_defined_by.

The is_defined_by specifies the Shape_aspect (see 4.2.394) that represents the Target_area.

See 4.3.1180 for the application assertion.

4.2.447 Target_circle

A Target_circle is a target formed by an enclosed area bounded by a circle. The origin of the target coordinate system shall be at the centre of the circle. The orientation of the Target_circle is the x-y-plane.

A Target_circle is a type of Placed_target (see 4.2.314).

The data associated with a Target_circle are the following:

- diameter.

The diameter specifies the diameter of the Target_circle.

4.2.448 Target_line

A Target_line is a target formed by a straight curve. The first end point of the Target_line shall be located in the origin of the local target coordinate system. The second end point shall be located on the Z-axis of the local coordinate system at the specified distance.

A Target_line is a type of Placed_target (see 4.2.314).

The data associated with a Target_line are the following:

- target_length.

The target_length specifies the length of the Target_line.

4.2.449 Target_point

A Target_point is a target that is formed by a single point. The Target_point shall be located in the origin of its local coordinate system.

A Target_point is a type of Placed_target (see 4.2.314).

4.2.450 Target_rectangle

A Target_rectangle is a target formed by an enclosed area bounded by four sides with opposite sides equal in length. The origin of the target coordinate system is defined to be at the centre of the rectangle. The orientation of the Target_rectangle is the X-Y-plane with length of the rectangle along the X-axis and the width of the rectangle along the Y-axis of its local coordinate system.

A Target_rectangle is a type of Placed_target (see 4.2.314).

The data associated with a Target_rectangle are the following:

- target_length;
- target_width.

4.2.450.1 target_length

The target_length specifies the length of the Target_rectangle.

4.2.450.2 target_width

The target_width specifies the width of the Target_rectangle.

4.2.451 Technical_solution

A Technical_solution is a solution where the functional requirements are fulfilled in a certain technical way.

EXAMPLE 221 – 'Disc brake', 'disc brake ventilated', 'disc brake with ABS' for Product_component (see 4.2.350) 'front left brake' are examples for a Technical_solution.

A Technical_solution is a type of Item_solution (see 4.2.246).

The data associated with a Technical_solution are the following:

- description.

The description specifies additional information about the Technical_solution.

See 4.3.1181 for the application assertion.

There shall be exactly one object that defines the description for a Technical_solution.

4.2.452 Tee_profile

A Tee_profile is an open profile with a shape similar to the capital letter "T" as shown in figure 61.

A Tee_profile is a type of Open_profile (see 4.2.292).

The data associated with a Tee_profile are the following:

- cross_bar_depth;
- cross_bar_width;
- depth;
- first_angle;
- first_offset;
- radius;
- second_angle;
- second_offset;
- width.

4.2.452.1 cross_bar_depth

The cross_bar_depth specifies the depth dimension of the Tee_profile bar size.

See 4.3.1182 for the application assertion.

4.2.452.2 cross_bar_width

The cross_bar_width specifies the width dimension of the Tee_profile bar size.

See 4.3.1182 for the application assertion.

4.2.452.3 depth

The depth specifies the depth dimension of the Tee_profile stem.

See 4.3.1182 for the application assertion.

4.2.452.4 first_angle

The first_angle specifies the angular measurement for creating a chamfer on the open end of a Tee_profile.

See 4.3.1182 for the application assertion.

4.2.452.5 first_offset

The first_offset specifies the distance from the edge of the Tee_profile stem to create a chamfer on the open end of a Tee_profile.

See 4.3.1182 for the application assertion.

4.2.452.6 radius

The radius specifies an arc size for blending the sides of a Tee_profile cross bar.

See 4.3.1182 for the application assertion.

The radius need not be specified for a particular Tee_profile.

4.2.452.7 second_angle

The second_angle specifies the angular measurement for creating a chamfer between the stem and the cross bar parts of the Tee_profile.

See 4.3.1182 for the application assertion.

4.2.452.8 second_offset

The second_offset specifies the distance from the edge between the Tee_profile stem and the Tee_profile cross bar along the stem to create a chamfer between the stem and the cross bar.

See 4.3.1182 for the application assertion.

4.2.452.9 width

The width specifies the width dimension of the Tee_profile stem.

See 4.3.1182 for the application assertion.

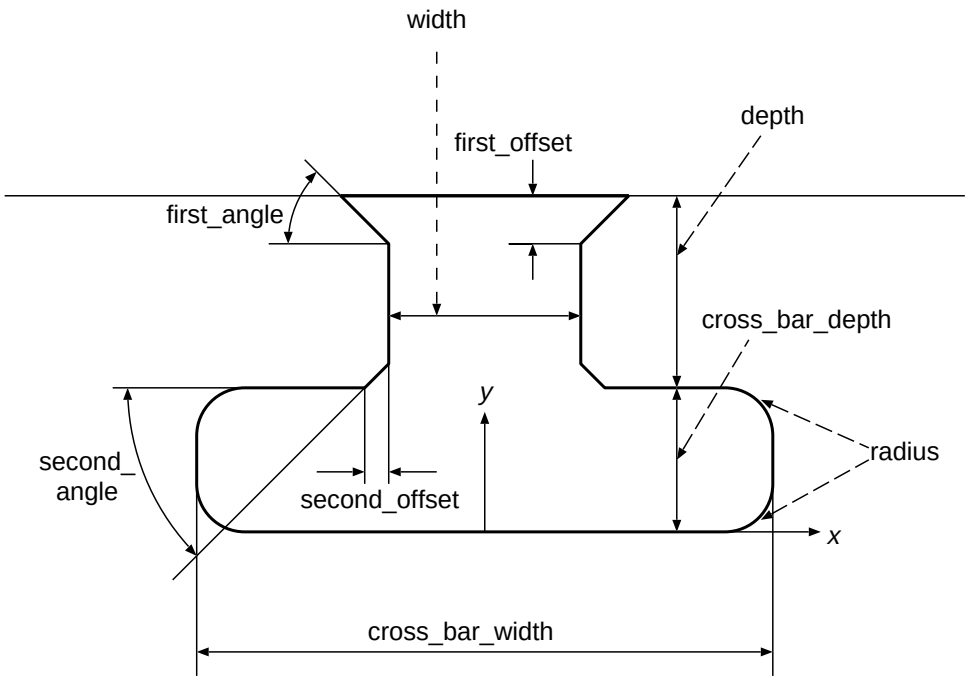

Figure 61 – Tee_profile

4.2.453 Template_instance

A Template_instance is an additional occurrence of a object that has been defined in a different Cartesian_coordinate_space (see 4.2.44) as a Geometric_model (see 4.2.211), a Styled_model (see 4.2.429), or as an External_model (see 4.2.166). A Template_instance is an image copy of this template definition into another Cartesian_coordinate_space where only the location of this copy has to be specified. Additionally uniform scaling, rotation, or mirroring information may be applied to this copy.

NOTE – In the case where the units of the Cartesian coordinate space of the definition are different from the units to be applied to the Template_instance, unit conversion is required. In case of length unit conversion this has to be considered in addition to the scale attribute.

EXAMPLE 222 – In a technical drawing of a mechanical part with several identical drilling holes the hole geometry (circle) together with its annotation elements (diameter dimension and centrelines) is defined once with the name 'annotated drilling hole' and the purpose 'drilling hole representation'. This particular definition is instantiated several times at different locations by corresponding Template_instance objects.

A Template_instance is a type of Detailed_model_element (see 4.2.137).

The data associated with a Template_instance are the following:

- id;
- scale;
- template_definition;

– transformation.

4.2.453.1 id

The id specifies the identifier of the Template_instance.

4.2.453.2 scale

The scale specifies the scaling factor for all Cartesian coordinate directions. The scaling factor shall be positive. If the scaling factor is omitted it shall be 1.0.

The scale need not be specified for a particular Template_instance.

4.2.453.3 template_definition

The template_definition specifies the template to be instantiated.

See 4.3.1183, 4.3.1184, and 4.3.1185 for the application assertions.

There shall be exactly one object that defines the template_definition for a Template_instance.

4.2.453.4 transformation

The transformation specifies the Cartesian transformation applied to the instance. All transformations that can be expressed by an orthonormal 2×2 (for 2D) or 3×3 (for 3D) matrix can be applied, e.g., rotation or mirroring operations.

See 4.3.1186 for the application assertion.

4.2.454 Text

A Text is a collection of characters that convey some human interpretable information.

A Text is a type of Annotation_element (see 4.2.15).

4.2.455 Text_appearance

A Text_appearance is the definition of the visual presentation of text. Text_appearance may be predefined or user defined. Predefined text fonts are the fonts A and B as defined in ISO 3098–1 and ISO 3098–2. User defined text fonts are defined by thickness, colour, text rotation angle, character aspect ratio, character rotation angle, character scale, and character slant angle as shown in figure 62.

4.2.456 Thickness

A Thickness is a geometric property of an object.

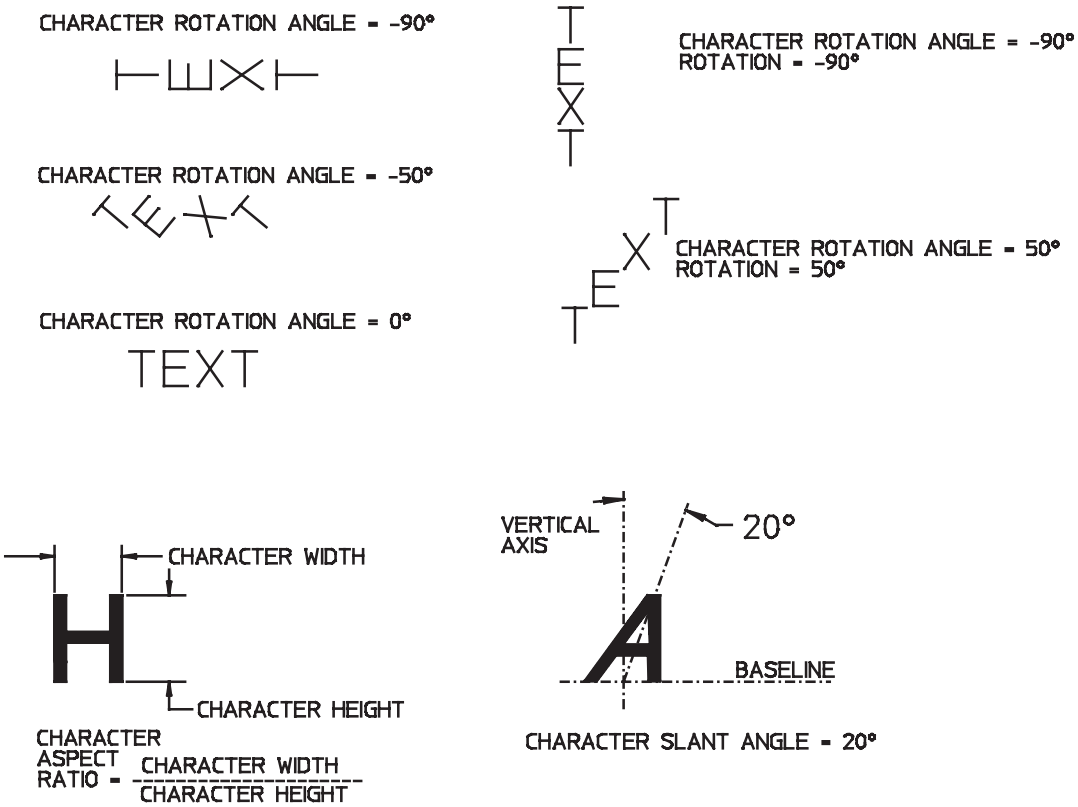

Figure 62 – Text appearance and rotation

A Thickness is a type of Shape_dependent_property (see 4.2.396).

The data associated with a Thickness are the following:

- description;
- material_side;
- thickness_value.

4.2.456.1 description

The description specifies additional information about the Thickness.

See 4.3.1188 for the application assertion.

The description need not be specified for a particular Thickness.

If present, there shall be exactly one object that defines the description for a Thickness.

4.2.456.2 material_side

The material_side specifies that side of a face where the material is.

See 4.3.1187 for the application assertion.

The material_side need not be specified for a particular Thickness.

4.2.456.3 thickness_value

The thickness_value specifies the Property_value (see 4.2.364) that represents the value of the Thickness.

NOTE – The interpretation of this value, e.g., whether the value is required or calculated, is dependent on the semantics of the attribute 'value_interpretation' of the referenced Property_value.

See 4.3.1189 for the application assertion.

4.2.457 Thread_feature

A Thread_feature is a machining feature that is specified by a ridge of uniform section on the form of a helix on the external or internal surface of a cylinder.

EXAMPLE 223 – Thread features may be used to screw parts together.

The data associated with a Thread_feature are the following:

- effective_thread_length;
- inner;
- maximum_thread_length;
- orientation;
- thread_definition.

4.2.457.1 effective_thread_length

The effective_thread_length specifies the length of the thread which is usable by the application.

4.2.457.2 inner

The inner specifies if the thread is applied as an inner thread or as an outer thread.

4.2.457.3 maximum_thread_length

The maximum_thread_length specifies the usable thread length plus the runout.

The maximum_thread_length need not be specified for a particular Thread_feature.

4.2.457.4 orientation

The orientation specifies an Axis_placement (see 4.2.33) whose location represents the start of the thread and whose z-axis points into the direction of the possible runout.

See 4.3.1190 for the application assertion.

4.2.457.5 thread_definition

The thread_definition specifies the Thread_specification (see 4.2.458) that contains the parameters specifying the thread.

See 4.3.1191 for the application assertion.

4.2.458 Thread_specification

A Thread_specification is a set of parameters specifying a thread independent from its application.

Each Thread_specification is either a Defined_thread (see 4.2.127) or a Catalog_thread (see 4.2.48).

The data associated with a Thread_specification are the following:

- qualifier.

The qualifier specifies text information about the thread.

EXAMPLE 224 – 'M 20', 'Tr 40 × 7', 'G ¾', or 'R ½' are examples for the qualifier.

4.2.459 Through_bottom_condition

A Through_bottom_condition is an end condition for a pocket feature that shall pass through two faces of a part.

A Through_bottom_condition is a type of Pocket_bottom_condition (see 4.2.320).

4.2.460 Through_hole_condition

A Through_hole_condition is a condition characterizing a Round_hole (see 4.2.387) that is open at both ends.

A Through_hole_condition is a type of Hole_bottom_condition (see 4.2.228).

4.2.461 Tiling

A Tiling consists of a pattern of tiles that represents graphical symbols defined within a containment border. The containment border defines the edges of the tile. All elements contained within the border are duplicated for each tile. Tiles are placed within a fill area adjacently and do not overlap. The containment border may be blanked. The Tiling may be defined by the user or may be externally defined.

4.2.462 Tolerance_table_cell

A Tolerance_table_cell is the information contained in one cell of a General_tolerance_table (see 4.2.207).

EXAMPLE 225 – Figure 34 depicts an example for a General_tolerance_table.

The data associated with a Tolerance_table_cell are the following:

- cell_value;
- description;
- limit;
- table;
- tolerance_class.

4.2.462.1 cell_value

The cell_value specifies the value of a Tolerance_table_cell.

See 4.3.1194 and 4.3.1197 for the application assertions.

There shall be exactly one object that defines the cell_value for a Tolerance_table_cell.

4.2.462.2 description

The description specifies additional information about the Tolerance_table_cell.

See 4.3.1193 for the application assertion.

The description need not be specified for a particular Tolerance_table_cell.

If present, there shall be exactly one object that defines the description for a Tolerance_table_cell.

4.2.462.3 limit

The limit specifies the limit for the dimensions of a part for which the values given in the Tolerance_table_cell are valid.

See 4.3.1195 and 4.3.1196 for the application assertions.

There shall be exactly one object that defines the limit for a Tolerance_table_cell.

4.2.462.4 table

The table specifies the General_tolerance_table (see 4.2.207) the Tolerance_table_cell belongs to.

See 4.3.1192 for the application assertion.

4.2.462.5 tolerance_class

The tolerance_class specifies the tolerance class for which the values given in the Tolerance_table_cell are valid.

EXAMPLE 226 – Examples for tolerance_class are 'f' for 'fine', 'm' for 'medium', 'c' for 'coarse', and 'v' for 'very coarse'.

4.2.463 Tolerance_zone

A Tolerance_zone is the zone wherein all points of the toleranced geometric element shall fall.

EXAMPLE 227 – A point, a line, a surface, or a middle plane are examples for a toleranced geometric element. Figure 63 depicts a Tolerance_zone of a straightness tolerance of '0.1' specified for a line.

The data associated with a Tolerance_zone are the following:

- form_type;
- is_zone_for.

4.2.463.1 form_type

The form_type specifies the shape of the Tolerance_zone.

EXAMPLE 228 – 'Cylindrical', 'parallelepiped', or 'spherical' are examples for form_type.

4.2.463.2 is_zone_for

The is_zone_for specifies the Geometric_tolerance (see 4.2.216) for that the Tolerance_zone defines the zone.

See 4.3.1198 for the application assertion.

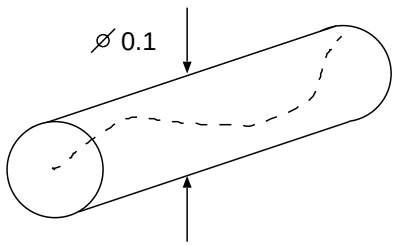

Figure 63 – Tolerance_zone

4.2.464 Tolerance_zone_definition

A Tolerance_zone_definition is the specification of the defining boundaries of a Tolerance_zone (see 4.2.463).

The data associated with a Tolerance_zone_definition are the following:

- first_element;
- is_defining;
- second_element.

4.2.464.1 first_element

The first_element specifies the Shape_aspect (see 4.2.394) that represents the first or - in the case of a cylindrical tolerance zone - the only boundary of the Tolerance_zone_definition.

See 4.3.1199 for the application assertion.

4.2.464.2 is_defining

The is_defining specifies the Tolerance_zone (see 4.2.463) for the Tolerance_zone_definition.

See 4.3.1200 for the application assertion.

4.2.464.3 second_element

The second_element specifies the Shape_aspect (see 4.2.394) that represents the second bounding element.

See 4.3.1199 for the application assertion.

The second_element need not be specified for a particular Tolerance_zone_definition.

4.2.465 Tool_attachment_point_frame

A Tool_attachment_point_frame is a kinematic attachment frame of a tool that may be attached to a link of a Kinematic_mechanism (see 4.2.257).

A Tool_attachment_point_frame is a type of Transformation_to_reference_frame (see 4.2.475).

4.2.466 Tool_center_point_frame

A Tool_center_point_frame is a kinematic reference frame of a tool that may be attached to a link of a Kinematic_mechanism (see 4.2.257).

A Tool_center_point_frame is a type of Transformation_to_reference_frame (see 4.2.475).

4.2.467 Tool_part_relationship

A Tool_part_relationship is a relationship between two Design_discipline_item_definition (see 4.2.134) objects one of which is representing a part (related) and one a tool (relating) that

is used to manufacture the part. The part that is referenced by a Tool_part_relationship is the result of the manufacturing process using the referenced tool.

A Tool_part_relationship is a type of Item_definition_relationship (see 4.2.240).

The data associated with a Tool_part_relationship are the following:

- transformation;
- used_technology_description.

4.2.467.1 transformation

The transformation specifies the relative position of the Item (see 4.2.236) representing the part with respect to the local coordinate system of the Item representing the tool. In the case where the transformation is realized by a Template_instance (see 4.2.453) the scale factor of that Template_instance shall be omitted or set to 1.

See 4.3.1201 and 4.3.1203 for the application assertions.

The transformation need not be specified for a particular Tool_part_relationship.

If present, there shall be exactly one object that defines the transformation for a Tool_part_-relationship.

4.2.467.2 used_technology_description

The used_technology_description specifies the technology used to manufacture the part with the tool and possibly the reasons for the use of a particular technology.

See 4.3.1202 for the application assertion.

The used_technology_description need not be specified for a particular Tool_part_relationship.

If present, there shall be exactly one object that defines the used_technology_description for a Tool_part_relationship.

4.2.468 Topologically_connected_set

A Topologically_connected_set is a collection of Face (see 4.2.167) and/or Oriented_edge_curve (see 4.2.297) objects that form a Compound_model (see 4.2.87).

A Topologically_connected_set is a type of Detailed_geometric_model_element (see 4.2.136).

The data associated with a Topologically_connected_set are the following:

- element.

The element specifies a Face (see 4.2.167) or an Oriented_edge_curve (see 4.2.297) that is part of the Topologically_connected_set.

See 4.3.1204 and 4.3.1205 for the application assertions.

There shall be at least one object that defines the element for a Topologically_connected_set.

4.2.469 Toroidal_surface

A Toroidal_surface is a surface that could be produced by revolving a circle about a non-intersecting line in the plane of its circle. This concept includes cases where the minor radius of the torus is actually greater than the major radius.

A Toroidal_surface is a type of Surface (see 4.2.434).

4.2.470 Torus

A Torus is a solid that is defined by sweeping the area of one circle with minor radius about another circle with larger radius. A Torus is defined by the position in space and the radius of the larger circle, and by the radius of the swept area.

A Torus is a type of Csg_primitive (see 4.2.101).

4.2.471 Total_runout_tolerance

A Total_runout_tolerance is a mechanism to control circular elements of a part to a datum axis the part is rotated about. The tolerance is applied simultaneously to all circular and profile measuring positions as the part is rotated 360 degrees. Where applied to surfaces constructed around a datum axis, Total_runout_tolerance is used to control cumulative variations of circularity, straightness, coaxiality, angularity, taper, and profile of a surface. Where applied to surfaces constructed at right angles to a datum axis, Total_runout_tolerance controls cumulative variations or perpendicularity and flatness.

A Total_runout_tolerance is a type of Geometric_tolerance (see 4.2.216).

The data associated with a Total_runout_tolerance are the following:

- angle;
- datum.

4.2.471.1 angle

The angle specifies the direction a runout tolerance is controlled in. If the angle is specified the runout tolerance applies in this angle which is fixed with respect to the datum axis. If the angle is not specified the runout tolerance applies normal to the feature surface.

The angle need not be specified for a particular Total_runout_tolerance.

4.2.471.2 datum

The datum specifies the Datum_feature (see 4.2.117) or the Compound_datum (see 4.2.80) that defines the reference for this type of geometric tolerance.

See 4.3.1206 for the application assertion.

4.2.472 Transformation

A Transformation is a geometric transformation composed of translation and rotation. Scaling is not included.

Each Transformation is either a Transformation_3d (see 4.2.474) or a Transformation_2d (see 4.2.473).

4.2.473 Transformation_2d

A Transformation_2d is the definition of a geometric transformation in 2D space.

A Transformation_2d is a type of Transformation (see 4.2.472).

4.2.474 Transformation_3d

A Transformation_3d is the definition of a geometric transformation in 3D space.

A Transformation_3d is a type of Transformation (see 4.2.472).

4.2.475 Transformation_to_reference_frame

A Transformation_to_reference_frame is a relative position of one kinematic frame with respect to another kinematic frame.

Each Transformation_to_reference_frame may be one of the following: a Tool_center_point_frame (see 4.2.466) or a Tool_attachment_point_frame (see 4.2.465).

4.2.476 Transition_feature

A Transition_feature is a transition area between two faces. A Transition_feature shall have shape representation.

Each Transition_feature is either an Edge_round (see 4.2.154), a Fillet (see 4.2.181), or a Chamfer (see 4.2.50).

The data associated with a Transition_feature are the following:

- face_1;
- face_2.

4.2.476.1 face_1

The face_1 specifies the first of the two Face (see 4.2.167) objects that the Transition_feature is applied to.

See 4.3.1207 for the application assertion.

4.2.476.2 face_2

The face_2 specifies the second of the two Face (see 4.2.167) objects that the Transition_feature is applied to.

See 4.3.1207 for the application assertion.

4.2.477 Treatment_result

A Treatment_result is a general surface condition that is a result of a certain treatment.

NOTE – At least one of the attributes 'id' or 'name' shall be instantiated.

A Treatment_result is a type of Surface_condition (see 4.2.437).

The data associated with a Treatment_result are the following:

- description;
- id;
- name;
- purpose.

4.2.477.1 description

The description specifies additional information about the Treatment_result.

See 4.3.1208 for the application assertion.

There shall be exactly one object that defines the description for a Treatment_result.

4.2.477.2 id

The id specifies the identifier of the Treatment_result.

The id need not be specified for a particular Treatment_result.

4.2.477.3 name

The name specifies the word or group of words by which the Treatment_result is referred to.

See 4.3.1208 for the application assertion.

The name need not be specified for a particular Treatment_result.

If present, there shall be exactly one object that defines the name for a Treatment_result.

4.2.477.4 purpose

The purpose specifies the effects that are a consequence of the treatment.

See 4.3.1208 for the application assertion.

The purpose need not be specified for a particular Treatment_result.

If present, there shall be exactly one object that defines the purpose for a Treatment_result.

4.2.478 Trimmed_curve

A Trimmed_curve is a curve of finite length that is the result of defining trimming points on an existing curve. The trimming points are the start and end points of the Trimmed_curve. These points may be specified by Cartesian points or by parameter values.

A Trimmed_curve is a type of Curve (see 4.2.102).

4.2.479 Trimmed_surface

A Trimmed_surface is a surface of finite area with identifiable boundaries. A Trimmed_surface is either a b-spline surface, a curve bounded surface, or a rectangular composite surface. A Trimmed_surface shall only be used in Geometrically_bounded_surface_model (see 4.2.220) objects.

A Trimmed_surface is a type of Surface (see 4.2.434).

4.2.480 Upper_lower_limit

An Upper_lower_limit is a limit specification for general tolerance table cells, usually used to discriminate table columns. The range specified by lower_limit and upper_limit corresponds to the dimension specification of a part. The dimensions, usually displayed on a technical drawing, falling into that range have the corresponding tolerance table entry applied if no other specific tolerance value has been assigned to them.

The data associated with an Upper_lower_limit are the following:

- lower_limit;
- upper_limit.

4.2.480.1 lower_limit

The lower_limit specifies the lower value of the value range.

4.2.480.2 upper_limit

The upper_limit specifies the upper value of the value range.

4.2.481 Upper_lower_toleranced_datum

An Upper_lower_toleranced_datum is an entry in a general tolerance table cell that is a tolerance range specified by two values with measure.

The data associated with an Upper_lower_toleranced_datum are the following:

- lower_tolerance_value;
- upper_tolerance_value.

4.2.481.1 lower_tolerance_value

The lower_tolerance_value specifies the lower value with measure of the tolerance range.

4.2.481.2 upper_tolerance_value

The upper_tolerance_value specifies the upper value with measure of the tolerance range.

4.2.482 Value_limit

A Value_limit is one dimension value representing either the lower limit or the upper limit of a Geometric_dimension (see 4.2.210). If a Value_limit is applied to a Geometric_dimension the dimension value shall not be used.

EXAMPLE 229 – '30.5 max' and '5 min' are examples for a Value_limit.

The data associated with a Value_limit are the following:

- limit;
- limit_qualifier.

4.2.482.1 limit

The limit specifies the value of the limit.

4.2.482.2 limit_qualifier

The limit_qualifier specifies the if the limit represents a lower limit ('min') or an upper limit ('max').

4.2.483 Value_range

A Value_range is a pair of dimension values representing the range in which the value of a Geometric_dimension (see 4.2.210) shall lie.

NOTE – This kind of tolerance replaces the nominal value of a Geometric_dimension. All values within the range are considered to be equally good. Usually this way of dimensioning is used for clearances between two aspects of the part rather than for sizes of objects.

The data associated with a Value_range are the following:

- lower_limit;
- upper_limit.

4.2.483.1 lower_limit

The lower_limit specifies the minimum acceptable value of the Geometric_dimension (see 4.2.210) that is constrained by the Value_range.

4.2.483.2 upper_limit

The upper_limit specifies the maximum acceptable value of the Geometric_dimension (see 4.2.210) that is constrained by the Value_range.

4.2.484 Value_termination

A Value_termination specifies a condition where a Joggle_feature (see 4.2.250) has a specified depth.

A Value_termination is a type of Joggle_termination (see 4.2.251).

The data associated with a Value_termination are the following:

- angle;
- depth.

4.2.484.1 angle

The angle specifies the slope angle of the terminating face of the Joggle_feature (see 4.2.250) measured from the panel surface.

See 4.3.1209 for the application assertion.

4.2.484.2 depth

The depth specifies the distance from the rim of the panel to a point that corresponds to the end of the Joggle_feature (see 4.2.250).

See 4.3.1209 for the application assertion.

4.2.485 Value_with_unit

A Value_with_unit is a numerical measure with a corresponding unit.

The data associated with a Value_with_unit are the following:

- unit_component;
- value_component.

4.2.485.1 unit_component

The unit_component specifies the quantity chosen as a standard in terms of which the Value_-with_unit is expressed.

4.2.485.2 value_component

The value_component specifies the quantitative part of a Value_with_unit.

4.2.486 Vector_appearance

A Vector_appearance is the definition of the visual appearance of a vector.

The data associated with a Vector_appearance are the following:

- arrow_head_type;
- arrow_line_font.

4.2.486.1 arrow_head_type

The arrow_head_type specifies the type of the arrow head.

4.2.486.2 arrow_line_font

The arrow_line_font specifies the font of the arrow line. The font determines the visible and invisible segments of the arrow line.

4.2.487 Vee_profile

A Vee_profile is an open profile that is specified by a shape bounded by two lines that connect at a point and extend infinitely. The enclosed angle shall be smaller than 180 degrees. The intersection of the two lines may be blended with a radius.

EXAMPLE 230 – Figure 64 depicts a Vee_profile.

A Vee_profile is a type of Open_profile (see 4.2.292).

The data associated with a Vee_profile are the following:

- profile_angle;
- radius;
- tilt_angle.

4.2.487.1 profile_angle

The profile_angle specifies the size of the angle between the two sides of the Vee_profile. The angle shall be greater than 0 degrees and less than 180 degrees.

See 4.3.1210 for the application assertion.

4.2.487.2 radius

The radius specifies the size of the blend radius at the point of the V, or where the two sides come together.

See 4.3.1210 for the application assertion.

The radius need not be specified for a particular Vee_profile.

4.2.487.3 tilt_angle

The tilt_angle specifies the size of the angle between one side of the Vee_profile and the x-vector of the local coordinate system of the Vee_profile.

See 4.3.1210 for the application assertion.

4.2.488 Vertex_loop

A Vertex_loop is a loop that consists of only one vertex. The dimensionality of a Vertex_loop is zero.

EXAMPLE 231 – The tip of a cone is an example for the usage of a Vertex_loop.

The data associated with a Vertex_loop are the following:

- loop_vertex.

The loop_vertex specifies a Vertex_point (see 4.2.489) that represents the geometry of the associated vertex.

See 4.3.1211 for the application assertion.

4.2.489 Vertex_point

A Vertex_point is a topological construct corresponding to a point. It has dimensionality 0 and extent 0. The geometric location of the Vertex_point is defined by an associated point.

The data associated with a Vertex_point are the following:

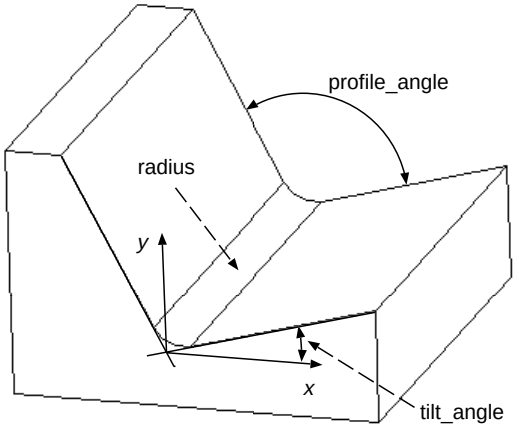

Figure 64 – Vee_profile

– vertex_geometry.

The vertex_geometry specifies the geometric point that defines the position in geometric space of the vertex point.

See 4.3.1212 for the application assertion.

4.2.490 View

A View is the representation of a two-dimensional picture. This picture consists of the image generated by the projection mechanism defined by one Model_image (see 4.2.284) and additional View_placed_annotation (see 4.2.494). A View is placed in the coordinate space of a Drawing_-sheet (see 4.2.152) or of a View_area (see 4.2.491).

The data associated with a View are the following:

– description;

– id;

– layout;

– name;

– transformation;

– view_space.

4.2.490.1 description

The description specifies additional information about the View.

See 4.3.1215 for the application assertion.

The description need not be specified for a particular View.

If present, there shall be exactly one object that defines the description for a View.

4.2.490.2 id

The id specifies the identification of the View.

The id need not be specified for a particular View.

4.2.490.3 layout

The layout references either a Drawing_sheet (see 4.2.152) or a View_area (see 4.2.491) where the View is placed.

See 4.3.1214 and 4.3.1217 for the application assertions.

There shall be exactly one object that defines the layout for a View.

4.2.490.4 name

The name specifies the word or group of words by which the View is referred to.

See 4.3.1215 for the application assertion.

There shall be exactly one object that defines the name for a View.

4.2.490.5 transformation

The transformation specifies the Transformation_2d (see 4.2.473) that is used to place and orient the View on a Drawing_sheet (see 4.2.152) or on a View_area (see 4.2.491).

See 4.3.1216 for the application assertion.

4.2.490.6 view_space

The view_space specifies the two-dimensional Cartesian coordinate space where the presented picture is defined.

See 4.3.1213 for the application assertion.

4.2.491 View_area

A View_area is a collection of View (see 4.2.490) objects placed in a specified rectangular area. The placement of the views is defined relative to the two-dimensional coordinate space of the View_area.

The data associated with a View_area are the following:

- area_space;
- description;
- id;
- name;
- revision_id;
- size.

4.2.491.1 area_space

The area_space specifies the two-dimensional Cartesian coordinate space relative to that the presented views are placed.

See 4.3.1218 for the application assertion.

4.2.491.2 description

The description specifies additional information about the View_area.

See 4.3.1219 for the application assertion.

The description need not be specified for a particular View_area.

If present, there shall be exactly one object that defines the description for a View_area.

4.2.491.3 id

The id specifies the identifier of the View_area.

The id need not be specified for a particular View_area.

4.2.491.4 name

The name specifies the word or group of words by which the View_area is referred to.

See 4.3.1219 for the application assertion.

The name need not be specified for a particular View_area.

If present, there shall be exactly one object that defines the name for a View_area.

4.2.491.5 revision_id

The revision_id specifies the identifier of the revision of the View_area.

The revision_id need not be specified for a particular View_area.

4.2.491.6 size

The size specifies the size of the View_area.

4.2.492 View_area_assignment

A View_area_assignment is a mechanism to associate a View_area (see 4.2.491) with the object that is presented on the View_area.

The data associated with a View_area_assignment are the following:

- is_describing;
- view_area.

4.2.492.1 is_describing

The is_describing specifies the object that is associated with the View_area (see 4.2.491).

See 4.3.1220, 4.3.1221, 4.3.1222, 4.3.1223, 4.3.1224, 4.3.1225, 4.3.1226, 4.3.1227, 4.3.1228, 4.3.1229, 4.3.1230, 4.3.1231, 4.3.1232, 4.3.1233, and 4.3.1234 for the application assertions.

There shall be exactly one object that the View_area_assignment is_describing.

4.2.492.2 view_area

The view_area specifies the View_area (see 4.2.491) that is associated with the object.

See 4.3.1235 for the application assertion.

4.2.493 View_area_relationship

A View_area_relationship is a relationship between two View_area (see 4.2.491) objects.

The data associated with a View_area_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.493.1 description

The description specifies additional information about the View_area_relationship.

See 4.3.1236 for the application assertion.

The description need not be specified for a particular View_area_relationship.

If present, there shall be exactly one object that defines the description for a View_area_relationship.

4.2.493.2 related

The related specifies the secondary view area in the relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.1237 for the application assertion.

4.2.493.3 relating

The relating specifies the primary view area in the relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.1237 for the application assertion.

4.2.493.4 relation_type

The relation_type specifies the kind of relationship. Where applicable the following values shall be used:

- 'copy': The application object defines a relationship where the related View_area (see 4.2.491) is a copy of the relating View_area;

- 'derivation': The application object defines a relationship where the related View_area is derived from the relating View_area;

- 'hierarchy': The application object defines a hierarchical relationship where the related View_area is on a lower level than the relating View_area;

- 'substitution': The application object defines a relationship where the related View_area replaces the relating View_area.

4.2.494 View_placed_annotation

A View_placed_annotation is an annotation that is located in the coordinate system of a View (see 4.2.490).

The data associated with a View_placed_annotation are the following:

- appearance;

- element;
- invisible;
- reference_view.

4.2.494.1 appearance

The appearance specifies the presentation characteristics for the annotation elements of the View_placed_annotation.

See 4.3.1239 for the application assertion.

4.2.494.2 element

The element specifies the annotation element that is associated to a View_placed_annotation.

See 4.3.1238 for the application assertion.

4.2.494.3 invisible

The invisible specifies if the View_placed_annotation is invisible.

4.2.494.4 reference_view

The reference_view specifies the view that is associated to a View_placed_annotation.

See 4.3.1240 for the application assertion.

4.2.495 View_relationship

A View_relationship is a relationship between two View (see 4.2.490) objects.

The data associated with a View_relationship are the following:

- description;
- related;
- relating;
- relation_type.

4.2.495.1 description

The description specifies additional information about the View_relationship.

See 4.3.1241 for the application assertion.

The description need not be specified for a particular View_relationship.

If present, there shall be exactly one object that defines the description for a View_relationship.

4.2.495.2 related

The related specifies the second of the two View (see 4.2.490) objects related by the View_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.1242 for the application assertion.

4.2.495.3 relating

The relating specifies the first of the two View (see 4.2.490) objects related by the View_relationship.

NOTE – The semantic of this attribute is defined by the attribute relation_type.

See 4.3.1242 for the application assertion.

4.2.495.4 relation_type

The relation_type specifies the meaning of the relationship. Where applicable the following values shall be used:

- 'dependency': The related View (see 4.2.490) is dependent of the relating View. This means that the related View has the same view direction as the relating View.

4.2.496 Visual_appearance

A Visual_appearance is the appearance of a surface of a part regarding the optical impression.

NOTE – At least one of the attributes 'id' or 'name' shall be instantiated.

A Visual_appearance is a type of Surface_condition (see 4.2.437).

The data associated with a Visual_appearance are the following:

- colour_id;
- colour_name;
- id;
- lustre;
- name;
- pattern;
- transparency.

4.2.496.1 colour_id

The colour_id specifies the identifier of the colour of the Visual_appearance.

EXAMPLE 232 – A colour can be identified using a code such as 'C130202250'.

4.2.496.2 colour_name

The colour_name specifies the word or group of words by which the colour of the Visual_-appearance is referred to.

EXAMPLE 233 – A colour may be referred to, e.g., by a customer, by name such as 'arctic white'.

See 4.3.1243 for the application assertion.

The colour_name need not be specified for a particular Visual_appearance.

If present, there shall be exactly one object that defines the colour_name for a Visual_appearance.

4.2.496.3 id

The id specifies the identifier of the Visual_appearance.

The id need not be specified for a particular Visual_appearance.

4.2.496.4 lustre

The lustre specifies the kind of shining or reflection of the surface.

4.2.496.5 name

The name specifies the word or group of words by which the Visual_appearance is referred to.

See 4.3.1243 for the application assertion.

The name need not be specified for a particular Visual_appearance.

If present, there shall be exactly one object that defines the name for a Visual_appearance.

4.2.496.6 pattern

The pattern specifies the pattern used for the definition of the Visual_appearance.

EXAMPLE 234 – A pattern may be used to specify the texture of a seat cover for visual appearance purposes.

The pattern need not be specified for a particular Visual_appearance.

4.2.496.7 transparency

The transparency specifies the grade of transparency of the surface.

The transparency need not be specified for a particular Visual_appearance.

4.2.497 Wireframe_model_2d

A Wireframe_model_2d is a collection of Curve_set_2d (see 4.2.105) objects, i.e. Curve (see 4.2.102) and Point (see 4.2.322) objects defined in two-dimensional space.

A Wireframe_model_2d is a type of Geometric_model (see 4.2.211).

The data associated with a Wireframe_model_2d are the following:

- element.

The element specifies the set of Curve_set_2d (see 4.2.105) objects that form the Wireframe_model_2d.

See 4.3.1244 for the application assertion.

4.2.498 Wireframe_model_3d

A Wireframe_model_3d is a collection of Curve_set_3d (see 4.2.106) objects, i.e. Curve (see 4.2.102) and Point (see 4.2.322) objects defined in three-dimensional space.

A Wireframe_model_3d is a type of Geometric_model (see 4.2.211).

The data associated with a Wireframe_model_3d are the following:

- element.

The element specifies the set of Curve_set_3d (see 4.2.106) objects that form the Wireframe_model_3d.

See 4.3.1245 for the application assertion.

4.2.499 Woodruff_slot_end_type

A Woodruff_slot_end_type is an end condition of a slot defined by a radius tangent to the bottom of the slot and curved towards the surface of the part.

EXAMPLE 235 – Figure 65 depicts a Woodruff_slot_end_type.

A Woodruff_slot_end_type is a type of Slot_end_type (see 4.2.406).

The data associated with a Woodruff_slot_end_type are the following:

- radius.

The radius specifies the radius of the Woodruff_slot_end_type.

See 4.3.1246 for the application assertion.

4.2.500 Work_order

A Work_order is the authorization for an Activity (see 4.2.2) to be performed.

The data associated with a Work_order are the following:

- description;

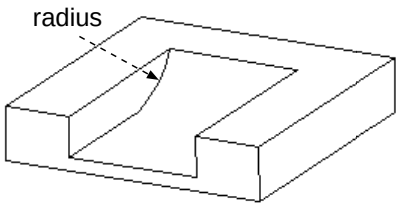

Figure 65 – Woodruff_slot_end_type

- id;
- internal;
- is_controlling;
- version_id;
- work_order_type.

4.2.500.1 description

The description specifies additional information about the Work_order (see 4.2.500).

See 4.3.1248 for the application assertion.

The description need not be specified for a particular Work_order.

If present, there shall be exactly one object that defines the description for a Work_order.

4.2.500.2 id

The id specifies the identifier of the Work_order.

4.2.500.3 internal

The internal specifies whether the Activity (see 4.2.2) objects controlled by this particular Work_order are performed internally within the organization or externally by another organization.

4.2.500.4 is_controlling

The is_controlling specifies the Activity (see 4.2.2) that is controlled by this particular Work_order.

See 4.3.1247 for the application assertion.

4.2.500.5 version_id

The version_id specifies the identification of a particular version of a Work_order.

The version_id need not be specified for a particular Work_order.

4.2.500.6 work_order_type

The work_order_type specifies the kind of the Work_order. Where applicable the following values shall be used:

- 'design release': An authorization for the design of a product or of an item and/or to create a bill of material;

- 'manufacturing release': An authorization for the manufacturing process of a product or of an item;

- 'design deviation permit': An authorization for a deviation from the approved design data;

- 'production deviation permit': An authorization for a deviation from the approved manufacturing process;

- 'management resolution': An authorization by a committee like the board of directors to design or change a product, a product_component or some items.

4.2.501 Work_request

A Work_request is the solicitation for some type of work to be done.

The data associated with a Work_request are the following:

- description;

- id;

- notified_person;

- recommended_method;

- request_type;

- requestor;

- scope;

- status;

- version_id.

4.2.501.1 description

The description specifies additional information about the Work_request.

See 4.3.1270 for the application assertion.

There shall be exactly one object that defines the description for a Work_request.

4.2.501.2 id

The id specifies the identifier of the Work_request.

4.2.501.3 notified_person

The notified_person specifies the person or the organization who shall be informed about the Work_request and the date when the person or organization was informed.

See 4.3.1257 for the application assertion.

4.2.501.4 recommended_method

The recommended_method specifies an Activity_method (see 4.2.4) that is recommended to solve the problem that the Work_request addresses.

See 4.3.1249 for the application assertion.

4.2.501.5 request_type

The request_type specifies the intention of the Work_request. Where applicable the following values shall be used:

- 'technical improvement': A request aiming at the technical improvement of an item;
- 'government regulation': A request resulting from legal requirements;
- 'durability improvement': A request aiming at a longer life time of an item;
- 'tool improvement': A request aiming at a reduction of the wear out of tools;
- 'production relief': A request aiming at a simpler assembly and production process;
- 'production requirement': A request for an activity necessary from a production point of view;
- 'quality improvement': A request aiming at an increased quality of an item;
- 'security reason': A request for an activity necessary from a security point of view;

– 'standardization': A request to unify variants of an item;

– 'cost reduction': A request aiming at the reduction of engineering and manufacturing costs of an item;

– 'customer rejection': A request resulting from a rejection by a customer;

– 'supplier request': A request resulting from requests by a supplier;

– 'customer request': A request resulting from requests by a customer;

– 'change of standard': A request to translate a standard change into action;

– 'production alignment': A request to adjust the manufacturing process of different items;

– 'procurement alignment': A request to adjust the purchasing process of different items.

4.2.501.6 requestor

The requestor specifies the person or organization who issued the Work_request and the date when this person or organization issued the Work_request.

See 4.3.1257 for the application assertion.

The requestor need not be specified for a particular Work_request.

4.2.501.7 scope

The scope specifies the objects that are affected by the Work_request.

See 4.3.1249, 4.3.1250, 4.3.1251, 4.3.1252, 4.3.1253, 4.3.1254, 4.3.1255, 4.3.1256, 4.3.1258, 4.3.1259, 4.3.1260, 4.3.1261, 4.3.1262, 4.3.1263, 4.3.1264, 4.3.1265, 4.3.1266, 4.3.1267, 4.3.1268, 4.3.1269, 4.3.1271, 4.3.1272, 4.3.1273, 4.3.1274, 4.3.1275, 4.3.1276, 4.3.1277, 4.3.1278, 4.3.1279, 4.3.1280, 4.3.1281, 4.3.1282, 4.3.1283, 4.3.1284, and 4.3.1285 for the application assertions.

4.2.501.8 status

The status specifies the status of the Work_request.

EXAMPLE 236 – 'ongoing' would be an example for status.

NOTE – The values and sequence of status are company specific.

4.2.501.9 version_id

The version_id specifies the identification of a particular version of a Work_request.

The version_id need not be specified for a particular Work_request.

4.3 Application assertions

This subclause specifies the application assertions for the Core Data for Automotive Mechanical Design Processes application protocol. Application assertions specify the relationships between application objects, the cardinality of the relationships, and the rules required for the integrity and validity of the application objects and UoFs. The application assertions and their definitions are given below.

4.3.1 Accuracy to Face

Each Accuracy is_defined_for zero or more Face objects. Each Face is related to zero or more Accuracy objects.

NOTE – This assertion is established through accuracy_select.

4.3.2 Accuracy to Geometric_model

Each Accuracy is_defined_for zero or more Geometric_model objects. Each Geometric_model is related to zero or more Accuracy objects.

NOTE – This assertion is established through accuracy_select.

4.3.3 Accuracy to Oriented_edge_curve

Each Accuracy is_defined_for zero or more Oriented_edge_curve objects. Each Oriented_edge_curve is related to zero or more Accuracy objects.

NOTE – This assertion is established through accuracy_select.

4.3.4 Accuracy to Vertex_point

Each Accuracy is_defined_for zero or more Vertex_point objects. Each Vertex_point is related to zero or more Accuracy objects.

NOTE – This assertion is established through accuracy_select.

4.3.5 Activity to Activity_method

Each Activity refers to zero or one Activity_method in the role of chosen_method. Each Activity_method acts as chosen_method for zero or more Activity objects.

4.3.6 Activity to Date_and_person_or_organization

Each Activity refers to zero or one Date_and_person_or_organization in the role of requestor. Each Date_and_person_or_organization acts as requestor for zero or more Activity objects.

4.3.7 Activity to Date_time

Each Activity refers to zero or one Date_time in the role of actual_end_date. Each Date_time acts as actual_end_date for zero or more Activity objects.

Each Activity refers to zero or one Date_time in the role of actual_start_date. Each Date_time acts as actual_start_date for zero or more Activity objects.

Each Activity refers to zero or one Date_time in the role of planned_end_date. Each Date_time acts as planned_end_date for zero or more Activity objects.

NOTE – This assertion is established through period_or_date_select.

Each Activity refers to zero or one Date_time in the role of planned_start_date. Each Date_time acts as planned_start_date for zero or more Activity objects.

NOTE – This assertion is established through event_or_date_select.

4.3.8 Activity to Event_reference

Each Activity refers to zero or one Event_reference in the role of planned_end_date. Each Event_reference acts as planned_end_date for zero or more Activity objects.

NOTE – This assertion is established through period_or_date_select.

Each Activity refers to zero or one Event_reference in the role of planned_start_date. Each Event_reference acts as planned_start_date for zero or more Activity objects.

NOTE – This assertion is established through event_or_date_select.

4.3.9 Activity to Multi_language_string

Each Activity refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Activity objects.

NOTE – This assertion is established through string_select.

4.3.10 Activity to Organization

Each Activity refers to zero or more Organization objects in the role of concerned_organization. Each Organization acts as concerned_organization for zero or more Activity objects.

Each Activity refers to zero or more Organization objects in the role of supplying_organization. Each Organization acts as supplying_organization for zero or more Activity objects.

4.3.11 Activity to Value_with_unit

Each Activity refers to zero or one Value_with_unit in the role of planned_end_date. Each Value_with_unit acts as planned_end_date for zero or more Activity objects.

NOTE – This assertion is established through period_or_date_select.

4.3.12 Activity to Work_request

Each Activity refers to zero or more Work_request objects in the role of resolved_request. Each Work_request acts as resolved_request for zero or more Activity objects.

4.3.13 Activity_element to Activity

Each Activity_element refers to exactly one Activity in the role of activity. Each Activity acts as activity for zero or more Activity_element objects.

4.3.14 Activity_element to Activity_method

Each Activity_element refers to zero or one Activity_method in the role of element. Each Activity_method acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select.

4.3.15 Activity_element to Assembly_substitute_relationship

Each Activity_element refers to zero or one Assembly_substitute_relationship in the role of element. Each Assembly_substitute_relationship acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.16 Activity_element to Class_category_association

Each Activity_element refers to zero or one Class_category_association in the role of element. Each Class_category_association acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.17 Activity_element to Class_condition_association

Each Activity_element refers to zero or one Class_condition_association in the role of element. Each Class_condition_association acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.18 Activity_element to Class_function_association

Each Activity_element refers to zero or one Class_function_association in the role of element. Each Class_function_association acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.19 Activity_element to Class_inclusion_association

Each Activity_element refers to zero or one Class_inclusion_association in the role of element. Each Class_inclusion_association acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.20 Activity_element to Class_specification_association

Each Activity_element refers to zero or one Class_specification_association in the role of element. Each Class_specification_association acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.21 Activity_element to Configuration

Each Activity_element refers to zero or one Configuration in the role of element. Each Configuration acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select.

4.3.22 Activity_element to Design_constraint

Each Activity_element refers to zero or one Design_constraint in the role of element. Each Design_constraint acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.23 Activity_element to Drawing

Each Activity_element refers to zero or one Drawing in the role of element. Each Drawing acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.24 Activity_element to External_document

Each Activity_element refers to zero or one External_document in the role of element. Each External_document acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.25 Activity_element to Geometric_model

Each Activity_element refers to zero or one Geometric_model in the role of element. Each Geometric_model acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and model_select.

4.3.26 Activity_element to Item

Each Activity_element refers to zero or one Item in the role of element. Each Item acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.27 Activity_element to Item_definition_instance_relationship

Each Activity_element refers to zero or one Item_definition_instance_relationship in the role of element. Each Item_definition_instance_relationship acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and item_relationship_select.

4.3.28 Activity_element to Item_definition_relationship

Each Activity_element refers to zero or one Item_definition_relationship in the role of element. Each Item_definition_relationship acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and item_relationship_select.

4.3.29 Activity_element to Item_instance

Each Activity_element refers to zero or one Item_instance in the role of element. Each Item_instance acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.30 Activity_element to Item_instance_relationship

Each Activity_element refers to zero or one Item_instance_relationship in the role of element. Each Item_instance_relationship acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and item_relationship_select.

4.3.31 Activity_element to Item_solution

Each Activity_element refers to zero or one Item_solution in the role of element. Each Item_solution acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.32 Activity_element to Item_version

Each Activity_element refers to zero or one Item_version in the role of element. Each Item_version acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.33 Activity_element to Material

Each Activity_element refers to zero or one Material in the role of element. Each Material acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.34 Activity_element to Physical_instance

Each Activity_element refers to zero or one Physical_instance in the role of element. Each Physical_instance acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select.

4.3.35 Activity_element to Physical_instance_usage

Each Activity_element refers to zero or one Physical_instance_usage in the role of element. Each Physical_instance_usage acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select.

4.3.36 Activity_element to Process_plan

Each Activity_element refers to zero or one Process_plan in the role of element. Each Process_plan acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.37 Activity_element to Product_class

Each Activity_element refers to zero or one Product_class in the role of element. Each Product_class acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.38 Activity_element to Product_component

Each Activity_element refers to zero or one Product_component in the role of element. Each Product_component acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.39 Activity_element to Product_function

Each Activity_element refers to zero or one Product_function in the role of element. Each Product_function acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.40 Activity_element to Product_specification

Each Activity_element refers to zero or one Product_specification in the role of element. Each Product_specification acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.41 Activity_element to Property

Each Activity_element refers to zero or one Property in the role of element. Each Property acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.42 Activity_element to Simulation_information

Each Activity_element refers to zero or one Simulation_information in the role of element. Each Simulation_information acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and model_select.

4.3.43 Activity_element to Specification

Each Activity_element refers to zero or one Specification in the role of element. Each Specification acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.44 Activity_element to Specification_category

Each Activity_element refers to zero or one Specification_category in the role of element. Each Specification_category acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.45 Activity_element to Specification_expression

Each Activity_element refers to zero or one Specification_expression in the role of element. Each Specification_expression acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.46 Activity_element to Specification_inclusion

Each Activity_element refers to zero or one Specification_inclusion in the role of element. Each Specification_inclusion acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.47 Activity_element to Styled_model

Each Activity_element refers to zero or one Styled_model in the role of element. Each Styled_model acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and model_select.

4.3.48 Activity_element to View_area

Each Activity_element refers to zero or one View_area in the role of element. Each View_area acts as element for zero or more Activity_element objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.49 Activity_method to Multi_language_string

Each Activity_method refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Activity_method objects.

NOTE – This assertion is established through string_select.

Each Activity_method refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Activity_method objects.

NOTE – This assertion is established through string_select.

4.3.50 Activity_relationship to Activity

Each Activity_relationship is related to exactly one Activity. Each Activity is referenced by zero or more Activity_relationship objects as related.

NOTE – The related Activity is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Activity_relationship is relating to exactly one Activity. Each Activity is referenced by zero or more Activity_relationship objects as relating.

NOTE – The relating Activity is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.51 Activity_relationship to Multi_language_string

Each Activity_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Activity_relationship objects.

NOTE – This assertion is established through string_select.

4.3.52 Actuator to Kinematic_pair

Each Actuator is_applied_to exactly one Kinematic_pair. Each Kinematic_pair is_referenced_by zero or one Actuator.

4.3.53 Actuator to Multi_language_string

Each Actuator refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Actuator objects.

NOTE – This assertion is established through string_select.

4.3.54 Alias_identification to Approval_status

Each Alias_identification is_applied_to zero or one Approval_status. Each Approval_status is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.55 Alias_identification to Classification_system

Each Alias_identification is_applied_to zero or one Classification_system. Each Classification_system is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.56 Alias_identification to Document_type

Each Alias_identification is_applied_to zero or one Document_type. Each Document_type is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.57 Alias_identification to External_document

Each Alias_identification is_applied_to zero or one External_document. Each External_document is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.58 Alias_identification to Geometric_model

Each Alias_identification is_applied_to zero or one Geometric_model. Each Geometric_model is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.59 Alias_identification to Item_instance

Each Alias_identification is_applied_to zero or one Item_instance. Each Item_instance is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.60 Alias_identification to Item_solution

Each Alias_identification is_applied_to zero or one Item_solution. Each Item_solution is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.61 Alias_identification to Multi_language_string

Each Alias_identification refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Alias_identification objects.

NOTE – This assertion is established through string_select.

4.3.62 Alias_identification to Organization

Each Alias_identification refers to zero or one Organization in the role of alias_scope. Each Organization acts as alias_scope for zero or more Alias_identification objects.

4.3.63 Alias_identification to Physical_instance

Each Alias_identification is_applied_to zero or one Physical_instance. Each Physical_instance is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.64 Alias_identification to Product_class

Each Alias_identification is_applied_to zero or one Product_class. Each Product_class is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.65 Alias_identification to Product_component

Each Alias_identification is_applied_to zero or one Product_component. Each Product_component is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.66 Alias_identification to Product_function

Each Alias_identification is_applied_to zero or one Product_function. Each Product_function is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.67 Alias_identification to Security_level

Each Alias_identification is_applied_to zero or one Security_level. Each Security_level is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.68 Alias_identification to Specification

Each Alias_identification is_applied_to zero or one Specification. Each Specification is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.69 Alias_identification to Specification_category

Each Alias_identification is_applied_to zero or one Specification_category. Each Specification_category is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.70 Alias_identification to Styled_model

Each Alias_identification is_applied_to zero or one Styled_model. Each Styled_model is related to zero or more Alias_identification objects.

NOTE – This assertion is established through alias_select.

4.3.71 Alternate_item_relationship to Item

Each Alternate_item_relationship refers to exactly one Item in the role of alternate. Each Item acts as alternate for zero or more Alternate_item_relationship objects.

Each Alternate_item_relationship refers to exactly one Item in the role of base. Each Item acts as base for zero or more Alternate_item_relationship objects.

4.3.72 Alternate_item_relationship to Multi_language_string

Each Alternate_item_relationship refers to zero or one Multi_language_string in the role of fulfilled_requirements. Each Multi_language_string acts as fulfilled_requirements for zero or more Alternate_item_relationship objects.

NOTE – This assertion is established through string_select.

4.3.73 Angle_specification to Feature_parameter

Each Angle_specification refers to exactly one Feature_parameter in the role of angle. Each Feature_parameter acts as angle for zero or more Angle_specification objects.

4.3.74 Angle_taper to Feature_parameter

Each Angle_taper refers to exactly one Feature_parameter in the role of angle. Each Feature_parameter acts as angle for zero or more Angle_taper objects.

4.3.75 Angularity_tolerance to Datum

Each Angularity_tolerance refers to exactly one Datum in the role of datum. Each Datum acts as datum for zero or more Angularity_tolerance objects.

4.3.76 Annotation_model to Cartesian_coordinate_space

Each Annotation_model is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Annotation_model objects.

4.3.77 Appearance_assignment to Curve_appearance

Each Appearance_assignment refers to zero or more Curve_appearance objects in the role of component. Each Curve_appearance acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.78 Appearance_assignment to Hatching

Each Appearance_assignment refers to zero or more Hatching objects in the role of component. Each Hatching acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.79 Appearance_assignment to Point_appearance

Each Appearance_assignment refers to zero or more Point_appearance objects in the role of component. Each Point_appearance acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.80 Appearance_assignment to Solid_fill_area

Each Appearance_assignment refers to zero or more Solid_fill_area objects in the role of component. Each Solid_fill_area acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.81 Appearance_assignment to Surface_appearance

Each Appearance_assignment refers to zero or more Surface_appearance objects in the role of component. Each Surface_appearance acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.82 Appearance_assignment to Text_appearance

Each Appearance_assignment refers to zero or more Text_appearance objects in the role of component. Each Text_appearance acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.83 Appearance_assignment to Tiling

Each Appearance_assignment refers to zero or more Tiling objects in the role of component. Each Tiling acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.84 Appearance_assignment to Vector_appearance

Each Appearance_assignment refers to zero or more Vector_appearance objects in the role of component. Each Vector_appearance acts as component for one or more Appearance_assignment objects.

NOTE – This assertion is established through appearance_select.

4.3.85 Application_context to Multi_language_string

Each Application_context refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Application_context objects.

NOTE – This assertion is established through string_select.

4.3.86 Approval to Activity

Each Approval is_applied_to zero or more Activity objects. Each Activity is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.87 Approval to Activity_element

Each Approval is_applied_to zero or more Activity_element objects. Each Activity_element is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.88 Approval to Alternate_item_relationship

Each Approval is_applied_to zero or more Alternate_item_relationship objects. Each Alternate_item_relationship is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.89 Approval to Approval_status

Each Approval refers to exactly one Approval_status in the role of approval_status. Each Approval_status acts as approval_status for zero or more Approval objects.

4.3.90 Approval to Assembly_substitute_relationship

Each Approval is_applied_to zero or more Assembly_substitute_relationship objects. Each Assembly_substitute_relationship is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.91 Approval to Class_category_association

Each Approval is_applied_to zero or more Class_category_association objects. Each Class_category_association is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and configuration_information_select.

4.3.92 Approval to Class_condition_association

Each Approval is_applied_to zero or more Class_condition_association objects. Each Class_condition_association is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and configuration_information_select.

4.3.93 Approval to Class_function_association

Each Approval is_applied_to zero or more Class_function_association objects. Each Class_function_association is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_select.

4.3.94 Approval to Class_inclusion_association

Each Approval is_applied_to zero or more Class_inclusion_association objects. Each Class_inclusion_association is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and configuration_information_select.

4.3.95 Approval to Class_specification_association

Each Approval is_applied_to zero or more Class_specification_association objects. Each Class_specification_association is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and configuration_information_select.

4.3.96 Approval to Configuration

Each Approval is_applied_to zero or more Configuration objects. Each Configuration is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.97 Approval to Date_and_person_or_organization

Each Approval is_approved_by zero or more Date_and_person_or_organization objects. Each Date_and_person_or_organization is related to zero or more Approval objects.

4.3.98 Approval to Date_time

Each Approval refers to zero or one Date_time in the role of actual_date. Each Date_time acts as actual_date for zero or more Approval objects.

Each Approval refers to zero or one Date_time in the role of nominal_date. Each Date_time acts as nominal_date for zero or more Approval objects.

4.3.99 Approval to Design_constraint

Each Approval is_applied_to zero or more Design_constraint objects. Each Design_constraint is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_select.

4.3.100 Approval to Design_discipline_item_definition

Each Approval is_applied_to zero or more Design_discipline_item_definition objects. Each Design_discipline_item_definition is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and item_information_select.

4.3.101 Approval to Drawing

Each Approval is_applied_to zero or more Drawing objects. Each Drawing is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.102 Approval to External_document

Each Approval is_applied_to zero or more External_document objects. Each External_document is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.103 Approval to Geometric_model

Each Approval is_applied_to zero or more Geometric_model objects. Each Geometric_model is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and model_select.

4.3.104 Approval to Item_definition_instance_relationship

Each Approval is_applied_to zero or more Item_definition_instance_relationship objects. Each Item_definition_instance_relationship is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select, item_information_select, and item_relationship_select.

4.3.105 Approval to Item_definition_relationship

Each Approval is_applied_to zero or more Item_definition_relationship objects. Each Item_definition_relationship is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select, item_information_select, and item_relationship_select.

4.3.106 Approval to Item_instance

Each Approval is_applied_to zero or more Item_instance objects. Each Item_instance is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and item_information_select.

4.3.107 Approval to Item_instance_relationship

Each Approval is_applied_to zero or more Item_instance_relationship objects. Each Item_instance_relationship is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select, item_information_select, and item_relationship_select.

4.3.108 Approval to Item_solution

Each Approval is_applied_to zero or more Item_solution objects. Each Item_solution is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_select.

4.3.109 Approval to Item_version

Each Approval is_applied_to zero or more Item_version objects. Each Item_version is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.110 Approval to Material

Each Approval is_applied_to zero or more Material objects. Each Material is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.111 Approval to Multi_language_string

Each Approval refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Approval objects.

NOTE – This assertion is established through string_select.

4.3.112 Approval to Physical_instance

Each Approval is_applied_to zero or more Physical_instance objects. Each Physical_instance is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.113 Approval to Physical_instance_usage

Each Approval is_applied_to zero or more Physical_instance_usage objects. Each Physical_instance_usage is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.114 Approval to Process_plan

Each Approval is_applied_to zero or more Process_plan objects. Each Process_plan is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.115 Approval to Product_class

Each Approval is_applied_to zero or more Product_class objects. Each Product_class is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_select.

4.3.116 Approval to Product_component

Each Approval is_applied_to zero or more Product_component objects. Each Product_component is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_-select.

4.3.117 Approval to Product_function

Each Approval is_applied_to zero or more Product_function objects. Each Product_function is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_-select.

4.3.118 Approval to Project

Each Approval is_applied_to zero or more Project objects. Each Project is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.119 Approval to Simulation_information

Each Approval is_applied_to zero or more Simulation_information objects. Each Simulation_-information is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and model_select.

4.3.120 Approval to Specification

Each Approval is_applied_to zero or more Specification objects. Each Specification is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_-select.

4.3.121 Approval to Specification_category

Each Approval is_applied_to zero or more Specification_category objects. Each Specification_-category is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and specification_information_-select.

4.3.122 Approval to Specification_expression

Each Approval is_applied_to zero or more Specification_expression objects. Each Specification_-expression is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and configuration_information_-select.

4.3.123 Approval to Specification_inclusion

Each Approval is_applied_to zero or more Specification_inclusion objects. Each Specification_inclusion is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and configuration_information_select.

4.3.124 Approval to Styled_model

Each Approval is_applied_to zero or more Styled_model objects. Each Styled_model is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select and model_select.

4.3.125 Approval to View_area

Each Approval is_applied_to zero or more View_area objects. Each View_area is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.126 Approval to Work_order

Each Approval is_applied_to zero or more Work_order objects. Each Work_order is related to zero or more Approval objects.

NOTE – This assertion is established through approval_element_select.

4.3.127 Approval_relationship to Approval

Each Approval_relationship is related to exactly one Approval. Each Approval is referenced by zero or more Approval_relationship objects as related.

NOTE – The related Approval is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Approval_relationship is relating to exactly one Approval. Each Approval is referenced by zero or more Approval_relationship objects as relating.

NOTE – The relating Approval is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.128 Approval_status to Classification_system

Each Approval_status refers to zero or one Classification_system in the role of used_classification_system. Each Classification_system acts as used_classification_system for zero or more Approval_status objects.

4.3.129 Area_placed_annotation to Annotation_element

Each Area_placed_annotation refers to exactly one Annotation_element in the role of element. Each Annotation_element acts as element for zero or more Area_placed_annotation objects.

4.3.130 Area_placed_annotation to Appearance_assignment

Each Area_placed_annotation refers to exactly one Appearance_assignment in the role of appearance. Each Appearance_assignment acts as appearance for zero or more Area_placed_annotation objects.

4.3.131 Area_placed_annotation to Drawing_sheet

Each Area_placed_annotation refers to zero or one Drawing_sheet in the role of reference_area. Each Drawing_sheet acts as reference_area for zero or more Area_placed_annotation objects.

NOTE – This assertion is established through area_select.

4.3.132 Area_placed_annotation to View_area

Each Area_placed_annotation refers to zero or one View_area in the role of reference_area. Each View_area acts as reference_area for zero or more Area_placed_annotation objects.

NOTE – This assertion is established through area_select.

4.3.133 Assembly_component_relationship to Assembly_definition

Each Assembly_component_relationship is relating to exactly one Assembly_definition. Each Assembly_definition is referenced by zero or more Assembly_component_relationship objects as relating.

NOTE – The relating Assembly_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.134 Assembly_component_relationship to Geometric_model_relationship_with_transformation

Each Assembly_component_relationship refers to zero or one Geometric_model_relationship_with_transformation in the role of transformation. Each Geometric_model_relationship_with_transformation acts as transformation for zero or more Assembly_component_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.135 Assembly_component_relationship to Template_instance

Each Assembly_component_relationship refers to zero or one Template_instance in the role of transformation. Each Template_instance acts as transformation for zero or more Assembly_component_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.136 Assembly_substitute_relationship to Assembly_component_relationship

Each Assembly_substitute_relationship refers to exactly one Assembly_component_relationship in the role of base. Each Assembly_component_relationship acts as base for zero or more Assembly_substitute_relationship objects.

Each Assembly_substitute_relationship refers to exactly one Assembly_component_relationship in the role of substitute. Each Assembly_component_relationship acts as substitute for zero or more Assembly_substitute_relationship objects.

4.3.137 Assembly_substitute_relationship to Multi_language_string

Each Assembly_substitute_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Assembly_substitute_relationship objects.

NOTE – This assertion is established through string_select.

4.3.138 Associated_annotation_symbol to Annotation_curve

Each Associated_annotation_symbol is_associated_to zero or more Annotation_curve objects. Each Annotation_curve is related to zero or more Associated_annotation_symbol objects.

NOTE – This assertion is established through associated_element_select and dimension_associated_element_select.

4.3.139 Associated_annotation_symbol to Annotation_subfigure

Each Associated_annotation_symbol is_associated_to zero or more Annotation_subfigure objects. Each Annotation_subfigure is related to zero or more Associated_annotation_symbol objects.

NOTE – This assertion is established through associated_element_select.

4.3.140 Associated_annotation_symbol to Annotation_symbol

Each Associated_annotation_symbol is_associated_to zero or more Annotation_symbol objects. Each Annotation_symbol is related to zero or more Associated_annotation_symbol objects.

NOTE – This assertion is established through associated_element_select.

4.3.141 Associated_annotation_symbol to Detailed_geometric_model_element

Each Associated_annotation_symbol is_associated_to zero or more Detailed_geometric_model_element objects. Each Detailed_geometric_model_element is related to zero or more Associated_annotation_symbol objects.

NOTE – This assertion is established through associated_element_select and dimension_associated_element_select.

4.3.142 Associated_annotation_symbol to Fill_area

Each Associated_annotation_symbol is_associated_to zero or more Fill_area objects. Each Fill_area is related to zero or more Associated_annotation_symbol objects.

NOTE – This assertion is established through associated_element_select.

4.3.143 Associated_annotation_symbol to Text

Each Associated_annotation_symbol is_associated_to zero or more Text objects. Each Text is related to zero or more Associated_annotation_symbol objects.

NOTE – This assertion is established through associated_element_select.

4.3.144 Associated_fill_area to Annotation_curve

Each Associated_fill_area is_derived_from zero or more Annotation_curve objects. Each Annotation_curve is related to zero or more Associated_fill_area objects.

NOTE – This assertion is established through dimension_associated_element_select.

4.3.145 Associated_fill_area to Detailed_geometric_model_element

Each Associated_fill_area is_derived_from zero or more Detailed_geometric_model_element objects. Each Detailed_geometric_model_element is related to zero or more Associated_fill_area objects.

NOTE – This assertion is established through dimension_associated_element_select.

4.3.146 Associated_leader to Annotation_curve

Each Associated_leader refers to zero or one Annotation_curve in the role of target. Each Annotation_curve acts as target for zero or more Associated_leader objects.

NOTE – This assertion is established through associated_element_select and dimension_associated_element_select.

4.3.147 Associated_leader to Annotation_subfigure

Each Associated_leader refers to zero or one Annotation_subfigure in the role of target. Each Annotation_subfigure acts as target for zero or more Associated_leader objects.

NOTE – This assertion is established through associated_element_select.

4.3.148 Associated_leader to Annotation_symbol

Each Associated_leader refers to zero or one Annotation_symbol in the role of target. Each Annotation_symbol acts as target for zero or more Associated_leader objects.

NOTE – This assertion is established through associated_element_select.

4.3.149 Associated_leader to Detailed_geometric_model_element

Each Associated_leader refers to zero or one Detailed_geometric_model_element in the role of target. Each Detailed_geometric_model_element acts as target for zero or more Associated_-leader objects.

NOTE – This assertion is established through associated_element_select and dimension_associated_-element_select.

4.3.150 Associated_leader to Fill_area

Each Associated_leader refers to zero or one Fill_area in the role of target. Each Fill_area acts as target for zero or more Associated_leader objects.

NOTE – This assertion is established through associated_element_select.

4.3.151 Associated_leader to Text

Each Associated_leader refers to zero or one Text in the role of target. Each Text acts as target for zero or more Associated_leader objects.

NOTE – This assertion is established through associated_element_select.

4.3.152 Associated_projection_curve to Annotation_curve

Each Associated_projection_curve is_projected_to zero or one Annotation_curve. Each Annotation_curve is related to zero or more Associated_projection_curve objects.

NOTE – This assertion is established through associated_element_select and dimension_associated_-element_select.

4.3.153 Associated_projection_curve to Annotation_subfigure

Each Associated_projection_curve is_projected_to zero or one Annotation_subfigure. Each Annotation_subfigure is related to zero or more Associated_projection_curve objects.

NOTE – This assertion is established through associated_element_select.

4.3.154 Associated_projection_curve to Annotation_symbol

Each Associated_projection_curve is_projected_to zero or one Annotation_symbol. Each Annotation_symbol is related to zero or more Associated_projection_curve objects.

NOTE – This assertion is established through associated_element_select.

4.3.155 Associated_projection_curve to Detailed_geometric_model_element

Each Associated_projection_curve is_projected_to zero or one Detailed_geometric_model_element. Each Detailed_geometric_model_element is related to zero or more Associated_projection_curve objects.

NOTE – This assertion is established through associated_element_select and dimension_associated_element_select.

4.3.156 Associated_projection_curve to Fill_area

Each Associated_projection_curve is_projected_to zero or one Fill_area. Each Fill_area is related to zero or more Associated_projection_curve objects.

NOTE – This assertion is established through associated_element_select.

4.3.157 Associated_projection_curve to Text

Each Associated_projection_curve is_projected_to zero or one Text. Each Text is related to zero or more Associated_projection_curve objects.

NOTE – This assertion is established through associated_element_select.

4.3.158 B_rep to Closed_shell

Each B_rep refers to exactly one Closed_shell in the role of outer. Each Closed_shell acts as outer for zero or more B_rep objects.

Each B_rep refers to zero or more Closed_shell objects in the role of void. Each Closed_shell acts as void for zero or more B_rep objects.

4.3.159 B_rep_model to B_rep

Each B_rep_model refers to zero or more B_rep objects in the role of element. Each B_rep acts as element for zero or more B_rep_model objects.

4.3.160 Bead_feature to Bead_end_type

Each Bead_feature refers to exactly two Bead_end_type objects in the role of end_condition. Each Bead_end_type acts as end_condition for zero or more Bead_feature objects.

4.3.161 Bead_feature to Feature_parameter

Each Bead_feature refers to zero or one Feature_parameter in the role of base_radius. Each Feature_parameter acts as base_radius for zero or more Bead_feature objects.

4.3.162 Bead_feature to Open_profile

Each Bead_feature refers to exactly one Open_profile in the role of bead_profile. Each Open_profile acts as bead_profile for zero or more Bead_feature objects.

4.3.163 Bead_feature to Path

Each Bead_feature refers to exactly one Path in the role of sweep_path. Each Path acts as sweep_path for zero or more Bead_feature objects.

4.3.164 Bead_feature to Transformation

Each Bead_feature refers to zero or one Transformation in the role of profile_placement. Each Transformation acts as profile_placement for zero or more Bead_feature objects.

4.3.165 Boolean_result to B_rep_model

Each Boolean_result refers to zero or one B_rep_model in the role of first_operand. Each B_rep_model acts as first_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

Each Boolean_result refers to zero or one B_rep_model in the role of second_operand. Each B_rep_model acts as second_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

4.3.166 Boolean_result to Boolean_result

Each Boolean_result refers to zero or one Boolean_result in the role of first_operand. Each Boolean_result acts as first_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select and csg_select.

Each Boolean_result refers to zero or one Boolean_result in the role of second_operand. Each Boolean_result acts as second_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select and csg_select.

4.3.167 Boolean_result to Csg_primitive

Each Boolean_result refers to zero or one Csg_primitive in the role of first_operand. Each Csg_primitive acts as first_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select and csg_select.

Each Boolean_result refers to zero or one Csg_primitive in the role of second_operand. Each Csg_primitive acts as second_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select and csg_select.

4.3.168 Boolean_result to Faceted_b_rep_model

Each Boolean_result refers to zero or one Faceted_b_rep_model in the role of first_operand. Each Faceted_b_rep_model acts as first_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

Each Boolean_result refers to zero or one Faceted_b_rep_model in the role of second_operand. Each Faceted_b_rep_model acts as second_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

4.3.169 Boolean_result to Half_space_solid

Each Boolean_result refers to zero or one Half_space_solid in the role of first_operand. Each Half_space_solid acts as first_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select.

Each Boolean_result refers to zero or one Half_space_solid in the role of second_operand. Each Half_space_solid acts as second_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select.

4.3.170 Boolean_result to Solid_replica

Each Boolean_result refers to zero or one Solid_replica in the role of first_operand. Each Solid_replica acts as first_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

Each Boolean_result refers to zero or one Solid_replica in the role of second_operand. Each Solid_replica acts as second_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

4.3.171 Boolean_result to Swept_face_solid

Each Boolean_result refers to zero or one Swept_face_solid in the role of first_operand. Each Swept_face_solid acts as first_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

Each Boolean_result refers to zero or one Swept_face_solid in the role of second_operand. Each Swept_face_solid acts as second_operand for zero or more Boolean_result objects.

NOTE – This assertion is established through boolean_operand_select, csg_select, and non_primitive_solid_select.

4.3.172 Boss_feature to Angle_taper

Each Boss_feature refers to zero or one Angle_taper in the role of taper. Each Angle_taper acts as taper for zero or more Boss_feature objects.

NOTE – This assertion is established through taper_select.

4.3.173 Boss_feature to Boss_top_condition

Each Boss_feature refers to exactly one Boss_top_condition in the role of top_condition. Each Boss_top_condition acts as top_condition for zero or more Boss_feature objects.

4.3.174 Boss_feature to Diameter_taper

Each Boss_feature refers to zero or one Diameter_taper in the role of taper. Each Diameter_taper acts as taper for zero or more Boss_feature objects.

NOTE – This assertion is established through taper_select.

4.3.175 Boss_feature to Directed_taper

Each Boss_feature refers to zero or one Directed_taper in the role of taper. Each Directed_taper acts as taper for zero or more Boss_feature objects.

NOTE – This assertion is established through taper_select.

4.3.176 Boss_feature to Feature_parameter

Each Boss_feature refers to zero or one Feature_parameter in the role of fillet_radius. Each Feature_parameter acts as fillet_radius for zero or more Boss_feature objects.

4.3.177 Boss_feature to Linear_path

Each Boss_feature refers to exactly one Linear_path in the role of sweep_path. Each Linear_path acts as sweep_path for zero or more Boss_feature objects.

4.3.178 Boss_feature to Transformation

Each Boss_feature refers to zero or one Transformation in the role of profile_placement. Each Transformation acts as profile_placement for zero or more Boss_feature objects.

4.3.179 Catalog_thread to External_document

Each Catalog_thread is_specified_in zero or one External_document. Each External_document is related to zero or more Catalog_thread objects.

NOTE – This assertion is established through external_source_select.

4.3.180 Catalog_thread to External_library_reference

Each Catalog_thread is_specified_in zero or one External_library_reference. Each External_library_reference is related to zero or more Catalog_thread objects.

NOTE – This assertion is established through external_source_select.

4.3.181 Centre_of_mass to Cartesian_coordinate_space

Each Centre_of_mass is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Centre_of_mass objects.

4.3.182 Centre_of_mass to Multi_language_string

Each Centre_of_mass refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Centre_of_mass objects.

NOTE – This assertion is established through string_select.

4.3.183 Chamfer to Chamfer_definition

Each Chamfer is_defined_by exactly one Chamfer_definition. Each Chamfer_definition is related to zero or more Chamfer objects.

4.3.184 Chamfer_angle to Feature_parameter

Each Chamfer_angle refers to exactly one Feature_parameter in the role of angle. Each Feature_parameter acts as angle for zero or more Chamfer_angle objects.

4.3.185 Chamfer_definition to Chamfer_angle

Each Chamfer_definition refers to zero or one Chamfer_angle in the role of value_2. Each Chamfer_angle acts as value_2 for zero or more Chamfer_definition objects.

NOTE – This assertion is established through chamfer_value_select.

4.3.186 Chamfer_definition to Chamfer_offset

Each Chamfer_definition refers to exactly one Chamfer_offset in the role of offset_1. Each Chamfer_offset acts as offset_1 for zero or more Chamfer_definition objects.

Each Chamfer_definition refers to zero or one Chamfer_offset in the role of value_2. Each Chamfer_offset acts as value_2 for zero or more Chamfer_definition objects.

NOTE – This assertion is established through chamfer_value_select.

4.3.187 Chamfer_offset to Feature_parameter

Each Chamfer_offset refers to exactly one Feature_parameter in the role of offset. Each Feature_parameter acts as offset for zero or more Chamfer_offset objects.

4.3.188 Change to Design_constraint_relationship

Each Change refers to zero or more Design_constraint_relationship objects in the role of described_change. Each Design_constraint_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.189 Change to Item_version_relationship

Each Change refers to zero or more Item_version_relationship objects in the role of described_change. Each Item_version_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.190 Change to Multi_language_string

Each Change refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Change objects.

NOTE – This assertion is established through string_select.

4.3.191 Change to Process_operation_relationship

Each Change refers to zero or more Process_operation_relationship objects in the role of described_change. Each Process_operation_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.192 Change to Process_plan_relationship

Each Change refers to zero or more Process_plan_relationship objects in the role of described_change. Each Process_plan_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.193 Change to Product_component_relationship

Each Change refers to zero or more Product_component_relationship objects in the role of described_change. Each Product_component_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.194 Change to Product_function_relationship

Each Change refers to zero or more Product_function_relationship objects in the role of described_change. Each Product_function_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.195 Change to Replaced_definition_relationship

Each Change refers to zero or more Replaced_definition_relationship objects in the role of described_change. Each Replaced_definition_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.196 Change to Replaced_usage_relationship

Each Change refers to zero or more Replaced_usage_relationship objects in the role of described_change. Each Replaced_usage_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.197 Change to Shape_aspect_relationship

Each Change refers to zero or more Shape_aspect_relationship objects in the role of described_change. Each Shape_aspect_relationship acts as described_change for zero or more Change objects.

NOTE – This assertion is established through change_relationship_select.

4.3.198 Circular_boss to Circular_closed_profile

Each Circular_boss refers to exactly one Circular_closed_profile in the role of boundary. Each Circular_closed_profile acts as boundary for zero or more Circular_boss objects.

4.3.199 Circular_closed_profile to Feature_parameter

Each Circular_closed_profile refers to exactly one Feature_parameter in the role of diameter. Each Feature_parameter acts as diameter for zero or more Circular_closed_profile objects.

4.3.200 Circular_path to Axis_placement

Each Circular_path refers to exactly one Axis_placement in the role of rotation_axis_defined_by. Each Axis_placement acts as rotation_axis_defined_by for zero or more Circular_path objects.

4.3.201 Circular_path to Feature_parameter

Each Circular_path refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Circular_path objects.

4.3.202 Circular_pattern to Circular_offset_pattern

Each Circular_pattern refers to zero or more Circular_offset_pattern objects in the role of relocated_feature. Each Circular_offset_pattern acts as relocated_feature for zero or more Circular_pattern objects.

4.3.203 Circular_pattern to Circular_omit_pattern

Each Circular_pattern refers to zero or more Circular_omit_pattern objects in the role of missing_feature. Each Circular_omit_pattern acts as missing_feature for zero or more Circular_pattern objects.

4.3.204 Circular_pattern to Feature_parameter

Each Circular_pattern refers to exactly one Feature_parameter in the role of angular_spacing. Each Feature_parameter acts as angular_spacing for zero or more Circular_pattern objects.

Each Circular_pattern refers to zero or one Feature_parameter in the role of diameter. Each Feature_parameter acts as diameter for zero or more Circular_pattern objects.

Each Circular_pattern refers to exactly one Feature_parameter in the role of rotation. Each Feature_parameter acts as rotation for zero or more Circular_pattern objects.

4.3.205 Circular_runout_tolerance to Datum

Each Circular_runout_tolerance refers to one or two Datum objects in the role of datum. Each Datum acts as datum for zero or more Circular_runout_tolerance objects.

4.3.206 Class_category_association to Product_class

Each Class_category_association refers to exactly one Product_class in the role of product_class. Each Product_class acts as product_class for zero or more Class_category_association objects.

4.3.207 Class_category_association to Specification_category

Each Class_category_association refers to exactly one Specification_category in the role of category. Each Specification_category acts as category for zero or more Class_category_association objects.

4.3.208 Class_condition_association to Multi_language_string

Each Class_condition_association refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Class_condition_association objects.

NOTE – This assertion is established through string_select.

4.3.209 Class_condition_association to Product_class

Each Class_condition_association refers to exactly one Product_class in the role of product_class. Each Product_class acts as product_class for zero or more Class_condition_association objects.

4.3.210 Class_condition_association to Specification_expression

Each Class_condition_association refers to exactly one Specification_expression in the role of condition. Each Specification_expression acts as condition for zero or more Class_condition_association objects.

4.3.211 Class_function_association to Multi_language_string

Each Class_function_association refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Class_function_association

objects.

NOTE – This assertion is established through string_select.

4.3.212 Class_function_association to Product_class

Each Class_function_association refers to exactly one Product_class in the role of product_class. Each Product_class acts as product_class for zero or more Class_function_association objects.

4.3.213 Class_function_association to Product_function

Each Class_function_association refers to exactly one Product_function in the role of product_function. Each Product_function acts as product_function for zero or more Class_function_association objects.

4.3.214 Class_inclusion_association to Multi_language_string

Each Class_inclusion_association refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Class_inclusion_association objects.

NOTE – This assertion is established through string_select.

4.3.215 Class_inclusion_association to Product_class

Each Class_inclusion_association refers to exactly one Product_class in the role of product_class. Each Product_class acts as product_class for zero or more Class_inclusion_association objects.

4.3.216 Class_inclusion_association to Specification_inclusion

Each Class_inclusion_association refers to exactly one Specification_inclusion in the role of inclusion. Each Specification_inclusion acts as inclusion for zero or more Class_inclusion_association objects.

4.3.217 Class_specification_association to Product_class

Each Class_specification_association refers to exactly one Product_class in the role of product_class. Each Product_class acts as product_class for zero or more Class_specification_association objects.

4.3.218 Class_specification_association to Specification

Each Class_specification_association refers to exactly one Specification in the role of specification. Each Specification acts as specification for zero or more Class_specification_association objects.

4.3.219 Classification_attribute to External_document

Each Classification_attribute refers to zero or one External_document in the role of attribute_source. Each External_document acts as attribute_source for zero or more Classification_attribute objects.

NOTE – This assertion is established through external_source_select.

4.3.220 Classification_attribute to External_library_reference

Each Classification_attribute refers to zero or one External_library_reference in the role of attribute_source. Each External_library_reference acts as attribute_source for zero or more Classification_attribute objects.

NOTE – This assertion is established through external_source_select.

4.3.221 Classification_attribute to Multi_language_string

Each Classification_attribute refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Classification_attribute objects.

NOTE – This assertion is established through string_select.

Each Classification_attribute refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Classification_attribute objects.

NOTE – This assertion is established through string_select.

4.3.222 Classification_attribute to Property_value

Each Classification_attribute refers to one or more Property_value objects in the role of attribute_value. Each Property_value acts as attribute_value for zero or more Classification_attribute objects.

4.3.223 Classification_system to External_document

Each Classification_system refers to zero or one External_document in the role of classification_system_source. Each External_document acts as classification_system_source for zero or more Classification_system objects.

NOTE – This assertion is established through external_source_select.

4.3.224 Classification_system to External_library_reference

Each Classification_system refers to zero or one External_library_reference in the role of classification_system_source. Each External_library_reference acts as classification_system_source for zero or more Classification_system objects.

NOTE – This assertion is established through external_source_select.

4.3.225 Classification_system to Multi_language_string

Each Classification_system refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Classification_system objects.

NOTE – This assertion is established through string_select.

Each Classification_system refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Classification_system objects.

NOTE – This assertion is established through string_select.

4.3.226 Closed_profile_usage to Closed_profile

Each Closed_profile_usage refers to exactly one Closed_profile in the role of profile. Each Closed_profile acts as profile for zero or more Closed_profile_usage objects.

4.3.227 Closed_profile_usage to Transformation

Each Closed_profile_usage refers to zero or one Transformation in the role of placement. Each Transformation acts as placement for zero or more Closed_profile_usage objects.

4.3.228 Closed_shell to Face

Each Closed_shell refers to one or more Face objects in the role of shell_boundary. Each Face acts as shell_boundary for zero or more Closed_shell objects.

4.3.229 Coating_layer to Material

Each Coating_layer refers to exactly one Material in the role of used_material. Each Material acts as used_material for zero or more Coating_layer objects.

4.3.230 Coating_layer to Value_with_unit

Each Coating_layer refers to zero or one Value_with_unit in the role of thickness. Each Value_with_unit acts as thickness for zero or more Coating_layer objects.

4.3.231 Coating_layer_relationship to Coating_layer

Each Coating_layer_relationship refers to exactly one Coating_layer in the role of following_layer. Each Coating_layer acts as following_layer for zero or more Coating_layer_relationship objects.

Each Coating_layer_relationship refers to exactly one Coating_layer in the role of preceding_layer. Each Coating_layer acts as preceding_layer for zero or more Coating_layer_relationship objects.

4.3.232 Coating_layer_relationship to Multi_language_string

Each Coating_layer_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Coating_layer_relationship objects.

NOTE – This assertion is established through string_select.

Each Coating_layer_relationship refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_string acts as purpose for zero or more Coating_layer_relationship objects.

NOTE – This assertion is established through string_select.

4.3.233 Collected_item_association to Collection_definition

Each Collected_item_association is relating to exactly one Collection_definition. Each Collection_definition has collected_items defined by two or more Collected_item_association objects.

NOTE – The relating Collection_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.234 Collection_definition to Multi_language_string

Each Collection_definition refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_string acts as purpose for zero or more Collection_definition objects.

NOTE – This assertion is established through string_select.

4.3.235 Compound_datum to Datum_feature

Each Compound_datum is_made_up_by two or more Datum_feature objects. Each Datum_feature is related to zero or more Compound_datum objects.

4.3.236 Compound_feature_in_panel_element to Compound_feature_in_panel

Each Compound_feature_in_panel_element is_element_for exactly one Compound_feature_in_panel. Each Compound_feature_in_panel has element defined by two or more Compound_feature_in_panel_element objects.

4.3.237 Compound_feature_in_panel_element to Process_feature_in_panel

Each Compound_feature_in_panel_element refers to zero or one Process_feature_in_panel in the role of feature. Each Process_feature_in_panel acts as feature for zero or more Compound_feature_in_panel_element objects.

NOTE – This assertion is established through compound_in_panel_select.

4.3.238 Compound_feature_in_panel_element to Transformation

Each Compound_feature_in_panel_element refers to zero or one Transformation in the role of element_placement. Each Transformation acts as element_placement for zero or more Compound_feature_in_panel_element objects.

4.3.239 Compound_feature_in_panel_element to Transition_feature

Each Compound_feature_in_panel_element refers to zero or one Transition_feature in the role of feature. Each Transition_feature acts as feature for zero or more Compound_feature_in_panel_element objects.

NOTE – This assertion is established through compound_in_panel_select.

4.3.240 Compound_feature_in_panel_element_relationship to Compound_feature_in_panel_element

Each Compound_feature_in_panel_element_relationship refers to exactly one Compound_feature_in_panel_element in the role of predecessor. Each Compound_feature_in_panel_element acts as predecessor for zero or more Compound_feature_in_panel_element_relationship objects.

Each Compound_feature_in_panel_element_relationship refers to exactly one Compound_feature_in_panel_element in the role of successor. Each Compound_feature_in_panel_element acts as successor for zero or more Compound_feature_in_panel_element_relationship objects.

4.3.241 Compound_feature_in_solid_element to Compound_feature_in_solid

Each Compound_feature_in_solid_element is_element_for exactly one Compound_feature_in_solid. Each Compound_feature_in_solid has element defined by two or more Compound_feature_in_solid_element objects.

4.3.242 Compound_feature_in_solid_element to Process_feature_in_solid

Each Compound_feature_in_solid_element refers to zero or one Process_feature_in_solid in the role of feature. Each Process_feature_in_solid acts as feature for zero or more Compound_feature_in_solid_element objects.

NOTE – This assertion is established through compound_in_solid_select.

4.3.243 Compound_feature_in_solid_element to Thread_feature

Each Compound_feature_in_solid_element refers to zero or one Thread_feature in the role of feature. Each Thread_feature acts as feature for zero or more Compound_feature_in_solid_element objects.

NOTE – This assertion is established through compound_in_solid_select.

4.3.244 Compound_feature_in_solid_element to Transformation

Each Compound_feature_in_solid_element refers to zero or one Transformation in the role of element_placement. Each Transformation acts as element_placement for zero or more Compound_feature_in_solid_element objects.

4.3.245 Compound_feature_in_solid_element to Transition_feature

Each Compound_feature_in_solid_element refers to zero or one Transition_feature in the role of feature. Each Transition_feature acts as feature for zero or more Compound_feature_in_solid_element objects.

NOTE – This assertion is established through compound_in_solid_select.

4.3.246 Compound_feature_in_solid_element_relationship to Compound_feature_in_solid_element

Each Compound_feature_in_solid_element_relationship refers to exactly one Compound_feature_in_solid_element in the role of predecessor. Each Compound_feature_in_solid_element acts as predecessor for zero or more Compound_feature_in_solid_element_relationship objects.

Each Compound_feature_in_solid_element_relationship refers to exactly one Compound_feature_in_solid_element in the role of successor. Each Compound_feature_in_solid_element acts as successor for zero or more Compound_feature_in_solid_element_relationship objects.

4.3.247 Compound_model to Topologically_connected_set

Each Compound_model refers to zero or more Topologically_connected_set objects in the role of element. Each Topologically_connected_set acts as element for zero or more Compound_model objects.

4.3.248 Concentricity_tolerance to Datum

Each Concentricity_tolerance refers to exactly one Datum in the role of datum. Each Datum acts as datum for zero or more Concentricity_tolerance objects.

4.3.249 Configuration to Class_condition_association

Each Configuration is_solution_for zero or one Class_condition_association. Each Class_condition_association is related to zero or more Configuration objects.

NOTE – This assertion is established through configured_specification_select.

4.3.250 Configuration to Class_specification_association

Each Configuration is_solution_for zero or one Class_specification_association. Each Class_specification_association is related to zero or more Configuration objects.

NOTE – This assertion is established through configured_specification_select.

4.3.251 Configuration to Item_solution

Each Configuration refers to zero or one Item_solution in the role of usage. Each Item_solution acts as usage for zero or more Configuration objects.

NOTE – This assertion is established through configured_item_select.

4.3.252 Configuration to Process_operation

Each Configuration refers to zero or one Process_operation in the role of usage. Each Process_operation acts as usage for zero or more Configuration objects.

NOTE – This assertion is established through configured_item_select.

4.3.253 Conical_bottom to Feature_parameter

Each Conical_bottom refers to exactly one Feature_parameter in the role of tip_angle. Each Feature_parameter acts as tip_angle for zero or more Conical_bottom objects.

Each Conical_bottom refers to zero or one Feature_parameter in the role of tip_radius. Each Feature_parameter acts as tip_radius for zero or more Conical_bottom objects.

4.3.254 Constant_radius_edge_round to Feature_parameter

Each Constant_radius_edge_round refers to zero or one Feature_parameter in the role of first_offset. Each Feature_parameter acts as first_offset for zero or more Constant_radius_edge_round objects.

Each Constant_radius_edge_round refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Constant_radius_edge_round objects.

Each Constant_radius_edge_round refers to zero or one Feature_parameter in the role of second_offset. Each Feature_parameter acts as second_offset for zero or more Constant_radius_edge_round objects.

4.3.255 Constant_radius_fillet to Feature_parameter

Each Constant_radius_fillet refers to zero or one Feature_parameter in the role of first_offset. Each Feature_parameter acts as first_offset for zero or more Constant_radius_fillet objects.

Each Constant_radius_fillet refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Constant_radius_fillet objects.

Each Constant_radius_fillet refers to zero or one Feature_parameter in the role of second_offset. Each Feature_parameter acts as second_offset for zero or more Constant_radius_fillet objects.

4.3.256 Constructive_geometric_element to Axis_placement

Each Constructive_geometric_element refers to zero or one Axis_placement in the role of element. Each Axis_placement acts as element for zero or more Constructive_geometric_element objects.

NOTE – This assertion is established through constructive_element_select.

4.3.257 Constructive_geometric_element to Curve

Each Constructive_geometric_element refers to zero or one Curve in the role of element. Each Curve acts as element for zero or more Constructive_geometric_element objects.

NOTE – This assertion is established through constructive_element_select.

4.3.258 Constructive_geometric_element to Face

Each Constructive_geometric_element refers to zero or one Face in the role of element. Each Face acts as element for zero or more Constructive_geometric_element objects.

NOTE – This assertion is established through constructive_element_select.

4.3.259 Constructive_geometric_element to Oriented_edge_curve

Each Constructive_geometric_element refers to zero or one Oriented_edge_curve in the role of element. Each Oriented_edge_curve acts as element for zero or more Constructive_geometric_element objects.

NOTE – This assertion is established through constructive_element_select.

4.3.260 Constructive_geometric_element to Point

Each Constructive_geometric_element refers to zero or one Point in the role of element. Each Point acts as element for zero or more Constructive_geometric_element objects.

NOTE – This assertion is established through constructive_element_select.

4.3.261 Constructive_geometric_element to Surface

Each Constructive_geometric_element refers to zero or one Surface in the role of element. Each Surface acts as element for zero or more Constructive_geometric_element objects.

NOTE – This assertion is established through constructive_element_select.

4.3.262 Constructive_geometric_element to Vertex_point

Each Constructive_geometric_element refers to zero or one Vertex_point in the role of element. Each Vertex_point acts as element for zero or more Constructive_geometric_element objects.

NOTE – This assertion is established through constructive_element_select.

4.3.263 Constructive_geometry to Constructive_geometric_element

Each Constructive_geometry refers to one or more Constructive_geometric_element objects in the role of element. Each Constructive_geometric_element has geometry defined by one or more Constructive_geometry objects.

4.3.264 Constructive_geometry_association to Constructive_geometry

Each Constructive_geometry_association refers to zero or one Constructive_geometry in the role of base_geometry. Each Constructive_geometry has associated_model defined by one or more Constructive_geometry_association objects.

NOTE – This assertion is established through constructive_geometry_select.

Each Constructive_geometry_association refers to exactly one Constructive_geometry in the role of constructive_geometry. Each Constructive_geometry has associated_model defined by one or more Constructive_geometry_association objects.

4.3.265 Constructive_geometry_association to Geometric_model

Each Constructive_geometry_association refers to zero or one Geometric_model in the role of base_geometry. Each Geometric_model acts as base_geometry for zero or more Constructive_-geometry_association objects.

NOTE – This assertion is established through constructive_geometry_select.

4.3.266 Constructive_geometry_association to Multi_language_string

Each Constructive_geometry_association refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Constructive_-

geometry_association objects.

NOTE – This assertion is established through string_select.

4.3.267 Contact_ratio to Physical_model

Each Contact_ratio refers to exactly one Physical_model in the role of measuring_reference. Each Physical_model acts as measuring_reference for zero or more Contact_ratio objects.

4.3.268 Context_dependent_appearance_assignment to Drawing_sheet

Each Context_dependent_appearance_assignment refers to zero or one Drawing_sheet in the role of appearance_context. Each Drawing_sheet acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE – This assertion is established through appearance_context_select and area_select.

4.3.269 Context_dependent_appearance_assignment to Group

Each Context_dependent_appearance_assignment refers to zero or one Group in the role of appearance_context. Each Group acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE – This assertion is established through appearance_context_select and structuring_method_select.

4.3.270 Context_dependent_appearance_assignment to Layer

Each Context_dependent_appearance_assignment refers to zero or one Layer in the role of appearance_context. Each Layer acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE – This assertion is established through appearance_context_select and structuring_method_select.

4.3.271 Context_dependent_appearance_assignment to Model_image

Each Context_dependent_appearance_assignment refers to zero or one Model_image in the role of appearance_context. Each Model_image acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE – This assertion is established through appearance_context_select.

4.3.272 Context_dependent_appearance_assignment to View

Each Context_dependent_appearance_assignment refers to zero or one View in the role of appearance_context. Each View acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE – This assertion is established through appearance_context_select.

4.3.273 Context_dependent_appearance_assignment to View_area

Each Context_dependent_appearance_assignment refers to zero or one View_area in the role of appearance_context. Each View_area acts as appearance_context for zero or more Context_dependent_appearance_assignment objects.

NOTE – This assertion is established through appearance_context_select and area_select.

4.3.274 Contract to Activity

Each Contract refers to zero or more Activity objects in the role of contracted_element. Each Activity acts as contracted_element for zero or more Contract objects.

NOTE – This assertion is established through contracted_element_select.

4.3.275 Contract to Item_version

Each Contract refers to zero or more Item_version objects in the role of contracted_element. Each Item_version acts as contracted_element for zero or more Contract objects.

NOTE – This assertion is established through contracted_element_select.

4.3.276 Csg_model to B_rep_model

Each Csg_model refers to zero or more B_rep_model objects in the role of tree_root_expression. Each B_rep_model acts as tree_root_expression for zero or more Csg_model objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.277 Csg_model to Boolean_result

Each Csg_model refers to zero or more Boolean_result objects in the role of tree_root_expression. Each Boolean_result acts as tree_root_expression for zero or more Csg_model objects.

NOTE – This assertion is established through csg_select.

4.3.278 Csg_model to Csg_primitive

Each Csg_model refers to zero or more Csg_primitive objects in the role of tree_root_expression. Each Csg_primitive acts as tree_root_expression for zero or more Csg_model objects.

NOTE – This assertion is established through csg_select.

4.3.279 Csg_model to Faceted_b_rep_model

Each Csg_model refers to zero or more Faceted_b_rep_model objects in the role of tree_root_-expression. Each Faceted_b_rep_model acts as tree_root_expression for zero or more Csg_model objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.280 Csg_model to Solid_replica

Each Csg_model refers to zero or more Solid_replica objects in the role of tree_root_expression. Each Solid_replica acts as tree_root_expression for zero or more Csg_model objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.281 Csg_model to Swept_face_solid

Each Csg_model refers to zero or more Swept_face_solid objects in the role of tree_root_expression. Each Swept_face_solid acts as tree_root_expression for zero or more Csg_model objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.282 Curve_set_2d to Curve

Each Curve_set_2d refers to zero or more Curve objects in the role of element. Each Curve acts as element for zero or more Curve_set_2d objects.

NOTE – This assertion is established through point_or_curve_select.

4.3.283 Curve_set_2d to Point

Each Curve_set_2d refers to zero or more Point objects in the role of element. Each Point acts as element for zero or more Curve_set_2d objects.

NOTE – This assertion is established through point_or_curve_select.

4.3.284 Curve_set_3d to Curve

Each Curve_set_3d refers to zero or more Curve objects in the role of element. Each Curve acts as element for zero or more Curve_set_3d objects.

NOTE – This assertion is established through point_or_curve_select.

4.3.285 Curve_set_3d to Point

Each Curve_set_3d refers to zero or more Point objects in the role of element. Each Point acts as element for zero or more Curve_set_3d objects.

NOTE – This assertion is established through point_or_curve_select.

4.3.286 Curved_distance_dimension to Shape_aspect

Each Curved_distance_dimension refers to exactly one Shape_aspect in the role of path. Each Shape_aspect acts as path for zero or more Curved_distance_dimension objects.

4.3.287 Data_environment to Multi_language_string

Each Data_environment refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Data_environment objects.

NOTE – This assertion is established through string_select.

4.3.288 Date_and_person_assignment to Activity

Each Date_and_person_assignment is_applied_to zero or one Activity. Each Activity is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.289 Date_and_person_assignment to Activity_element

Each Date_and_person_assignment is_applied_to zero or one Activity_element. Each Activity_element is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.290 Date_and_person_assignment to Assembly_substitute_relationship

Each Date_and_person_assignment is_applied_to zero or one Assembly_substitute_relationship. Each Assembly_substitute_relationship is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.291 Date_and_person_assignment to Class_category_association

Each Date_and_person_assignment is_applied_to zero or one Class_category_association. Each Class_category_association is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.292 Date_and_person_assignment to Class_condition_association

Each Date_and_person_assignment is_applied_to zero or one Class_condition_association. Each Class_condition_association is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.293 Date_and_person_assignment to Class_function_association

Each Date_and_person_assignment is_applied_to zero or one Class_function_association. Each Class_function_association is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.294 Date_and_person_assignment to Class_inclusion_association

Each Date_and_person_assignment is_applied_to zero or one Class_inclusion_association. Each Class_inclusion_association is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.295 Date_and_person_assignment to Class_specification_association

Each Date_and_person_assignment is_applied_to zero or one Class_specification_association. Each Class_specification_association is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.296 Date_and_person_assignment to Configuration

Each Date_and_person_assignment is_applied_to zero or one Configuration. Each Configuration is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.297 Date_and_person_assignment to Date_and_person_or_organization

Each Date_and_person_assignment refers to exactly one Date_and_person_or_organization in the role of assigned_date_and_person. Each Date_and_person_or_organization acts as assigned_date_-and_person for zero or more Date_and_person_assignment objects.

4.3.298 Date_and_person_assignment to Design_constraint

Each Date_and_person_assignment is_applied_to zero or one Design_constraint. Each Design_-constraint is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_-information_select.

4.3.299 Date_and_person_assignment to Design_discipline_item_definition

Each Date_and_person_assignment is_applied_to zero or one Design_discipline_item_definition. Each Design_discipline_item_definition is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_-select.

4.3.300 Date_and_person_assignment to Drawing

Each Date_and_person_assignment is_applied_to zero or one Drawing. Each Drawing is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.301 Date_and_person_assignment to External_document

Each Date_and_person_assignment is_applied_to zero or one External_document. Each External_-document is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.302 Date_and_person_assignment to Geometric_model

Each Date_and_person_assignment is_applied_to zero or one Geometric_model. Each Geometric_-model is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.303 Date_and_person_assignment to Item

Each Date_and_person_assignment is_applied_to zero or one Item. Each Item is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.304 Date_and_person_assignment to Item_definition_instance_relationship

Each Date_and_person_assignment is_applied_to zero or one Item_definition_instance_relationship. Each Item_definition_instance_relationship is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.305 Date_and_person_assignment to Item_definition_relationship

Each Date_and_person_assignment is_applied_to zero or one Item_definition_relationship. Each Item_definition_relationship is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.306 Date_and_person_assignment to Item_instance

Each Date_and_person_assignment is_applied_to zero or one Item_instance. Each Item_instance is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_select.

4.3.307 Date_and_person_assignment to Item_instance_relationship

Each Date_and_person_assignment is_applied_to zero or one Item_instance_relationship. Each Item_instance_relationship is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.308 Date_and_person_assignment to Item_solution

Each Date_and_person_assignment is_applied_to zero or one Item_solution. Each Item_solution is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.309 Date_and_person_assignment to Item_version

Each Date_and_person_assignment is_applied_to zero or one Item_version. Each Item_version is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.310 Date_and_person_assignment to Material

Each Date_and_person_assignment is_applied_to zero or one Material. Each Material is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.311 Date_and_person_assignment to Physical_instance

Each Date_and_person_assignment is_applied_to zero or one Physical_instance. Each Physical_instance is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.312 Date_and_person_assignment to Physical_instance_usage

Each Date_and_person_assignment is_applied_to zero or one Physical_instance_usage. Each Physical_instance_usage is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.313 Date_and_person_assignment to Process_plan

Each Date_and_person_assignment is_applied_to zero or one Process_plan. Each Process_plan is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.314 Date_and_person_assignment to Product_class

Each Date_and_person_assignment is_applied_to zero or one Product_class. Each Product_class is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.315 Date_and_person_assignment to Product_component

Each Date_and_person_assignment is_applied_to zero or one Product_component. Each Product_component is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.316 Date_and_person_assignment to Product_function

Each Date_and_person_assignment is_applied_to zero or one Product_function. Each Product_function is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.317 Date_and_person_assignment to Product_specification

Each Date_and_person_assignment is_applied_to zero or one Product_specification. Each Product_specification is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.318 Date_and_person_assignment to Project

Each Date_and_person_assignment is_applied_to zero or one Project. Each Project is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.319 Date_and_person_assignment to Property

Each Date_and_person_assignment is_applied_to zero or one Property. Each Property is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.320 Date_and_person_assignment to Simulation_information

Each Date_and_person_assignment is_applied_to zero or one Simulation_information. Each Simulation_information is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.321 Date_and_person_assignment to Specification

Each Date_and_person_assignment is_applied_to zero or one Specification. Each Specification is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.322 Date_and_person_assignment to Specification_category

Each Date_and_person_assignment is_applied_to zero or one Specification_category. Each Specification_category is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.323 Date_and_person_assignment to Specification_expression

Each Date_and_person_assignment is_applied_to zero or one Specification_expression. Each Specification_expression is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.324 Date_and_person_assignment to Specification_inclusion

Each Date_and_person_assignment is_applied_to zero or one Specification_inclusion. Each Specification_inclusion is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.325 Date_and_person_assignment to Styled_model

Each Date_and_person_assignment is_applied_to zero or one Styled_model. Each Styled_model is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.326 Date_and_person_assignment to View_area

Each Date_and_person_assignment is_applied_to zero or one View_area. Each View_area is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.327 Date_and_person_assignment to Work_request

Each Date_and_person_assignment is_applied_to zero or one Work_request. Each Work_request is related to zero or more Date_and_person_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.328 Date_and_person_or_organization to Date_time

Each Date_and_person_or_organization refers to exactly one Date_time in the role of actual_date. Each Date_time acts as actual_date for zero or more Date_and_person_or_organization objects.

4.3.329 Date_and_person_or_organization to Organization

Each Date_and_person_or_organization refers to zero or one Organization in the role of person_or_organization. Each Organization acts as person_or_organization for zero or more Date_and_person_or_organization objects.

NOTE – This assertion is established through person_or_organization_select.

4.3.330 Date_and_person_or_organization to Person

Each Date_and_person_or_organization refers to zero or one Person in the role of person_or_organization. Each Person acts as person_or_organization for zero or more Date_and_person_or_organization objects.

NOTE – This assertion is established through person_or_organization_select.

4.3.331 Date_and_person_or_organization to Person_in_organization

Each Date_and_person_or_organization refers to zero or one Person_in_organization in the role of person_or_organization. Each Person_in_organization acts as person_or_organization for zero or more Date_and_person_or_organization objects.

NOTE – This assertion is established through person_or_organization_select.

4.3.332 Date_time_assignment to Activity

Each Date_time_assignment is_applied_to zero or one Activity. Each Activity is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.333 Date_time_assignment to Activity_element

Each Date_time_assignment is_applied_to zero or one Activity_element. Each Activity_element is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.334 Date_time_assignment to Assembly_substitute_relationship

Each Date_time_assignment is_applied_to zero or one Assembly_substitute_relationship. Each Assembly_substitute_relationship is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.335 Date_time_assignment to Class_category_association

Each Date_time_assignment is_applied_to zero or one Class_category_association. Each Class_category_association is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.336 Date_time_assignment to Class_condition_association

Each Date_time_assignment is_applied_to zero or one Class_condition_association. Each Class_condition_association is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.337 Date_time_assignment to Class_function_association

Each Date_time_assignment is_applied_to zero or one Class_function_association. Each Class_function_association is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.338 Date_time_assignment to Class_inclusion_association

Each Date_time_assignment is_applied_to zero or one Class_inclusion_association. Each Class_inclusion_association is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.339 Date_time_assignment to Class_specification_association

Each Date_time_assignment is_applied_to zero or one Class_specification_association. Each Class_specification_association is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.340 Date_time_assignment to Configuration

Each Date_time_assignment is_applied_to zero or one Configuration. Each Configuration is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.341 Date_time_assignment to Date_time

Each Date_time_assignment refers to exactly one Date_time in the role of assigned_date_time. Each Date_time acts as assigned_date_time for zero or more Date_time_assignment objects.

4.3.342 Date_time_assignment to Design_constraint

Each Date_time_assignment is_applied_to zero or one Design_constraint. Each Design_constraint is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.343 Date_time_assignment to Design_discipline_item_definition

Each Date_time_assignment is_applied_to zero or one Design_discipline_item_definition. Each Design_discipline_item_definition is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_select.

4.3.344 Date_time_assignment to Drawing

Each Date_time_assignment is_applied_to zero or one Drawing. Each Drawing is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.345 Date_time_assignment to External_document

Each Date_time_assignment is_applied_to zero or one External_document. Each External_document is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.346 Date_time_assignment to Geometric_model

Each Date_time_assignment is_applied_to zero or one Geometric_model. Each Geometric_model is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.347 Date_time_assignment to Item

Each Date_time_assignment is_applied_to zero or one Item. Each Item is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.348 Date_time_assignment to Item_definition_instance_relationship

Each Date_time_assignment is_applied_to zero or one Item_definition_instance_relationship. Each Item_definition_instance_relationship is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.349 Date_time_assignment to Item_definition_relationship

Each Date_time_assignment is_applied_to zero or one Item_definition_relationship. Each Item_definition_relationship is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.350 Date_time_assignment to Item_instance

Each Date_time_assignment is_applied_to zero or one Item_instance. Each Item_instance is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_select.

4.3.351 Date_time_assignment to Item_instance_relationship

Each Date_time_assignment is_applied_to zero or one Item_instance_relationship. Each Item_instance_relationship is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.352 Date_time_assignment to Item_solution

Each Date_time_assignment is_applied_to zero or one Item_solution. Each Item_solution is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.353 Date_time_assignment to Item_version

Each Date_time_assignment is_applied_to zero or one Item_version. Each Item_version is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.354 Date_time_assignment to Material

Each Date_time_assignment is_applied_to zero or one Material. Each Material is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.355 Date_time_assignment to Physical_instance

Each Date_time_assignment is_applied_to zero or one Physical_instance. Each Physical_instance is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.356 Date_time_assignment to Physical_instance_usage

Each Date_time_assignment is_applied_to zero or one Physical_instance_usage. Each Physical_instance_usage is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.357 Date_time_assignment to Process_plan

Each Date_time_assignment is_applied_to zero or one Process_plan. Each Process_plan is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.358 Date_time_assignment to Product_class

Each Date_time_assignment is_applied_to zero or one Product_class. Each Product_class is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.359 Date_time_assignment to Product_component

Each Date_time_assignment is_applied_to zero or one Product_component. Each Product_component is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.360 Date_time_assignment to Product_function

Each Date_time_assignment is_applied_to zero or one Product_function. Each Product_function is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.361 Date_time_assignment to Product_specification

Each Date_time_assignment is_applied_to zero or one Product_specification. Each Product_specification is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.362 Date_time_assignment to Project

Each Date_time_assignment is_applied_to zero or one Project. Each Project is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.363 Date_time_assignment to Property

Each Date_time_assignment is_applied_to zero or one Property. Each Property is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.364 Date_time_assignment to Simulation_information

Each Date_time_assignment is_applied_to zero or one Simulation_information. Each Simulation_information is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.365 Date_time_assignment to Specification

Each Date_time_assignment is_applied_to zero or one Specification. Each Specification is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.366 Date_time_assignment to Specification_category

Each Date_time_assignment is_applied_to zero or one Specification_category. Each Specification_category is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.367 Date_time_assignment to Specification_expression

Each Date_time_assignment is_applied_to zero or one Specification_expression. Each Specification_expression is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.368 Date_time_assignment to Specification_inclusion

Each Date_time_assignment is_applied_to zero or one Specification_inclusion. Each Specification_inclusion is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.369 Date_time_assignment to Styled_model

Each Date_time_assignment is_applied_to zero or one Styled_model. Each Styled_model is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.370 Date_time_assignment to View_area

Each Date_time_assignment is_applied_to zero or one View_area. Each View_area is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.371 Date_time_assignment to Work_request

Each Date_time_assignment is_applied_to zero or one Work_request. Each Work_request is related to zero or more Date_time_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.372 Datum_feature to Datum_target_set

Each Datum_feature is_defined_by zero or one Datum_target_set. Each Datum_target_set is related to zero or more Datum_feature objects.

NOTE – This assertion is established through datum_representation_select.

4.3.373 Datum_feature to Derived_geometry

Each Datum_feature is_defined_by zero or one Derived_geometry. Each Derived_geometry is related to zero or more Datum_feature objects.

NOTE – This assertion is established through datum_representation_select.

4.3.374 Datum_feature to Material_condition

Each Datum_feature is_controlled_by zero or one Material_condition. Each Material_condition is related to zero or more Datum_feature objects.

4.3.375 Datum_feature to Shape_aspect

Each Datum_feature is_defined_by zero or one Shape_aspect. Each Shape_aspect is related to zero or more Datum_feature objects.

NOTE – This assertion is established through datum_representation_select.

4.3.376 Datum_target_set to Datum_target

Each Datum_target_set refers to one or more Datum_target objects in the role of target. Each Datum_target acts as target for zero or more Datum_target_set objects.

4.3.377 Datum_target_set to Multi_language_string

Each Datum_target_set refers to zero or one Multi_language_string in the role of rule_description. Each Multi_language_string acts as rule_description for zero or more Datum_target_set objects.

NOTE – This assertion is established through string_select.

4.3.378 Default_chamfer to Feature_parameter

Each Default_chamfer refers to exactly one Feature_parameter in the role of offset_value. Each Feature_parameter acts as offset_value for zero or more Default_chamfer objects.

4.3.379 Default_chamfer to Multi_language_string

Each Default_chamfer refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Default_chamfer objects.

NOTE – This assertion is established through string_select.

4.3.380 Default_draft_angle to Feature_parameter

Each Default_draft_angle refers to exactly one Feature_parameter in the role of draft_angle_value. Each Feature_parameter acts as draft_angle_value for zero or more Default_draft_angle objects.

4.3.381 Default_draft_angle to Multi_language_string

Each Default_draft_angle refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Default_draft_angle objects.

NOTE – This assertion is established through string_select.

4.3.382 Default_edge_round to Feature_parameter

Each Default_edge_round refers to exactly one Feature_parameter in the role of radius_value. Each Feature_parameter acts as radius_value for zero or more Default_edge_round objects.

4.3.383 Default_edge_round to Multi_language_string

Each Default_edge_round refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Default_edge_round objects.

NOTE – This assertion is established through string_select.

4.3.384 Default_fillet to Feature_parameter

Each Default_fillet refers to exactly one Feature_parameter in the role of radius_value. Each Feature_parameter acts as radius_value for zero or more Default_fillet objects.

4.3.385 Default_fillet to Multi_language_string

Each Default_fillet refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Default_fillet objects.

NOTE – This assertion is established through string_select.

4.3.386 Default_roughness to Multi_language_string

Each Default_roughness refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Default_roughness objects.

NOTE – This assertion is established through string_select.

4.3.387 Default_roughness to Value_with_unit

Each Default_roughness refers to exactly one Value_with_unit in the role of max_value. Each Value_with_unit acts as max_value for zero or more Default_roughness objects.

Each Default_roughness refers to zero or one Value_with_unit in the role of min_value. Each Value_with_unit acts as min_value for zero or more Default_roughness objects.

4.3.388 Default_setting_association to Default_chamfer

Each Default_setting_association refers to zero or more Default_chamfer objects in the role of default_value. Each Default_chamfer acts as default_value for zero or more Default_setting_-association objects.

NOTE – This assertion is established through default_setting_select.

4.3.389 Default_setting_association to Default_draft_angle

Each Default_setting_association refers to zero or more Default_draft_angle objects in the role of default_value. Each Default_draft_angle acts as default_value for zero or more Default_setting_-association objects.

NOTE – This assertion is established through default_setting_select.

4.3.390 Default_setting_association to Default_edge_round

Each Default_setting_association refers to zero or more Default_edge_round objects in the role of default_value. Each Default_edge_round acts as default_value for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_setting_select.

4.3.391 Default_setting_association to Default_fillet

Each Default_setting_association refers to zero or more Default_fillet objects in the role of default_value. Each Default_fillet acts as default_value for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_setting_select.

4.3.392 Default_setting_association to Default_roughness

Each Default_setting_association refers to zero or more Default_roughness objects in the role of default_value. Each Default_roughness acts as default_value for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_setting_select.

4.3.393 Default_setting_association to Default_thickness

Each Default_setting_association refers to zero or more Default_thickness objects in the role of default_value. Each Default_thickness acts as default_value for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_setting_select.

4.3.394 Default_setting_association to Digital_document

Each Default_setting_association refers to zero or one Digital_document in the role of default_context. Each Digital_document acts as default_context for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_context_select.

4.3.395 Default_setting_association to Drawing_sheet

Each Default_setting_association refers to zero or one Drawing_sheet in the role of default_context. Each Drawing_sheet acts as default_context for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_context_select and area_select.

4.3.396 Default_setting_association to General_tolerances

Each Default_setting_association refers to zero or more General_tolerances objects in the role of default_value. Each General_tolerances acts as default_value for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_setting_select.

4.3.397 Default_setting_association to Item_shape

Each Default_setting_association refers to zero or one Item_shape in the role of default_context. Each Item_shape acts as default_context for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_context_select.

4.3.398 Default_setting_association to View_area

Each Default_setting_association refers to zero or one View_area in the role of default_context. Each View_area acts as default_context for zero or more Default_setting_association objects.

NOTE – This assertion is established through default_context_select and area_select.

4.3.399 Default_thickness to Multi_language_string

Each Default_thickness refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Default_thickness objects.

NOTE – This assertion is established through string_select.

4.3.400 Default_thickness to Value_with_unit

Each Default_thickness refers to exactly one Value_with_unit in the role of thickness_value. Each Value_with_unit acts as thickness_value for zero or more Default_thickness objects.

4.3.401 Defined_thread to Feature_parameter

Each Defined_thread refers to exactly one Feature_parameter in the role of crest. Each Feature_parameter acts as crest for zero or more Defined_thread objects.

Each Defined_thread refers to exactly one Feature_parameter in the role of density. Each Feature_parameter acts as density for zero or more Defined_thread objects.

Each Defined_thread refers to exactly one Feature_parameter in the role of major_diameter. Each Feature_parameter acts as major_diameter for zero or more Defined_thread objects.

Each Defined_thread refers to exactly one Feature_parameter in the role of minor_diameter. Each Feature_parameter acts as minor_diameter for zero or more Defined_thread objects.

Each Defined_thread refers to exactly one Feature_parameter in the role of pitch_diameter. Each Feature_parameter acts as pitch_diameter for zero or more Defined_thread objects.

4.3.402 Derived_geometry to Constructive_geometric_element

Each Derived_geometry refers to exactly one Constructive_geometric_element in the role of geometry. Each Constructive_geometric_element acts as geometry for zero or more Derived_geometry objects.

4.3.403 Derived_geometry to Shape_aspect

Each Derived_geometry is_derived_from one or more Shape_aspect objects. Each Shape_aspect is related to zero or more Derived_geometry objects.

4.3.404 Descriptive_specification to Multi_language_string

Each Descriptive_specification refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Descriptive_specification objects.

NOTE – This assertion is established through string_select.

4.3.405 Design_constraint to Multi_language_string

Each Design_constraint refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Design_constraint objects.

NOTE – This assertion is established through string_select.

Each Design_constraint refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Design_constraint objects.

NOTE – This assertion is established through string_select.

4.3.406 Design_constraint to Product_class

Each Design_constraint is_valid_for zero or more Product_class objects. Each Product_class is related to zero or more Design_constraint objects.

4.3.407 Design_constraint_association to Design_constraint

Each Design_constraint_association is_based_on exactly one Design_constraint. Each Design_constraint is related to zero or more Design_constraint_association objects.

4.3.408 Design_constraint_association to Item_solution

Each Design_constraint_association is_constraining zero or one Item_solution. Each Item_solution is related to zero or more Design_constraint_association objects.

NOTE – This assertion is established through solution_base_select.

4.3.409 Design_constraint_association to Multi_language_string

Each Design_constraint_association refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Design_constraint_association objects.

NOTE – This assertion is established through string_select.

4.3.410 Design_constraint_association to Product_component

Each Design_constraint_association is_constraining zero or one Product_component. Each Product_component is related to zero or more Design_constraint_association objects.

NOTE – This assertion is established through solution_base_select.

4.3.411 Design_constraint_relationship to Design_constraint

Each Design_constraint_relationship is related to exactly one Design_constraint. Each Design_constraint is referenced by zero or more Design_constraint_relationship objects as related.

NOTE – The related Design_constraint is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Design_constraint_relationship is relating to exactly one Design_constraint. Each Design_constraint is referenced by zero or more Design_constraint_relationship objects as relating.

NOTE – The relating Design_constraint is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.412 Design_constraint_relationship to Multi_language_string

Each Design_constraint_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Design_constraint_relationship objects.

NOTE – This assertion is established through string_select.

4.3.413 Design_discipline_item_definition to Application_context

Each Design_discipline_item_definition is_relevant_for one or more Application_context objects. Each Application_context is related to zero or more Design_discipline_item_definition objects.

4.3.414 Design_discipline_item_definition to Item_version

Each Design_discipline_item_definition refers to exactly one Item_version in the role of associated_item_version. Each Item_version acts as associated_item_version for zero or more Design_discipline_item_definition objects.

4.3.415 Design_discipline_item_definition to Multi_language_string

Each Design_discipline_item_definition refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Design_discipline_item_definition objects.

NOTE – This assertion is established through string_select.

4.3.416 Detailed_element to Multi_language_string

Each Detailed_element refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Detailed_element objects.

NOTE – This assertion is established through string_select.

4.3.417 Diameter_taper to Feature_parameter

Each Diameter_taper refers to exactly one Feature_parameter in the role of final_diameter. Each Feature_parameter acts as final_diameter for zero or more Diameter_taper objects.

4.3.418 Dimension to Annotation_curve

Each Dimension refers to one or more Annotation_curve objects in the role of composition_curve. Each Annotation_curve acts as composition_curve for zero or more Dimension objects.

4.3.419 Dimension to Dimension_callout

Each Dimension refers to exactly one Dimension_callout in the role of primary_callout. Each Dimension_callout acts as primary_callout for zero or more Dimension objects.

Each Dimension refers to zero or one Dimension_callout in the role of secondary_callout. Each Dimension_callout acts as secondary_callout for zero or more Dimension objects.

4.3.420 Dimension_callout to Geometric_dimension

Each Dimension_callout is_displaying exactly one Geometric_dimension. Each Geometric_dimension is related to zero or more Dimension_callout objects.

4.3.421 Dimension_curve to Annotation_symbol

Each Dimension_curve refers to zero, one, or two Annotation_symbol objects in the role of terminator. Each Annotation_symbol acts as terminator for zero or more Dimension_curve objects.

4.3.422 Dimension_sequence_pair to Dimension

Each Dimension_sequence_pair refers to exactly one Dimension in the role of predecessor. Each Dimension acts as predecessor for zero or more Dimension_sequence_pair objects.

Each Dimension_sequence_pair refers to exactly one Dimension in the role of successor. Each Dimension acts as successor for zero or more Dimension_sequence_pair objects.

4.3.423 Dimension_tolerance to Feature_parameter

Each Dimension_tolerance is_tolerancing zero or one Feature_parameter. Each Feature_parameter is related to zero or more Dimension_tolerance objects.

NOTE – This assertion is established through toleranced_value_select.

4.3.424 Dimension_tolerance to Geometric_dimension

Each Dimension_tolerance is_tolerancing zero or one Geometric_dimension. Each Geometric_dimension is related to zero or more Dimension_tolerance objects.

NOTE – This assertion is established through toleranced_value_select.

4.3.425 Dimension_tolerance to Limits_and_fits

Each Dimension_tolerance is_defined_by zero or one Limits_and_fits. Each Limits_and_fits is related to zero or more Dimension_tolerance objects.

NOTE – This assertion is established through tolerance_definition_select.

4.3.426 Dimension_tolerance to Multi_language_string

Each Dimension_tolerance refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Dimension_tolerance objects.

NOTE – This assertion is established through string_select.

4.3.427 Dimension_tolerance to Plus_minus_tolerance

Each Dimension_tolerance is_defined_by zero or one Plus_minus_tolerance. Each Plus_minus_tolerance is related to zero or more Dimension_tolerance objects.

NOTE – This assertion is established through tolerance_definition_select.

4.3.428 Dimension_tolerance to Value_limit

Each Dimension_tolerance is_defined_by zero or one Value_limit. Each Value_limit is related to zero or more Dimension_tolerance objects.

NOTE – This assertion is established through tolerance_definition_select.

4.3.429 Dimension_tolerance to Value_range

Each Dimension_tolerance is_defined_by zero or one Value_range. Each Value_range is related to zero or more Dimension_tolerance objects.

NOTE – This assertion is established through tolerance_definition_select.

4.3.430 Directed_taper to Feature_parameter

Each Directed_taper refers to exactly one Feature_parameter in the role of draft_angle. Each Feature_parameter acts as draft_angle for zero or more Directed_taper objects.

4.3.431 Document_relationship to External_document

Each Document_relationship is related to exactly one External_document. Each External_document is referenced by zero or more Document_relationship objects as related.

NOTE – The related External_document is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Document_relationship is relating to exactly one External_document. Each External_document is referenced by zero or more Document_relationship objects as relating.

NOTE – The relating External_document is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.432 Document_relationship to Multi_language_string

Each Document_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Document_relationship objects.

NOTE – This assertion is established through string_select.

4.3.433 Document_type to Classification_system

Each Document_type refers to zero or one Classification_system in the role of used_classification_system. Each Classification_system acts as used_classification_system for zero or more Document_type objects.

4.3.434 Drawing to Document_type

Each Drawing refers to zero or more Document_type objects in the role of drawing_type. Each Document_type acts as drawing_type for zero or more Drawing objects.

4.3.435 Drawing to Multi_language_string

Each Drawing refers to zero or one Multi_language_string in the role of title. Each Multi_language_string acts as title for zero or more Drawing objects.

NOTE – This assertion is established through string_select.

4.3.436 Drawing_assignment to Class_function_association

Each Drawing_assignment is_describing zero or one Class_function_association. Each Class_function_association is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.437 Drawing_assignment to Design_constraint

Each Drawing_assignment is_describing zero or one Design_constraint. Each Design_constraint is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.438 Drawing_assignment to Design_discipline_item_definition

Each Drawing_assignment is_describing zero or one Design_discipline_item_definition. Each Design_discipline_item_definition is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and item_information_select.

4.3.439 Drawing_assignment to Drawing

Each Drawing_assignment refers to exactly one Drawing in the role of drawing. Each Drawing acts as drawing for zero or more Drawing_assignment objects.

4.3.440 Drawing_assignment to Item_definition_instance_relationship

Each Drawing_assignment is_describing zero or one Item_definition_instance_relationship. Each Item_definition_instance_relationship is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select, item_information_select, and item_relationship_select.

4.3.441 Drawing_assignment to Item_definition_relationship

Each Drawing_assignment is_describing zero or one Item_definition_relationship. Each Item_definition_relationship is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select, item_information_select, and item_relationship_select.

4.3.442 Drawing_assignment to Item_instance

Each Drawing_assignment is_describing zero or one Item_instance. Each Item_instance is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and item_information_select.

4.3.443 Drawing_assignment to Item_instance_relationship

Each Drawing_assignment is_describing zero or one Item_instance_relationship. Each Item_instance_relationship is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select, item_information_select, and item_relationship_select.

4.3.444 Drawing_assignment to Item_solution

Each Drawing_assignment is_describing zero or one Item_solution. Each Item_solution is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.445 Drawing_assignment to Process_operation

Each Drawing_assignment is_describing zero or one Process_operation. Each Process_operation is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and process_information_select.

4.3.446 Drawing_assignment to Process_plan

Each Drawing_assignment is_describing zero or one Process_plan. Each Process_plan is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and process_information_select.

4.3.447 Drawing_assignment to Product_class

Each Drawing_assignment is_describing zero or one Product_class. Each Product_class is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.448 Drawing_assignment to Product_component

Each Drawing_assignment is_describing zero or one Product_component. Each Product_component is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.449 Drawing_assignment to Product_function

Each Drawing_assignment is_describing zero or one Product_function. Each Product_function is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.450 Drawing_assignment to Specification

Each Drawing_assignment is_describing zero or one Specification. Each Specification is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.451 Drawing_assignment to Specification_category

Each Drawing_assignment is_describing zero or one Specification_category. Each Specification_category is related to zero or more Drawing_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.452 Drawing_sequence to Drawing

Each Drawing_sequence refers to exactly one Drawing in the role of predecessor. Each Drawing acts as predecessor for zero or more Drawing_sequence objects.

Each Drawing_sequence refers to exactly one Drawing in the role of successor. Each Drawing acts as successor for zero or more Drawing_sequence objects.

4.3.453 Drawing_sheet to Cartesian_coordinate_space_2d

Each Drawing_sheet refers to exactly one Cartesian_coordinate_space_2d in the role of sheet_space. Each Cartesian_coordinate_space_2d acts as sheet_space for zero or more Drawing_sheet objects.

4.3.454 Drawing_sheet to Drawing

Each Drawing_sheet refers to exactly one Drawing in the role of associated_drawing. Each Drawing acts as associated_drawing for zero or more Drawing_sheet objects.

4.3.455 Drawing_sheet to Multi_language_string

Each Drawing_sheet refers to zero or one Multi_language_string in the role of title. Each Multi_language_string acts as title for zero or more Drawing_sheet objects.

NOTE – This assertion is established through string_select.

4.3.456 Edge_loop to Oriented_edge_curve

Each Edge_loop refers to one or more Oriented_edge_curve objects in the role of edge. Each Oriented_edge_curve acts as edge for zero or more Edge_loop objects.

4.3.457 Edge_transition to Oriented_edge_curve

Each Edge_transition refers to exactly one Oriented_edge_curve in the role of edge_1. Each Oriented_edge_curve acts as edge_1 for zero or more Edge_transition objects.

Each Edge_transition refers to exactly one Oriented_edge_curve in the role of edge_2. Each Oriented_edge_curve acts as edge_2 for zero or more Edge_transition objects.

4.3.458 Edge_transition to Vertex_point

Each Edge_transition refers to exactly one Vertex_point in the role of vertex_joint. Each Vertex_point acts as vertex_joint for zero or more Edge_transition objects.

4.3.459 Effectivity to Assembly_substitute_relationship

Each Effectivity is_applied_to zero or more Assembly_substitute_relationship objects. Each Assembly_substitute_relationship is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.460 Effectivity to Class_category_association

Each Effectivity is_applied_to zero or more Class_category_association objects. Each Class_category_association is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.461 Effectivity to Class_condition_association

Each Effectivity is_applied_to zero or more Class_condition_association objects. Each Class_condition_association is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.462 Effectivity to Class_function_association

Each Effectivity is_applied_to zero or more Class_function_association objects. Each Class_function_association is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.463 Effectivity to Class_inclusion_association

Each Effectivity is_applied_to zero or more Class_inclusion_association objects. Each Class_inclusion_association is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.464 Effectivity to Class_specification_association

Each Effectivity is_applied_to zero or more Class_specification_association objects. Each Class_specification_association is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.465 Effectivity to Date_time

Each Effectivity refers to zero or one Date_time in the role of end_definition. Each Date_time acts as end_definition for zero or more Effectivity objects.

NOTE – This assertion is established through period_or_date_select.

Each Effectivity refers to zero or one Date_time in the role of start_definition. Each Date_time acts as start_definition for zero or more Effectivity objects.

NOTE – This assertion is established through event_or_date_select.

4.3.466 Effectivity to Dated_configuration

Each Effectivity is_applied_to zero or more Dated_configuration objects. Each Dated_configuration is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select.

4.3.467 Effectivity to Design_constraint

Each Effectivity is_applied_to zero or more Design_constraint objects. Each Design_constraint is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.468 Effectivity to Drawing

Each Effectivity is_applied_to zero or more Drawing objects. Each Drawing is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.469 Effectivity to Event_reference

Each Effectivity refers to zero or one Event_reference in the role of end_definition. Each Event_reference acts as end_definition for zero or more Effectivity objects.

NOTE – This assertion is established through period_or_date_select.

Each Effectivity refers to zero or one Event_reference in the role of start_definition. Each Event_reference acts as start_definition for zero or more Effectivity objects.

NOTE – This assertion is established through event_or_date_select.

4.3.470 Effectivity to External_document

Each Effectivity is_applied_to zero or more External_document objects. Each External_document is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.471 Effectivity to Geometric_model

Each Effectivity is_applied_to zero or more Geometric_model objects. Each Geometric_model is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and model_select.

4.3.472 Effectivity to Item

Each Effectivity is_applied_to zero or more Item objects. Each Item is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.473 Effectivity to Item_definition_instance_relationship

Each Effectivity is_applied_to zero or more Item_definition_instance_relationship objects. Each Item_definition_instance_relationship is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and item_relationship_select.

4.3.474 Effectivity to Item_definition_relationship

Each Effectivity is_applied_to zero or more Item_definition_relationship objects. Each Item_definition_relationship is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and item_relationship_select.

4.3.475 Effectivity to Item_instance

Each Effectivity is_applied_to zero or more Item_instance objects. Each Item_instance is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.476 Effectivity to Item_instance_relationship

Each Effectivity is_applied_to zero or more Item_instance_relationship objects. Each Item_instance_relationship is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and item_relationship_select.

4.3.477 Effectivity to Item_solution

Each Effectivity is_applied_to zero or more Item_solution objects. Each Item_solution is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.478 Effectivity to Item_version

Each Effectivity is_applied_to zero or more Item_version objects. Each Item_version is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.479 Effectivity to Material

Each Effectivity is_applied_to zero or more Material objects. Each Material is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.480 Effectivity to Multi_language_string

Each Effectivity refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Effectivity objects.

NOTE – This assertion is established through string_select.

4.3.481 Effectivity to Organization

Each Effectivity refers to zero or one Organization in the role of concerned_organization. Each Organization acts as concerned_organization for zero or more Effectivity objects.

4.3.482 Effectivity to Process_plan

Each Effectivity is_applied_to zero or more Process_plan objects. Each Process_plan is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_-select.

4.3.483 Effectivity to Product_class

Each Effectivity is_applied_to zero or more Product_class objects. Each Product_class is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.484 Effectivity to Product_component

Each Effectivity is_applied_to zero or more Product_component objects. Each Product_component is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.485 Effectivity to Product_function

Each Effectivity is_applied_to zero or more Product_function objects. Each Product_function is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.486 Effectivity to Product_specification

Each Effectivity is_applied_to zero or more Product_specification objects. Each Product_specification is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_-select.

4.3.487 Effectivity to Property

Each Effectivity is_applied_to zero or more Property objects. Each Property is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_select.

4.3.488 Effectivity to Security_classification

Each Effectivity is_applied_to zero or more Security_classification objects. Each Security_classification is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select.

4.3.489 Effectivity to Simulation_information

Each Effectivity is_applied_to zero or more Simulation_information objects. Each Simulation_information is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and model_select.

4.3.490 Effectivity to Specification

Each Effectivity is_applied_to zero or more Specification objects. Each Specification is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.491 Effectivity to Specification_category

Each Effectivity is_applied_to zero or more Specification_category objects. Each Specification_category is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.492 Effectivity to Specification_expression

Each Effectivity is_applied_to zero or more Specification_expression objects. Each Specification_expression is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.493 Effectivity to Specification_inclusion

Each Effectivity is_applied_to zero or more Specification_inclusion objects. Each Specification_inclusion is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_select, and configuration_information_select.

4.3.494 Effectivity to Styled_model

Each Effectivity is_applied_to zero or more Styled_model objects. Each Styled_model is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select, activity_element_and_effectivity_-select, and model_select.

4.3.495 Effectivity to Value_with_unit

Each Effectivity refers to zero or one Value_with_unit in the role of end_definition. Each Value_-with_unit acts as end_definition for zero or more Effectivity objects.

NOTE – This assertion is established through period_or_date_select.

4.3.496 Effectivity to View_area

Each Effectivity is_applied_to zero or more View_area objects. Each View_area is related to zero or more Effectivity objects.

NOTE – This assertion is established through effectivity_select and activity_element_and_effectivity_-select.

4.3.497 Effectivity_relationship to Effectivity

Each Effectivity_relationship is related to exactly one Effectivity. Each Effectivity is referenced by zero or more Effectivity_relationship objects as related.

NOTE – The related Effectivity is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Effectivity_relationship is relating to exactly one Effectivity. Each Effectivity is referenced by zero or more Effectivity_relationship objects as relating.

NOTE – The relating Effectivity is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.498 Effectivity_relationship to Multi_language_string

Each Effectivity_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Effectivity_relationship objects.

NOTE – This assertion is established through string_select.

4.3.499 Element_delivery to Activity_element

Each Element_delivery refers to exactly one Activity_element in the role of deliverable_element. Each Activity_element acts as deliverable_element for zero or more Element_delivery objects.

4.3.500 Element_delivery to Organization

Each Element_delivery refers to exactly one Organization in the role of destination. Each Organization acts as destination for zero or more Element_delivery objects.

4.3.501 Element_delivery to Value_with_unit

Each Element_delivery refers to exactly one Value_with_unit in the role of quantity. Each Value_with_unit acts as quantity for zero or more Element_delivery objects.

4.3.502 Event_reference to Activity

Each Event_reference refers to zero or one Activity in the role of event_context. Each Activity acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.503 Event_reference to Activity_element

Each Event_reference refers to zero or one Activity_element in the role of event_context. Each Activity_element acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.504 Event_reference to Assembly_substitute_relationship

Each Event_reference refers to zero or one Assembly_substitute_relationship in the role of event_context. Each Assembly_substitute_relationship acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.505 Event_reference to Class_category_association

Each Event_reference refers to zero or one Class_category_association in the role of event_context. Each Class_category_association acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.506 Event_reference to Class_condition_association

Each Event_reference refers to zero or one Class_condition_association in the role of event_context. Each Class_condition_association acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.507 Event_reference to Class_function_association

Each Event_reference refers to zero or one Class_function_association in the role of event_context. Each Class_function_association acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.508 Event_reference to Class_inclusion_association

Each Event_reference refers to zero or one Class_inclusion_association in the role of event_context. Each Class_inclusion_association acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.509 Event_reference to Class_specification_association

Each Event_reference refers to zero or one Class_specification_association in the role of event_context. Each Class_specification_association acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.510 Event_reference to Configuration

Each Event_reference refers to zero or one Configuration in the role of event_context. Each Configuration acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.511 Event_reference to Design_constraint

Each Event_reference refers to zero or one Design_constraint in the role of event_context. Each Design_constraint acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.512 Event_reference to Design_discipline_item_definition

Each Event_reference refers to zero or one Design_discipline_item_definition in the role of event_context. Each Design_discipline_item_definition acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_select.

4.3.513 Event_reference to Drawing

Each Event_reference refers to zero or one Drawing in the role of event_context. Each Drawing acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.514 Event_reference to External_document

Each Event_reference refers to zero or one External_document in the role of event_context. Each External_document acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.515 Event_reference to Geometric_model

Each Event_reference refers to zero or one Geometric_model in the role of event_context. Each Geometric_model acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.516 Event_reference to Item

Each Event_reference refers to zero or one Item in the role of event_context. Each Item acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.517 Event_reference to Item_definition_instance_relationship

Each Event_reference refers to zero or one Item_definition_instance_relationship in the role of event_context. Each Item_definition_instance_relationship acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.518 Event_reference to Item_definition_relationship

Each Event_reference refers to zero or one Item_definition_relationship in the role of event_context. Each Item_definition_relationship acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.519 Event_reference to Item_instance

Each Event_reference refers to zero or one Item_instance in the role of event_context. Each Item_instance acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_-select.

4.3.520 Event_reference to Item_instance_relationship

Each Event_reference refers to zero or one Item_instance_relationship in the role of event_context. Each Item_instance_relationship acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_-select, and item_relationship_select.

4.3.521 Event_reference to Item_solution

Each Event_reference refers to zero or one Item_solution in the role of event_context. Each Item_solution acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_-information_select.

4.3.522 Event_reference to Item_version

Each Event_reference refers to zero or one Item_version in the role of event_context. Each Item_-version acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.523 Event_reference to Material

Each Event_reference refers to zero or one Material in the role of event_context. Each Material acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.524 Event_reference to Physical_instance

Each Event_reference refers to zero or one Physical_instance in the role of event_context. Each Physical_instance acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.525 Event_reference to Physical_instance_usage

Each Event_reference refers to zero or one Physical_instance_usage in the role of event_context. Each Physical_instance_usage acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.526 Event_reference to Process_plan

Each Event_reference refers to zero or one Process_plan in the role of event_context. Each Process_plan acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.527 Event_reference to Product_class

Each Event_reference refers to zero or one Product_class in the role of event_context. Each Product_class acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.528 Event_reference to Product_component

Each Event_reference refers to zero or one Product_component in the role of event_context. Each Product_component acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.529 Event_reference to Product_function

Each Event_reference refers to zero or one Product_function in the role of event_context. Each Product_function acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.530 Event_reference to Product_specification

Each Event_reference refers to zero or one Product_specification in the role of event_context. Each Product_specification acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.531 Event_reference to Project

Each Event_reference refers to zero or one Project in the role of event_context. Each Project acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.532 Event_reference to Property

Each Event_reference refers to zero or one Property in the role of event_context. Each Property acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.533 Event_reference to Simulation_information

Each Event_reference refers to zero or one Simulation_information in the role of event_context. Each Simulation_information acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.534 Event_reference to Specification

Each Event_reference refers to zero or one Specification in the role of event_context. Each Specification acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.535 Event_reference to Specification_category

Each Event_reference refers to zero or one Specification_category in the role of event_context. Each Specification_category acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.536 Event_reference to Specification_expression

Each Event_reference refers to zero or one Specification_expression in the role of event_context. Each Specification_expression acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.537 Event_reference to Specification_inclusion

Each Event_reference refers to zero or one Specification_inclusion in the role of event_context. Each Specification_inclusion acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.538 Event_reference to Styled_model

Each Event_reference refers to zero or one Styled_model in the role of event_context. Each Styled_model acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.539 Event_reference to Value_with_unit

Each Event_reference refers to zero or one Value_with_unit in the role of offset. Each Value_with_unit acts as offset for zero or more Event_reference objects.

4.3.540 Event_reference to View_area

Each Event_reference refers to zero or one View_area in the role of event_context. Each View_area acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.541 Event_reference to Work_request

Each Event_reference refers to zero or one Work_request in the role of event_context. Each Work_request acts as event_context for zero or more Event_reference objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.542 Exclusive_process_operation to Process_operation

Each Exclusive_process_operation refers to two or more Process_operation objects in the role of element. Each Process_operation acts as element for zero or more Exclusive_process_operation objects.

4.3.543 External_document to Document_type

Each External_document refers to zero or one Document_type in the role of document_type. Each Document_type acts as document_type for zero or more External_document objects.

4.3.544 External_document to Multi_language_string

Each External_document refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more External_document objects.

NOTE – This assertion is established through string_select.

Each External_document refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more External_document objects.

NOTE – This assertion is established through string_select.

4.3.545 External_document_assignment to Activity

Each External_document_assignment is_assigned_to zero or one Activity. Each Activity is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.546 External_document_assignment to Approval

Each External_document_assignment is_assigned_to zero or one Approval. Each Approval is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.547 External_document_assignment to Change

Each External_document_assignment is_assigned_to zero or one Change. Each Change is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.548 External_document_assignment to Class_function_association

Each External_document_assignment is_assigned_to zero or one Class_function_association. Each Class_function_association is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.549 External_document_assignment to Contract

Each External_document_assignment is_assigned_to zero or one Contract. Each Contract is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.550 External_document_assignment to Design_constraint

Each External_document_assignment is_assigned_to zero or one Design_constraint. Each Design_constraint is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.551 External_document_assignment to Design_discipline_item_definition

Each External_document_assignment is_assigned_to zero or one Design_discipline_item_definition. Each Design_discipline_item_definition is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and item_information_select.

4.3.552 External_document_assignment to Drawing_sheet

Each External_document_assignment is_assigned_to zero or one Drawing_sheet. Each Drawing_sheet is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select and area_select.

4.3.553 External_document_assignment to External_document

Each External_document_assignment refers to exactly one External_document in the role of assigned_document. Each External_document acts as assigned_document for zero or more External_document_assignment objects.

4.3.554 External_document_assignment to Item_classification

Each External_document_assignment is_assigned_to zero or one Item_classification. Each Item_classification is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.555 External_document_assignment to Item_definition_instance_relationship

Each External_document_assignment is_assigned_to zero or one Item_definition_instance_relationship. Each Item_definition_instance_relationship is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, item_information_select, and item_relationship_select.

4.3.556 External_document_assignment to Item_definition_relationship

Each External_document_assignment is_assigned_to zero or one Item_definition_relationship. Each Item_definition_relationship is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, item_information_select, and item_relationship_select.

4.3.557 External_document_assignment to Item_instance

Each External_document_assignment is_assigned_to zero or one Item_instance. Each Item_instance is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and item_information_select.

4.3.558 External_document_assignment to Item_instance_relationship

Each External_document_assignment is_assigned_to zero or one Item_instance_relationship. Each Item_instance_relationship is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, item_information_select, and item_relationship_select.

4.3.559 External_document_assignment to Item_solution

Each External_document_assignment is_assigned_to zero or one Item_solution. Each Item_solution is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.560 External_document_assignment to Material

Each External_document_assignment is_assigned_to zero or one Material. Each Material is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.561 External_document_assignment to Physical_instance

Each External_document_assignment is_assigned_to zero or one Physical_instance. Each Physical_instance is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.562 External_document_assignment to Physical_instance_usage

Each External_document_assignment is_assigned_to zero or one Physical_instance_usage. Each Physical_instance_usage is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.563 External_document_assignment to Process_operation

Each External_document_assignment is_assigned_to zero or one Process_operation. Each Process_operation is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and process_information_select.

4.3.564 External_document_assignment to Process_operation_resource

Each External_document_assignment is_assigned_to zero or one Process_operation_resource. Each Process_operation_resource is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.565 External_document_assignment to Process_plan

Each External_document_assignment is_assigned_to zero or one Process_plan. Each Process_plan is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and process_information_select.

4.3.566 External_document_assignment to Product_class

Each External_document_assignment is_assigned_to zero or one Product_class. Each Product_class is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.567 External_document_assignment to Product_component

Each External_document_assignment is_assigned_to zero or one Product_component. Each Product_component is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.568 External_document_assignment to Product_function

Each External_document_assignment is_assigned_to zero or one Product_function. Each Product_function is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.569 External_document_assignment to Product_specification

Each External_document_assignment is_assigned_to zero or one Product_specification. Each Product_specification is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.570 External_document_assignment to Project

Each External_document_assignment is_assigned_to zero or one Project. Each Project is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.571 External_document_assignment to Property

Each External_document_assignment is_assigned_to zero or one Property. Each Property is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.572 External_document_assignment to Retention_period

Each External_document_assignment is_assigned_to zero or one Retention_period. Each Retention_period is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.573 External_document_assignment to Specification

Each External_document_assignment is_assigned_to zero or one Specification. Each Specification is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.574 External_document_assignment to Specification_category

Each External_document_assignment is_assigned_to zero or one Specification_category. Each Specification_category is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select, general_select, and specification_information_select.

4.3.575 External_document_assignment to Surface_condition

Each External_document_assignment is_assigned_to zero or one Surface_condition. Each Surface_condition is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.576 External_document_assignment to View_area

Each External_document_assignment is_assigned_to zero or one View_area. Each View_area is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select and area_select.

4.3.577 External_document_assignment to Work_order

Each External_document_assignment is_assigned_to zero or one Work_order. Each Work_order is related to zero or more External_document_assignment objects.

NOTE – This assertion is established through external_document_select.

4.3.578 External_model to Cartesian_coordinate_space

Each External_model is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more External_model objects.

4.3.579 External_model to Digital_document

Each External_model is_defined_as exactly one Digital_document. Each Digital_document has associated_model_space defined by zero or one External_model.

4.3.580 External_model to Multi_language_string

Each External_model refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more External_model objects.

NOTE – This assertion is established through string_select.

4.3.581 Face to Face_bound

Each Face refers to one or more Face_bound objects in the role of bound. Each Face_bound acts as bound for zero or more Face objects.

4.3.582 Face to Surface

Each Face refers to exactly one Surface in the role of face_geometry. Each Surface acts as face_geometry for zero or more Face objects.

4.3.583 Face_bound to Edge_loop

Each Face_bound refers to zero or one Edge_loop in the role of loop. Each Edge_loop acts as loop for zero or more Face_bound objects.

NOTE – This assertion is established through loop_select.

4.3.584 Face_bound to Vertex_loop

Each Face_bound refers to zero or one Vertex_loop in the role of loop. Each Vertex_loop acts as loop for zero or more Face_bound objects.

NOTE – This assertion is established through loop_select.

4.3.585 Face_transition to Face

Each Face_transition refers to exactly one Face in the role of face_1. Each Face acts as face_1 for zero or more Face_transition objects.

Each Face_transition refers to exactly one Face in the role of face_2. Each Face acts as face_2 for zero or more Face_transition objects.

4.3.586 Face_transition to Oriented_edge_curve

Each Face_transition refers to exactly one Oriented_edge_curve in the role of edge_joint. Each Oriented_edge_curve acts as edge_joint for zero or more Face_transition objects.

4.3.587 Faceted_b_rep to Faceted_closed_shell

Each Faceted_b_rep refers to exactly one Faceted_closed_shell in the role of outer. Each Faceted_closed_shell acts as outer for zero or more Faceted_b_rep objects.

Each Faceted_b_rep refers to zero or more Faceted_closed_shell objects in the role of void. Each Faceted_closed_shell acts as void for zero or more Faceted_b_rep objects.

4.3.588 Faceted_b_rep_model to Faceted_b_rep

Each Faceted_b_rep_model refers to zero or more Faceted_b_rep objects in the role of element. Each Faceted_b_rep acts as element for zero or more Faceted_b_rep_model objects.

4.3.589 Faceted_closed_shell to Faceted_face

Each Faceted_closed_shell refers to four or more Faceted_face objects in the role of shell_boundary. Each Faceted_face acts as shell_boundary for zero or more Faceted_closed_shell objects.

4.3.590 Faceted_face to Plane

Each Faceted_face refers to exactly one Plane in the role of face_geometry. Each Plane acts as face_geometry for zero or more Faceted_face objects.

4.3.591 Faceted_face to Poly_loop

Each Faceted_face refers to one or more Poly_loop objects in the role of bound. Each Poly_loop is_bound_for exactly one Faceted_face.

4.3.592 Feature_definition to Axis_placement

Each Feature_definition refers to zero or one Axis_placement in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more Feature_definition objects.

4.3.593 Feature_definition to Cartesian_coordinate_space_3d

Each Feature_definition is_defined_in exactly one Cartesian_coordinate_space_3d. Each Cartesian_coordinate_space_3d is related to zero or more Feature_definition objects.

4.3.594 Feature_occurrence to Multi_language_string

Each Feature_occurrence refers to zero or one Multi_language_string in the role of feature_function. Each Multi_language_string acts as feature_function for zero or more Feature_occurrence objects.

NOTE – This assertion is established through string_select.

4.3.595 Feature_parameter to Value_with_unit

Each Feature_parameter refers to exactly one Value_with_unit in the role of specified_value. Each Value_with_unit acts as specified_value for zero or more Feature_parameter objects.

4.3.596 Feature_placement to Geometric_model

Each Feature_placement refers to zero or one Geometric_model in the role of placement_reference. Each Geometric_model acts as placement_reference for zero or more Feature_placement objects.

NOTE – This assertion is established through placement_reference_select.

4.3.597 Feature_placement to Placed_feature

Each Feature_placement refers to zero or one Placed_feature in the role of placement_reference. Each Placed_feature acts as placement_reference for zero or more Feature_placement objects.

NOTE – This assertion is established through placement_reference_select.

4.3.598 Feature_placement to Transformation

Each Feature_placement refers to exactly one Transformation in the role of transformation. Each Transformation acts as transformation for zero or more Feature_placement objects.

4.3.599 Featured_shape to Item_shape

Each Featured_shape refers to exactly one Item_shape in the role of base_shape. Each Item_shape acts as base_shape for zero or more Featured_shape objects.

4.3.600 Fill_area to Annotation_curve

Each Fill_area refers to one or more Annotation_curve objects in the role of boundary. Each Annotation_curve acts as boundary for zero or more Fill_area objects.

4.3.601 Final_item_solution to Descriptive_specification

Each Final_item_solution refers to zero or more Descriptive_specification objects in the role of final_specification. Each Descriptive_specification acts as final_specification for zero or more Final_item_solution objects.

NOTE – This assertion is established through final_specification_select.

4.3.602 Final_item_solution to Design_discipline_item_definition

Each Final_item_solution refers to zero or more Design_discipline_item_definition objects in the role of final_specification. Each Design_discipline_item_definition acts as final_specification for zero or more Final_item_solution objects.

NOTE – This assertion is established through final_specification_select.

4.3.603 Flat_slot_end_type to Feature_parameter

Each Flat_slot_end_type refers to exactly one Feature_parameter in the role of first_radius. Each Feature_parameter acts as first_radius for zero or more Flat_slot_end_type objects.

Each Flat_slot_end_type refers to exactly one Feature_parameter in the role of second_radius. Each Feature_parameter acts as second_radius for zero or more Flat_slot_end_type objects.

4.3.604 Flat_with_chamfer_bottom to Chamfer_definition

Each Flat_with_chamfer_bottom refers to exactly one Chamfer_definition in the role of chamfer. Each Chamfer_definition acts as chamfer for zero or more Flat_with_chamfer_bottom objects.

4.3.605 Flat_with_radius_bottom to Feature_parameter

Each Flat_with_radius_bottom refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Flat_with_radius_bottom objects.

4.3.606 Form_feature_in_panel to Angle_specification

Each Form_feature_in_panel refers to zero or one Angle_specification in the role of base_boundary_defined_by. Each Angle_specification acts as base_boundary_defined_by for zero or more Form_feature_in_panel objects.

NOTE – This assertion is established through profile_or_angle_select.

Each Form_feature_in_panel refers to zero or one Angle_specification in the role of target_boundary_defined_by. Each Angle_specification acts as target_boundary_defined_by for zero or more Form_feature_in_panel objects.

NOTE – This assertion is established through profile_or_angle_select.

4.3.607 Form_feature_in_panel to Closed_profile_usage

Each Form_feature_in_panel refers to zero or one Closed_profile_usage in the role of base_boundary_defined_by. Each Closed_profile_usage acts as base_boundary_defined_by for zero or more Form_feature_in_panel objects.

NOTE – This assertion is established through profile_or_angle_select.

Each Form_feature_in_panel refers to zero or one Closed_profile_usage in the role of target_boundary_defined_by. Each Closed_profile_usage acts as target_boundary_defined_by for zero or more Form_feature_in_panel objects.

NOTE – This assertion is established through profile_or_angle_select.

4.3.608 Form_feature_in_panel to Feature_parameter

Each Form_feature_in_panel refers to exactly one Feature_parameter in the role of base_fillet_radius. Each Feature_parameter acts as base_fillet_radius for zero or more Form_feature_in_panel objects.

Each Form_feature_in_panel refers to exactly one Feature_parameter in the role of target_fillet_radius. Each Feature_parameter acts as target_fillet_radius for zero or more Form_feature_in_panel objects.

4.3.609 Form_feature_in_panel to Shell

Each Form_feature_in_panel refers to zero or one Shell in the role of target_face. Each Shell acts as target_face for zero or more Form_feature_in_panel objects.

NOTE – This assertion is established through general_end_select.

4.3.610 Form_feature_in_panel to Surface

Each Form_feature_in_panel refers to zero or one Surface in the role of target_face. Each Surface acts as target_face for zero or more Form_feature_in_panel objects.

NOTE – This assertion is established through general_end_select.

4.3.611 Function_component_association to Product_component

Each Function_component_association refers to exactly one Product_component in the role of product_component. Each Product_component acts as product_component for zero or more Function_component_association objects.

4.3.612 Function_component_association to Product_function

Each Function_component_association refers to exactly one Product_function in the role of product_function. Each Product_function acts as product_function for zero or more Function_-

component_association objects.

4.3.613 General_boss to General_closed_profile

Each General_boss refers to exactly one General_closed_profile in the role of boundary. Each General_closed_profile acts as boundary for zero or more General_boss objects.

4.3.614 General_bottom_condition to Feature_parameter

Each General_bottom_condition refers to zero or one Feature_parameter in the role of floor_radius. Each Feature_parameter acts as floor_radius for zero or more General_bottom_condition objects.

4.3.615 General_bottom_condition to Shell

Each General_bottom_condition refers to zero or one Shell in the role of floor_face. Each Shell acts as floor_face for zero or more General_bottom_condition objects.

NOTE – This assertion is established through general_end_select.

4.3.616 General_bottom_condition to Surface

Each General_bottom_condition refers to zero or one Surface in the role of floor_face. Each Surface acts as floor_face for zero or more General_bottom_condition objects.

NOTE – This assertion is established through general_end_select.

4.3.617 General_classification to Classification_attribute

Each General_classification refers to zero or more Classification_attribute objects in the role of attribute. Each Classification_attribute has associated_classification defined by one or more General_classification objects.

4.3.618 General_classification to Classification_system

Each General_classification refers to zero or one Classification_system in the role of used_classification_system. Each Classification_system has allowed_class defined by zero or more General_classification objects.

4.3.619 General_classification to External_document

Each General_classification refers to zero or one External_document in the role of classification_source. Each External_document acts as classification_source for zero or more General_classification objects.

NOTE – This assertion is established through external_source_select.

4.3.620 General_classification to External_library_reference

Each General_classification refers to zero or one External_library_reference in the role of classification_source. Each External_library_reference acts as classification_source for zero or more General_classification objects.

NOTE – This assertion is established through external_source_select.

4.3.621 General_classification to Multi_language_string

Each General_classification refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more General_classification objects.

NOTE – This assertion is established through string_select.

4.3.622 General_classification_hierarchy to General_classification

Each General_classification_hierarchy refers to exactly one General_classification in the role of sub_classification. Each General_classification acts as sub_classification for zero or more General_classification_hierarchy objects.

Each General_classification_hierarchy refers to exactly one General_classification in the role of super_classification. Each General_classification acts as super_classification for zero or more General_classification_hierarchy objects.

4.3.623 General_closed_profile to Curve

Each General_closed_profile refers to exactly one Curve in the role of profile_shape. Each Curve acts as profile_shape for zero or more General_closed_profile objects.

4.3.624 General_compound_feature to Feature_definition

Each General_compound_feature refers to zero or more Feature_definition objects in the role of elements. Each Feature_definition acts as elements for zero or more General_compound_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.625 General_compound_feature to General_feature

Each General_compound_feature refers to zero or more General_feature objects in the role of elements. Each General_feature acts as elements for zero or more General_compound_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.626 General_compound_feature to Thread_feature

Each General_compound_feature refers to zero or more Thread_feature objects in the role of elements. Each Thread_feature acts as elements for zero or more General_compound_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.627 General_compound_feature to Transition_feature

Each General_compound_feature refers to zero or more Transition_feature objects in the role of elements. Each Transition_feature acts as elements for zero or more General_compound_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.628 General_feature to Axis_placement

Each General_feature refers to zero or one Axis_placement in the role of location_and_orientation. Each Axis_placement acts as location_and_orientation for zero or more General_feature objects.

4.3.629 General_feature to General_feature_parameter

Each General_feature refers to zero or more General_feature_parameter objects in the role of feature_parameter. Each General_feature_parameter acts as feature_parameter for zero or more General_feature objects.

4.3.630 General_feature_parameter to Feature_parameter

Each General_feature_parameter refers to exactly one Feature_parameter in the role of parameter_value. Each Feature_parameter acts as parameter_value for zero or more General_feature_parameter objects.

4.3.631 General_feature_parameter to Multi_language_string

Each General_feature_parameter refers to zero or one Multi_language_string in the role of parameter_role. Each Multi_language_string acts as parameter_role for zero or more General_feature_parameter objects.

NOTE – This assertion is established through string_select.

4.3.632 General_item_definition_instance_relationship to Multi_language_string

Each General_item_definition_instance_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more General_item_definition_instance_relationship objects.

NOTE – This assertion is established through string_select.

Each General_item_definition_instance_relationship refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more General_item_definition_instance_relationship objects.

NOTE – This assertion is established through string_select.

4.3.633 General_item_definition_relationship to Multi_language_string

Each General_item_definition_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more General_item_definition_relationship objects.

NOTE – This assertion is established through string_select.

Each General_item_definition_relationship refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more General_item_definition_relationship objects.

NOTE – This assertion is established through string_select.

4.3.634 General_item_instance_relationship to Multi_language_string

Each General_item_instance_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more General_item_instance_relationship objects.

NOTE – This assertion is established through string_select.

Each General_item_instance_relationship refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more General_item_instance_relationship objects.

NOTE – This assertion is established through string_select.

4.3.635 General_item_property to External_model

Each General_item_property refers to zero or more External_model objects in the role of property_value. Each External_model acts as property_value for zero or more General_item_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.636 General_item_property to Geometric_model

Each General_item_property refers to zero or more Geometric_model objects in the role of property_value. Each Geometric_model acts as property_value for zero or more General_item_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.637 General_item_property to Multi_language_string

Each General_item_property refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more General_item_property objects.

NOTE – This assertion is established through string_select.

4.3.638 General_item_property to Property_value

Each General_item_property refers to zero or more Property_value objects in the role of property_value. Each Property_value acts as property_value for zero or more General_item_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.639 General_item_property to Styled_model

Each General_item_property refers to zero or more Styled_model objects in the role of property_value. Each Styled_model acts as property_value for zero or more General_item_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.640 General_open_profile to Curve

Each General_open_profile refers to exactly one Curve in the role of profile_shape. Each Curve acts as profile_shape for zero or more General_open_profile objects.

4.3.641 General_path to Curve

Each General_path refers to exactly one Curve in the role of path_geometry. Each Curve acts as path_geometry for zero or more General_path objects.

4.3.642 General_pattern to Axis_placement

Each General_pattern refers to one or more Axis_placement objects in the role of added_instance. Each Axis_placement acts as added_instance for zero or more General_pattern objects.

4.3.643 General_pocket_in_solid to Profile

Each General_pocket_in_solid refers to exactly one Profile in the role of boundary. Each Profile acts as boundary for zero or more General_pocket_in_solid objects.

4.3.644 General_process_property to External_model

Each General_process_property refers to zero or more External_model objects in the role of property_value. Each External_model acts as property_value for zero or more General_process_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.645 General_process_property to Geometric_model

Each General_process_property refers to zero or more Geometric_model objects in the role of property_value. Each Geometric_model acts as property_value for zero or more General_process_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.646 General_process_property to Multi_language_string

Each General_process_property refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more General_process_property objects.

NOTE – This assertion is established through string_select.

4.3.647 General_process_property to Property_value

Each General_process_property refers to zero or more Property_value objects in the role of property_value. Each Property_value acts as property_value for zero or more General_process_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.648 General_process_property to Styled_model

Each General_process_property refers to zero or more Styled_model objects in the role of property_value. Each Styled_model acts as property_value for zero or more General_process_property objects.

NOTE – This assertion is established through general_property_representation_select.

4.3.649 General_tolerances to External_document

Each General_tolerances refers to zero or one External_document in the role of table_definition. Each External_document acts as table_definition for zero or more General_tolerances objects.

NOTE – This assertion is established through general_tolerance_table_select.

4.3.650 General_tolerances to General_tolerance_table

Each General_tolerances refers to zero or one General_tolerance_table in the role of table_definition. Each General_tolerance_table acts as table_definition for zero or more General_tolerances objects.

NOTE – This assertion is established through general_tolerance_table_select.

4.3.651 General_top_condition to Shell

Each General_top_condition refers to zero or one Shell in the role of top_face. Each Shell acts as top_face for zero or more General_top_condition objects.

NOTE – This assertion is established through general_end_select.

4.3.652 General_top_condition to Surface

Each General_top_condition refers to zero or one Surface in the role of top_face. Each Surface acts as top_face for zero or more General_top_condition objects.

NOTE – This assertion is established through general_end_select.

4.3.653 Geometric_dimension to Multi_language_string

Each Geometric_dimension refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Geometric_dimension objects.

NOTE – This assertion is established through string_select.

4.3.654 Geometric_model to Cartesian_coordinate_space

Each Geometric_model is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Geometric_model objects.

4.3.655 Geometric_model to Multi_language_string

Each Geometric_model refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Geometric_model objects.

NOTE – This assertion is established through string_select.

4.3.656 Geometric_model to Template_instance

Each Geometric_model refers to zero or more Template_instance objects in the role of additional_elements. Each Template_instance acts as additional_elements for zero or more Geometric_model objects.

4.3.657 Geometric_model_relationship to External_model

Each Geometric_model_relationship is related to zero or one External_model. Each External_model is referenced by zero or more Geometric_model_relationship objects as related.

NOTE – The related External_model is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

NOTE – This assertion is established through geometric_or_external_model_select.

Each Geometric_model_relationship is relating to zero or one External_model. Each External_model is referenced by zero or more Geometric_model_relationship objects as relating.

NOTE – The relating External_model is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE – This assertion is established through geometric_or_external_model_select.

4.3.658 Geometric_model_relationship to Geometric_model

Each Geometric_model_relationship is related to zero or one Geometric_model. Each Geometric_model is referenced by zero or more Geometric_model_relationship objects as related.

NOTE – The related Geometric_model is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

NOTE – This assertion is established through geometric_or_external_model_select.

Each Geometric_model_relationship is relating to zero or one Geometric_model. Each Geometric_model is referenced by zero or more Geometric_model_relationship objects as relating.

NOTE – The relating Geometric_model is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE – This assertion is established through geometric_or_external_model_select.

4.3.659 Geometric_model_relationship to Multi_language_string

Each Geometric_model_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Geometric_model_relationship objects.

NOTE – This assertion is established through string_select.

4.3.660 Geometric_model_relationship_with_transformation to Transformation

Each Geometric_model_relationship_with_transformation refers to exactly one Transformation in the role of transformation. Each Transformation acts as transformation for zero or more Geometric_model_relationship_with_transformation objects.

4.3.661 Geometric_set_3d to Curve

Each Geometric_set_3d refers to zero or more Curve objects in the role of element. Each Curve acts as element for zero or more Geometric_set_3d objects.

NOTE – This assertion is established through point_or_curve_or_surface_select and point_or_curve_-select.

4.3.662 Geometric_set_3d to Point

Each Geometric_set_3d refers to zero or more Point objects in the role of element. Each Point acts as element for zero or more Geometric_set_3d objects.

NOTE – This assertion is established through point_or_curve_or_surface_select and point_or_curve_-select.

4.3.663 Geometric_set_3d to Surface

Each Geometric_set_3d refers to zero or more Surface objects in the role of element. Each Surface acts as element for zero or more Geometric_set_3d objects.

NOTE – This assertion is established through point_or_curve_or_surface_select.

4.3.664 Geometric_tolerance to Annotation_curve

Each Geometric_tolerance is_applied_to zero or one Annotation_curve. Each Annotation_curve is related to zero or more Geometric_tolerance objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_-select.

4.3.665 Geometric_tolerance to Constructive_geometric_element

Each Geometric_tolerance is_applied_to zero or one Constructive_geometric_element. Each Constructive_geometric_element is related to zero or more Geometric_tolerance objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_-select.

4.3.666 Geometric_tolerance to Derived_geometry

Each Geometric_tolerance is_applied_to zero or one Derived_geometry. Each Derived_geometry is related to zero or more Geometric_tolerance objects.

NOTE – This assertion is established through placed_element_select.

4.3.667 Geometric_tolerance to Material_condition

Each Geometric_tolerance is_controlled_by zero or one Material_condition. Each Material_condition is related to zero or more Geometric_tolerance objects.

4.3.668 Geometric_tolerance to Multi_language_string

Each Geometric_tolerance refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Geometric_tolerance objects.

NOTE – This assertion is established through string_select.

Each Geometric_tolerance refers to zero or one Multi_language_string in the role of qualifying_note. Each Multi_language_string acts as qualifying_note for zero or more Geometric_tolerance objects.

NOTE – This assertion is established through string_select.

4.3.669 Geometric_tolerance to Shape_aspect

Each Geometric_tolerance is_applied_to zero or one Shape_aspect. Each Shape_aspect is related to zero or more Geometric_tolerance objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_select.

4.3.670 Geometric_tolerance_precedence to Geometric_tolerance

Each Geometric_tolerance_precedence refers to exactly one Geometric_tolerance in the role of primary_tolerance. Each Geometric_tolerance acts as primary_tolerance for zero or more Geometric_tolerance_precedence objects.

Each Geometric_tolerance_precedence refers to exactly one Geometric_tolerance in the role of secondary_tolerance. Each Geometric_tolerance acts as secondary_tolerance for zero or more Geometric_tolerance_precedence objects.

4.3.671 Geometrical_relationship to Geometric_model_relationship_with_transformation

Each Geometrical_relationship refers to zero or one Geometric_model_relationship_with_transformation in the role of transformation. Each Geometric_model_relationship_with_transformation acts as transformation for zero or more Geometrical_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.672 Geometrical_relationship to Multi_language_string

Each Geometrical_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Geometrical_relationship objects.

NOTE – This assertion is established through string_select.

Each Geometrical_relationship refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Geometrical_relationship objects.

NOTE – This assertion is established through string_select.

4.3.673 Geometrical_relationship to Template_instance

Each Geometrical_relationship refers to zero or one Template_instance in the role of transformation. Each Template_instance acts as transformation for zero or more Geometrical_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.674 Geometrically_bounded_surface_model to Geometric_set_3d

Each Geometrically_bounded_surface_model refers to zero or more Geometric_set_3d objects in the role of element. Each Geometric_set_3d acts as element for zero or more Geometrically_bounded_surface_model objects.

4.3.675 Ground_representation to Geometric_model

Each Ground_representation refers to exactly one Geometric_model in the role of shape_description. Each Geometric_model acts as shape_description for zero or more Ground_representation objects.

4.3.676 Group to Detailed_element

Each Group refers to zero or more Detailed_element objects in the role of element. Each Detailed_element acts as element for zero or more Group objects.

4.3.677 Group to Multi_language_string

Each Group refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Group objects.

NOTE – This assertion is established through string_select.

Each Group refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_string acts as purpose for zero or more Group objects.

NOTE – This assertion is established through string_select.

4.3.678 Group_relationship to Group

Each Group_relationship is related to exactly one Group. Each Group is referenced by zero or more Group_relationship objects as related.

NOTE – The related Group is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Group_relationship is relating to exactly one Group. Each Group is referenced by zero or more Group_relationship objects as relating.

NOTE – The relating Group is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.679 Group_relationship to Multi_language_string

Each Group_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Group_relationship objects.

NOTE – This assertion is established through string_select.

4.3.680 Hardness to Multi_language_string

Each Hardness refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Hardness objects.

NOTE – This assertion is established through string_select.

4.3.681 Hardness to Value_with_unit

Each Hardness refers to zero or one Value_with_unit in the role of depth. Each Value_with_unit acts as depth for zero or more Hardness objects.

Each Hardness refers to exactly one Value_with_unit in the role of hardness_value. Each Value_with_unit acts as hardness_value for zero or more Hardness objects.

4.3.682 Hidden_element_handling to Appearance_assignment

Each Hidden_element_handling refers to zero or one Appearance_assignment in the role of hidden_element_appearance. Each Appearance_assignment acts as hidden_element_appearance for zero or more Hidden_element_handling objects.

4.3.683 Hidden_element_handling to Model_image

Each Hidden_element_handling is_defined_for one or more Model_image objects. Each Model_image has zero or one Hidden_element_handling.

4.3.684 Hole_feature_in_panel to Angle_taper

Each Hole_feature_in_panel refers to zero or one Angle_taper in the role of taper. Each Angle_taper acts as taper for zero or more Hole_feature_in_panel objects.

NOTE – This assertion is established through taper_select.

4.3.685 Hole_feature_in_panel to Closed_profile_usage

Each Hole_feature_in_panel refers to exactly one Closed_profile_usage in the role of hole_profile. Each Closed_profile_usage acts as hole_profile for zero or more Hole_feature_in_panel objects.

4.3.686 Hole_feature_in_panel to Diameter_taper

Each Hole_feature_in_panel refers to zero or one Diameter_taper in the role of taper. Each Diameter_taper acts as taper for zero or more Hole_feature_in_panel objects.

NOTE – This assertion is established through taper_select.

4.3.687 Hole_feature_in_panel to Directed_taper

Each Hole_feature_in_panel refers to zero or one Directed_taper in the role of taper. Each Directed_taper acts as taper for zero or more Hole_feature_in_panel objects.

NOTE – This assertion is established through taper_select.

4.3.688 Hybrid_geometric_model_3d to Detailed_geometric_model_element

Each Hybrid_geometric_model_3d refers to zero or more Detailed_geometric_model_element objects in the role of element. Each Detailed_geometric_model_element acts as element for zero or more Hybrid_geometric_model_3d objects.

4.3.689 Included_feature to Feature_definition

Each Included_feature refers to zero or one Feature_definition in the role of definition. Each Feature_definition acts as definition for zero or more Included_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.690 Included_feature to General_feature

Each Included_feature refers to zero or one General_feature in the role of definition. Each General_feature acts as definition for zero or more Included_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.691 Included_feature to Thread_feature

Each Included_feature refers to zero or one Thread_feature in the role of definition. Each Thread_feature acts as definition for zero or more Included_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.692 Included_feature to Transition_feature

Each Included_feature refers to zero or one Transition_feature in the role of definition. Each Transition_feature acts as definition for zero or more Included_feature objects.

NOTE – This assertion is established through feature_definition_select.

4.3.693 Initial_configuration to Kinematic_mechanism

Each Initial_configuration is_applied_to exactly one Kinematic_mechanism. Each Kinematic_mechanism is related to zero or more Initial_configuration objects.

4.3.694 Initial_configuration to Pair_value

Each Initial_configuration refers to one or more Pair_value objects in the role of initial_pair_values. Each Pair_value acts as initial_pair_values for zero or more Initial_configuration objects.

4.3.695 Instance_placement to Geometric_model_relationship_with_transformation

Each Instance_placement refers to zero or one Geometric_model_relationship_with_transformation in the role of transformation. Each Geometric_model_relationship_with_transformation acts as transformation for zero or more Instance_placement objects.

NOTE – This assertion is established through transformation_select.

4.3.696 Instance_placement to Product_component

Each Instance_placement refers to exactly one Product_component in the role of product_component. Each Product_component acts as product_component for zero or more Instance_placement objects.

4.3.697 Instance_placement to Single_instance

Each Instance_placement refers to exactly one Single_instance in the role of placed_instance. Each Single_instance acts as placed_instance for zero or more Instance_placement objects.

4.3.698 Instance_placement to Template_instance

Each Instance_placement refers to zero or one Template_instance in the role of transformation. Each Template_instance acts as transformation for zero or more Instance_placement objects.

NOTE – This assertion is established through transformation_select.

4.3.699 Interpolated_configuration_sequence to Kinematic_configuration_interpolation

Each Interpolated_configuration_sequence refers to one or more Kinematic_configuration_interpolation objects in the role of interpolation. Each Kinematic_configuration_interpolation acts as interpolation for zero or more Interpolated_configuration_sequence objects.

4.3.700 Item to Multi_language_string

Each Item refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item objects.

NOTE – This assertion is established through string_select.

Each Item refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Item objects.

NOTE – This assertion is established through string_select.

4.3.701 Item_classification to Item

Each Item_classification refers to zero or more Item objects in the role of associated_item. Each Item acts as associated_item for zero or more Item_classification objects.

4.3.702 Item_classification to Multi_language_string

Each Item_classification refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item_classification objects.

NOTE – This assertion is established through string_select.

4.3.703 Item_cost_property to Property_value

Each Item_cost_property refers to one or more Property_value objects in the role of cost_property_value. Each Property_value acts as cost_property_value for zero or more Item_cost_property objects.

4.3.704 Item_definition_instance_relationship to Design_discipline_item_definition

Each Item_definition_instance_relationship is relating to exactly one Design_discipline_item_definition. Each Design_discipline_item_definition is referenced by zero or more Item_definition_instance_relationship objects as relating.

NOTE – The relating Design_discipline_item_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.705 Item_definition_instance_relationship to Item_instance

Each Item_definition_instance_relationship is related to exactly one Item_instance. Each Item_instance is referenced by zero or more Item_definition_instance_relationship objects as related.

NOTE – The related Item_instance is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

4.3.706 Item_definition_relationship to Design_discipline_item_definition

Each Item_definition_relationship is related to exactly one Design_discipline_item_definition. Each Design_discipline_item_definition is referenced by zero or more Item_definition_relationship objects as related.

NOTE – The related Design_discipline_item_definition is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Item_definition_relationship is relating to exactly one Design_discipline_item_definition. Each Design_discipline_item_definition is referenced by zero or more Item_definition_relationship objects as relating.

NOTE – The relating Design_discipline_item_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.707 Item_instance to Design_discipline_item_definition

Each Item_instance refers to zero or one Design_discipline_item_definition in the role of definition. Each Design_discipline_item_definition acts as definition for zero or more Item_instance objects.

NOTE – This assertion is established through instance_definition_select.

4.3.708 Item_instance to Multi_language_string

Each Item_instance refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item_instance objects.

NOTE – This assertion is established through string_select.

4.3.709 Item_instance to Product_specification

Each Item_instance refers to zero or one Product_specification in the role of definition. Each Product_specification acts as definition for zero or more Item_instance objects.

NOTE – This assertion is established through instance_definition_select.

4.3.710 Item_instance_relationship to Item_instance

Each Item_instance_relationship is related to exactly one Item_instance. Each Item_instance is referenced by zero or more Item_instance_relationship objects as related.

NOTE – The related Item_instance is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Item_instance_relationship is relating to exactly one Item_instance. Each Item_instance is referenced by zero or more Item_instance_relationship objects as relating.

NOTE – The relating Item_instance is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.711 Item_property to Design_constraint

Each Item_property refers to zero or one Design_constraint in the role of described_object. Each Design_constraint acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.712 Item_property to Design_discipline_item_definition

Each Item_property refers to zero or one Design_discipline_item_definition in the role of described_object. Each Design_discipline_item_definition acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and item_information_select.

4.3.713 Item_property to Feature_definition

Each Item_property refers to zero or one Feature_definition in the role of described_object. Each Feature_definition acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.714 Item_property to General_feature

Each Item_property refers to zero or one General_feature in the role of described_object. Each General_feature acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.715 Item_property to Item_definition_instance_relationship

Each Item_property refers to zero or one Item_definition_instance_relationship in the role of described_object. Each Item_definition_instance_relationship acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, item_information_select, and item_relationship_select.

4.3.716 Item_property to Item_definition_relationship

Each Item_property refers to zero or one Item_definition_relationship in the role of described_-object. Each Item_definition_relationship acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, item_information_select, and item_relationship_select.

4.3.717 Item_property to Item_instance

Each Item_property refers to zero or one Item_instance in the role of described_object. Each Item_instance acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and item_information_select.

4.3.718 Item_property to Item_instance_relationship

Each Item_property refers to zero or one Item_instance_relationship in the role of described_-object. Each Item_instance_relationship acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, item_information_select, and item_relationship_select.

4.3.719 Item_property to Item_shape

Each Item_property refers to zero or one Item_shape in the role of described_object. Each Item_shape acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and shape_select.

4.3.720 Item_property to Item_solution

Each Item_property refers to zero or one Item_solution in the role of described_object. Each Item_solution acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and specification_property_-select.

4.3.721 Item_property to Physical_instance

Each Item_property refers to zero or one Physical_instance in the role of described_object. Each Physical_instance acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select.

4.3.722 Item_property to Product_class

Each Item_property refers to zero or one Product_class in the role of described_object. Each Product_class acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.723 Item_property to Product_component

Each Item_property refers to zero or one Product_component in the role of described_object. Each Product_component acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.724 Item_property to Product_function

Each Item_property refers to zero or one Product_function in the role of described_object. Each Product_function acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.725 Item_property to Shape_aspect

Each Item_property refers to zero or one Shape_aspect in the role of described_object. Each Shape_aspect acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and shape_select.

4.3.726 Item_property to Shape_aspect_relationship

Each Item_property refers to zero or one Shape_aspect_relationship in the role of described_object. Each Shape_aspect_relationship acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select and shape_information_select.

4.3.727 Item_property to Thread_feature

Each Item_property refers to zero or one Thread_feature in the role of described_object. Each Thread_feature acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.728 Item_property to Transition_feature

Each Item_property refers to zero or one Transition_feature in the role of described_object. Each Transition_feature acts as described_object for zero or more Item_property objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.729 Item_quality_property to Multi_language_string

Each Item_quality_property refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item_quality_property objects.

NOTE – This assertion is established through string_select.

4.3.730 Item_quality_property to Property_value

Each Item_quality_property refers to one or more Property_value objects in the role of quality_property_value. Each Property_value acts as quality_property_value for zero or more Item_quality_property objects.

4.3.731 Item_shape to Design_discipline_item_definition

Each Item_shape refers to zero or one Design_discipline_item_definition in the role of described_object. Each Design_discipline_item_definition acts as described_object for zero or more Item_shape objects.

NOTE – This assertion is established through item_information_select.

4.3.732 Item_shape to Item_definition_instance_relationship

Each Item_shape refers to zero or one Item_definition_instance_relationship in the role of described_object. Each Item_definition_instance_relationship acts as described_object for zero or more Item_shape objects.

NOTE – This assertion is established through item_information_select and item_relationship_select.

4.3.733 Item_shape to Item_definition_relationship

Each Item_shape refers to zero or one Item_definition_relationship in the role of described_object. Each Item_definition_relationship acts as described_object for zero or more Item_shape objects.

NOTE – This assertion is established through item_information_select and item_relationship_select.

4.3.734 Item_shape to Item_instance

Each Item_shape refers to zero or one Item_instance in the role of described_object. Each Item_instance acts as described_object for zero or more Item_shape objects.

NOTE – This assertion is established through item_information_select.

4.3.735 Item_shape to Item_instance_relationship

Each Item_shape refers to zero or one Item_instance_relationship in the role of described_object. Each Item_instance_relationship acts as described_object for zero or more Item_shape objects.

NOTE – This assertion is established through item_information_select and item_relationship_select.

4.3.736 Item_shape to Multi_language_string

Each Item_shape refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item_shape objects.

NOTE – This assertion is established through string_select.

4.3.737 Item_solution to Item_solution

Each Item_solution refers to zero or one Item_solution in the role of base_element. Each Item_solution acts as base_element for zero or more Item_solution objects.

NOTE – This assertion is established through solution_base_select.

4.3.738 Item_solution to Product_component

Each Item_solution refers to zero or one Product_component in the role of base_element. Each Product_component acts as base_element for zero or more Item_solution objects.

NOTE – This assertion is established through solution_base_select.

4.3.739 Item_solution_relationship to Item_solution

Each Item_solution_relationship is related to exactly one Item_solution. Each Item_solution is referenced by zero or more Item_solution_relationship objects as related.

NOTE – The related Item_solution is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Item_solution_relationship is relating to exactly one Item_solution. Each Item_solution is referenced by zero or more Item_solution_relationship objects as relating.

NOTE – The relating Item_solution is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.740 Item_solution_relationship to Multi_language_string

Each Item_solution_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item_solution_relationship objects.

NOTE – This assertion is established through string_select.

4.3.741 Item_version to Item

Each Item_version refers to exactly one Item in the role of associated_item. Each Item has associated_version defined by one or more Item_version objects.

4.3.742 Item_version to Multi_language_string

Each Item_version refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item_version objects.

NOTE – This assertion is established through string_select.

4.3.743 Item_version_relationship to Item_version

Each Item_version_relationship is related to exactly one Item_version. Each Item_version is referenced by zero or more Item_version_relationship objects as related.

NOTE – The related Item_version is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Item_version_relationship is relating to exactly one Item_version. Each Item_version is referenced by zero or more Item_version_relationship objects as relating.

NOTE – The relating Item_version is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.744 Item_version_relationship to Multi_language_string

Each Item_version_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Item_version_relationship objects.

NOTE – This assertion is established through string_select.

4.3.745 Joggle_feature to Feature_parameter

Each Joggle_feature refers to exactly one Feature_parameter in the role of direction_angle_at_path_end. Each Feature_parameter acts as direction_angle_at_path_end for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of direction_angle_at_path_start. Each Feature_parameter acts as direction_angle_at_path_start for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of height. Each Feature_parameter acts as height for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of slope_angle_at_path_end. Each Feature_parameter acts as slope_angle_at_path_end for zero or more Joggle_feature objects.

Each Joggle_feature refers to exactly one Feature_parameter in the role of slope_angle_at_path_start. Each Feature_parameter acts as slope_angle_at_path_start for zero or more Joggle_feature objects.

4.3.746 Joggle_feature to Joggle_termination

Each Joggle_feature refers to exactly one Joggle_termination in the role of termination. Each Joggle_termination acts as termination for zero or more Joggle_feature objects.

4.3.747 Joggle_feature to Linear_path

Each Joggle_feature refers to exactly one Linear_path in the role of defining_path. Each Linear_path acts as defining_path for zero or more Joggle_feature objects.

4.3.748 Kinematic_configuration_definition to Pair_value

Each Kinematic_configuration_definition refers to one or more Pair_value objects in the role of pair_values. Each Pair_value acts as pair_values for zero or more Kinematic_configuration_definition objects.

4.3.749 Kinematic_configuration_definition to Path_approximation

Each Kinematic_configuration_definition refers to exactly one Path_approximation in the role of t_parameter. Each Path_approximation acts as t_parameter for zero or more Kinematic_configuration_definition objects.

4.3.750 Kinematic_configuration_interpolation to Kinematic_configuration_definition

Each Kinematic_configuration_interpolation refers to exactly one Kinematic_configuration_definition in the role of next_definition. Each Kinematic_configuration_definition acts as next_definition for zero or more Kinematic_configuration_interpolation objects.

Each Kinematic_configuration_interpolation refers to exactly one Kinematic_configuration_definition in the role of previous_definition. Each Kinematic_configuration_definition acts as previous_definition for zero or more Kinematic_configuration_interpolation objects.

4.3.751 Kinematic_joint to Kinematic_link

Each Kinematic_joint refers to exactly one Kinematic_link in the role of first_link. Each Kinematic_link acts as first_link for zero or more Kinematic_joint objects.

Each Kinematic_joint refers to exactly one Kinematic_link in the role of second_link. Each Kinematic_link acts as second_link for zero or more Kinematic_joint objects.

4.3.752 Kinematic_joint to Kinematic_pair

Each Kinematic_joint refers to exactly one Kinematic_pair in the role of pair. Each Kinematic_pair has joint defined by exactly one Kinematic_joint.

4.3.753 Kinematic_link to Kinematic_link_representation

Each Kinematic_link refers to exactly one Kinematic_link_representation in the role of representation. Each Kinematic_link_representation acts as representation for zero or more Kinematic_link objects.

4.3.754 Kinematic_link_representation to Geometric_model

Each Kinematic_link_representation refers to exactly one Geometric_model in the role of physical_description. Each Geometric_model acts as physical_description for zero or more Kinematic_link_representation objects.

4.3.755 Kinematic_link_representation to Transformation_to_reference_frame

Each Kinematic_link_representation refers to zero or more Transformation_to_reference_frame objects in the role of additional_reference_frame. Each Transformation_to_reference_frame acts as additional_reference_frame for zero or more Kinematic_link_representation objects.

4.3.756 Kinematic_mechanism to Kinematic_link

Each Kinematic_mechanism refers to exactly one Kinematic_link in the role of base. Each Kinematic_link acts as base for zero or more Kinematic_mechanism objects.

4.3.757 Kinematic_mechanism to Kinematic_structure

Each Kinematic_mechanism refers to exactly one Kinematic_structure in the role of structure_-definition. Each Kinematic_structure is_referenced_by exactly one Kinematic_mechanism.

4.3.758 Kinematic_mechanism to Transformation_to_reference_frame

Each Kinematic_mechanism refers to exactly one Transformation_to_reference_frame in the role of base_placement. Each Transformation_to_reference_frame acts as base_placement for zero or more Kinematic_mechanism objects.

4.3.759 Kinematic_pair to Transformation_to_reference_frame

Each Kinematic_pair refers to exactly one Transformation_to_reference_frame in the role of transformation_item_1. Each Transformation_to_reference_frame acts as transformation_item_1 for zero or more Kinematic_pair objects.

Each Kinematic_pair refers to exactly one Transformation_to_reference_frame in the role of transformation_item_2. Each Transformation_to_reference_frame acts as transformation_item_2 for zero or more Kinematic_pair objects.

4.3.760 Kinematic_structure to Kinematic_joint

Each Kinematic_structure refers to one or more Kinematic_joint objects in the role of joint. Each Kinematic_joint is_referenced_by one or more Kinematic_structure objects.

4.3.761 Kinematic_transformation_result to Interpolated_configuration_sequence

Each Kinematic_transformation_result refers to one or more Interpolated_configuration_sequence objects in the role of result. Each Interpolated_configuration_sequence acts as result for zero or more Kinematic_transformation_result objects.

4.3.762 Kinematic_transformation_result to Kinematic_mechanism

Each Kinematic_transformation_result is_applied_to exactly one Kinematic_mechanism. Each Kinematic_mechanism is related to zero or more Kinematic_transformation_result objects.

4.3.763 Layer to Detailed_element

Each Layer refers to one or more Detailed_element objects in the role of element. Each Detailed_-element acts as element for zero or more Layer objects.

4.3.764 Layer to Multi_language_string

Each Layer refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Layer objects.

NOTE – This assertion is established through string_select.

4.3.765 Leader to Annotation_symbol

Each Leader refers to zero or one Annotation_symbol in the role of terminator. Each Annotation_symbol acts as terminator for zero or more Leader objects.

4.3.766 Light_source to Model_image

Each Light_source refers to one or more Model_image objects in the role of view. Each Model_image acts as view for zero or more Light_source objects.

4.3.767 Linear_path to Axis_placement

Each Linear_path is_defined_by exactly one Axis_placement. Each Axis_placement is related to zero or more Linear_path objects.

4.3.768 Linear_path to Feature_parameter

Each Linear_path refers to exactly one Feature_parameter in the role of distance. Each Feature_parameter acts as distance for zero or more Linear_path objects.

4.3.769 Linear_profile_tolerance to Datum

Each Linear_profile_tolerance refers to zero, one, two, or three Datum objects in the role of datum. Each Datum acts as datum for zero or more Linear_profile_tolerance objects.

4.3.770 Linear_profile_tolerance to Reference_plane

Each Linear_profile_tolerance refers to zero or one Reference_plane in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Linear_profile_tolerance objects.

4.3.771 Location_dimension to Annotation_curve

Each Location_dimension refers to zero or one Annotation_curve in the role of origin. Each Annotation_curve acts as origin for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_select.

Each Location_dimension refers to zero or one Annotation_curve in the role of target. Each Annotation_curve acts as target for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_select.

4.3.772 Location_dimension to Constructive_geometric_element

Each Location_dimension refers to zero or one Constructive_geometric_element in the role of origin. Each Constructive_geometric_element acts as origin for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_select.

Each Location_dimension refers to zero or one Constructive_geometric_element in the role of target. Each Constructive_geometric_element acts as target for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_select.

4.3.773 Location_dimension to Derived_geometry

Each Location_dimension refers to zero or one Derived_geometry in the role of origin. Each Derived_geometry acts as origin for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select.

Each Location_dimension refers to zero or one Derived_geometry in the role of target. Each Derived_geometry acts as target for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select.

4.3.774 Location_dimension to Shape_aspect

Each Location_dimension refers to zero or one Shape_aspect in the role of origin. Each Shape_aspect acts as origin for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_select.

Each Location_dimension refers to zero or one Shape_aspect in the role of target. Each Shape_aspect acts as target for zero or more Location_dimension objects.

NOTE – This assertion is established through placed_element_select and element_with_dimension_select.

4.3.775 Locator_feature to Feature_parameter

Each Locator_feature refers to exactly one Feature_parameter in the role of diameter. Each Feature_parameter acts as diameter for zero or more Locator_feature objects.

Each Locator_feature refers to exactly one Feature_parameter in the role of tip_angle. Each Feature_parameter acts as tip_angle for zero or more Locator_feature objects.

Each Locator_feature refers to exactly one Feature_parameter in the role of tip_radius. Each Feature_parameter acts as tip_radius for zero or more Locator_feature objects.

4.3.776 Make_from_relationship to Multi_language_string

Each Make_from_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Make_from_relationship objects.

NOTE – This assertion is established through string_select.

Each Make_from_relationship refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Make_from_relationship objects.

NOTE – This assertion is established through string_select.

4.3.777 Mass to Property_value

Each Mass refers to one or more Property_value objects in the role of mass_property_value. Each Property_value acts as mass_property_value for zero or more Mass objects.

4.3.778 Mated_item_association to Mating_definition

Each Mated_item_association is relating to exactly one Mating_definition. Each Mating_definition has mated_items defined by two or more Mated_item_association objects.

NOTE – The relating Mating_definition is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.779 Mated_item_relationship to Geometric_model_relationship_with_transformation

Each Mated_item_relationship refers to zero or one Geometric_model_relationship_with_transformation in the role of transformation. Each Geometric_model_relationship_with_transformation acts as transformation for zero or more Mated_item_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.780 Mated_item_relationship to Mated_item_association

Each Mated_item_relationship is related to exactly one Mated_item_association. Each Mated_item_association is referenced by zero or more Mated_item_relationship objects as related.

NOTE – The related Mated_item_association is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Mated_item_relationship is relating to exactly one Mated_item_association. Each Mated_-item_association is referenced by zero or more Mated_item_relationship objects as relating.

NOTE – The relating Mated_item_association is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.781 Mated_item_relationship to Quantified_instance

Each Mated_item_relationship refers to zero or more Quantified_instance objects in the role of mating_material. Each Quantified_instance acts as mating_material for zero or more Mated_-item_relationship objects.

4.3.782 Mated_item_relationship to Shape_aspect_relationship

Each Mated_item_relationship refers to zero or one Shape_aspect_relationship in the role of mated_shape. Each Shape_aspect_relationship acts as mated_shape for zero or more Mated_-item_relationship objects.

4.3.783 Mated_item_relationship to Template_instance

Each Mated_item_relationship refers to zero or one Template_instance in the role of transformation. Each Template_instance acts as transformation for zero or more Mated_item_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.784 Material to Design_constraint

Each Material refers to zero or one Design_constraint in the role of described_object. Each Design_constraint acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and specification_property_-select.

4.3.785 Material to Design_discipline_item_definition

Each Material refers to zero or one Design_discipline_item_definition in the role of described_-object. Each Design_discipline_item_definition acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and item_information_select.

4.3.786 Material to Feature_definition

Each Material refers to zero or one Feature_definition in the role of described_object. Each Feature_definition acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.787 Material to General_feature

Each Material refers to zero or one General_feature in the role of described_object. Each General_feature acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.788 Material to Item_definition_instance_relationship

Each Material refers to zero or one Item_definition_instance_relationship in the role of described_object. Each Item_definition_instance_relationship acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, item_information_select, and item_relationship_select.

4.3.789 Material to Item_definition_relationship

Each Material refers to zero or one Item_definition_relationship in the role of described_object. Each Item_definition_relationship acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, item_information_select, and item_relationship_select.

4.3.790 Material to Item_instance

Each Material refers to zero or one Item_instance in the role of described_object. Each Item_instance acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and item_information_select.

4.3.791 Material to Item_instance_relationship

Each Material refers to zero or one Item_instance_relationship in the role of described_object. Each Item_instance_relationship acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, item_information_select, and item_relationship_select.

4.3.792 Material to Item_shape

Each Material refers to zero or one Item_shape in the role of described_object. Each Item_shape acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and shape_select.

4.3.793 Material to Item_solution

Each Material refers to zero or one Item_solution in the role of described_object. Each Item_solution acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.794 Material to Material_property

Each Material refers to zero or more Material_property objects in the role of material_property. Each Material_property acts as material_property for zero or more Material objects.

4.3.795 Material to Physical_instance

Each Material refers to zero or one Physical_instance in the role of described_object. Each Physical_instance acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select.

4.3.796 Material to Product_class

Each Material refers to zero or one Product_class in the role of described_object. Each Product_class acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.797 Material to Product_component

Each Material refers to zero or one Product_component in the role of described_object. Each Product_component acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.798 Material to Product_function

Each Material refers to zero or one Product_function in the role of described_object. Each Product_function acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and specification_property_select.

4.3.799 Material to Shape_aspect

Each Material refers to zero or one Shape_aspect in the role of described_object. Each Shape_aspect acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and shape_select.

4.3.800 Material to Shape_aspect_relationship

Each Material refers to zero or one Shape_aspect_relationship in the role of described_object. Each Shape_aspect_relationship acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select and shape_information_select.

4.3.801 Material to Thread_feature

Each Material refers to zero or one Thread_feature in the role of described_object. Each Thread_feature acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.802 Material to Transition_feature

Each Material refers to zero or one Transition_feature in the role of described_object. Each Transition_feature acts as described_object for zero or more Material objects.

NOTE – This assertion is established through item_property_select, shape_information_select, and feature_definition_select.

4.3.803 Material_property to Material_property_representation

Each Material_property refers to one or more Material_property_representation objects in the role of material_property_value. Each Material_property_representation acts as material_property_value for zero or more Material_property objects.

4.3.804 Material_property to Multi_language_string

Each Material_property refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Material_property objects.

NOTE – This assertion is established through string_select.

4.3.805 Material_property_representation to Data_environment

Each Material_property_representation refers to exactly one Data_environment in the role of environment_condition. Each Data_environment acts as environment_condition for zero or more Material_property_representation objects.

4.3.806 Material_property_representation to Property_value

Each Material_property_representation refers to one or more Property_value objects in the role of property_value. Each Property_value acts as property_value for zero or more Material_property_representation objects.

4.3.807 Material_side_specification to Cartesian_coordinate_space

Each Material_side_specification is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Material_side_specification objects.

4.3.808 Material_side_specification to Point_on_surface

Each Material_side_specification refers to exactly one Point_on_surface in the role of position. Each Point_on_surface acts as position for zero or more Material_side_specification objects.

4.3.809 Model_change to Change

Each Model_change is_describing exactly one Change. Each Change is related to zero or more Model_change objects.

4.3.810 Model_change to Detailed_element

Each Model_change refers to zero or more Detailed_element objects in the role of added_element. Each Detailed_element acts as added_element for zero or more Model_change objects.

Each Model_change refers to zero or more Detailed_element objects in the role of deleted_element. Each Detailed_element acts as deleted_element for zero or more Model_change objects.

4.3.811 Model_change to Geometric_model_relationship

Each Model_change refers to zero or one Geometric_model_relationship in the role of change_description. Each Geometric_model_relationship acts as change_description for zero or more Model_change objects.

NOTE – This assertion is established through model_change_select.

4.3.812 Model_change to Multi_language_string

Each Model_change refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Model_change objects.

NOTE – This assertion is established through string_select.

4.3.813 Model_change to Styled_model_relationship

Each Model_change refers to zero or one Styled_model_relationship in the role of change_description. Each Styled_model_relationship acts as change_description for zero or more Model_change objects.

NOTE – This assertion is established through model_change_select.

4.3.814 Model_change to View_area_relationship

Each Model_change refers to zero or one View_area_relationship in the role of change_description. Each View_area_relationship acts as change_description for zero or more Model_change objects.

NOTE – This assertion is established through model_change_select.

4.3.815 Model_image to External_model

Each Model_image is_displaying zero or one External_model. Each External_model is related to zero or more Model_image objects.

NOTE – This assertion is established through presented_model_select.

4.3.816 Model_image to Multi_language_string

Each Model_image refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Model_image objects.

NOTE – This assertion is established through string_select.

4.3.817 Model_image to Styled_model

Each Model_image is_displaying zero or one Styled_model. Each Styled_model is related to zero or more Model_image objects.

NOTE – This assertion is established through presented_model_select.

4.3.818 Model_image to View

Each Model_image is_presented_in exactly one View. Each View has image defined by zero or one Model_image.

4.3.819 Moments_of_inertia to Cartesian_coordinate_space

Each Moments_of_inertia is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Moments_of_inertia objects.

4.3.820 Moments_of_inertia to Value_with_unit

Each Moments_of_inertia refers to one, two, or three Value_with_unit objects in the role of inertia_value. Each Value_with_unit acts as inertia_value for zero or more Moments_of_inertia objects.

4.3.821 Multi_language_string to String_with_language

Each Multi_language_string refers to one or more String_with_language objects in the role of language_dependent_string. Each String_with_language acts as language_dependent_string for zero or more Multi_language_string objects.

4.3.822 Ngon_profile to Feature_parameter

Each Ngon_profile refers to exactly one Feature_parameter in the role of circumscribed_radius. Each Feature_parameter acts as circumscribed_radius for zero or more Ngon_profile objects.

Each Ngon_profile refers to zero or one Feature_parameter in the role of corner_radius. Each Feature_parameter acts as corner_radius for zero or more Ngon_profile objects.

4.3.823 Organization_in_contract to Contract

Each Organization_in_contract refers to one or more Contract objects in the role of contract. Each Contract has release defined by zero or more Organization_in_contract objects.

4.3.824 Organization_in_contract to Date_and_person_or_organization

Each Organization_in_contract refers to zero or more Date_and_person_or_organization objects in the role of signature. Each Date_and_person_or_organization acts as signature for zero or more Organization_in_contract objects.

4.3.825 Organization_in_contract to Multi_language_string

Each Organization_in_contract refers to zero or one Multi_language_string in the role of role_of_organization. Each Multi_language_string acts as role_of_organization for zero or more Organization_in_contract objects.

NOTE – This assertion is established through string_select.

4.3.826 Organization_in_contract to Organization

Each Organization_in_contract refers to exactly one Organization in the role of contracted_organization. Each Organization acts as contracted_organization for zero or more Organization_in_contract objects.

4.3.827 Organization_relationship to Organization

Each Organization_relationship is related to exactly one Organization. Each Organization is referenced by zero or more Organization_relationship objects as related.

NOTE – The related Organization is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Organization_relationship is relating to exactly one Organization. Each Organization is referenced by zero or more Organization_relationship objects as relating.

NOTE – The relating Organization is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.828 Oriented_edge_curve to B_spline_curve

Each Oriented_edge_curve refers to zero or one B_spline_curve in the role of edge_geometry. Each B_spline_curve acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.829 Oriented_edge_curve to Circle

Each Oriented_edge_curve refers to zero or one Circle in the role of edge_geometry. Each Circle acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.830 Oriented_edge_curve to Curve_on_surface

Each Oriented_edge_curve refers to zero or one Curve_on_surface in the role of edge_geometry. Each Curve_on_surface acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.831 Oriented_edge_curve to Ellipse

Each Oriented_edge_curve refers to zero or one Ellipse in the role of edge_geometry. Each Ellipse acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.832 Oriented_edge_curve to Hyperbola

Each Oriented_edge_curve refers to zero or one Hyperbola in the role of edge_geometry. Each Hyperbola acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.833 Oriented_edge_curve to Line

Each Oriented_edge_curve refers to zero or one Line in the role of edge_geometry. Each Line acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.834 Oriented_edge_curve to Parabola

Each Oriented_edge_curve refers to zero or one Parabola in the role of edge_geometry. Each Parabola acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.835 Oriented_edge_curve to Polyline

Each Oriented_edge_curve refers to zero or one Polyline in the role of edge_geometry. Each Polyline acts as edge_geometry for zero or more Oriented_edge_curve objects.

NOTE – This assertion is established through topologically_bounded_curve_select.

4.3.836 Oriented_edge_curve to Vertex_point

Each Oriented_edge_curve refers to exactly one Vertex_point in the role of edge_end. Each Vertex_point acts as edge_end for zero or more Oriented_edge_curve objects.

Each Oriented_edge_curve refers to exactly one Vertex_point in the role of edge_start. Each Vertex_point acts as edge_start for zero or more Oriented_edge_curve objects.

4.3.837 Pair_value to Kinematic_pair

Each Pair_value is_applied_to exactly one Kinematic_pair. Each Kinematic_pair is related to zero or more Pair_value objects.

4.3.838 Panel_hole_with_barring to Closed_profile_usage

Each Panel_hole_with_barring refers to exactly one Closed_profile_usage in the role of barring_profile. Each Closed_profile_usage acts as barring_profile for zero or more Panel_hole_with_barring objects.

4.3.839 Parallelism_tolerance to Datum

Each Parallelism_tolerance refers to exactly one Datum in the role of datum. Each Datum acts as datum for zero or more Parallelism_tolerance objects.

4.3.840 Parallelism_tolerance to Reference_plane

Each Parallelism_tolerance refers to zero or one Reference_plane in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Parallelism_tolerance objects.

4.3.841 Partial_circular_path to Feature_parameter

Each Partial_circular_path refers to exactly one Feature_parameter in the role of sweep_angle. Each Feature_parameter acts as sweep_angle for zero or more Partial_circular_path objects.

4.3.842 Partial_circular_profile to Feature_parameter

Each Partial_circular_profile refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Partial_circular_profile objects.

Each Partial_circular_profile refers to exactly one Feature_parameter in the role of sweep_angle. Each Feature_parameter acts as sweep_angle for zero or more Partial_circular_profile objects.

4.3.843 Path to Cartesian_coordinate_space

Each Path is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Path objects.

4.3.844 Perpendicularity_tolerance to Datum

Each Perpendicularity_tolerance refers to exactly one Datum in the role of datum. Each Datum acts as datum for zero or more Perpendicularity_tolerance objects.

4.3.845 Perpendicularity_tolerance to Reference_plane

Each Perpendicularity_tolerance refers to zero or one Reference_plane in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Perpendicularity_tolerance objects.

4.3.846 Person_in_organization to Organization

Each Person_in_organization refers to exactly one Organization in the role of organization. Each Organization acts as organization for zero or more Person_in_organization objects.

4.3.847 Person_in_organization to Person

Each Person_in_organization refers to exactly one Person in the role of person. Each Person has organization defined by one or more Person_in_organization objects.

4.3.848 Person_or_organization_assignment to Activity

Each Person_or_organization_assignment is_applied_to zero or one Activity. Each Activity is related to exactly one Person_or_organization_assignment having the role 'custodian' and to zero or more Person_or_organization objects having other roles.

NOTE – This assertion is established through general_organizational_data_select.

4.3.849 Person_or_organization_assignment to Activity_element

Each Person_or_organization_assignment is_applied_to zero or one Activity_element. Each Activity_element is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.850 Person_or_organization_assignment to Assembly_substitute_relationship

Each Person_or_organization_assignment is_applied_to zero or one Assembly_substitute_relationship. Each Assembly_substitute_relationship is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.851 Person_or_organization_assignment to Class_category_association

Each Person_or_organization_assignment is_applied_to zero or one Class_category_association. Each Class_category_association is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.852 Person_or_organization_assignment to Class_condition_association

Each Person_or_organization_assignment is_applied_to zero or one Class_condition_association. Each Class_condition_association is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.853 Person_or_organization_assignment to Class_function_association

Each Person_or_organization_assignment is_applied_to zero or one Class_function_association. Each Class_function_association is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.854 Person_or_organization_assignment to Class_inclusion_association

Each Person_or_organization_assignment is_applied_to zero or one Class_inclusion_association. Each Class_inclusion_association is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.855 Person_or_organization_assignment to Class_specification_association

Each Person_or_organization_assignment is_applied_to zero or one Class_specification_association. Each Class_specification_association is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.856 Person_or_organization_assignment to Configuration

Each Person_or_organization_assignment is_applied_to zero or one Configuration. Each Configuration is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.857 Person_or_organization_assignment to Design_constraint

Each Person_or_organization_assignment is_applied_to zero or one Design_constraint. Each Design_constraint is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.858 Person_or_organization_assignment to Design_discipline_item_definition

Each Person_or_organization_assignment is_applied_to zero or one Design_discipline_item_definition. Each Design_discipline_item_definition is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_-select.

4.3.859 Person_or_organization_assignment to Drawing

Each Person_or_organization_assignment is_applied_to zero or one Drawing. Each Drawing is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.860 Person_or_organization_assignment to External_document

Each Person_or_organization_assignment is_applied_to zero or one External_document. Each External_document is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.861 Person_or_organization_assignment to Geometric_model

Each Person_or_organization_assignment is_applied_to zero or one Geometric_model. Each Geometric_model is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.862 Person_or_organization_assignment to Item

Each Person_or_organization_assignment is_applied_to zero or one Item. Each Item is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.863 Person_or_organization_assignment to Item_definition_instance_relationship

Each Person_or_organization_assignment is_applied_to zero or one Item_definition_instance_relationship. Each Item_definition_instance_relationship is related to zero or more Person_or_organization_-assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_-select, and item_relationship_select.

4.3.864 Person_or_organization_assignment to Item_definition_relationship

Each Person_or_organization_assignment is_applied_to zero or one Item_definition_relationship. Each Item_definition_relationship is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.865 Person_or_organization_assignment to Item_instance

Each Person_or_organization_assignment is_applied_to zero or one Item_instance. Each Item_instance is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_select.

4.3.866 Person_or_organization_assignment to Item_instance_relationship

Each Person_or_organization_assignment is_applied_to zero or one Item_instance_relationship. Each Item_instance_relationship is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.867 Person_or_organization_assignment to Item_solution

Each Person_or_organization_assignment is_applied_to zero or one Item_solution. Each Item_solution is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.868 Person_or_organization_assignment to Item_version

Each Person_or_organization_assignment is_applied_to zero or one Item_version. Each Item_version is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.869 Person_or_organization_assignment to Material

Each Person_or_organization_assignment is_applied_to zero or one Material. Each Material is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.870 Person_or_organization_assignment to Organization

Each Person_or_organization_assignment refers to zero or one Organization in the role of assigned_person_or_organization. Each Organization acts as assigned_person_or_organization for zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through person_or_organization_select.

4.3.871 Person_or_organization_assignment to Person

Each Person_or_organization_assignment refers to zero or one Person in the role of assigned_person_or_organization. Each Person acts as assigned_person_or_organization for zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through person_or_organization_select.

4.3.872 Person_or_organization_assignment to Person_in_organization

Each Person_or_organization_assignment refers to zero or one Person_in_organization in the role of assigned_person_or_organization. Each Person_in_organization acts as assigned_person_or_organization for zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through person_or_organization_select.

4.3.873 Person_or_organization_assignment to Physical_instance

Each Person_or_organization_assignment is_applied_to zero or one Physical_instance. Each Physical_instance is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.874 Person_or_organization_assignment to Physical_instance_usage

Each Person_or_organization_assignment is_applied_to zero or one Physical_instance_usage. Each Physical_instance_usage is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.875 Person_or_organization_assignment to Process_plan

Each Person_or_organization_assignment is_applied_to zero or one Process_plan. Each Process_plan is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.876 Person_or_organization_assignment to Product_class

Each Person_or_organization_assignment is_applied_to zero or one Product_class. Each Product_class is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.877 Person_or_organization_assignment to Product_component

Each Person_or_organization_assignment is_applied_to zero or one Product_component. Each Product_component is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.878 Person_or_organization_assignment to Product_function

Each Person_or_organization_assignment is_applied_to zero or one Product_function. Each Product_function is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.879 Person_or_organization_assignment to Product_specification

Each Person_or_organization_assignment is_applied_to zero or one Product_specification. Each Product_specification is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.880 Person_or_organization_assignment to Project

Each Person_or_organization_assignment is_applied_to zero or one Project. Each Project is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.881 Person_or_organization_assignment to Property

Each Person_or_organization_assignment is_applied_to zero or one Property. Each Property is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.882 Person_or_organization_assignment to Simulation_information

Each Person_or_organization_assignment is_applied_to zero or one Simulation_information. Each Simulation_information is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.883 Person_or_organization_assignment to Specification

Each Person_or_organization_assignment is_applied_to zero or one Specification. Each Specification is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.884 Person_or_organization_assignment to Specification_category

Each Person_or_organization_assignment is_applied_to zero or one Specification_category. Each Specification_category is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.885 Person_or_organization_assignment to Specification_expression

Each Person_or_organization_assignment is_applied_to zero or one Specification_expression. Each Specification_expression is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.886 Person_or_organization_assignment to Specification_inclusion

Each Person_or_organization_assignment is_applied_to zero or one Specification_inclusion. Each Specification_inclusion is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.887 Person_or_organization_assignment to Styled_model

Each Person_or_organization_assignment is_applied_to zero or one Styled_model. Each Styled_model is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.888 Person_or_organization_assignment to View_area

Each Person_or_organization_assignment is_applied_to zero or one View_area. Each View_area is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.889 Person_or_organization_assignment to Work_request

Each Person_or_organization_assignment is_applied_to zero or one Work_request. Each Work_request is related to zero or more Person_or_organization_assignment objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.890 Physical_instance to Item_version

Each Physical_instance is_based_on zero or one Item_version. Each Item_version is related to zero or more Physical_instance objects.

NOTE – This assertion is established through physical_instance_definition_select.

4.3.891 Physical_instance to Multi_language_string

Each Physical_instance refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Physical_instance objects.

NOTE – This assertion is established through string_select.

4.3.892 Physical_instance to Product_specification

Each Physical_instance is_based_on zero or one Product_specification. Each Product_specification is related to zero or more Physical_instance objects.

NOTE – This assertion is established through physical_instance_definition_select.

4.3.893 Physical_instance_usage to Item_instance

Each Physical_instance_usage refers to exactly one Item_instance in the role of role. Each Item_instance acts as role for zero or more Physical_instance_usage objects.

4.3.894 Physical_instance_usage to Physical_instance

Each Physical_instance_usage refers to exactly one Physical_instance in the role of physical_assembly. Each Physical_instance acts as physical_assembly for zero or more Physical_instance_usage objects.

Each Physical_instance_usage refers to exactly one Physical_instance in the role of physical_component. Each Physical_instance acts as physical_component for zero or more Physical_instance_usage objects.

4.3.895 Placed_feature to Feature_definition

Each Placed_feature refers to exactly one Feature_definition in the role of definition. Each Feature_definition acts as definition for zero or more Placed_feature objects.

4.3.896 Placed_feature to Feature_placement

Each Placed_feature is_placed_by exactly one Feature_placement. Each Feature_placement is_placing exactly one Placed_feature.

4.3.897 Placed_target to Axis_placement

Each Placed_target refers to exactly one Axis_placement in the role of parameter_reference. Each Axis_placement acts as parameter_reference for zero or more Placed_target objects.

4.3.898 Placed_target to Cartesian_coordinate_space

Each Placed_target is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Placed_target objects.

4.3.899 Planar_bottom_condition to Feature_parameter

Each Planar_bottom_condition refers to zero or one Feature_parameter in the role of floor_radius. Each Feature_parameter acts as floor_radius for zero or more Planar_bottom_condition objects.

4.3.900 Pocket_feature_in_solid to Angle_taper

Each Pocket_feature_in_solid refers to zero or one Angle_taper in the role of taper. Each Angle_taper acts as taper for zero or more Pocket_feature_in_solid objects.

NOTE – This assertion is established through taper_select.

4.3.901 Pocket_feature_in_solid to Diameter_taper

Each Pocket_feature_in_solid refers to zero or one Diameter_taper in the role of taper. Each Diameter_taper acts as taper for zero or more Pocket_feature_in_solid objects.

NOTE – This assertion is established through taper_select.

4.3.902 Pocket_feature_in_solid to Directed_taper

Each Pocket_feature_in_solid refers to zero or one Directed_taper in the role of taper. Each Directed_taper acts as taper for zero or more Pocket_feature_in_solid objects.

NOTE – This assertion is established through taper_select.

4.3.903 Pocket_feature_in_solid to Linear_path

Each Pocket_feature_in_solid refers to exactly one Linear_path in the role of sweep_path. Each Linear_path acts as sweep_path for zero or more Pocket_feature_in_solid objects.

4.3.904 Pocket_feature_in_solid to Pocket_bottom_condition

Each Pocket_feature_in_solid refers to exactly one Pocket_bottom_condition in the role of bottom_condition. Each Pocket_bottom_condition acts as bottom_condition for zero or more Pocket_feature_in_solid objects.

4.3.905 Pocket_feature_in_solid to Transformation

Each Pocket_feature_in_solid refers to zero or one Transformation in the role of profile_placement. Each Transformation acts as profile_placement for zero or more Pocket_feature_in_solid objects.

4.3.906 Point_direction to Cartesian_point

Each Point_direction refers to exactly one Cartesian_point in the role of location. Each Cartesian_point acts as location for zero or more Point_direction objects.

4.3.907 Point_direction_model to Point_direction_sequence

Each Point_direction_model refers to zero or more Point_direction_sequence objects in the role of point_direction. Each Point_direction_sequence acts as point_direction for zero or more Point_direction_model objects.

4.3.908 Point_direction_model to Point_sequence

Each Point_direction_model refers to zero or more Point_sequence objects in the role of point. Each Point_sequence acts as point for zero or more Point_direction_model objects.

4.3.909 Point_direction_sequence to Point_direction

Each Point_direction_sequence refers to zero or more Point_direction objects in the role of element. Each Point_direction acts as element for zero or more Point_direction_sequence objects.

NOTE – This assertion is established through point_direction_element_select.

4.3.910 Point_direction_sequence to Point_on_surface

Each Point_direction_sequence refers to zero or more Point_on_surface objects in the role of element. Each Point_on_surface acts as element for zero or more Point_direction_sequence objects.

NOTE – This assertion is established through point_direction_element_select.

4.3.911 Point_sequence to Cartesian_point

Each Point_sequence refers to one or more Cartesian_point objects in the role of element. Each Cartesian_point acts as element for zero or more Point_sequence objects.

4.3.912 Poly_loop to Cartesian_point

Each Poly_loop refers to three or more Cartesian_point objects in the role of polygon. Each Cartesian_point acts as polygon for zero or more Poly_loop objects.

4.3.913 Position_tolerance to Datum

Each Position_tolerance refers to one, two, or three Datum objects in the role of datum. Each Datum acts as datum for zero or more Position_tolerance objects.

4.3.914 Position_tolerance to Reference_plane

Each Position_tolerance refers to zero or one Reference_plane in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Position_tolerance objects.

4.3.915 Process_cost_property to Property_value

Each Process_cost_property refers to one or more Property_value objects in the role of cost_property_value. Each Property_value acts as cost_property_value for zero or more Process_cost_property objects.

4.3.916 Process_operation to Cartesian_coordinate_space

Each Process_operation is_defined_in zero or one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Process_operation objects.

4.3.917 Process_operation to Multi_language_string

Each Process_operation refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Process_operation objects.

NOTE – This assertion is established through string_select.

Each Process_operation refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Process_operation objects.

NOTE – This assertion is established through string_select.

4.3.918 Process_operation to Organization

Each Process_operation refers to zero or one Organization in the role of location. Each Organization acts as location for zero or more Process_operation objects.

4.3.919 Process_operation to Property_value

Each Process_operation refers to zero or one Property_value in the role of process_duration. Each Property_value acts as process_duration for zero or more Process_operation objects.

4.3.920 Process_operation_input_or_output to Assembly_component_relationship

Each Process_operation_input_or_output refers to zero or one Assembly_component_relationship in the role of element. Each Assembly_component_relationship acts as element for zero or more Process_operation_input_or_output objects.

NOTE – This assertion is established through process_operation_input_or_output_select.

4.3.921 Process_operation_input_or_output to Design_discipline_item_definition

Each Process_operation_input_or_output refers to zero or one Design_discipline_item_definition in the role of element. Each Design_discipline_item_definition acts as element for zero or more Process_operation_input_or_output objects.

NOTE – This assertion is established through process_operation_input_or_output_select.

4.3.922 Process_operation_input_or_output to Item_instance

Each Process_operation_input_or_output refers to zero or one Item_instance in the role of element. Each Item_instance acts as element for zero or more Process_operation_input_or_output objects.

NOTE – This assertion is established through process_operation_input_or_output_select.

4.3.923 Process_operation_input_or_output to Mated_item_association

Each Process_operation_input_or_output refers to zero or one Mated_item_association in the role of element. Each Mated_item_association acts as element for zero or more Process_operation_input_or_output objects.

NOTE – This assertion is established through process_operation_input_or_output_select.

4.3.924 Process_operation_input_or_output to Multi_language_string

Each Process_operation_input_or_output refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Process_operation_input_or_output objects.

NOTE – This assertion is established through string_select.

4.3.925 Process_operation_input_or_output to Process_plan_operation_assignment

Each Process_operation_input_or_output refers to exactly one Process_plan_operation_assignment in the role of operation. Each Process_plan_operation_assignment acts as operation for zero or more Process_operation_input_or_output objects.

4.3.926 Process_operation_input_or_output to Shape_aspect

Each Process_operation_input_or_output refers to zero or more Shape_aspect objects in the role of concerned_shape. Each Shape_aspect acts as concerned_shape for zero or more Process_operation_input_or_output objects.

4.3.927 Process_operation_input_or_output to Transformation

Each Process_operation_input_or_output refers to zero or one Transformation in the role of transformation. Each Transformation acts as transformation for zero or more Process_operation_input_or_output objects.

4.3.928 Process_operation_relationship to Multi_language_string

Each Process_operation_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Process_operation_relationship objects.

NOTE – This assertion is established through string_select.

4.3.929 Process_operation_relationship to Process_operation

Each Process_operation_relationship is related to exactly one Process_operation. Each Process_operation is referenced by zero or more Process_operation_relationship objects as related.

NOTE – The related Process_operation is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Process_operation_relationship is relating to exactly one Process_operation. Each Process_operation is referenced by zero or more Process_operation_relationship objects as relating.

NOTE – The relating Process_operation is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.930 Process_operation_relationship to Property_value

Each Process_operation_relationship refers to zero or one Property_value in the role of waiting_time. Each Property_value acts as waiting_time for zero or more Process_operation_relationship objects.

4.3.931 Process_operation_resource to Multi_language_string

Each Process_operation_resource refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Process_operation_resource objects.

NOTE – This assertion is established through string_select.

4.3.932 Process_operation_resource_assignment to Design_discipline_item_definition

Each Process_operation_resource_assignment refers to zero or one Design_discipline_item_definition in the role of resource. Each Design_discipline_item_definition acts as resource for zero or more Process_operation_resource_assignment objects.

NOTE – This assertion is established through resource_select.

4.3.933 Process_operation_resource_assignment to Multi_language_string

Each Process_operation_resource_assignment refers to zero or one Multi_language_string in the role of reason. Each Multi_language_string acts as reason for zero or more Process_operation_resource_assignment objects.

NOTE – This assertion is established through string_select.

4.3.934 Process_operation_resource_assignment to Process_operation

Each Process_operation_resource_assignment refers to exactly one Process_operation in the role of operation. Each Process_operation acts as operation for zero or more Process_operation_resource_assignment objects.

4.3.935 Process_operation_resource_assignment to Process_operation_resource

Each Process_operation_resource_assignment refers to zero or one Process_operation_resource in the role of resource. Each Process_operation_resource acts as resource for zero or more Process_-

operation_resource_assignment objects.

NOTE – This assertion is established through resource_select.

4.3.936 Process_operation_resource_assignment to Property_value

Each Process_operation_resource_assignment refers to zero or one Property_value in the role of process_duration_for_resource. Each Property_value acts as process_duration_for_resource for zero or more Process_operation_resource_assignment objects.

4.3.937 Process_operation_resource_assignment to Transformation

Each Process_operation_resource_assignment refers to zero or one Transformation in the role of transformation. Each Transformation acts as transformation for zero or more Process_operation_resource_assignment objects.

4.3.938 Process_plan to Item_version

Each Process_plan refers to zero or more Item_version objects in the role of produced_output. Each Item_version acts as produced_output for zero or more Process_plan objects.

4.3.939 Process_plan to Multi_language_string

Each Process_plan refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Process_plan objects.

NOTE – This assertion is established through string_select.

Each Process_plan refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Process_plan objects.

NOTE – This assertion is established through string_select.

4.3.940 Process_plan to Organization

Each Process_plan refers to zero or one Organization in the role of location. Each Organization acts as location for zero or more Process_plan objects.

4.3.941 Process_plan_operation_assignment to Process_operation

Each Process_plan_operation_assignment refers to exactly one Process_operation in the role of operation. Each Process_operation acts as operation for zero or more Process_plan_operation_assignment objects.

4.3.942 Process_plan_operation_assignment to Process_plan

Each Process_plan_operation_assignment refers to exactly one Process_plan in the role of plan. Each Process_plan acts as plan for zero or more Process_plan_operation_assignment objects.

4.3.943 Process_plan_relationship to Multi_language_string

Each Process_plan_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Process_plan_relationship objects.

NOTE – This assertion is established through string_select.

4.3.944 Process_plan_relationship to Process_plan

Each Process_plan_relationship is related to exactly one Process_plan. Each Process_plan is referenced by zero or more Process_plan_relationship objects as related.

NOTE – The related Process_plan is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Process_plan_relationship is relating to exactly one Process_plan. Each Process_plan is referenced by zero or more Process_plan_relationship objects as relating.

NOTE – The relating Process_plan is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.945 Process_property to Process_operation

Each Process_property refers to zero or one Process_operation in the role of described_object. Each Process_operation acts as described_object for zero or more Process_property objects.

NOTE – This assertion is established through process_information_select.

4.3.946 Process_property to Process_plan

Each Process_property refers to zero or one Process_plan in the role of described_object. Each Process_plan acts as described_object for zero or more Process_property objects.

NOTE – This assertion is established through process_information_select.

4.3.947 Process_quality_property to Multi_language_string

Each Process_quality_property refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Process_quality_property objects.

NOTE – This assertion is established through string_select.

4.3.948 Process_quality_property to Property_value

Each Process_quality_property refers to one or more Property_value objects in the role of quality_property_value. Each Property_value acts as quality_property_value for zero or more Process_quality_property objects.

4.3.949 Process_state to Design_discipline_item_definition

Each Process_state refers to exactly one Design_discipline_item_definition in the role of related_item_definition. Each Design_discipline_item_definition acts as related_item_definition for zero or more Process_state objects.

4.3.950 Product_class to Multi_language_string

Each Product_class refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Product_class objects.

NOTE – This assertion is established through string_select.

Each Product_class refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Product_class objects.

NOTE – This assertion is established through string_select.

4.3.951 Product_class to Product_component

Each Product_class refers to zero or one Product_component in the role of root. Each Product_component is_root_entry_for zero or one Product_class.

4.3.952 Product_class_hierarchy to Product_class

Each Product_class_hierarchy refers to exactly one Product_class in the role of sub_class. Each Product_class acts as sub_class for zero or more Product_class_hierarchy objects.

Each Product_class_hierarchy refers to exactly one Product_class in the role of super_class. Each Product_class acts as super_class for zero or more Product_class_hierarchy objects.

4.3.953 Product_component to Application_context

Each Product_component is_relevant_for one or more Application_context objects. Each Application_context is related to zero or more Product_component objects.

4.3.954 Product_component to Class_category_association

Each Product_component is_influenced_by zero or more Class_category_association objects. Each Class_category_association is related to zero or more Product_component objects.

4.3.955 Product_component to Multi_language_string

Each Product_component refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Product_component objects.

NOTE – This assertion is established through string_select.

Each Product_component refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Product_component objects.

NOTE – This assertion is established through string_select.

4.3.956 Product_component_relationship to Multi_language_string

Each Product_component_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Product_component_relationship objects.

NOTE – This assertion is established through string_select.

4.3.957 Product_component_relationship to Product_component

Each Product_component_relationship is related to exactly one Product_component. Each Product_component is referenced by zero or more Product_component_relationship objects as related.

NOTE – The related Product_component is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Product_component_relationship is relating to exactly one Product_component. Each Product_component is referenced by zero or more Product_component_relationship objects as relating.

NOTE – The relating Product_component is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.958 Product_function to Application_context

Each Product_function is_relevant_for one or more Application_context objects. Each Application_context is related to zero or more Product_function objects.

4.3.959 Product_function to Multi_language_string

Each Product_function refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Product_function objects.

NOTE – This assertion is established through string_select.

Each Product_function refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Product_function objects.

NOTE – This assertion is established through string_select.

4.3.960 Product_function_relationship to Multi_language_string

Each Product_function_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Product_function_relationship objects.

NOTE – This assertion is established through string_select.

4.3.961 Product_function_relationship to Product_function

Each Product_function_relationship is related to exactly one Product_function. Each Product_function is referenced by zero or more Product_function_relationship objects as related.

NOTE – The related Product_function is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Product_function_relationship is relating to exactly one Product_function. Each Product_function is referenced by zero or more Product_function_relationship objects as relating.

NOTE – The relating Product_function is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.962 Product_specification to Item_version

Each Product_specification refers to zero or one Item_version in the role of explicit_product_version. Each Item_version has implicit_product_version defined by zero or one Product_specification.

4.3.963 Product_specification to Multi_language_string

Each Product_specification refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Product_specification objects.

NOTE – This assertion is established through string_select.

4.3.964 Product_specification to Product_class

Each Product_specification refers to exactly one Product_class in the role of product_class. Each Product_class acts as product_class for zero or more Product_specification objects.

4.3.965 Product_specification to Specification

Each Product_specification refers to zero or more Specification objects in the role of specification. Each Specification acts as specification for zero or more Product_specification objects.

4.3.966 Profile to Axis_placement

Each Profile refers to zero or one Axis_placement in the role of parameter_reference. Each Axis_placement acts as parameter_reference for zero or more Profile objects.

4.3.967 Profile to Cartesian_coordinate_space

Each Profile is_defined_in exactly one Cartesian_coordinate_space. Each Cartesian_coordinate_space is related to zero or more Profile objects.

4.3.968 Project to Activity

Each Project refers to zero or more Activity objects in the role of work_program. Each Activity has associated_project defined by zero or one Project.

4.3.969 Project to Date_time

Each Project refers to zero or one Date_time in the role of actual_end_date. Each Date_time acts as actual_end_date for zero or more Project objects.

Each Project refers to zero or one Date_time in the role of actual_start_date. Each Date_time acts as actual_start_date for zero or more Project objects.

Each Project refers to zero or one Date_time in the role of planned_end_date. Each Date_time acts as planned_end_date for zero or more Project objects.

NOTE – This assertion is established through period_or_date_select.

Each Project refers to zero or one Date_time in the role of planned_start_date. Each Date_time acts as planned_start_date for zero or more Project objects.

NOTE – This assertion is established through event_or_date_select.

4.3.970 Project to Event_reference

Each Project refers to zero or one Event_reference in the role of planned_end_date. Each Event_reference acts as planned_end_date for zero or more Project objects.

NOTE – This assertion is established through period_or_date_select.

Each Project refers to zero or one Event_reference in the role of planned_start_date. Each Event_reference acts as planned_start_date for zero or more Project objects.

NOTE – This assertion is established through event_or_date_select.

4.3.971 Project to Multi_language_string

Each Project refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Project objects.

NOTE – This assertion is established through string_select.

Each Project refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Project objects.

NOTE – This assertion is established through string_select.

4.3.972 Project to Product_class

Each Project refers to zero or more Product_class objects in the role of affected_product_class. Each Product_class acts as affected_product_class for zero or more Project objects.

4.3.973 Project to Value_with_unit

Each Project refers to zero or one Value_with_unit in the role of planned_end_date. Each Value_with_unit acts as planned_end_date for zero or more Project objects.

NOTE – This assertion is established through period_or_date_select.

4.3.974 Project_relationship to Multi_language_string

Each Project_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Project_relationship objects.

NOTE – This assertion is established through string_select.

4.3.975 Project_relationship to Project

Each Project_relationship is related to exactly one Project. Each Project is referenced by zero or more Project_relationship objects as related.

NOTE – The related Project is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Project_relationship is relating to exactly one Project. Each Project is referenced by zero or more Project_relationship objects as relating.

NOTE – The relating Project is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.976 Projection to Shape_aspect

Each Projection refers to exactly one Shape_aspect in the role of projection_end. Each Shape_aspect acts as projection_end for zero or more Projection objects.

4.3.977 Projection to Tolerance_zone

Each Projection is_specifying exactly one Tolerance_zone. Each Tolerance_zone has created_by defined by zero, one, two, or three Projection objects.

4.3.978 Property_change to Change

Each Property_change is_describing exactly one Change. Each Change is related to zero or more Property_change objects.

4.3.979 Property_change to Multi_language_string

Each Property_change refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Property_change objects.

NOTE – This assertion is established through string_select.

4.3.980 Property_change to Property

Each Property_change refers to zero or more Property objects in the role of added_property. Each Property acts as added_property for zero or more Property_change objects.

Each Property_change refers to zero or more Property objects in the role of deleted_property. Each Property acts as deleted_property for zero or more Property_change objects.

4.3.981 Property_relationship to Multi_language_string

Each Property_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Property_relationship objects.

NOTE – This assertion is established through string_select.

4.3.982 Property_relationship to Property

Each Property_relationship is related to exactly one Property. Each Property is referenced by zero or more Property_relationship objects as related.

NOTE – The related Property is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Property_relationship is relating to exactly one Property. Each Property is referenced by zero or more Property_relationship objects as relating.

NOTE – The relating Property is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.983 Property_value to Multi_language_string

Each Property_value refers to zero or one Multi_language_string in the role of specified_value. Each Multi_language_string acts as specified_value for zero or more Property_value objects.

NOTE – This assertion is established through property_value_select and string_select.

4.3.984 Property_value to Value_with_unit

Each Property_value refers to zero or one Value_with_unit in the role of specified_value. Each Value_with_unit acts as specified_value for zero or more Property_value objects.

NOTE – This assertion is established through property_value_select.

4.3.985 Quantified_instance to Value_with_unit

Each Quantified_instance refers to exactly one Value_with_unit in the role of quantity. Each Value_with_unit acts as quantity for zero or more Quantified_instance objects.

4.3.986 Rectangular_boss to Rectangular_closed_profile

Each Rectangular_boss refers to exactly one Rectangular_closed_profile in the role of boundary. Each Rectangular_closed_profile acts as boundary for zero or more Rectangular_boss objects.

4.3.987 Rectangular_closed_pocket_in_solid to Rectangular_closed_profile

Each Rectangular_closed_pocket_in_solid refers to exactly one Rectangular_closed_profile in the role of boundary. Each Rectangular_closed_profile acts as boundary for zero or more Rectangular_closed_pocket_in_solid objects.

4.3.988 Rectangular_closed_profile to Feature_parameter

Each Rectangular_closed_profile refers to zero or one Feature_parameter in the role of corner_radius. Each Feature_parameter acts as corner_radius for zero or more Rectangular_closed_profile objects.

Each Rectangular_closed_profile refers to exactly one Feature_parameter in the role of profile_length. Each Feature_parameter acts as profile_length for zero or more Rectangular_closed_profile objects.

Each Rectangular_closed_profile refers to exactly one Feature_parameter in the role of profile_width. Each Feature_parameter acts as profile_width for zero or more Rectangular_closed_profile objects.

4.3.989 Rectangular_offset_pattern to Feature_parameter

Each Rectangular_offset_pattern refers to exactly one Feature_parameter in the role of offset_distance. Each Feature_parameter acts as offset_distance for zero or more Rectangular_offset_pattern objects.

4.3.990 Rectangular_open_pocket_in_solid to Square_u_profile

Each Rectangular_open_pocket_in_solid refers to exactly one Square_u_profile in the role of boundary. Each Square_u_profile acts as boundary for zero or more Rectangular_open_pocket_in_solid objects.

4.3.991 Rectangular_pattern to Feature_parameter

Each Rectangular_pattern refers to exactly one Feature_parameter in the role of column_spacing. Each Feature_parameter acts as column_spacing for zero or more Rectangular_pattern objects.

Each Rectangular_pattern refers to exactly one Feature_parameter in the role of row_spacing. Each Feature_parameter acts as row_spacing for zero or more Rectangular_pattern objects.

4.3.992 Rectangular_pattern to Rectangular_offset_pattern

Each Rectangular_pattern refers to zero or more Rectangular_offset_pattern objects in the role of relocated_feature. Each Rectangular_offset_pattern acts as relocated_feature for zero or more Rectangular_pattern objects.

4.3.993 Rectangular_pattern to Rectangular_omit_pattern

Each Rectangular_pattern refers to zero or more Rectangular_omit_pattern objects in the role of missing_feature. Each Rectangular_omit_pattern acts as missing_feature for zero or more Rectangular_pattern objects.

4.3.994 Recyclability to Multi_language_string

Each Recyclability refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Recyclability objects.

NOTE – This assertion is established through string_select.

4.3.995 Recyclability to Property_value

Each Recyclability refers to one or more Property_value objects in the role of recycling_class_value. Each Property_value acts as recycling_class_value for zero or more Recyclability objects.

4.3.996 Replaced_definition_relationship to Multi_language_string

Each Replaced_definition_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Replaced_definition_relationship objects.

NOTE – This assertion is established through string_select.

4.3.997 Replaced_usage_relationship to Multi_language_string

Each Replaced_usage_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Replaced_usage_relationship objects.

NOTE – This assertion is established through string_select.

4.3.998 Replicate_base_assignment to Feature_definition

Each Replicate_base_assignment refers to exactly one Feature_definition in the role of base_-feature. Each Feature_definition acts as base_feature for zero or more Replicate_base_assignment objects.

4.3.999 Replicate_base_assignment to Transformation

Each Replicate_base_assignment refers to zero or one Transformation in the role of transformation. Each Transformation acts as transformation for zero or more Replicate_base_assignment objects.

4.3.1000 Replicate_feature to Replicate_base_assignment

Each Replicate_feature refers to exactly one Replicate_base_assignment in the role of replicate_-base. Each Replicate_base_assignment acts as replicate_base for zero or more Replicate_feature objects.

4.3.1001 Retention_period to Activity

Each Retention_period is_applied_to zero or more Activity objects. Each Activity is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1002 Retention_period to Activity_element

Each Retention_period is_applied_to zero or more Activity_element objects. Each Activity_-element is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1003 Retention_period to Assembly_substitute_relationship

Each Retention_period is_applied_to zero or more Assembly_substitute_relationship objects. Each Assembly_substitute_relationship is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1004 Retention_period to Class_category_association

Each Retention_period is_applied_to zero or more Class_category_association objects. Each Class_category_association is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.1005 Retention_period to Class_condition_association

Each Retention_period is_applied_to zero or more Class_condition_association objects. Each Class_condition_association is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.1006 Retention_period to Class_function_association

Each Retention_period is_applied_to zero or more Class_function_association objects. Each Class_function_association is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1007 Retention_period to Class_inclusion_association

Each Retention_period is_applied_to zero or more Class_inclusion_association objects. Each Class_inclusion_association is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.1008 Retention_period to Class_specification_association

Each Retention_period is_applied_to zero or more Class_specification_association objects. Each Class_specification_association is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.1009 Retention_period to Configuration

Each Retention_period is_applied_to zero or more Configuration objects. Each Configuration is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1010 Retention_period to Date_time

Each Retention_period refers to zero or one Date_time in the role of earliest_end_definition. Each Date_time acts as earliest_end_definition for zero or more Retention_period objects.

NOTE – This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Date_time in the role of latest_end_definition. Each Date_time acts as latest_end_definition for zero or more Retention_period objects.

NOTE – This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Date_time in the role of start_definition. Each Date_time acts as start_definition for zero or more Retention_period objects.

NOTE – This assertion is established through event_or_date_select.

4.3.1011 Retention_period to Design_constraint

Each Retention_period is_applied_to zero or more Design_constraint objects. Each Design_constraint is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1012 Retention_period to Design_discipline_item_definition

Each Retention_period is_applied_to zero or more Design_discipline_item_definition objects. Each Design_discipline_item_definition is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_select.

4.3.1013 Retention_period to Drawing

Each Retention_period is_applied_to zero or more Drawing objects. Each Drawing is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1014 Retention_period to Event_reference

Each Retention_period refers to zero or one Event_reference in the role of earliest_end_definition. Each Event_reference acts as earliest_end_definition for zero or more Retention_period objects.

NOTE – This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Event_reference in the role of latest_end_definition. Each Event_reference acts as latest_end_definition for zero or more Retention_period objects.

NOTE – This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Event_reference in the role of start_definition. Each Event_reference acts as start_definition for zero or more Retention_period objects.

NOTE – This assertion is established through event_or_date_select.

4.3.1015 Retention_period to External_document

Each Retention_period is_applied_to zero or more External_document objects. Each External_document is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1016 Retention_period to Geometric_model

Each Retention_period is_applied_to zero or more Geometric_model objects. Each Geometric_model is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.1017 Retention_period to Item

Each Retention_period is_applied_to zero or more Item objects. Each Item is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1018 Retention_period to Item_definition_instance_relationship

Each Retention_period is_applied_to zero or more Item_definition_instance_relationship objects. Each Item_definition_instance_relationship is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.1019 Retention_period to Item_definition_relationship

Each Retention_period is_applied_to zero or more Item_definition_relationship objects. Each Item_definition_relationship is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.1020 Retention_period to Item_instance

Each Retention_period is_applied_to zero or more Item_instance objects. Each Item_instance is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and item_information_select.

4.3.1021 Retention_period to Item_instance_relationship

Each Retention_period is_applied_to zero or more Item_instance_relationship objects. Each Item_instance_relationship is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select, item_information_select, and item_relationship_select.

4.3.1022 Retention_period to Item_solution

Each Retention_period is_applied_to zero or more Item_solution objects. Each Item_solution is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1023 Retention_period to Item_version

Each Retention_period is_applied_to zero or more Item_version objects. Each Item_version is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1024 Retention_period to Material

Each Retention_period is_applied_to zero or more Material objects. Each Material is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1025 Retention_period to Multi_language_string

Each Retention_period refers to zero or one Multi_language_string in the role of retention_purpose. Each Multi_language_string acts as retention_purpose for zero or more Retention_period objects.

NOTE – This assertion is established through string_select.

4.3.1026 Retention_period to Physical_instance

Each Retention_period is_applied_to zero or more Physical_instance objects. Each Physical_instance is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1027 Retention_period to Physical_instance_usage

Each Retention_period is_applied_to zero or more Physical_instance_usage objects. Each Physical_instance_usage is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1028 Retention_period to Process_plan

Each Retention_period is_applied_to zero or more Process_plan objects. Each Process_plan is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1029 Retention_period to Product_class

Each Retention_period is_applied_to zero or more Product_class objects. Each Product_class is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1030 Retention_period to Product_component

Each Retention_period is_applied_to zero or more Product_component objects. Each Product_component is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1031 Retention_period to Product_function

Each Retention_period is_applied_to zero or more Product_function objects. Each Product_function is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1032 Retention_period to Product_specification

Each Retention_period is_applied_to zero or more Product_specification objects. Each Product_specification is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1033 Retention_period to Project

Each Retention_period is_applied_to zero or more Project objects. Each Project is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1034 Retention_period to Property

Each Retention_period is_applied_to zero or more Property objects. Each Property is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1035 Retention_period to Simulation_information

Each Retention_period is_applied_to zero or more Simulation_information objects. Each Simulation_information is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.1036 Retention_period to Specification

Each Retention_period is_applied_to zero or more Specification objects. Each Specification is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1037 Retention_period to Specification_category

Each Retention_period is_applied_to zero or more Specification_category objects. Each Specification_category is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and specification_information_select.

4.3.1038 Retention_period to Specification_expression

Each Retention_period is_applied_to zero or more Specification_expression objects. Each Specification_expression is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.1039 Retention_period to Specification_inclusion

Each Retention_period is_applied_to zero or more Specification_inclusion objects. Each Specification_inclusion is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and configuration_information_select.

4.3.1040 Retention_period to Styled_model

Each Retention_period is_applied_to zero or more Styled_model objects. Each Styled_model is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select and model_select.

4.3.1041 Retention_period to Value_with_unit

Each Retention_period refers to zero or one Value_with_unit in the role of earliest_end_definition. Each Value_with_unit acts as earliest_end_definition for zero or more Retention_period objects.

NOTE – This assertion is established through period_or_date_select.

Each Retention_period refers to zero or one Value_with_unit in the role of latest_end_definition. Each Value_with_unit acts as latest_end_definition for zero or more Retention_period objects.

NOTE – This assertion is established through period_or_date_select.

4.3.1042 Retention_period to View_area

Each Retention_period is_applied_to zero or more View_area objects. Each View_area is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1043 Retention_period to Work_request

Each Retention_period is_applied_to zero or more Work_request objects. Each Work_request is related to zero or more Retention_period objects.

NOTE – This assertion is established through general_organizational_data_select.

4.3.1044 Rib_feature to Directed_taper

Each Rib_feature refers to zero or one Directed_taper in the role of draft_taper. Each Directed_taper acts as draft_taper for zero or more Rib_feature objects.

4.3.1045 Rib_feature to Feature_parameter

Each Rib_feature refers to zero or one Feature_parameter in the role of fillet_radius. Each Feature_parameter acts as fillet_radius for zero or more Rib_feature objects.

Each Rib_feature refers to zero or one Feature_parameter in the role of shoulder_radius. Each Feature_parameter acts as shoulder_radius for zero or more Rib_feature objects.

4.3.1046 Rib_feature to Open_profile

Each Rib_feature refers to exactly one Open_profile in the role of rib_profile. Each Open_profile acts as rib_profile for zero or more Rib_feature objects.

4.3.1047 Rib_feature to Path

Each Rib_feature refers to exactly one Path in the role of sweep_path. Each Path acts as sweep_path for zero or more Rib_feature objects.

4.3.1048 Rib_feature to Transformation

Each Rib_feature refers to zero or one Transformation in the role of profile_placement. Each Transformation acts as profile_placement for zero or more Rib_feature objects.

4.3.1049 Roughness to Curve_on_surface

Each Roughness refers to zero or one Curve_on_surface in the role of measuring_direction. Each Curve_on_surface acts as measuring_direction for zero or more Roughness objects.

4.3.1050 Roughness to Value_with_unit

Each Roughness refers to zero or one Value_with_unit in the role of cutoff_value. Each Value_with_unit acts as cutoff_value for zero or more Roughness objects.

Each Roughness refers to exactly one Value_with_unit in the role of roughness_max_value. Each Value_with_unit acts as roughness_max_value for zero or more Roughness objects.

Each Roughness refers to zero or one Value_with_unit in the role of roughness_min_value. Each Value_with_unit acts as roughness_min_value for zero or more Roughness objects.

Each Roughness refers to zero or one Value_with_unit in the role of sampling_length. Each Value_with_unit acts as sampling_length for zero or more Roughness objects.

4.3.1051 Round_hole to Angle_taper

Each Round_hole refers to zero or one Angle_taper in the role of taper. Each Angle_taper acts as taper for zero or more Round_hole objects.

NOTE – This assertion is established through taper_select.

4.3.1052 Round_hole to Chamfer_definition

Each Round_hole refers to zero or one Chamfer_definition in the role of top_chamfer. Each Chamfer_definition acts as top_chamfer for zero or more Round_hole objects.

4.3.1053 Round_hole to Circular_closed_profile

Each Round_hole refers to exactly one Circular_closed_profile in the role of boundary. Each Circular_closed_profile acts as boundary for zero or more Round_hole objects.

4.3.1054 Round_hole to Diameter_taper

Each Round_hole refers to zero or one Diameter_taper in the role of taper. Each Diameter_taper acts as taper for zero or more Round_hole objects.

NOTE – This assertion is established through taper_select.

4.3.1055 Round_hole to Directed_taper

Each Round_hole refers to zero or one Directed_taper in the role of taper. Each Directed_taper acts as taper for zero or more Round_hole objects.

NOTE – This assertion is established through taper_select.

4.3.1056 Round_hole to Hole_bottom_condition

Each Round_hole refers to exactly one Hole_bottom_condition in the role of bottom_condition. Each Hole_bottom_condition acts as bottom_condition for zero or more Round_hole objects.

4.3.1057 Round_hole to Linear_path

Each Round_hole refers to exactly one Linear_path in the role of sweep_path. Each Linear_path acts as sweep_path for zero or more Round_hole objects.

4.3.1058 Round_hole to Transformation

Each Round_hole refers to zero or one Transformation in the role of profile_placement. Each Transformation acts as profile_placement for zero or more Round_hole objects.

4.3.1059 Rounded_u_profile to Feature_parameter

Each Rounded_u_profile refers to exactly one Feature_parameter in the role of width. Each Feature_parameter acts as width for zero or more Rounded_u_profile objects.

4.3.1060 Same_time_machining_relationship to Geometric_model_relationship_with_transformation

Each Same_time_machining_relationship refers to zero or one Geometric_model_relationship_with_transformation in the role of transformation. Each Geometric_model_relationship_with_transformation acts as transformation for zero or more Same_time_machining_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.1061 Same_time_machining_relationship to Multi_language_string

Each Same_time_machining_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Same_time_machining_relationship objects.

NOTE – This assertion is established through string_select.

Each Same_time_machining_relationship refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Same_time_machining_relationship objects.

NOTE – This assertion is established through string_select.

4.3.1062 Same_time_machining_relationship to Template_instance

Each Same_time_machining_relationship refers to zero or one Template_instance in the role of transformation. Each Template_instance acts as transformation for zero or more Same_time_machining_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.1063 Security_classification to Activity

Each Security_classification is_applied_to zero or more Activity objects. Each Activity is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1064 Security_classification to Activity_element

Each Security_classification is_applied_to zero or more Activity_element objects. Each Activity_element is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1065 Security_classification to Assembly_substitute_relationship

Each Security_classification is_applied_to zero or more Assembly_substitute_relationship objects. Each Assembly_substitute_relationship is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1066 Security_classification to Class_function_association

Each Security_classification is_applied_to zero or more Class_function_association objects. Each Class_function_association is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1067 Security_classification to Configuration

Each Security_classification is_applied_to zero or more Configuration objects. Each Configuration is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1068 Security_classification to Design_constraint

Each Security_classification is_applied_to zero or more Design_constraint objects. Each Design_constraint is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1069 Security_classification to Drawing

Each Security_classification is_applied_to zero or more Drawing objects. Each Drawing is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1070 Security_classification to External_document

Each Security_classification is_applied_to zero or more External_document objects. Each External_document is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1071 Security_classification to Geometric_model

Each Security_classification is_applied_to zero or more Geometric_model objects. Each Geometric_model is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and model_select.

4.3.1072 Security_classification to Item

Each Security_classification is_applied_to zero or more Item objects. Each Item is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1073 Security_classification to Item_solution

Each Security_classification is_applied_to zero or more Item_solution objects. Each Item_solution is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1074 Security_classification to Item_version

Each Security_classification is_applied_to zero or more Item_version objects. Each Item_version is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1075 Security_classification to Material

Each Security_classification is_applied_to zero or more Material objects. Each Material is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1076 Security_classification to Multi_language_string

Each Security_classification refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_string acts as purpose for zero or more Security_classification objects.

NOTE – This assertion is established through string_select.

4.3.1077 Security_classification to Physical_instance

Each Security_classification is_applied_to zero or more Physical_instance objects. Each Physical_instance is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1078 Security_classification to Physical_instance_usage

Each Security_classification is_applied_to zero or more Physical_instance_usage objects. Each Physical_instance_usage is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1079 Security_classification to Process_plan

Each Security_classification is_applied_to zero or more Process_plan objects. Each Process_plan is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1080 Security_classification to Product_class

Each Security_classification is_applied_to zero or more Product_class objects. Each Product_class is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1081 Security_classification to Product_component

Each Security_classification is_applied_to zero or more Product_component objects. Each Product_component is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1082 Security_classification to Product_function

Each Security_classification is_applied_to zero or more Product_function objects. Each Product_function is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1083 Security_classification to Project

Each Security_classification is_applied_to zero or more Project objects. Each Project is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1084 Security_classification to Property

Each Security_classification is_applied_to zero or more Property objects. Each Property is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1085 Security_classification to Security_level

Each Security_classification refers to exactly one Security_level in the role of security_classification_level. Each Security_level acts as security_classification_level for zero or more Security_classification objects.

4.3.1086 Security_classification to Simulation_information

Each Security_classification is_applied_to zero or more Simulation_information objects. Each Simulation_information is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and model_select.

4.3.1087 Security_classification to Specification

Each Security_classification is_applied_to zero or more Specification objects. Each Specification is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1088 Security_classification to Specification_category

Each Security_classification is_applied_to zero or more Specification_category objects. Each Specification_category is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and specification_information_select.

4.3.1089 Security_classification to Styled_model

Each Security_classification is_applied_to zero or more Styled_model objects. Each Styled_model is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select and model_select.

4.3.1090 Security_classification to View_area

Each Security_classification is_applied_to zero or more View_area objects. Each View_area is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1091 Security_classification to Work_order

Each Security_classification is_applied_to zero or more Work_order objects. Each Work_order is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1092 Security_classification to Work_request

Each Security_classification is_applied_to zero or more Work_request objects. Each Work_request is related to zero or more Security_classification objects.

NOTE – This assertion is established through security_element_select.

4.3.1093 Security_level to Classification_system

Each Security_level refers to zero or one Classification_system in the role of used_classification_system. Each Classification_system acts as used_classification_system for zero or more Security_level objects.

4.3.1094 Selected_instance to Value_with_unit

Each Selected_instance refers to zero or one Value_with_unit in the role of maximum_quantity. Each Value_with_unit acts as maximum_quantity for zero or more Selected_instance objects.

Each Selected_instance refers to zero or one Value_with_unit in the role of minimum_quantity. Each Value_with_unit acts as minimum_quantity for zero or more Selected_instance objects.

4.3.1095 Shape_aspect to Item_shape

Each Shape_aspect refers to exactly one Item_shape in the role of composition. Each Item_shape acts as composition for zero or more Shape_aspect objects.

4.3.1096 Shape_aspect to Multi_language_string

Each Shape_aspect refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Shape_aspect objects.

NOTE – This assertion is established through string_select.

4.3.1097 Shape_aspect_relationship to Multi_language_string

Each Shape_aspect_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Shape_aspect_relationship objects.

NOTE – This assertion is established through string_select.

4.3.1098 Shape_aspect_relationship to Shape_aspect

Each Shape_aspect_relationship is related to exactly one Shape_aspect. Each Shape_aspect is referenced by zero or more Shape_aspect_relationship objects as related.

NOTE – The related Shape_aspect is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Shape_aspect_relationship is relating to exactly one Shape_aspect. Each Shape_aspect is referenced by zero or more Shape_aspect_relationship objects as relating.

NOTE – The relating Shape_aspect is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1099 Shape_dependent_property to Item_shape

Each Shape_dependent_property refers to zero or one Item_shape in the role of described_object. Each Item_shape acts as described_object for zero or more Shape_dependent_property objects.

NOTE – This assertion is established through shape_select.

4.3.1100 Shape_dependent_property to Shape_aspect

Each Shape_dependent_property refers to zero or one Shape_aspect in the role of described_object. Each Shape_aspect acts as described_object for zero or more Shape_dependent_property objects.

NOTE – This assertion is established through shape_select.

4.3.1101 Shape_description_association to External_model

Each Shape_description_association refers to zero or one External_model in the role of defining_geometry. Each External_model acts as defining_geometry for zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_definition_select.

4.3.1102 Shape_description_association to Feature_definition

Each Shape_description_association is_defining_shape_for zero or one Feature_definition. Each Feature_definition is related to zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_information_select and feature_definition_select.

4.3.1103 Shape_description_association to General_feature

Each Shape_description_association is_defining_shape_for zero or one General_feature. Each General_feature is related to zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_information_select and feature_definition_select.

4.3.1104 Shape_description_association to Geometric_model

Each Shape_description_association refers to zero or one Geometric_model in the role of defining_geometry. Each Geometric_model acts as defining_geometry for zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_definition_select.

4.3.1105 Shape_description_association to Item_shape

Each Shape_description_association is_defining_shape_for zero or one Item_shape. Each Item_shape is related to zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_information_select and shape_select.

4.3.1106 Shape_description_association to Shape_aspect

Each Shape_description_association is_defining_shape_for zero or one Shape_aspect. Each Shape_aspect is related to zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_information_select and shape_select.

4.3.1107 Shape_description_association to Shape_aspect_relationship

Each Shape_description_association is_defining_shape_for zero or one Shape_aspect_relationship. Each Shape_aspect_relationship is related to zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_information_select.

4.3.1108 Shape_description_association to Thread_feature

Each Shape_description_association is_defining_shape_for zero or one Thread_feature. Each Thread_feature is related to zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_information_select and feature_definition_select.

4.3.1109 Shape_description_association to Transition_feature

Each Shape_description_association is_defining_shape_for zero or one Transition_feature. Each Transition_feature is related to zero or more Shape_description_association objects.

NOTE – This assertion is established through shape_information_select and feature_definition_select.

4.3.1110 Shell to Face

Each Shell refers to one or more Face objects in the role of face. Each Face acts as face for zero or more Shell objects.

4.3.1111 Simple_pair_range to Kinematic_pair

Each Simple_pair_range is_applied_to exactly one Kinematic_pair. Each Kinematic_pair is related to zero or more Simple_pair_range objects.

4.3.1112 Simulation_information to Design_discipline_item_definition

Each Simulation_information refers to zero or more Design_discipline_item_definition objects in the role of described_object. Each Design_discipline_item_definition acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select and item_information_select.

4.3.1113 Simulation_information to Ground_representation

Each Simulation_information refers to exactly one Ground_representation in the role of ground. Each Ground_representation is_referenced_by one or more Simulation_information objects.

4.3.1114 Simulation_information to Item_definition_instance_relationship

Each Simulation_information refers to zero or more Item_definition_instance_relationship objects in the role of described_object. Each Item_definition_instance_relationship acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select, item_information_select, and item_relationship_select.

4.3.1115 Simulation_information to Item_definition_relationship

Each Simulation_information refers to zero or more Item_definition_relationship objects in the role of described_object. Each Item_definition_relationship acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select, item_information_select, and item_relationship_select.

4.3.1116 Simulation_information to Item_instance

Each Simulation_information refers to zero or more Item_instance objects in the role of described_object. Each Item_instance acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select and item_information_select.

4.3.1117 Simulation_information to Item_instance_relationship

Each Simulation_information refers to zero or more Item_instance_relationship objects in the role of described_object. Each Item_instance_relationship acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select, item_information_select, and item_relationship_select.

4.3.1118 Simulation_information to Item_solution

Each Simulation_information refers to zero or more Item_solution objects in the role of described_object. Each Item_solution acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select.

4.3.1119 Simulation_information to Kinematic_mechanism

Each Simulation_information refers to one or more Kinematic_mechanism objects in the role of mechanism. Each Kinematic_mechanism is_referenced_by one or more Simulation_information objects.

4.3.1120 Simulation_information to Product_class

Each Simulation_information refers to zero or more Product_class objects in the role of described_object. Each Product_class acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select.

4.3.1121 Simulation_information to Product_component

Each Simulation_information refers to zero or more Product_component objects in the role of described_object. Each Product_component acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select.

4.3.1122 Simulation_information to Product_function

Each Simulation_information refers to zero or more Product_function objects in the role of described_object. Each Product_function acts as described_object for zero or more Simulation_information objects.

NOTE – This assertion is established through simulation_context_select.

4.3.1123 Simultaneous_activity to Activity

Each Simultaneous_activity refers to two or more Activity objects in the role of element. Each Activity acts as element for zero or more Simultaneous_activity objects.

4.3.1124 Simultaneous_activity to Multi_language_string

Each Simultaneous_activity refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Simultaneous_activity objects.

NOTE – This assertion is established through string_select.

4.3.1125 Simultaneous_process_operation to Process_operation

Each Simultaneous_process_operation refers to two or more Process_operation objects in the role of element. Each Process_operation acts as element for zero or more Simultaneous_process_operation objects.

4.3.1126 Size_dimension to Annotation_curve

Each Size_dimension is_applied_to zero or one Annotation_curve. Each Annotation_curve is related to zero or more Size_dimension objects.

NOTE – This assertion is established through element_with_dimension_select.

4.3.1127 Size_dimension to Constructive_geometric_element

Each Size_dimension is_applied_to zero or one Constructive_geometric_element. Each Constructive_geometric_element is related to zero or more Size_dimension objects.

NOTE – This assertion is established through element_with_dimension_select.

4.3.1128 Size_dimension to Shape_aspect

Each Size_dimension is_applied_to zero or one Shape_aspect. Each Shape_aspect is related to zero or more Size_dimension objects.

NOTE – This assertion is established through element_with_dimension_select.

4.3.1129 Slot_feature to Open_profile

Each Slot_feature refers to exactly one Open_profile in the role of slot_profile. Each Open_profile acts as slot_profile for zero or more Slot_feature objects.

4.3.1130 Slot_feature to Path

Each Slot_feature refers to exactly one Path in the role of sweep_path. Each Path acts as sweep_path for zero or more Slot_feature objects.

4.3.1131 Slot_feature to Slot_end_type

Each Slot_feature refers to exactly two Slot_end_type objects in the role of end_condition. Each Slot_end_type acts as end_condition for zero or more Slot_feature objects.

4.3.1132 Slot_feature to Transformation

Each Slot_feature refers to zero or one Transformation in the role of profile_placement. Each Transformation acts as profile_placement for zero or more Slot_feature objects.

4.3.1133 Solid_replica to B_rep_model

Each Solid_replica refers to zero or one B_rep_model in the role of replicated_solid. Each B_rep_model acts as replicated_solid for zero or more Solid_replica objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.1134 Solid_replica to Boolean_result

Each Solid_replica refers to zero or one Boolean_result in the role of replicated_solid. Each Boolean_result acts as replicated_solid for zero or more Solid_replica objects.

NOTE – This assertion is established through csg_select.

4.3.1135 Solid_replica to Csg_primitive

Each Solid_replica refers to zero or one Csg_primitive in the role of replicated_solid. Each Csg_primitive acts as replicated_solid for zero or more Solid_replica objects.

NOTE – This assertion is established through csg_select.

4.3.1136 Solid_replica to Faceted_b_rep_model

Each Solid_replica refers to zero or one Faceted_b_rep_model in the role of replicated_solid. Each Faceted_b_rep_model acts as replicated_solid for zero or more Solid_replica objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.1137 Solid_replica to Solid_replica

Each Solid_replica refers to zero or one Solid_replica in the role of replicated_solid. Each Solid_replica acts as replicated_solid for zero or more Solid_replica objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.1138 Solid_replica to Swept_face_solid

Each Solid_replica refers to zero or one Swept_face_solid in the role of replicated_solid. Each Swept_face_solid acts as replicated_solid for zero or more Solid_replica objects.

NOTE – This assertion is established through csg_select and non_primitive_solid_select.

4.3.1139 Solution_certification to Date_time

Each Solution_certification refers to exactly one Date_time in the role of certification_date. Each Date_time acts as certification_date for zero or more Solution_certification objects.

4.3.1140 Solution_certification to Item_solution

Each Solution_certification refers to exactly one Item_solution in the role of certified_solution. Each Item_solution acts as certified_solution for zero or more Solution_certification objects.

4.3.1141 Solution_certification to Multi_language_string

Each Solution_certification refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Solution_certification objects.

NOTE – This assertion is established through string_select.

Each Solution_certification refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_string acts as purpose for zero or more Solution_certification objects.

NOTE – This assertion is established through string_select.

4.3.1142 Solution_instance_association to Item_instance

Each Solution_instance_association refers to exactly one Item_instance in the role of instance. Each Item_instance acts as instance for zero or more Solution_instance_association objects.

4.3.1143 Solution_instance_association to Item_solution

Each Solution_instance_association refers to exactly one Item_solution in the role of solution. Each Item_solution acts as solution for zero or more Solution_instance_association objects.

4.3.1144 Specification to Multi_language_string

Each Specification refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Specification objects.

NOTE – This assertion is established through string_select.

Each Specification refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Specification objects.

NOTE – This assertion is established through string_select.

4.3.1145 Specification to Specification_category

Each Specification refers to exactly one Specification_category in the role of category. Each Specification_category acts as category for zero or more Specification objects.

4.3.1146 Specification_category to Multi_language_string

Each Specification_category refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Specification_category objects.

NOTE – This assertion is established through string_select.

4.3.1147 Specification_expression to Multi_language_string

Each Specification_expression refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Specification_expression objects.

NOTE – This assertion is established through string_select.

4.3.1148 Specification_expression to Specification

Each Specification_expression refers to zero or more Specification objects in the role of operand. Each Specification acts as operand for zero or more Specification_expression objects.

NOTE – This assertion is established through specification_operand_select.

4.3.1149 Specification_expression to Specification_expression

Each Specification_expression refers to zero or more Specification_expression objects in the role of operand. Each Specification_expression acts as operand for zero or more Specification_expression objects.

NOTE – This assertion is established through specification_operand_select.

4.3.1150 Specification_inclusion to Multi_language_string

Each Specification_inclusion refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Specification_inclusion objects.

NOTE – This assertion is established through string_select.

4.3.1151 Specification_inclusion to Specification

Each Specification_inclusion refers to zero or one Specification in the role of if_condition. Each Specification acts as if_condition for zero or more Specification_inclusion objects.

NOTE – This assertion is established through specification_operand_select.

Each Specification_inclusion refers to zero or one Specification in the role of included_specification. Each Specification acts as included_specification for zero or more Specification_inclusion objects.

NOTE – This assertion is established through specification_operand_select.

4.3.1152 Specification_inclusion to Specification_expression

Each Specification_inclusion refers to zero or one Specification_expression in the role of if_condition. Each Specification_expression acts as if_condition for zero or more Specification_inclusion objects.

NOTE – This assertion is established through specification_operand_select.

Each Specification_inclusion refers to zero or one Specification_expression in the role of included_specification. Each Specification_expression acts as included_specification for zero or more Specification_inclusion objects.

NOTE – This assertion is established through specification_operand_select.

4.3.1153 Specified_higher_usage to Assembly_component_relationship

Each Specified_higher_usage refers to exactly one Assembly_component_relationship in the role of upper_usage. Each Assembly_component_relationship acts as upper_usage for zero or more Specified_higher_usage objects.

4.3.1154 Specified_higher_usage to Next_higher_assembly

Each Specified_higher_usage refers to exactly one Next_higher_assembly in the role of next_usage. Each Next_higher_assembly acts as next_usage for zero or more Specified_higher_usage objects.

4.3.1155 Spherical_bottom to Feature_parameter

Each Spherical_bottom refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Spherical_bottom objects.

4.3.1156 Square_u_profile to Feature_parameter

Each Square_u_profile refers to exactly one Feature_parameter in the role of first_angle. Each Feature_parameter acts as first_angle for zero or more Square_u_profile objects.

Each Square_u_profile refers to zero or one Feature_parameter in the role of first_radius. Each Feature_parameter acts as first_radius for zero or more Square_u_profile objects.

Each Square_u_profile refers to exactly one Feature_parameter in the role of second_angle. Each Feature_parameter acts as second_angle for zero or more Square_u_profile objects.

Each Square_u_profile refers to zero or one Feature_parameter in the role of second_radius. Each Feature_parameter acts as second_radius for zero or more Square_u_profile objects.

Each Square_u_profile refers to exactly one Feature_parameter in the role of width. Each Feature_parameter acts as width for zero or more Square_u_profile objects.

4.3.1157 Straightness_tolerance to Reference_plane

Each Straightness_tolerance refers to zero or one Reference_plane in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Straightness_tolerance objects.

4.3.1158 Structuring_method_hierarchy to Group

Each Structuring_method_hierarchy is related to exactly one Group. Each Group is referenced by zero or more Structuring_method_hierarchy objects as related.

NOTE – The related Group is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Structuring_method_hierarchy is relating to zero or one Group. Each Group is referenced by zero or more Structuring_method_hierarchy objects as relating.

NOTE – The relating Group is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE – This assertion is established through structuring_method_select.

4.3.1159 Structuring_method_hierarchy to Layer

Each Structuring_method_hierarchy is relating to zero or one Layer. Each Layer is referenced by zero or more Structuring_method_hierarchy objects as relating.

NOTE – The relating Layer is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

NOTE – This assertion is established through structuring_method_select.

4.3.1160 Styled_element to Appearance_assignment

Each Styled_element refers to exactly one Appearance_assignment in the role of appearance. Each Appearance_assignment acts as appearance for zero or more Styled_element objects.

4.3.1161 Styled_geometric_model to Geometric_model

Each Styled_geometric_model refers to exactly one Geometric_model in the role of styled_geometry. Each Geometric_model acts as styled_geometry for zero or more Styled_geometric_model objects.

4.3.1162 Styled_model to Multi_language_string

Each Styled_model refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Styled_model objects.

NOTE – This assertion is established through string_select.

4.3.1163 Styled_model to Styled_element

Each Styled_model refers to one or more Styled_element objects in the role of element. Each Styled_element acts as element for zero or more Styled_model objects.

4.3.1164 Styled_model to Template_instance

Each Styled_model refers to zero or more Template_instance objects in the role of additional_elements. Each Template_instance acts as additional_elements for zero or more Styled_model objects.

4.3.1165 Styled_model_element to Detailed_model_element

Each Styled_model_element refers to exactly one Detailed_model_element in the role of element. Each Detailed_model_element acts as element for zero or more Styled_model_element objects.

4.3.1166 Styled_model_relationship to Multi_language_string

Each Styled_model_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Styled_model_relationship objects.

NOTE – This assertion is established through string_select.

4.3.1167 Styled_model_relationship to Styled_model

Each Styled_model_relationship is related to exactly one Styled_model. Each Styled_model is referenced by zero or more Styled_model_relationship objects as related.

NOTE – The related Styled_model is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each Styled_model_relationship is relating to exactly one Styled_model. Each Styled_model is referenced by zero or more Styled_model_relationship objects as relating.

NOTE – The relating Styled_model is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1168 Surface_appearance to Surface_appearance_element

Each Surface_appearance refers to one or more Surface_appearance_element objects in the role of element. Each Surface_appearance_element acts as element for zero or more Surface_appearance objects.

4.3.1169 Surface_appearance_element to Visual_appearance

Each Surface_appearance_element refers to zero or one Visual_appearance in the role of surface_condition. Each Visual_appearance acts as surface_condition for zero or more Surface_appearance_element objects.

4.3.1170 Surface_condition to Item_shape

Each Surface_condition is_applied_to zero or more Item_shape objects. Each Item_shape is related to zero or more Surface_condition objects.

NOTE – This assertion is established through shape_select.

4.3.1171 Surface_condition to Process_operation

Each Surface_condition is_caused_by zero or one Process_operation. Each Process_operation is related to zero or more Surface_condition objects.

4.3.1172 Surface_condition to Shape_aspect

Each Surface_condition is_applied_to zero or more Shape_aspect objects. Each Shape_aspect is related to zero or more Surface_condition objects.

NOTE – This assertion is established through shape_select.

4.3.1173 Surface_model to Shell

Each Surface_model refers to zero or more Shell objects in the role of element. Each Shell acts as element for zero or more Surface_model objects.

4.3.1174 Surface_profile_tolerance to Datum

Each Surface_profile_tolerance refers to zero, one, two, or three Datum objects in the role of datum. Each Datum acts as datum for zero or more Surface_profile_tolerance objects.

4.3.1175 Swept_face_solid to Face

Each Swept_face_solid refers to exactly one Face in the role of face. Each Face acts as face for zero or more Swept_face_solid objects.

4.3.1176 Symmetry_tolerance to Datum

Each Symmetry_tolerance refers to exactly one Datum in the role of datum. Each Datum acts as datum for zero or more Symmetry_tolerance objects.

4.3.1177 Symmetry_tolerance to Reference_plane

Each Symmetry_tolerance refers to zero or one Reference_plane in the role of affected_plane. Each Reference_plane acts as affected_plane for zero or more Symmetry_tolerance objects.

4.3.1178 Tactile_appearance to Multi_language_string

Each Tactile_appearance refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Tactile_appearance objects.

NOTE – This assertion is established through string_select.

Each Tactile_appearance refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Tactile_appearance objects.

NOTE – This assertion is established through string_select.

4.3.1179 Tactile_appearance to Value_with_unit

Each Tactile_appearance refers to zero or one Value_with_unit in the role of depth. Each Value_with_unit acts as depth for zero or more Tactile_appearance objects.

4.3.1180 Target_area to Shape_aspect

Each Target_area is_defined_by exactly one Shape_aspect. Each Shape_aspect is related to zero or more Target_area objects.

4.3.1181 Technical_solution to Multi_language_string

Each Technical_solution refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Technical_solution objects.

NOTE – This assertion is established through string_select.

4.3.1182 Tee_profile to Feature_parameter

Each Tee_profile refers to exactly one Feature_parameter in the role of cross_bar_depth. Each Feature_parameter acts as cross_bar_depth for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of cross_bar_width. Each Feature_parameter acts as cross_bar_width for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of depth. Each Feature_parameter acts as depth for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of first_angle. Each Feature_parameter acts as first_angle for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of first_offset. Each Feature_parameter acts as first_offset for zero or more Tee_profile objects.

Each Tee_profile refers to zero or one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of second_angle. Each Feature_parameter acts as second_angle for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of second_offset. Each Feature_parameter acts as second_offset for zero or more Tee_profile objects.

Each Tee_profile refers to exactly one Feature_parameter in the role of width. Each Feature_parameter acts as width for zero or more Tee_profile objects.

4.3.1183 Template_instance to External_model

Each Template_instance refers to zero or one External_model in the role of template_definition. Each External_model acts as template_definition for zero or more Template_instance objects.

NOTE – This assertion is established through template_definition_select.

4.3.1184 Template_instance to Geometric_model

Each Template_instance refers to zero or one Geometric_model in the role of template_definition. Each Geometric_model acts as template_definition for zero or more Template_instance objects.

NOTE – This assertion is established through template_definition_select.

4.3.1185 Template_instance to Styled_model

Each Template_instance refers to zero or one Styled_model in the role of template_definition. Each Styled_model acts as template_definition for zero or more Template_instance objects.

NOTE – This assertion is established through template_definition_select.

4.3.1186 Template_instance to Transformation

Each Template_instance refers to exactly one Transformation in the role of transformation. Each Transformation acts as transformation for zero or more Template_instance objects.

4.3.1187 Thickness to Material_side_specification

Each Thickness refers to zero or one Material_side_specification in the role of material_side. Each Material_side_specification acts as material_side for zero or more Thickness objects.

4.3.1188 Thickness to Multi_language_string

Each Thickness refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Thickness objects.

NOTE – This assertion is established through string_select.

4.3.1189 Thickness to Property_value

Each Thickness refers to one or more Property_value objects in the role of thickness_value. Each Property_value acts as thickness_value for zero or more Thickness objects.

4.3.1190 Thread_feature to Axis_placement

Each Thread_feature refers to exactly one Axis_placement in the role of orientation. Each Axis_placement acts as orientation for zero or more Thread_feature objects.

4.3.1191 Thread_feature to Thread_specification

Each Thread_feature refers to exactly one Thread_specification in the role of thread_definition. Each Thread_specification acts as thread_definition for zero or more Thread_feature objects.

4.3.1192 Tolerance_table_cell to General_tolerance_table

Each Tolerance_table_cell refers to exactly one General_tolerance_table in the role of table. Each General_tolerance_table has cell defined by one or more Tolerance_table_cell objects.

4.3.1193 Tolerance_table_cell to Multi_language_string

Each Tolerance_table_cell refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Tolerance_table_cell objects.

NOTE – This assertion is established through string_select.

4.3.1194 Tolerance_table_cell to Plus_minus_toleranced_datum

Each Tolerance_table_cell refers to zero or one Plus_minus_toleranced_datum in the role of cell_value. Each Plus_minus_toleranced_datum acts as cell_value for zero or more Tolerance_table_cell objects.

NOTE – This assertion is established through cell_entry_select.

4.3.1195 Tolerance_table_cell to Significant_number_of_digits

Each Tolerance_table_cell refers to zero or one Significant_number_of_digits in the role of limit. Each Significant_number_of_digits acts as limit for zero or more Tolerance_table_cell objects.

NOTE – This assertion is established through limit_select.

4.3.1196 Tolerance_table_cell to Upper_lower_limit

Each Tolerance_table_cell refers to zero or one Upper_lower_limit in the role of limit. Each Upper_lower_limit acts as limit for zero or more Tolerance_table_cell objects.

NOTE – This assertion is established through limit_select.

4.3.1197 Tolerance_table_cell to Upper_lower_toleranced_datum

Each Tolerance_table_cell refers to zero or one Upper_lower_toleranced_datum in the role of cell_value. Each Upper_lower_toleranced_datum acts as cell_value for zero or more Tolerance_table_cell objects.

NOTE – This assertion is established through cell_entry_select.

4.3.1198 Tolerance_zone to Geometric_tolerance

Each Tolerance_zone is_zone_for one or more Geometric_tolerance objects. Each Geometric_tolerance is related to zero or more Tolerance_zone objects.

4.3.1199 Tolerance_zone_definition to Shape_aspect

Each Tolerance_zone_definition refers to exactly one Shape_aspect in the role of first_element. Each Shape_aspect acts as first_element for zero or more Tolerance_zone_definition objects.

Each Tolerance_zone_definition refers to zero or one Shape_aspect in the role of second_element. Each Shape_aspect acts as second_element for zero or more Tolerance_zone_definition objects.

4.3.1200 Tolerance_zone_definition to Tolerance_zone

Each Tolerance_zone_definition is_defining exactly one Tolerance_zone. Each Tolerance_zone is related to zero or more Tolerance_zone_definition objects.

4.3.1201 Tool_part_relationship to Geometric_model_relationship_with_transformation

Each Tool_part_relationship refers to zero or one Geometric_model_relationship_with_transformation in the role of transformation. Each Geometric_model_relationship_with_transformation acts as transformation for zero or more Tool_part_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.1202 Tool_part_relationship to Multi_language_string

Each Tool_part_relationship refers to zero or one Multi_language_string in the role of used_technology_description. Each Multi_language_string acts as used_technology_description for zero or more Tool_part_relationship objects.

NOTE – This assertion is established through string_select.

4.3.1203 Tool_part_relationship to Template_instance

Each Tool_part_relationship refers to zero or one Template_instance in the role of transformation. Each Template_instance acts as transformation for zero or more Tool_part_relationship objects.

NOTE – This assertion is established through transformation_select.

4.3.1204 Topologically_connected_set to Face

Each Topologically_connected_set refers to zero or more Face objects in the role of element. Each Face acts as element for zero or more Topologically_connected_set objects.

NOTE – This assertion is established through connected_element_select.

4.3.1205 Topologically_connected_set to Oriented_edge_curve

Each Topologically_connected_set refers to zero or more Oriented_edge_curve objects in the role of element. Each Oriented_edge_curve acts as element for zero or more Topologically_connected_set objects.

NOTE – This assertion is established through connected_element_select.

4.3.1206 Total_runout_tolerance to Datum

Each Total_runout_tolerance refers to one or two Datum objects in the role of datum. Each Datum acts as datum for zero or more Total_runout_tolerance objects.

4.3.1207 Transition_feature to Face

Each Transition_feature refers to exactly one Face in the role of face_1. Each Face acts as face_1 for zero or more Transition_feature objects.

Each Transition_feature refers to exactly one Face in the role of face_2. Each Face acts as face_2 for zero or more Transition_feature objects.

4.3.1208 Treatment_result to Multi_language_string

Each Treatment_result refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Treatment_result objects.

NOTE – This assertion is established through string_select.

Each Treatment_result refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Treatment_result objects.

NOTE – This assertion is established through string_select.

Each Treatment_result refers to zero or one Multi_language_string in the role of purpose. Each Multi_language_string acts as purpose for zero or more Treatment_result objects.

NOTE – This assertion is established through string_select.

4.3.1209 Value_termination to Feature_parameter

Each Value_termination refers to exactly one Feature_parameter in the role of angle. Each Feature_parameter acts as angle for zero or more Value_termination objects.

Each Value_termination refers to exactly one Feature_parameter in the role of depth. Each Feature_parameter acts as depth for zero or more Value_termination objects.

4.3.1210 Vee_profile to Feature_parameter

Each Vee_profile refers to exactly one Feature_parameter in the role of profile_angle. Each Feature_parameter acts as profile_angle for zero or more Vee_profile objects.

Each Vee_profile refers to zero or one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Vee_profile objects.

Each Vee_profile refers to exactly one Feature_parameter in the role of tilt_angle. Each Feature_parameter acts as tilt_angle for zero or more Vee_profile objects.

4.3.1211 Vertex_loop to Vertex_point

Each Vertex_loop refers to exactly one Vertex_point in the role of loop_vertex. Each Vertex_point acts as loop_vertex for zero or more Vertex_loop objects.

4.3.1212 Vertex_point to Point

Each Vertex_point refers to exactly one Point in the role of vertex_geometry. Each Point acts as vertex_geometry for zero or more Vertex_point objects.

4.3.1213 View to Cartesian_coordinate_space_2d

Each View refers to exactly one Cartesian_coordinate_space_2d in the role of view_space. Each Cartesian_coordinate_space_2d acts as view_space for zero or more View objects.

4.3.1214 View to Drawing_sheet

Each View refers to zero or one Drawing_sheet in the role of layout. Each Drawing_sheet acts as layout for zero or more View objects.

NOTE – This assertion is established through area_select.

4.3.1215 View to Multi_language_string

Each View refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more View objects.

NOTE – This assertion is established through string_select.

Each View refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more View objects.

NOTE – This assertion is established through string_select.

4.3.1216 View to Transformation_2d

Each View refers to exactly one Transformation_2d in the role of transformation. Each Transformation_2d acts as transformation for zero or more View objects.

4.3.1217 View to View_area

Each View refers to zero or one View_area in the role of layout. Each View_area acts as layout for zero or more View objects.

NOTE – This assertion is established through area_select.

4.3.1218 View_area to Cartesian_coordinate_space_2d

Each View_area refers to exactly one Cartesian_coordinate_space_2d in the role of area_space. Each Cartesian_coordinate_space_2d acts as area_space for zero or more View_area objects.

4.3.1219 View_area to Multi_language_string

Each View_area refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more View_area objects.

NOTE – This assertion is established through string_select.

Each View_area refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more View_area objects.

NOTE – This assertion is established through string_select.

4.3.1220 View_area_assignment to Class_function_association

Each View_area_assignment is_describing zero or one Class_function_association. Each Class_function_association is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1221 View_area_assignment to Design_constraint

Each View_area_assignment is_describing zero or one Design_constraint. Each Design_constraint is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1222 View_area_assignment to Design_discipline_item_definition

Each View_area_assignment is_describing zero or one Design_discipline_item_definition. Each Design_discipline_item_definition is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and item_information_select.

4.3.1223 View_area_assignment to Item_definition_instance_relationship

Each View_area_assignment is_describing zero or one Item_definition_instance_relationship. Each Item_definition_instance_relationship is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select, item_information_select, and item_relationship_select.

4.3.1224 View_area_assignment to Item_definition_relationship

Each View_area_assignment is_describing zero or one Item_definition_relationship. Each Item_definition_relationship is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select, item_information_select, and item_relationship_select.

4.3.1225 View_area_assignment to Item_instance

Each View_area_assignment is_describing zero or one Item_instance. Each Item_instance is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and item_information_select.

4.3.1226 View_area_assignment to Item_instance_relationship

Each View_area_assignment is_describing zero or one Item_instance_relationship. Each Item_instance_relationship is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select, item_information_select, and item_relationship_select.

4.3.1227 View_area_assignment to Item_solution

Each View_area_assignment is_describing zero or one Item_solution. Each Item_solution is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1228 View_area_assignment to Process_operation

Each View_area_assignment is_describing zero or one Process_operation. Each Process_operation is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and process_information_select.

4.3.1229 View_area_assignment to Process_plan

Each View_area_assignment is_describing zero or one Process_plan. Each Process_plan is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and process_information_select.

4.3.1230 View_area_assignment to Product_class

Each View_area_assignment is_describing zero or one Product_class. Each Product_class is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1231 View_area_assignment to Product_component

Each View_area_assignment is_describing zero or one Product_component. Each Product_component is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1232 View_area_assignment to Product_function

Each View_area_assignment is_describing zero or one Product_function. Each Product_function is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1233 View_area_assignment to Specification

Each View_area_assignment is_describing zero or one Specification. Each Specification is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1234 View_area_assignment to Specification_category

Each View_area_assignment is_describing zero or one Specification_category. Each Specification_category is related to zero or more View_area_assignment objects.

NOTE – This assertion is established through general_select and specification_information_select.

4.3.1235 View_area_assignment to View_area

Each View_area_assignment refers to exactly one View_area in the role of view_area. Each View_area acts as view_area for zero or more View_area_assignment objects.

4.3.1236 View_area_relationship to Multi_language_string

Each View_area_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more View_area_relationship objects.

NOTE – This assertion is established through string_select.

4.3.1237 View_area_relationship to View_area

Each View_area_relationship is related to exactly one View_area. Each View_area is referenced by zero or more View_area_relationship objects as related.

NOTE – The related View_area is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each View_area_relationship is relating to exactly one View_area. Each View_area is referenced by zero or more View_area_relationship objects as relating.

NOTE – The relating View_area is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1238 View_placed_annotation to Annotation_element

Each View_placed_annotation refers to exactly one Annotation_element in the role of element. Each Annotation_element acts as element for zero or more View_placed_annotation objects.

4.3.1239 View_placed_annotation to Appearance_assignment

Each View_placed_annotation refers to exactly one Appearance_assignment in the role of appearance. Each Appearance_assignment acts as appearance for zero or more View_placed_annotation objects.

4.3.1240 View_placed_annotation to View

Each View_placed_annotation refers to exactly one View in the role of reference_view. Each View acts as reference_view for zero or more View_placed_annotation objects.

4.3.1241 View_relationship to Multi_language_string

Each View_relationship refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more View_relationship objects.

NOTE – This assertion is established through string_select.

4.3.1242 View_relationship to View

Each View_relationship is related to exactly one View. Each View is referenced by zero or more View_relationship objects as related.

NOTE – The related View is the secondary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the child object.

Each View_relationship is relating to exactly one View. Each View is referenced by zero or more View_relationship objects as relating.

NOTE – The relating View is the primary object in the relationship, i.e., in a hierarchical relationship structure it plays the role of the parent object.

4.3.1243 Visual_appearance to Multi_language_string

Each Visual_appearance refers to zero or one Multi_language_string in the role of colour_name. Each Multi_language_string acts as colour_name for zero or more Visual_appearance objects.

NOTE – This assertion is established through string_select.

Each Visual_appearance refers to zero or one Multi_language_string in the role of name. Each Multi_language_string acts as name for zero or more Visual_appearance objects.

NOTE – This assertion is established through string_select.

4.3.1244 Wireframe_model_2d to Curve_set_2d

Each Wireframe_model_2d refers to zero or more Curve_set_2d objects in the role of element. Each Curve_set_2d acts as element for zero or more Wireframe_model_2d objects.

4.3.1245 Wireframe_model_3d to Curve_set_3d

Each Wireframe_model_3d refers to zero or more Curve_set_3d objects in the role of element. Each Curve_set_3d acts as element for zero or more Wireframe_model_3d objects.

4.3.1246 Woodruff_slot_end_type to Feature_parameter

Each Woodruff_slot_end_type refers to exactly one Feature_parameter in the role of radius. Each Feature_parameter acts as radius for zero or more Woodruff_slot_end_type objects.

4.3.1247 Work_order to Activity

Each Work_order is_controlling one or more Activity objects. Each Activity has authorization defined by zero or one Work_order.

4.3.1248 Work_order to Multi_language_string

Each Work_order refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Work_order objects.

NOTE – This assertion is established through string_select.

4.3.1249 Work_request to Activity_method

Each Work_request refers to zero or more Activity_method objects in the role of recommended_-method. Each Activity_method acts as recommended_method for zero or more Work_request objects.

The assertion between work_request and activity_method in the role of scope exists only because of the select type structure and shall not be instantiated.

NOTE – This assertion is established through activity_element_select.

4.3.1250 Work_request to Assembly_substitute_relationship

Each Work_request refers to zero or more Assembly_substitute_relationship objects in the role of scope. Each Assembly_substitute_relationship acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.1251 Work_request to Class_category_association

Each Work_request refers to zero or more Class_category_association objects in the role of scope. Each Class_category_association acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and configuration_information_select.

4.3.1252 Work_request to Class_condition_association

Each Work_request refers to zero or more Class_condition_association objects in the role of scope. Each Class_condition_association acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and configuration_information_select.

4.3.1253 Work_request to Class_function_association

Each Work_request refers to zero or more Class_function_association objects in the role of scope. Each Class_function_association acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.1254 Work_request to Class_inclusion_association

Each Work_request refers to zero or more Class_inclusion_association objects in the role of scope. Each Class_inclusion_association acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and configuration_information_select.

4.3.1255 Work_request to Class_specification_association

Each Work_request refers to zero or more Class_specification_association objects in the role of scope. Each Class_specification_association acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and configuration_information_select.

4.3.1256 Work_request to Configuration

Each Work_request refers to zero or more Configuration objects in the role of scope. Each Configuration acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select.

4.3.1257 Work_request to Date_and_person_or_organization

Each Work_request refers to one or more Date_and_person_or_organization objects in the role of notified_person. Each Date_and_person_or_organization acts as notified_person for zero or more Work_request objects.

Each Work_request refers to zero or one Date_and_person_or_organization in the role of requestor. Each Date_and_person_or_organization acts as requestor for zero or more Work_request objects.

4.3.1258 Work_request to Design_constraint

Each Work_request refers to zero or more Design_constraint objects in the role of scope. Each Design_constraint acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.1259 Work_request to Drawing

Each Work_request refers to zero or more Drawing objects in the role of scope. Each Drawing acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.1260 Work_request to External_document

Each Work_request refers to zero or more External_document objects in the role of scope. Each External_document acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.1261 Work_request to Geometric_model

Each Work_request refers to zero or more Geometric_model objects in the role of scope. Each Geometric_model acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and model_select.

4.3.1262 Work_request to Item

Each Work_request refers to zero or more Item objects in the role of scope. Each Item acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.1263 Work_request to Item_definition_instance_relationship

Each Work_request refers to zero or more Item_definition_instance_relationship objects in the role of scope. Each Item_definition_instance_relationship acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and item_relationship_select.

4.3.1264 Work_request to Item_definition_relationship

Each Work_request refers to zero or more Item_definition_relationship objects in the role of scope. Each Item_definition_relationship acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and item_relationship_select.

4.3.1265 Work_request to Item_instance

Each Work_request refers to zero or more Item_instance objects in the role of scope. Each Item_instance acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.1266 Work_request to Item_instance_relationship

Each Work_request refers to zero or more Item_instance_relationship objects in the role of scope. Each Item_instance_relationship acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and item_relationship_select.

4.3.1267 Work_request to Item_solution

Each Work_request refers to zero or more Item_solution objects in the role of scope. Each Item_solution acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_select, and specification_information_select.

4.3.1268 Work_request to Item_version

Each Work_request refers to zero or more Item_version objects in the role of scope. Each Item_version acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.1269 Work_request to Material

Each Work_request refers to zero or more Material objects in the role of scope. Each Material acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_effectivity_select.

4.3.1270 Work_request to Multi_language_string

Each Work_request refers to zero or one Multi_language_string in the role of description. Each Multi_language_string acts as description for zero or more Work_request objects.

NOTE – This assertion is established through string_select.

4.3.1271 Work_request to Physical_instance

Each Work_request refers to zero or more Physical_instance objects in the role of scope. Each Physical_instance acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select.

4.3.1272 Work_request to Physical_instance_usage

Each Work_request refers to zero or more Physical_instance_usage objects in the role of scope. Each Physical_instance_usage acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select.

4.3.1273 Work_request to Process_plan

Each Work_request refers to zero or more Process_plan objects in the role of scope. Each Process_plan acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.1274 Work_request to Product_class

Each Work_request refers to zero or more Product_class objects in the role of scope. Each Product_class acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.1275 Work_request to Product_component

Each Work_request refers to zero or more Product_component objects in the role of scope. Each Product_component acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.1276 Work_request to Product_function

Each Work_request refers to zero or more Product_function objects in the role of scope. Each Product_function acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.1277 Work_request to Product_specification

Each Work_request refers to zero or more Product_specification objects in the role of scope. Each Product_specification acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.1278 Work_request to Property

Each Work_request refers to zero or more Property objects in the role of scope. Each Property acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

4.3.1279 Work_request to Simulation_information

Each Work_request refers to zero or more Simulation_information objects in the role of scope. Each Simulation_information acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and model_select.

4.3.1280 Work_request to Specification

Each Work_request refers to zero or more Specification objects in the role of scope. Each Specification acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.1281 Work_request to Specification_category

Each Work_request refers to zero or more Specification_category objects in the role of scope. Each Specification_category acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and specification_information_select.

4.3.1282 Work_request to Specification_expression

Each Work_request refers to zero or more Specification_expression objects in the role of scope. Each Specification_expression acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and configuration_information_select.

4.3.1283 Work_request to Specification_inclusion

Each Work_request refers to zero or more Specification_inclusion objects in the role of scope. Each Specification_inclusion acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and configuration_information_select.

4.3.1284 Work_request to Styled_model

Each Work_request refers to zero or more Styled_model objects in the role of scope. Each Styled_model acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select, activity_element_and_effectivity_-select, and model_select.

4.3.1285 Work_request to View_area

Each Work_request refers to zero or more View_area objects in the role of scope. Each View_area acts as scope for zero or more Work_request objects.

NOTE – This assertion is established through activity_element_select and activity_element_and_-effectivity_select.

5 Application interpreted model

5.1 Mapping table

This clause contains the mapping table that shows how each UoF and application object of this part of ISO 10303 (see clause 4) maps to one or more AIM constructs (see annex A). The mapping table is organized in five columns.

– Column 1) Application element: Name of an application element as it appears in the application object definition in 4.2. Application object names are written in uppercase. Attribute names and assertions are listed after the application object to which they belong and are written in lower case.

– Column 2) AIM element: Name of an AIM element as it appears in the AIM (see annex A), the term 'IDENTICAL MAPPING', or the term 'PATH'. AIM entities are written in lower case. Attribute names of AIM entities are referred to as <entity name> . <attribute name>. The mapping of an application element may result in several related AIM elements. Each of these AIM elements requires a line of its own in the table. The term 'IDENTICAL MAPPING' indicates that both application objects of an application assertion map to the same AIM element. The term 'PATH' indicates that the application assertion maps to the entire reference path.

– Column 3) Source: For those AIM elements that are interpreted from the integrated resources, this is the number of the corresponding part of ISO 10303. For those AIM elements that are created for the purpose of this part of ISO 10303, this is the number of this part. For those AIM elements that are directly incorporated from an application interpreted construct (AIC) this is the AIC reference.

– Column 4) Rules: One or more numbers may be given that refer to rules that apply to the current AIM element or reference path. For rules that are derived from relationships between application objects, the same rule is referred to by the mapping entries of all the involved AIM elements. The expanded names of the rules are listed after the table.

– Column 5) Reference path: To describe fully the mapping of an ARM element, it may be necessary to specify a reference path through several related AIM elements. The reference path column documents the role of an AIM element relative to the AIM element in the row succeeding it. Two or more such related AIM elements define the interpretation of the integrated resources that satisfies the requirement specified by the application object. For each AIM element that has been created for use within this part of ISO 10303, a reference path up to its supertype from an integrated resource is specified.

For the expression of reference paths the following notational conventions apply:

a) `[]` : multiple AIM elements or sections of the reference path are required to satisfy an information requirement;

b) `()` : multiple AIM elements or sections of the reference path are identified as alternatives within the mapping to satisfy an information requirement;

c) `<>` : at least one of the enclosed sections of the reference path are required to satisfy an information requirement;

d) `{}` : enclosed section constrains the reference path to satisfy an information requirement;

e) `||` : the mapping is to the enclosed supertype entity only;

f) `->` : attribute references the entity or select type given in the following row;

g) `<-` : entity or select type is referenced by the attribute in the following row;

h) `[i]` : attribute is an aggregation of which a single member is given in the following row;

i) `[n]` : attribute is an aggregation of which member `n` is given in the following row;

j) `=>` : entity is a supertype of the entity given in the following row;

k) `<=` : entity is a subtype of the entity given in the following row;

l) `=` : the string, select, or enumeration type is constrained to a choice or value;

m) `\` : the line continuations for strings that wrap.

The entries '41', '43', '44', '519', and '520' in the third column of the mapping tables (source) refer to the following documents:

ISO 10303–41:—[3], *Industrial automation systems and integration*
– Product data representation and exchange:
– Integrated generic resource: Fundamentals of product description and support
– ISO TC 184/SC4 N539

ISO 10303–43:—[3], *Industrial automation systems and integration*
– Product data representation and exchange:
– Integrated generic resource: Representation structures
– ISO TC 184/SC4 N540

ISO 10303–44:—[3], *Industrial automation systems and integration*

NOTE – The following note numbers correspond to the footnotemarks listed in the table above:

1 Same instance as beginning of reference path.

2 This case has to be taken in case the component (related_product_definition) is used only once within the assembly (relating_product_definition) so that the association of a particular mapped_-item with the particular product_definition_relationship of which it describes the transformation is possible.

3 This case has to be taken in case the component (related_product_definition) is used multiple times within the assembly (relating_product_definition) in order to allow the association of a particular mapped_item with the particular product_definition_relationship of which it describes the transformation.

4 Same instance as beginning of OR.
