

Forensic Analysis of Illicit Drugs and Trace Explosives using Ambient Pressure Ionization Mass Spectrometry

Tim M. Brewer, Christopher Szakal, Matthew Staymates, Ed Sisco, Lenny Demoranville, Thomas Forbes, Eric Windsor, Shin Muramoto and Greg Gillen

Material Measurement Laboratory (MML)
Surface and Microanalysis Science Division
National Institute of Standards and Technology

The Science and Technology Directorate of the U.S. Department of Homeland Security sponsored the production of portions of this work under Interagency Agreement HSHQDC-12-X-00024 and HSHQDC-11-X-00420 with the National Institute of Standards and Technology

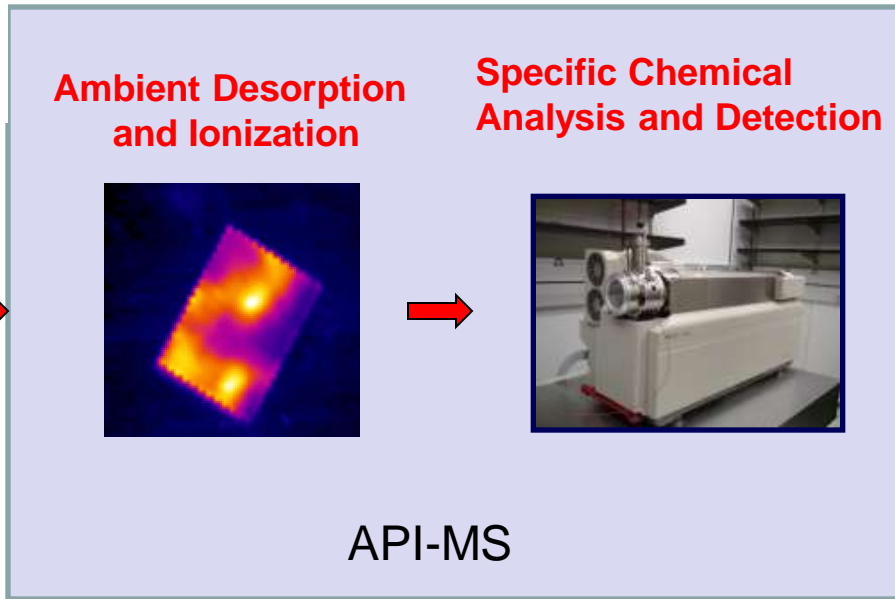

Forensic and Trace Contraband Detection

Contraband Materials

- Organic
- Inorganic
- Nuclear

Goals:

1. Next generation technology for DHS screening
2. Improved technologies for high throughput forensic analysis
3. Standard methods for evaluation of API sources

API-MS Surface Analysis Methodologies Under Investigation at NIST

- Liquid Based Sources
 - Electrospray Ionization (ESI)
 - Atmospheric Pressure Chemical Ionization (APCI)
 - Desorption Electrospray Ionization (DESI) and (SESI)
 - Desorption Electro-Flow Focusing Ionization (DEFFI)
 - PaperSpray Ionization (PS)
- Plasma Based Sources
 - Atmospheric Pressure Glow Discharge (APGD)
 - Low Temperature Plasma (LTP)
- Thermal Based Sources
 - Atmospheric Pressure Thermal Desorption Ionization (APTDI)
- Laser Based Sources
 - Atmospheric Pressure Matrix-Assisted Laser Desorption Ionization (AP-MALDI)
 - Laser Diode Thermal Desorption (LDTD)

Why API-MS

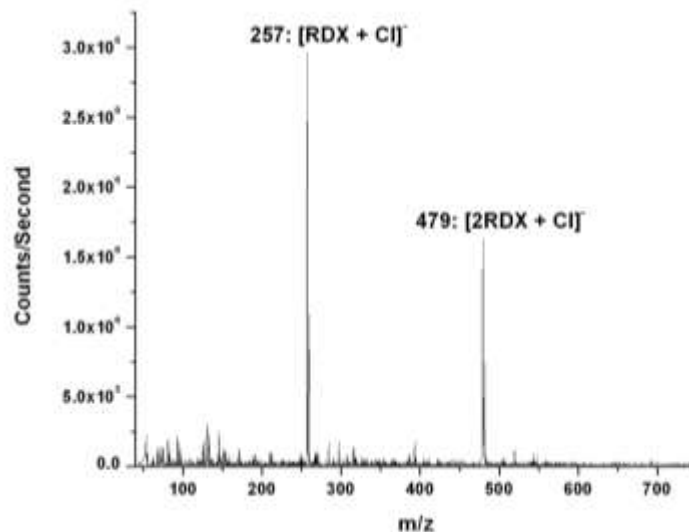

- Fast analysis – high sample throughput
- Multiple sources – maximum flexibility
 - High ionization efficiency
 - Selectivity and flexibility of gas phase and solution phase chemistries
- Sample requirements minimized (direct analysis of wet/insulating/geometric samples or swipes, + vacuum-incompatible surfaces, non planar, non conductive)
 - Can analyze solids, liquids and vapors both positive and negative polarities
- Performance of Mass Spectrometers and MS/MS (chemical speciation and identification)
 - No need for chromatographic separation

Liquid: DESI Analysis of Explosives Residues

Liquid: DESI C-4 Spectra

C-4 samples from
Montgomery County
bomb squad

Explosives-containing portions of C-4 samples obtained with liquid-liquid extraction in acetonitrile (explosives, polars)

Liquid: DESI Fingerprint analysis

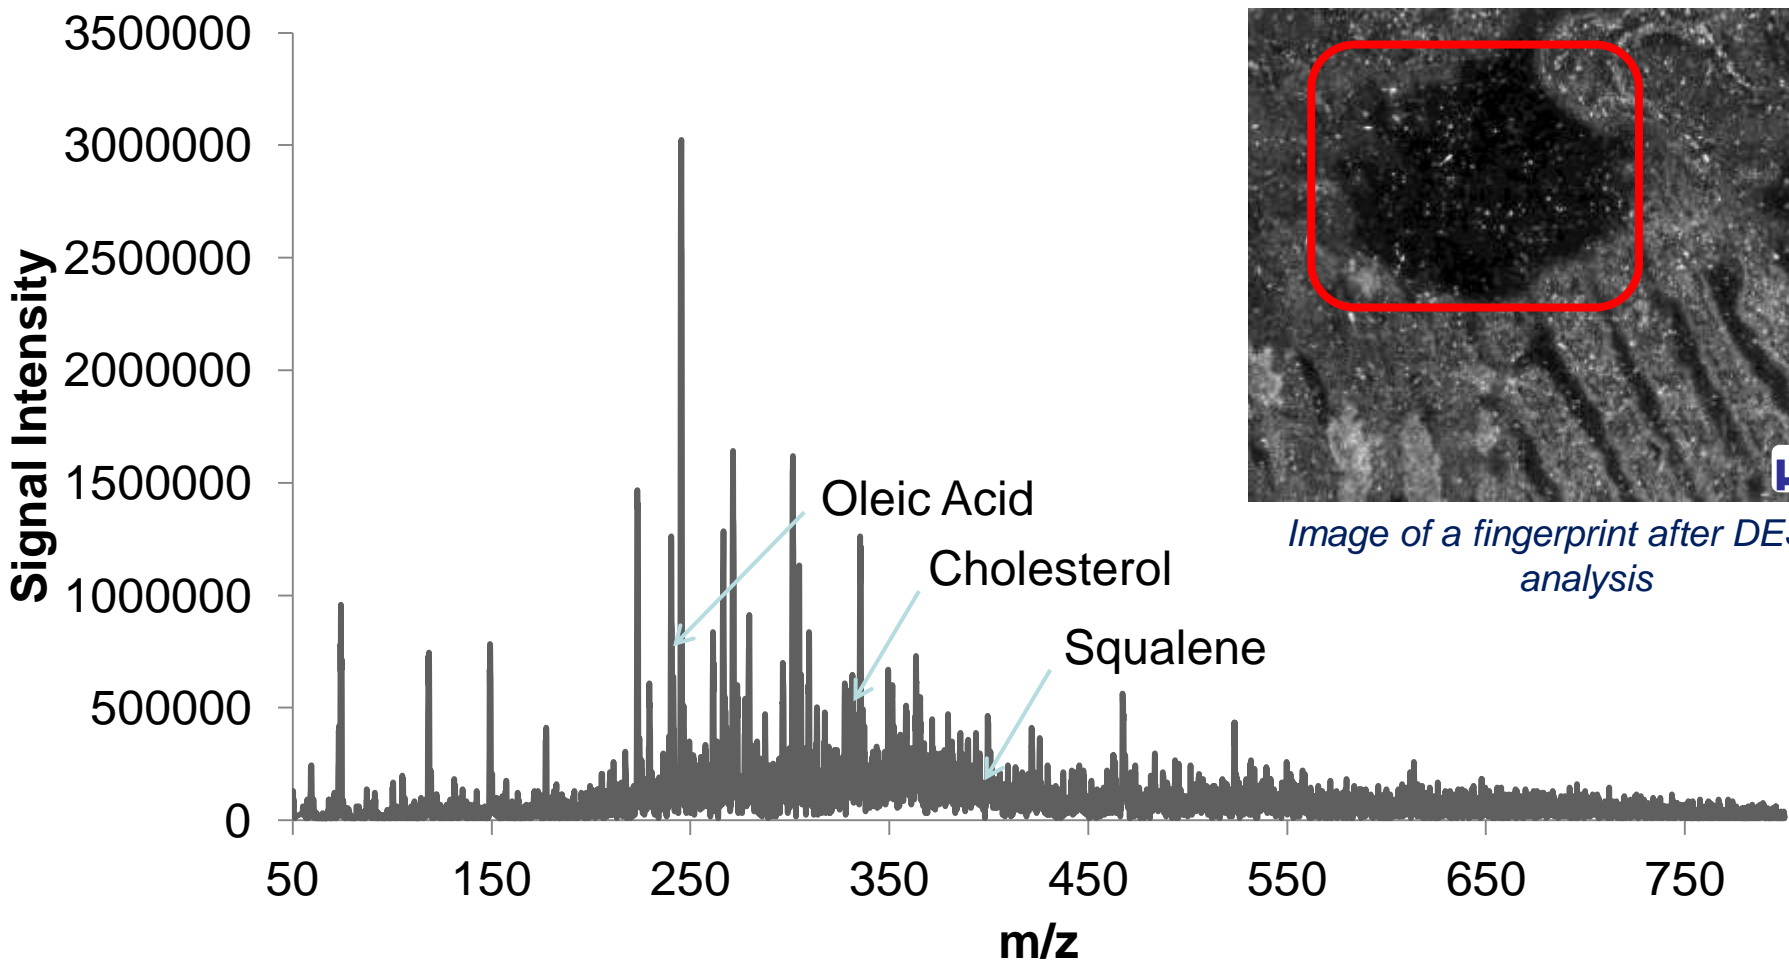

Image of a fingerprint after DESI-MS analysis

Liquid: Nebulizer Assisted DESI

Allows for analysis on metal surfaces

Selected Ion Monitoring vs. Frequency

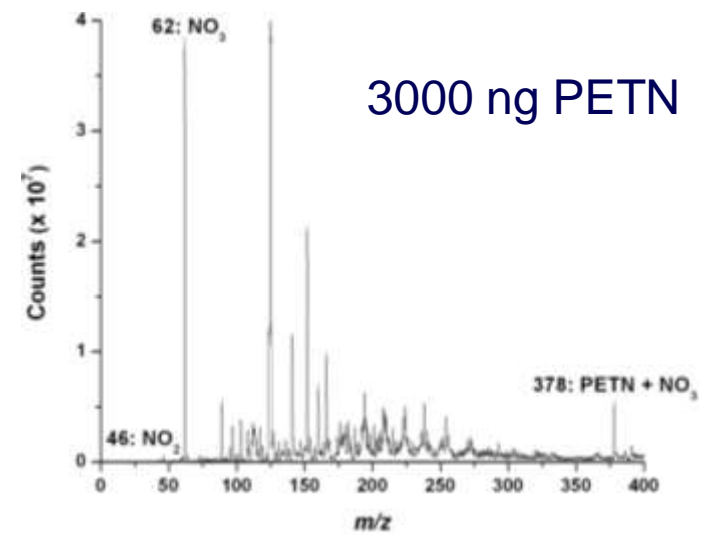

time

Typical enhancement of 10x but have seen up to 2000x enhancement

Liquid: Desorption Electro-Flow Focusing Ionization

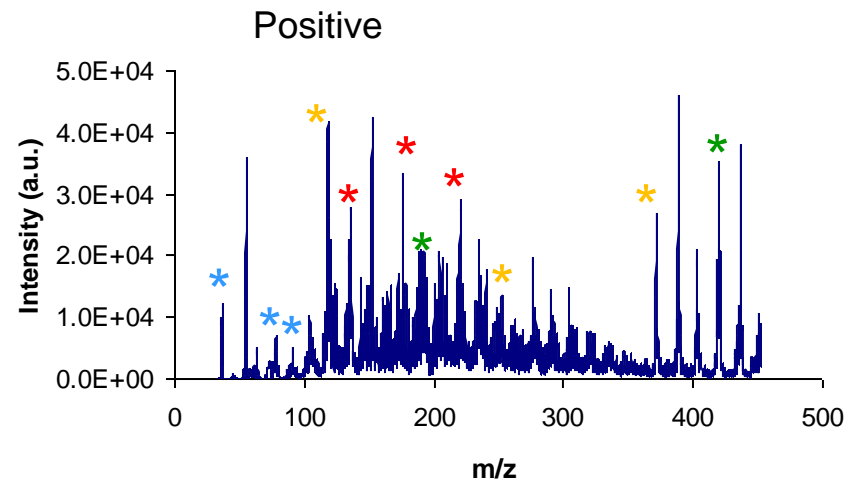

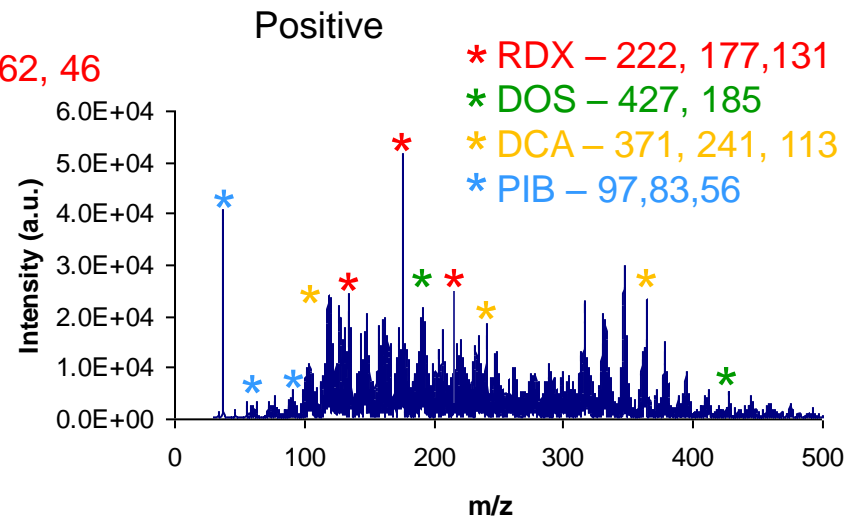

Liquid: PaperSpray – Directly from Swipes

The Swipe is the Ion Source – Little to no Sample Preparation Required

Plasma: APGD Analysis of C-4 Residues

Placed visible amount on explosive swipe. Plasma 75W and 1 L/min He and O 0.1 L/min. No liquid needed for extraction.

Plasma: OTC Pharmaceutical - Aleve

Active Ingredient – Naproxen

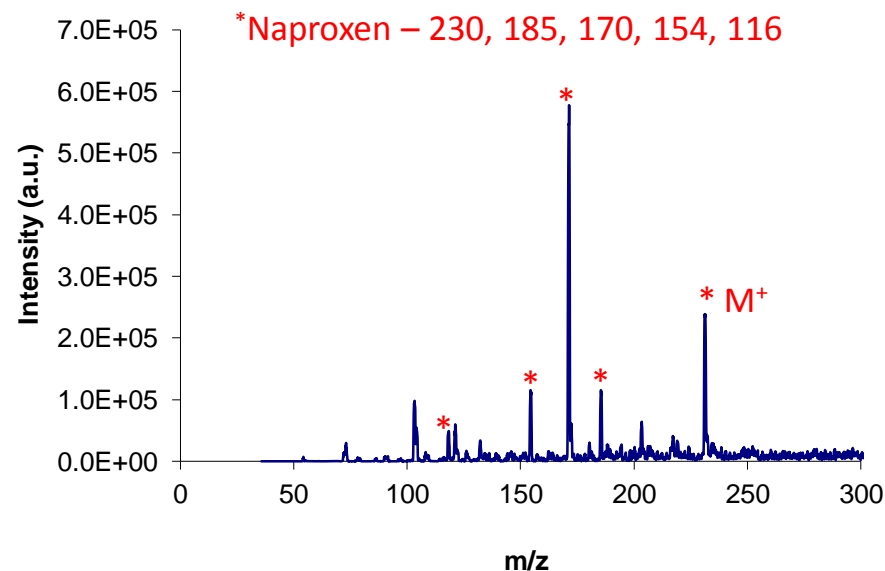

MW = 230

Aleve

NIST EI Database
Naproxen

NIST Chemistry WebBook (<http://webbook.nist.gov/chemistry>)

*Naproxen – 230, 185, 170, 154, 116

Molecular ion Signal at m/z 230

EI “like” fragmentation - NIST EI Database Searchable (>200,000 compounds)

APGD-MS spectra of Aleve Pill. Plasma 75W and 1 L/min He and O 0.1 L/min

Plasma: APGD Analysis of Forensic Compounds

Forensic Compounds Characterized by APGD

Narcotics

THC
Cocaine
Heroin
MDMA
Methamphetamine
Hydrocodone

Explosives

C-4
RDX
PETN
TNT
NG
HMX
Semtex H
Semtex A

OTC pharmaceuticals

Mucinex DM
Aleve
Sudafed
Alka-Selzter Plus Nighttime
Ibuprofen
Tylenol
Asprin

*Pseudoephedrine – 330, 165, 118, 77

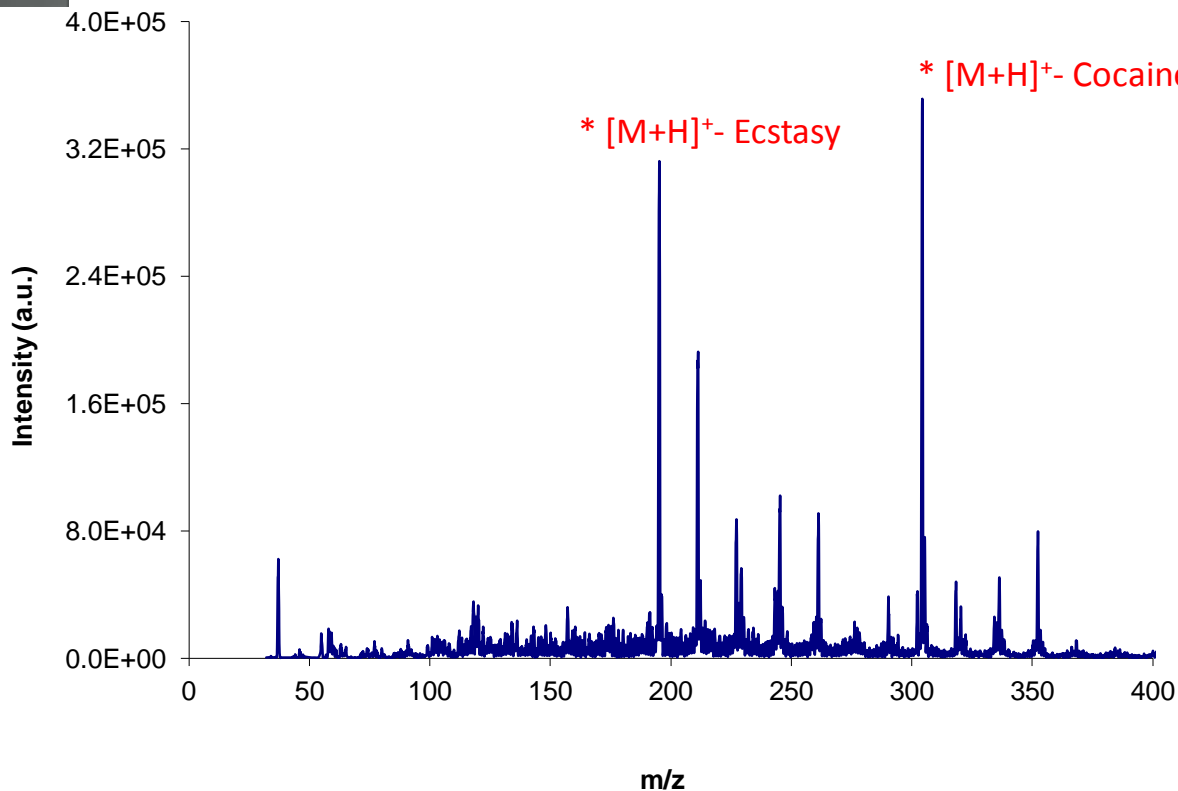

*Methamphetamine – 150, 134, 58

Plasma: APGD-MS Analysis of Ecstasy and Cocaine Mixture

MW = 193

MW = 303

Plasma: Low Temperature Plasma – Explosive Particles

■ -Q1: 87 MCA scans from Sample 7 (SEMTEX H) of LTP w/ff (Nanospray)

Max: 7.3e7 cps

SEMTEX H

■ -Q1: 36 MCA scans from Sample 8 (SEMTEX A) of LTP w/ff (Nanospray)

Max: 1.3e8 cps

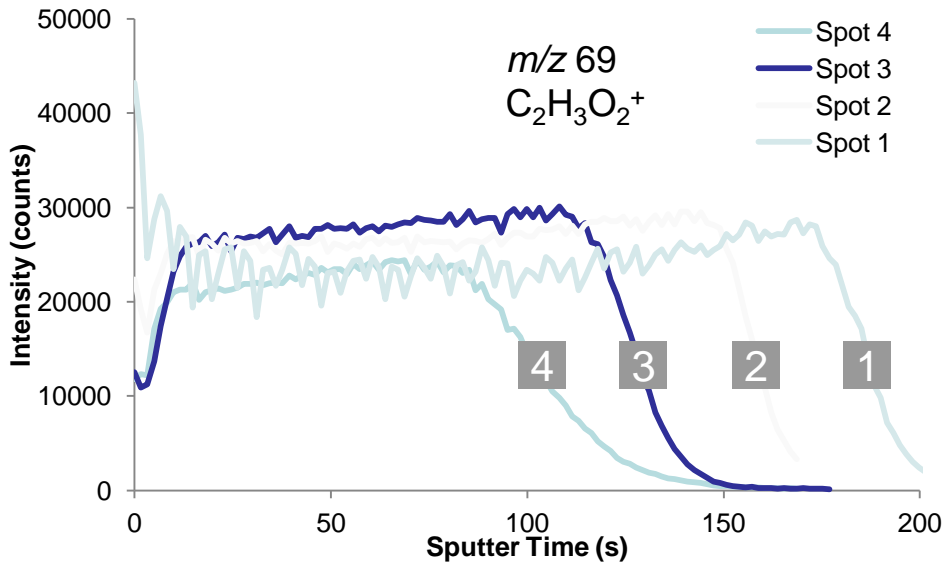

SEMTEX A

Plasma: LTP Depth Profiling - PMMA

SIMS depth profiling can reveal changes in chemistry along the depth of the film

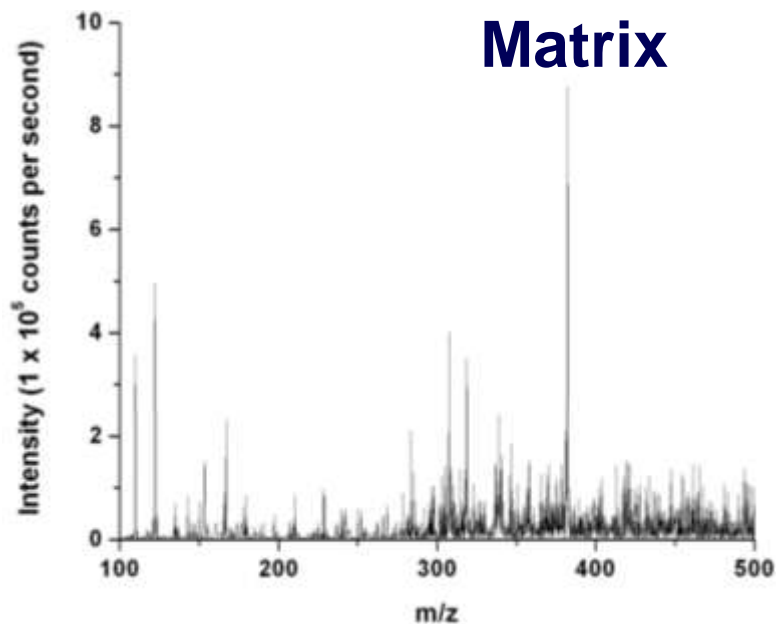

Results suggest damage is localized at the surface, and the extent of damage seems proportional to plasma exposure. In the sub-surface region, the intensity is seen to quickly return to steady state values

Laser: AP Laser Diode Thermal Desorption Mass Spectrometry (LDTD-MS)

Laser: Narcotics on Currency with AP-MALDI

0.5 μ L CHCA matrix on US Currency with doped heroin

Thermal: AP Thermal Desorption Ionization - Mass Spectrometry (APTDI-MS)

Thermal wire rapidly heated
without subsequent
ionization technique of both
liquids and solids

How do we evaluate APIMS Systems? - Standard Test Materials

- *Flexible – many different compounds*
- *Rapid*
- *Large dynamic range in mass*
- *Quantifiable*
- *Precise high*
- *Accuracy approximately 5% depending on material and the ability to measure starting material purity*

Stability of drop size during ~2 hours of jetting

	mean	SD	RSD
Mass, ng	48.7	0.10	0.2 %
Volume, pL	60.5	0.12	0.2 %

500 μm image field SIMS of single inkjet droplet of cocaine on silicon

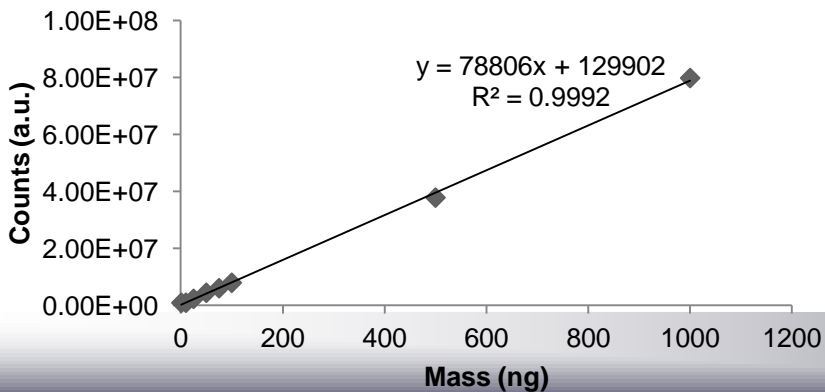

Preliminary Quantification with Inkjet Printing

Plasma: APGD of Cocaine

Liquid: DESI of Cocaine and RDX

Cocaine

RDX

Useful Yields for APIMS Analysis

SIMS community have used for years, there is also growing interest in APIMS.

But, how sensitive are these method of analysis? How does sensitivity vary between compounds, ion source type and instrument configurations?

One method for evaluation is to measure the useful yield.

Useful yield = number of molecules detected/molecules in analytical volume.

The useful yield takes into account beam induced damage, ionization probability, instrument transmission and detector efficiency. *It is the best measure of the analytical sensitivity for a given molecule under a given set of experimental conditions.*

Useful yields of organic molecules under dynamic SIMS cluster bombardment, Greg Gillen, Christopher Szakal, Tim M. Brewer, Surf. Interface Anal. 43, 376. 2011

Useful Yield Calculations

Compound	Ion	m/z	DESI	APGD	LDTD	DEFFI	LTP	APTDI
Cocaine	(M+H) ⁺	304	7.5x10 ⁻⁸	1.8x10 ⁻⁸				2.5x10 ⁻¹¹
TNT	(M-H) ⁻	226	6.5x10 ⁻⁸		3.9x10 ⁻¹⁰		7.7x10 ⁻⁷	3.1x10 ⁻¹²
RDX	(M+NO ₃) ⁻	284	2.5x10 ⁻⁸	2.5x10 ⁻⁸	3.2x10 ⁻⁸	3.5x10 ⁻⁷		5.2x10 ⁻¹²
	(M+ ³⁵ Cl) ⁻	235	3.9x10 ⁻⁷					
PETN	(M+NO ₃) ⁻	378	6.8x10 ⁻⁸	5.9x10 ⁻⁸	2.5x10 ⁻⁹	6.5x10 ⁻⁸		
	(M+ ³⁵ Cl) ⁻	351	1.5x10 ⁻⁸					
AN	(NO ₃) ⁻	62			1.5x10 ⁻¹⁰		7.0x10 ⁻⁷	

Conclusions

- Develop next generation technologies
 - Multi-source approach
 - Mixture analysis without chromatographic separation
- Improved technologies for high throughput forensic analysis
 - Multi-source approach for API-MS of trace and forensic contraband materials allows for fast, chemical surface analysis of a wide range of materials on multiple substrates
 - Characteristic mass spectra for all molecules studied from multiple sampling media
- Objectively evaluate the API sources by leveraging inkjet printing
 - A procedure and test materials have been developed to quantify the difference sources
 - A procedure and test materials have been developed measure useful yields of a range of organic compounds

DESI Source Research - Schlieren imaging
