5.2 AIM EXPRESS short listing

This clause specifies the EXPRESS schema that uses elements from the integrated resources (and the AICs) and contains the types, entity specializations, rules, and functions that are specific to this part of ISO 10303. This clause also specifies modifications to the text for constructs that are imported from the integrated resources (and the AICs). The definitions and EXPRESS provided in the integrated resources for constructs used in the AIM may include select list items and subtypes that are not imported into the AIM. Requirements stated in the integrated resources that refer to such items and subtypes apply exclusively to those items that are imported into the AIM.

NOTE 1 – The following conventions apply for the definition text:

– Terms written in boldface refer to the AIM objects, i.e., '**circle**' refers to the entity as defined in ISO 10303-42;

– Terms written in normal face refer to the concept, i.e., 'circle' refers to the concept of a round plane figure whose circumference is everywhere equidistant from its centre.

NOTE 2 – The following shortform and the longform documented in annex A correspond to the conformance class CC8 of this part of ISO 10303 which includes all UoFs. This document does not contain shortforms or longforms for the other conformance classes although this is planned for the future.

EXPRESS specification:

5.2.1 Fundamental concepts and assumptions

This subclause describes fundamental concepts and assumptions related to the data structure defined within this part of ISO 10303.

ISO 10303-214 is designed to be used for data exchange, sharing, modeling, and storage in the design phase.

The intention is to gather information on a technical **product** related to various applications of product data.

5.2.1.1 Usage of global rules

Many of the relationships among different entities in the integrated resource parts of ISO 10303 are specified using the most generic cardinality of zero or more between two related entities. This cardinality means that the relationship is optional or there may be one or more instances of a related entity that is related to a single instance of the relating entity or vice versa.

This part of ISO 10303 uses global rules to constrain these cardinalities. Examples of these rules include **contract_requires_organization**, **approval_requires_approval_person_organization**, and **item_requires_version**.

Global rules are also used to restrict values of STRING type attributes to be only those that are applicable within the context of ISO 10303-214.

5.2.1.2 Various Views on Product Versions

Every **product** has to be related with one or more instances of **product_definition_formation** (enforced by the global rule **item_requires_version**), each representing a version of the **product**.

A **product_definition_formation** may be represented by different instances of **representation** (e.g. various kinds of geometric representations, kinematic structures, drawings), i.e. different points of view on a **product**.

Product_definition establishes the relationship between a specific **representation** and a **product_definition_formation**.

5.2.1.3 Relating the shape of a product to administrative product data

The shape of a **product** is represented by **shape_representation**. This entity and its subtypes are defining valid geometric and/or topologic combinations of entities to describe the **product**'s shape.

Shape_representation is related to **product_definition** by **shape_definition_representation** and **product_definition_shape**, which points to **product_definition** via two select types: **characterized_definition** and **characterized_product_definition**. Due to the global rule **shape_representation_subtype_exclusiveness** **shape_representation** shall be an instance of at most one of its subtypes.

5.2.1.4 Identification of a portion of product's shape

A portion of the whole **product**'s shape may be identified by a **shape_aspect**, that points to a **product_definition_shape**.

The **shape_aspect** may be related via **shape_definition_representation** to **shape_representation**, representing the portion of shape.

5.2.1.5 Types of shape representation

By this part of ISO 10303 nine model types for representation of **product**'s shape are defined:

- geometrically bounded 2D wireframe model represented by **geometrically_bounded_2d_wireframe_representation** (represented in the ARM by UoF G1);

- geometrically bounded 3D wireframe model represented by **geometrically_bounded_wireframe_shape_representation** (represented in the ARM by UoF G2);

- geometrically bounded surface model represented by **geometrically_bounded_surface_shape_representation** (represented in the ARM by UoF G8);

- connected surface model represented by **manifold_surface_shape_representation** (represented in the ARM by UoF G3);

- faceted Brep model represented by **faceted_brep_shape_representation** (represented in the ARM by UoF G4);

- Brep model represented by **advanced_brep_shape_representation** (represented in the ARM by UoF G5);

- compound Brep model represented by **compound_brep_shape_representation** and as special cases **edge_based_wireframe_shape_representation** and **non_manifold_surface_shape_representation** (represented in the ARM by UoF G6);

- CSG model represented by **csg_shape_representation** (represented in the ARM by UoF G7);

- hybrid model represented by **hybrid_3d_shape_representation** (included in the ARM in all geometric UoFs Gx).

All these types are subtypes of **shape_representation**. Each type is self contained, meaning that one type may not contain another, enforced by the global rule **shape_representation_subtype_exclusiveness**. Local rules, defined for every subtype, describe restrictions on geometric and/or topological entities, that may be referenced by the respective **shape_representation** subtype. The local rules in the subtypes of **shape_representation** uniformly allow for instances of **axis2_placement**, **mapped_item**, and one or more specific subtypes of **geometric_representation_item** according to the subtype of **shape_representation**. In the case of a **mapped_item** the mapped_representation of the associated instance of **representation_map** is restricted to the same subtype of **shape_representation** in order to avoid mixed shape representation types.

The **hybrid_3d_shape_representation** is an exception of this rule. It is especially created to allow for a mix of different kinds of **shape_representation** as it usually occurs in CAD

systems. Therefore the allowed types of instances of **geometric_representation_item** is not further constrained as well as the type the mapped_representation for a **mapped_item** instance is restricted to **shape_representation** only, but not to a specific subtype.

5.2.1.6 Relation of units, coordinate space, and accuracy information to shape information

Information on units related to the **product**'s shape as well as information on the coordinate space and the accuracy (uncertainty) of the shape information is assigned to instances of **shape_representation** by subtypes of **representation_context**, i.e. **global_unit_assigned_context**, **geometric_representation_context**, and **global_uncertainty_assigned_context**, respectively.

These subtypes allow for definition of a set of units, of the coordinate space dimension, and of one to three accuracy values for distance, angular, and curvature accuracy to be assigned to a **shape_representation**.

In the case where an instance of **representation_context** shall be shared among two or more **shape_representation** instances with different accuracy values complex instances of **shape_representation** and **uncertainty_assigned_representation** have to be used to assign the various accuracy values through the **uncertainty_assigned_representation** instances independent from the **representation_context**. The accuracy information defined by the **uncertainty_assigned_representation** takes precedence over any **global_uncertainty_assigned_context** that is referenced by the **shape_representation**.

5.2.1.7 Relating the shape of a component to the shape of its assembly

In order to build assembly structures, relationships between the assembly and component(s) have to be defined.

Two alternatives for the implementation of assembly structure representations are recommended:

- One alternative describes the assembly with the shape of the components built in. With this approach the shape of the component is mapped into the shape of the assembly via **mapped_item**;

- The other alternative describes the components and the assembly with their own shape information together with the transformation information between the the assembly and the component. This approach uses the **representation_relationship_with_transformation**;

Both mechanisms make sense even in mixed combinations. The product structure, i.e. **next_assembly_usage_occurence** is identical and is required for both approaches.

1) **mapped_item** approach:

This approach represents the assembled model completely. It is appropriate for explicit representation of assemblies. It uses **mapped_item** in combination with **repesentation_map** which takes a **representation**, i.e. the **shape_representation** of the component and turns it into

an item in a second **representation**, i.e. a **mapped_item** included in the **shape_representation** of the assembly. The transformation to be applied is determined from the mapping origin and the mapping target which are items of the two instances of **representation** (and therefore founded in the two contexts). **Mapped_item** is constrained such that:

- No **mapped_item** shall be dependent on itself to define the **representation** being mapped (acyclic);

- The mapping_origin shall be in the context of the **representation** referenced by **mapped_item**.mapping_source;

- The mapping_target shall be in the context of the representation including the **mapped_item**;

There is no constraint to prevent both instances of **representation** having the same context (i.e. the new item is shifted in position but does not change spaces). This allows the use of **mapped_item** to position sub-models in a single coordinate space. It is even possible to define an identity matrix transformation by referring to the same entity instance as both mapping_origin and mapping_target. This represents the case where a component is defined in (one of) its final positions. Until it is mapped into the second **representation**, it is not included in the **representation** even though defined in the same space.

2) **representation_relationship_with_transformation** approach:

This approach represents the components and the set of instructions how to build the assembly. This approach is adequate for the implicit representation of assemblies.

Thus, **representation_relationship_with_transformation** is used to define the relative positions within an assembly. It does not allow for:

- Inclusion: The decision to create a **representation** which brings all the components together is left to the receiving system;

- The ability to define a component in one position and then replicate it in the same space.

The **shape_representation** may be defined explicitly and completely for the assembly and the **representation_relationship_with_transformation** gives just the additional information how an instances of **shape_representation** for a component geometrically relates to the shape of the assembly.

The rule **coordinated_assembly_and_shape** implies that the relationships between the assembly and the component on the **product_definition** level and the **shape_representation** level has to be linked through a **context_dependent_shape_representation**. This is necessary to distinguish between several occurrences of the same component within an assembly.

According to ISO 10303-43 the attributes rep_1 and rep_2 of **representation_relationship_with_transformation** are determined as follows:

- rep_1 is defined as the **representation** with a context to which the transformation applies;

- rep_2 is the **representation** with a context which is the result of the transformation.

Based on this definition the attributes of **representation_relationship_with_transformation** should be instantiated as follows:

- rep_1 references the **shape_representation** for the **product_definition** that is the related_product_definition (identifying the component) of the **assembly_component_usage**;

- rep_2 references the **shape_representation** for the **product_definition** that is the relating_product_definition (identifying the assembly) of the **assembly_component_usage**;

Further restrictions are implied by the informal proposition on **representation_relationship_with_transformation**, defined in ISO 10303-43: If the transformation is an **item_defined_transformation**, the ordering of the instances of **representation** given for the inherited attributes of **representation_relationship** shall be consistent with the ordering of the two instances of **representation_item** given as attributes of **item_defined_transformation**.

Therefore the inherited attributes relating_representation_item and related_representation_item of **item_defined_transformation** have to be used as follows:

- related_representation_item references the **representation_item** (e.g. **axis2_placement_3d**) in a representation for the **product_definition** that is the related_product_definition (identifying the component) of the **assembly_component_usage**;

- relating_representation_item references the **representation_item** (e.g. **axis2_placement_3d**) in a representation for the **product_definition** that is the relating_product_definition (identifying the assembly) of the **assembly_component_usage**;

5.2.1.8 Representation of transformations

Transformation information is represented for an **item_defined_transformation** (inherited attributes relating_representation_item and related_representation_item) and for a **mapped_item** (attribute mapping_target of **mapped_item** and attribute mapping_origin of the referenced **representation_map**) as a combination of two instances of **representation_item**.

The allowed combinations for these two instances of **representation_item** are as follows:

- **axis2_placement_3d** for the related_representation_item or mapping_origin attribute and another instance of **axis2_placement_3d** for the relating_representation_item or mapping_target attribute;

- **axis2_placement_3d** for the related_representation_item or mapping_origin attribute and an instance of **cartesian_transformation_operator_3d** for the relating_representation_item or mapping_target attribute;

- **axis2_placement_2d** for the related_representation_item or mapping_origin attribute and another instance of **axis2_placement_2d** for the relating_representation_item or mapping_target attribute;

- **axis2_placement_2d** for the related_representation_item or mapping_origin attribute and an instance of **cartesian_transformation_operator_2d** for the relating_representation_item or mapping_target attribute.

For a **representation_relationship_with_transformation** there may be also an instance of **functionally_defined_transformation** used that is a **cartesian_transformation_operator**.

For any usage of an istance of **cartesian_transformation_operator** to define the transformation information of an instance of **assembly_component_usage** the derived attribute scl has to be 1.0, since scaling is not allowed components within an assembly.

5.2.1.9 Specification control

This clause describes the AIM entities used by ISO 10303-214 that provide the capability to describe automotive products with a large number of variants.

EXAMPLE 237 – Examples for automotive products are passenger cars, trucks, busses, engines, or other components of these products.

Because of the large number of variants there is no explicit representation for each of the variants that could be produced. The main concepts that are used to handle this large number of variants are the following:

- **product_class** is used to identify a set of similar products to be offered to the market.

A **product_class** is a **product_concept** and a **characterized_object**. The **characterized_object** may have **property_definition** entities associated to it through **property_definition**.definition and the select type **characterized_definition**.

The instances of **product_class** may build a hierarchical tree-like structure through instances of **product_concept_relationship** that have the attribute name set to 'class hierarchy' and that reference with the attribute related_product_concept the **product_class** that is a subclass of the **product_class** referenced by the attribute relating_product_concept. The supertypes **product_concept** and **characterized_object** are not intended to be instantiated on their own for this Part of ISO 10303. This is enforced by the rules **subtype_mandatory_product_concept** and **subtype_mandatory_characterized_object**.

- **product_concept_feature** is used to describe a characteristic of the products within a **product_class**.

The **product_concept_feature** is associated to a **product_class** through a **product_concept_feature_association** with the attribute name set to 'replaceable standard', 'non replaceable standard', 'availability', 'identification', 'option', or any other non standardized value. For a definition of the meaning of the standardized values see 4.2.68 or clause 5.2 (**product_concept_feature_association** imported entity modification for permissive list definition).

A **package_product_concept_feature** is a subtype of **product_concept_feature** that is used when the characteristic is in fact a set of other characteristics, e.g. a package of several options for a passenger car. In this case there is a **conditional_concept_feature** with the inherited attribute name set to 'inclusion' and the attribute condition referencing a **concept_feature_relationship_with_condition** with the attribute conditional_operator set to 'implication'. The inherited attribute relating_product_concept_feature of the **concept_feature_relationship_with_condition** references the **package_product_concept_feature** and the inherited attribute related_product_concept_feature references either the one **product_concept_feature** that belongs to the package or another **conditional_concept_feature** that references the **product_concept_feature** of the package through an 'and' operation.

– **product_concept_feature_category** is used to group similar instances of **product_concept_feature**, e.g. the different outside colour characteristics of the products.

A **product_concept_feature_category** is a **group** that groups instances of **product_concept_feature**. Instances of **product_concept_feature** are assigned to **product_concept_feature_category** through **group_member_assignment** that is a subtype of **group_assignment**. For this **group_assignment** the attribute items references through the select type **group_member_item** instances of **product_concept_feature** or **package_product_concept_feature**, the attribute assigned_group references **product_concept_feature_category** or **exclusive_product_concept_feature_category**, the attribute role references **group_role** with the attribute name set to 'specification category member'.

Exclusive_product_concept_feature_category is subtype of **product_concept_feature_category** that is used when the members of the **group** are mutually exclusive in their usage within a product, e.g. there is exactly one outside colour that can be choosen for a particular product.

Product_concept_feature_category is associated to **product_class** through **product_concept_feature_category_usage** that is subtype of **group_assignment**.

For this **group_assignment** the attribute items references through the select type **category_usage_item** an instance of **product_class**, the attribute assigned_group references **product_concept_feature_category** or **exclusive_product_concept_feature_category**, the attribute role references **group_role** with the attribute name set to 'mandatory category usage' or 'optional category usage'. For a definition of the meaning of the two values see 4.2.64 or clause 5.2 (**product_concept_feature_category_usage**, where rule explanation for allowed values of **group_role**.name).

– **conditional_concept_feature** is used to control the usage of a **product** (in the ARM: an item classified as 'part') within the products of a **product_class** and to represent conditions for instances of **product_class**.

The **conditional_concept_feature** is subtype of **product_concept_feature** with the attribute name set to 'expression' or 'inclusion'. The **conditional_concept_feature** is used to build up boolean conditions for instances of **product_concept_feature**. The **conditional_concept_feature** references with its attribute condition a **concept_feature_relationship_with_condition** that represents a binary boolean operation. A **concept_feature_relationship_with_condition** is subtype of **concept_feature_relationship** with the attribute conditional_operator set to 'and', 'or', 'oneof', 'not', or 'implication'. For a definition of the meaning of the values see 4.2.417 or clause 5.2 (**concept_feature_relationship_with_condition** imported entity modification for permissive list values for attribute conditional_operator).

Conditional_concept_feature may be associated to a **product_class** through **product_concept_feature_association** with the attribute name set to 'part_usage', 'identification', 'validity', or any other non standardized value. For a definition of the meaning of the standardized values see4.2.65 or clause 5.2 (**product_concept_feature_association** imported entity modification for permissive list definition).

The value 'part usage' indicates that the **conditional_concept_feature** controls the usage of a part within a product of the associated **product_class**. In this case the **product_concept_feature_association** is referenced by a **configured_effective_context_assignment** that

is a subtype of **effective_context_assignment** subtype of **effectivity_assignment** through the select type **configured_effective_context_item**. The **configured_effective_context_assignment** is instatiated as a complex instance with **configured_effective_item_assignment** that is a subtype of **effective_item_assignment** subtype of **effectivity_assignment**.

The **configured_effective_item_assignment** references through the select type **configured_effective_item** the instance of **solution_based_product_definition** that identifies the variant, i.e. the **product** to be controlled.

The complex instance references through the inherited attribute assigned_effectivity an instance of **effectivity** that controls the part usagen in terms of start and end date (i.e. **dated_effectivity**), lot identification (i.e. **lot_effectivity**), serial number range (i.e. **serial_numbered_effectivity**), or start and end events (i.e. **event_based_effectivity**), like 'start of production'.

- **product_definition** that has a **product_definition_context** with the name attribute set to 'functional definition' is used to describe the functional requirements for products in a **product_class** and for instances of **product_component**.

Such instances of **product_definition** for functional requirements may be related to instances of **product_class** through an instance of **configuration_design** and **configuration_item**. In this case the name attribute of **configuration_item** is set to 'class function definition' and the name attribute of **configuration_design** is set to 'possibility' or 'main function'. For a definition of the meaning of the standardized values see4.2.66 or clause 5.2 (**configuration_design** imported entity modification for permissive list definition). In this case one instance of **configuration_item** reflects all the main and possible functions of a **product_class**.

To relate the functional requirements represented by instances of **product_definition** to an instance of **product_component** another instance of **configuration_design** is used with the name attribute set to 'component function definition'. In this case the **configuration_item** is a **product_component** and the functional requirement does not apply globally to the products of the **product_class**, but to one identified **product_component** of that **product_class**.

- **product_component** is used to describe the common decomposition structure of all products of a **product_class**.

A **product_component** is a **configuration_item_with_context** and a **characterized_object**. The **characterized_object** may have **property_definition** entities associated to it through **property_definition**.definition and the select type **characterized_definition**.

The instances of **product_component** may build a hierarchical tree-like structure through instances of **configuration_item_relationship** that have the attribute name set to 'decomposition' and that reference with the attribute related_configuration_item the **product_component** that is a subcomponent of the **product_component** referenced by the attribute relating_configuration_item. The supertypes **configuration_item_with_context** and **characterized_object** are not intended to be instantiated on their own for this Part of ISO 10303. This is enforced by the rules **subtype_mandatory_configuration_item_with_context** and **subtype_mandatory_characterized_object**.

- **solution_based_product_definition** is used to describe the variants for a **product_component**.

A **solution_based_product_definition** is a **product_definition**. An instance of **solution_based_product_definition** may be associated to the **product_component** where it is a vari-

ant of through an instance of **configuration_design** with the name attribute set to 'solution alternate definition'.

An instance of **solution_based_product_definition** may also be a variant of another instance of **solution_based_product_definition**, e.g. where the first level defines technically different solutions and the second level defines different suppliers for the same technical solution. In this case an instance of **product_definition_relationship** with the name attribute set to 'solution alternative definition' is used to relate (as related_product_definition) the first **solution_based_product_definition** instance to the second **solution_based_product_definition** instance (as relating_product_definition) that is the basis for the first one.

All instances of **solution_based_product_definition** that are defined through this path as variant of the same instance of **product_component** or another instance of **solution_based_product_definition** are the mutually exclusive alternate solutions (variants) on this basis.

- **product_definition_occurrence** is used to identify elements of a **solution_based_product_definition**, i.e. the elements of a particular variant for a **product_component**.

A **product_definition_occurrence** is a **product_definition** that has a **product_definition_context** with the name attribute set to 'definitional occurrence'.

A **product_definition_occurrence** defines exactly one occurrence of a part within the assembly structure of a product. An instance of **product_definition_occurrence** may be defined as an element (as related_product_definition) of a **solution_based_product_definition** instance (as relating_product_definition) through a **product_defninition_relationship** with the name attribute set to 'solution instance association'.

5.2.1.10 Form Features

This clause describes the concept concerning the definition and application of form features in this part of ISO 10303.

This standard includes the definition of various form features for the application in panel like parts (i.e. with negligible thickness) and for the application in solid volume parts. Also included is a concept for so-called general features whose semantics and parameters are not predefined as well as for transition features and for threads. This standard distinguishes between the definition of the features that is realized by the entity **feature_definition** which is a subtype of **characterized_object** and their occurrence on a part.

Predefined form features specified for an application in panels are **bead**, **joggle**, **hole_in_panel** that may be a bearing **hole**, **locator** and **feature_in_panel** that is either a boss, a pocket, or a **stair_step**. These features are provided with a set of parameters, profiles, or paths that are supposed to be sufficient to determine the shape of a part after the feature is applied.

Predefined form features specified for an application in solid parts are **boss**, **pocket**, **rib**, **round_hole** and **slot**.

These features are specified by a volume that is defined by a profile and by a path along which the profile is swept. The feature itself is created by adding or subtracting this volume from the part's shape.

For the definition of predefined features a set of predefined profiles, i.e. **circular_closed_profile**,

ngon_closed_profile, **rectangular_closed_profile**, **partial_circular_profile**, **rounded_u_-profile**, **square_u_profile**, **tee_profile**, and **vee_profile**, as well as two general profiles (**closed_-path_profile** and **open_path_profile**) are included. The paths that may be used to define form features are represented by the entity **path_feature_component**. This is either a predefined type of path (**path_feature_component**.name = 'linear', 'partial circular', or 'complete circular') that is specified by a set of parameters or a general type of path (**path_feature_component**.name = 'complex') that is specified by **curve**.

Paths and profiles are specified as instances of **shape_aspect**. Here, a distinction is made between the definition of such feature components and their occurrence. The definitions of paths and profiles are subtypes of **shape_aspect** that reference a **feature_component_definition** which is a subtype of **characterized_object** as 'of_shape'.

This definition of a feature component is associated with its occurrence which is a **shape_aspect** of a **feature_definition** through a subtype of **shape_aspect_relationship** named **shape_defining_relationship**.

For the application of form feature definitions this standard supports two approaches:

- by the entity **instanced_feature** that is a **shape_aspect** of the **product_definition_-shape** and at the same time a subtype of **feature_definition**;

- by the entity **placed_feature** that is also a **shape_aspect** of the **product_definition_-shape** and related to the **feature_definition** by an instance of **mapped_item** and **representation_map**;

The approach using **instanced_feature** supports the identification of 'areas of interest' on an already designed shape that are of a certain meaning to the user, e.g. that correspond to a process operation. The identification of parameters on these features does not mean that a variation of the parameter values results in an (automatic) update of the shape but is only meant to support the specification of these areas in a more appropriate way, e.g. to support process planning. In the case of the application of a feature as an **instanced_feature** the feature itself as well as all of its components (paths or profiles) are defined in the part coordinate system.

The approach using **placed_feature** supports the definition of the feature independent from its application in its own coordinate system and a placement of the **representation** of the **feature_definition** into the **representation** of the **placed_feature** using a **mapped_item** and a **representation_map**. The shape of the feature needs not to be represented since a receiving system is supposed to be able to create the shape that results from the application of the **feature_definition** on a base shape interpreting the values of the feature parameters and the semantics included in the type of feature. In the case of the application of a feature as a **placed_feature** the feature itself and possibly a path used for the feature definition are defined in one coordinate system, a used profile is defined in its own coordinate system. Profiles are placed in the feature coordinate system using a **mapped_item** and a **representation_map**.

This standard supports the application of surface conditions and tolerances to form features only implicitly by applying surface conditions and tolerances to elements of the shape representation of the form feature. An exception are tolerances applied to the location and orientation of the features that may be realized by using **axis2_placement** entities representing the feature coordinate system.

5.2.2 automotive_design types

5.2.2.1 action_item

An **action_item** type specifies those objects to which an **action** may be assigned.

EXPRESS specification:

```
*)
TYPE action_item = SELECT
  (action,
   action_method,
   action_property,
   assembly_component_usage,
   assembly_component_usage_substitute,
   auto_design_drawing_revision,
   conditional_concept_feature,
   configurable_item,
   configuration_design,
   configured_effective_context_assignment,
   configured_effective_item_assignment,
   document,
   draughting_model,
   kinematic_property_definition,
   material_designation,
   mechanical_design_geometric_presentation_representation,
   physically_modelled_product_definition,
   presentation_area,
   process_plan,
   product,
   product_class,
   product_component,
   product_concept_feature,
   product_concept_feature_association,
   product_concept_feature_category,
   product_concept_feature_category_usage,
   product_definition,
   product_definition_formation,
   product_definition_occurrence,
   product_definition_relationship,
   product_definition_substitute,
   project,
   property_definition,
   representation,
   shape_representation,
   solution_based_product_definition);
END_TYPE;
(*
```

5.2.2.2 action_request_item

An **action_request_item** type specifies those objects to which a **versioned_action_request** may be assigned.

EXPRESS specification:

```
*)
TYPE action_request_item = SELECT
  (action_method,
   action_property,
   assembly_component_usage,
   assembly_component_usage_substitute,
   auto_design_drawing_revision,
   conditional_concept_feature,
   configurable_item,
   configuration_design,
   configured_effective_context_assignment,
   configured_effective_item_assignment,
   document,
   draughting_model,
   kinematic_property_definition,
   material_designation,
   mechanical_design_geometric_presentation_representation,
   physically_modelled_product_definition,
   presentation_area,
   process_plan,
   product,
   product_class,
   product_component,
   product_concept_feature,
   product_concept_feature_association,
   product_concept_feature_category,
   product_concept_feature_category_usage,
   product_definition,
   product_definition_formation,
   product_definition_occurrence,
   product_definition_relationship,
   product_definition_substitute,
   property_definition,
   representation,
   shape_representation,
   solution_based_product_definition);
END_TYPE;
(*
```

5.2.2.3 approval_item

An **approval_item** type specifies those objects to which an **approval** may be assigned.

EXPRESS specification:

```
*)
TYPE approval_item = SELECT
  (action,
   action_directive,
   alternate_product_relationship,
   applied_action_assignment,
   assembly_component_usage,
   assembly_component_usage_substitute,
   auto_design_drawing_revision,
   conditional_concept_feature,
   configuration_design,
   configured_effective_context_assignment,
   configured_effective_item_assignment,
   document,
   draughting_model,
   kinematic_property_definition,
   material_designation,
   mechanical_design_geometric_presentation_representation,
   physically_modelled_product_definition,
   presentation_area,
   process_plan,
   product_class,
   product_component,
   product_concept_feature,
   product_concept_feature_association,
   product_concept_feature_category,
   product_concept_feature_category_usage,
   product_definition,
   product_definition_formation,
   product_definition_occurrence,
   product_definition_relationship,
   product_definition_substitute,
   project,
   representation,
   shape_representation,
   solution_based_product_definition);
END_TYPE;
(*
```

5.2.2.4 category_usage_item

A **category_usage_item** type specifies those objects to which a **group** may be assigned.

EXPRESS specification:

```
*)
TYPE category_usage_item = SELECT
  (product_class);
END_TYPE;
```

```
(*
```

5.2.2.5 certification_item

A **certification_item** type specifies those objects to which a **certification** may be assigned.

EXPRESS specification:

```
*)
TYPE certification_item = SELECT
  (solution_based_product_definition);
END_TYPE;
(*
```

5.2.2.6 configured_effective_context_item

A **configured_effective_context_item** type specifies those objects to which an **effectivity** may be assigned. The **configured_effective_context_item** provides the context in which the assigned **effectivity** is valid.

EXPRESS specification:

```
*)
TYPE configured_effective_context_item = SELECT
  (product_concept_feature_association);
END_TYPE;
(*
```

5.2.2.7 configured_effective_item

A **configured_effective_item** type specifies those objects to which an **effectivity** may be assigned. The **effectivity** specifies the valid uses of the **configured_effective_item** for configuration purposes.

EXPRESS specification:

```
*)
TYPE configured_effective_item = SELECT
  (action,
   solution_based_product_definition);
END_TYPE;
(*
```

5.2.2.8 contract_item

A **contract_item** type specifies those objects to which a **contract** may be assigned.

EXPRESS specification:

```
*)
TYPE contract_item = SELECT
  (action,
   product_definition_formation);
END_TYPE;
(*
```

5.2.2.9 date_and_organization_item

A **date_and_organization_item** type specifies those objects to which an **organization** and a **date** or **date_and_time** may be assigned.

EXPRESS specification:

```
*)
TYPE date_and_organization_item = SELECT
  (action,
   action_property,
   applied_action_assignment,
   assembly_component_usage,
   assembly_component_usage_substitute,
   auto_design_drawing_revision,
   conditional_concept_feature,
   configurable_item,
   configuration_design,
   configured_effective_context_assignment,
   configured_effective_item_assignment,
   document,
   draughting_model,
   kinematic_property_definition,
   material_designation,
   mechanical_design_geometric_presentation_representation,
   physically_modelled_product_definition,
   presentation_area,
   process_plan,
   product,
   product_class,
   product_component,
   product_concept_feature,
   product_concept_feature_association,
   product_concept_feature_category,
   product_concept_feature_category_usage,
   product_definition,
   product_definition_formation,
   product_definition_occurrence,
   product_definition_relationship,
   product_definition_substitute,
   project,
```

```
   property_definition,
   representation,
   shape_representation,
   solution_based_product_definition,
   versioned_action_request);
END_TYPE;
(*
```

5.2.2.10 date_and_person_and_organization_item

A **date_and_person_and_organization_item** type specifies those objects to which a **person_-and_organization** and a **date** or **date_and_time** may be assigned.

EXPRESS specification:

```
*)
TYPE date_and_person_and_organization_item = SELECT
  (action,
   applied_action_assignment,
   applied_organization_assignment,
   assembly_component_usage,
   assembly_component_usage_substitute,

(*
```

5.2.2.20 event_item

An **event_item** type specifies those objects to which an **event_reference** may be assigned.

EXPRESS specification:

```
*)
TYPE event_item = SELECT
  (event_based_effectivity,
   project);
END_TYPE;
(*
```

5.2.2.21 external_identification_item

An **external_identification_item** type specifies those objects to which an external identifier and the external source for which the identifier is valid may be assigned.

EXPRESS specification:

```
*)
TYPE external_identification_item = SELECT
  (document);
END_TYPE;
(*
```

5.2.2.22 group_item

A **group_item** type specifies those objects to which a **group** may be assigned.

EXPRESS specification:

```
*)
TYPE group_item = SELECT
  (product_component);
END_TYPE;
(*
```

5.2.2.23 group_member_item

A **group_member_item** type specifies those objects to which a **group** may be assigned in a way that the group_member_item is a member of the **group**.

EXPRESS specification:

```
*)
```

```
TYPE group_member_item = SELECT
  (approval_status,
   characterized_product_category,
   document_type,
   drawing_definition,
   product_concept_feature,
   product_concept_feature_category_usage,
   product_definition,
   representation_item,
   security_classification_level,
   shape_aspect);
END_TYPE;
(*
```

5.2.2.24 identification_item

An **identification_item** type specifies those objects to which an **identifier** may be assigned.

EXPRESS specification:

```
*)
TYPE identification_item = SELECT
  (approval_status,
   assembly_component_usage,
   classification_system,
   document,
   document_type,
   draughting_model,

(*
```

5.2.3 automotive_design entities

5.2.3.1 automotive_design entity definitions

5.2.3.1.1 applied_action_assignment

An **applied_action_assignment** is a type of **action_assignment** that assigns an **action** to an **action_item.**

EXPRESS specification:

```
*)
ENTITY applied_action_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF action_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **action** is assigned.

5.2.3.1.2 applied_action_request_assignment

An **applied_action_request_assignment** is a type of **action_request_assignment** that assigns a **versioned_action_request** to an **action_request_item.**

EXPRESS specification:

```
*)
ENTITY applied_action_request_assignment
  SUBTYPE OF (action_request_assignment);
  items : SET [1:?] OF action_request_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **versioned_action_request** is assigned.

5.2.3.1.3 applied_approval_assignment

An **applied_approval_assignment** is a type of **approval_assignment** that assigns an **approval** to an **approval_item.**

EXPRESS specification:

```
*)
ENTITY applied_approval_assignment
  SUBTYPE OF (approval_assignment);
  items : SET [1:?] OF approval_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **approval** is assigned.

5.2.3.1.4 applied_certification_assignment

An **applied_certification_assignment** is a type of **certification_assignment** that assigns a **certification** to a **certification_item.**

EXPRESS specification:

```
*)
ENTITY applied_certification_assignment
  SUBTYPE OF (certification_assignment);
```

```
  items : SET [1:?] OF certification_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **certification** is assigned.

5.2.3.1.5 applied_contract_assignment

An **applied_contract_assignment** is a type of **contract_assignment** that assigns a **contract** to a **contract_item.**

EXPRESS specification:

```
*)
ENTITY applied_contract_assignment
  SUBTYPE OF (contract_assignment);
  items : SET [1:?] OF contract_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **contract** is assigned.

5.2.3.1.6 applied_date_and_organization_assignment

An **applied_date_and_organization_assignment** is a type of **organization_assignment** that assigns an **organization** and a **date** or **date_and_time** to a **date_and_organization_-item.**

EXPRESS specification:

```
*)
ENTITY applied_date_and_organization_assignment
  SUBTYPE OF (organization_assignment);
  items : SET [1:?] OF date_and_organization_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **organization** is assigned.

5.2.3.1.7 applied_date_and_person_and_organization_assignment

An **applied_date_and_person_and_organization_assignment** is a type of **person_and_organization_assignment** that assigns a **person_and_organization** and a **date** or **date_and_time** to an **date_and_person_and_organization_item.**

EXPRESS specification:

```
*)
ENTITY applied_date_and_person_and_organization_assignment
  SUBTYPE OF (person_and_organization_assignment);
  items : SET [1:?] OF date_and_person_and_organization_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **person_and_organization** is assigned.

5.2.3.1.8 applied_date_and_person_assignment

An **applied_date_and_person_assignment** is a type of **person_assignment** that assigns a person and a **date** or **date_and_time** to a **date_and_person_item.**

EXPRESS specification:

```
*)
ENTITY applied_date_and_person_assignment
  SUBTYPE OF (person_assignment);
  items : SET [1:?] OF date_and_person_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **person** is assigned.

5.2.3.1.9 applied_date_and_time_assignment

An **applied_date_and_time_assignment** is a type of **date_and_time_assignment** that assigns a **date_and_time** to a **date_and_time_item.**

EXPRESS specification:

```
*)
```

```
ENTITY applied_date_and_time_assignment
  SUBTYPE OF (date_and_time_assignment);
  items : SET [1:?] OF date_and_time_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **date_and_time** is assigned.

5.2.3.1.10 applied_date_assignment

An **applied_date_assignment** is a type of **date_assignment** that assigns a **date** to a **date_-item.**

EXPRESS specification:

```
*)
ENTITY applied_date_assignment
  SUBTYPE OF (date_assignment);
  items : SET [1:?] OF date_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **date** is assigned.

5.2.3.1.11 applied_document_reference

An **applied_document_reference** is a type of **document_reference** that assigns a **document** to a **document_reference_item.**

EXPRESS specification:

```
*)
ENTITY applied_document_reference
  SUBTYPE OF (document_reference);
  items : SET [1:?] OF document_reference_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **document** is assigned.

5.2.3.1.12 applied_effective_context_assignment

An **applied_effective_context_assignment** is a type of **effective_context_assignment** that assigns an **effectivity** to an **effective_context_item.**

EXPRESS specification:

```
*)
ENTITY applied_effective_context_assignment
  SUBTYPE OF (effective_context_assignment);
  items : SET [1:?] OF effective_context_item;
WHERE
  WR1:  SIZEOF(['AUTOMOTIVE_DESIGN.DATED_EFFECTIVITY',
         'AUTOMOTIVE_DESIGN.EVENT_BASED_EFFECTIVITY']
               * TYPEOF(SELF.assigned_effectivity)) = 1;
  WR2:  (SIZEOF( QUERY( i <* SELF.items |
          'AUTOMOTIVE_DESIGN.ORGANIZATION' IN TYPEOF(i)
         )) = 0) OR
        (SELF.role.name = 'concerned organization');
  WR3:  (SIZEOF( QUERY( i <* SELF.items |
         'AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION_CONTEXT' IN TYPEOF(i)
         )) = 0) OR
        (SELF.role.name = 'effectivity context');
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **effectivity** is assigned.

Formal propositions:

WR1: The **applied_effective_context_assignment** shall reference as its **assigned_effectivity** an **effectivity** that is of type **dated_effectivity** or **event_based_effectivity**.

WR2: If the **applied_effective_context_assignment** contains an **organization** in its set of **items**, it shall reference as its **role** an **effectivity_role** that has a **name** of 'concerned organization'.

WR3: If the **applied_effective_context_assignment** contains a **product_definition_context** in its set of **items**, it shall reference as its **role** an **effectivity_role** that has a **name** of 'effectivity context'.

5.2.3.1.13 applied_effective_item_assignment

An **applied_effective_item_assignment** is a type of **effective_item_assignment** that assigns an **effectivity** to an **effective_item.**

EXPRESS specification:

```
*)
ENTITY applied_effective_item_assignment
  SUBTYPE OF (effective_item_assignment);
  items : SET [1:?] OF effective_item;
WHERE
  WR1:  SIZEOF(['AUTOMOTIVE_DESIGN.DATED_EFFECTIVITY',
         'AUTOMOTIVE_DESIGN.EVENT_BASED_EFFECTIVITY'] *
               TYPEOF(SELF.assigned_effectivity)) = 1;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **effectivity** is assigned.

Formal propositions:

WR1: The **applied_effective_item_assignment** shall reference as its **assigned_effectivity** an **effectivity** that is of type **dated_effectivity** or **event_based_effectivity**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **applied_effective_item_assignment** entity:

– product_definition_substitute_requires_effectivity_assignment (see 5.2.4.68).

5.2.3.1.14 applied_external_identification_assignment

An **applied_external_identification_assignment** is a type of **external_identification_assignment** that assigns an external identifier and an external source to an **external_identification_item.**

EXPRESS specification:

```
*)
ENTITY applied_external_identification_assignment
  SUBTYPE OF (external_identification_assignment);
  items : SET [1:?] OF external_identification_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **identifier** is assigned.

5.2.3.1.15 applied_group_assignment

An **applied_group_assignment** is a type of **group_assignment** that assigns a **group** to a **group_item.**

EXPRESS specification:

```
*)
ENTITY applied_group_assignment
  SUBTYPE OF (group_assignment);
  items : SET [1:?] OF group_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **group** is assigned.

5.2.3.1.16 applied_identification_assignment

An **applied_identification_assignment** is a type of **identification_assignment** that assigns an **identifier** to an **identification_item.**

EXPRESS specification:

```
*)
ENTITY applied_identification_assignment
  SUBTYPE OF (identification_assignment);
  items : SET [1:?] OF identification_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **identifier** is assigned.

5.2.3.1.17 applied_multi_language_attribute_assignment

An **applied_multi_language_assignment** is a type of **multi_language_attribute_assignment** that assigns an alternate **label** to a **multi_language_attribute_item.**

EXPRESS specification:

```
*)
ENTITY applied_multi_language_attribute_assignment
  SUBTYPE OF (multi_language_attribute_assignment);
```

```
  items : SET [1:?] OF multi_language_attribute_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **label** is assigned.

5.2.3.1.18 applied_organization_assignment

An **applied_organization_assignment** is a type of **organization_assignment** that assigns an **organization** to an **organization_item.**

EXPRESS specification:

```
*)
ENTITY applied_organization_assignment
  SUBTYPE OF (organization_assignment);
  items : SET [1:?] OF organization_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **organization** is assigned.

5.2.3.1.19 applied_person_and_organization_assignment

An **applied_person_and_organization_assignment** is a type of **person_and_organization_-assignment** that assigns a **person_and_organization** to a **person_and_organization_item.**

EXPRESS specification:

```
*)
ENTITY applied_person_and_organization_assignment
  SUBTYPE OF (person_and_organization_assignment);
  items : SET [1:?] OF person_and_organization_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **person_and_organization** is assigned.

5.2.3.1.20 applied_person_assignment

An **applied_person_assignment** is a type of **person_assignment** that assigns a **person** to a **person_item.**

EXPRESS specification:

```
*)
ENTITY applied_person_assignment
  SUBTYPE OF (person_assignment);
  items : SET [1:?] OF person_item;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the **person** is assigned.

5.2.3.1.21 applied_presented_item

An **applied_presented_item** is a type of **presented_item** that assigns a **presentation_representation,** or a **presentation_set** to an item in the **presented_item_select.**

EXPRESS specification:

```
*)
ENTITY applied_presented_item
  SUBTYPE OF (presented_item);
  items : SET [1:?] OF presented_item_select;
END_ENTITY;
(*
```

5.2.3.1.22 applied_security_classification_assignment

An **applied_security_classification_assignment** is a type of **security_classification_assignment** that assigns a **security_classification** to a **security_classification_item.**

EXPRESS specification:

```
*)
ENTITY applied_security_classification_assignment

Attribute definitions:

items: the set of **items** to which the **security_classification** is assigned.

5.2.3.1.23 area_presentation_relationship

An **area_presentation_relationship** is a **representation_relationship** that relates two view areas. See ARM definition for View_area_relationship in paragraph 4.2.493 for more information.

EXPRESS specification:

```
*)
ENTITY area_presentation_relationship
  SUBTYPE OF (representation_relationship);
WHERE
  WR1:  ('AUTOMOTIVE_DESIGN.PRESENTATION_AREA' IN
         TYPEOF(SELF\representation_relationship.rep_1))
           AND
        ('AUTOMOTIVE_DESIGN.PRESENTATION_AREA' IN
         TYPEOF(SELF\representation_relationship.rep_2));
END_ENTITY;
(*
```

Formal propositions:

WR1: Both **representation**s related with an **area_presentation_relationship** shall be of type **presentation_area**.

5.2.3.1.24 auto_design_drawing_revision

An **auto_design_drawing_revision** is a type of **drawing_revision** that specifies constraints within the context of draughting.

EXPRESS specification:

```
*)
ENTITY auto_design_drawing_revision
  SUBTYPE OF (drawing_revision);
WHERE
  WR1:  -- drawing_requires_sheets:

5.2.3.1.27 boss

A **boss** is a type of **feature_definition** that is the representation of an enclosed shape protrusion that is added to a solid base shape. This added volume is represented by sweeping a closed profile along a linear path represented by a **path_feature_component.** The top of the **boss** is represented by a **boss_top.** The walls of the **boss** may have a slope that is represented by a

taper. See ARM definition for Boss_feature in paragraph 4.2.42, for Circular_boss in paragraph 4.2.56, for Rectangular_boss in paragraph 4.2.368, and for General_boss in paragraph 4.2.190 for more information.

Formal propositions:

WR1: The **boss_top** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **description** of the **boss_top** shall be either 'planar' or 'non-planar'.

WR3: If the **description** of the **boss_top** is 'planar', the **boss_top** shall have exactly one **direction_shape_representation.**

WR4: If the **description** of the **boss_top** is 'planar', the **boss_top** shall have exactly one **location_shape_representation.**

WR5: If the **description** of the **boss_top** is 'non-planar', the **boss_top** shall either have exactly one **face_shape_representation** or exactly one **connected_face_shape_representation.**

WR6: The **boss_top** shall be the **relating_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'boss top usage' in which the **related_shape_aspect** is a **shape_aspect** of a **boss** with a **name** of 'top condition' and a **description** of 'boss top occurrence'.

WR7: The **boss_top** shall have exactly one **shape_representation_with_parameters** to specify its implicit representation.

WR8: The **shape_representation_with_parameters** that represents the **boss_top** shall contain exactly one **representation_item** in its set of **items**.

WR9: Exactly one **representation_item** used for the implicit representation of a **boss_top** shall be of type **descriptive_representation_item** with a **name** of 'top location' and a **description** of either 'path start' or 'path end'.

5.2.3.1.29 camera_image_2d_with_scale

A **camera_image_2d_with_scale** is a type of **camera_image** with a derived scale. The scale is the ratio between the size of the viewport and the size of the view window of the **camera_model.**

NOTE 1 – The viewport specifies the rectangular boundary of the view as it is depicted in the drawing sheet.

NOTE 2 – The definition of this entity is identical to the definition in ISO 10303-202.

EXPRESS specification:

```
*)
ENTITY camera_image_2d_with_scale
  SUBTYPE OF (camera_image);
DERIVE
  scale: positive_ratio_measure :=
          ((SELF\mapped_item.mapping_target\planar_extent.size_in_x) /
           (SELF\mapped_item.mapping_source.
            mapping_origin\camera_model_d2.view_window.size_in_x));
WHERE
  WR1:  ('AUTOMOTIVE_DESIGN.CAMERA_MODEL_D2' IN
          TYPEOF(SELF\mapped_item.mapping_source.mapping_origin));
  WR2:  aspect_ratio (SELF\mapped_item.mapping_target) =
          aspect_ratio (SELF\mapped_item.mapping_source.
                              mapping_origin\camera_model_d2.view_window);
  WR3:  SELF\mapped_item.mapping_source.
              mapping_origin\camera_model_d2.view_window_clipping;
END_ENTITY;
(*
```

Attribute definitions:

scale: The **positive_ratio_measure** derived from the rectangular size of the viewport and the rectangular size of the **view_window** of the **camera_model_d2.**

Formal propositions:

WR1: The source of the projection shall be a **camera_model_d2.**

WR2: The aspect ratio of the viewport shall equal the aspect ratio of the **view_window** of the **camera_model.**

WR3: The **view_window_clipping** attribute of the **camera_model_d2** shall be true.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **camera_image_2d_-with_scale** entity:

– restrict_multi_language_for_camera_image_2d_with_scale (see 5.2.4.90).

5.2.3.1.30 chamfer

A **chamfer** is a type of **transition_feature** that is the representation of a linear transition between two joining non-coplanar faces. See ARM definition for Chamfer in paragraph 4.2.50 for more information.

EXPRESS specification:

```
*)
ENTITY chamfer
  SUBTYPE OF (transition_feature);
WHERE
  WR1:  SIZEOF( QUERY (fcr <* USEDIN (SELF, 'AUTOMOTIVE_DESIGN.' +
              'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |

```

Formal propositions:

WR1: The **circular_closed_profile** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **circular_closed_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the **circular_closed_profile** shall contain two **representation_items** in its set of **items**.

WR4: Exactly one **representation_item** used for the implicit representation of a **circular_closed_profile** shall be of type **placement** with a **name** of 'orientation'.

WR5: Exactly one **representation_item** used for the implicit representation of a **circular_closed_profile** shall be of type **measure_representation_item** and **length_angle_measure_with_unit** with a **name** of 'diameter'.

Informal propositions:

IP1: The **circular_closed_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **circular_closed_profile** is defined at the centre of the circle.

5.2.3.1.34 circular_pattern

A **circular_pattern** is a type of **replicate_feature** that relates a base feature and one or more **shape_aspects** which are the placement of the base feature at a specified circular location on the base part. A diameter is defined with a placement on the part and a number of base features are equally spaced around this diameter. See ARM definition for Circular_pattern in paragraph 4.2.61 for more information.

EXPRESS specification:

Formal propositions:

WR1: The implicit representation of the **circular_pattern** shall contain four or five **representation_items** in its set of **items**.

WR2: The implicit representation of the **circular_pattern** shall contain at most one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'diameter'.

WR3: The implicit representation of the **circular_pattern** shall contain exactly one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a name of 'base feature rotation'.

WR4: The implicit representation of the **circular_pattern** shall contain exactly one **representation_item** of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'number of features'.

WR5: The implicit representation of the **circular_pattern** shall contain exactly one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'angular spacing'.

Informal propositions:

IP1: The location of the **circular_pattern** shall be defined at the center of the circle.

IP2: The **circular_pattern** shall be defined in the X-Y plane, with the X direction intersecting the placement position of the first base feature.

5.2.3.1.35 classification_system

A **classification_system** is a type of group that describes a method for classifying objects. See ARM definition for Classification_system in paragraph 4.2.70 for more information.

EXPRESS specification:

```
*)
ENTITY classification_system
  SUBTYPE OF (group);
WHERE
  WR1:  (SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.APPLIED_DOCUMENT_REFERENCE.ITEMS')
               ) = 0 ) OR
        (SIZEOF( QUERY( adr <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +

          adr.role.name = 'classification system source'
               )) = 1 );
END_ENTITY;
(*
```

Formal propositions:

WR1: The **classification_system** shall be contained in the set of **items** of at most one **applied_document_reference.** If present, this **applied_document_reference** shall reference as its **role** a **document_role** that has a **name** of 'classification system source'.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **classification_system** entity:

– restrict_multi_language_for_classification_system (see 5.2.4.94).

5.2.3.1.36 closed_path_profile

A **closed_path_profile** is a type of **shape_aspect** that consists of a connected set of curves and possibly a reference system that may be used to place the **closed_path_profile.** See ARM definition for General_closed_profile in paragraph 4.2.194 for more information.

EXPRESS specification:

```
*)
ENTITY closed_path_profile
  SUBTYPE OF (shape_aspect);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.FEATURE_COMPONENT_DEFINITION' IN
         TYPEOF(SELF.of_shape.definition);

                TYPEOF (pdr.used_representation)
        )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **closed_path_profile** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **closed_path_profile** shall have at most one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the **closed_path_profile** shall contain one **representation_item** in its set of **items**.

WR4: Exactly one **representation_item** used for the implicit representation of a **closed_path_profile** shall be of type **placement** with a **name** of 'orientation'.

WR5: The **closed_path_profile** shall have exactly one **path_shape_representation.**

Informal propositions:

IP1: The **closed_path_profile** shall be planar and shall lie in the X-Y plane of the reference system if this is present.

5.2.3.1.37 component_function_definition

A **component_function_definition** is a type of **configuration_design** that specifies that a **product_component** fulfills a certain function. See ARM definition for Function_component_association in paragraph 4.2.189 for more information.

EXPRESS specification:

```
*)
ENTITY component_function_definition
  SUBTYPE OF (configuration_design);
WHERE
  WR1:  SELF.design.frame_of_reference.name = 'functional definition';
  WR2:  'AUTOMOTIVE_DESIGN.PRODUCT_COMPONENT' IN
         TYPEOF(SELF.configuration);
END_ENTITY;
(*
```

Formal propositions:

WR1: The **component_function_definition** shall reference as the **design** a **product_definition** that references as its **frame_of_reference** a **product_definition_context** that has a **name** of 'functional definition'.

WR2: The **component_function_definition** shall reference as the **configuration** a **configuration_item** that is of type **product_component.**

5.2.3.1.38 compound_feature_in_panel

A **compound_feature_in_panel** is a type of **feature_definition** that is the representation of several other features for the purpose of creating unique user defined features for application on

panel parts. See ARM definition for Compound_feature_in_panel in paragraph 4.2.81 for more information.

EXPRESS specification:

```
*)
ENTITY compound_feature_in_panel
  SUBTYPE OF (feature_definition);

Formal propositions:

WR1: Each instance of **compound_feature_in_solid** shall either be of type **instanced_feature** and **composite_shape_aspect**, or shall have a shape that has exactly one **shape_aspect** identified on it that is of type **composite_shape_aspect.**

WR2: The **shape_aspect_relationships** that are used to relate the single features with the **composite_shape_aspect** shall be **feature_component_relationships.**

WR3: If the **compound_feature_in_solid** is of type **instanced_feature** and **composite_shape_aspect** the **related_shape_aspects** defined by its **component_relationships** shall be of type **instanced_feature**, **transition_feature**, or **thread_occurrence.**

WR4: If the **compound_feature_in_solid** is not of type **instanced_feature**, the **composite_shape_aspect** identified on its shape shall only have **related_shape_aspects** defined by its **component_relationships** that are of type **placed_feature**, **transition_feature**, or **thread_occurrence.**

WR5: Each **placed_feature** that is specified by the **component_relationships** of a **composite_shape_aspect** of a **compound_feature_in_solid** shall have a **representation_item** of type **placement** with a **name** of 'element placement' in its **shape_representation_with_parameters.**

5.2.3.1.40 compound_shape_representation

A **compound_shape_representation** is a type of **shape_representation** that represents the shape or a portion of the shape of a product using elements of different dimensionality such as wireframes or surface models that are topologically connected. The topology of a **compound_shape_representation** may be non-manifold. See ARM definition for Compound_model in paragraph 4.2.87 for more information.

EXPRESS specification:

```
*)

        )) = 0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **compound_shape_representation** shall have a **coordinate_space_dimension** equal to three.

WR2: The **items** in the **compound_shape_representation** shall be of type **edge_based_wireframe_model, face_based_surface_model, mapped_item** or **axis2_placement_3d.**

WR3: The **items** of a **compound_shape_representation** shall include at least one **mapped_item** or one **edge_based_wireframe_model** or one **face_based_surface_model.**

WR4: If there is a **mapped_item** in a **compound_shape_representation,** the source of the **mapped_item** shall be a **compound_shape_representation,** a **edge_based_wireframe_shape_representation,** or a **non_manifold_surface_shape_representation.**

Informal propositions:

IP1: All elements in a **compound_shape_representation** shall be topologically connected.

5.2.3.1.41 configured_effective_context_assignment

A **configured_effective_context_assignment** is a type of **effective_context_assignment** that assigns an effectivity to a **configured_effective_context_item** that specifies the context for which the usage of a configuration controlled item is valid. See ARM definition for Configuration in paragraph 4.2.89, for Dated_configuration in paragraph 4.2.115, for Lot_configuration in paragraph 4.2.272, and for Serial_configuration in paragraph 4.2.393 for more information.

EXPRESS specification:

```
*)
ENTITY configured_effective_context_assignment
  SUBTYPE OF (effective_context_assignment);
  items : SET [1:?] OF configured_effective_context_item;
WHERE
  WR1:  SIZEOF(SELF.items) = 1;
  WR2:  SIZEOF( QUERY( ea <* USEDIN(SELF.assigned_effectivity,
              'AUTOMOTIVE_DESIGN.EFFECTIVITY_ASSIGNMENT.' +
              'ASSIGNED_EFFECTIVITY') |
         'AUTOMOTIVE_DESIGN.CONFIGURED_EFFECTIVE_ITEM_ASSIGNMENT' IN
          TYPEOF(ea)
               )) = 1;
  WR3:  SELF.role.name = 'configuration';
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items that specify the valid context for the **assigned_effectivity.**

Formal propositions:

WR1: The **configured_effective_context_assignment** shall contain exactly one item in its set of **items**.

WR2: The **configured_effective_context_assignment** shall reference as its **assigned_effectivity** an **effectivity** that is referenced as the **assigned_effectivity** by exactly one **configured_effective_item_assignment.**

WR3: The **configured_effective_context_assignment** shall reference as its **role** an **effectivity_role** that has a **name** of 'configuration'.

5.2.3.1.42 configured_effective_item_assignment

A **configured_effective_item_assignment** is a type of **effective_item_assignment** that assigns an effectivity to a **configured_effective_item** with the purpose of applying configuration control mechanisms to it. See ARM definition for Configuration in paragraph 4.2.89, for Dated_configuration in paragraph 4.2.115, for Lot_configuration in paragraph 4.2.272, and for Serial_configuration in paragraph 4.2.393 for more information.

EXPRESS specification:

```
*)
ENTITY configured_effective_item_assignment
  SUBTYPE OF (effective_item_assignment);
  items : SET [1:?] OF configured_effective_item;
WHERE
```

```
  WR1:  SIZEOF(SELF.items) = 1;

         'AUTOMOTIVE_DESIGN.CONFIGURED_EFFECTIVE_CONTEXT_ASSIGNMENT' IN
          TYPEOF(ae)
              )) = 1;
  WR3:  SELF.role.name = 'configuration';
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items to which the effectivity is assigned.

Formal propositions:

WR1: The **configured_effective_item_assignment** shall contain exactly one item in its set of **items**.

WR2: The **configured_effective_item_assignment** shall reference as its **assigned_effectivity** an **effectivity** that is referenced as the **assigned_effectivity** by exactly one **configured_effective_context_assignment.**

WR3: The **configured_effective_item_assignment** shall reference as its **role** an **effectivity_role** that has a **name** of 'configuration'.

5.2.3.1.43 connected_face_shape_representation

A **connected_face_shape_representation** is a type of **representation** that represents a portion of a part's boundary by a connected set of faces.

EXPRESS specification:

```
*)
ENTITY connected_face_shape_representation
  SUBTYPE OF (representation);
WHERE
  WR1:  SIZEOF(SELF.items) = 1;
  WR2:  SIZEOF( QUERY( i <* SELF.items |
                ('AUTOMOTIVE_DESIGN.CLOSED_SHELL' IN TYPEOF(i)) OR
                ('AUTOMOTIVE_DESIGN.OPEN_SHELL' IN TYPEOF(i))
              )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **connected_face_shape_representation** shall have exactly one **representation_item** in its set of **items**.

WR2: The geometric element that is used to represent the **connected_face_shape_representation** shall be a **closed_shell** or an **open_shell.**

5.2.3.1.44 constructive_geometry_representation

A **constructive_geometry_representation** is a type of **representation** that is a collection of non-shape geometry that is used to support the definition of the geometry that is representing the shape of the part. See ARM definition for Constructive_geometry in paragraph 4.2.95 for more information.

EXPRESS specification:

```
*)
ENTITY constructive_geometry_representation
  SUBTYPE OF (representation);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.GEOMETRIC_REPRESENTATION_CONTEXT' IN
         TYPEOF(SELF.context_of_items);
  WR2:  SIZEOF( QUERY( cgr_i <* SELF.items |
                SIZEOF(['AUTOMOTIVE_DESIGN.PLACEMENT',
                        'AUTOMOTIVE_DESIGN.CURVE',
                        'AUTOMOTIVE_DESIGN.EDGE',
                        'AUTOMOTIVE_DESIGN.FACE',
                        'AUTOMOTIVE_DESIGN.POINT',
                        'AUTOMOTIVE_DESIGN.SURFACE',
                        'AUTOMOTIVE_DESIGN.VERTEX'] * TYPEOF(cgr_i)) <> 1
        )) = 0;
  WR3:  SIZEOF( QUERY( rr <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                            'REPRESENTATION_RELATIONSHIP.REP_2') |
                'AUTOMTOIVE_DESIGN.CONSTRUCTIVE_GEOMETRY_REPRESENTATION_RELATIONSHIP' IN
                 TYPEOF(rr)
              )) < 1;
  WR4:  SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                'REPRESENTATION_MAP.MAPPED_REPRESENTATION')
        ) = 0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **constructive_geometry_representation** shall have a **geometric_representation_context** as **context_of_items.**

WR2: The **items** in the **constructive_geometry_representation** shall be of type **placement**, **curve**, **edge**, **face**, **point**, **surface**, or **vertex**.

WR3: The **constructive_geometry_representation** shall play the role of **rep_2** for at least one **constructive_geometry_representation_relationship.**

WR4: The **constructive_geometry_representation** shall not play the role of **mapped_representation** for a **representation_map.**

5.2.3.1.45 constructive_geometry_representation_relationship

A **constructive_geometry_representation_relationship** is a type of **representation_relationship** that associates the geometry representing the part's shape with the constructive geometry which was used for its definition or a constructive geometry with another constructive geometry which was used for its definition.

EXPRESS specification:

```
*)
ENTITY constructive_geometry_representation_relationship
  SUBTYPE OF (representation_relationship);
WHERE
  WR1:  SELF.rep_1.context_of_items :=: SELF.rep_2.context_of_items;
  WR2:  'AUTOMOTIVE_DESIGN.CONSTRUCTIVE_GEOMETRY_REPRESENTATION' IN
         TYPEOF(SELF.rep_2);
  WR3:  SIZEOF(['AUTOMOTIVE_DESIGN.SHAPE_REPRESENTATION',
                 'AUTOMOTIVE_DESIGN.CONSTRUCTIVE_GEOMETRY_REPRESENTATION'] *
                TYPEOF(SELF.rep_1)
        ) = 1;
  WR4:  NOT('AUTOMOTIVE_DESIGN.REPRESENTATION_RELATIONSHIP_WITH_TRANSFORMATION' IN
            TYPEOF(SELF));
END_ENTITY;
(*
```

Formal propositions:

WR1: Both **representation**s playing the roles of **rep_1** and **rep_2** of the **constructive_geometry_representation_relationship** shall share the same **geometric_representation_context.**

WR2: The **representation** playing the role of **rep_2** of the **constructive_geometry_representation_relationship** shall be of type **constructive_geometry_representation.**

WR3: The **representation** playing the role of **rep_1** of the **constructive_geometry_representation_relationship** shall be of type **shape_representation** or **constructive_geometry_representation.**

WR4: The **constructive_geometry_representation_relationship** shall not be of type **representation_relationship_with_transformation.**

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **constructive_geometry_representation_relationship** entity:

– restrict_multi_language_for_constructive_geometry_representation_relationship (see 5.2.4.98).

5.2.3.1.46 default_tolerance_table

A **default_tolerance_table** is a type of **representation** that specifies information about general tolerances. See ARM definition for General_tolerance_table in paragraph 4.2.207 for more information.

EXPRESS specification:

```
*)
ENTITY default_tolerance_table
  SUBTYPE OF (representation);
WHERE
  WR1:  SIZEOF( QUERY( rep_rel <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
         'REPRESENTATION_RELATIONSHIP.REP_1') |
         'AUTOMOTIVE_DESIGN.DEFAULT_TOLERANCE_TABLE_CELL'
         IN TYPEOF(rep_rel.rep_2)
        )) > 0;
  WR2:  SELF\representation.context_of_items.context_type = 'default setting';
END_ENTITY;
(*
```

Formal propositions:

WR1: Each **default_tolerance_table** shall participate in at least one **representation_relationship** in the role of **rep_1** where the **representation** that plays the role of **rep_2** is of type **default_tolerance_table_cell**.

WR2: The **context_of_items** of the **default_tolerance_table** shall reference a **representation_context** with a **context_type** of 'default setting'.

5.2.3.1.47 default_tolerance_table_cell

A **default_tolerance_table_cell** is a type of **representation** that specifies one cell entry in a **default_tolerance_table.** See ARM definition for Tolerance_table_cell in paragraph 4.2.462 for more information.

EXPRESS specification:

```
*)
ENTITY default_tolerance_table_cell
  SUBTYPE OF (representation);

Formal propositions:

WR1: Each **default_tolerance_table_cell** shall participate in exactly one **representation_relationship** in the role of the **rep_2** where a **default_tolerance_table** participates in the role of **rep_1**.

WR2: The **context_of_items** of the **default_tolerance_table** shall reference a **representation_context** with a **context_type** of 'default setting'.

WR3: Either exactly one **representation_item** in the set of **items** shall be a **measure_representation_item** with the **name** of 'significant number of digits' or there shall be two **representation_items** of type **measure_representation_item** where one of them has the **name** of 'lower limit' and the other one has the **name** of 'upper limit'.

WR4: Either exactly one **representation_item** in the set of **items** shall be a **measure_representation_item** with the **name** of 'plus minus tolerance value' or there shall be two **representation_items** of type **measure_representation_item** where one of them has the **name** of 'lower tolerance value' and the other one has the **name** of 'upper tolerance value'

WR5: The **default_tolerance_table_cell** shall contain at most four **representation_items** in its set of **items**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **default_tolerance_table_cell** entity:

– restrict_multi_language_for_default_tolerance_table_cell (see 5.2.4.100).

5.2.3.1.48 digital_document_reference

A **digital_document_reference** is a type of **document_reference** that assigns a document that contains the externally defined geometry information to an **externally_defined_representation.** See ARM definition for External_model in paragraph 4.2.166 for more information.

EXPRESS specification:

```
*)
ENTITY digital_document_reference
  SUBTYPE OF (document_reference);
  items : SET [1:?] OF digital_document_reference_item;
WHERE
  WR1:  SELF.assigned_document.kind.product_data_type = 'digital';
  WR2:  SELF.role.name = 'external definition';
  WR3:  SIZEOF(SELF.items) = 1;
END_ENTITY;
(*
```

Attribute definitions:

items: the set of **items** to which the digital document is assigned.

Formal propositions:

WR1: The **digital_document_reference** shall reference as its **assigned_document** a **document** that references as its **kind** a **document_type** with a **product_data_type** of 'digital'.

WR2: The **digital_document_reference** shall reference as its **role** a **document_role** that has a **name** of 'external definition'.

WR3: The **digital_document_reference** shall contain exactly one item in its set of **items**.

5.2.3.1.49 directed_angle

A **directed_angle** is a type of **shape_aspect** that specifies an angle value and the element the angle is measured from. See ARM definition for Angle_specification in paragraph 4.2.9 for more information.

EXPRESS specification:

```
*)
ENTITY directed_angle

                 )) = 1 )
              )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **directed_angle** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **directed_angle** shall have exactly one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the shape of the **directed_angle** shall contain exactly two **representation_items** in its set of **items**.

WR4: The implicit representation of the **directed_angle** shall have exactly one **representation_item** in its set of **items** which is a **descriptive_representation_item** with a **name** of 'angle reference' and a **description** of either 'punch direction', 'profile normal', or 'surface normal'.

WR5: The implicit representation of the **directed_angle** shall have exactly one **representation_item** in its set of **items** which is of type **measure_representation_item** and **plane_angle_measure_with_unit** and has a **name** of 'angle'.

5.2.3.1.50 directed_dimensional_location

A **directed_dimensional_location** is a type of **dimension_location** that identifies the direction to measure the location dimension.

NOTE – The definition of this entity is identical to the definition in ISO 10303–224.

EXPRESS specification:

```
*)
ENTITY directed_dimensional_location
  SUBTYPE OF (dimensional_location);
END_ENTITY;
(*
```

Attribute definitions:

SELF\shape_aspect_relationship.related_shape_aspect: the target of the directed dimension.

SELF\shape_aspect_relationship.relating_shape_aspect: the origin of the directed dimension.

5.2.3.1.51 direction_shape_representation

A **direction_shape_representation** is a type of **representation** that represents a direction vector in two or three dimensional space.

EXPRESS specification:

```
*)
ENTITY direction_shape_representation
  SUBTYPE OF (representation);
WHERE
  WR1:  SIZEOF(SELF.items) = 1;
  WR2:  SIZEOF( QUERY( i <* SELF.items |
         'AUTOMOTIVE_DESIGN.DIRECTION' IN TYPEOF(i)
              )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **direction_shape_representation** shall have exactly one **representation_item** in its set of items.

WR2: The geometric element that is used to represent the **direction_shape_representation** shall be a **direction**.

5.2.3.1.52 draughting_model

A **draughting_model** is a type of **representation** that represents of the shape of a product for the purpose of draughting. A **draughting_model** may contain **mapped_item**s that are the mappings of **shape_representation**s or of other **draughting_model**s. A **mapped_item** that is the mapping of a **shape_representation** specifies an explicit representation of the shape of a product that is to be presented in the drawing. A **mapped_item** that is the mapping of another **draughting_model** specifies the use of a sub-model.
The **draughting_model** may contain **styled_item**s. These **styled_item**s specify the style for a **mapped_item** that is the mapping of a **shape_representation,** and provide the **curve_style** to be used in presenting the **shape_representation** in the drawing.The **draughting_model** may contain **annotation_occurrence**s. These **annotation_occurrence**s specify annotation that is placed in the same coordinate system as the **shape_representation,** and is projected into a view when the **draughting_model** is presented in a drawing.

EXPRESS specification:

```
*)
ENTITY draughting_model
  SUBTYPE OF (representation);
UNIQUE
  UR1:  SELF\representation.name;
WHERE
  WR1:  SIZEOF (QUERY (it <* SELF.items |

              ))) = 1))
       )) = 0;
END_ENTITY;
(*
```

Formal propositions:

UR1: The name of a **draughting_model** shall be unique.

WR1: Each item of a **draughting_model** shall be a **mapped_item**, **styled_item**, **axis2_placement**, or **camera_model_d3.**

WR2: If there is a **mapped_item** in the **draughting_model**, the source of the **mapped_item** shall be a **shape_representation** or another **draughting_model.**

WR3: If a **mapped_item** is styled, the source of the **mapped_item** shall be a **shape_representation** and the style applied to the **mapped_item** shall be a **curve_style.**

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **draughting_model** entity:

– draughting_model_annotation_layers (see 5.2.4.51);

– restrict_multi_language_for_draughting_model (see 5.2.4.106);

– restrict_version_assignment_for_draughting_model (see 5.2.4.171).

5.2.3.1.53 draughting_pre_defined_text_font

A **draughting_pre_defined_text_font** is a type of **pre_defined_text_font** that is identified by name. The definition of the appearance of each **draughting_pre_defined_text_font** is given in ISO 3098-1.

NOTE – The definition of this entity is identical to the definition in ISO 10303–202.

EXPRESS specification:

```
*)
ENTITY draughting_pre_defined_text_font
  SUBTYPE OF (pre_defined_text_font);
WHERE
  WR1:  SELF.name IN ['ISO 3098-1 font A', 'ISO 3098-1 font B'];
END_ENTITY;
(*
```

Formal propositions:

WR1: The name of the **draughting_pre_defined_text_font** shall be 'ISO 3098-1 font A' or 'ISO 3098-1 font B'.

Attribute value definitions:

The **draughting_pre_defined_text_font**s are:

ISO 3098-1 font A: the text font denoted as Lettering A in clause 3 of ISO 3098-1.

ISO 3098-1 font B: the text font denoted as Lettering B in clause 3 of ISO 3098-1.

5.2.3.1.54 draughting_specification_reference

A **draughting_specification_reference** is a type of **document_reference** that is the designation of an external draughting specification for a drawing revision.

NOTE – The definition of this entity is identical to the definition in ISO 10303–505.

EXPRESS specification:

```
*)
ENTITY draughting_specification_reference
  SUBTYPE OF (document_reference);
  specified_items : SET [1:?] OF specified_item;
WHERE
  WR1:  (SELF.assigned_document.kind.product_data_type =
                   'draughting specification');
END_ENTITY;
(*
```

Attribute definitions:

specified_items: The **drawing_revision**s to which a draughting specification is applied.

Formal propositions:

WR1: Each document assigned shall be a draughting specification.

5.2.3.1.55 edge_round

An **edge_round** is a type of **transition_feature** that is the representation of a circular convex transition between two faces. See ARM definition for Edge_round in paragraph 4.2.154 for more information.

EXPRESS specification:

```
*)
ENTITY edge_round
  SUBTYPE OF (transition_feature);

END_ENTITY;
(*
```

Formal propositions:

WR1: An **edge_round** has an implicit representation if and only if it has a **description** of 'constant radius'.

WR2: If the **description** of the **edge_round** is 'constant radius', the implicit representation shall contain between one and three **representation_items** in its set of **items**.

WR3: If the **description** of the **edge_round** is 'constant radius', the implicit representation shall only contain **representation_items** in its set of **items** that have a **name** of either 'radius', 'first face offset', or 'second face offset'.

WR4: If the **description** of the **edge_round** is 'constant radius', exactly one **representation_item** used for the implicit representation of the **edge_round** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'radius'.

WR5: If the **description** of the **edge_round** is 'constant radius', at most one **representation_item** used for the implicit representation of the **edge_round** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'first face offset'.

WR6: If the **description** of the **edge_round** is 'constant radius', at most one **representation_item** used for the implicit representation of the **edge_round** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'second face offset'.

5.2.3.1.56 element_delivery

An **element_delivery** is a type of **directed_action** that specifies the delivery of a physical object defined by either a **product_definition_formation,** by a **configurable_item** that identifies a physically realizable object by selecting a set of **product_concept_feature** instances for a product class, or by a **product_definition** that identifies a physically realized occurrence of a product. See ARM definition for Element_delivery in paragraph 4.2.158 for more information.

EXPRESS specification:

```
*)
ENTITY element_delivery
  SUBTYPE OF (directed_action);
WHERE
  WR1:  SIZEOF( QUERY( aa <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'ACTION_ASSIGNMENT.ASSIGNED_ACTION') |
         'AUTOMOTIVE_DESIGN.ELEMENT_DELIVERY_ASSIGNMENT' IN
          TYPEOF(aa)
              )) = 1;
  WR2:  (SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                'APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS')) = 1) AND
        (SIZEOF( QUERY( aoa <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                'APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS') |
          aoa.role.name <> 'destination'
         )) = 0 );
  WR3:  (SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                'ACTION_PROPERTY.DEFINITION')) <= 1 ) AND
        ((SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
         'ACTION_PROPERTY.DEFINITION')) = 0) OR
         (SIZEOF( QUERY( ap <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'ACTION_PROPERTY.DEFINITION') |
         SIZEOF( USEDIN( ap, 'AUTOMOTIVE_DESIGN.' +
             'ACTION_PROPERTY_REPRESENTATION.PROPERTY')) <> 1
          )) = 0 ) AND
         (SIZEOF( QUERY( ap <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'ACTION_PROPERTY.DEFINITION') |
         SIZEOF( QUERY( apr <* USEDIN( ap, 'AUTOMOTIVE_DESIGN.' +
               'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
         (apr.representation.description <> 'delivery quantity') OR
         (SIZEOF(apr.items) <> 1) OR
         (SIZEOF( QUERY( apr_i <* apr.items |
          NOT ('AUTOMOTIVE_DESIGN.MEASURE_REPRESENTATION_ITEM' IN
               TYPEOF(apr_i)) OR
          (apr_i\measure_representation_item.name <> 'quantity')
               )) > 0 )
              )) > 0
```

```
        )) = 0 ));
END_ENTITY;
(*
```

Formal propositions:

WR1: The **element_delivery** shall be referenced as the **assigned_action** by exactly one instance of **element_delivery_assignment.**

WR2: There shall be exactly one instance of **applied_organization_assignment** that contains the **element_delivery** in its set of **items**. This **applied_organization_assignment** shall reference as its **role** an **organization_role** that has a **name** of 'destination'.

WR3: There shall be at most one instance of **action_property** that references the **element_delivery** as its **definition**. If present, this **action_property** shall be referenced as the **property** by exactly one instance of **action_property_representation.** This **action_property_representation** shall reference as its **representation** a **representation** that has a **description** of 'delivery quantity' and that contains exactly one **representation_item** in its set of **items**. This **representation_item** shall be a **measure_representation_item** and shall have a **name** of 'quantity'.

Informal propositions:

IP1: In case the **element_delivery** is not referenced by an **action_property** as the **definition**, the quantity of the delivery shall be one.

5.2.3.1.57 element_delivery_assignment

An **element_delivery_assignment** is a type of **action_assignment** that assigns an **element_delivery** to an item to be delivered. See ARM definition for Element_delivery in paragraph 4.2.158 for more information.

EXPRESS specification:

```
*)
ENTITY element_delivery_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF element_delivery_item;
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.ELEMENT_DELIVERY' IN TYPEOF(SELF.assigned_action);
  WR2:  SELF.role.description = 'deliverable element';
  WR3:  (SIZEOF(SELF.items) = 1 ) AND
        (SIZEOF( QUERY( i <* SELF.items |
          NOT ( 'AUTOMOTIVE_DESIGN.APPLIED_ACTION_ASSIGNMENT' IN
                TYPEOF(i)) OR
          (i\applied_action_assignment.role.description <> 'activity element') OR
          (SIZEOF(i\applied_action_assignment.items) <> 1) OR
          (SIZEOF( QUERY( i_i <* i\applied_action_assignment.items |
```

```
          'AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION_FORMATION' IN
           TYPEOF(i_i)
          )) +
          SIZEOF( QUERY( i_i <* i\applied_action_assignment.items |
          ('AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION' IN TYPEOF(i_i)) AND
          (i_i.name = 'physical instance') AND
          (i_i.frame_of_reference.name = 'physical occurrence')
          )) +
          SIZEOF( QUERY( i_i <* i\applied_action_assignment.items |
          ('AUTOMOTIVE_DESIGN.CONFIGURABLE_ITEM' IN TYPEOF(i_i)) AND
          (i_i.description = 'product specification')
          )) <> 1 )
        )) = 0 );
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items to which the **element_delivery** is assigned.

Formal propositions:

WR1: The **element_delivery_assignment** shall reference as its **assigned_action** an action that is of type **element_delivery.**

WR2: The **element_delivery_assignment** shall reference as its **role** an **action_role** that has a **description** of 'deliverable element'.

WR3: The **element_delivery_assignment** shall contain exactly one item in its set of **items**. This item shall be an **applied_action_assignment** that references as its **role** an **action_role** that has a **description** of 'activity element' and that contains exactly one item in its set of **items**. This item shall either be a **product_definition_formation,** a **product_definition** that has a **name** of 'physical instance' and that references as its **frame_of_reference** a **product_definition_context** that has a **name** of 'physical occurrence', or a **configurable_item** that has a **description** of 'product specification'.

5.2.3.1.58 event_assignment

An **event_assignment** is a type of **action_assignment** that assigns an event to an **event_item.** See ARM definition for Event_reference in paragraph 4.2.160 for more information.

EXPRESS specification:

```
*)
ENTITY event_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF event_item;
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.EVENT_REFERENCE' IN TYPEOF(SELF.assigned_action);
```

```
  WR2:  (SIZEOF( QUERY( i <* SELF.items |
          'AUTOMOTIVE_DESIGN.EVENT_BASED_EFFECTIVITY' IN TYPEOF(i)
         )) = 0 ) OR
        ((SIZEOF( QUERY( i <* SELF.items |
           'AUTOMOTIVE_DESIGN.EVENT_BASED_EFFECTIVITY' IN TYPEOF(i)
          )) > 0 ) AND
         (SELF.role.name IN ['effectivity start',
              'effectivity end']));
  WR3:  (SIZEOF( QUERY( i <* SELF.items |
          'AUTOMOTIVE_DESIGN.PROJECT' IN TYPEOF(i)
         )) = 0 ) OR
        ((SIZEOF( QUERY( i <* SELF.items |
           'AUTOMOTIVE_DESIGN.PROJECT' IN TYPEOF(i)
          )) > 0 ) AND
         (SELF.role.name IN ['actual start',
              'planned start',
              'planned end']));
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items to which the **event_reference** is assigned.

Formal propositions:

WR1: The **event_assignment** shall reference as its **assigned_action** an action that is of type **event_reference**.

WR2: If the **event_assignment** contains an **event_based_effectivity** in its set of **items**, it shall reference as its **role** an **action_role** that has a **name** of either 'effectivity start' or 'effectivity end'.

WR3: If the **event_assignment** contains a **project** in its set of **items**, it shall reference as its **role** an **action_role** that has a **name** of either 'actual start', 'planned start', or 'planned end'.

5.2.3.1.59 event_based_effectivity

An **event_based_effectivity** is a type of effectivity that specifies the start or end of the valid use of an aspect of product data by referring to an event. See ARM definition for Effectivity in paragraph 4.2.156 for more information.

EXPRESS specification:

```
*)
ENTITY event_based_effectivity
  SUBTYPE OF (effectivity);
WHERE
  WR1:  SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.EVENT_ASSIGNMENT.ITEMS')) > 0;
```

```
  WR2:  SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.EVENT_ASSIGNMENT.ITEMS')) <= 2;
  WR3:  SIZEOF( QUERY( ea <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.EVENT_ASSIGNMENT.ITEMS') |
         ea.role.name = 'effectivity start' )) <= 1;
  WR4:  SIZEOF( QUERY( ea <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.EVENT_ASSIGNMENT.ITEMS') |
         ea.role.name = 'effectivity end' )) <= 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **event_based_effectivity** shall be contained in the set of **items** of at least one **event_assignment.**

WR2: The **event_based_effectivity** shall be contained in the set of **items** of at most two **event_assignmen**s.

WR3: The **event_based_effectivity** shall be contained in the set of **items** of at most one **event_assignment** that references as its **role** an **action_role** with a **name** of 'effectivity start'.

WR4: The **event_based_effectivity** shall be contained in the set of **items** of at most one **event_assignment** that references as its **role** an **action_role** with a **name** of 'effectivity end'.

5.2.3.1.60 event_context_assignment

An **event_context_assignment** is a type of **action_assignment** that assigns an **event_reference** to an **event_context_item** that specifies the context for the event. See ARM definition for Event_reference in paragraph 4.2.160 for more information.

EXPRESS specification:

```
*)
ENTITY event_context_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF event_context_item;
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.EVENT_REFERENCE' IN TYPEOF(SELF.assigned_action);
  WR2:  SELF.role.name = 'event context';
  WR3:  SIZEOF(SELF.items) = 1;
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items that specify the context for the **event_reference.**

Formal propositions:

WR1: The **event_context_assignment** shall reference as its **assigned_action** an **action** that is of type **event_reference**.

WR2: The **event_context_assignment** shall reference as its **role** an **action_role** that has a **name** of 'event context'.

WR3: The **event_context_assignment** shall contain exactly one item in its set of **items**.

5.2.3.1.61 event_reference

An **event_reference** is a type of action that defines a point in time established with respect to an action. See ARM definition for Event_reference in paragraph 4.2.160 for more information.

EXPRESS specification:

```
*)
ENTITY event_reference
  SUBTYPE OF (action);
WHERE
  WR1:  SIZEOF( QUERY( aa <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'ACTION_ASSIGNMENT.ASSIGNED_ACTION') |
               'AUTOMOTIVE_DESIGN.EVENT_CONTEXT_ASSIGNMENT' IN
                TYPEOF(aa)
              )) <= 1;
  WR2:  (SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                 'ACTION_PROPERTY.DEFINITION')) <= 1 ) AND
        ((SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
         'ACTION_PROPERTY.DEFINITION')) = 0 ) OR
         (SIZEOF( QUERY( ap <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'ACTION_PROPERTY.DEFINITION') |
         (SIZEOF( USEDIN( ap, 'AUTOMOTIVE_DESIGN.' +
          'ACTION_PROPERTY_REPRESENTATION.PROPERTY')) = 1 ) AND
         (SIZEOF( QUERY( apr <* USEDIN( ap, 'AUTOMOTIVE_DESIGN.' +
               'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
                (apr.representation.name <> 'offset definition') OR
                (SIZEOF( apr.representation.items) <> 1) OR
                (SIZEOF( QUERY( apr_r_i <* apr.representation.items |
               (SIZEOF(['AUTOMOTIVE_DESIGN.MEASURE_REPRESENTATION_ITEM',
                'AUTOMOTIVE_DESIGN.TIME_MEASURE_WITH_UNIT']
               * TYPEOF(apr_r_i)) <> 2 ) OR
               (apr_r_i.name <> 'offset value')
               )) > 0 )
         )) = 0 )
          )) = 1 ));
END_ENTITY;
(*
```

Formal propositions:

WR1: The **event_reference** shall be referenced as the **assigned_action** by at most one instance of **event_context_assignment.**

WR2: There shall be at most one instance of **action_property** that references the **event_reference** as its **definition**. If present, this **action_property** shall be referenced as the **property** by exactly one instance of **action_property_representation.** This **action_property_representation** shall reference as its **representation** a **representation** that has a **description** of 'offset definition' and that contains exactly one **representation_item** in its set of **items**. This **representation_item** shall be of type **measure_representation_item** and **time_measure_with_unit** and shall have a **name** of 'offset value'.

5.2.3.1.62 exclusive_product_concept_feature_category

An **exclusive_product_concept_feature_category** is a type of **product_concept_feature_category** in which the contained **product_concept_feature** instances describe mutually exclusive characteristics of a product. See ARM definition for Specification_category in paragraph 4.2.416 for more information.

EXPRESS specification:

```
*)
ENTITY exclusive_product_concept_feature_category
  SUBTYPE OF (product_concept_feature_category);
END_ENTITY;
(*
```

5.2.3.1.63 externally_defined_classification_attribute

An **externally_defined_classification_attribute** is a type of representation and of **externally_defined_item** that represents a characteristic used to classify a product. The classification characteristic is specified in an external source. See ARM definition for Classification_attribute in paragraph 4.2.69 for more information.

EXPRESS specification:

```
*)
ENTITY externally_defined_classification_attribute
  SUBTYPE OF (externally_defined_item, representation);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.KNOWN_SOURCE' IN TYPEOF(SELF.source);
  WR2:  SIZEOF( QUERY( pdr <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                              'PROPERTY_DEFINITION_REPRESENTATION.USED_REPRESENTATION') |
                 (pdr.definition.description <> 'category attribute') OR
                 NOT ('AUTOMOTIVE_DESIGN.CHARACTERIZED_PRODUCT_CATEGORY' IN
                      TYPEOF(pdr.definition\property_definition.definition))
               )) = 0;
```

```
  WR3:  SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                'PROPERTY_DEFINITION_REPRESENTATION.USED_REPRESENTATION')) >= 1;
  WR4:  SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                'REPRESENTATION_RELATIONSHIP.REP_1')) >= 1;
  WR5:  SIZEOF( QUERY( rr <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                              'REPRESENTATION_RELATIONSHIP.REP_1') |
                (rr.name <> 'classification attribute value') OR
                NOT ('AUTOMOTIVE_DESIGN.PROPERTY_VALUE_REPRESENTATION' IN
                     TYPEOF(rr.rep_2))
              )) = 0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **externally_defined_classification_attribute** shall reference as its **source** an **external_source** that is of type **known_source.**

WR2: The **externally_defined_classification_attribute** shall be referenced as the **used_representation** only by instances of **property_definition_representation** that reference as their **definition** a **property_definition** that has a **description** of 'category attribute' and that references as its **definition** a **characterized_object** of type **characterized_product_category.**

WR3: The **externally_defined_classification_attribute** shall be referenced as the **used_representation** by at least one instance of **property_definition_representation.**

WR4: The **externally_defined_classification_attribute** shall be referenced as the **rep_1** by at least one instance of **representation_relationship.**

WR5: The **externally_defined_classification_attribute** shall be referenced as the **rep_1** only by instances of **representation_relationship** that have a **name** of 'classification attribute value' and that reference as the **rep_2** a **property_value_representation.**

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_classification_attribute** entity:

– restrict_multi_language_for_externally_defined_classification_attribute (see 5.2.4.111).

5.2.3.1.64 externally_defined_classification_system

An **externally_defined_classification_system** is a type of **group** and of **externally_defined_item** that describes a method for classifying objects where the complete set of possible values is described in an external source. See ARM definition for Classification_system in paragraph 4.2.70 for more information.

EXPRESS specification:

```
*)
```

```
ENTITY externally_defined_classification_system
  SUBTYPE OF (externally_defined_item, group);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.KNOWN_SOURCE' IN TYPEOF(SELF.source);
END_ENTITY;
(*
```

Formal propositions:

WR1: The **externally_defined_classification_system** shall reference as its **source** an **external_source** that is of type **known_source.**

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_classification_system** entity:

– restrict_multi_language_for_externally_defined_classification_system (see 5.2.4.112).

5.2.3.1.65 externally_defined_product_category

An **externally_defined_product_category** is a type of **characterized_product_category** and of **externally_defined_item** that characterizes products of the same kind by referring to an entry in an external library due to ISO 13584. See ARM definition for General_classification in paragraph 4.2.192 for more information.

EXPRESS specification:

```
*)
ENTITY externally_defined_product_category
  SUBTYPE OF (characterized_product_category, externally_defined_item);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.KNOWN_SOURCE' IN TYPEOF(SELF.source);
END_ENTITY;
(*
```

Formal propositions:

WR1: The **externally_defined_product_category** shall reference as its **source** an **external_source** that is of type **known_source.**

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_product_category** entity:

– restrict_multi_language_for_externally_defined_product_category (see 5.2.4.113).

5.2.3.1.66 externally_defined_representation

An **externally_defined_representation** is a type of **representation** that is the identification of a geometric model that is described in a digital document. See ARM definition for External_model in paragraph 4.2.166 for more information.

EXPRESS specification:

```
*)
ENTITY externally_defined_representation
  SUBTYPE OF (representation);
WHERE
  WR1:  SIZEOF( USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'DIGITAL_DOCUMENT_REFERENCE.ITEMS')) = 1;
  WR2:  SIZEOF (SELF.items) = 1;
  WR3:  SIZEOF (QUERY (it <* items |
               SIZEOF (['AUTOMOTIVE_DESIGN.AXIS2_PLACEMENT_2D',
                        'AUTOMOTIVE_DESIGN.AXIS2_PLACEMENT_3D']
                       * TYPEOF (it)) = 1)) =1;
END_ENTITY;
(*
```

Formal propositions:

WR1: There shall be exactly one instance of **digital_document_reference** that contains the **externally_defined_representation** in its set of **items**.

WR2: The **externally_defined_representation** shall contain exactly one **representation_item** in its set of items.

WR3: The **externally_defined_representation** shall contain exactly one **representation_item** that is either an **axis2_placement_2d** or an **axis2_placement_3d.**

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_representation** entity:

– restrict_multi_language_for_externally_defined_representation (see 5.2.4.114).

5.2.3.1.67 externally_defined_thread

An **externally_defined_thread** is a thread whose specification is given in a document. See ARM definition for Catalog_thread in paragraph 4.2.48 for more information.

EXPRESS specification:

```
*)
ENTITY externally_defined_thread
  SUBTYPE OF (externally_defined_item, feature_definition);
```

```

Formal propositions:

WR1: The **shape_representation_with_parameters** that represents the **externally_defined_thread** shall contain exactly two **representation_items** in its set of **items**.

WR2: Exactly one **representation_item** used for the implicit representation of the **externally_defined_thread** shall be of type **descriptive_representation_item** with a **name** of 'qualifier'.

WR3: An **externally_defined_thread** shall either be referenced by an **applied_document_reference** with a **document_role** that has a **name** of 'specification' or its attribute **source** shall reference a **known_source.**

5.2.3.1.68 face_shape_representation

A **face_shape_representation** is a type of **representation** that represents a portion of a part's boundary by a topologically bounded surface.

EXPRESS specification:

```
*)
```

```
ENTITY face_shape_representation
  SUBTYPE OF (representation);
WHERE
  WR1:  SIZEOF (SELF.items) = 1;
  WR2:  SIZEOF( QUERY (it <* SELF.items |
                 'AUTOMOTIVE_DESIGN.FACE_SURFACE' IN TYPEOF (it)
              )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **face_shape_representation** shall have exactly one **representation_item** in its set of **items**.

WR2: The geometric element that is used to represent the **face_shape_representation** shall be a **face_surface.**

5.2.3.1.69 feature_component_definition

A **feature_component_definition** is a type of **characterized_object** that is used as a constituent of a preconceived form pattern.

EXPRESS specification:

```
*)
ENTITY feature_component_definition
  SUBTYPE OF (characterized_object);
WHERE
  WR1:  SIZEOF( QUERY( pds <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
                'PROPERTY_DEFINITION.DEFINITION') |
         SIZEOF( QUERY( sa <* USEDIN( pds, 'AUTOMOTIVE_DESIGN.' +
              'SHAPE_ASPECT.OF_SHAPE') |
         NOT ('AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION_SHAPE' IN
                TYPEOF(sa))
                )) > 1
              )) = 0;
END_ENTITY;
(*
```

Formal propositions:

WR1: A **feature_component_definition** shall be the basis shape for exactly one **shape_aspect.**

5.2.3.1.70 feature_component_relationship

A **feature_component_relationship** is a type of **shape_aspect_relationship** that is used to relate features with implicitly represented components.

EXAMPLE 238 – A Chamfer may have the implicit chamfer offset amount defined with a **feature_component_relationship.**

EXPRESS specification:

```
*)
ENTITY feature_component_relationship
  SUBTYPE OF (shape_aspect_relationship);
END_ENTITY;
(*
```

5.2.3.1.71 feature_definition

A **feature_definition** is a type of **characterized_object** that is a preconceived form pattern. See ARM definition for Feature_definition in paragraph 4.2.175 for more information.

EXPRESS specification:

```
*)
ENTITY feature_definition
  SUBTYPE OF (characterized_object);
WHERE
  WR1:  SIZEOF( QUERY( pd <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'PROPERTY_DEFINITION.DEFINITION') |
         SIZEOF( QUERY( pdr <* USEDIN( pd, 'AUTOMOTIVE_DESIGN.' +
              'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION') |
         'AUTOMOTIVE_DESIGN.SHAPE_REPRESENTATION_WITH_PARAMETERS' IN
          TYPEOF(pdr.used_representation)
               )) = 1
              )) = 1;
  WR2:  SIZEOF( QUERY( pd <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +
              'PROPERTY_DEFINITION.DEFINITION') |
         SIZEOF( QUERY( pdr <* USEDIN( pd, 'AUTOMOTIVE_DESIGN.' +
              'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION') |
         ('AUTOMOTIVE_DESIGN.SHAPE_REPRESENTATION_WITH_PARAMETERS' IN
           TYPEOF(pdr.used_representation)) AND
         (SIZEOF( QUERY( srwp_i <* pdr.used_representation.items |
          ('AUTOMOTIVE_DESIGN.PLACEMENT' IN TYPEOF(srwp_i)) AND
          (srwp_i.name = 'orientation') )) = 1 )
               )) = 1
              )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **feature_definition** shall have exactly one implicit **representation**.

WR2: Exactly one **representation_item** in the implicit **representation** of the **feature_definition** shall be a **placement** with a **name** of 'orientation. This **placement** shall define a reference location and orientation for the origin of the **feature_definition.**

5.2.3.1.72 feature_in_panel

A **feature_in_panel** is a type of **feature_definition** applicable to panel parts. A **feature_in_panel** consists of a ruled surface between two closed profiles one of which lies on the panel. See ARM definition for Form_feature_in_panel in paragraph 4.2.188 for more information.

EXPRESS specification:

```
*)
ENTITY feature_in_panel
  SUBTYPE OF (feature_definition);
WHERE
  WR1:  SELF.description IN ['pocket','boss','stairstep'];

Formal propositions:

WR1: The **feature_in_panel** shall have a **description** of either 'pocket', 'boss', or 'stairstep'.

WR2: The implicit representation of the **feature_in_panel** shall contain exactly three **representation_items** in its set of **items**.

WR3: The implicit representation of a **feature_in_panel** shall contain exactly one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'base fillet radius'.

WR4: The implicit representation of a **feature_in_panel** shall contain exaclty one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'target fillet radius'.

WR5: The **feature_in_panel** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'base boundary' and a **description** of either 'directed angle occurrence' or 'closed profile occurrence'.

WR6: The **feature_in_panel** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'target boundary' and a **description** of either 'directed angle occurrence' or 'closed profile occurrence'.

WR7: The **feature_in_panel** shall be the basis shape for at most one **shape_aspect** with a **description** of 'directed angle occurrence'.

WR8: Each **shape_aspect** of a **feature_in_panel** with a **description** of 'directed angle occurrence' shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'directed angle usage' in which the **relating_shape_aspect** is a **directed_angle.**

WR9: Each **shape_aspect** of a **feature_in_panel** with a **description** of 'closed profile occurrence' shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'closed profile usage' and a **relating_shape_aspect** that references a **circular_closed_profile, ngon_closed_profile, rectangular_closed_profile,** or **closed_path_profile.**

WR10: The **feature_in_panel** shall have at most one **connected_face_shape_representation.** If present, this **connected_face_shape_representation** shall have a **description** of 'target face'.

WR11: Each **feature_in_panel** that is the basis shape for a **shape_aspect** with a **name** of 'target boundary' and a **description** of 'directed angle occurrence' shall have a **connected_face_shape_representation.**

5.2.3.1.73 feature_pattern

A **feature_pattern** is a type of **replicate_feature** that relates a base feature and one or more **shape_aspects** which are the placement of the base feature at a specified location on the base part. See ARM definition for General_pattern in paragraph 4.2.204 for more information.

EXPRESS specification:

```
*)
ENTITY feature_pattern
  SUBTYPE OF (replicate_feature);

END_ENTITY;
(*
```

Attribute definitions:

items: The set of items that are members of the group.

Formal propositions:

WR1: If the **group_member_assignment** contains a **shape_aspect** in its set of **items**, it shall reference as its **role** a **group_role** that has a **name** of 'feature categorization'.

WR2: If the **group_member_assignment** contains a **document_type, drawing_definition, approval_status, security_classification_level, characterized_product_category,** or **externally_defined_product_category** in its set of **items**, it shall reference as its **assigned_group** either a **classification_system** or an **externally_defined_classification_system** and it shall reference as its **role** a **group_role** that has a **name** of 'classified member'.

WR3: If the **group_member_assignment** contains a **product_definition** in its set of **items**, this **product_definition** shall reference as its **frame_of_reference** a **product_definition_context** that has a **name** of 'definitional template' and shall be referenced as the **relating_product_definition** by either an **assembly_component_relationship,** by a **product_definition_relationship** that has a **name** of 'mating membership', or by a **product_definition_relationship** that has a **name** of 'collection membership' .

WR4: If the **group_member_assignment** contains a **product_definition** in its set of **items** that is referenced as the **relating_product_definition** by an **assembly_component_relationship,** it shall reference as its **assigned_group** a group that has a **name** of 'assembly definition' and shall reference as its **role** a **group_role** that has a **name** of 'assembly'.

WR5: If the **group_member_assignment** contains a **product_definition** in its set of **items** that is referenced as the **relating_product_definition** by a **product_definition_relationship** that has a **name** of 'mating membership', it shall reference as its **assigned_group** a group that has a **name** of 'mating definition' and shall reference as its **role** a **group_role** that has a **name** of 'mating'.

WR6: If the **group_member_assignment** contains a **product_definition** in its set of **items** that is referenced as the **relating_product_definition** by a **product_definition_relationship** that has a **name** of 'collection membership', it shall reference as its **assigned_group** a group that has a **name** of 'collection definition' and shall reference as its **role** a **group_role** that has a **name** of 'collection'.

WR7: If the **group_member_assignment** contains a **product_concept_feature_category_usage** in its set of **items**, it shall reference as its **assigned_group** a **group** that has a **name** of 'influencing category group' and shall reference as its **role** a **group_role** that has a **name** of 'class usage group member'.

WR8: If the **group_member_assignment** contains a **product_concept_feature** in its set of **items**, it shall reference as its **assigned_group** a **product_concept_feature_category** and shall reference as its **role** a **group_role** that has a **name** of 'specification category member'.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **group_member_assignment** entity:

– restrict_classification_system_for_approval_status (see 5.2.4.76);

– restrict_classification_system_for_document_type (see 5.2.4.77);

– restrict_classification_system_for_security_classification_level (see 5.2.4.78).

5.2.3.1.77 hidden_element_over_riding_styled_item

The **hidden_element_over_riding_styled_item** is a type of **context_dependent_over_riding_-styled_item** that specifies the handling of hidden elements. See ARM definition for Hidden_-element_handling in paragraph 4.2.227 for more information.

EXPRESS specification:

```
*)
ENTITY hidden_element_over_riding_styled_item
  SUBTYPE OF (context_dependent_over_riding_styled_item);
WHERE
  WR1:  SIZEOF(SELF.style_context) = 1;
  WR2:  'AUTOMOTIVE_DESIGN.PRESENTATION_VIEW' IN TYPEOF
                (SELF.style_context[1]);
  WR3:  'AUTOMOTIVE_DESIGN.CAMERA_IMAGE' IN TYPEOF
                (SELF.item);
  WR4:  'AUTOMOTIVE_DESIGN.CAMERA_MODEL_D3_WITH_HLHSR' IN TYPEOF
                (SELF.item\mapped_item.mapping_source.mapping_origin);
  WR5:  SIZEOF( QUERY( rep <* USEDIN(SELF,
                 'AUTOMOTIVE_DESIGN.REPRESENTATION.ITEMS') |
                    'AUTOMOTIVE_DESIGN.PRESENTATION_VIEW'
                    IN TYPEOF(rep)
        )) > 0;
END_ENTITY;
(*
```

Formal propositions:

WR1: There shall be exactly one **style_context.**

WR2: The **style_context** shall be a **presentation_view.**

WR3: The item where the overriding style is applied for all hidden elements shall be a **camera_-image.**

WR4: The **mapping_origin** of the item shall be a **camera_model_d3_with_hlhsr.**

WR5: The **hidden_element_over_riding_styled_item** shall be included in the set of items of a **presentation_view.**

5.2.3.1.78 hole_bottom

A **hole_bottom** is a type of **shape_aspect** that is the end condition for a **round_hole.** See ARM definition for Conical_bottom in paragraph 4.2.90, for Flat_bottom in paragraph 4.2.183, for Flat_with_chamfer_bottom in paragraph 4.2.185, for Flat_with_radius_bottom in paragraph

4.2.186, for Spherical_bottom in paragraph 4.2.421, and for Through_hole_condition in paragraph 4.2.460 for more information.

Formal propositions:

WR1: The **hole_bottom** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **description** of the **hole_bottom** shall be either 'through', 'flat', 'flat with chamfer', 'flat with radius', 'spherical', or 'conical'.

WR3: If the **description** of the **hole_bottom** is 'flat with chamfer' or 'through', the **hole_bottom** shall not have any representation.

WR4: If the **description** of the **hole_bottom** is 'flat', 'flat with radius', 'spherical', or 'conical', the **hole_bottom** shall have exactly one **shape_representation_with_parameters** to specify its implicit representation.

WR5: If the **description** of the **hole_bottom** is 'flat', the **shape_representation_with_parameters** that represents the **hole_bottom** shall contain exactly one **representation_item** in its set of **items**.

WR6: If the **description** of the **hole_bottom** is 'flat with radius' or 'spherical', the **shape_representation_with_parameters** that represents the **hole_bottom** shall contain exactly two **representation_items** in its set of **items**.

WR7: If the **description** of the **hole_bottom** is 'conical', the **shape_representation_with_parameters** that represents the **hole_bottom** shall contain exactly three **representation_items** in its set of **items**.

WR8: If the **description** of the **hole_bottom** is 'flat', 'flat with radius', 'spherical', or 'conical', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall be of type **descriptive_representation_item** with a **name** of 'bottom location' and a **description** of either 'path start' or 'path end'.

WR9: If the **description** of the **hole_bottom** is 'flat with radius', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'corner radius'. This **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

WR10: If the **description** of the **hole_bottom** is 'spherical', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'radius'. This **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

WR11: If the **description** of the **hole_bottom** is 'conical', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'tip radius'. This **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

WR12: If the **description** of the **hole_bottom** is 'conical', exactly one **representation_item** used for the implicit representation of a **hole_bottom** shall have a **name** of 'tip angle'. This **representation_item** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit.**

WR13: If the **description** of the **hole_bottom** is 'flat with chamfer', the **hole_bottom** shall be the **relating_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'first chamfer offset' in which the **related_shape_aspect** is a **chamfer_offset.**

WR14: If the **description** of the **hole_bottom** is 'flat with chamfer', the **hole_bottom** shall be the **relating_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'second chamfer offset' in which the **related_shape_aspect** is a **chamfer_offset.**

WR15: The **hole_bottom** shall be the **relating_shape_aspect** in at least one **feature_component_relationship** with a **description** of 'hole bottom usage' in which the **related_shape_aspect** is an aspect of the shape of a **round_hole** with a **description** of 'bottom condition occurrence'.

5.2.3.1.79 hole_in_panel

A **hole_in_panel** is a type of **feature_definition** applicable to panel parts. A **hole_in_panel** is an opening in a panel bounded by a closed profile that is created by a stamping process. A **hole_in_panel** may have a barring if the punched material is partially bended in the punch direction. See ARM definition for Hole_feature_in_panel in paragraph 4.2.229 and for Panel_hole_with_barring in paragraph 4.2.299 for more information.

Formal propositions:

WR1: The **hole_in_panel** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'hole profile' and a **description** of 'closed profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'closed profile usage' and a **relating_shape_aspect** that references a **circular_closed_profile**, **ngon_closed_profile**, **rectangular_closed_profile**, or **closed_path_profile.**

WR2: The **hole_in_panel** shall be the basis shape for at most one **shape_aspect** with a **name** of 'taper' and a **description** of 'taper occurrence'. If present, this **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'taper usage' in which the **relating_shape_aspect** is a **taper**.

WR3: The **hole_in_panel** shall be the basis shape for at most one **shape_aspect** with a **name** of 'barring profile' and a **description** of 'closed profile occurrence'. If present, this **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'closed profile usage'.

Informal propositions:

IP1: The barring profile shall lie in the same plane as the hole profile.

IP2: The barring profile shall lie completely inside the hole profile.

5.2.3.1.80 hybrid_3d_shape_representation

A **hybrid_shape_representation** is a type of **shape_representation** that represents the shape or a portion of the shape of a product using different types of **shape_representations.** Both geometrically bounded and topologically bounded **shape_representations** are allowed. See ARM definition for Hybrid_geometric_model_3d in paragraph 4.2.230 for more information.

EXPRESS specification:

```
*)
ENTITY hybrid_3d_shape_representation
  SUBTYPE OF (shape_representation);

END_ENTITY;
(*
```

Formal propositions:

WR1: A **hybrid_3d_shape_representation** shall contain **representation_items** that are of type **geometric_representation_item** or **mapped_item.**

WR2: If there is a **mapped_item** in a **hybrid_3d_shape_representation,** the source of the **mapped_item** shall be a **shape_representation.**

5.2.3.1.81 instanced_feature

An **instanced_feature** is a type of **shape_aspect** and of **feature_definition** that is the identification of a preconceived form pattern on a part. See ARM definition for Included_feature in paragraph 4.2.232 for more information.

EXPRESS specification:

```
*)
ENTITY instanced_feature
  SUBTYPE OF (feature_definition, shape_aspect);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION' IN

END_ENTITY;
(*
```

Formal propositions:

WR1: The **instanced_feature** shall be an aspect of the shape of a **product_definition.**

5.2.3.1.82 joggle

A **joggle** is a type of **feature_definition** applicable to panel parts. A **joggle** is a change in elevation of a face along a rim desgned to accommodate either clearance for the insertion of another part or a contact point for attachment of another part. See ARM definition for Joggle_feature in paragraph 4.2.250 for more information.

EXPRESS specification:

END_ENTITY;
(*
```

Formal propositions:

WR1: The **joggle_termination** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **description** for the **joggle_termination** shall be either 'value termination' or 'face termination'.

WR3: A **joggle_termination** has an implicit representation if and only if it has a **description** of 'value termination'.

WR4: If the **description** of the **joggle_termination** is 'value termination', its implicit representation shall contain exactly two **representation_items** in its set of **items**.

WR5: If the **description** of the **joggle_termination** is 'value termination', exactly one **representation_item** used for the implicit representation of the **joggle_termination** shall be of type **measure_representation_item** and **length_measure_with_unit** with a name of 'depth'.

WR6: If the **description** of the **joggle_termination** is 'value termination', exactly one **representation_item** used for the implicit representation of the **joggle_termination** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a name of 'angle'.

WR7: The **joggle_termination** shall be the **relating_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'joggle termination usage' in which the **related_shape_aspect** is a **shape_aspect** of a **joggle** with a **name** of 'termination' and a **description** of 'joggle termination occurrence'.

5.2.3.1.84 known_source

A **known_source** is a type of **external_source** and of **pre_defined_item** that provides a mechanism to refer to an entry in an external library due to ISO 13584. See ARM definition for External_library_reference in paragraph 4.2.165 for more information.

EXPRESS specification:

```
*)
ENTITY known_source
  SUBTYPE OF (external_source, pre_defined_item);
WHERE
  WR1:  SELF.name = 'ISO 13584 dictionary';
END_ENTITY;
(*
```

Formal propositions:

WR1: The **known_source** shall have a **name** of 'ISO 13584 dictionary'.

5.2.3.1.85 location_shape_representation

A **location_shape_representation** is a type of **representation** that represents a geometric position or a reference point.

EXPRESS specification:

```
*)
ENTITY location_shape_representation
  SUBTYPE OF (representation);
WHERE
  WR1:  SIZEOF(SELF.items) = 1;
  WR2:  SIZEOF( QUERY( i <* SELF.items|
                'AUTOMOTIVE_DESIGN.POINT' IN TYPEOF(i)
              )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **location_shape_representation** shall have exactly one **representation_item** in its set of **items**.

WR2: The geometric element that is used to represent the **location_shape_representation** shall be a **point**.

5.2.3.1.86 locator

A **locator** is a type of **feature_definition** applicable to panel parts. A **locator** is a conical impression used to locate the panel in the tooling. See ARM definition for Locator_feature in paragraph 4.2.271 for more information.

EXPRESS specification:

```
*)
ENTITY locator
  SUBTYPE OF (feature_definition);
WHERE
  WR1:  SIZEOF( QUERY( pd <* USEDIN( SELF, 'AUTOMOTIVE_DESIGN.' +

Formal propositions:

WR1: The **modified_pattern** shall be the **related_object** in exactly one **characterized_object_relationship** with a **name** of 'replicate base assignment' in which the **relating_object** is either a **circular_pattern** or a **rectangular_pattern.**

WR2: If the **modified_pattern** is the **related_object** in a **characterized_object_relationship** with a **name** of 'replicate base assignment' in which the **relating_object** is a **circular_pattern,** its shape shall only have **shape_aspect** instances with a **description** of either 'circular omit' or 'circular offset'.

WR3: If the **modified_pattern** is the **related_object** in a **characterized_object_relationship** with a **name** of 'replicate base assignment' in which the **relating_object** is a **circular_-**

pattern, its shape shall have at least one **shape_aspect** with a **description** of either 'circular omit' or 'circular offset'.

WR4: If the **modified_pattern** is the **related_object** in a **characterized_object_relationship** with a **name** of 'replicate base assignment' in which the **relating_object** is a **rectangular_pattern,** its shape shall only have **shape_aspect** instances with a **description** of either 'rectangular omit' or 'rectangular offset'.

WR5: If the **modified_pattern** is the **related_object** in a **characterized_object_relationship** with a **name** of 'replicate base assignment' in which the **relating_object** is a **rectangular_pattern,** its shape shall have at least one **shape_aspect** with a **description** of either 'rectangular omit' or 'rectangular offset'.

WR6: Each **shape_aspect** of the shape of a **modified_pattern** shall have exactly one implicit representation.

WR7: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'circular omit', its implicit representation shall contain exactly one **representation_item** in its set of items.

WR8: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'circular omit', its implicit representation shall contain exactly one **representation_item** of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'omit index'.

WR9: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'circular offset' or 'rectangular omit', its implicit representation shall contain exactly two **representation_items** in its set of items.

WR10: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'circular offset', its implicit representation shall contain exactly one **representation_item** of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'offset index'.

WR11: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'circular offset', its implicit representation shall contain exactly one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'angular offset'.

WR12: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'rectangular offset', its implicit representation shall contain exactly three **representation_items** in its set of items.

WR13: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'rectangular omit' or 'rectangular offset', its implicit representation shall contain exactly one **representation_item** of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'row index'.

WR14: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'rectangular omit' or 'rectangular offset', its implicit representation shall contain exactly one **representation_item** of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'column index'.

WR15: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'rectangular offset', its implicit representation shall contain exactly one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'offset distance'.

WR16: If the **shape_aspect** of the shape of a **modified_pattern** has a **description** of 'rectangular offset', it shall have exactly one **direction_shape_representation** with a **description** of 'offset direction'.

5.2.3.1.90 ngon_closed_profile

An **ngon_closed_profile** is a type of **shape_aspect** that consists of an enclosed 2D area and a reference system for the parameters of the **ngon_closed_profile.** The enclosed area is defined by three or more straight sides with the corners lying on one circle. The reference system is used to define location and orientation of the **square_u_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Ngon_profile in paragraph 4.2.288 for more information.

EXPRESS specification:

END_ENTITY;
(*
```

Formal propositions:

WR1: The **ngon_closed_profile** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **ngon_closed_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the **ngon_closed_profile** shall contain three or four **representation_items** in its set of **items**.

WR4: The implicit representation of an **ngon_closed_profile** shall contain only **representation_items** in its set of **items** that have a **name** of either 'orientation', 'number of sides', 'circumscribed diameter', or 'corner radius'.

WR5: Exactly one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall be of type **placement** with a **name** of 'orientation'.

WR6: Exactly one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall be of type **measure_representation_item** with a **value_component** of type **count_measure** and a **name** of 'number of sides'.

WR7: Exactly one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'circumscribed diameter'.

WR8: At most one **representation_item** used for the implicit representation of an **ngon_closed_profile** shall have a **name** of 'corner radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

Informal propositions:

IP1: The **ngon_closed_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **ngon_closed_profile** is defined at the centre of the circumscribed circle.

IP3: One of the sides of the ngon shall be parallel to the X direction intersecting the negative Y direction.

5.2.3.1.91 occurrence_usage_definition

An **occurrence_usage_definition** is a type of **configuration_design** that identifies a **configurable_item** that serves as definition for a particular **product_definition_occurrence.** See ARM definition for Item_instance in paragraph 4.2.241 for more information.

EXPRESS specification:

```
*)
```

```
ENTITY occurrence_usage_definition
  SUBTYPE OF (configuration_design);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION_OCCURRENCE' IN TYPEOF(SELF.design);
  WR2:  ('AUTOMOTIVE_DESIGN.CONFIGURABLE_ITEM' IN TYPEOF(SELF.configuration)) AND
        (SELF.configuration.description = 'product specification');
END_ENTITY;
(*
```

Formal propositions:

WR1: The **occurrence_usage_definition** shall reference as the **design** a **product_definition** that is of type **product_definition_occurrence.**

WR2: The **occurrence_usage_definition** shall reference as the **configuration** a **configuration_item** that is of type **configurable_item** and has a **description** of 'product specification'.

5.2.3.1.92 open_path_profile

An **open_path_profile** is a type of **shape_aspect** that consists of a connected set of curves and possibly a reference system that may be used to place the **open_path_profile.** The start vertex and end vertex for the set of curves do not connect creating an area open on one side. The reference system consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for General_open_profile in paragraph 4.2.202 for more information.

EXPRESS specification:

```

           TYPEOF(pdr.used_representation))
             )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **open_path_profile** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **open_path_profile** shall have at most one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the **open_path_profile** shall contain one **representation_item** in its set of **items**.

WR4: Exactly one **representation_item** used for the implicit representation of an **open_path_profile** shall be of type **placement** with a **name** of 'orientation'.

WR5: The **open_path_profile** shall have exactly one **path_shape_representation.**

Informal propositions:

IP1: The **open_path_profile** shall be planar and shall lie in the X-Y plane of the reference system if this is present.

5.2.3.1.93 package_product_concept_feature

A **package_product_concept_feature** is a type of **product_concept_feature** that combines several **product_concept_feature** instances that shall be offered to the market as a set. See ARM definition for Specification in paragraph 4.2.415 for more information.

EXPRESS specification:

```
*)
ENTITY package_product_concept_feature
  SUBTYPE OF (product_concept_feature);
END_ENTITY;
(*
```

5.2.3.1.94 partial_circular_profile

A **partial_circular_profile** is a type of **shape_aspect** that consists of an arc of constant radius and a reference system for the parameters of the **partial_circular_profile.** The reference system is used to define location and orientation of the **partial_circular_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Partial_circular_profile in paragraph 4.2.303 for more information.

EXPRESS specification:

```

Formal propositions:

WR1: The **path_feature_component** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **description** for the **path_feature_component** shall be either 'partial circular', 'complete circular', 'linear', or 'complex'.

WR3: If the **description** of the **path_feature_component** is 'complex' the **path_feature_component** shall not have an implicit representation specified by a **shape_representation_with_parameters.**

WR4: If the **description** of the **path_feature_component** is 'linear', 'partial circular', or 'complete circular' the **path_feature_component** shall have an implicit representation specified by a **shape_representation_with_parameters.** This **shape_representation_with_parameters** shall contain exactly one **representation_item** of type **placement** with a **name** of 'orientation'.

WR5: If the **description** of the **path_feature_component** is 'partial circular', the implicit representation of the **path_feature_component** shall contain exactly three **representation_items** in its set of **items**.

WR6: If the **description** of the **path_feature_component** is 'partial circular', exactly one **representation_item** used for the implicit representation of the **path_feature_component** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'radius'.

WR7: If the **description** of the **path_feature_component** is 'partial circular', exactly one **representation_item** used for the implicit representation of the **path_feature_component** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'sweep angle'.

WR8: If the **description** of the **path_feature_component** is 'complete circular', the implicit representation of the **path_feature_component** shall contain exactly two **representation_items** in its set of **items**.

WR9: If the **description** of the **path_feature_component** is 'complete circular', exactly one **representation_item** used for the implicit representation of the **path_feature_component** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'radius'.

WR10: If the **description** of the **path_feature_component** is 'linear', the implicit representation of the **path_feature_component** shall contain exactly two **representation_items** in its set of **items**.

WR11: If the **description** of the **path_feature_component** is 'linear', exactly one **representation_item** used for the implicit representation of the **path_feature_component** shall

be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'distance'.

WR12: If the **description** of the **path_feature_component** is 'complex', the **path_feature_component** shall have exactly one **path_shape_representation** with a **description** of 'path geometry'. This **path_shape_representation** shall contain a **curve** with a **name** of 'path curve'.

Informal propositions:

IP1: In the case of a linear **path_feature_component** the path starts at the intersection of the three directions of the **axis2_placement_3d** and travels along the third direction.

IP2: In the case of a circular **path_feature_component** the path lies in the plane defined by the first and second direction of the **axis2_placement_3d;** the third direction of the **axis2_placement_3d** is the rotation axis.

5.2.3.1.96 path_shape_representation

A **path_shape_representation** is a type of **representation** that represents a curved path such that the collection of curves is continuous and directed.

EXPRESS specification:

```
*)
ENTITY path_shape_representation
  SUBTYPE OF (representation);
WHERE
  WR1:  SIZEOF(SELF.items) = 1;
  WR2:  SIZEOF( QUERY( i <* SELF.items |
                'AUTOMOTIVE_DESIGN.CURVE' IN TYPEOF(i) )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **path_shape_representation** shall have exactly one **representation_item** in its set of **items**.

WR2: The geometric element that is used to represent the **path_shape_representation** shall be a **curve**.

5.2.3.1.97 physically_modelled_product_definition

A **physically_modelled_product_definition** is a type of **product_definition_with_associated_documents** that specifies a model of a shape of the part which is physically available. See ARM definition for Physical_model in paragraph 4.2.312 for more information.

EXPRESS specification:

```
*)
ENTITY physically_modelled_product_definition
  SUBTYPE OF (product_definition_with_associated_documents);
WHERE
  WR1:  SELF.frame_of_reference\application_context_element.name = 'physical occurrence';
  WR2:  (SIZEOF(SELF.documentation_ids) = 1) AND
        (SIZEOF( QUERY( d <* SELF.documentation_ids |
                 d.kind.product_data_type = 'physical model' )) = 1);
  WR3:  SIZEOF( QUERY( aoa <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
                              'APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS') |
                aoa.role.name = 'location'
              )) = 1;
  WR4:  (SIZEOF( QUERY( pd <* USEDIN( SELF,'AUTOMOTIVE_DESIGN.' +
                                        'PROPERTY_DEFINITION.DEFINITION') |
                           'AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION_SHAPE' IN
                            TYPEOF(pd))) = 0 ) OR
        (SIZEOF( QUERY ( pds <* USEDIN( SELF,
                         'AUTOMOTIVE_DESIGN.PROPERTY_DEFINITION.DEFINITION') |
                 ('AUTOMOTIVE_DESIGN.PRODUCT_DEFINITION_SHAPE' IN
                   TYPEOF(pds)) AND
                 (SIZEOF( USEDIN( pds, 'AUTOMOTIVE_DESIGN.' +
                          'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION')) = 1 ) AND
                 (SIZEOF( QUERY( pdr <* USEDIN( pds, 'AUTOMOTIVE_DESIGN.' +
                                 'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION') |
                          ('AUTOMOTIVE_DESIGN.SHAPE_DEFINITION_REPRESENTATION' IN
                           TYPEOF(pdr)) AND
                          ('AUTOMOTIVE_DESIGN.SHAPE_REPRESENTATION' IN
                           TYPEOF(pdr.used_representation)) AND
                          (SIZEOF(pdr.used_representation.items) = 1)
                        )) = 1 )
               )) = 1 );
END_ENTITY;
(*
```

Formal propositions:

WR1: The **physically_modelled_product_definition** shall reference as its **frame_of_reference** a **product_definition_context** that has a **name** of 'physical occurrence'.

WR2: The **physically_modelled_product_definition** shall have exactly one **document** in its set of **documentation_ids.** This **document** shall reference as its **kind** a **document_type** that has a **product_data_type** of 'physical model'.

WR3: The **physically_modelled_product_definition** shall be contained in the set of items of exactly one **applied_organization_assignment** that references as its **role** an **organization_role** that has a **name** of 'location'.

WR4: If the **physically_modelled_product_definition** is referenced as **definition** by a **product_definition_shape,** this **product_definition_shape** shall be referenced as the **defini-**

tion by exactly one instance of **property_definition_representation.** This **property_definition_representation** shall be a **shape_definition_representation** and shall reference as its **representation** a **shape_representation** that contains exactly one **representation_item** in its set of **items**. This **representation_item** shall be a **measure_representation_item** and a **ratio_measure_with_unit** and shall have a **name** of 'scale value'.

Informal propositions:

IP1: In case the **physically_modelled_product_definition** is not referenced by a **product_definition_shape** as the **definition**, the scale shall be 1:1.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **physically_modelled_product_definition** entity:

– restrict_version_assignment_for_physically_modelled_product_definition (see 5.2.4.173).

5.2.3.1.98 placed_datum_target_feature

A **placed_datum_target_feature** is a type of **datum_target** that represents the implicit definition. See ARM definition for Placed_target in paragraph 4.2.314 for more information.

EXPRESS specification:

```

Formal propositions:

WR1: The **placed_feature** shall be an aspect of the shape of either a **product_definition,** a **compound_feature_in_solid,** or a **compound_feature_in_panel.**

WR2: The **placed_feature** shall have a **shape_representation** with a **description** of 'feature definition placement' that contains a **mapped_item** in its set of **items**. This **mapped_item** shall reference a **representation_map** that references the **shape_representation** of a **feature_definition** as **mapped_representation.**

5.2.3.1.100 pocket

A **pocket** is a type of **feature_definition** that is the representation of a volume that is removed from a solid base shape. This volume may be enclosed in which case it is represented by sweeping a closed profile along a linear path represented by a **path_feature_component.** If the removed volume is not enclosed it is represented by sweeping an open profile. The bottom of the pocket is represented by a **pocket_bottom.** The walls of a **pocket** may have a slope that is represented by a **taper**. See ARM definition for General_pocket_in_solid in paragraph 4.2.205, Rectangular_closed_pocket_in_solid in paragraph 4.2.369, and Rectangular_open_pocket_in_solid in paragraph 4.2.373 for more information.

Formal propositions:

WR1: The **pocket** shall have a description of 'open rectangular', 'closed rectangular', or 'non-rectangular'.

WR2: If the **pocket** has a description of 'non-rectangular', the **pocket** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'boundary' and a **description** of 'profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'profile usage'in which the **relating_shape_aspect** is a **circular_closed_profile, ngon_closed_profile, rectangular_closed_profile, closed_path_profile, square_u_profile, partial_circular_profile, rounded_u_profile, vee_profile, tee_profile,** or **open_path_profile.**

WR3: If the **pocket** has a description of 'closed rectangular', the **pocket** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'boundary' and a **description** of 'closed profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'closed profile usage' in which the **relating_shape_aspect** is a **rectangular_closed_profile.**

WR4: If the **pocket** has a description of 'open rectangular', the **pocket** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'boundary' and a **description** of 'open profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'open profile usage' in which the **relating_shape_aspect** is a **square_u_profile.**

WR5: The **pocket** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'sweep path' and a **description** of 'path feature component occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'path feature component usage' in which the **relating_shape_aspect** is a **path_feature_component** with a **description** of 'linear'.

WR6: The **pocket** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'bottom condition' and a **description** of 'pocket bottom occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'pocket bottom usage' in which the **relating_shape_aspect** is a **pocket_bottom.**

WR7: The **pocket** shall be the basis shape for at most one **shape_aspect** with a **name** of 'taper' and a **description** of 'taper occurrence'. If present, this **shape_aspect** shall be the **re-**

lated_shape_aspect in exactly one **feature_component_relationship** with a **name** of 'taper usage' in which the **relating_shape_aspect** is a **taper**.

5.2.3.1.101 pocket_bottom

A **pocket_bottom** is a type of **shape_aspect** that is the bottom condition for a **pocket**. See ARM definition for Pocket_bottom_condition in paragraph 4.2.320, for Planar_bottom_condition in paragraph 4.2.315, for Through_bottom_condition in paragraph 4.2.459, and for General_-bottom_condition in paragraph 4.2.191 for more information.

(*
```

Formal propositions:

WR1: The **items** in a **point_placement_shape_representation** shall be of type **compound_representation_item**, **mapped_item**, or **axis2_placement_3d.**

WR2: At least one of the **items** in a **point_placement_shape_representation** shall be either a **compound_representation_item** or a **mapped_item.**

Informal propositions:

IP1: For each **compound_representation_item** in the set of **items** the **item_element** shall be of type **list_representation_item.**

IP2: For each **compound_representation_item** in the set of **items** the **list_representation_-item** shall include only **representation_item**s of type **placement** or **point**.

5.2.3.1.103 pre_defined_point_marker_symbol

A **pre_defined_point_marker_symbol** is a type of **pre_defined_symbol** that presents the position of a point and is identified by name.

NOTE – The definition of this entity is identical to the definition in ISO 10303–202.

EXPRESS specification:

```
*)
ENTITY pre_defined_point_marker_symbol
  SUBTYPE OF (pre_defined_marker);
WHERE
  WR1:  SELF.name IN
        ['asterisk',
        'circle',
        'dot',
        'plus',
        'square',
        'triangle',
        'x'];
END_ENTITY;
(*
```

Formal propositions:

WR1: The name of the **pre_defined_point_marker_symbol** shall be 'asterisk', 'circle', 'dot', 'plus', 'square', 'triangle', or 'x'.

Attribute value definitions:

See ARM definition for Point_appearance in paragraph 4.2.323 for a figure that defines each **pre_defined_point_marker_symbol** which shall be supported by all implementations of this part of ISO 10303. Each symbol definition includes the size of the symbol prior to scaling. The orientation of the individual symbol is exactly as shown in this figure.

The **pre_defined_point_marker_symbols** are:

asterisk: a graphical symbol depicted as three line segments of equal length that intersect at their midpoints forming the origin of the symbol. One of the segments is parallel to the vertical axis of the coordinate system into which the symbol is placed. The other two segments are at angles of 60 and 120 degrees from the first segment, rotated about the origin.

circle: a graphical symbol depicted as a circle. The origin of the symbol is the geometric centre of the circle.

dot: a graphical symbol depicted as a circle with a fill-pattern applied to it. The origin of the dot symbol is the centre of the circle.

plus: a graphical symbol depicted as two perpendicular line segments. The origin of the symbol is the intersection point of the two lines.

square: a graphical symbol depicted as an even-sided rectangle. The origin of the symbol is the geometrical centre of the rectangle.

triangle: a graphical symbol depicted as three line segments that form an equilateral triangle. The origin of the triangle corresponds to the geometric centre of the triangle. One side of the triangle is parallel to the horizontal axis of the coordinate system into which the symbol is placed.

x: a graphical symbol depicted as two line segments of equal length that intersect at their midpoints forming the origin of the symbol. One line segment is at an angle of 45 degrees to the vertical axis of the coordinate system into which the symbol is placed. The other segment is perpendicular to the first.

5.2.3.1.104 pre_defined_terminator_symbol

A **pre_defined_terminator_symbol** is a type of **pre_defined_symbol** that presents a terminator and is identified by name.

NOTE – The definition of this entity is identical to the definition in ISO 10303–202.

EXPRESS specification:

```
*)
ENTITY pre_defined_terminator_symbol
  SUBTYPE OF (pre_defined_symbol);
WHERE
  WR1:  SELF.name IN ['blanked arrow', 'blanked box',
                      'blanked dot', 'dimension origin', 'filled arrow',
                      'filled box', 'filled dot', 'integral symbol',
                      'open arrow', 'slash', 'unfilled arrow'];
END_ENTITY;
(*
```

Formal propositions:

WR1: The name of the **pre_defined_terminator_symbol** shall be 'blanked arrow', 'blanked box', 'blanked dot', 'dimension origin', 'filled arrow', 'filled box', 'filled dot', 'integral symbol', 'open arrow', 'slash', or 'unfilled arrow'.

Attribute value definitions:

See ARM definition for Annotation_symbol in paragraph 4.2.18 for a figure that defines each **pre_defined_terminator_symbol** which shall be supported by all implementations of this part of ISO 10303. Each symbol definition includes the size of the symbol prior to scaling. The orientation of each symbol as positioned on an annotation curve parallel to the x-axis is zero degrees. The annotation curves shown in the figure are not part of the symbol definition.

The **pre_defined_terminator_symbols** are:

blanked arrow: a graphical symbol depicted as three line segments which form an isosceles triangle. The origin of the symbol corresponds to the intersection point of the two equal sides. The annotation curve, to which the symbol is applied, acts as a bisector to the angle created by the two equal sides. The area within the symbol is blanked.

blanked box: a graphical symbol depicted as four line segments which form a square. Two opposite sides of the square are parallel to the annotation curve to which the symbol is applied. The origin of the symbol is the geometric centre of the square. The area within the symbol is blanked.

blanked dot: a graphical symbol depicted as a circle. The origin of the symbol is the centre of the circle. The area within the symbol is blanked.

dimension origin: a graphical symbol depicted as a circle. The origin of the symbol is the centre of the circle.

filled arrow: a graphical symbol depicted as three line segments which form an isosceles triangle. The origin of the symbol corresponds to the intersection point of the two equal sides. The annotation curve, to which the symbol is applied, acts as a bisector to the angle created by the two equal sides. The area within the symbol is shaded.

filled box: a graphical symbol depicted as four line segments which form a square. Two opposite sides of the square are parallel to the annotation curve to which the symbol is applied. The origin of the symbol is the geometric centre of the square. The area that lies within the symbol is shaded.

filled dot: a graphical symbol depicted as a circle. The origin of the symbol is the centre of the circle. The area within the symbol is shaded.

integral symbol: a graphical symbol depicted as one line segment forming two adjacent arcs. The origin of the symbol is the midpoint between the two arcs.

open arrow: a graphical symbol depicted as three line segments which form an isosceles triangle where the third side of the triangle is blanked. The origin of the symbol corresponds to the intersection point of the two equal sides. The annotation curve, to which the symbol is applied, acts as a bisector to the angle created by the two equal sides.

slash: a graphical symbol depicted as a line segment with the midpoint of the segment being the origin and lying on the annotation curve to which it is applied.

unfilled arrow: a graphical symbol depicted as three line segments which form an isosceles triangle. The origin of the symbol corresponds to the intersection point of the two equal sides. The annotation curve, to which the symbol is applied, acts as a bisector to the angle created by the two equal sides.

5.2.3.1.105 presentation_view_relationship

An **presentation_view_relationship** is a **presentation_representation_relationship** that relates two view areas. See ARM definition for View_area_relationship in paragraph 4.2.493 for more information.

EXPRESS specification:

```
*)
ENTITY presentation_view_relationship
  SUBTYPE OF (representation_relationship);
WHERE
  WR1:  ('AUTOMOTIVE_DESIGN.PRESENTATION_VIEW' IN
         TYPEOF(SELF\representation_relationship.rep_1))
           AND
        ('AUTOMOTIVE_DESIGN.PRESENTATION_VIEW' IN
         TYPEOF(SELF\representation_relationship.rep_2));
END_ENTITY;
(*
```

Formal propositions:

WR1: Both **representation**s related with an **presentation_view_relationship** shall be of type **presentation_view**.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **presentation_view_-relationship** entity:

– restrict_multi_language_for_presentation_view_relationship (see 5.2.4.129).

5.2.3.1.106 process_change

A **process_change** is a type of **action_property** that describes the differences between two **action**s concerning the properties of these **action**s.

EXPRESS specification:

```
*)
ENTITY process_change
  SUBTYPE OF (action_property);
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.ACTION_RELATIONSHIP' IN TYPEOF(SELF.definition);
```

```
  WR2:  (SIZEOF( USEDIN(SELF, 'AUTOMOTIVE_DESIGN.ACTION_PROPERTY_REPRESENTATION.' +
                             'PROPERTY')) <= 4 ) AND
        (SIZEOF( QUERY( apr <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
                              'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
                 NOT (apr.name IN ['added elements','deleted elements',
                                   'relating change description',
                                   'related change description'])
               )) = 0 );
  WR3:  SIZEOF( QUERY( apr <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
                              'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
                 apr.name = 'added elements'
               )) <= 1;
  WR4:  SIZEOF( QUERY( apr <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
                              'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
                 apr.name = 'deleted elements'
               )) <= 1;
  WR5:  SIZEOF( QUERY( apr <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
                              'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
                 apr.name = 'relating change description'
               )) <= 1;
  WR6:  SIZEOF( QUERY( apr <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
                              'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
                 apr.name = 'related change description'
               )) <= 1;
  WR7:  SIZEOF( QUERY( apr <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +
                             'ACTION_PROPERTY_REPRESENTATION.PROPERTY') |
                (apr.representation.name = 'relating change descripiton') AND
                (SIZEOF( QUERY( rr <* USEDIN(apr.representation,
                         'AUTOMOTIVE_DESIGN.REPRESENTATION_RELATIONSHIP.REP_1') |
                         (SIZEOF( QUERY( apr_1 <* USEDIN(rr.rep_2,
                                    'AUTOMOTIVE_DESIGN.' +
                                    'ACTION_PROPERTY_REPRESENTATION.' +
                                    'REPRESENTATION') |
                                  apr_1.name = 'related change description'
                                 )) = 1) AND
                         (rr.name = 'change description')
                       )) = 1 )
               )) = 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **process_change** shall reference as its **definition** an **action_relationship.**

WR2: Each **process_change** shall be referenced by at most four **action_property_representation**s. The **name** of this **action_property_representation**s shall be either 'added elements','deleted elements', 'relating change description', or 'related change description'.

WR3: There shall be at most one **action_property_representation** with a **name** of 'added elements' referencing a **process_change.**

WR4: There shall be at most one **action_property_representation** with a **name** of 'deleted elements' referencing a **process_change.**

WR5: There shall be at exactly one **action_property_representation** with a **name** of 'relating change description' referencing a **process_change.**

WR6: There shall be at exactly one **action_property_representation** with a **name** of 'related change description' referencing a **process_change.**

WR7: The representation, that is referenced as representation by the **action_property_representation** with a **name** of 'relating change description' shall play the role of **rep_1** in a **representation_relationship** where the role of **rep_2** is played by a representation that is referenced as representation by the **action_property_representation** with a **name** of 'related change description'. This **representation_relationship** shall have a **name** of 'change description'.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **process_change** entity:

– restrict_multi_language_for_process_change (see 5.2.4.130).

5.2.3.1.107 process_plan

A **process_plan** is a type of **product_definition_process** that specifies the information necessary to realize or produce a product. See ARM definition for Process_plan in paragraph 4.2.341 for more information.

EXPRESS specification:

```
*)
ENTITY process_plan
  SUBTYPE OF (product_definition_process);
WHERE
  WR1:  SIZEOF( QUERY( ppa <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +

                NOT ('AUTOMOTIVE_DESIGN.PROCESS_PLAN' IN
                     TYPEOF(ar.related_action)) AND
                ((ar.name <> 'process plan operation assignment') OR
                 (ar.related_action.description <> 'process operation'))
              )) = 0;
```

```
END_ENTITY;
(*
```

Formal propositions:

WR1: The **process_plan** shall only be referenced as **process**by **process_product_associations** that have a **name** of 'produced output' and that reference as **defined_product** a **product_definition.**

WR2: The **process_plan** shall only be referenced as the **related_action** by **action_relationships** that reference as the **relating_action** a **process_plan.**

WR3: The **process_plan** shall only be referenced as the **relating_action** by **action_relationships** that reference as the **related_action** a **process_plan,** or by **action_relationships** that have a **name** of 'process plan operation assignment' and that reference as the **related_action** an **action** that has a **description** of 'process operation'.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **process_plan** entity:

– restrict_multi_language_for_process_plan (see 5.2.4.131);

– restrict_version_assignment_for_process_plan (see 5.2.4.175).

5.2.3.1.108 process_plan_assignment

A **process_plan_assignment** is a type of **action_assignment** that assigns a **process_plan** to a **process_plan_item** that defines the input or output of a process operation within the context of the assigned **process_plan.**

EXPRESS specification:

```
*)
ENTITY process_plan_assignment
  SUBTYPE OF (action_assignment);

                 TYPEOF(ci))) <= 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **product_class** shall be referenced as the **item_concept** only by **configuration_items** that are of type **product_component**, by **configuration_items** that have a **description** of 'class function definition' and that are referenced as the **configuration** by at least one **configuration_design** that references as its **design** a **product_definition** that references as its **frame_of_reference** a **product_definition_context** with a **name** of 'functional definition', or by **configuration_items** that are of type **configurable_item** and have a **description** of 'product specification'.

WR2: The **product_class** shall be referenced as the **item_concept** by at most one **configuration_item** that is of type **product_component.**

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_class** entity:

– restrict_multi_language_for_product_class (see 5.2.4.135);

– restrict_version_assignment_for_product_class (see 5.2.4.176).

5.2.3.1.110 product_component

A **product_component** is a type of **configuration_item_with_context** and of **characterized_object** that identifies an element in the decomposition structure of the products belonging to a **product_class.** See ARM definition for Product_component in paragraph 4.2.350 for more information.

EXPRESS specification:

```
*)
ENTITY product_component
  SUBTYPE OF (characterized_object, configuration_item_with_context);
WHERE
  WR1:  SELF.purpose IN ['instance required','no instance required'];
END_ENTITY;
(*
```

Formal propositions:

WR1: The **product_component** shall have a **purpose** of either 'instance required' or 'no instance required'.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_component** entity:

– restrict_multi_language_for_product_component (see 5.2.4.136);

– restrict_version_assignment_for_product_component (see 5.2.4.177).

5.2.3.1.111 product_concept_feature_category

A **product_concept_feature_category** is a type of group that specifies a set of similar **product_concept_feature** instances. See ARM definition for Specification_category in paragraph 4.2.416 for more information.

EXPRESS specification:

```
*)
ENTITY product_concept_feature_category
  SUBTYPE OF (group);
WHERE
  WR1:  SIZEOF( QUERY( gma <* USEDIN(SELF, 'AUTOMOTIVE_DESIGN.' +

                       )) > 0 )
        )) = 0;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **product_concept_feature_category** shall be the **assigned_group** of a **group_member_assignment** that contains only **product_concept_feature**s in its set of **items** that are not of type **conditional_concept_feature.**

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_concept_feature_category** entity:

– restrict_multi_language_for_product_concept_feature_category (see 5.2.4.139).

5.2.3.1.112 product_concept_feature_category_usage

A **product_concept_feature_category_usage** is a type of **group_assignment** that assigns a **product_concept_feature_category** to a **product_class.** The **product_concept_feature_category_usage** specifies if the usage of one or more of the grouped **product_concept_feature** instances is mandatory or optional for all products of that **product_class.** See ARM definition for Class_category_association in paragraph 4.2.64 for more information.

EXPRESS specification:

```
*)
ENTITY product_concept_feature_category_usage
  SUBTYPE OF (group_assignment);
  items : SET [1:?] OF category_usage_item;
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.PRODUCT_CONCEPT_FEATURE_CATEGORY' IN
         TYPEOF(SELF.assigned_group);
  WR2:  SELF.role.name IN ['mandatory category usega','optional category usage'];
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items to which the **product_concept_feature_category** is assigned.

Formal propositions:

WR1: The **product_concept_feature_category_usage** shall reference as its **assigned_group** a **group** that is of type **product_concept_feature_category.**

WR2: The **product_concept_feature_category_usage** shall reference as its **role** a **group_role** that has a **name** of either 'mandatory category usage' or 'optional category usage'.

5.2.3.1.113 product_definition_occurrence

A **product_definition_occurrence** is a type of **product_definition** that identifies an occurrence of an object that is defined by either a **product_definition** that acts as a definitional template for a product, or by a **configurable_item** that identifies a physically realizable object by selecting a set of **product_concept_feature** instances for a product class. See ARM definition for Item_instance in paragraph 4.2.241, for Selected_instance in paragraph 4.2.392, for Single_instance in paragraph 4.2.404, and for Quantified_instance in paragraph 4.2.365 for more information.

EXPRESS specification:

```

Formal propositions:

WR1: Each **property_value_representation** shall contain at most three **representation_items** in its set of **items**.

WR2: Each **representation_item** in the set of **items** of a **property_value_representation** shall be either of type **measure_representation_item** or **descriptive_representation_item.**

WR3: There shall be at most one **representation_item** with a **name** of 'lower' in the set of **items** of a **property_value_representation.**

WR4: There shall be at most one **representation_item** with a **name** of 'upper' in the set of **items** of a **property_value_representation.**

WR5: There shall be exactly one **representation_item** with a **name** of 'specified value' in the set of **items** of a **property_value_representation.**

5.2.3.1.119 rectangular_closed_profile

A **rectangular_closed_profile** is a type of **shape_aspect** that consists of an enclosed 2D area and a reference system for the parameters of the **rectangular_closed_profile.** The enclosed area is defined by four straight sides with opposite sides equal in length. The reference system is used to define location and orientation of the **rectangular_closed_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Rectangular_closed_profile in paragraph 4.2.370 for more information.

             )) <= 1;
END_ENTITY;
(*
```

Formal propositions:

WR1: The **rectangular_closed_profile** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **rectangular_closed_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the **rectangular_closed_profile** shall contain three or four **representation_items** in its set of **items**.

WR4: The implicit representation of a **rectangular_closed_profile** shall contain only **representation_items** in its set of **items** that have a **name** of either 'orientation', 'length', 'width', or 'corner radius'.

WR5: Exactly one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall be of type **placement** with a **name** of 'orientation'.

WR6: Exactly one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'width'.

WR7: Exactly one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'length'.

WR8: At most one **representation_item** used for the implicit representation of a **rectangular_closed_profile** shall have a **name** of 'corner radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

Informal propositions:

IP1: The **rectangular_closed_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **rectangular_closed_profile** is defined at the centre of the rectangle.

IP3: The length of the **rectangular_closed_profile** is defined in the X direction and the width is defined in the Y direction of the reference system.

5.2.3.1.120 rectangular_pattern

A **rectangular_pattern** is a type of **replicate_feature** that relates a base feature and one or more **shape_aspects** which are the placement of the base feature at a specified row and column location on the base part. A position is defined on the part and a number of base features are equally place in rows and columns. See ARM definition for Rectangular_pattern in paragraph 4.2.374 for more information.

Formal propositions:

WR1: The **retention** shall be referenced as the **assigned_action** by at least one instance of **retention_assignment.**

WR2: The **retention** shall either be contained in the set of **items** of an **applied_date_assignment** that references as its **role** a **date_role** with a **name** of 'start', or shall be contained in the set of **items** of an **applied_date_and_time_assignment** that references as its **role** a **date_time_role** with a **name** of 'start', or shall be referenced as the **relating_action** by an instance of **action_relationship** that has a **name** of 'start'.

WR3: The **retention** shall either be contained in the set of **items** of an **applied_date_assignment** that references as its **role** a **date_role** with a **name** of 'earliest end', or shall be contained in the set of **items** of an **applied_date_and_time_assignment** that references as its **role** a **date_time_role** with a **name** of 'earliest end', or shall be referenced as the **relating_action** by an instance of **action_relationship** that has a **name** of 'earliest end', or shall be referenced as the **definition** by an instance of **action_property** that has a **name** of 'retention period' and that is referenced as the **property** by an instance of **action_property_representation** that references as its **representation** a **representation** that contains a **representation_item** in its set of **items** that has a **name** of 'earliest end'.

WR4: The **retention** shall either be contained in the set of **items** of an **applied_date_assignment** that references as its **role** a **date_role** with a **name** of 'latest end', or shall be contained in the set of **items** of an **applied_date_and_time_assignment** that references as its **role** a **date_time_role** with a **name** of 'latest end', or shall be referenced as the **relating_action** by an instance of **action_relationship** that has a **name** of 'latest end', or shall be referenced as the **definition** by an instance of **action_property** that has a **name** of 'retention period' and that is referenced as the **property** by an instance of **action_property_representation** that references as its **representation** a **representation** that contains a **representation_item** in its set of **items** that has a **name** of 'latest end'.

WR5: There shall be at most one instance of **action_property** with a **name** of 'retention period' that references the **retention** as its **definition**. If present, this **action_property** shall be referenced as the **property** by exactly one instance of **action_property_representation.** This **action_property_representation** shall reference as its **representation** a **representation** that contains at most two **representation_items** in its set of **items**. Both **representa-**

tion_items shall be of type **measure_representation_item** and **time_measure_with_unit** and shall have a **name** of either 'earliest end' or 'latest end'. At most one of the two **representation_item**s shall have a **name** of 'earliest end', and at most one of the two **representation_item**s shall have a **name** of 'latest end'.

WR6: The **retention** shall be referenced by **action_relationship**s only as the **relating_action.** The **retention** shall participate as the **relating_action** in at most three **action_relationship**s. If present, these **action_relationship**s shall have a **name** of either 'start', 'earliest end' or 'latest end' and shall reference as the **related_action** an **event_reference.** The **retention** shall participate in at most one **action_relationship** that has a **name** of 'start', in at most one **action_relationship** that has a **name** of 'earliest end', and in at most one **action_relationship** that has a **name** of 'latest end'.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **retention** entity:

– restrict_multi_language_for_retention (see 5.2.4.157);

– retention_requires_retention_assignment (see 5.2.4.183).

5.2.3.1.124 retention_assignment

A **retention_assignment** is a type of **action_assignment** that assigns a **retention** to a **retention_item** that needs to be retained. See ARM definition for Retention_period in paragraph 4.2.381 for more information.

EXPRESS specification:

```
*)
ENTITY retention_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF retention_item;
WHERE
  WR1:  'AUTOMOTIVE_DESIGN.RETENTION' IN TYPEOF(SELF.assigned_action);
  WR2:  SELF.role.name = 'retention';
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items to be retained.

Formal propositions:

WR1: The **retention_assignment** shall reference as its **assigned_action** an **action** that is of type **retention**.

WR2: The **retention_assignment** shall reference as its **role** an **action_role** that has a **name** of 'retention'.

5.2.3.1.125 rib

A **rib** is a type of **feature_definition** that is the representation of a volume that is added to a solid base shape in order to increase the stability of certain regions of the part. This added volume is represented by sweeping an open profile along a path represented by a **path_feature_component.** The walls of a rib may have an additional slope that is represented by a **taper**. See ARM definition for Rib_feature in paragraph 4.2.382 for more information.

Formal propositions:

WR1: The implicit representation of the **rib** shall contain between one and three **representation_items** in its set of items.

WR2: The implicit representation of a **rib** shall contain only **representation_items** in its set of **items** that have a **name** of either 'orientation', 'fillet radius', or 'shoulder radius'.

WR3: At most one **representation_item** used for the implicit representation of the **rib** shall have a **name** of 'fillet radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

WR4: At most one **representation_item** used for the implicit representation of the **rib** shall have a **name** of 'shoulder radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit**.

WR5: The **rib** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'rib profile' and a **description** of 'open profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'open profile usage' and a **relating_shape_aspect** that references a **square_u_profile, partial_circular_profile, rounded_u_profile, vee_profile, tee_profile,** or **open_path_profile.**

WR6: The **rib** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'sweep path' and a **description** of 'path feature component occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'path feature component usage' and a **relating_shape_aspect** that references a **path_feature_component.**

WR7: The **rib** shall be the basis shape for at most one **shape_aspect** with a **name** of 'taper' and a **description** of 'taper occurrence'. If present, this **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'taper usage' and a **relating_shape_aspect** that references a **taper** with a **description** of 'directed taper'.

Informal propositions:

IP1: The ends of a **rib** shall disappear in the base shape.

5.2.3.1.126 round_hole

A **round_hole** is a type of **feature_definition** that is the representation of a cylindrical enclosed volume that is removed from a solid base shape. This removed volume is represented by sweeping a **circular_closed_profile** along a linear path represented by a **path_feature_component.** The bottom of the **round_hole** is represented by a **hole_bottom.** A **round_hole** may have a change in diameter that is represented by a **taper**. See ARM definition for Round_hole in paragraph 4.2.387 for more information.

Formal propositions:

WR1: The **round_hole** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'boundary' and a **description** of 'closed profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'closed profile usage' and a **relating_shape_aspect** that references a **circular_closed_profile.**

WR2: The **round_hole** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'sweep path' and a **description** of 'path feature component occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'path feature component usage' and a **relating_shape_aspect** that references a **path_feature_component** with a **description** of 'linear'.

WR3: The **round_hole** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'bottom condition' and a **description** of 'hole bottom occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'hole bottom usage' and the **relating_shape_aspect** that references a **hole_bottom** with a **description** of either 'conical', 'flat', 'flat with radius', 'spherical', 'through', or 'flat with chamfer'.

WR4: The **round_hole** shall be the basis shape for at most one **shape_aspect** with a **name** of 'taper' and a **description** of 'taper occurrence'. If present, this **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'taper usage' and the **relating_shape_aspect** that references a **taper**.

WR5: The **round_hole** shall be the basis shape for at most one **shape_aspect** with a **name** of 'top chamfer'. If present, this **shape_aspect** shall be the **relating_shape_aspect** in exactly two **feature_component_relationships** both of which refer to a **chamfer_offset** as **related_shape_aspect.** The first of the two **feature_component_relationships** shall have a **name** of 'first chamfer offset' whereas the second shall have a **name** of 'second chamfer offset'.

5.2.3.1.127 rounded_u_profile

A **rounded_u_profile** is a type of **shape_aspect** that consists of an arc with connected straight lines at each end and a reference system. The reference system consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Rounded_U_profile in paragraph 4.2.388 for more information.

Formal propositions:

WR1: The implicit representation of the **slot** shall contain one or two **representation_items** in its set of **items**.

WR2: At most one **representation_item** used for the implicit representation of the **slot** shall have a **name** of 'depth'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit** with.

WR3: The **slot** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'sweep shape' and a **description** of 'open profile occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'open profile usage' and a **relating_shape_aspect** that references a **square_u_profile**, **partial_circular_profile**, **rounded_u_profile**, **vee_profile**, **tee_profile**, or **open_path_profile.**

WR4: The **slot** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'sweep path' and a **description** of 'path feature component occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **shape_defining_relationship** with a **name** of 'path feature component usage' and a **relating_shape_aspect** that references a **path_feature_component.**

WR5: The **slot** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'end condition at path start' and a **description** of 'slot end occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'slot end usage' in which the **relating_shape_aspect** is a **slot_end.**

WR6: The **slot** shall be the basis shape for exactly one **shape_aspect** with a **name** of 'end condition at path end' and a **description** of 'slot end occurrence'. This **shape_aspect** shall be the **related_shape_aspect** in exactly one **feature_component_relationship** with a **name** of 'slot end usage' in which the **relating_shape_aspect** is a **slot_end.**

5.2.3.1.132 slot_end

A **slot_end** is a type of **shape_aspect** that is the representation of the end condition for a **slot**. For more information see ARM definition for Slot_end_type in paragraph 4.2.406, for Flat_slot_end_type in paragraph 4.2.184, for Open_slot_end_type in paragraph 4.2.293, for Radiused_slot_end_type in paragraph 4.2.367, and for Woodruff_slot_end_type in paragraph 4.2.499.

Formal propositions:

WR1: The **solution_based_product_definition** shall either be referenced as the **related_product_definition** by exactly one **product_definition_relationship** that has a **name** of 'solution alternative definition' and that references as the **relating_product_definition** a **solution_based_product_definition**, or shall be referenced as the **design** by exactly one **confi-**

guration_design that is of type **solution_alternative_definition.**

WR2: The **solution_based_product_definition** shall have a **name** of either 'final', 'supplier', 'technical', 'technical supplier', 'technical final', 'supplier final', or 'technical supplier final'.

WR3: If the **solution_based_product_definition** has a **name** of 'supplier', 'technical supplier', 'supplier final', or 'technical supplier final' it shall be contained in the set of **items** of exactly one **applied_organization_assignment** that references as its **role** an **organization_role** with a **name** of 'supplier'.

WR4: If the **solution_based_product_definition** has a **name** of 'final', 'technical final', 'supplier final', or 'technical supplier final' it shall be referenced as the **definition** by a **property_definition** that is referenced as the **definition** by a **property_definition_representation** that references as its **used_representation** a **representation** that has a **description** of 'final item characteristics'. This **representation** shall contain one **descriptive_representation_item** in its set of **items** that has a **name** of 'final item status'.

WR5: If the **solution_based_product_definition** has a **name** of 'final', 'technical final', 'supplier final', or 'technical supplier final', it shall be referenced as the **relating_product_definition** by at least one **product_definition_relationship** with a **name** of 'final specification' that references as the **related_product_definition** a **product_definition** that references as its **frame_of_reference** a **product_definition_context** with a **name** of 'definitional template', or it shall be referenced as the **definition** by a **property_definition** that is referenced as the **definition** by a **property_definition_representation** that references as its **used_representation** a **representation** that has a **description** of 'final item characteristics' and contains at least one **descriptive_representation_item** in its set of **items** that has a **name** of 'final specification'.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **solution_based_product_definition** entity:

– restrict_multi_language_for_solution_based_product_definition (see 5.2.4.163);

– restrict_version_assignment_for_solution_based_product_definition (see 5.2.4.182).

5.2.3.1.135 square_u_profile

A **square_u_profile** is a type of **shape_aspect** that consists of three connected straight lines and a reference system for the parameters of the **square_u_profile.** The reference system is used to define location and orientation of the **square_u_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Square_u_profile in paragraph 4.2.423 for more information.

Formal propositions:

WR1: The **square_u_profile** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **square_u_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the **square_u_profile** shall contain between four and six **representation_items** in its set of **items**.

WR4: The implicit representation of a **square_u_profile** shall contain only **representation_items** in its set of **items** that have a **name** of either 'orientation', 'width', 'first angle', 'second

angle', 'first radius', or 'second radius'.

WR5: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **placement** with a **name** of 'orientation'.

WR6: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'width'.

WR7: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'first angle'.

WR8: Exactly one **representation_item** used for the implicit representation of a **square_u_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'second angle'.

WR9: At most one **representation_item** used for the implicit representation of a **square_u_profile** shall have a **name** of 'first radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

WR10: At most one **representation_item** used for the implicit representation of a **square_u_profile** shall have a **name** of 'second radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

Informal propositions:

IP1: The **square_u_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **square_u_profile** is defined at the midpoint of the base line.

IP3: The **square_u_profile** is defined with the base line in the X direction and the Y direction in the direction of the open end of the profile.

5.2.3.1.136 surface_condition

A **surface_condition** is a type of **property_definition** that has a **representation** specifying surface condition information. See ARM definition for Surface_condition in paragraph 4.2.437, for Coating_layer in paragraph 4.2.74, for Contact_ratio in paragraph 4.2.97, for Hardness in paragraph 4.2.225, for Roughness in paragraph 4.2.386, for Tactile_appearance in paragraph 4.2.445, for Treatment_result in paragraph 4.2.477, and for Visual_appearance in 4.2.496 for more information.

Formal propositions:

WR1: The **surface_condition** shall only be referenced as the **definition** by instances of **property_definition_representation** that reference as their **used_representation** a **representation** that has a **description** of either 'coating layer', 'contact ratio', 'hardness', 'roughness', 'tactile appearance', 'treatment result', or 'visual appearance'.

WR2: The **surface_condition** shall reference as its **definition** a **product_definition_shape** or a **shape_aspect.**

WR3: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'coating layer', this **representation** shall contain exactly one **representation_item** in its set of **items**. This **representation_item** shall be a **measure_representation_item** and **length_measure_with_unit** and shall have a **name** of 'thickness'.

WR4: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a

description of 'contact ratio', this **representation** shall also be referenced as the **used_representation** by exactly one **property_definition_representation** that has a **name** of 'measuring reference'. This **property_definition_representation** shall reference as its **definition** a **surface_condition** that references as its **definition** a **product_definition** that is of type **physically_modelled_product_definition.**

WR5: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'contact ratio', this **representation** shall contain exactly one **representation_item** in its set of **items**. This **representation_item** shall be a **measure_representation_item** and **ratio_measure_with_unit** and shall have a **name** of 'ratio value'.

WR6: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'hardness', this **property_definition_representation** shall be a **material_property_representation.**

WR7: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'hardness', this **representation** shall contain between two and five **representation_items** in its set of **items**. These **representation_items** shall either be of type **descriptive_representation_item** and have a **name** of 'description', 'measuring method', or 'measuring position', or shall be of type **measure_representation_item** and have a **name** of 'hardness value', or shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'depth'.

WR8: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'hardness', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'description'.

WR9: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'hardness', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'measuring method'.

WR10: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'hardness', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'measuring position'.

WR11: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'hardness', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **measure_representation_item** and **length_measure_with_unit** and has a **name** of 'depth'.

WR12: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'hardness', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **measure_representation_item** and has a **name** of 'hardness value'.

WR13: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'roughness', this **representation** shall contain between two and six **representation_item**s in its set of **items**. These **representation_item**s shall either be of type **descriptive_representation_item** and have a **name** of 'measuring method', or shall be of type **measure_representation_item** and have a **name** of 'roughness max value' or 'roughness min value', or shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'cutoff value' or 'sampling length', or shall be of type **pcurve** or **surface_curve** with a **name** of 'measuring direction'.

WR14: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'roughness', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **measure_representation_item** and has a **name** of 'roughness max value'.

WR15: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'roughness', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **measure_representation_item** and has a **name** of 'roughness min value'.

WR16: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'roughness', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **measure_representation_item** and **length_measure_with_unit** and has a **name** of 'cutoff value'.

WR17: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'roughness', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **measure_representation_item** and **length_measure_with_unit** and has a **name** of 'sampling length'.

WR18: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'roughness', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'measuring method'.

WR19: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'roughness', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **pcurve** or **surface_curve** and has a **name** of 'measuring

method'.

WR20: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'tactile appearance', this **representation** shall contain between one and two **representation_item**s in its set of **items**. These **representation_item**s shall either be of type **descriptive_representation_item** and have a **name** of 'description', or shall be of type **measure_representation_item** and **length_measure_with_unit** and have a **name** of 'depth'.

WR21: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'tactile appearance', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'description'.

WR22: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'tactile appearance', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **measure_representation_item** and **length_measure_with_unit** and has a **name** of 'depth'.

WR23: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'treatment result', this **representation** shall contain between one and two **representation_item**s in its set of **items**. These **representation_item**s shall be of type **descriptive_representation_item** and have a **name** of 'description' or 'purpose'.

WR24: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'treatment result', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'description'.

WR25: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'treatment result', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'purpose'.

WR26: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'visual appearance', this **representation** shall contain between two and five **representation_item**s in its set of **items**. These **representation_item**s shall be of type **descriptive_representation_item** and have a **name** of 'colour id', 'colour name', 'lustre', 'pattern', or 'transparency'.

WR27: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'visual appearance', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a

name of 'colour id'.

WR28: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'visual appearance', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'colour name'.

WR29: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'visual appearance', this **representation** shall contain exactly one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'lustre'.

WR30: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'visual appearance', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'pattern'.

WR31: If the **surface_condition** is referenced as the **definition** by a **property_definition_representation** that references as the **used_representation** a **representation** that has a **description** of 'visual appearance', this **representation** shall contain at most one **representation_item** in its set of **items** that is of type **descriptive_representation_item** and has a **name** of 'transparency'.

5.2.3.1.137 surface_condition_callout

A **surface_condition_callout** is a type of **draughting_callout** that presents a surface condition.

EXPRESS specification:

```
*)
ENTITY surface_condition_callout
  SUBTYPE OF (draughting_callout);
END_ENTITY;
(*
```

5.2.3.1.138 taper

A **taper** is a type of **shape_aspect** which represents a linear change of shape applied to a feature. See ARM definition for Angle_taper in paragraph 4.2.10, for Diameter_taper in paragraph 4.2.138, and for Directed_taper in paragraph 4.2.145 for more information.

Formal propositions:

WR1: The **taper** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **description** of the **taper** shall be either 'angle taper', 'diameter taper', or 'directed taper'.

WR3: The **taper** shall have exactly one implicit representation defined by a **shape_representation_with_parameters.**

WR4: The **shape_representation_with_parameters** that represents the shape of the **taper** shall contain exactly one **representation_item** in its set of **items**.

WR5: If the **description** of the **taper** is 'angle taper', the implicit representation of the **taper** shall contain exactly one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'taper angle'.

WR6: If the **description** of the **taper** is 'diameter taper', the implicit representation of the **taper** shall contain exactly one **representation_item** of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'final diameter'.

WR7: If the **description** of the **taper** is 'directed taper', the implicit representation of the **taper** shall contain exactly one **representation_item** of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'draft angle'.

WR8: If the **description** of the **taper** is 'directed taper', its shape shall be represented by exactly one **direction_shape_representation.** This **direction_shape_representation** shall have a **description** of 'draft direction'.

5.2.3.1.139 tee_profile

A **tee_profile** is a type of **shape_aspect** that consists of an upside down T shape and a reference system for the parameters of the **tee_profile.** The **tee_profile** consist of a stem and a perpendicular crossbar. The stem has two parallel lines connected at their ends by the crossbar. The crossbar is a rectangle. The profile is symmetric about the centreline of the stem. The

reference system is used to define location and orientation of the **tee_profile** and consists of two orthogonal reference axes X and Y that intersect in a reference point. See ARM definition for Tee_profile in paragraph 4.2.452 for more information.

Formal propositions:

WR1: The **tee_profile** shall be an aspect of the shape of a **feature_component_definition.**

WR2: The **tee_profile** shall have exactly one implicit representation defined by a **shape_representation_with_parameters.**

WR3: The **shape_representation_with_parameters** that represents the **tee_profile** shall contain nine or ten **representation_items** in its set of **items**.

WR4: The implicit representation of a **tee_profile** shall contain only **representation_items** in its set of **items** that have a **name** of either 'orientation', 'width', 'depth', 'cross bar width', 'cross bar depth', 'first offset', 'second offset', 'first angle', 'second angle', or 'radius'.

WR5: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **placement** with a **name** of 'orientation'.

WR6: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'width'.

WR7: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'depth'.

WR8: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'crossbar width'.

WR9: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'crossbar depth'.

WR10: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'first offset'.

WR11: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **length_measure_with_unit** with a **name** of 'second offset'.

WR12: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'first angle'.

WR13: Exactly one **representation_item** used for the implicit representation of a **tee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'second angle'.

WR14: At most one **representation_item** used for the implicit representation of a **tee_profile** shall have a **name** of 'radius'. If present, this **representation_item** shall be of type **measure_representation_item** and **length_measure_with_unit.**

Informal propositions:

IP1: The **tee_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **tee_profile** is defined at the midpoint of the side of the crossbar opposite the stem.

IP3: The **tee_profile** is defined with the side of the crossbar opposite the stem in the X direction and the profile symmetric with respect to the Y direction.

5.2.3.1.140 thread

A **thread** is a type of **feature_definition** that is the specification of a thread. See ARM definition for Thread_specification in paragraph 4.2.458 and for Defined_thread in paragraph 4.2.127 for more information.

WR6: Exactly one **representation_item** used for the implicit representation of a **vee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'profile angle'.

WR7: Exactly one **representation_item** used for the implicit representation of a **vee_profile** shall be of type **measure_representation_item** and **plane_angle_measure_with_unit** with a **name** of 'tilt angle'.

WR8: At most one **representation_item** used for the implicit representation of a **vee_profile** shall have a **name** of 'profile radius'. If present, this **representation_item** shall be of type

measure_representation_item with a **value_component** of type **length_measure_with_-unit.**

Informal propositions:

IP1: The **vee_profile** shall be planar and shall lie in the X-Y plane of the reference system.

IP2: The reference point of the **vee_profile** is defined at the position where the two lines connect.

5.2.3.1.145 version_assignment

A **version_assignment** is an **identification_assignment** that assigns a version identifier to a **version_item.**

EXPRESS specification:

```
*)
ENTITY version_assignment
  SUBTYPE OF (identification_assignment);
  items : SET [1:?] OF version_item;
WHERE
  WR1:  SELF.role.name = 'version id';
  WR2:  SIZEOF(SELF.items) = 1;
END_ENTITY;
(*
```

Attribute definitions:

items: The set of items to which the version identifier is assigned.

Formal propositions:

WR1: The **version_assignment** shall reference as its **role** an **identification_role** that has a **name** of 'version id'.

WR2: The **version_assignment** shall contain exactly one item in its set of **items**.

5.2.3.2 automotive_design imported entity modifications

5.2.3.2.1 action

The base definition of the **action** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **action** entity:

– action_subtype_restriction (see 5.2.4.2);

– activity_requires_person_or_organization_assignment (see 5.2.4.3);

– restrict_action_resource_requirement_for_process_operation (see 5.2.4.73);

– restrict_multi_language_for_action (see 5.2.4.79).

5.2.3.2.2 action_assignment

The base definition of the **action_assignment** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_assignment** entity:

– action_assignment_subtype_exclusiveness (see 5.2.4.1).

5.2.3.2.3 action_directive

The base definition of the **action_directive** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **action_directive** entity:

– restrict_action_directive (see 5.2.4.72);

– restrict_multi_language_for_action_directive (see 5.2.4.80);

– restrict_version_assignment_for_action_directive (see 5.2.4.168).

5.2.3.2.4 action_method

The base definition of the **action_method** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_method** entity:

– restrict_multi_language_for_action_method (see 5.2.4.81).

5.2.3.2.5 action_property

The base definition of the **action_property** entity is given in ISO 10303–49. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_property** entity:

– restrict_multi_language_for_action_property (see 5.2.4.82).

5.2.3.2.6 action_relationship

The base definition of the **action_relationship** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_relationship** entity:

– restrict_multi_language_for_action_relationship (see 5.2.4.83).

5.2.3.2.7 action_request_role

The base definition of the **action_request_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_request_role** entity:

– dependent_instantiable_action_request_role (see 5.2.4.12).

5.2.3.2.8 action_resource_requirement

The base definition of the **action_resource_requirement** entity is given in ISO 10303–49. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **action_resource_requirement** entity:

– restrict_action_resource_requirement_for_process_operation (see 5.2.4.73);

– restrict_multi_language_for_action_resource_requirement (see 5.2.4.84).

5.2.3.2.9 action_role

The base definition of the **action_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **action_role** entity:

– dependent_instantiable_action_role (see 5.2.4.13).

5.2.3.2.10 alternate_product_relationship

The base definition of the **alternate_product_relationship** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **alternate_product_relationship** entity:

– restrict_multi_language_for_alternate_product_relationship (see 5.2.4.85).

5.2.3.2.11 application_context

The base definition of the **application_context** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **application_context** entity:

– application_context_requires_ap_definition (see 5.2.4.4);

– restrict_multi_language_for_application_context (see 5.2.4.86).

5.2.3.2.12 approval

The base definition of the **approval** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **approval** entity:

– approval_requires_approval_assignment (see 5.2.4.6);

– restrict_approval_date_time_for_approval (see 5.2.4.74);

– restrict_multi_language_for_approval (see 5.2.4.87).

5.2.3.2.13 approval_date_time_role

The base definition of the **approval_date_time_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **approval_date_time_role** entity:

– dependent_instantiable_approval_date_time_role (see 5.2.4.14);

– restrict_approval_date_time_role (see 5.2.4.75).

5.2.3.2.14 approval_person_organization

The base definition of the **approval_person_organization** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_person_organization** entity:

– approval_person_organization_requires_date_time (see 5.2.4.5).

5.2.3.2.15 approval_role

The base definition of the **approval_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_role** entity:

– dependent_instantiable_approval_role (see 5.2.4.15).

5.2.3.2.16 approval_status

The base definition of the **approval_status** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approval_status** entity:

– restrict_classification_system_for_approval_status (see 5.2.4.76).

5.2.3.2.17 approver_role

The base definition of the **approver_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **approver_role** entity:

– dependent_instantiable_approver_role (see 5.2.4.16).

5.2.3.2.18 assembly_component_usage

The base definition of the **assembly_component_usage** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **assembly_component_usage** entity:

– restrict_multi_language_for_assembly_component_usage (see 5.2.4.88).

5.2.3.2.19 assembly_component_usage_substitute

The base definition of the **assembly_component_usage_substitute** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **assembly_component_usage_substitute** entity:

– restrict_multi_language_for_assembly_component_usage_substitute (see 5.2.4.89).

5.2.3.2.20 camera_image

The base definition of the **camera_image** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **camera_image** entity:

– subtype_mandatory_camera_image_2d_or_3d (see 5.2.4.190).

5.2.3.2.21 camera_image_3d_with_scale

The base definition of the **camera_image_3d_with_scale** entity is given in ISO 10303–517. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **camera_image_3d_with_scale** entity:

– restrict_multi_language_for_camera_image_3d_with_scale (see 5.2.4.91).

5.2.3.2.22 camera_model

The base definition of the **camera_model** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **camera_model** entity:

– subtype_mandatory_camera_model_2d_or_3d (see 5.2.4.191).

5.2.3.2.23 certification

The base definition of the **certification** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **certification** entity:

– restrict_multi_language_for_certification (see 5.2.4.92).

5.2.3.2.24 certification_role

The base definition of the **certification_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **certification_role** entity:

– dependent_instantiable_certification_role (see 5.2.4.17).

5.2.3.2.25 characterized_object

The base definition of the **characterized_object** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **characterized_object** entity:

– characterized_object_subtype_exclusiveness (see 5.2.4.7).

5.2.3.2.26 colour_rgb

The base definition of the **colour_rgb** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **colour_rgb** entity:

– dependent_instantiable_colour_rgb (see 5.2.4.18).

5.2.3.2.27 configurable_item

The base definition of the **configurable_item** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **configurable_item** entity:

– restrict_multi_language_for_configurable_item (see 5.2.4.95);

– restrict_product_concept_features_for_product_specification (see 5.2.4.167);

– restrict_version_assignment_for_configurable_item (see 5.2.4.169).

5.2.3.2.28 configuration_design

The base definition of the **configuration_design** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **configuration_design** entity:

– configuration_design_subtype_exclusiveness (see 5.2.4.8);

– restrict_multi_language_for_configuration_design (see 5.2.4.96).

5.2.3.2.29 configuration_item_relationship

The base definition of the **configuration_item_relationship** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **configuration_item_relationship** entity:

– restrict_multi_language_for_configuration_item_relationship (see 5.2.4.97).

5.2.3.2.30 contract_role

The base definition of the **contract_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **contract_role** entity:

– dependent_instantiable_contract_role (see 5.2.4.19).

5.2.3.2.31 curve_style

The base definition of the **curve_style** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **curve_style** entity:

– dependent_instantiable_curve_style (see 5.2.4.20).

5.2.3.2.32 curve_style_font

The base definition of the **curve_style_font** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **curve_style_font** entity:

– curve_font_usage (see 5.2.4.10).

5.2.3.2.33 data_environment

The base definition of the **data_environment** entity is given in ISO 10303–45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **data_environment** entity:

– restrict_multi_language_for_data_environment (see 5.2.4.99).

5.2.3.2.34 date

The base definition of the **date** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **date** entity:

– dependent_instantiable_date (see 5.2.4.21).

5.2.3.2.35 date_and_time

The base definition of the **date_and_time** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **date_and_time** entity:

– dependent_instantiable_date_and_time (see 5.2.4.22).

5.2.3.2.36 date_role

The base definition of the **date_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **date_role** entity:

– dependent_instantiable_date_role (see 5.2.4.23).

5.2.3.2.37 date_time_role

The base definition of the **date_time_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **date_time_role** entity:

– dependent_instantiable_date_time_role (see 5.2.4.24).

5.2.3.2.38 derived_unit

The base definition of the **derived_unit** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **derived_unit** entity:

– dependent_instantiable_derived_unit (see 5.2.4.25).

5.2.3.2.39 descriptive_representation_item

The base definition of the **descriptive_representation_item** entity is given in ISO 10303–45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **descriptive_representation_item** entity:

– restrict_multi_language_for_descriptive_representation_item (see 5.2.4.101).

5.2.3.2.40 dimensional_location

The base definition of the **dimensional_location** entity is given in ISO 10303–47. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **dimensional_location** entity:

– restrict_multi_language_for_dimensional_location (see 5.2.4.102).

5.2.3.2.41 dimensional_size

The base definition of the **dimensional_size** entity is given in ISO 10303–47. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **dimensional_size** entity:

– dependent_instantiable_dimensional_size (see 5.2.4.26);

– restrict_multi_language_for_dimensional_size (see 5.2.4.103).

5.2.3.2.42 document

The base definition of the **document** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **document** entity:

– restrict_multi_language_for_document (see 5.2.4.104);

– restrict_version_assignment_for_document (see 5.2.4.170).

5.2.3.2.43 document_relationship

The base definition of the **document_relationship** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_relationship** entity:

– restrict_multi_language_for_document_relationship (see 5.2.4.105).

5.2.3.2.44 document_role

The base definition of the **document_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_role** entity:

– dependent_instantiable_document_role (see 5.2.4.27).

5.2.3.2.45 document_type

The base definition of the **document_type** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **document_type** entity:

– restrict_classification_system_for_document_type (see 5.2.4.77).

5.2.3.2.46 draughting_subfigure_representation

The base definition of the **draughting_subfigure_representation** entity is given in ISO 10303–504. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **draughting_subfigure_representation** entity:

– draughting_subfigure_representation_layers (see 5.2.4.52).

5.2.3.2.47 draughting_title

The base definition of the **draughting_title** entity is given in ISO 10303–101. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **draughting_title** entity:

– restrict_multi_language_for_draughting_title (see 5.2.4.107).

5.2.3.2.48 drawing_revision

The base definition of the **drawing_revision** entity is given in ISO 10303–101. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **drawing_revision** entity:

– subtype_mandatory_drawing_revision (see 5.2.4.192).

5.2.3.2.49 drawing_sheet_revision

The base definition of the **drawing_sheet_revision** entity is given in ISO 10303–101. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **drawing_sheet_-revision** entity:

– drawing_sheet_annotation_layers (see 5.2.4.53);

– restrict_multi_language_for_drawing_sheet_revision (see 5.2.4.108);

– sheets_belong_to_one_drawing (see 5.2.4.188).

5.2.3.2.50 drawing_sheet_revision_usage

The base definition of the **drawing_sheet_revision_usage** entity is given in ISO 10303–101. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **drawing_sheet_-revision_usage** entity:

– sheets_belong_to_one_drawing (see 5.2.4.188).

5.2.3.2.51 effective_context_assignment

The base definition of the **effective_context_assignment** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **effective_context_-assignment** entity:

– effective_context_assignment_subtype_exclusiveness (see 5.2.4.56).

5.2.3.2.52 effective_item_assignment

The base definition of the **effective_item_assignment** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **effective_item_-assignment** entity:

– effective_item_assignment_subtype_exclusiveness (see 5.2.4.57).

5.2.3.2.53 effectivity

The base definition of the **effectivity** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **effectivity** entity:

– effectivity_requires_effective_item_assignment (see 5.2.4.58);

– restrict_multi_language_for_effectivity (see 5.2.4.109);

– subtype_mandatory_effectivity (see 5.2.4.193).

5.2.3.2.54 effectivity_relationship

The base definition of the **effectivity_relationship** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **effectivity_relationship** entity:

– restrict_multi_language_for_effectivity_relationship (see 5.2.4.110).

5.2.3.2.55 effectivity_role

The base definition of the **effectivity_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **effectivity_role** entity:

– dependent_instantiable_effectivity_role (see 5.2.4.28).

5.2.3.2.56 externally_defined_curve_font

The base definition of the **externally_defined_curve_font** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_-curve_font** entity:

– curve_font_usage (see 5.2.4.10).

5.2.3.2.57 externally_defined_symbol

The base definition of the **externally_defined_symbol** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_-symbol** entity:

– dependent_instantiable_externally_defined_symbol (see 5.2.4.29).

5.2.3.2.58 externally_defined_text_font

The base definition of the **externally_defined_text_font** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **externally_defined_text_font** entity:

– text_font_usage (see 5.2.4.200).

5.2.3.2.59 fill_area_style

The base definition of the **fill_area_style** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **fill_area_style** entity:

– dependent_instantiable_fill_area_style (see 5.2.4.30).

5.2.3.2.60 fill_area_style_colour

The base definition of the **fill_area_style_colour** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **fill_area_style_colour** entity:

– dependent_instantiable_fill_area_style_colour (see 5.2.4.31).

5.2.3.2.61 fill_area_style_tile_symbol_with_style

The base definition of the **fill_area_style_tile_symbol_with_style** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **fill_area_style_tile_symbol_with_style** entity:

– fill_area_style_tile_symbol_constraint (see 5.2.4.59).

5.2.3.2.62 geometric_representation_context

The base definition of the **geometric_representation_context** entity is given in ISO 10303–42. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **geometric_representation_-context** entity:

– dimensionality_is_two_or_three (see 5.2.4.50).

5.2.3.2.63 geometric_tolerance

The base definition of the **geometric_tolerance** entity is given in ISO 10303–47. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **geometric_tolerance** entity:

– geometric_tolerance_subtype_exclusiveness (see 5.2.4.61);

– restrict_multi_language_for_geometric_tolerance (see 5.2.4.115).

5.2.3.2.64 global_unit_assigned_context

The base definition of the **global_unit_assigned_context** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **global_unit_assigned_-context** entity:

– global_length_and_angle_units_2d_or_3d (see 5.2.4.62).

5.2.3.2.65 group

The base definition of the **group** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **group** entity:

– restrict_multi_language_for_group (see 5.2.4.116).

5.2.3.2.66 group_assignment

The base definition of the **group_assignment** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **group_assignment** entity:

– group_assignment_subtype_exclusiveness (see 5.2.4.63).

5.2.3.2.67 group_role

The base definition of the **group_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **group_role** entity:

– dependent_instantiable_group_role (see 5.2.4.32).

5.2.3.2.68 identification_assignment

The base definition of the **identification_assignment** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **identification_assignment** entity:

– identification_assignment_subtype_exclusiveness (see 5.2.4.64).

5.2.3.2.69 identification_role

The base definition of the **identification_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **identification_role** entity:

– dependent_instantiable_identification_role (see 5.2.4.33);

– restrict_multi_language_for_identification_role (see 5.2.4.117).

5.2.3.2.70 language_role

The base definition of the **language_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **language_role** entity:

– dependent_instantiable_language_role (see 5.2.4.34).

5.2.3.2.71 make_from_usage_option

The base definition of the **make_from_usage_option** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **make_from_usage_-option** entity:

– restrict_multi_language_for_make_from_usage_option (see 5.2.4.118).

5.2.3.2.72 mapped_item

The base definition of the **mapped_item** entity is given in ISO 10303–43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **mapped_item** entity:

– drawing_sheet_layout_usage (see 5.2.4.54).

5.2.3.2.73 material_property

The base definition of the **material_property** entity is given in ISO 10303–45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **material_property** entity:

– restrict_multi_language_for_material_property (see 5.2.4.119).

5.2.3.2.74 measure_representation_item

The base definition of the **measure_representation_item** entity is given in ISO 10303–45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **measure_representation_-item** entity:

– restrict_multi_language_for_measure_representation_item (see 5.2.4.120).

5.2.3.2.75 measure_with_unit

The base definition of the **measure_with_unit** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **measure_with_unit** entity:

– dependent_instantiable_measure_with_unit (see 5.2.4.35).

5.2.3.2.76 mechanical_design_geometric_presentation_representation

The base definition of the **mechanical_design_geometric_presentation_representation** entity is given in ISO 10303–517. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **mechanical_design_geometric_presentation_representation** entity:

– restrict_multi_language_for_mechanical_design_geometric_presentation_representation (see 5.2.4.121);

– restrict_version_assignment_for_mechanical_design_geometric_presentation_representation (see 5.2.4.172).

5.2.3.2.77 named_unit

The base definition of the **named_unit** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **named_unit** entity:

– dependent_instantiable_named_unit (see 5.2.4.36).

5.2.3.2.78 next_assembly_usage_occurrence

The base definition of the **next_assembly_usage_occurrence** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **next_assembly_usage_occurrence** entity:

– coordinated_assembly_and_shape (see 5.2.4.9).

5.2.3.2.79 organization_assignment

The base definition of the **organization_assignment** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **organization_assignment** entity:

– organization_assignment_subtype_exclusiveness (see 5.2.4.65).

5.2.3.2.80 organization_relationship

The base definition of the **organization_relationship** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **organization_relationship** entity:

– restrict_multi_language_for_organization_relationship (see 5.2.4.123).

5.2.3.2.81 organization_role

The base definition of the **organization_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **organization_role** entity:

– dependent_instantiable_organization_role (see 5.2.4.37);

– restrict_multi_language_for_organization_role (see 5.2.4.124).

5.2.3.2.82 pair_actuator

The base definition of the **pair_actuator** entity is given in ISO 10303–105. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **pair_actuator** entity:

– restrict_multi_language_for_pair_actuator (see 5.2.4.125).

5.2.3.2.83 person

The base definition of the **person** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **person** entity:

– person_requires_person_and_organization (see 5.2.4.66).

5.2.3.2.84 person_and_organization_role

The base definition of the **person_and_organization_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **person_and_organization_-role** entity:

– dependent_instantiable_person_and_organization_role (see 5.2.4.38).

5.2.3.2.85 person_role

The base definition of the **person_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **person_role** entity:

– dependent_instantiable_person_role (see 5.2.4.39).

5.2.3.2.86 pre_defined_colour

The base definition of the **pre_defined_colour** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_colour** entity:

– dependent_instantiable_pre_defined_colour (see 5.2.4.40);

– subtype_mandatory_pre_defined_colour (see 5.2.4.194).

5.2.3.2.87 pre_defined_curve_font

The base definition of the **pre_defined_curve_font** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_curve_-font** entity:

– curve_font_usage (see 5.2.4.10);

– subtype_mandatory_pre_defined_curve_font (see 5.2.4.195).

5.2.3.2.88 pre_defined_symbol

The base definition of the **pre_defined_symbol** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **pre_defined_symbol** entity:

– dependent_instantiable_pre_defined_symbol (see 5.2.4.41).

5.2.3.2.89 pre_defined_text_font

The base definition of the **pre_defined_text_font** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **pre_defined_text_font** entity:

– subtype_mandatory_pre_defined_text_font (see 5.2.4.196);

– text_font_usage (see 5.2.4.200).

5.2.3.2.90 presentation_area

The base definition of the **presentation_area** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **presentation_area** entity:

– restrict_multi_language_for_presentation_area (see 5.2.4.126);

– restrict_version_assignment_for_presentation_area (see 5.2.4.174).

5.2.3.2.91 presentation_layer_assignment

The base definition of the **presentation_layer_assignment** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **presentation_layer_-assignment** entity:

– presentation_layer_assignment_constraint_2d_or_3d (see 5.2.4.67);

– restrict_multi_language_for_presentation_layer_assignment (see 5.2.4.127).

5.2.3.2.92 presentation_style_by_context

The base definition of the **presentation_style_by_context** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **presentation_style_-by_context** entity:

– dependent_instantiable_presentation_style_by_context (see 5.2.4.42).

5.2.3.2.93 presentation_view

The base definition of the **presentation_view** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **presentation_view** entity:

– drawing_view_annotation_layers (see 5.2.4.55);

– restrict_multi_language_for_presentation_view (see 5.2.4.128).

5.2.3.2.94 process_product_association

The base definition of the **process_product_association** entity is given in ISO 10303–49. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **process_product_-association** entity:

– restrict_multi_language_for_process_product_association (see 5.2.4.132);

– restrict_process_product_association (see 5.2.4.165).

5.2.3.2.95 product

The base definition of the **product** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product** entity:

– product_requires_version (see 5.2.4.70);

– restrict_multi_language_for_product (see 5.2.4.133).

5.2.3.2.96 product_category

The base definition of the **product_category** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_category** entity:

– restrict_multi_language_for_product_category (see 5.2.4.134).

5.2.3.2.97 product_concept

The base definition of the **product_concept** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_concept** entity:

– subtype_mandatory_product_concept (see 5.2.4.197).

5.2.3.2.98 product_concept_feature

The base definition of the **product_concept_feature** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_concept_-feature** entity:

– restrict_multi_language_for_product_concept_feature (see 5.2.4.137);

– restrict_version_assignment_for_product_concept_feature (see 5.2.4.178).

5.2.3.2.99 product_concept_feature_association

The base definition of the **product_concept_feature_association** entity is given in ISO 10303–44. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_concept_-feature_association** entity:

– restrict_multi_language_for_product_concept_feature_association (see 5.2.4.138).

5.2.3.2.100 product_definition

The base definition of the **product_definition** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_definition** entity:

– functional_product_definition_requires_functional_product (see 5.2.4.60);

– product_definition_subtype_exclusiveness (see 5.2.4.69);

– restrict_multi_language_for_product_definition (see 5.2.4.140);

– restrict_version_assignment_for_product_definition (see 5.2.4.179).

5.2.3.2.101 product_definition_formation

The base definition of the **product_definition_formation** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_formation** entity:

– restrict_multi_language_for_product_definition_formation (see 5.2.4.141).

5.2.3.2.102 product_definition_formation_relationship

The base definition of the **product_definition_formation_relationship** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_formation_relationship** entity:

– restrict_multi_language_for_product_definition_formation_relationship (see 5.2.4.142).

5.2.3.2.103 product_definition_relationship

The base definition of the **product_definition_relationship** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_definition_relationship** entity:

– definition_replacement_requires_effectivity_assignment (see 5.2.4.11);

– restrict_multi_language_for_product_definition_relationship (see 5.2.4.144);

– restrict_product_categories_for_tool_part_relationship (see 5.2.4.166).

5.2.3.2.104 product_definition_shape

The base definition of the **product_definition_shape** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_shape** entity:

– restrict_multi_language_for_product_definition_shape (see 5.2.4.145).

5.2.3.2.105 product_definition_substitute

The base definition of the **product_definition_substitute** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **product_definition_substitute** entity:

– product_definition_substitute_requires_effectivity_assignment (see 5.2.4.68);

– restrict_multi_language_for_product_definition_substitute (see 5.2.4.146).

5.2.3.2.106 product_definition_with_associated_documents

The base definition of the **product_definition_with_associated_documents** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_definition_with_associated_documents** entity:

– subtype_mandatory_product_definition_with_associated_documents (see 5.2.4.198).

5.2.3.2.107 product_related_product_category

The base definition of the **product_related_product_category** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **product_related_product_category** entity:

– restrict_product_categories_for_tool_part_relationship (see 5.2.4.166).

5.2.3.2.108 property_definition

The base definition of the **property_definition** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **property_definition** entity:

– restrict_multi_language_for_property_definition (see 5.2.4.149).

5.2.3.2.109 property_definition_relationship

The base definition of the **property_definition_relationship** entity is given in ISO 10303–45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **property_definition_-relationship** entity:

– restrict_multi_language_for_property_definition_relationship (see 5.2.4.150).

5.2.3.2.110 property_definition_representation

The base definition of the **property_definition_representation** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **property_definition_-representation** entity:

– restrict_multi_language_for_property_definition_representation (see 5.2.4.151).

5.2.3.2.111 representation

The base definition of the **representation** entity is given in ISO 10303–43. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **representation** entity:

– dependent_instantiable_representation (see 5.2.4.43);

– representation_subtype_exclusiveness (see 5.2.4.71);

– restrict_multi_language_for_representation (see 5.2.4.153);

– restrict_version_assignment_for_representation (see 5.2.4.180).

5.2.3.2.112 representation_item

The base definition of the **representation_item** entity is given in ISO 10303–43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **representation_item** entity:

– restrict_multi_language_for_representation_item (see 5.2.4.154).

5.2.3.2.113 representation_relationship

The base definition of the **representation_relationship** entity is given in ISO 10303–43. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **representation_relationship** entity:

– restrict_multi_language_for_representation_relationship (see 5.2.4.155).

5.2.3.2.114 resource_requirement_type

The base definition of the **resource_requirement_type** entity is given in ISO 10303–49. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **resource_requirement_type** entity:

– restrict_multi_language_for_resource_requirement_type (see 5.2.4.156).

5.2.3.2.115 security_classification

The base definition of the **security_classification** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **security_classification** entity:

– restrict_multi_language_for_security_classification (see 5.2.4.158);

– security_classification_requires_security_classification_assignment (see 5.2.4.184).

5.2.3.2.116 security_classification_level

The base definition of the **security_classification_level** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **security_classification_-level** entity:

– restrict_classification_system_for_security_classification_level (see 5.2.4.78).

5.2.3.2.117 security_classification_role

The base definition of the **security_classification_role** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **security_classification_-role** entity:

– dependent_instantiable_security_classification_role (see 5.2.4.44).

5.2.3.2.118 shape_aspect

The base definition of the **shape_aspect** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **shape_aspect** entity:

– restrict_multi_language_for_shape_aspect (see 5.2.4.159);

– shape_aspect_subtype_exclusiveness (see 5.2.4.186).

5.2.3.2.119 shape_aspect_relationship

The base definition of the **shape_aspect_relationship** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **shape_aspect_-relationship** entity:

– restrict_multi_language_for_shape_aspect_relationship (see 5.2.4.160);

– shape_aspect_relationship_subtype_exclusiveness (see 5.2.4.185).

5.2.3.2.120 shape_dimension_representation

The base definition of the **shape_dimension_representation** entity is given in ISO 10303–47. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **shape_dimension_representation** entity:

– restrict_multi_language_for_shape_dimension_representation (see 5.2.4.161).

5.2.3.2.121 shape_representation

The base definition of the **shape_representation** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **shape_representation** entity:

– restrict_multi_language_for_shape_representation (see 5.2.4.162);

– restrict_version_assignment_for_shape_representation (see 5.2.4.181);

– shape_representation_subtype_exclusiveness (see 5.2.4.187).

5.2.3.2.122 styled_item

The base definition of the **styled_item** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **styled_item** entity:

– styled_curve (see 5.2.4.189).

5.2.3.2.123 symbol_colour

The base definition of the **symbol_colour** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **symbol_colour** entity:

– dependent_instantiable_symbol_colour (see 5.2.4.45).

5.2.3.2.124 terminator_symbol

The base definition of the **terminator_symbol** entity is given in ISO 10303–101. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **terminator_symbol** entity:

– terminator_symbol_constraint (see 5.2.4.199).

5.2.3.2.125 text_style

The base definition of the **text_style** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **text_style** entity:

– dependent_instantiable_text_style (see 5.2.4.46).

5.2.3.2.126 text_style_for_defined_font

The base definition of the **text_style_for_defined_font** entity is given in ISO 10303–46. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **text_style_for_-defined_font** entity:

– dependent_instantiable_text_style_for_defined_font (see 5.2.4.47).

5.2.3.2.127 tolerance_value

The base definition of the **tolerance_value** entity is given in ISO 10303–47. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **tolerance_value** entity:

– dependent_instantiable_tolerance_value (see 5.2.4.48).

5.2.3.2.128 uncertainty_qualifier

The base definition of the **uncertainty_qualifier** entity is given in ISO 10303–45. The following modifications apply to this part of ISO 10303.

Associated global rule:

The following global rule defined in this part of ISO 10303 applies to the **uncertainty_qualifier** entity:

– dependent_instantiable_uncertainty_qualifier (see 5.2.4.49).

5.2.3.2.129 versioned_action_request

The base definition of the **versioned_action_request** entity is given in ISO 10303–41. The following modifications apply to this part of ISO 10303.

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the **versioned_action_request** entity:

– restrict_multi_language_for_versioned_action_request (see 5.2.4.164);

– versioned_action_request_requires_date_and_person_or_organization (see 5.2.4.201).

5.2.4 automotive_design rule definitions

5.2.4.1 action_assignment_subtype_exclusiveness

The **action_assignment_subtype_exclusiveness** rule specifies that an instance of the subtypes of **action_assignment** shall be one of **applied_action_assignment**, **event_assignment**, **event_context_assignment**, or **retention_assignment.**

EXPRESS specification:

```
*)
RULE action_assignment_subtype_exclusiveness FOR
    (action_assignment);
WHERE
  WR1:  SIZEOF (QUERY (aa <* action_assignment |
                (SIZEOF (TYPEOF (aa) *
                         ['AUTOMOTIVE_DESIGN.APPLIED_ACTION_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.ELEMENT_DELIVERY_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.EVENT_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.EVENT_CONTEXT_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.PROCESS_PLAN_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.RENTENTION_ASSIGNMENT'])
                 > 1) OR
                ((SIZEOF (TYPEOF (aa)) > 2) AND
                 (SIZEOF (TYPEOF (aa) *
                         ['AUTOMOTIVE_DESIGN.APPLIED_ACTION_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.ELEMENT_DELIVERY_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.EVENT_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.EVENT_CONTEXT_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.PROCESS_PLAN_ASSIGNMENT',
                          'AUTOMOTIVE_DESIGN.RENTENTION_ASSIGNMENT'])
```

```
                    = 1))
        )) = 0;

END_RULE;
(*
```

Argument definitions:

action_assignment: the set of all instances of **action_assignment**.

Formal propositions:

WR1: Each instance of the subtypes of **action_assignment** shall be one of **applied_action_assignment**, **event_assignment**, **event_context_assignment**, or **retention_assignment**.

5.2.4.2 action_subtype_restriction

The **action_subtype_restriction** rule specifies that an instance of the subtypes of action shall be either one of **executed_action**, **event_reference**, **retention**, **property_process**, or **product_definition_process**, or shall be a complex instance of **property_process** and **product_definition_process**.

EXPRESS specification:

```
*)
RULE action_subtype_restriction FOR
    (action);
WHERE
  WR1:  SIZEOF (QUERY (a <* action |
                (SIZEOF (TYPEOF (a) *
                         ['AUTOMOTIVE_DESIGN.EXECUTED_ACTION',
                          'AUTOMOTIVE_DESIGN.EVENT_REFERENCE',
                          'AUTOMOTIVE_DESIGN.RENTENTION'])
                 > 1) OR
                ((SIZEOF (TYPEOF (a)) > 2) AND
                 (SIZEOF (TYPEOF (a) *
                         ['AUTOMOTIVE_DESIGN.EXECUTED_ACTION',
                          'AUTOMOTIVE_DESIGN.EVENT_REFERENCE',
                          'AUTOMOTIVE_DESIGN.RENTENTION'])
                  = 1))
        )) = 0;

END_RULE;
(*
```

Argument definitions:

action: the set of all instances of **action**.

Formal propositions:

WR1: Each instance of the subtypes of **action** shall be either one of **executed_action**, **event_reference**, **retention**, **property_process**, or **product_definition_process**, or shall be a complex instance of **property_process** and **product_definition_process**.

5.2.4.3 activity_requires_person_or_organization_assignment

The **activity_requires_person_or_organization_assignment** rule specifies that each instance of **action** which is not one of its subtypes and does not have a **description** of 'process operation' shall be referenced by at least one instance of either **applied_person_assignment** that has a **person_role** with a **name** of 'custodian', **applied_person_and_organization_assignment** that has a **person_and_organization_role** with a **name** of 'custodian', or **applied_organization_assignment** that has an **organization_role** with a **name** of 'custodian'. This rule enforces the requirement for every activity to have a person, an organization, or a person and an organization assigned to it that has the responsibility for the activity.

EXPRESS specification:

```
*)
RULE activity_requires_person_or_organization_assignment FOR
    (action);
WHERE
  WR1:  SIZEOF (QUERY (a <* action |
                (SIZEOF (TYPEOF (a)) = 1 ) AND
                (a.description <> 'process operation') AND
                (SIZEOF( QUERY( u <* USEDIN( a, 'AUTOMOTIVE_DESIGN.' +
                           'APPLIED_PERSON_ASSIGNMENT.ITEMS') |
                           (u.person_role.name = 'custodian')
                       )) +
                 SIZEOF( QUERY( u <* USEDIN( a, 'AUTOMOTIVE_DESIGN.' +
                           'APPLIED_PERSON_AND_ORGANIZATION_ASSIGNMENT.ITEMS') |
                           (u.person_and_organization_role.name = 'custodian')
                       )) +
                 SIZEOF( QUERY( u <* USEDIN( a, 'AUTOMOTIVE_DESIGN.' +
                           'APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS') |
                           (u.organization_role.name = 'custodian')
                       ))
                 = 0 )
        )) = 0;

END_RULE;
(*
```

Argument definitions:

action: the set of all instances of **action**.

Formal propositions:

WR1: Each instance of **action** which is not one of its subtypes and does not have a **description** of 'process operation' shall be referenced by at least one instance of either **applied_person_assignment** that has a **person_role** with a **name** of 'custodian', **applied_person_and_organization_assignment** that has a **person_and_organization_role** with a **name** of 'custodian', or **applied_organization_assignment** that has an **organization_role** with a **name** of 'custodian'.

5.2.4.4 application_context_requires_ap_definition

The **application_context_requires_ap_definition** rule ensures that each instance of **application_context** shall be referenced by exactly one **application_protocol_definition.** The rule also specifies that the context for all product data in the scope of this part of ISO 10303 is associated with the schema name 'automotive_design'.

EXPRESS specification:

```
*)
RULE application_context_requires_ap_definition FOR
    (application_context);
WHERE
  WR1:   SIZEOF (QUERY (ac <* application_context |
         SIZEOF( QUERY( apd <* USEDIN( ac,'AUTOMOTIVE_DESIGN.' +
               'APPLICATION_PROTOCOL_DEFINITION.APPLICATION') |
         apd.application_interpreted_model_schema_name =
         'automotive_design'
         )) <> 1
        )) = 0;

END_RULE;
(*
```

Argument definitions:

application_context: the set of all instances of **application_context**.

Formal propositions:

WR1: For each instance of **application_context** there shall be exactly one instance of **application_protocol_definition** which contains the instance of **application_context** as its application attribute. Each **application_protocol_definition** shall specify the **application_interpreted_model_schema** with the **name** of 'automotive_design'.

5.2.4.5 approval_person_organization_requires_date_time

The **approval_person_organization_requires_date_time** rule specifies that each instance of **approval_person_organization** shall be referenced by exactly one of either **applied_date_assignment** or **applied_date_and_time_assignment** where the assigned date or date and time specifies the actual date of the approval. This rule enforces the requirement for every approval, that in case the approving person or organization is specified, also the actual date of the approval has to be given.

EXPRESS specification:

```
*)
RULE approval_person_organization_requires_date_time FOR
    (approval_person_organization);
WHERE
  WR1:  SIZEOF( QUERY( apo <* approval_person_organization |
         (SIZEOF( QUERY( u <* USEDIN( apo, 'AUTOMOTIVE_DESIGN.' +
            'APPLIED_DATE_ASSIGNMENT.ITEMS') |
            (u.date_role.name = 'actual')
                )) +
          SIZEOF( QUERY( u <* USEDIN( apo, 'AUTOMOTIVE_DESIGN.' +
            'APPLIED_DATE_AND_TIME_ASSIGNMENT.ITEMS') |
            (u.date_time_role.name = 'actual')
                ))
         ) <> 1
        )) = 0;

END_RULE;
(*
```

Argument definitions:

approval_person_organization: the set of all instances of **approval_person_organization**.

Formal propositions:

WR1: There shall be exactly one instance of either **applied_date_assignment** or **applied_date_and_time_assignment** associated to an **approval_person_organization** where the **name** of **date_role/date_time_role** is 'actual'.

5.2.4.6 approval_requires_approval_assignment

The **approval_requires_approval_assignment** rule specifies that each instance of **approval** is referenced by at least one instance of **approval_assignment** as the **assigned_approval.** This rule enforces the requirement for every approval to be applied at least once.

EXPRESS specification:

```
*)
RULE approval_requires_approval_assignment FOR
    (approval);
WHERE
  WR1:  SIZEOF( QUERY( a <* approval |
                SIZEOF( USEDIN( a, 'AUTOMOTIVE_DESIGN.' +
                                   'APPROVAL_ASSIGNMENT.ASSIGNED_APPROVAL')
                      ) = 0
        )) = 0;

END_RULE;
(*
```

Argument definitions:

approval: the set of all instances of **approval**.

Formal propositions:

WR1: Each instance of **approval** shall be referenced at least once as the **assigned_approval** by an instance of **approval_assignment.**

5.2.4.7 characterized_object_subtype_exclusiveness

The **characterized_object_subtype_exclusiveness** rule specifies that an instance of the subtypes of **characterized_object** shall be one of **characterized_product_category**, **feature_component_definition**, **feature_definition**, **product_class**, or **product_component.**

EXPRESS specification:

```
*)
RULE characterized_object_subtype_exclusiveness FOR
    (characterized_object);
WHERE
  WR1:  SIZEOF (QUERY (co <* characterized_object |
                (SIZEOF (TYPEOF (co) *
                         ['AUTOMOTIVE_DESIGN.CHARACTERIZED_PRODUCT_CATEGORY',
                          'AUTOMOTIVE_DESIGN.FEATURE_COMPONENT_DEFINITION',
                          'AUTOMOTIVE_DESIGN.FEATURE_DEFINITION',
                          'AUTOMOTIVE_DESIGN.PRODUCT_CLASS',
                          'AUTOMOTIVE_DESIGN.PRODUCT_COMPONENT'])
                 > 1) OR
                ((SIZEOF (TYPEOF (co)) > 2) AND
                 (SIZEOF (TYPEOF (co) *
                          ['AUTOMOTIVE_DESIGN.CHARACTERIZED_PRODUCT_CATEGORY',
                           'AUTOMOTIVE_DESIGN.FEATURE_COMPONENT_DEFINITION',
                           'AUTOMOTIVE_DESIGN.FEATURE_DEFINITION',
```

```
                          'AUTOMOTIVE_DESIGN.PRODUCT_CLASS',
                          'AUTOMOTIVE_DESIGN.PRODUCT_COMPONENT'])
                  = 1 ))
        )) = 0;

END_RULE;
(*
```

Argument definitions:

characterized_object: the set of all instances of **characterized_object**.

Formal propositions:

WR1: Each instance of the subtypes of **characterized_object** shall be one of **characterized_product_category**, **feature_component_definition**, **feature_definition**, **product_class**, or **product_component.**

5.2.4.8 configuration_design_subtype_exclusiveness

The **configuration_design_subtype_exclusiveness** rule specifies that an instance of the subtypes of a **configuration_design** shall be only one of **component_function_definition**, **occurrence_usage_definition**, or **solution_alternative_definition**

EXPRESS specification:

```
*)
RULE configuration_design_subtype_exclusiveness FOR
    (configuration_design);
WHERE
  WR1:  SIZEOF (QUERY (pd <* configuration_design |
         (SIZEOF (TYPEOF (pd) *
         ['AUTOMOTIVE_DESIGN.component_function_definition',
          'AUTOMOTIVE_DESIGN.occurrence_usage_definition',
          'AUTOMOTIVE_DESIGN.solution_alternative_definition'])
                > 1) OR
         ((SIZEOF (TYPEOF (pd)) > 2) AND
         (SIZEOF (TYPEOF (pd) *
         ['AUTOMOTIVE_DESIGN.component_function_definition',
          'AUTOMOTIVE_DESIGN.occurrence_usage_definition',
          'AUTOMOTIVE_DESIGN.solution_alternative_definition'])
                 = 1))
        )) = 0;

END_RULE;
(*
```

Argument definitions:

configuration_design: the set of all instances of **configuration_design**.

Formal propositions:

WR1: Each instance of the subtypes of **configuration_design** shall be one of **component_function_definition**, **occurrence_usage_definition**, or **solution_alternative_definition**

5.2.4.9 coordinated_assembly_and_shape

The **coordinated_assembly_and_shape** rule specifies that the relationship between two **product_definition** entities which are an assembly and a component in a **next_assembly_usage_occurrence** and the relationship between two **shape_representation** entities which contain the representation of the shapes of the assembly and the component in a **shape_representation_relationship** must be explicitly related through the **context_dependent_shape_representation.** This rule calls the function **assembly_shape_is_defined** which returns true if the assembly relationship and shape relationship are explicitly related.

EXPRESS specification:

```
*)
RULE coordinated_assembly_and_shape FOR
    (next_assembly_usage_occurrence);
WHERE
  WR1:  SIZEOF (QUERY (nauo <* next_assembly_usage_occurrence |
        NOT (assembly_shape_is_defined (nauo)))) = 0;

END_RULE;
(*
```

Argument definitions:

next_assembly_usage_occurrence: the set of all instances of **next_assembly_usage_occurrence**.

Formal propositions:

WR1: For each instance of **next_assembly_usage_occurrence**, the **assembly_shape_is_defined** function shall be true.

5.2.4.10 curve_font_usage

The **curve_font_usage** rule ensures that each **curve_style_font**, **pre_defined_curve_font**, and **externally_defined_curve_font** shall define the curve font of at least one **curve_style.**

EXPRESS specification:

```
*)
RULE curve_font_usage FOR
    (curve_style_font,
     externally_defined_curve_font,
     pre_defined_curve_font);
WHERE
  WR1:  SIZEOF (QUERY (csf <* curve_style_font |
        NOT (SIZEOF (USEDIN (csf, 'AUTOMOTIVE_DESIGN.' +
                                  'CURVE_STYLE.CURVE_FONT'))>=1)))=0;
  WR2:  SIZEOF (QUERY (pdcf <* pre_defined_curve_font |
              NOT (SIZEOF (USEDIN (pdcf, 'AUTOMOTIVE_DESIGN.' +
                                         'CURVE_STYLE.CURVE_FONT'))>=1)))=0;
  WR3:  SIZEOF (QUERY (edcf <* externally_defined_curve_font |
              NOT (SIZEOF (USEDIN (edcf, 'AUTOMOTIVE_DESIGN.' +
                                         'CURVE_STYLE.CURVE_FONT'))>=1)))=0;

END_RULE;
(*
```

Argument definitions:

curve_style_font: the set of all instances of **curve_style_font**.

externally_defined_curve_font: the set of all instances of **externally_defined_curve_font**.

pre_defined_curve_font: the set of all instances of **pre_defined_curve_font**.

Formal propositions:

WR1: Each **curve_style_font** shall participate in the definition of at least one **curve_style.**

WR2: Each **pre_defined_curve_font** shall participate in the definition of at least one **curve_-style.**

WR3: Each **externally_defined_curve_font** shall participate in the definition of at least one **curve_style.**

5.2.4.11 definition_replacement_requires_effectivity_assignment

The **definition_replacement_requires_effectivity_assignment** rule specifies that each instance of **product_definition_relationship** with a **name** of 'definition replacement' shall be referenced by at least one instance of **applied_effective_item_assignment** that specifies the start of the **assigned_effectivity.** This rule enforces the requirement for every instance of **replaced_definition_relationship** to have at least one effectivity applied to it specifiying the start of the validity of the replacement.

EXPRESS specification:

```
*)
RULE definition_replacement_requires_effectivity_assignment FOR
    (product_definition_relationship);
WHERE
  WR1:  SIZEOF( QUERY( pdr <* product_definition_relationship |
                (pdr.name = 'definition replacement') AND
                (SIZEOF( QUERY(aeia <* USEDIN(pdr,'AUTOMOTIVE_DESIGN.' +
                                    'APPLIED_EFFECTIVE_ITEM_ASSIGNMENT.ITEMS') |
                         (('AUTOMOTIVE_DESIGN.DATED_EFFECTIVITY' IN
                           TYPEOF(aeia.assigned_effectivity)) OR
                          ('AUTOMOTIVE_DESIGN.EVENT_BASED_EFFECTIVITY' IN
                           TYPEOF(aeia.assigned_effectivity))) AND
                         (SIZEOF( QUERY( ea <* USEDIN(aeia.assigned_effectivity,
                          'AUTOMOTIVE_DESIGN.EVENT_ASSIGNMENT.ITEMS') |
                                  ea.action_role.name = 'effective start'
                         )) > 0)
                )) = 0)
        )) = 0;

END_RULE;
(*
```

Argument definitions:

product_definition_relationship: the set of all instances of **product_definition_relationship**.

Formal propositions:

WR1: For each instance of **product_definition_relationship** with a **name** of 'definition replacement', there shall be at least one instance of **applied_effective_item_assignment** that contains the instance in its set of **items**, and that has an **assigned_effectivity** that is a **dated_effectivity** or that has an **assigned_effectivity** that is an **event_based_effectivity** that is contained in the set of **items** of an **event_assignment** that references an **action_role** with a **name** of 'effectivity start'.

5.2.4.12 dependent_instantiable_action_request_role

The **dependent_instantiable_action_request_role** rule specifies that each instance of **action_request_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_action_request_role FOR
    (action_request_role);
```

```
WHERE
  WR1:  SIZEOF ( QUERY (a <* action_request_role |
        NOT (SIZEOF (USEDIN (a,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

action_request_role: identifies the set of all instances of **action_request_role.**

Formal propositions:

WR1: For each instance of **action_request_role,** there shall be a reference to the **action_request_role** instance from an attribute of another entity.

5.2.4.13 dependent_instantiable_action_role

The **dependent_instantiable_action_role** rule specifies that each instance of **action_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_action_role FOR
    (action_role);
WHERE
  WR1:  SIZEOF ( QUERY (a <* action_role |
        NOT (SIZEOF (USEDIN (a,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

action_role: identifies the set of all instances of **action_role.**

Formal propositions:

WR1: For each instance of **action_role,** there shall be a reference to the **action_role** instance from an attribute of another entity.

5.2.4.14 dependent_instantiable_approval_date_time_role

The **dependent_instantiable_approval_date_time_role** rule specifies that each instance of **approval_date_time_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_approval_date_time_role FOR
    (approval_date_time_role);
WHERE
  WR1:  SIZEOF ( QUERY (a <* approval_date_time_role |
        NOT (SIZEOF (USEDIN (a,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

approval_date_time_role: identifies the set of all instances of **approval_date_time_role.**

Formal propositions:

WR1: For each instance of **approval_date_time_role,** there shall be a reference to the **approval_date_time_role** instance from an attribute of another entity.

5.2.4.15 dependent_instantiable_approval_role

The **dependent_instantiable_approval_role** rule specifies that each instance of **approval_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_approval_role FOR
    (approval_role);
WHERE
  WR1:  SIZEOF ( QUERY (a <* approval_role |
        NOT (SIZEOF (USEDIN (a,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

approval_role: identifies the set of all instances of **approval_role.**

Formal propositions:

WR1: For each instance of **approval_role,** there shall be a reference to the **approval_role** instance from an attribute of another entity.

5.2.4.16 dependent_instantiable_approver_role

The **dependent_instantiable_approver_role** rule specifies that each instance of **approver_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_approver_role FOR
    (approver_role);
WHERE
  WR1:  SIZEOF ( QUERY (a <* approver_role |
        NOT (SIZEOF (USEDIN (a,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

approver_role: identifies the set of all instances of **approver_role.**

Formal propositions:

WR1: For each instance of **approver_role,** there shall be a reference to the **approver_role** instance from an attribute of another entity.

5.2.4.17 dependent_instantiable_certification_role

The **dependent_instantiable_certification_role** rule specifies that each instance of **certification_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_certification_role FOR
    (certification_role);
WHERE
  WR1:  SIZEOF ( QUERY (c <* certification_role |
        NOT (SIZEOF (USEDIN (c,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

certification_role: identifies the set of all instances of **certification_role.**

Formal propositions:

WR1: For each instance of **certification_role,** there shall be a reference to the **certification_-role** instance from an attribute of another entity.

5.2.4.18 dependent_instantiable_colour_rgb

The **dependent_instantiable_colour_rgb** rule specifies that each instance of **colour_rgb** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_colour_rgb FOR
    (colour_rgb);
WHERE
  WR1:  SIZEOF ( QUERY (c <* colour_rgb |
        NOT (SIZEOF (USEDIN (c,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

colour_rgb: identifies the set of all instances of **colour_rgb.**

Formal propositions:

WR1: For each instance of **colour_rgb,** there shall be a reference to the **colour_rgb** instance from an attribute of another entity.

5.2.4.19 dependent_instantiable_contract_role

The **dependent_instantiable_contract_role** rule specifies that each instance of **contract_-role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_contract_role FOR
    (contract_role);
WHERE
  WR1:  SIZEOF ( QUERY (c <* contract_role |
        NOT (SIZEOF (USEDIN (c,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

contract_role: identifies the set of all instances of **contract_role.**

Formal propositions:

WR1: For each instance of **contract_role,** there shall be a reference to the **contract_role** instance from an attribute of another entity.

5.2.4.20 dependent_instantiable_curve_style

The **dependent_instantiable_curve_style** rule specifies that each instance of **curve_style** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_curve_style FOR
    (curve_style);
WHERE
  WR1:  SIZEOF ( QUERY (c <* curve_style |
        NOT (SIZEOF (USEDIN (c,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

curve_style: identifies the set of all instances of **curve_style.**

Formal propositions:

WR1: For each instance of **curve_style,** there shall be a reference to the **curve_style** instance from an attribute of another entity.

5.2.4.21 dependent_instantiable_date

The **dependent_instantiable_date** rule specifies that each instance of **date** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date FOR
    (date);
WHERE
```

```
  WR1:  SIZEOF ( QUERY (d <* date |
        NOT (SIZEOF (USEDIN (d,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

date: identifies the set of all instances of date.

Formal propositions:

WR1: For each instance of date, there shall be a reference to the date instance from an attribute of another entity.

5.2.4.22 dependent_instantiable_date_and_time

The **dependent_instantiable_date_and_time** rule specifies that each instance of **date_and_time** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date_and_time FOR
    (date_and_time);
WHERE
  WR1:  SIZEOF ( QUERY (d <* date_and_time |
        NOT (SIZEOF (USEDIN (d,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

date_and_time: identifies the set of all instances of **date_and_time.**

Formal propositions:

WR1: For each instance of **date_and_time,** there shall be a reference to the **date_and_time** instance from an attribute of another entity.

5.2.4.23 dependent_instantiable_date_role

The **dependent_instantiable_date_role** rule specifies that each instance of **date_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date_role FOR
    (date_role);
WHERE
  WR1:  SIZEOF ( QUERY (d <* date_role |
        NOT (SIZEOF (USEDIN (d,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

date_role: identifies the set of all instances of **date_role.**

Formal propositions:

WR1: For each instance of **date_role,** there shall be a reference to the **date_role** instance from an attribute of another entity.

5.2.4.24 dependent_instantiable_date_time_role

The **dependent_instantiable_date_time_role** rule specifies that each instance of **date_time_-role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date_time_role FOR
    (date_time_role);
WHERE
  WR1:  SIZEOF ( QUERY (d <* date_time_role |
        NOT (SIZEOF (USEDIN (d,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

date_time_role: identifies the set of all instances of **date_time_role.**

Formal propositions:

WR1: For each instance of **date_time_role,** there shall be a reference to the **date_time_role** instance from an attribute of another entity.

5.2.4.25 dependent_instantiable_derived_unit

The **dependent_instantiable_derived_unit** rule specifies that each instance of **derived_unit** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_derived_unit FOR
    (derived_unit);
WHERE
  WR1:  SIZEOF ( QUERY (d <* derived_unit |
        NOT (SIZEOF (USEDIN (d,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

derived_unit: identifies the set of all instances of **derived_unit.**

Formal propositions:

WR1: For each instance of **derived_unit,** there shall be a reference to the **derived_unit** instance from an attribute of another entity.

5.2.4.26 dependent_instantiable_dimensional_size

The **dependent_instantiable_dimensional_size** rule specifies that each instance of **dimensional_size** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_dimensional_size FOR
    (dimensional_size);
WHERE
  WR1:  SIZEOF ( QUERY (d <* dimensional_size |
        NOT (SIZEOF (USEDIN (d,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

dimensional_size: identifies the set of all instances of **dimensional_size.**

Formal propositions:

WR1: For each instance of **dimensional_size,** there shall be a reference to the **dimensional_size** instance from an attribute of another entity.

5.2.4.27 dependent_instantiable_document_role

The **dependent_instantiable_document_role** rule specifies that each instance of **document_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_document_role FOR
    (document_role);
WHERE
  WR1:  SIZEOF ( QUERY (d <* document_role |
        NOT (SIZEOF (USEDIN (d,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

document_role: identifies the set of all instances of **document_role.**

Formal propositions:

WR1: For each instance of **document_role,** there shall be a reference to the **document_role** instance from an attribute of another entity.

5.2.4.28 dependent_instantiable_effectivity_role

The **dependent_instantiable_effectivity_role** rule specifies that each instance of **effectivity_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_effectivity_role FOR
    (effectivity_role);
WHERE
  WR1:  SIZEOF ( QUERY (e <* effectivity_role |
        NOT (SIZEOF (USEDIN (e,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

effectivity_role: identifies the set of all instances of **effectivity_role.**

Formal propositions:

WR1: For each instance of **effectivity_role,** there shall be a reference to the **effectivity_role** instance from an attribute of another entity.

5.2.4.29 dependent_instantiable_externally_defined_symbol

The **dependent_instantiable_externally_defined_symbol** rule specifies that each instance of **externally_defined_symbol** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_externally_defined_symbol FOR
    (externally_defined_symbol);
WHERE
  WR1:  SIZEOF ( QUERY (e <* externally_defined_symbol |
        NOT (SIZEOF (USEDIN (e,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

externally_defined_symbol: identifies the set of all instances of **externally_defined_symbol.**

Formal propositions:

WR1: For each instance of **externally_defined_symbol,** there shall be a reference to the **externally_defined_symbol** instance from an attribute of another entity.

5.2.4.30 dependent_instantiable_fill_area_style

The **dependent_instantiable_fill_area_style** rule specifies that each instance of **fill_area_-style** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_fill_area_style FOR
    (fill_area_style);
WHERE
```

```
  WR1:  SIZEOF ( QUERY (f <* fill_area_style |
        NOT (SIZEOF (USEDIN (f,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

fill_area_style: identifies the set of all instances of **fill_area_style.**

Formal propositions:

WR1: For each instance of **fill_area_style,** there shall be a reference to the **fill_area_style** instance from an attribute of another entity.

5.2.4.31 dependent_instantiable_fill_area_style_colour

The **dependent_instantiable_fill_area_style_colour** rule specifies that each instance of **fill_area_style_colour** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_fill_area_style_colour FOR
    (fill_area_style_colour);
WHERE
  WR1:  SIZEOF ( QUERY (f <* fill_area_style_colour |
        NOT (SIZEOF (USEDIN (f,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

fill_area_style_colour: identifies the set of all instances of **fill_area_style_colour.**

Formal propositions:

WR1: For each instance of **fill_area_style_colour,** there shall be a reference to the **fill_area_style_colour** instance from an attribute of another entity.

5.2.4.32 dependent_instantiable_group_role

The **dependent_instantiable_group_role** rule specifies that each instance of **group_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_group_role FOR
    (group_role);
WHERE
  WR1:  SIZEOF ( QUERY (g <* group_role |
        NOT (SIZEOF (USEDIN (g,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

group_role: identifies the set of all instances of **group_role.**

Formal propositions:

WR1: For each instance of **group_role,** there shall be a reference to the **group_role** instance from an attribute of another entity.

5.2.4.33 dependent_instantiable_identification_role

The **dependent_instantiable_identification_role** rule specifies that each instance of **identification_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_identification_role FOR
    (identification_role);
WHERE
  WR1:  SIZEOF ( QUERY (i <* identification_role |
        NOT (SIZEOF (USEDIN (i,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

identification_role: identifies the set of all instances of **identification_role.**

Formal propositions:

WR1: For each instance of **identification_role,** there shall be a reference to the **identification_role** instance from an attribute of another entity.

5.2.4.34 dependent_instantiable_language_role

The **dependent_instantiable_language_role** rule specifies that each instance of **language_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_language_role FOR
    (language_role);
WHERE
  WR1:  SIZEOF ( QUERY (l <* language_role |
        NOT (SIZEOF (USEDIN (l,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

language_role: identifies the set of all instances of **language_role.**

Formal propositions:

WR1: For each instance of **language_role,** there shall be a reference to the **language_role** instance from an attribute of another entity.

5.2.4.35 dependent_instantiable_measure_with_unit

The **dependent_instantiable_measure_with_unit** rule specifies that each instance of **measure_with_unit** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_measure_with_unit FOR
    (measure_with_unit);
WHERE
  WR1:  SIZEOF ( QUERY (m <* measure_with_unit |
        NOT (SIZEOF (USEDIN (m,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

measure_with_unit: identifies the set of all instances of **measure_with_unit.**

Formal propositions:

WR1: For each instance of **measure_with_unit**, there shall be a reference to the **measure_with_unit** instance from an attribute of another entity.

5.2.4.36 dependent_instantiable_named_unit

The **dependent_instantiable_named_unit** rule specifies that each instance of **named_unit** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_named_unit FOR
    (named_unit);
WHERE
  WR1:  SIZEOF ( QUERY (n <* named_unit |
        NOT (SIZEOF (USEDIN (n,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

named_unit: identifies the set of all instances of **named_unit.**

Formal propositions:

WR1: For each instance of **named_unit**, there shall be a reference to the **named_unit** instance from an attribute of another entity.

5.2.4.37 dependent_instantiable_organization_role

The **dependent_instantiable_organization_role** rule specifies that each instance of **organization_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_organization_role FOR
    (organization_role);
WHERE
  WR1:  SIZEOF ( QUERY (o <* organization_role |
        NOT (SIZEOF (USEDIN (o,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

organization_role: identifies the set of all instances of **organization_role.**

Formal propositions:

WR1: For each instance of **organization_role,** there shall be a reference to the **organization_role** instance from an attribute of another entity.

5.2.4.38 dependent_instantiable_person_and_organization_role

The **dependent_instantiable_person_and_organization_role** rule specifies that each instance of **person_and_organization_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_person_and_organization_role FOR
    (person_and_organization_role);
WHERE
  WR1:  SIZEOF ( QUERY (p <* person_and_organization_role |
        NOT (SIZEOF (USEDIN (p,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

person_and_organization_role: identifies the set of all instances of **person_and_organization_role.**

Formal propositions:

WR1: For each instance of **person_and_organization_role,** there shall be a reference to the **person_and_organization_role** instance from an attribute of another entity.

5.2.4.39 dependent_instantiable_person_role

The **dependent_instantiable_person_role** rule specifies that each instance of **person_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_person_role FOR
    (person_role);
```

```
WHERE
  WR1:  SIZEOF ( QUERY (p <* person_role |
        NOT (SIZEOF (USEDIN (p,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

person_role: identifies the set of all instances of **person_role.**

Formal propositions:

WR1: For each instance of **person_role,** there shall be a reference to the **person_role** instance from an attribute of another entity.

5.2.4.40 dependent_instantiable_pre_defined_colour

The **dependent_instantiable_pre_defined_colour** rule specifies that each instance of **pre_defined_colour** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_pre_defined_colour FOR
    (pre_defined_colour);
WHERE
  WR1:  SIZEOF ( QUERY (p <* pre_defined_colour |
        NOT (SIZEOF (USEDIN (p,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

pre_defined_colour: identifies the set of all instances of **pre_defined_colour.**

Formal propositions:

WR1: For each instance of **pre_defined_colour,** there shall be a reference to the **pre_defined_colour** instance from an attribute of another entity.

5.2.4.41 dependent_instantiable_pre_defined_symbol

The **dependent_instantiable_pre_defined_symbol** rule specifies that each instance of **pre_defined_symbol** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_pre_defined_symbol FOR
    (pre_defined_symbol);
WHERE
  WR1:  SIZEOF ( QUERY (p <* pre_defined_symbol |
        NOT (SIZEOF (USEDIN (p,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

pre_defined_symbol: identifies the set of all instances of **pre_defined_symbol.**

Formal propositions:

WR1: For each instance of **pre_defined_symbol,** there shall be a reference to the **pre_defined_symbol** instance from an attribute of another entity.

5.2.4.42 dependent_instantiable_presentation_style_by_context

The **dependent_instantiable_presentation_style_by_context** rule specifies that each instance of **presentation_style_by_context** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_presentation_style_by_context FOR
    (presentation_style_by_context);
WHERE
  WR1:  SIZEOF ( QUERY (p <* presentation_style_by_context |
        NOT (SIZEOF (USEDIN (p,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

presentation_style_by_context: identifies the set of all instances of **presentation_style_by_context.**

Formal propositions:

WR1: For each instance of **presentation_style_by_context,** there shall be a reference to the **presentation_style_by_context** instance from an attribute of another entity.

5.2.4.43 dependent_instantiable_representation

The **dependent_instantiable_representation** rule specifies that each instance of **representation** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_representation FOR
    (representation);
WHERE
  WR1:  SIZEOF ( QUERY (r <* representation |
        NOT (SIZEOF (USEDIN (r,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

representation: identifies the set of all instances of representation.

Formal propositions:

WR1: For each instance of representation, there shall be a reference to the representation instance from an attribute of another entity.

5.2.4.44 dependent_instantiable_security_classification_role

The **dependent_instantiable_security_classification_role** rule specifies that each instance of **security_classification_role** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_security_classification_role FOR
    (security_classification_role);
WHERE
  WR1:  SIZEOF ( QUERY (s <* security_classification_role |
        NOT (SIZEOF (USEDIN (s,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

security_classification_role: identifies the set of all instances of **security_classification_role.**

Formal propositions:

WR1: For each instance of **security_classification_role**, there shall be a reference to the **security_classification_role** instance from an attribute of another entity.

5.2.4.45 dependent_instantiable_symbol_colour

The **dependent_instantiable_symbol_colour** rule specifies that each instance of **symbol_colour** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_symbol_colour FOR
    (symbol_colour);
WHERE
  WR1:  SIZEOF ( QUERY (s <* symbol_colour |
        NOT (SIZEOF (USEDIN (s,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

symbol_colour: identifies the set of all instances of **symbol_colour.**

Formal propositions:

WR1: For each instance of **symbol_colour**, there shall be a reference to the **symbol_colour** instance from an attribute of another entity.

5.2.4.46 dependent_instantiable_text_style

The **dependent_instantiable_text_style** rule specifies that each instance of **text_style** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_text_style FOR
    (text_style);
WHERE
  WR1:  SIZEOF ( QUERY (t <* text_style |
        NOT (SIZEOF (USEDIN (t,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

text_style: identifies the set of all instances of **text_style.**

Formal propositions:

WR1: For each instance of **text_style,** there shall be a reference to the **text_style** instance from an attribute of another entity.

5.2.4.47 dependent_instantiable_text_style_for_defined_font

The **dependent_instantiable_text_style_for_defined_font** rule specifies that each instance of **text_style_for_defined_font** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_text_style_for_defined_font FOR
    (text_style_for_defined_font);
WHERE
  WR1:  SIZEOF ( QUERY (t <* text_style_for_defined_font |
        NOT (SIZEOF (USEDIN (t,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

text_style_for_defined_font: identifies the set of all instances of **text_style_for_defined_-font.**

Formal propositions:

WR1: For each instance of **text_style_for_defined_font,** there shall be a reference to the **text_style_for_defined_font** instance from an attribute of another entity.

5.2.4.48 dependent_instantiable_tolerance_value

The **dependent_instantiable_tolerance_value** rule specifies that each instance of **tolerance_value** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_tolerance_value FOR
    (tolerance_value);
```

```
WHERE
  WR1:  SIZEOF ( QUERY (t <* tolerance_value |
        NOT (SIZEOF (USEDIN (t,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

tolerance_value: identifies the set of all instances of **tolerance_value.**

Formal propositions:

WR1: For each instance of **tolerance_value,** there shall be a reference to the **tolerance_value** instance from an attribute of another entity.

5.2.4.49 dependent_instantiable_uncertainty_qualifier

The **dependent_instantiable_uncertainty_qualifier** rule specifies that each instance of **uncertainty_qualifier** is dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_uncertainty_qualifier FOR
    (uncertainty_qualifier);
WHERE
  WR1:  SIZEOF ( QUERY (u <* uncertainty_qualifier |
        NOT (SIZEOF (USEDIN (u,'')) > 0 ))) = 0;

END_RULE;
(*
```

Argument definitions:

uncertainty_qualifier: identifies the set of all instances of **uncertainty_qualifier.**

Formal propositions:

WR1: For each instance of **uncertainty_qualifier,** there shall be a reference to the **uncertainty_qualifier** instance from an attribute of another entity.

5.2.4.50 dimensionality_is_two_or_three

The **dimensionality_is_two_or_three** rule ensures that all **representations** with a **geometric_representation_context** are defined in a two-dimensional or three-dimensional coordinate

system.

EXPRESS specification:

```
*)
RULE dimensionality_is_two_or_three FOR
    (geometric_representation_context);
WHERE
  WR1:  SIZEOF (QUERY (g <* geometric_representation_context |
                 NOT ((g.coordinate_space_dimension = 2) OR
                      (g.coordinate_space_dimension = 3))
               )) = 0;

END_RULE;
(*
```

Argument definitions:

geometric_representation_context: the set of all instances of **geometric_representation_-context**.

Formal propositions:

WR1: Each **geometric_representation_context** shall have a **coordinate_space_dimension** equal to two or three.

5.2.4.51 draughting_model_annotation_layers

The **draughting_model_annotation_layers** rule ensures that every **annotation_occurrence** that is an item in a **draughting_model** is assigned to at least one layer.

EXPRESS specification:

```
*)
RULE draughting_model_annotation_layers FOR
    (draughting_model);
WHERE
  WR1:  SIZEOF
               (QUERY (dm <* draughting_model |
               NOT (SIZEOF (QUERY (ao <* QUERY (it <* dm\representation.items |
                  ('AUTOMOTIVE_DESIGN.ANNOTATION_OCCURRENCE' IN TYPEOF (it))) |
                  NOT (SIZEOF (USEDIN (ao, 'AUTOMOTIVE_DESIGN.' +
                                           'PRESENTATION_LAYER_ASSIGNMENT.' +
                                           'ASSIGNED_ITEMS')) >= 1)
                   ))=0)
               ))=0;

END_RULE;
```

```
(*
```

Argument definitions:

draughting_model: the set of all instances of **draughting_model**.

Formal propositions:

WR1: Every item of each **draughting_model** that is an **annotation_occurrence** shall be one of the **assigned_items** of at least one **presentation_layer_assignment.**

5.2.4.52 draughting_subfigure_representation_layers

The **draughting_subfigure_representation_layers** rule ensures that every **annotation_occurrence** that is an item in a **draughting_subfigure_representation** is assigned to at least one layer.

EXPRESS specification:

```
*)
RULE draughting_subfigure_representation_layers FOR
    (draughting_subfigure_representation);
WHERE
  WR1:  SIZEOF (QUERY (dsr <* draughting_subfigure_representation |
               NOT (SIZEOF (QUERY (item <* dsr\representation.items |

        )) = 0;

END_RULE;
(*
```

Argument definitions:

action: the set of all instances of **action**.

action_resource_requirement: the set of all instances of **action_resource_requirement**.

Formal propositions:

WR1: For each instance of **action** with a **description** of 'process operation' there shall be at most one instance of **action_resource_requirement** with a **name** of 'reference tool' that references the action in its set of operations.

WR2: Each instance of **action_resource_requirement** with a **name** of 'reference tool' shall be a **requirement_for_action_resource** and shall have exactly one item in its set of **resources** that references an instance of **action_resource** which is a **product_definition_resource.**

WR3: For each instance of **action_resource_requirement** the value of the **name** attribute shall be either 'reference tool' or 'non reference tool'.

5.2.4.74 restrict_approval_date_time_for_approval

The **restrict_approval_date_time_for_approval** rule specifies that each instance of **approval** shall be referenced by at most one instance of **approval_date_time** that specifies the actual date of the **approval** and by at most one instance of **approval_date_time** that specifies the nominal date of the **approval**. This rule enforces the requirement for every approval to have at most one actual and at most one nominal date or a nominal date and a time associated to it to indicate when the approval has taken place or will take place.

EXPRESS specification:

```
*)
RULE restrict_approval_date_time_for_approval FOR
    (approval);
WHERE
  WR1:  SIZEOF( QUERY( a <* approval |
         SIZEOF( QUERY( adt <* USEDIN( a, 'AUTOMOTIVE_DESIGN.' +
               'APPROVAL_DATE_TIME.DATED_APPROVAL') |

WR1: For each instance of **shape_representation,** there shall be at most one instance of **version_assignment** that contains the instance of **shape_representation** in its set of items.

5.2.4.182 restrict_version_assignment_for_solution_based_product_definition

The **restrict_version_assignment_for_solution_based_product_definition** rule specifies that each instance of **solution_based_product_definition** shall be referenced by at most one instance of **version_assignment** that specifies the version of the **solution_based_product_definition**.

EXPRESS specification:

```
*)
RULE restrict_version_assignment_for_solution_based_product_definition FOR
    (solution_based_product_definition);
WHERE
  WR1:  SIZEOF(QUERY(ent <* solution_based_product_definition |
          SIZEOF(USEDIN(ent, 'AUTOMOTIVE_DESIGN.VERSION_ASSIGNMENT.ITEMS')) > 1
        )) = 0;

END_RULE;
(*
```

Argument definitions:

solution_based_product_definition: identifies the set of all instances of **solution_based_product_definition.**

Formal propositions:

WR1: For each instance of **solution_based_product_definition,** there shall be at most one instance of **version_assignment** that contains the instance of **solution_based_product_definition** in its set of items.

5.2.4.183 retention_requires_retention_assignment

The **retention_requires_retention_assignment** rule specifies that each instance of **retention** is referenced by at least one instance of **retention_assignment** as the **assigned_action.** This rule enforces the requirement for every instance of retention period to be applied at least once.

EXPRESS specification:

```
*)
RULE retention_requires_retention_assignment FOR
    (retention);
WHERE
  WR1:  SIZEOF( QUERY( r <* retention |
                SIZEOF( QUERY( aa <* USEDIN( r, 'AUTOMOTIVE_DESIGN.' +

                (SIZEOF( TYPEOF (e)) > 3)
        )) = 0;

END_RULE;
(*
```

Argument definitions:

effectivity: the set of all instances of **effectivity**.

Formal propositions:

WR1: Each instance of **effectivity** shall either be a **serial_numbered_effectivity**, **lot_effectivity**, or **dated_effectivity.**

WR2: Each instance of **effectivity** shall either be a **serial_numbered_effectivity**, **lot_effectivity**, or **event_based_effectivity.**

5.2.4.194 subtype_mandatory_pre_defined_colour

The **subtype_mandatory_pre_defined_colour** rule ensures that all **pre_defined_colour** entities are **draughting_pre_defined_colour** entities.

EXPRESS specification:

```
*)
RULE subtype_mandatory_pre_defined_colour FOR
    (pre_defined_colour);
WHERE
  WR1:  SIZEOF (QUERY (pdc <* pre_defined_colour |
               NOT ('AUTOMOTIVE_DESIGN.DRAUGHTING_PRE_DEFINED_COLOUR'
                       IN TYPEOF (pdc))))=0;

END_RULE;
(*
```

Argument definitions:

pre_defined_colour: the set of all instances of **pre_defined_colour**.

Formal propositions:

WR1: Each **pre_defined_colour** shall be a **draughting_pre_defined_colour.**

5.2.4.195 subtype_mandatory_pre_defined_curve_font

The **subtype_mandatory_pre_defined_curve_font** rule ensures that all **pre_defined_curve_-font** entities are **draughting_pre_defined_curve_font** entities.

EXPRESS specification:

```
*)
RULE subtype_mandatory_pre_defined_curve_font FOR
    (pre_defined_curve_font);
WHERE
  WR1:  SIZEOF (QUERY (pdcf <* pre_defined_curve_font |
               NOT ('AUTOMOTIVE_DESIGN.DRAUGHTING_PRE_DEFINED_CURVE_FONT'
                       IN TYPEOF (pdcf))))=0;

END_RULE;
(*
```

Argument definitions:

pre_defined_curve_font: the set of all instances of **pre_defined_curve_font**.

Formal propositions:

WR1: Each **pre_defined_curve_font** shall be a **draughting_pre_defined_curve_font.**

5.2.4.196 subtype_mandatory_pre_defined_text_font

The **subtype_mandatory_pre_defined_text_font** rule ensures that all **pre_defined_text_-font** entities are **draughting_pre_defined_text_font** entities.

EXPRESS specification:

```
*)
RULE subtype_mandatory_pre_defined_text_font FOR
    (pre_defined_text_font);
WHERE
  WR1:  SIZEOF (QUERY (pdtf <* pre_defined_text_font |
               NOT ('AUTOMOTIVE_DESIGN.DRAUGHTING_PRE_DEFINED_TEXT_FONT'
                       IN TYPEOF (pdtf))))=0;

END_RULE;
(*
```

Argument definitions:

pre_defined_text_font: the set of all instances of **pre_defined_text_font**.

Formal propositions:

WR1: Each **pre_defined_text_font** shall be a **draughting_pre_defined_text_font.**

5.2.4.197 subtype_mandatory_product_concept

The **subtype_mandatory_product_concept** rule specifies the permitted usage of the **product_concept** entity only as its subtype **product_class.**

EXPRESS specification:

```
*)
RULE subtype_mandatory_product_concept FOR
    (product_concept);
WHERE
  WR1:  SIZEOF( QUERY(pc <* product_concept |
```

```
                (SIZEOF( TYPEOF(pc) ) = 1) OR
                (SIZEOF( TYPEOF(pc) * ['AUTOMOTIVE_DESIGN.PRODUCT_CLASS'] ) = 0)
        )) = 0;

END_RULE;
(*

```

```
                                        'TEXT_LITERAL.FONT'))>=1
              )))=0;

END_RULE;
(*
```

Argument definitions:

externally_defined_text_font: the set of all instances of **externally_defined_text_font**.

pre_defined_text_font: the set of all instances of **pre_defined_text_font**.

Formal propositions:

WR1: Each **pre_defined_text_font** shall be the font for at least one **text_literal.**

WR2: Each **externally_defined_text_font** shall be the font for at least one **text_literal.**

5.2.4.201 versioned_action_request_requires_date_and_person_-or_organization

The **versioned_action_request_requires_date_and_person_or_organization** rule specifies that each instance of **versioned_action_request** shall be referenced by at least one instance of either **applied_date_and_person_assignment**, **applied_date_and_person_and_organization_assignment**, or **applied_date_and_organization_assignment** that has the role with a **name** of 'notified person or organization'. This rule enforces the requirement for every work request to have at least one notified person associated to it.

EXPRESS specification:

```
*)
RULE versioned_action_request_requires_date_and_person_or_organization FOR
    (versioned_action_request);
WHERE
  WR1:  SIZEOF( QUERY( v_a_r <* versioned_action_request |

                         adaoa.role.name = 'notified person or organization' ))
                ) = 0
        )) = 0;

END_RULE;
```

```
(*
```

Argument definitions:

versioned_action_request: the set of all instances of **versioned_action_request**.

Formal propositions:

WR1: For each instance of **versioned_action_request** there shall be at least one instance of either **applied_date_and_person_assignment**, **applied_date_and_person_and_organization**, or **applied_date_and_organization** that contains the instance of **versioned_action_request** in its set of **items** and has a role with a **name** of 'notified person or organization'.

5.2.5 automotive_design function definitions

5.2.5.1 assembly_shape_is_defined

The **assembly_shape_is_defined** function accepts a **next_assembly_usage_occurrence** as input and returns a boolean result. The function will return TRUE if the shape is defined for the **product_definition** which is the **related_product_definition** and the shape is defined for the **product_definition** which is the **relating_product_definition** in the **next_assembly_usage_occurrence**, and the two shapes are related through a **shape_representation_relationship**, and the two relationships are related through **context_dependent_shape_representation**. The function will also return TRUE if the shape of the **related_product_definition** or the **relating_product_definition** is not defined.

The only time this function will return false is when the shapes are defined for the **related_product_definition** and the **relating_product_definition** and related through **shape_representation_relationship**, but the **next_assembly_usage_occurrence** and the **shape_representation_relationship** are not explicitly related through **context_dependent_shape_representation**.

NOTE – The definition of this function is identical to the definition in ISO 10303-203.

EXPRESS specification:

```
*)
FUNCTION assembly_shape_is_defined
  (assy: next_assembly_usage_occurrence) : BOOLEAN;
  LOCAL
        sdr_set : SET OF shape_definition_representation := [];
        srr_set : SET OF shape_representation_relationship := [];
  END_LOCAL;

  -- Gather all instances of shape_definition_representation where the
  -- component part has a representation defined for it.

  sdr_set := QUERY (pdr <* bag_to_set (USEDIN
```

```
            (assy.related_product_definition,
            'AUTOMOTIVE_DESIGN.PROPERTY_DEFINITION_REPRESENTATION.' +
            'DEFINITION.DEFINITION')) |
            'AUTOMOTIVE_DESIGN.SHAPE_DEFINITION_REPRESENTATION' IN
            TYPEOF (pdr)) +
            QUERY (pdr <* bag_to_set (
            USEDIN (assy.related_product_definition,
            'AUTOMOTIVE_DESIGN.' +
            'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION.' +
            'DEFINITION.RELATED_PRODUCT_DEFINITION')) |
            'AUTOMOTIVE_DESIGN.SHAPE_DEFINITION_REPRESENTATION' IN
            TYPEOF (pdr));

  -- If there is a representation defined for the component part

  IF SIZEOF (sdr_set) > 0 THEN

    -- For each representation of the shape of the component part gather all
    -- instances of shape_representation_relationship where the
    -- representation of component part is related to another representation.

            'AUTOMOTIVE_DESIGN.SHAPE_DEFINITION_REPRESENTATION'
            IN TYPEOF (pdr))) >= 1 THEN

            -- If the shape_representation_relationship and the product_-
            -- definition_relationship of each occurrence of the component
            -- and assembly relationship is not given via the
            -- context_dependent_shape_representation then return FALSE

            IF SIZEOF (QUERY (cdsr <*
              USEDIN (assy, 'AUTOMOTIVE_DESIGN.' +
              'CONTEXT_DEPENDENT_SHAPE_REPRESENTATION.' +
              'REPRESENTED_PRODUCT_RELATION') |
              NOT ((cdsr.represented_product_relation.definition :=: assy) AND
              (cdsr.representation_relation :=: srr_set[j]))) > 0
              THEN RETURN (FALSE);
            END_IF;
          END_IF;
        END_REPEAT;
      END_IF;
    END_REPEAT;
  END_IF;

  -- If the shape of the component is not specified or there are no
  -- violations then return TRUE

  RETURN (TRUE);
END_FUNCTION; -- assembly_shape_is_defined
(*
```

Argument definitions:

assy: The **assy** identifies the **next_assembly_usage_occurrence** for which the relationships are to be checked.

5.2.5.2 product_class_hierarchy

The **product_class_hierarchy** function returns the set of **product_class** instances that are related either directly or indirectly, i.e. transitively, to a given instance of **product_class** through instances of **product_concept_relationship** that have a **name** of 'hierarchy'.

EXPRESS specification:

```
*)
FUNCTION product_class_hierarchy
         (pc1 : product_class;
          pc  : SET OF product_class): SET OF product_class;
```

```
LOCAL
 i         : INTEGER;
 j         : INTEGER;
 pc_local  : SET OF product_class;
 pcr       : SET OF product_concept_relationship;
 temp      : SET OF product_class;
 new       : BOOLEAN;
END_LOCAL;

 pc_local := pc;

 pcr := USEDIN(pc1, 'AUTOMOTIVE_DESIGN.PRODUCT_CONCEPT_RELATIONSHIP.' +
                    'RELATING_PRODUCT_CONCEPT');
 pcr := pcr + USEDIN(pc1, 'AUTOMOTIVE_DESIGN.PRODUCT_CONCEPT_RELATIONSHIP.' +
                          'RELATED_PRODUCT_CONCEPT');
 IF SIZEOF(pcr) = 0 THEN
   RETURN(pc_local);
 END_IF;

 REPEAT i:=1 TO HIINDEX(pcr);
   IF pcr[i].name = 'class hierarchy' THEN
     new := TRUE;
     REPEAT j:=1 TO HIINDEX(pc_local);
       IF pcr[i].relating_product_concept :=: pc_local[j] THEN
          new := FALSE;
       END_IF;
     END_REPEAT;
     IF new THEN
       pc_local := pc_local + pcr[i].relating_product_concept;
       temp := product_class_hierarchy(pcr[i].relating_product_concept,pc_local);
       IF (SIZEOF(pc_local) < SIZEOF(temp)) THEN
         pc_local := temp;
       END_IF;
     END_IF;
     REPEAT j:=1 TO HIINDEX(pc_local);
       IF pcr[i].related_product_concept :=: pc_local[j] THEN
          new := FALSE;
       END_IF;
     END_REPEAT;
     IF new THEN
       pc_local := pc_local + pcr[i].related_product_concept;
       temp := product_class_hierarchy(pcr[i].related_product_concept,pc_local);
       IF (SIZEOF(pc_local) < SIZEOF(temp)) THEN
         pc_local := temp;
       END_IF;
     END_IF;
   END_IF;
 END_REPEAT;

 RETURN(pc_local);

END_FUNCTION;
```

```
(*
```

Argument definitions:

pc: The **pc** identifies the set of **product_class** instances that have been identified to be in the set of **product_class** instances directly or indirectly related to **pc1**. This is input to the function.

pc1: The **pc1** identifies the **product_class** for which the set of directly or indirectly related **product_class** instances is determined. This is input to the function.

5.2.5.3 using_representations

The function **using_representations** returns the set of **representation**s in which a **representation_item** is used.

A **representation_item** is used in a **representation** if it is:

a) referenced in the set of **items** of the **representation**; or

b) referenced by a **representation_item** used in the **representation**.

NOTE 1 – The second condition is a recursive check allowing for a **representation_item** to be used in a **representation** by being part of a tree of related **representation_item**s. The tree is rooted in an entity used in a **representation** by fulfilling the first condition.

NOTE 2 – The definition of this function is identical to the definition in ISO 10303-203.

EXPRESS specification:

```
*)
FUNCTION using_representations
  (item : representation_item)
  : SET OF representation;
  LOCAL
    results            : SET OF representation;
    result_bag         : BAG OF representation;
    intermediate_items : SET OF representation_item;
    i                  : INTEGER;
  END_LOCAL;

  -- Find the representations in which the item is used and add to the
  -- results set.

  result_bag := USEDIN(item,'AUTOMOTIVE_DESIGN.REPRESENTATION.ITEMS');

  IF SIZEOF(result_bag) > 0 THEN
    REPEAT i := 1 TO HIINDEX(result_bag);
      results := results + result_bag[i];
    END_REPEAT;
  END_IF;
```

```
  -- Find the set of representation_items in which item is used.

  intermediate_items := QUERY(z <* bag_to_set( USEDIN(item , '')) |
    'AUTOMOTIVE_DESIGN.REPRESENTATION_ITEM' IN TYPEOF(z));

  -- If the set of intermediate items is not empty;

  IF SIZEOF(intermediate_items) > 0 THEN

    -- For each element in the set, recursively add the
    -- using_representations of that element.

    REPEAT i := 1 TO HIINDEX(intermediate_items);
      results := results + using_representations(intermediate_items[i]);
    END_REPEAT;
  END_IF;

  -- Return the set of representation in which the input item is
  -- used directly and indirectly (through intervening representation_items).

  RETURN (results);
END_FUNCTION; -- using_representations
(*
```

Argument definitions:

item: the **representation_item** for which using **representation**s are determined. This is input to the function.

EXPRESS specification:

```
*)
END_SCHEMA;  -- automotive_design
(*
```

6 Conformance requirements

Conformance to this part of ISO 10303 includes satisfying the requirements stated in this part, the requirements of the implementation method(s) supported, and the relevant requirements of the normative references.

An implementation shall support at least one of the following implementation methods: ISO 10303-21, ISO 10303-22.

Requirements with respect to implementation methods-specific requirements are specified in annex C.

The Protocol Information Conformance Statement (PICS) proforma lists the options or the

combination of options that may be included in the implementation. The PICS proforma is provided in annex D.

NOTE 1 – An implementation using the method of ISO 10303–22 will make use of a specific language binding.

NOTE 2 – ISO 10303–314 defines the abstract test suite to be used in the assessment of conformance. ISO 10303–32 describes the conformance assessment process.

The conformance classes are specified using combinations of UoFs as given in tables 33, 34, 35, and 36.

NOTE 3 – Since the UoFs have interdependencies specified by the structure defined in clause 4, not every combination of UoFs is appropriate as a conformance class. There are also user requirements that restrict the allowed combinations of UoFs. Figure 66 shows the interdependencies of the UoFs.

Table 37 specifies for each conformance class the set of AIM elements that an implementation of the conformance class shall support.

NOTE 4 – Each of the following conformance classes, with the exception of CC18, makes use of a subset of the constructs specified in the AIM EXPRESS expanded listing given in annex A. The EXPRESS specifications of the conformance classes CC1 to CC17 are included in annex L in digital form.

NOTE 5 – There are totally 18 conformance classes defined for data exchange and sharing in the following application areas:

- conformance classes 1 to 5 for CAD/CAM;
- conformance classes 6 to 10 for product structure and configuration management;
- conformance classes 11 to 13 for process planning;
- conformance classes 14 and 15 for feature based design;
- conformance classes 16 and 17 for simulation and quality control;
- conformance class 18 for complete data storage and retrieval.

The conformance classes are characterized as follows:

6.1 Conformance Class for component design with 3D shape representation (CC1)

The scope of the CC1 is:

- geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;
- presentation data: geometric_presentation;
- product_structure data: product_management_data and element_structure.

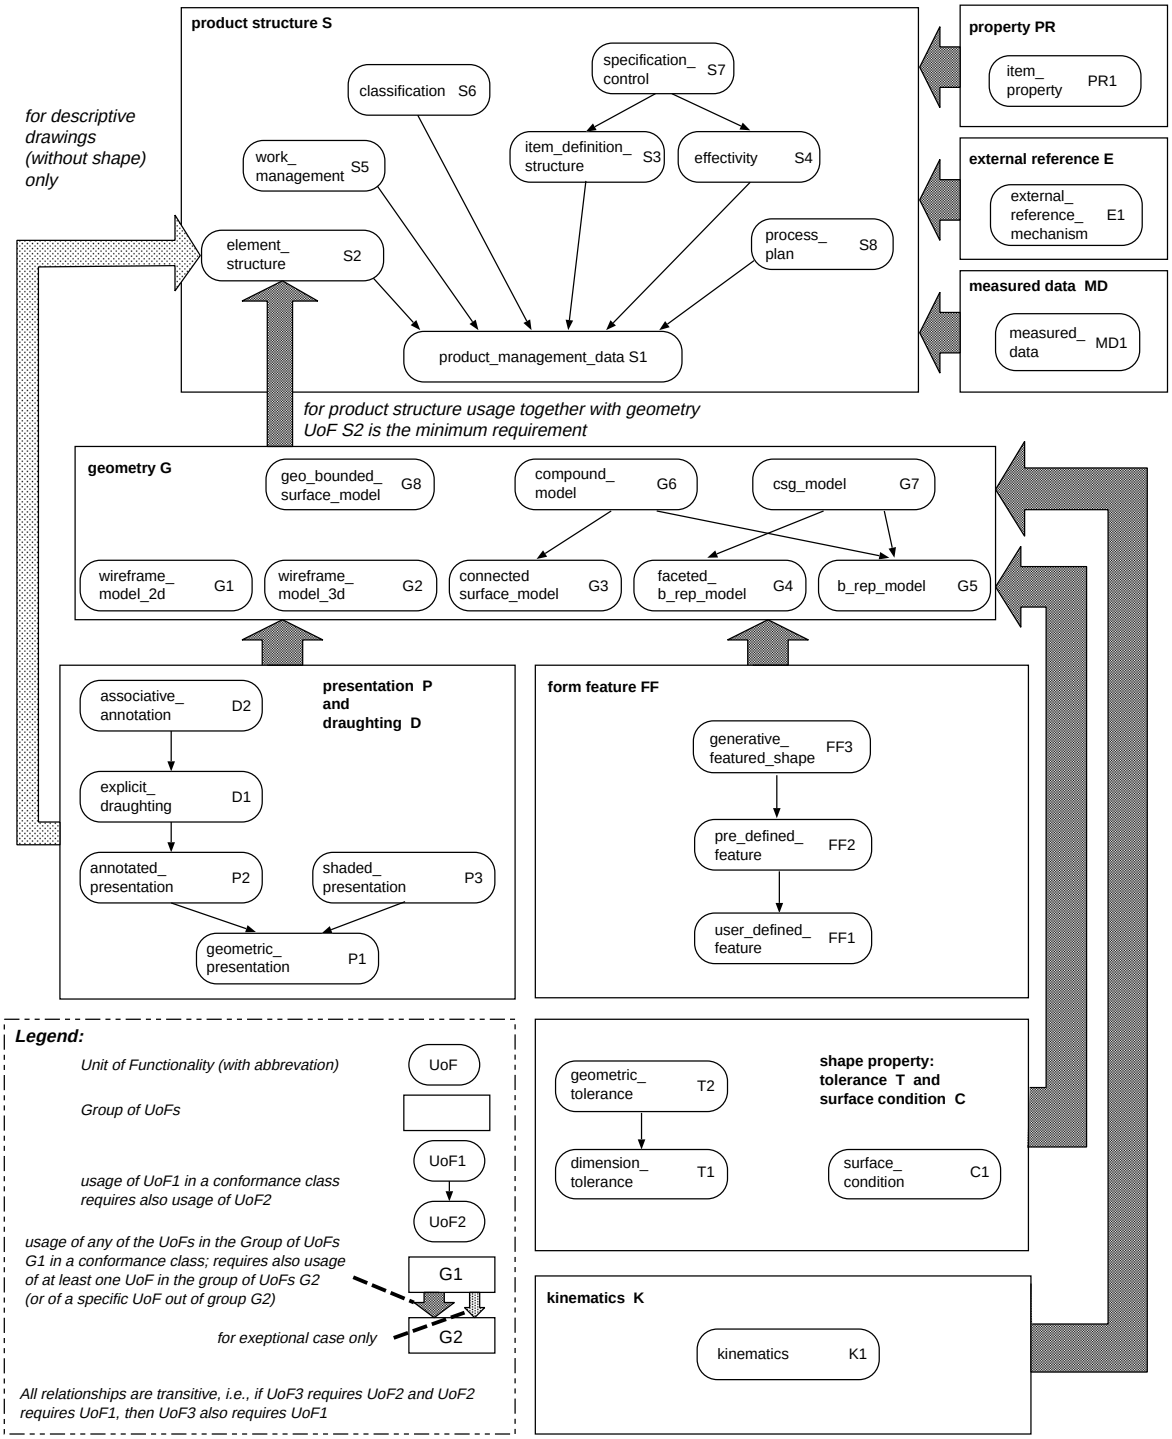

Figure 66 – Interdependencies between UoFs

NOTE 1 – This conformance class supports the following areas:

- component design of car body, power train, chassis, or interior parts;
- component design of tools.

NOTE 2 – This conformance class includes requirements that match those defined in the conformance classes 2, 4, 5, and 6 of ISO 10303–203, with the additional requirement for geometric_presentation (P1), csg_model (G7), and element_structure (S2). In the area of configuration_control information this conformance class requires product_management_data (S1), which is a subset of conformance class 1 of ISO 10303–203.

6.2 Conformance Class for assembly design with 3D shape representation (CC2)

The scope of the CC2 is:

- external_reference data;
- geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;
- presentation data: geometric_presentation;
- product_structure data: product_management_data, element_structure, and item_definition_structure.

NOTE 1 – This conformance class supports the following areas:

- conceptual design including assembly definitions;
- mountability examination;
- packaging layout.

NOTE 2 – This conformance class includes requirements that match those defined in the conformance classes 2, 4, 5, and 6 of ISO 10303–203, with the additional requirement for geometric_presentation (P1), csg_model (G7), element_structure (S2), and external_reference_mechanism (E1). In the area of configuration_control information this conformance class requires product_management_data (S1) and item_definition_structure (S3), which is a subset of conformance class 1 of ISO 10303–203.

NOTE 3 – This conformance class includes the requirements as defined for the conformance class 1 of this part of ISO 10303, with the additional requirement for item_definition_structure (S3) and external_reference_mechanism (E1).

6.3 Conformance Class for component drawings with wireframe or surface shape representation (CC3)

The scope of the CC3 is:

- draughting data: explicit_draughting;
- geometry data: wireframe_model_2d, wireframe_model_3d, and connected_surface_model;
- presentation data: geometric_presentation and annotated_presentation;
- product_structure data: product_management_data and element_structure.

NOTE 1 – This conformance class supports the following areas:

- component drawings or sketches for car body or some interior parts;
- component drawings or sketches for tools.

NOTE 2 – This conformance class includes requirements that match those defined in ISO 10303–201, with additional requirements for wireframe_model_3d (G2) and connected_surface_model (G3).

6.4 Conformance Class for assembly drawings with wireframe, surface or solid shape representation (CC4)

The scope of the CC4 is:

- draughting data: explicit_draughting and associative_annotation;
- external_reference data;
- geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;
- presentation data: geometric_presentation and annotated_presentation;
- product_structure data: product_management_data, element_structure, and item_definition_structure;
- tolerance data: dimension_tolerance.

NOTE 1 – This conformance class is suitable for use in the following areas:

- component or assembly drawings for power train, chassis, or interior parts;
- component or assembly drawings for tools.

NOTE 2 – This conformance class includes requirements that match those defined in the conformance classes 3, 5, 7, 9, and 10 of ISO 10303–202, with the additional requirement for item_definition_structure (S3), external_reference_mechanism (E1), and csg_model (G7).

NOTE 3 – This conformance class includes the requirements as defined for the conformance classes 2 and 3 of this part of ISO 10303.

6.5 Conformance Class for styling data (CC5)

The scope of the CC5 is:

- external_reference data;

- geometry data: connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

- presentation data: geometric_presentation, annotated_presentation, and shaded_presentation;

- product_structure data: product_management_data, element_structure, and item_definition_structure.

NOTE – This conformance class is suitable for use in the following areas:

- digital mockup;

- styling.

6.6 Conformance Class for product data management without shape representation (CC6)

The scope of the CC6 is:

- external_reference data;

- property data;

- product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, and classification.

NOTE 1 – This conformance class is suitable for use in the following areas:

- product data management systems that manage CAD models as files;

- administrative data of parts, assemblies, documents, and models.

NOTE 2 – This conformance class includes requirements that match those defined in the conformance class 1 of ISO 10303–203.

6.7 Conformance Class for product data management with 3D shape representation (CC7)

The scope of the CC7 is:

- external_reference data;

- geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;

– property data;

– presentation data: geometric_presentation;

– product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, and classification.

NOTE 1 – This conformance class supports the following areas:

– administrative data of parts, assemblies, documents, and models;

– conceptual design including assembly definitions;

– mountability examination;

– packaging layout;

– data exchange between product data management systems linked to CAD/CAM systems.

NOTE 2 – This conformance class includes requirements that match those defined in the conformance classes 1, 2, 4, 5, and 6 of ISO 10303–203, with the additional requirement for geometric_presentation (P1), csg_model (G7), element_structure (S2), and external_reference_mechanism (E1).

NOTE 3 – This conformance class includes the requirements as defined for the conformance classes 2 and 6 of this part of ISO 10303.

6.8 Conformance Class for configuration controlled design without shape representation (CC8)

The scope of the CC8 is:

– external_reference data;

– property data;

– product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, and specification_control.

NOTE – This conformance class is suitable for use in the following areas:

– configuration control for power train, chassis, car body, or interior parts;

– configuration control for tools.

NOTE 1 – This conformance class includes the requirements as defined for the conformance class 6 of this part of ISO 10303, with the additional requirement for specification_control (S7).

6.9 Conformance Class for configuration controlled design with 3D shape representation (CC9)

The scope of the CC9 is:

– external_reference data;

– geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;

– property data;

– presentation data: geometric_presentation;

– product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, and specification_control.

NOTE 1 – This conformance class supports the following areas:

– configuration control for power train, chassis, car body, or interior parts;

– configuration control for tools;

– administrative and configuration control data of parts, assemblies, documents, and models;

– product data management systems for control of a large number of product variants.

NOTE 2 – This conformance class includes requirements that match those defined in the conformance classes 1, 2, 4, 5, and 6 of ISO 10303–203, with the additional requirement for geometric_presentation (P1), csg_model (G7), element_structure (S2), external_reference_mechanism (E1), and specification_control (S7).

NOTE 3 – This conformance class includes the requirements as defined for the conformance classes 7 and 8 of this part of ISO 10303.

6.10 Conformance Class for configuration controlled design with shape representation and draughting data (CC10)

The scope of the CC10 is:

– draughting data: explicit_draughting and associative_annotation;

– external_reference data;

– geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, csg_model, and geometrically_bounded_surface_model;

– property data;

– presentation data: geometric_presentation and annotated_presentation;

– product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, work_management, classification, and specification_control;

– tolerance data: dimension_tolerance.

NOTE 1 – This conformance class supports the following areas:

– configuration control and assembly drawings for power train, chassis, car body, or interior parts;

– configuration control and assembly drawings for tools;

– administrative and configuration control data of parts, assemblies, documents, and models;

– product data management systems for control of a large number of product variants with links to CAD/CAM systems.

NOTE 2 – This conformance class includes the requirements as defined for the conformance classes 4 and 9 of this part of ISO 10303.

6.11 Conformance Class for process planning of components (CC11)

The scope of the CC11 is:

– draughting data: explicit_draughting and associative_annotation;

– external_reference data;

– geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, compound_model, and csg_model;

– measured_data;

– property data;

– presentation data: geometric_presentation and annotated_presentation;

– product_structure data: product_management_data, element_structure, classification, and process_plan.

NOTE 1 – This conformance class supports process planning for components (piece parts) with shape and draughting data.

NOTE 2 – This conformance class includes the requirements as defined for the conformance class 1 of this part of ISO 10303, without the requirement for geometrically_bounded_surface_model (G8), and the conformance class 3 of this part of ISO 10303.

6.12 Conformance Class for process planning of components with form feature and tolerance data (CC12)

The scope of the CC12 is:

– surface_condition data;

– draughting data: explicit_draughting and associative_annotation;

– external_reference data;

– form_features data: user_defined_feature, included_feature, and generative_featured_shape;

– geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_-b_rep_model, b_rep_model, compound_model, and csg_model;

– measured_data;

– property data;

– presentation data: geometric_presentation and annotated_presentation;

– product_structure data: product_management_data, element_structure, classification, and process_plan;

– tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 – This conformance class supports process planning data for components (piece parts) with shape, draughting, form_feature, tolerance, and surface_condition data.

NOTE 2 – This conformance class includes the requirements as defined for the conformance class 11 of this part of ISO 10303, with the additional requirement for user_defined_feature (FF1), pre_-defined_feature (FF2), generative_featured_shape (FF3), surface_condition (C1), dimension_tolerance (T1), and geometric_tolerance (T2).

6.13 Conformance Class for effectivity controlled process planning of assemblies (CC13)

The scope of the CC13 is:

– surface_condition data;

– draughting data: explicit_draughting and associative_annotation;

– external_reference data;

– form_features data: user_defined_feature, included_feature, and generative_featured_shape;

– geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_-b_rep_model, b_rep_model, compound_model, and csg_model;

– measured_data;

– property data;

– presentation data: geometric_presentation and annotated_presentation;

– product_structure data: product_management_data, element_structure, item_definition_structure, effectivity, classification, and process_plan;

– tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 – This conformance class supports process planning with effectivity control for assemblies with shape, draughting, form_feature, tolerance, and surface_condition data.

NOTE 2 – This conformance class includes the requirements as defined for the conformance class 12 of this part of ISO 10303, with the additional requirement for item_definition_structure (S3) and effectivity (S4).

6.14 Conformance Class for feature based design (CC14)

The scope of the CC14 is:

– surface_condition data;

– external_reference data;

– form_features data: user_defined_feature and included_feature;

– geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, and csg_model;

– property data;

– presentation data: geometric_presentation;

– product_structure data: product_management_data, element_structure, and item_definition_structure;

– tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 – This conformance class supports the following areas:

– feature based conceptual design for components and assemblies, including manufacturing information such as tolerance and surface_condition data;

– feature based mountability examination.

NOTE 2 – This conformance class allows for identification of form features on the final shape of a component or of an assembly.

NOTE 3 – This conformance class includes requirements that match those defined in ISO 10303–224, with the additional requirement for geometric_presentation (P1), wireframe_model_3d (G2), connected_surface_model (G3), faceted_b_rep_model (G4), csg_model (G7), external_reference_mechanism (E1), and surface_condition (C1).

NOTE 4 – This conformance class includes the requirements as defined for the conformance class 2 of this part of ISO 10303, without the requirement for geometrically_bounded_surface_model (G8) and with the additional requirement for user_defined_feature (FF1), pre_defined_feature (FF2), item_property (PR1), surface_condition (C1), dimension_tolerance (T1), and geometric_tolerance (T2).

6.15 Conformance Class for feature based design with flexible feature placement (CC15)

The scope of the CC15 is:

- surface_condition data;
- external_reference data;
- form_features data: user_defined_feature, included_feature, and generative_featured_shape;
- geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, and csg_model;
- property data;
- presentation data: geometric_presentation;
- product_structure data: product_management_data, element_structure, and item_definition_structure;
- tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 – This conformance class supports the following areas:

- feature based conceptual design for components and assemblies, supporting efficient design changes through flexible feature placement;
- feature based mountability examination.

NOTE 2 – This conformance class allows for an independent feature definition, e.g. in a feature library, and its usage through placement on the shape of a component or of an assembly.

NOTE 3 – This conformance class includes the requirements as defined for the conformance class 14 of this part of ISO 10303, with the additional requirement for generative_featured_shape (FF3).

6.16 Conformance Class for kinematic simulations for components and assemblies with 3d shape representation (CC16)

The scope of the CC16 is:

- external_reference data;
- geometry data: wireframe_model_3d, connected_surface_model, faceted_b_rep_model, b_rep_model, and csg_model;
- kinematics data;

- property data;
- presentation data: geometric_presentation;
- product_structure data: product_management_data, element_structure, and item_definition_structure.

NOTE 1 – This conformance class supports the following areas:

- collision detection;
- support of kinematics modules of CAD systems.

NOTE 2 – This conformance class includes the requirements as defined for the conformance class 2 of this part of ISO 10303, without the requirement for geometrically_bounded_surface_model (G8) and with the additional requirement for kinematics (K1) and item_property (PR1).

6.17 Conformance Class for measured data (CC17)

The scope of the CC17 is:

- external_reference data;
- geometry data: wireframe_model_3d;
- measured_data;
- property data;
- presentation data: geometric_presentation;
- product_structure data: product_management_data and element_structure.

NOTE – This conformance class supports the following areas:

- exchange of scanned (measured) data from a measuring system to a CAD/CAM system;
- quality control.

6.18 Conformance Class for data storage and retrieval systems (CC18)

The scope of the CC18 is:

- surface_condition data;
- draughting data: explicit_draughting and associative_annotation;
- external_reference data;

– form_features data: user_defined_feature, included_feature, and generative_featured_shape;

– geometry data: wireframe_model_2d, wireframe_model_3d, connected_surface_model, faceted_-b_rep_model, b_rep_model, compound_model, csg_model, and geometrically_bounded_surface_-model;

– kinematics data;

– measured_data;

– property data;

– presentation data: geometric_presentation, annotated_presentation, and shaded_presentation;

– product_structure data: product_management_data, element_structure, item_definition_-structure, effectivity, work_management, classification, specification_control, and process_-plan;

– tolerance data: dimension_tolerance and geometric_tolerance.

NOTE 1 – This conformance class supports database implementations to store, retrieve, or archive all of the data specified in this part of ISO 10303. Data manipulation functionality as performed in application systems is not expected to be implemented within the scope of this conformance class.

NOTE 2 – This conformance class includes all requirements as defined for the conformance classes 1 to 17 of this part of ISO 10303.

Table 33 – Usage of UoFs in Conformance Classes CC1-CC5 for CAD/CAM data exchange and sharing

AIM short names

Table B.1 provides the short names of entities specified in the AIM of this part of ISO 10303. Requirements on the use of the short names are found in the implementation methods included in ISO 10303.

Table B.1 – AIM short names

Entity names	Short names
ACTION	ACTION
ACTION_ASSIGNMENT	ACTASS
ACTION_DIRECTIVE	ACTDRC
ACTION_METHOD	ACTMTH
ACTION_PROPERTY	ACTPRP
ACTION_PROPERTY_REPRESENTATION	ACPRRP
ACTION_RELATIONSHIP	ACTRLT
ACTION_REQUEST_ASSIGNMENT	ACRQAS
ACTION_REQUEST_ROLE	ACRQRL
ACTION_REQUEST_SOLUTION	ACRQSL
ACTION_REQUEST_STATUS	ACRQST
ACTION_RESOURCE	ACTRSR
ACTION_RESOURCE_REQUIREMENT	ACRSRQ
ACTION_RESOURCE_TYPE	ACRSTY
ACTION_ROLE	ACTRL
ACTION_STATUS	ACTSTT
ADDRESS	ADDRSS
ADVANCED_BREP_SHAPE_REPRESENTATION	ABSR
ADVANCED_FACE	ADVFC
ALTERNATE_PRODUCT_RELATIONSHIP	ALPRRL

Annex C
(normative)
Implementation method-specific requirements

The implementation method defines what types of exchange behaviour are required with respect to this part of ISO 10303. Conformance to this part of ISO 10303 shall be realized in one or more implementation methods.

C.1 Requirements specific to the implementation method defined in ISO 10303–21

For an exchange structure, the file format shall be encoded according to the syntax and EXPRESS language mapping defined in ISO 10303–21 and the AIM defined in annex A of this part of ISO 10303. The header of the exchange structure shall identify use of this part of ISO 10303 by the schema name 'automotive_design' and include the object information identifier (see annex E).

The exchange structure shall not make use of the SCOPE construct (see clause 10.3 of ISO 10303–21).

Annex D
(normative)

Protocol Implementation Conformance Statement (PICS) proforma

The Protocol Implementation Conformance Statement (PICS) proforma is supplied for completion by the person or organization (the client) requesting conformance testing. Its purpose is to ascertain the scope of claimed conformance to a particular application protocol by an implementation under test (IUT) using a defined implementation method. Through the completion of this form, the PICS proforma becomes a PICS.

The information contained in the PICS is used to configure an appropriate executable test suite for use by the client.

NOTE 1 – The framework for conformance testing is given in ISO 10303–31 (Conformance testing methodology and framework: General concepts) and ISO 10303–32 (Conformance testing methodology and framework: Requirements on testing laboratories and clients). See clause 6 of this part of ISO 10303 for the conformance requirements. Refer to ISO 10303–314 (Abstract test suite: Core data for automotive mechanical design processes) for the test purposes and test cases relevant for the conformance testing of an ISO 10303–214 implementation.

The PICS proforma lists all allowed implementation options (conformance classes) and asks further questions about the implementation. These questions are related to limits of the implementation and the handling of specific situations.

The first part of the PICS proforma asks for a brief summary of the implementation's capabilities. Further parts are provided to handle the different conformance classes in more detail.

These additional parts are grouped by UoF. For each UoF, a set of application objects is identified for which additional information on their implementation is required for conformance testing. The application objects are presented in the form of a table, in which specific implementation properties are listed. The majority of questions relate to the upper limit of aggregations for attributes where no upper limits are defined in clause 4, but where in practice an upper limit is expected to be defined by an implementation. For the preprocessor, questions relate to whether an upper limit of aggregates of the specified attribute exists in the output of the implementation. For the postprocessor side, the question is whether the implementation is incapable of processing input data exceeding a fixed limit.

NOTE 2 – In cases where this limit is dependent on the underlying hardware (e.g., the amount of memory available to the process), this fact is to be described as well.

Other questions relate to the support of optional attributes, i.e., whether a preprocessor implementation will omit these attributes, or whether a postprocessor will make use of this optional information. A third group of questions is related to very specific situations, e.g., the processing of certain kinds of surface geometry, or the nesting depth for assembly structures.

With each UoF, the set of conformance classes is identified which enclose the UoF, allowing the implementor to identify the relevant tables to be filled out within the PICS.

D.1 General conformance statements

D.1.1 Protocol implementation identification

ISO 10303–214 implementation name: .....

Current version and release date: .....

D.1.2 Implementation method

Indicate the chosen implementation method and supported directions of translation.

If more than one implementation method is supported, a separate PICS proforma is to be filled out for each of them.

	ISO 10303–21	**ISO 10303–22**
Preprocessor		
Postprocessor		

D.1.3 Implemented conformance classes

NOTE – An implementation may support more than one conformance class.

D.2 Conformance statements for UoF C1

If conformance to class CC12, CC13, CC14, CC15, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Default_setting_–association	upper limit for default_value		
Hardness	upper limit for environment_condition		
Surface_condition	upper limit for is_applied_to		

D.3 Conformance statements for UoF D1

If conformance to class CC3, CC4, CC10, CC11, CC12, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Dimension	upper limit for composition_curve		
Drawing	upper limit for language upper limit for drawing_specification upper limit for drawing_type		

D.4 Conformance statements for UoF D2

If conformance to class CC4, CC10, CC11, CC12, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Associated_annotation_–symbol	upper limit for is_associated_to		
Associated_fill_area	upper limit for is_derived_from		

D.5 Conformance statements for UoF E1

If conformance to class CC2, CC4, CC5, CC6, CC7, CC8, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, CC17, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Archived_document	supported		
External_document	upper limit for language		
Physical_model	supported		

D.6 Conformance statements for UoF FF1

If conformance to class CC12, CC13, CC14, CC15, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
General_compound_feature	upper limit for elements		
General_feature	upper limit for feature_parameter		

D.7 Conformance statements for UoF FF2

If conformance to class CC12, CC13, CC14, CC15, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Circular_pattern	upper limit for relocated_feature upper limit for missing_feature		
Compound_feature_in_panel	upper limit for element		
Compound_feature_in_solid	upper limit for element		
Default_setting_–association	upper limit for default_value		
General_pattern	upper limit for added_instance		
Rectangular_pattern	upper limit for relocated_feature upper limit for missing_feature		

D.8 Conformance statements for UoF G1

If conformance to class CC3, CC4, CC10, CC11, CC12, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Curve_set_2d	upper limit for element		
Geometric_model	upper limit for additional_elements		
Wireframe_model_2d	upper limit for element		

D.9 Conformance statements for UoF G2

If conformance to class CC1, CC2, CC3, CC4, CC7, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, CC17, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Curve_set_3d	upper limit for element		
Geometric_model	upper limit for additional_elements		
Hybrid_geometric_model_3d	upper limit for element		
Wireframe_model_3d	upper limit for element		

D.10 Conformance statements for UoF G3

If conformance to class CC1, CC2, CC3, CC4, CC5, CC7, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Edge_loop	upper limit for edge		
Face	support of Faces with no explicit outer bound support of Faces on non-GC_1 surfaces required numerical accuracy support of Faces across seam of closed surfaces upper limit for bound		
Geometric_model	upper limit for additional_elements		
Hybrid_geometric_model_3d	upper limit for element		
Shell	upper limit for face		
Surface_model	upper limit for element		

D.11 Conformance statements for UoF G4

If conformance to class CC1, CC2, CC4, CC5, CC7, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Faceted_b_rep	upper limit for void		
Faceted_b_rep_model	upper limit for element		
Faceted_closed_shell	upper limit for shell_boundary		
Faceted_face	upper limit for bound		
Geometric_model	upper limit for additional_elements		
Hybrid_geometric_model_3d	upper limit for element		
Poly_loop	upper limit for polygon upper limit for is_bound_for		

D.12 Conformance statements for UoF G5

If conformance to class CC1, CC2, CC4, CC5, CC7, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
B_rep	upper limit for void		
B_rep_model	upper limit for element		
Closed_shell	upper limit for shell_boundary		
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Edge_loop	upper limit for edge		
Face	support of Faces with no explicit outer bound support of Faces on non-GC_1 surfaces required numerical accuracy support of Faces across seam of closed surfaces upper limit for bound		
Geometric_model	upper limit for additional_elements		
Hybrid_geometric_model_3d	upper limit for element		

D.13 Conformance statements for UoF G6

If conformance to class CC5, CC11, CC12, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Compound_model	upper limit for element		
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Edge_loop	upper limit for edge		
Face	support of Faces with no explicit outer bound support of Faces on non-GC_1 surfaces required numerical accuracy support of Faces across seam of closed surfaces upper limit for bound		
Geometric_model	upper limit for additional_elements		
Hybrid_geometric_model_3d	upper limit for element		
Topologically_–connected_set	upper limit for element		

D.14 Conformance statements for UoF G7

If conformance to class CC1, CC2, CC4, CC5, CC7, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
B_rep	upper limit for void		
B_rep_model	upper limit for element		
Closed_shell	upper limit for shell_boundary		
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Csg_model	upper limit for tree_root_expression		
Edge_loop	upper limit for edge		
Face	support of Faces with no explicit outer bound support of Faces on non-GC_1 surfaces required numerical accuracy support of Faces across seam of closed surfaces upper limit for bound		
Faceted_b_rep	upper limit for void		
Faceted_b_rep_model	upper limit for element		
Faceted_closed_shell	upper limit for shell_boundary		
Faceted_face	upper limit for bound		
Geometric_model	upper limit for additional_elements		
Hybrid_geometric_model_3d	upper limit for element		
Poly_loop	upper limit for polygon upper limit for is_bound_for		

D.15 Conformance statements for UoF G8

If conformance to class CC1, CC2, CC4, CC7, CC9, CC10, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Constructive_geometric_–element	upper limit for geometry		
Constructive_geometry	upper limit for element upper limit for associated_model		
Geometric_model	upper limit for additional_elements		
Geometric_set_3d	upper limit for element		
Geometrically_bounded_–surface_model	upper limit for element		

D.16 Conformance statements for UoF K1

If conformance to class CC16 or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Ground_representation	upper limit for is_referenced_by		
Initial_configuration	upper limit for initial_pair_values		
Interpolated_configuration_–sequence	upper limit for interpolation		
Kinematic_configuration_–definition	upper limit for pair_values		
Kinematic_joint	upper limit for is_referenced_by		
Kinematic_link_–representation	upper limit for additional_reference_frame		
Kinematic_mechanism	upper limit for is_referenced_by		
Kinematic_structure	upper limit for joint upper limit for is_referenced_by		
Kinematic_transformation_–result	upper limit for result		
Simulation_information	upper limit for mechanism upper limit for described_object		

D.17 Conformance statements for UoF MD1

If conformance to class CC11, CC12, CC13, CC17, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Point_direction_model	upper limit for point_direction upper limit for point		
Point_direction_sequence	upper limit for element		
Point_sequence	upper limit for element		

D.18 Conformance statements for UoF PR1

If conformance to class CC6, CC7, CC8, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, CC17, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Default_setting_–association	upper limit for default_value		
General_item_property	upper limit for property_value		
Item_cost_property	upper limit for cost_property_value		
Item_quality_property	upper limit for quality_property_value		
Mass	upper limit for mass_property_value		
Material	upper limit for material_property		
Material_property	upper limit for material_property_value		
Material_property_–representation	upper limit for property_value		
Property_change	upper limit for added_property upper limit for deleted_property		
Recyclability	upper limit for recycling_class_value		
Thickness	upper limit for thickness_value		

D.19 Conformance statements for UoF P1

If conformance to class CC1, CC2, CC3, CC4, CC5, CC7, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, CC17, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Appearance_assignment	upper limit for component		
Styled_model	upper limit for element upper limit for additional_elements		
Surface_appearance	upper limit for element		

D.20 Conformance statements for UoF P2

If conformance to class CC3, CC4, CC5, CC10, CC11, CC12, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Fill_area	upper limit for boundary		

D.21 Conformance statements for UoF P3

If conformance to class CC5 or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Hidden_element_handling	upper limit for is_defined_for		
Light_source	upper limit for view		
Surface_appearance	upper limit for element		

D.22 Conformance statements for UoF S1

If conformance to class CC1, CC2, CC3, CC4, CC5, CC6, CC7, CC8, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, CC17, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Approval	upper limit for is_applied_to upper limit for is_approved_by		
Design_discipline_–item_definition	upper limit for is_relevant_for		
Item	upper limit for associated_version		
Item_classification	upper limit for associated_item		
Multi_language_string	upper limit for language_dependent_string		
Person	upper limit for organization		
Security_classification	upper limit for is_applied_to		

D.23 Conformance statements for UoF S2

If conformance to class CC1, CC2, CC3, CC4, CC5, CC6, CC7, CC8, CC9, CC10, CC11, CC12, CC13, CC14, CC15, CC16, CC17, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Accuracy	upper limit for is_defined_for		
Cartesian_coordinate_space	upper limit for unit		
Group	upper limit for element		
Layer	upper limit for element		
Model_change	upper limit for added_element upper limit for deleted_element		

D.24 Conformance statements for UoF S3

If conformance to class CC2, CC4, CC5, CC6, CC7, CC8, CC9, CC10, CC13, CC14, CC15, CC16, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Next_higher_assembly	supported		
Promissory_usage	supported		

D.25 Conformance statements for UoF S4

If conformance to class CC6, CC7, CC8, CC9, CC10, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Effectivity	upper limit for is_applied_to		
Retention_period	upper limit for is_applied_to		

D.26 Conformance statements for UoF S5

If conformance to class CC6, CC7, CC8, CC9, CC10, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Activity	upper limit for resolved_request upper limit for concerned_organization upper limit for supplying_organization upper limit for authorization upper limit for associated_project		
Change	upper limit for described_change		
Contract	upper limit for contracted_element upper limit for release		
Organization_in_contract	upper limit for signature upper limit for contract		
Project	upper limit for affected_product_class upper limit for work_program		
Simultaneous_activity	upper limit for element		
Work_order	upper limit for is_controlling		
Work_request	upper limit for recommended_method upper limit for notified_person upper limit for scope		

D.27 Conformance statements for UoF S6

If conformance to class CC6, CC7, CC8, CC9, CC10, CC11, CC12, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Classification_attribute	upper limit for attribute_value upper limit for associated_classification		
Classification_system	upper limit for allowed_class		
General_classification	upper limit for attribute		
Item_classification	upper limit for associated_item		

D.28 Conformance statements for UoF S7

If conformance to class CC8, CC9, CC10, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Collection_definition	upper limit for collected_items		
Design_constraint	upper limit for is_valid_for		
Final_item_solution	upper limit for final_specification		
Product_component	upper limit for is_influenced_by upper limit for is_relevant_for upper limit for is_root_entry_for		
Product_function	upper limit for is_relevant_for		
Product_specification	upper limit for specification		
Specification_expression	upper limit for operand		
Specified_higher_usage	supported		

D.29 Conformance statements for UoF S8

If conformance to class CC11, CC12, CC13, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Exclusive_process_–operation	upper limit for element		
General_process_property	upper limit for property_value		
Mated_item_relationship	upper limit for mating_material		
Mating_definition	upper limit for mated_items		
Process_cost_property	upper limit for cost_property_value		
Process_operation_–input_or_output	upper limit for concerned_shape		
Process_plan	upper limit for produced_output		
Process_quality_property	upper limit for quality_property_value		
Simultaneous_process_–operation	upper limit for element		

D.30 Conformance statements for UoF T1

If conformance to class CC4, CC10, CC12, CC13, CC14, CC15, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Default_setting_–association	upper limit for default_value		
Derived_geometry	upper limit for is_derived_from		
General_tolerance_table	upper limit for cell		

D.31 Conformance statements for UoF T2

If conformance to class CC12, CC13, CC14, CC15, or CC18 is claimed, then identify the implementation's properties with the following application objects:

Application object	Property	Preproc.	Postproc.
Compound_datum	upper limit for is_made_up_by		
Datum_target_set	upper limit for target		
Derived_geometry	upper limit for is_derived_from		
Tolerance_zone	upper limit for is_zone_for upper limit for created_by		

Annex E
(normative)
Information object registration

E.1 Document identification

To provide for unambiguous identification of an information object in an open system, the object identifier

{ iso standard 10303 part(214) version(-2) }

is assigned to this part of ISO 10303. The meaning of this value is defined in ISO/IEC 8824-1, and is described in ISO 10303-1.

E.2 Schema identification

To provide for unambiguous identification of the **automotive_design** expanded schema in an open information system, the object identifier

{ iso standard 10303 part(214) version(-2) object(1) automotive-design(1) }

is assigned to the **automotive_design** expanded schema schema (see annex A). The meaning of this value is defined in ISO/IEC 8824-1, and is described in ISO 10303-1.

To provide for unambiguous identification of the **automotive_design** short form schema in an open information system, the object identifier

{ iso standard 10303 part(214) version(-2) object(1) automotive-design(2) }

is assigned to the **automotive_design** short form schema schema (see 5.2). The meaning of this value is defined in ISO/IEC 8824-1, and is described in ISO 10303-1.

Annex F
(informative)
Application activity model

The application activity model (AAM) is provided as an aid in understanding the scope and information requirements defined in this application protocol. The model is presented as a set of activity figures that contain the activity diagrams and a set of definitions of the activities and their data.

The AAM covers activities that go beyond the scope of this application protocol. The viewpoint of the application activity model is that of a car developer.

F.1 Application activity model definitions and abbreviations

The following terms are used in the application activity model. Terms marked with an asterisk are outside the scope of this application protocol.

The definitions given in this annex do not supersede the definitions given in the main body of the text.

F.1.1 aesthetics: Aspects of beauty, taste, and style that influence the design of a product.

F.1.2 CAD system: Computer hardware and software that supports the computer aided design of products by providing functions for defining the geometry (2D or 3D) and technological properties.

F.1.3 calculation system: Computer hardware and software that supports the determination and optimization of certain properties of the product such as strength of material.

F.1.4 car surface data: Data describing the 3D shape of the car body.

F.1.5 change request: A request for a change in a product specification in one phase of the development process generated from a different phase of the development process.

F.1.6 characteristic sections: Properties of material such as modulus of elasticity.

F.1.7 concept: Elaborated idea of a product developed on the basis of requirements based on a list of specifications.

F.1.8 conceptual product description: Preliminary geometrical description of major components of the car such as overall length, wheelbase, and gross weight.

F.1.9 constraints: Restrictions that have to be followed in order to achieve feasible results in design, simulation, or analysis.

F.1.10 corporation product strategy: The company's program for bringing the new product to market, such as advertising.

F.1.11 costs: Financial targets set by the company for developing the product or financial charges which result from product development.

F.1.12 crash test: Procedure of testing safety and behaviour of a car in the case of an accident by crashing it at a barrier or another vehicle.

F.1.13 create layout: Develop a rough packaging layout for the car as a whole including the definition of all major dimensions.

F.1.14 create physical model: Model the car body and certain components, such as wheels and instrument panel, out of wood or other material.

F.1.15 define product: Specify the essential properties of the car in the form of specification lists that is based on the given conditions such as market conditions.

F.1.16 design product: Process of defining functionality, geometry, and technological properties of the product including conceptual, preliminary, and detailed design as well as calculation.

F.1.17 design tool: Process of defining functionality, geometry and technological properties of a tool on the basis of the part description and of the production planning output.

F.1.18 develop concept: Process of elaborating initial ideas on the basis of specification lists into a detailed concept including discussions of new technologies and functional aspects of the product, possible materials and production processes.

F.1.19 develop conceptual design: Process of checking the technical concept including the design and redesign of the major parts of the car.

F.1.20 develop methods: Specification of manufacturing methods and tool properties including an initial design of the tool on the basis of production planning data and of the part description.

F.1.21 develop part design: Detailed design of the product geometry which may be the initial design or an optimization process.

F.1.22 develop product: Process of product development including definition, styling, design and evaluation of the car.

F.1.23 develop tool: Process of development of the tools needed for the production of the car; i.e. for production planning, tool design, tool manufacturing, quality control, etc.

F.1.24 develop tool design and perform analysis: Verification of the developed methods by calculations and simulations resulting in detailed descriptions of the tool geometry and of its assembly structure.

F.1.25 due dates: Deadlines defined in schedules which have to be met in the various phases of the development of the product.

F.1.26 ergonomic dummy: Physical model of a human being that is used to test the ergonomic properties of the car, such as seat, steering, and switches position.

F.1.27 ergonomics: Constraints based on the mental and physical capacities of persons.

F.1.28 evaluate product: Process of specifying, executing, and verifying tests for a prototype of a constituent or for the whole car.

F.1.29 experiences: Knowledge of developers obtained during previous product developments.

F.1.30 given quality: Requirements concerning quality set up by the company, by authorized inspection departments, or by government.

F.1.31 interpret tests: Process of generating test reports and drawing conclusions out of the test results.

F.1.32 layout description: Packaging layout of the whole car including all major dimensions.

F.1.33 load rating: Designation of an operating limit for loading used in calculation systems.

F.1.34 long term production plan: Plan of a company concerning production set up for a long period of time for aspects of manufacturing, assembling, quality assurance, and recycling including outsourcing considerations.

F.1.35 manufacture production tools: Provision of the tools which are necessary for producing the car, including NC programming and simulation.

F.1.36 manufacture prototype: Process of producing a physical prototype or a simulation model of the car or of parts of it according to a prototype specification using for example stereolithography systems.

F.1.37 manufacture tool: Process of manufacturing the tools needed for the car production, such as deep drawing dies, trimming dies, or injection moulds, using various manufacturing technologies such as milling, lathing, drilling, or laser cutting, that may be numerically controlled.

F.1.38 manufacturing equipment: Machines and tools that can be used to manufacture a product or constituents.

F.1.39 mass: Quantity of matter a body contains.

F.1.40 mass production timing: Scheduling of the distribution of tools needed for manufacturing processes and assembly lines in order to ensure just-in-time availability.

F.1.41 material description: Identification of materials and description of their properties, such as strength or endurance.

F.1.42 measured data and measurement protocols: Data obtained by 3D scanning of manufactured tools using measurement tools.

F.1.43 measurement programs: Sequences of test procedures set up to assure quality of tools and products.

F.1.44 measuring gauges: Measuring instruments having defined deviations from the nominal values for testing tolerances of dimension or shape, such as diameters of holes.

F.1.45 measuring machines: Machines that provide data about an object by measuring its properties.

F.1.46 measuring systems: Measuring machines connected to an CA-System.

F.1.47 methods plan: Technical drawing including the description of operations necessary to manufacture the part.

F.1.48 mountability: Degree of difficulty in assembling objects.

F.1.49 NC data packages: Information necessary for the NC operator to produce the part. This includes documents sent to the shop floor specifying machine setup, part loading, or tooling.

F.1.50 NC/RC programs: Sequences of statements for controlling NC machines and robots. NC/RC programs may conform with international or national standards.

F.1.51 optical impression: Effect produced in the mind of an observer at the sight of an object.

F.1.52 overall conception: Sum of abstract ideas concerning all involved aspects.

F.1.53 packaging layout system: Computer hardware and software that supports the generation of packacking layouts. A packaging layout is a plan for the arrangement of components forming a car or a part of it; this layout can exist at different levels of detail and serves the determination of an optimum solution with respect to space and ergonomics.

F.1.54 part description: Set of data or documents providing information on geometrical, functional, and technological properties of a part.

F.1.55 PDM system: Computer hardware and software that supports the computer aided management of product data by providing functions for handling regular or variational bill-of-materials and that support engineering processes such as release or change processes.

F.1.56 perform calculations: Determination of the properties and expected behaviour of the car and of its constituents using various methods, such as FEA, vibrational behaviour analysis, or strength examination in order to optimize material and dimensions and to check safety criteria.

F.1.57 plan production: Process of generating a plan for the manufacturing process of a product, including the sequence of operations.

F.1.58 plan tests: Preparation of tests including the specification of prototypes and the selection of test methods, facilities, and evaluation systems.

F.1.59 planning systems: Software tools used to organize the production process of products including the creation of process plans and the determination of manufacturing sequences.

F.1.60 preconditions: Necessary or required conditions.

F.1.61 preliminary designed components (patents): Components usable within several types of cars which are designed in a universal form and which can easily be adapted to new products in order to meet the specific requirements of a particular product (e.g., the patent of a turbo charger which can be adapted to suit a particular engine).

F.1.62 product description: All data needed to describe a product completely, including geometrical information of the shape and technological information, such as material, tolerances, and surface conditions.

F.1.63 production and assembly sequences: Results of the production planning stage laid down in process plans that specify how and in which order parts have to be manufactured and assembled.

F.1.64 production control data: Information about the production process, such as utilization rate of machines.

F.1.65 production know-how: Knowledge of how to produce something.

F.1.66 production order: Arrangement of the production process defining the way one production operation follows another.

F.1.67 program and simulate NC/RC: Generation of tool pathing using CAM systems including the definition of the NC milling strategy and the selection of milling cutters, collision detection, and simulation of the manufacturing process.

F.1.68 prototype: A model or pattern from which subsequent copies are made, or improved specimens are developed.

F.1.69 raw material: Crude unprocessed or partially processed material used as a feedstock for a processing operation.

F.1.70 RC programming system: Programming systems used to create robot control data.

F.1.71 regulations: Rules, such as special working conditions, that are set up by the government or by companies influenced by public opinion, such as aspects of environmental protection.

F.1.72 results of calculation: Values that ensue from a calculation.

F.1.73 security aspects: Conditions that define protection for persons and objects.

F.1.74 simulation systems: Systems that mimic some or all of the behaviour of one system with another system, such as die sinking simulations for the specification of manufacturing facilities.

F.1.75 sketches (characteristic sections): A rough drawing, an outline.

F.1.76 specification list: A list of something demanded as an obligation.

F.1.77 standards: Rules set up within the automotive industry or a car company in order to ensure commonality between products and tools. These can be international (e.g., ISO, IEC), national (e.g., AFNOR, ANSI, DIN), or company internal standards.

F.1.78 standard parts: Standardized parts with variable dimensions or shape. Standard parts, such as screws, are usually listed in catalogues.

F.1.79 stereolithography systems: System for the generation of 3D physical models of a part out of resin using CAD data.

F.1.80 style product: Process of specifying the shape of a car according to the specification list in consideration of aesthetical and visual aspects.

F.1.81 style shape (exterior and interior): Process of generating the data describing the 3D shape of a car including exterior and interior surfaces.

F.1.82 technical practicability: The capability of an object to perform tasks.

F.1.83 test facilities: Test sites and tools used to obtain data about a product with respect to certain characteristics, such as heat development inside the combustion chamber, wear, corrosion, and material behaviour.

F.1.84 test prototype: Process of performing tests on prototypes or of executing simulation programs as part of the product evaluation process.

F.1.85 test parts: Parts manufactured with preliminary tools used to evaluate the tools.

F.1.86 test plan data: Information on the tests to be executed on prototypes of the product in order to evaluate the product design.

F.1.87 test reports: Information output of the test stage of the product development, e.g., temperature measurements.

F.1.88 test results: Values that ensue from a test.

F.1.89 test run: Procedure of testing functional units over a certain period of time.

EXAMPLE 240 – Test run of an engine to simulate a two year wearing period within one week.

F.1.90 test tool to control quality: Manufacturing of test parts using preliminary tools in order to evaluate and optimize the tool design.

F.1.91 tolerance data: Data that gives information about a permissible deviation from a specified value.

F.1.92 tool: Piece of hardware that supports the manufacturing or assembly process of a product; e.g., die, tin-plate folder, or robot.

F.1.93 tool control: Computer sensible code containing sequences of statements necessary to control a machine tool.

F.1.94 tool database: Database containing information on existing or available tools and their attributes. This may include company specific tool data as well as catalogues from tool manufacturers.

F.1.95 tool description: All data necessary to describe a tool, including geometrical information of the shape and technological information, such as tolerances, material, and surface condition descriptions.

F.1.96 tool selection: Set of tools that fulfil certain constraints and conditions, such as costs, tool wear, and availability.

F.1.97 visualization systems: Computer hardware and software that processes product description data into a graphical form of representation in order to make easy understanding and interpretation possible.

F.2 Application activity model diagrams

The application activity model diagrams are given in figures F.1 through F.9. The graphical form of the application activity model is presented in the IDEF0 [1] activity modelling format. Activities and data flows that are out of scope are marked with asterisks.

The data flows are marked with numbers to identify the data classes which are included in these data flows. The numbers correspond to the description in table F.1.

Table F.1 consists of six columns. The first column contains the numbers of the data classes. In columns two, three, and four, the data classes are marked to be in scope (full support or reference only) or out of scope.

The classification "in scope – full support" means that corresponding definitions of application objects are provided in clause 4 of this part of ISO 10303.

The classification "in scope – reference only" means that the explicit description of the data is not specified by this part of ISO 10303, but it can be referenced.

Table F.1 – The AAM-data classes

Data class No.	In scope		Out of scope	Description	UoF correspondence
	full support	reference only			
1	X			**Drawing data:** dimensions, views, layout, etc.	D1, D2, P1, P2
2	X			**Wireframe data:** points, polygons, conics, curves, etc.	G1, G2
3	X			**Surface data:** unbounded and bounded surfaces planes, open shells, etc.	G3, G8
4	X			**Solid data:** B–Rep, CSG, etc.	G4, G5, G7
5		X		**Process Control Data:** NC–data, RC–data, MC–data, etc.	E1
6	X			**Visualization data:** color, line style, point style, etc.	P1 – P3
				Simulation data:	
7a	X			kinematics	K1
7b			X	other simulation data	—
				Compound model and analysis data:	
8a	X			compound representation	G6
8b			X	FEA data	—
9	X			**Form feature data:** general feature, solid features, panel features, transition features, compound features, patterns	FF1 – FF3
10			X	**Parametric design data**	—
11	X			**Material, Surface conditions,** **and Tolerance data**	PR1, C1 T1, T2
12	X			**Product structure and** **management data:** version and release management, work management, assembly structure, fastening information, process operation, process plan, specification control, etc.	S1 – S8
13		X		**Compound documents:** requirements, feasibility studies, etc.	E1
14a	X			**Scan data**	MD1
14b			X	**other measured data**	—

EXAMPLE 241 – The data description of a NC–data file is not specified by this part of ISO 10303. This data may be provided in an ASCII–file according to, e.g., ISO 6983 [6]. The reference to this NC–data, the knowledge about its existence and about its type, creator, etc., is supported by this part.

Data classified as "out of scope" are not supported by this part of ISO 10303. In the figures, data classes that are out of scope are marked with an asterisk after the corresponding number.

The fifth column of table F.1 contains a description of the data classes with some typical examples.

The sixth column of table F.1 lists the correspondence of the data classes to the UoF specified in clause 4.

Annex G
(informative)
Application reference model

This annex provides the application reference model for this part of ISO 10303 and is given in figures G.1 through G.50. The application reference model is a graphical representation of the structure and constraints of the application objects specified in clause 4. The graphical form of the application reference model is presented in the EXPRESS-G format. The application reference model is independent from any implementation method.

NOTE 1 – Not all possible application assertions that are established through select types apply for this part of ISO 10303. See 4.3 for those application assertions that are in scope.

NOTE 2 – In EXPRESS-G it is not possible to express the inverse cardinalities for relationships where the relationship path includes select types. In those cases a footnote mark on the diagram refers to the end of this annex where additional information can be found.

NOTE 3 – The following footnotes correspond to the footnote marks in the ARM EXPRESS-G figures above:

1 Each Default_setting_association has default_value defined by zero or one object of each kind included in the default_setting_select.

EXAMPLE 242 – There shall not be two objects of Default_chamfer associated to one Default_-setting_association.

2 Each object included in the appearance_select is related to one or more Appearance_assignment object.

3 Each object included in the accuracy_select is related to zero or one Accuracy object.

Annex J
(informative)

AIM EXPRESS listing

This annex provides a listing of the table of short names and a listing of the EXPRESS specified in the AIM of this part of ISO 10303. No text or annotation is included. This annex is provided only in computer-interpretable form.

NOTE 4 – The information provided on this diskette is informative; the normative text is that contained in the body of this part of ISO 10303.

The expanded listing that is included in this annex corresponds to conformance class 18 as specified in clause 6 and to the **automotive_design** schema listed in annex A.

This annex also provides the listings of the EXPRESS of the conformance classes 1 (CC1) and 2 (CC2) as specified in clause 6 in computer-interpretable form. The schema names and object identifiers (see annex E) are as follows:

– CC1: Conformance class for component design with 3D shape representation

For the identification of the CC1 schema the object identifier

{ iso standard 10303 part(214) version(-2) object(1) automotive-design-cc01(3) }

is assigned to the **automotive_design_cc01** schema.

– CC2: Conformance class schema for assembly design with 3D shape representation

For the identification of the CC2 schema the object identifier

{ iso standard 10303 part(214) version(-2) object(1) automotive-design-cc02(4) }

is assigned to the **automotive_design_cc02** schema.

Table J.1 shows the correspondance between the file names on the diskette and the schemas they contain:

NOTE 5 – The single files are compressed into one file named 'a_d.zip'.

Table J.1 – File names for schemas

Information	File name
list of short names	s_names.txt
automotive_design schema	a_d.exp
automotive_design_cc01 schema	a_d_cc01.exp
automotive_design_cc02 schema	a_d_cc02.exp

Annex K
(informative)

ARM EXPRESS listing

The following EXPRESS-listing corresponds to the EXPRESS-G diagrams given in annex G. This annex is provided in computer-interpretable form only.

NOTE 1 – The entities are listed in alphabetical order. The type UNDEFINED_OBJECT refers to a user defined type, which is not detailed any further to be either of type INTEGER, REAL, STRING, etc. This level of detail was considered not to be appropriate the ARM modelling.

NOTE 2 – The information provided on this diskette is informative; the normative text is that contained in the body of this part of ISO 10303.

Annex L
(informative)
