Foreword

The National Standard Reference Data System provides access to the quantitative data of physical science, critically evaluated and compiled for convenience and readily accessible through a variety of distribution channels. The System was established in 1963 by action of the President's Office of Science and Technology and the Federal Council for Science and Technology, and responsibility to administer it was assigned to the National Bureau of Standards.

NSRDS receives advice and planning assistance from a Review Committee of the National Research Council of the National Academy of Sciences-National Academy of Engineering. A number of Advisory Panels, each concerned with a single technical area, meet regularly to examine major portions of the program, assign relative priorities, and identify specific key problems in need of further attention. For selected specific topics, the Advisory Panels sponsor subpanels which make detailed studies of users' needs, the present state of knowledge, and existing data resources as a basis for recommending one or more data compilation activities. This assembly of advisory services contributes greatly to the guidance of NSRDS activities.

The System now includes a complex of data centers and other activities in academic institutions and other laboratories. Components of the NSRDS produce compilations of critically evaluated data, reviews of the state of quantitative knowledge in specialized areas, and computations of useful functions derived from standard reference data. The centers and projects also establish criteria for evaluation and compilation of data and recommend improvements in experimental techniques. They are normally associated with research in the relevant field.

The technical scope of NSRDS is indicated by the categories of projects active or being planned: nuclear properties, atomic and molecular properties, solid state properties, thermodynamic and transport properties, chemical kinetics, and colloid and surface properties.

Reliable data on the properties of matter and materials are a major foundation of scientific and technical progress. Such important activities as basic scientific research, industrial quality control, development of new materials for building and other technologies, measuring and correcting environmental pollution depend on quality reference data. In NSRDS, the Bureau's responsibility to support American science, industry, and commerce is vitally fulfilled.

ERNEST AMBLER, *Director*

Preface

This series of publications is aimed at providing physical properties data on materials used in energy storage systems. It was inspired by a requirement in the Department of Energy's Division of Energy Storage Systems for materials property data needed by its contractors in the timely development of energy storage devices. As prime contractor for this program, the Lawrence Livermore Laboratory (LLL) has requested the Office of Standard Reference Data (OSRD) to manage the task of gathering the data, using its established network of data centers and other identified sources of expertise. The OSRD monitors the progress of work, reviews the results, and conveys the numerical data to LLL where the data are converted for entry into an automated data storage and retrieval system. Every effort is made to supply data which have been critically examined in light of the latest knowledge concerning theory and experiment. However it must be recognized that in a rapidly moving technology some of the data will be superseded rather quickly as new materials and techniques are introduced. Thus access to the data via computer terminal as well as publication in this series should help provide the practitioner with timely and useful data which he requires to solve his problems in energy storage.

Physical Properties Data Compilations

Relevant to Energy Storage

I. Molten Salts: Eutectic Data

George J. Janz, Carolyn B. Allen, Joseph R. Downey, Jr., and R. P. T. Tomkins

Molten Salts Data Center, Cogswell Laboratory, Rensselaer Polytechnic Institute, Troy, New York 12181

The present compilation provides an authoritative compendium of melting points, and compositions of molten salt eutectic mixtures. Data for mixtures melting in the range -138°C to 2800°C are reported. Value judgments have not been attempted. Titles of the articles in the literature citations and a system index are included for approximately 6000 eutectic entries.

Key words: Data compilation; eutectic; eutectic composition; eutectic data; eutectic temperature; inorganic compound; melting point; molten salt; phase diagrams.

Introduction

An analysis of energy-related research and development programs shows the emergence of thermal energy storage, advanced batteries, and coal gasification as well-defined areas in the past decade. The potential of inorganic compounds and their mixtures in these technologies is receiving consideration from various practical viewpoints, for example, the relatively large latent enthalpies that accompany the process of melting have directed consideration of such materials in the design of a series of "second-generation" thermal energy storage subsystems of considerably greater capacity than the systems utilizing the storage capacity of fluids (such as water) and rocks. As molten salts, the features of large liquid state ranges, low vapor pressures, high electrical conductivities, and good viscosities are important considerations relative to diverse applications, such as heat transfer fluids, solvents, reaction media, and as molten electrolytes.

While the accumulated store of information on molten salts is considerable, and while several authoritative molten salts treatises have appeared in the past two decades [1-7] ¹ a basic difficulty to the potential utilization of such materials is the diversity of the information sources.

The present communication reports the results of a compilation of data for eutectic systems (melting points; compositions), undertaken to provide an authoritative reference for such systems. A partial list of some of the more useful compilations of phase diagrams would include

International Critical Tables [8], Landolt-Bornstein [9] Clark [10], Robertson [11], Thoma [12], Voskresenskaya [13], Sinistri et al. [14], Shaffer [15], Franzozini et al. [16], Torapov et al. [17], and Levin et al. [18]. Such sources, as well as the primary research literature, were used to develop the summary reported here.

In the compilation of eutectic data, a listing by increasing melting temperatures has been adopted. The temperature range covered is from -138°C to 2800°C . The composition data are reported as mole percent. Value judgments have not been attempted, and where two or more sets of results were reported, these are listed as individual entries. While it was the intent to limit this compilation to inorganics, some organic compounds appeared particularly relevant and these have been included. To enable the location of the data entries by the materials (i.e., salts), both a systems index and a compound index were developed and are included. In the citation of the primary literature, titles have been generally included as part of the bibliography as a further aid on the matter of data origin.

It should be noted that this compilation is an effort to provide an authoritative and comprehensive collection of eutectic data to June 1976. Considerations of safety and hazards, and corrosion and containment are important factors, but fall outside the scope of the present communication. An assessment of these factors for inorganic compounds and their mixtures as molten salts has been completed and has been published elsewhere [19].

¹ Figures in brackets indicate literature references for the introduction.

Acknowledgments

We found the significant contribution by Paul V. Clark (Albuquerque, N.M.) a particularly helpful staging area; without this, our task would have been much more difficult.

The completion of this work owes much to the participation of Mary Leu Waldron, Elizabeth Schoonmaker, Mark J. Chudzicki, Ralph G. Kornbrekke, Timothy P. Walker, Keith M. Smith, and Katherine Petrarca at the

Molten Salts Data Center—Rensselaer Polytechnic Institute. We acknowledge this with pleasure.

We thank David R. Lide, Jr., Howard J. White, Jr., and Lewis H. Gevantman (Office of Standard Reference Data, National Bureau of Standards) for continued interest and helpful suggestions. The assistance provided by the Data Systems Design Group and the Computer Assisted Printing Section of NBS is acknowledged.

Eutectic Data

Table 1 reports data on inorganic eutectics current to June 1976. Also included are systems which form a series of solid solutions with minimum melting point; some solid solutions systems with no minimum melting point are included to provide reference to a system which may be under consideration. Some organic systems are also included, notably the formates and acetates, but coverage is not as complete as for the inorganic systems.

The table is arranged in order of increasing melting point; systems which have no eutectic melting point, e.g. solid solutions without minimum, are listed at the end of the table. It should be kept in mind that a specific eutectic for a given system may not be the one with the lowest melting point. In order to locate the minimum melting eutectic for a given system (or to determine whether a given system forms a eutectic) reference must be made to the System Index.

No attempt at value judgments has been made in the course of this compilation. All available data are included even where conflicts are evident. The reader is left to establish his own "best" values for the eutectic information and the systems index should be useful for this task.

The comments column refers to the melting point column in degrees celsius. In addition several abbreviations have been used in the table and are listed herewith.

15. SUPPLEMENTARY NOTES Library of Congress Catalog Card Number: 77-10824			
16. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.) The present compilation provides an authoritative compendium of melting points, and compositions of molten salt eutectic mixtures. Data for mixtures melting in the range - 138°C to 2800°C are reported. Value judgments have not been attempted. Titles of the articles in the literature citations and a system index are included for approximately 6000 eutectic entries.			
17. KEY WORDS (six to twelve entries; alphabetical order; capitalize only the first letter of the first key word unless a proper name; separated by semicolons) Data compilation; eutectic; eutectic composition; eutectic data; eutectic temperature; inorganic compound; melting point; molten salt; phase diagrams
