

Methanol Thermodynamic Properties From 176 to 673 K at Pressures to 700 Bar

Robert D. Goodwin

Thermophysics Division, National Engineering Laboratory, National Bureau of Standards, Boulder, Colorado 80303

Received January 30, 1987; revised manuscript received June 11, 1987

Available data for vapor pressures and for the orthobaric densities of methanol are examined and formulated. Then, $P\rho T$ data are correlated by an equation of state (EOS) which is constrained to the given coexistence boundary. Via ideal gas state specific heats, the thermodynamic properties of methanol then are obtained by numerical integrations of the EOS, and are tabulated along isobars. A comparison is made with some recent calorimetric enthalpy differences data over a wide range of the EOS surface.

Key words: compressibility factors; densities; enthalpies; entropies; equation of state; fugacities; heats of vaporization; ideal gas; Joule-Thomson coefficients; methanol; orthobaric densities; specific heats; speeds of sound; thermodynamic properties; vapor pressures; virial coefficients.

Symbols and Units

| | |
|---|--|
| Subscripts c and t refer to critical and liquid triple points | |
| Subscripts g and l refer to saturated vapor and liquid | |
| Subscript σ refers to liquid-vapor coexistence | |
| $\alpha, \beta, \gamma, \delta, \epsilon, p$ | exponents in various functions |
| $B(T), C(T)$ | virial coefficients, Eq. (4) |
| $C_\sigma(T)$ | saturated liquid specific heat, $J \text{ mol}^{-1} \text{ K}^{-1}$ |
| $C_v(\rho, T)$ | isochoric specific heat, $J \text{ mol}^{-1} \text{ K}^{-1}$ |
| C_b | isochoric specific heat at the critical point (C.P.), $161.14 \text{ J mol}^{-1} \text{ K}^{-1}$ |
| $C_v(T)_\sigma$ | isochoric specific heat at the liquid boundary, $J \text{ mol}^{-1} \text{ K}^{-1}$ |
| $C_p(\rho, T)$ | isobaric specific heat, $J \text{ mol}^{-1} \text{ K}^{-1}$ |
| $E(\rho, T)$ | internal energy, J/mol |
| $E_0^\circ = H_0^\circ$ | 35 374.762 J/mol (arbitrary) |
| f | fugacity, bar |
| f/P | fugacity/pressure coefficient |
| $F(\rho, T)$ | defined function in the EOS |
| $G(\rho, T)$ | Gibbs energy, J/mol |
| $H(\rho, T)$ | enthalpy, J/mol |
| H_0° | enthalpy for ideal gas state at $T = 0$ |
| L | liter, 10^{-3} m^3 |
| mol | 32.0424 g of methanol (molecular weight) |
| P | pressure, bar ($1 \text{ bar} \equiv 10^5 \text{ N/m}^2$) |
| P° | 1.013 25 bar (1 atm) |
| $P_\sigma(T)$ | vapor pressure of saturated liquid, bar |
| $P_\sigma(\rho)$ | $P_\sigma[T_\sigma(\rho)]$, vapor pressure as function of density, bar |
| Q_{vap} | ΔH_{vap} , heat of vaporization, J/mol |
| R | gas constant, $8.3145 \text{ J mol}^{-1} \text{ K}^{-1}$, 0.083 145 (bar L/mol)/K |
| ρ | density, mol/L |
| σ | ρ/ρ_c , reduced density |
| σ_0 | 0.825, reversal of isochore curvatures, Eq. (6) |
| σ_t | ρ_t/ρ_c , reduced liquid density at triple point |

| | |
|------------------|---|
| $S(\rho, T)$ | entropy, $\text{J mol}^{-1} \text{ K}^{-1}$ |
| T | temperature, K |
| $T_\sigma(\rho)$ | liquid-vapor coexistence temperature |
| $u(T)$ | defined where used |
| $x(T)$ | defined where used |
| v | $1/\rho$, molal volume, L/mol |
| $W(\rho, T)$ | speed of sound, m/s |
| $Z(P, \rho, T)$ | $P/(\rho \cdot R \cdot T)$, the "compressibility factor" |

1. Introduction

Methanol is a major commodity chemical whose heavy industrial use has been described by Machado and Streett.⁴² Thermodynamic charts for methanol have been prepared by Smith,⁶⁰ and a $P\rho T$ surface was correlated by Bhattacharyya and Thodos.⁶ In an ongoing series of reports, fundamental properties were collected by Wilhoit, *et al.*⁶⁸ A valuable survey was presented by Eubank,¹⁷ and a book on the thermophysical properties was published in Russian by Zubarev, Prusakov, and Sergeeva.⁷⁴

Polymerization of methanol in the vapor state is a troublesome phenomenon for the experimentalist and correlator. This has been examined by Weltner and Pitzer,⁶⁷ Inskeep,²⁹ Kell,³³ Tucker,⁶⁶ Kudchadker,³⁸ Bartczak,⁵ Francis,²¹ and Nath.⁴⁷

In the present correlation of the thermodynamic properties of methanol we rely heavily on the $P\rho T$ data of Machado and Streett⁴² and on the recent data of Straty.⁶³ Isochore curvatures in Straty's $P\rho T$ data change sign at a reduced density near 0.83, not at the critical density. We thus obtain a specific heat $C_b(\rho, T)$, which is finite at the critical point, via Eq. (10), below.

Symbols and units are given in the list above, and the coexistence phase diagram is outlined in Fig. 1. Selected fixed-point values are listed in Table 1. The triple-point tem-

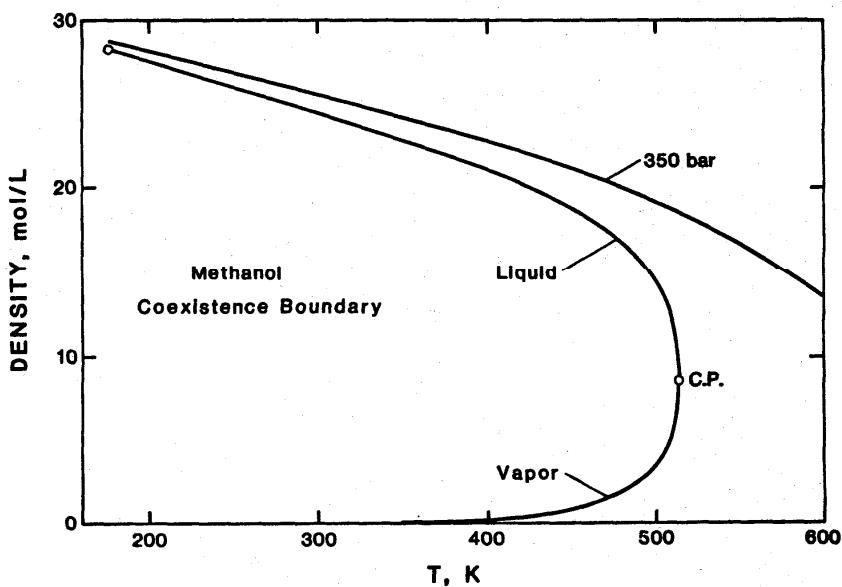

FIG. 1. Methanol coexistence boundary.

TABLE 1. Selected fixed-point values for methanol

| | Triple point | Boiling point | Critical point |
|--------------------------|-----------------------|------------------------|----------------|
| Temperature, K | 175.59 | 337.668 | 512.60 |
| Pressure, bar | $1.835 \cdot 10^{-6}$ | 1.013 25 | 80.9464 |
| Density, mol/L, vapor | $1.271 \cdot 10^{-7}$ | $3.8131 \cdot 10^{-2}$ | 8.40 |
| liquid | 28.226 | 23.352 | 8.40 |

perature is from Carlson and Westrum.¹⁰ Young⁷⁰ reported $T_c = 513.15$ K, $P_c = 79.59 \pm 0.08$ bar, $\rho_c = 8.455$ mol/L. The only recent determination of critical parameters apparently is that of Kay and Donham³²: $T_c = 512.58$ K, $P_c = 80.972$ bar, $\rho_c = 8.49$ mol/L.

Our critical density, $\rho_c = 8.40$ mol/L, was adjusted in the course of fitting orthobaric densities. The boiling-point temperature in Table 1 is from Eq. (1) at $P^* = 1.013 25$ bar, and the triple-point pressure is from Eq. (1) at $T = T_t$. Other fixed-point orthobaric densities are from Eqs. (2) and (3) at appropriate temperatures.

2. Developing the Equation of State

The present isochoric equation of state (EOS) is constrained to the formulated coexistence boundary (vapor pressures and orthobaric densities). The winnowing of masses of data, to cull inaccurate but often precise sets, is a difficult but necessary process. Hence, some excluded data are presented in this report, but are used with zero weight for the least-squares determination of the coefficients in fitting functions. The selected virial EOS for low-density regions also is presented below [Eq. (4)]. Apparently no high-pressure melting line $P_m(T)$ has been established for methanol, which forms glasses under these conditions. See, however, e.g., Carlson and Westrum¹⁰ for calorimetric transitions at low pressures and temperatures.

2.1. Methanol Vapor Pressures

Some of the available vapor-pressure data for methanol are listed in Table 2. Deviations from Eq. (1) are given in Table 3 using $x(T) = T/T_c$, $P_\sigma(T)$ in bar, and exponent $p = 1.70$. Then

TABLE 2. Summary of vapor-pressure data for methanol

| ID | Author/year | Range of T , K | Range of P , bar |

| 13 | Mundel, 1913 (Ref. 46) | 205–229 | $1.4 \cdot 10^{-4}$ – $1.3 \cdot 10^{-3}$ |
| 51 | Waltner, 1951 | 313–338 | 0.35–1.00 |
| 55 | Kay, 1955 (Ref. 32) | 403–503 | 8.4–69.0 |
| 64 | Skaates, 1964 (Ref. 59) | 403–503 | 8.4–69.0 |
| 67 | Hirata, 1967 (Ref. 28) | 363–473 | 2.5–39.4 |
| 70 | Ambrose/Sprake, 1970 (Ref. 3) | 222–357 | 0.1–2.1 |
| 73 | Zubarev, 1972 | 175–510 | $1.9 \cdot 10^{-6}$ –77.4 |
| 74 | Counsell, 1973 (Ref. 13) | 306–338 | 0.25–1.0 |
| 71 | Gibbard, 1974 (Ref. 23) | 288–338 | 0.10–1.0 |
| 75 | Ambrose/Sprake/Townsend, 1975 (Ref. 4) | 353–463 | 1.8–33.1 |
| 83 | Machado, 1983 | 298–473 | 0.2–40.1 |
| 65 | Miller, 1984 (Ref. 45) | 175–180 | $1.7 \cdot 10^{-6}$ – $4.1 \cdot 10^{-6}$ |
| 99 | Straty, 1985 | 488–508 | 53–74 |

$$\ln(P_\sigma) = a/x + b + cx + dx^2 + ex^3 + f(1-x)^p, \quad (1)$$

where

$$\begin{aligned} a &= -10.752\ 848\ 790, & d &= 4.373\ 231\ 941, \\ b &= 16.758\ 206\ 642, & e &= -2.381\ 377\ 449, \\ c &= -3.603\ 424\ 623, & f &= 4.572\ 198\ 698. \end{aligned}$$

The root-mean-square (rms) relative pressure deviation of 0.34% for 83 selected data is not as precise as obtained for many other substances. Data of Straty⁶³ at ID = 99 [(ID) identification of data sources] were used before discovering that he doubted their accuracy, based on apparatus limitations. The data of Young,⁷⁰ ID = 10, based on those of Ramsay and Young,⁵³ are included to provide information on possible temperature-scale adjustments (column ΔT), which would be useful to salvage their extensive and precise orthobaric densities and $P\rho T$ data.

Column Resid. in Table 3 gives values of the residual,

$$\ln(P_\sigma/P_t)/\ln(P_c/P_t) - (1 - T_t/T)/(1 - T_t/T_c),$$

the examination of which is most helpful for developing any vapor-pressure equation.

2.2. Methanol Orthobaric Densities

Table 4 presents some sources of orthobaric density data for methanol.

2.2.a. Saturated Liquid Densities

Deviations from Eq. (2) are given in Table 5 using $x(T) \equiv T/T_c$, $u(T) \equiv (1-x)$, and exponent $\beta = 0.35$. Then

$$(\rho_1/\rho_c - 1) = au^\beta + b(x-1) + c(x^2-1) + d(x^3-1), \quad (2)$$

where

$$\begin{aligned} a &= 2.517\ 309\ 06, & c &= 3.066\ 817\ 68, \\ b &= -2.466\ 694\ 19, & d &= -1.325\ 076\ 80. \end{aligned}$$

The rms relative density deviation is 0.17% for 43 selected data. Data at ID = 72 have been obtained from formulated

Table 3. Comparison of reported vapor pressures with values calculated from Eq. (1)

TABLE 4. Summary of orthobaric density data for methanol

| ID | Author/year | Range of T , K |
|----|------------------------------|------------------|
| 87 | Ramsay, 1887 (Ref. 53) | 263–512 |
| 10 | Young, 1910 (Ref. 70) | 263–512 |
| 55 | Kay, 1955 (Ref. 32) | 403–503 |
| 72 | Via Zubarev, 1985 | 423–512 |
| 73 | Zubarev, 1973 (Ref. 74) | 175–510 |
| 83 | Machado, 1983 (Ref. 42) | 298–473 |
| 85 | Via Machado/Tait, 1985 | 298–489 |
| 90 | Via $C_\sigma(T)$ data, 1985 | 176–325 |
| 99 | Via Straty, 1985 | 376–511 |

(1). At ID = 69, data are from virial Eqs. (4) and (1). At ID = 72, data are from formulations of our derived isochores of Zubarev (Table 9, ID = 90), and Eq. (1). At ID = 99 we used individual representations of the Straty⁶³ pseudooisochores, with Eq. (1). Many deviations in Table 6 are unacceptably large (see Fig. 2). Derived heats of vaporization depend directly on these vapor densities via Eq. (17). In the last column of Table 6 under $F(z)$ are given experimental values of $(Z_g - 1)/(Z_c - 1)$. In the limit of low densities, one obtains from Eqs. (1) and (3), $Z_\sigma \sim \exp(-0.13T_c/T_\sigma)$, i.e., $Z_\sigma \rightarrow 0$ in this limit, $T_\sigma(\rho) \rightarrow 0$.

isochores, obtained in turn from formulations of the Zubarev⁷⁴ isotherms. Data at ID = 85 are obtained from Tait equation formulations of the isotherms of Machado and Streett.⁴²

2.2.b. Saturated Vapor Densities

The computation of ΔE along isotherms via Eq. (9), using EOS Eq. (6), involves a leading term for the saturated vapor at $T_\sigma(\rho)$ for each density along the isotherm, Goodwin,²⁶

$$\Delta E = \int_0^\rho \{RT_\sigma(\rho)[Z_\sigma(\rho) - 1] + \dots\} \frac{d\rho}{\rho}, \quad (2a)$$

where it is important that the integrand approach zero in the limit of low densities. Our earlier formulation of the saturated vapor densities ρ_g , has been used for various simple fluids, e.g., Goodwin,²⁶ but is not suitable for methanol. Hence we have used Eq. (3), where $x(T) \equiv T/T_c$, $u(T) \equiv (1-x)$, $\beta = 0.35$,

$$\ln(\rho_g/\rho_c) = a(1 - 1/x) + bu^\beta + cu + du^2, \quad (3)$$

and

$$a = 10.619\ 668\ 50, \quad c = 3.818\ 454\ 21,$$

$$b = -2.556\ 682\ 02, \quad d = 4.795\ 567\ 52.$$

For 53 selected data in Table 6 the rms of relative deviations is 0.21%.

Above the first blank line in Table 6, we derived the vapor density data from experimental heats of vaporization of the named authors (ID) via the Clapeyron Eq. (17) using Eq. (1). Thus our derived heats of vaporization in Table 16 will have the same accuracy (with respect to experimental data) as the fit of the vapor density data in Table 6. However, at ID = 90, data are from fitting our liquid entropies and experimental $C_\sigma(T)$ data simultaneously [Sec. 3.3(c)]. Given the formulated liquid entropies, $S_\sigma(T)/J\ mol^{-1}\ K^{-1}$, then the vapor densities in mol/L are

$$\rho_g(T) = 100 \left(\frac{dP_\sigma}{dT} \right) / [S_g(T) - S_\sigma(T)], \quad (3a)$$

where for the vapor at these low densities we have approximated

$$S_g(T) = S^\circ(T) + R \ln[P^\circ/P_\sigma(T)]. \quad (3b)$$

At ID = 39 in Table 6 the vapor densities are obtained from the Beattie-Bridgman EOS of Lashakov³⁹ with Eq.

Table 5. Comparison of reported saturated liquid densities with values calculated from Eq. (2)

2.2.c. Alternative Vapor Density Equation

After completing the present report, we reinvestigated the formulation of saturated vapor densities to obtain $Z_\sigma \rightarrow 1$ as $\rho \rightarrow 0$. The argument is temperature, T . On integrating Eq. (9) along isotherms using EOS (6), however, $T = T_\sigma(\rho)$, $P = P_\sigma[T_\sigma(\rho)]$ for Eq. (2a), and then the argument is density, ρ . In either case, symbols refer to the state of saturated vapor at coexistence, where $x \equiv T/T_c$, $u \equiv (1-x)$, $Z \equiv P/(\rho RT)$, $\beta = 0.35$,

$$Z = 1 + (Z_c - 1)\exp[f(x)], \quad (3c)$$

$$f(x) = A_1(1 - 1/x) + A_2 u^\beta + \sum_{i=3}^7 A_i u^{i-2}, \quad (3d)$$

$$A_1 = 77.027\ 624\ 2, \quad A_5 = 270.449\ 459,$$

$$A_2 = -0.797\ 401\ 6, \quad A_6 = -600.239\ 197,$$

$$A_3 = 73.261\ 311\ 3, \quad A_7 = 887.047\ 221.$$

$$A_4 = 51.823\ 505\ 7,$$

This equation yields $Z = 1$ in the limit of low temperatures.

2.3. The Virial Equation

For the virial equation of state,

$$Z(P, \rho, T) = 1 + B(T)\rho + C(T)\rho^2 + \dots, \quad (4)$$

we used 18 mixed $P\rho T$ data from Kell³³ and from Kudchadker,³⁷ at 298 to 573 K, to formulate $B(T)$ in L/mol, using $x(T) \equiv T/1000$,

$$B(T) = B_1 + \frac{B_2}{x} + \frac{B_3}{x^2} + \frac{B_4}{x^5}, \quad (4a)$$

$$B_1 = 3.6922, \quad B_3 = 1.3098,$$

$$B_2 = -4.3214, \quad B_4 = -0.015\ 008.$$

with an average absolute deviation of 0.021 L/mol.

Corresponding data for $C(T)$ in (L/mol)² have been formulated graphically,

$$C(T) = -\exp[C_1 - C_2(T/100)], \quad (4b)$$

$$C_1 = 17.1634, \quad C_2 = 4.4545.$$

For methanol, $C(T)$ always is negative in the present range of reduced temperatures of 0.58 to 0.97, quite in contrast to simple substances.

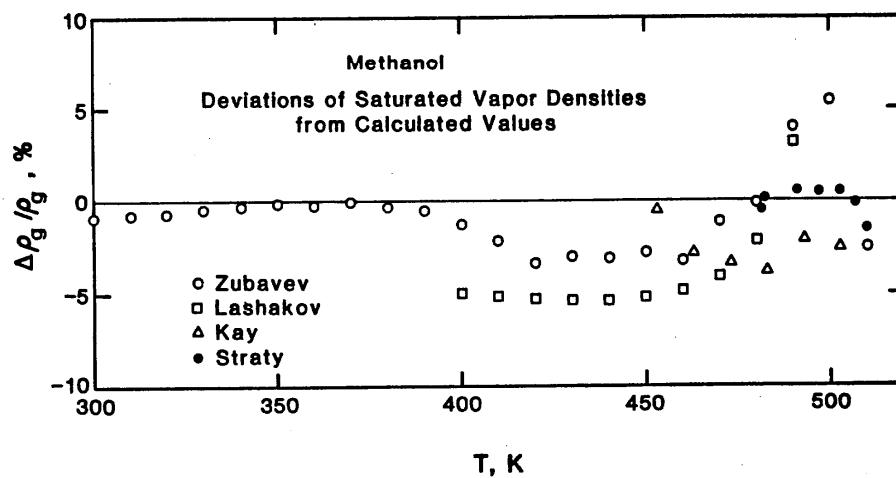

FIG. 2. Methanol vapor densities deviations

2.4. Pressure-Density-Temperature Data

The location of available $P\rho T$ data for methanol was plotted in P - T coordinates by Machado and Streett.⁴² Recent data of Straty⁶³ along isochores (at densities from 0.25 to $2.62 \times$ the critical) extend from 378 to 573 K at pressures from 26 to 342 bar. Sources of data are given in Table 7. To obtain least-squares coefficients of the EOS, we used 164 data of Machado and Streett⁴²; 220 data of Straty⁶³; and 16 low-density data generated by virial Eq. (4), above, which constitute 400 points from more than 1606 available data points. The vapor pressures, Eq. (1), and the orthobaric densities, Eqs. (2) and (3), also contribute to the EOS as constraints.

The $P\rho T$ data of Zubarev and Bagdonas^{71,72} were given first as raw data (with some typographic errors), and then as smoothed tables. We corrected the raw data errors where possible and arranged these data onto isotherms. Each isotherm then is represented by a polynomial, in which the number of terms n were selected:

$$\ln(Z) = \sum_{i=1}^n A_i \sigma^i, \quad (5)$$

where $\sigma \equiv \rho/\rho_c$ is the reduced density. In Table 8 we give T , ρ , P , Z , Z_{calc} , and the differences of Z in percent. The coefficients A_i are given at the top of each isotherm in Table 8. By reading these isotherms at rounded densities, we obtain the isochoric Zubarev data given in Table 9 at ID = 90.

2.5. The Equation of State

An outline of this EOS was given by Goodwin.²⁵ At present (see the Introduction) the specific heat $C_v(\rho, T)$ is finite at the critical point. The following isochoric EOS gives pressure as a function of temperature along paths of constant density (isochores) which originate on the liquid-vapor coexistence boundary, specified by vapor pressure Eq. (1), and by the orthobaric densities Eqs. (2) and (3). For any iso-

chore (density) the coexistence temperature $T_\sigma(\rho)$, as found by iteration from Eqs. (2) and (3), and thus the vapor pressure, $P_\sigma[T_\sigma(\rho)]$ becomes a function of density. In outline

$$P - P_\sigma(\rho) = \rho R [T - T_\sigma(\rho)] + \sigma(\rho R T_c) F(\rho, T). \quad (6)$$

The function $F(\rho, T)$ consists of two temperature-dependent functions, each with an isochoric (density dependent) coefficient. Let $x(T) \equiv T/T_c$, $u(\rho, T) \equiv T/T_\sigma(\rho)$, then,

$$F(\rho, T) \equiv B(\rho)\Phi(\rho, T) + C(\rho)\Psi(\rho, T), \quad (6a)$$

$$\Phi(\rho, T) \equiv \ln[(1+u^2)/2], \quad (6b)$$

$$\Psi(\rho, T) \equiv (1/x)\ln[1+\epsilon(u-1)]/\epsilon, \quad (6c)$$

$$B(\rho) \equiv B_1 \sigma \exp(-\gamma\sigma), \quad (6d)$$

and

$$C(\rho) = [C_1 + C_2 u + C_3 u^2](\sigma - \sigma_0) \exp(-\delta\sigma). \quad (6e)$$

Function $\Phi(\rho, T)$ has an inflection versus $u(T)$ at coexistence (zero curvature). Function $\Psi(\rho, T)$ has large curvature versus $u(T)$ approaching coexistence, but its coefficient, $C(\rho)$, changes sign at a reduced density, $\sigma_0 = 0.825$. The coefficients $B(\rho)$, $C(\rho)$ were tediously formulated by trial fitting of the $P\rho T$ data. To obtain a well-behaved critical isotherm, we constrain the slope of the critical isochore to equal the slope of vapor-pressure Eq. (1), both at the critical point, via the least-squares program of McCarty.⁴³

Parameters and coefficients for Eq. (6) are

$$\gamma = 0.82, \quad \delta = 3.3, \quad \epsilon = 7.0, \quad \sigma_0 = 0.825$$

$$B_1 = 3.271\ 666\ 57, \quad C_2 = 24.384\ 012\ 46,$$

$$C_3 = -20.376\ 962\ 79, \quad C_4 = -75.609\ 064\ 80.$$

Deviations of experimental densities and pressures from the EOS, Eq. (6), are presented in Table 9. At the bottom of each author's individual table in Table 9, $\Delta\rho/\rho$ av. is the trend of density deviations, obtained as the average of signed relative deviations in percent. $|\Delta P/P|$ av. is the average of

220 data points, $|\Delta\rho/\rho|$ rms = 0.675%, $\Delta\rho/\rho$ av. = -0.02%, $|\Delta P/P|$ av. = 0.59%, weight = 81.09%.

absolute relative pressure deviations in percent. The weight gives the relative least-squares weight assigned to this data source, obtained as the sum of weights for all of his points, divided by the sum of weights for all of the 400 data used, in percent. The largest relative density deviations in the data of Straty⁶³ at ID = 99 in Table 9 apparently occur near $\sigma_0 = 0.825$ rather than near $\sigma = 1.0$, the critical density.

Behavior of the calculated critical isotherm is given in Table 10. As a consequence of constraints on the EOS, there are no negative slopes, $(\partial P/\partial\rho)_T$, along this isotherm.

3. Thermal Properties and Computations

3.1. Functions for Ideal Gas States

For the hypothetical ideal gas states at $P^\circ = 1.013\text{25}$ bar (1 atm), spectroscopic specific heats, enthalpies, and entropies have been generously contributed by Dr. Jing Chao.¹¹ His "molecular model treats the methanol vapor as a mixture of monomers, dimers, and tetramers." We have formulated these data (Table 11), and have given interpolated results in Table 12.

Enthalpies are represented by using $x(T) \equiv T/100$, $c = 2.0$,

$$[H^\circ(T) - E_0^\circ]/RT = 4 + \sum_{i=1}^9 A_i [\exp(-\epsilon/x)]^i, \quad (7)$$

where

$$\begin{aligned} A_1 &= 3.638\,616\,27, & A_6 &= -3286.183\,71, \\ A_2 &= -31.383\,548\,8, & A_7 &= 3538.294\,44, \\ A_3 &= 197.493\,130, & A_8 &= -2181.106\,71, \\ A_4 &= -769.861\,023, & A_9 &= 585.635\,19, \\ A_5 &= 1956.074\,28. \end{aligned}$$

Specific heats are obtained from $C_p^\circ(T) = dH^\circ(T)/dT$.

Entropies are represented using $x(T) \equiv T/100$,

$$\frac{S^\circ(T)}{R} = B_1 \ln(1+T) + f(x) \sum_{i=2}^9 B_i \left(\frac{cx}{(1+cx)} \right)^{i-2}, \quad (8)$$

$$f(x) \equiv 1/[1 + d \ln(1 + 1/x)],$$

where $c = 0.30$, $d = 0.25$, and

$$\begin{aligned} B_1 &= 4.956\,945\,73, & B_6 &= -1462.316\,95, \\ B_2 &= 3.625\,593\,78, & B_7 &= 2666.793\,01, \\ B_3 &= -20.482\,766\,8, & B_8 &= -2295.923\,87, \\ B_4 &= 10.181\,779\,4, & B_9 &= 786.755\,36, \\ B_5 &= 340.165\,534. \end{aligned}$$

The rms relative deviations in percent are given at the bottom of Table 11, where for $C_p^\circ(T)/R$ the first three data are ignored.

3.2. The Homogeneous Domain

The homogeneous domain of Fig. 1 includes all regions which can be reached by integration along isotherms, starting at zero density, without crossing the vapor-liquid coexistence

Table 10. The critical isotherm for methanol

| ρ/ρ_c | P bar | Z | $\partial P/\partial \rho$ bar/(mol/l) | $\partial \rho/\partial T$ (mol/l)/K | $\partial P/\partial T$ bar/K | $\partial^2 P/\partial T^2$ (bar/K)/K |

tence boundaries. In this report, the numerical values of E and H are based on $E = 0$ for saturated liquid at the triple point. They were determined by adding the selected value $H_0^\circ = E_0^\circ = 35\ 374.762\text{ J/mol}$ to the ideal gas state values of $(E^\circ - E_0^\circ)$ and $(H^\circ - E_0^\circ)$ from Eq. (7).

We start computations for thermal properties in the homogeneous domain with ideal gas state functions at zero density, and then integrate numerically along isotherms (see Goodwin²⁶) using the EOS in the following relations,

$$\Delta E = \int \left[P - T \left(\frac{\partial P}{\partial T} \right) \right] \frac{dp}{\rho^2}, \quad (9)$$

$$\Delta C_v = -T \int \left(\frac{\partial^2 P}{\partial T^2} \right) \frac{dp}{\rho^2}, \quad (10)$$

and

$$\Delta S = R \ln \left(\frac{P^\circ}{(\rho RT)} \right) + \int_0^\rho \left[R - \left(\frac{\partial P}{\partial T} \right) / \rho \right] \frac{dp}{\rho}. \quad (11)$$

Equation (11) is for use with initial entropies in hypothetical ideal gas states at $P^\circ = 1.013\ 25\text{ bar}$ (1 atm). For all other initial states,

$$\Delta S = - \int \left(\frac{\partial P}{\partial T} \right) \frac{dp}{\rho^2}. \quad (11a)$$

In each (ρ, T) state, reached by above integrations, we compute

$$H = E + P/\rho, \quad (12)$$

$$C_p = C_v + T \left[\left(\frac{\partial P}{\partial T} \right)^2 / \left(\frac{\partial P}{\partial \rho} \right) \right] / \rho^2, \quad (13)$$

and

$$W^2 = C_p \left(\frac{\partial P}{\partial \rho} \right) / C_v. \quad (14)$$

The fugacity/pressure coefficient f/P for any state is computed by reference to the hypothetical ideal gas state at the same temperature and at $P^\circ = 1.013\ 25\text{ bar}$,

$$\frac{f}{P} = \left(\frac{P^\circ}{P} \right) \exp \left(\frac{\Delta G}{RT} \right), \quad (15)$$

and

$$\Delta G = (H - E_0^\circ) - H^\circ - T(S - S^\circ),$$

where ΔG is the isothermal Gibbs free-energy change, and the selected value E_0° was added to our tabulated values for $H(\rho, T)$ relative to $(H^\circ - E_0^\circ)$ from Eq. (7).

3.3. Properties at Coexistence

To obtain specific heats for compressed liquid states via Eq. (10) it is necessary to start with values $C_v(T)_\sigma$ for the isochoric specific heat, $C_v(\rho, T)$ at the liquid coexistence boundary. Also, for the computation of properties along isobars, it is economical to have formulas for isochoric specific heats at the saturated vapor boundary, and for enthalpies and entropies on the saturated liquid boundary.

3.3.a. Specific Heats on the Vapor Boundary

Data for $C_v(T)_\sigma$, the isochoric specific heat at the vapor boundary, are produced with Eq. (10), and have a "hook" approaching T_c due to the behavior of isochore curvatures. At the critical point, $C_v(T)_\sigma$ has the value $\bar{C}_v = 161.14\text{ (J/mol)/K}$. Let $x(T) \equiv T/T_c$, $u(T) \equiv (1-x)$, then

$$\ln \left(\frac{\sigma C_v(T)_\sigma}{\bar{C}_v} \right) = A_1 u^\epsilon + \sum_{i=2}^6 A_i u^{i-1}, \quad (16)$$

where $\sigma \equiv \rho/\rho_c$, $\epsilon = 0.37$, and

$$A_1 = 2.619\ 990, \quad A_4 = 63.387\ 330,$$

$$A_2 = 8.540\ 236, \quad A_5 = -189.708\ 463,$$

$$A_3 = 9.176\ 559, \quad A_6 = 205.567\ 230.$$

For 42 data at $180.0 < T < 512.3\text{ K}$ the rms relative deviation for $C_v(T)_\sigma$ is 0.24%, and the largest deviation of a datum from the calculated value is -0.60% at 180 K.

3.3.b. Saturated Liquid Enthalpies and Entropies

The heat of vaporization in J/mol from the Clapeyron equation,

$$Q_{\text{vap}} \equiv \Delta H_{\text{vap}} = 100T \left(\frac{dP_{\sigma}}{dT} \right) (v_g - v_l), \quad (17)$$

yields the enthalpy and entropy of saturated liquid,

$$H_{\sigma} \equiv H_l = (H_g - Q_{\text{vap}}), \quad (18)$$

$$S_{\sigma} \equiv S_l = (S_g - Q_{\text{vap}}/T). \quad (19)$$

The following formula for $H_{\sigma}(T)$, the enthalpy of saturated liquid, uses arguments $u(T) \equiv (T_c - T)/(T_c - T_t)$ and the exponent $\beta = 0.35$,

$$\frac{(H_{\sigma} - H_c)}{(H_t - H_c)} = u + (u^{\beta} - u) \sum_{i=1}^6 A_i u^{i-1}, \quad (20)$$

$$H_t = 0.0, \quad H_c = 30030.1 \text{ J/mol},$$

$$A_1 = 0.42108110, \quad A_4 = 5.54131457,$$

$$A_2 = 0.68995569, \quad A_5 = -5.07907550,$$

$$A_3 = -2.57506538, \quad A_6 = 1.46899092.$$

For 41 data at $190.0 < T \leq 512.3 \text{ K}$, the rms relative deviation for $H_{\sigma}(T)$ is 0.34%. The maximum deviations of data from the calculated values are -1.70% at 190 K, and -2.61% at 180 K.

The following formula for $S_{\sigma}(T)$, the entropy of saturated liquid, uses arguments $x(T) \equiv T/T_c$, $u(T) \equiv (1-x)$, and exponent $\beta = 0.35$,

$$\frac{(S_{\sigma} - S_c)}{(S_t - S_c)} = A_1 u^{\beta} + A_2 \ln(x) + \sum_{i=3}^5 A_i (x^{i-2} - 1), \quad (21)$$

$$S_t = 90.083, \quad S_c = 196.128 \text{ (J/mol)/K},$$

$$A_1 = 0.351885933, \quad A_4 = -3.604841554,$$

$$A_2 = -1.315787023, \quad A_5 = 1.274787183,$$

$$A_3 = 4.062495073,$$

For 44 $S_{\sigma}(T)$ data at $175.59 < T \leq 512.60 \text{ K}$ the rms relative deviation is 0.11%, and the maximum deviation of a datum from the calculated value is +0.26 (J/mol)/K at 200 K.

3.3.c. Saturated Liquid Specific Heats

Specific heats $C_{\sigma}(T)$ along the saturated liquid path, are computed using the relation $C_{\sigma}(T) = T dS_{\sigma}(T)/dT$. From Eq. (21) with $x = T/T_c$, $u = (1-x)$, $S_n = (S_t - S_c)$, $\beta = 0.35$,

$$C_{\sigma}(T) = S_n x f(x),$$

$$f(x) = -A_1 \beta u^{\beta-1} + \frac{A_2}{x} + \sum_{i=3}^5 A_i (i-2) x^{i-3}. \quad (22)$$

Experimental data of Carlson and Westrum¹⁰ for $C_{\sigma}(T)$ were used in simultaneous fitting with our derived $S_{\sigma}(T)$ data to obtain coefficients A_i for Eq. (21). These data are compared with calculated results in Table 13. The isochoric specific heat at this liquid boundary is computed by the relation

$$C_v(T)_{\sigma} = C_{\sigma}(T) + T \left(\frac{\partial P}{\partial T} \right) \left(\frac{d\rho_l}{dT} \right) / \rho_l^2, \quad (23)$$

where ρ_l is the density of saturated liquid.

The following formula for $C_v(T)_{\sigma}$, the isochoric specific heat at the liquid boundary, uses arguments $x \equiv (T/T_c)$, $u \equiv (1-x)$, and parameters $\alpha = 1$, $\epsilon = 0.70$. The critical-point value of $C_v(T)_{\sigma}$ is $\bar{C}_v = 161.14 \text{ (J/mol)/K}$,

$$C_v(T)_{\sigma}/\bar{C}_v = A_0 + (1 - A_0)f(x) \exp[\alpha(1 - 1/x)],$$

$$f(x) \equiv 1 + A_1 u^{\epsilon} + \sum_{i=2}^6 A_i u^{i-1}, \quad (24)$$

where $A_0 = 58/\bar{C}_v$, and

$$A_1 = -18.505575, \quad A_4 = 136.856019,$$

$$A_2 = 35.208953, \quad A_5 = -175.234460,$$

$$A_3 = -64.875865, \quad A_6 = 94.705808.$$

For 37 $C_v(T)_{\sigma}$ data derived by Eq. (23) at $175.59 < T \leq 500 \text{ K}$, the rms relative deviation is 0.10%. The behavior of these data is shown in Fig. 3.

3.4. Compressed Liquid States

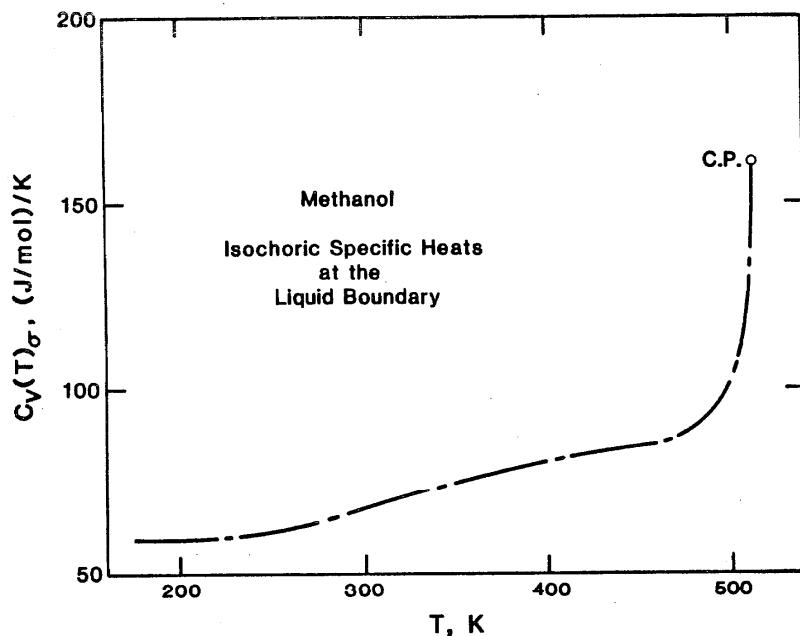

For thermal properties along isobars, Table 17, we use Eq. (24) for $C_v(T)_{\sigma}$, and the formulated $H_{\sigma}(T)$, $S_{\sigma}(T)$, Eqs. (20) and (21).

Then, starting with E , S , C_v on the saturated liquid boundary, we integrate along isotherms up to any given (ρ, T) , (P, T) point, using Eqs. (9), (10), and (11a), and then apply Eqs. (12), (13), and (14) at that point on the $P\rho T$ surface.

3.5. Comparisons

Saturated liquid specific heat data $C_{\sigma}(T)$ of Carlson and Westrum¹⁰ are compared with our results from Eq. (22) in Table 13. Deviations are under 0.5% except at their highest temperature, 320 K.

Single-phase enthalpy differences data of Wormald, et al.⁶⁹ have as reference state the saturated liquid at 298.15 K, where our value of the enthalpy from Table 16 is 9146.7 J/mol. In Table 14 we compare enthalpy differences at their

FIG. 3. Derived $C_v(T)_\sigma$ at the liquid boundary.

pressures along their isotherms. The largest differences occur along the near-critical isotherm at 515.2 K, as seen in Fig. 4.

4. Tables of Thermophysical Properties

All of the following tabulated properties are interpolated or extrapolated in regions for which no $P\rho T$ data exist; see Table 7. No melting line is used here.

4.1. The Joule-Thomson Inversion Locus

The $P\rho T$ coordinates of the Joule-Thomson inversion, $(\partial T/\partial P)_H = 0$, are presented in Table 15. For each temperature the density is iterated to satisfy the condition, $T(\partial P/\partial T) = \rho(\partial P/\partial \rho)$, by starting with an initial trial density, ρ_i ,

$$\rho_i/\rho_c = \exp[1.01322 - 0.16444(T/T_c)], \quad (25)$$

which is a good approximation of the $\rho(T)$ relation for the Joule-Thomson locus.

4.2. Properties at Coexistence

Table 16 gives some properties at the liquid coexistence boundary, computed by methods of Sec. 3.3. Here, dP_σ/dT is the slope of the vapor-pressure curve, Eq. (1); $d\rho_1/dT$ is the slope of the saturated liquid densities curve, Eq. (2); whereas $\partial P/\partial T$ and $\partial P/\partial \rho$ are slopes of the single-phase $P\rho T$ surface at the liquid boundary. In the second part of Table 16, C_v is the isochoric specific heat at the liquid boundary, whereas C_σ is the specific heat along the saturated liquid path; and C_p is the isobaric specific heat at the saturated liquid boundary. Properties of the saturated vapor are given in Table 17 at the coexistence boundary.

In Table 17 are given values of the Joule-Thomson coefficient, $\mu \equiv (\partial T/\partial P)_H$, computed by the relation,

$$\mu = 100 \left[T \left(\frac{\partial v}{\partial T} \right)_p - v \right] / C_p, \text{ K/bar.} \quad (26)$$

4.3. Properties Along Selected Isobars

Table 17 gives properties along isobars, computed by methods of Sec. 3, using EOS Eq. (6). Each isobar starts at the triple-point temperature, hence is extrapolated into the pseudosolid region. Each page for isobars at $P < P_c$ contains a blank line for the transition from saturated liquid to saturated vapor at the coexistence temperature. As described in Sec. 3.4, the properties for compressed liquid states at $T < T_c$ are based on formulated enthalpies and entropies for the saturated liquid, Eqs. (20) and (21). Small discontinuities at $T = T_c$ along isobars at $P > P_c$ are expected, due to change in the paths of computation from $T < T_c$ to $T > T_c$, Sec. 3.

5. Comments

The consistency among various data for saturated vapor densities in Table 6 (see Fig. 2) is very poor, and the EOS representation of some of the Straty $P\rho T$ data (at reduced densities near 0.8 and near coexistence) is seen in Table 9 to be rather poor.

Thus a meticulous experimental examination of all $P\rho T$ characteristics of the coexistence region is needed for an improved correlation of the thermodynamic properties of methanol. Specific heat and speed of sound data over wide ranges of the $P\rho T$ surface clearly would strengthen confidence in derived properties. The formulation of a BWR-type of EOS, by simultaneous fitting of $P\rho T$ and enthalpy data, may be desirable, aided by the background given in the present report.

6. Acknowledgments

The following individuals have given invaluable assistance. Frank R. Williamson contributed expertise in literature searches. Robert D. McCarty contributed his least-squares program which provides for constraints. James F. Ely indicated the numerical integration technique used here, and the method for computing fugacities. Appreciation to Karen A. Bowie is expressed for devotion in preparing the final manuscript. Support of the U.S. Department of Energy, Division of Chemical Sciences, is gratefully acknowledged.
