# Three Simple Steps that will Revolutionize Your ML Research

*Step 1: Gather lots of training data!*

*Step 2: Apply Deep Learning!!*

*Step 3: Observe Impressive Gains!!!*

# Broad Coverage Semantics

## Example Tasks:

### Coreference: clustering NPs

A fire in a Bangladeshi garment factory has left at least 37 people dead and 100 hospitalized. Most of the deceased were killed in the crush as workers tried to flee the blaze in the four-story building.

### Semantic Role Labeling: who did what, etc.

an X-ray flare 400 times brighter than usual

TMP

On January 5, 2015

## Many applications:

Question Answering

Information Extraction

Machine Translation

# Does the Recipe Work for Broad Coverage Semantics?

*Step 1: Gather lots of training data!*

**Challenge 1: Data is costly and limited  
(e.g. linguists required to label  
PennTreebank / OntoNotes)**

*Step 2: Apply Deep Learning!!*

**Challenge 2: Pipeline of structured  
prediction problems with cascading errors  
(e.g. POS->Parsing->SRL->Coref)**

*Step 3: Observe Impressive Gains!!!*

# New Learning Approaches

*New state-of-the-art results for two tasks:*

## Coreference:

A fire in a Bangladeshi garment factory has left at least 37 people dead and 100 hospitalized. Most of the deceased were killed in the crush as workers tried to flee the blaze in the four-story building.

## Semantic Role Labeling:

ARG0

NASA

PRED

observe

ARG1

an X-ray flare 400 times brighter than usual

TMP

On January 5, 2015

## *Common themes:*

- End-to-end training of deep neural networks
- No preprocessing (e.g., no POS, no parser, etc.)
- Large gains in accuracy with simpler models and no extra training data

# Semantic Role Labeling (SRL)

role label

- who
- what
- when
- where
- why
- ...

predicate

argument

The robot broke my favorite mug with a wrench.

breaker  
ARG0

thing broken  
ARG1

instrument  
ARG2

My mug broke into pieces immediately.

thing broken

Predicted coreference link

# Span Ranking Model

$$\begin{aligned} P(y_1, \dots, y_M \mid D) &= \prod_{i=1}^M P(y_i \mid D) \\ &= \prod_{i=1}^M \frac{e^{s(i, y_i)}}{\sum_{y' \in \mathcal{Y}(i)} e^{s(i, y')}} \end{aligned}$$

Factor coreference score  $s(i, j)$  to enable span pruning:

$$s(i, j) = \begin{cases} s_m(i) + s_m(j) + s_a(i, j) & j \neq \epsilon \\ 0 & j = \epsilon \end{cases}$$

# Span Ranking Model

$$P(y_1, \dots, y_M \mid D) = \prod_{i=1}^M P(y_i \mid D)$$

$$\frac{e^{s(i, y_i)}}{\sum_{y' \in \mathcal{Y}(i)} e^{s(i, y')}}$$

Is this span a mention?

Factor coreference score  $s(i, j)$  to enable span pruning:

$$s(i, j) = \begin{cases} s_m(i) + s_m(j) + s_a(i, j) & j \neq \epsilon \\ 0 & j = \epsilon \end{cases}$$

# Span Ranking Model

$$P(y_1, \dots, y_M \mid D) = \prod_{i=1}^M P(y_i \mid D)$$
$$= \prod_{i=1}^M \frac{e^{s(i, y_i)}}{\sum_{(i, y)} e^{s(i, y)}}$$

Is span  $j$  an antecedent of span  $i$ ?

Factor coreference score  $s(i, j)$  to enable span pruning:

$$s(i, j) = \begin{cases} s_m(i) + s_m(j) + s_a(i, j) & j \neq \epsilon \\ 0 & j = \epsilon \end{cases}$$

# Span Ranking Model

$$\begin{aligned} P(y_1, \dots, y_M \mid D) &= \prod_{i=1}^M P(y_i \mid D) \\ &= \prod_{i=1}^M \frac{e^{s(i, y_i)}}{\sum_{y' \in \mathcal{Y}(i)} e^{s(i, y')}} \end{aligned}$$

Factor coreference score  $s(i, j)$  to enable span pruning:

$$s(i, j) = \begin{cases} s_m(i) + s_m(j) + s_a(i, j) & j \neq \epsilon \\ 0 & j = \epsilon \end{cases}$$

Dummy antecedent  
has a fixed zero score

# Experimental Setup

**Dataset:** English OntoNotes (CoNLL-2012)

**Genres:** Telephone conversations, newswire, newsgroups, broadcast conversation, broadcast news, weblogs

**Documents:** 2802 training, 343 development, 348 test

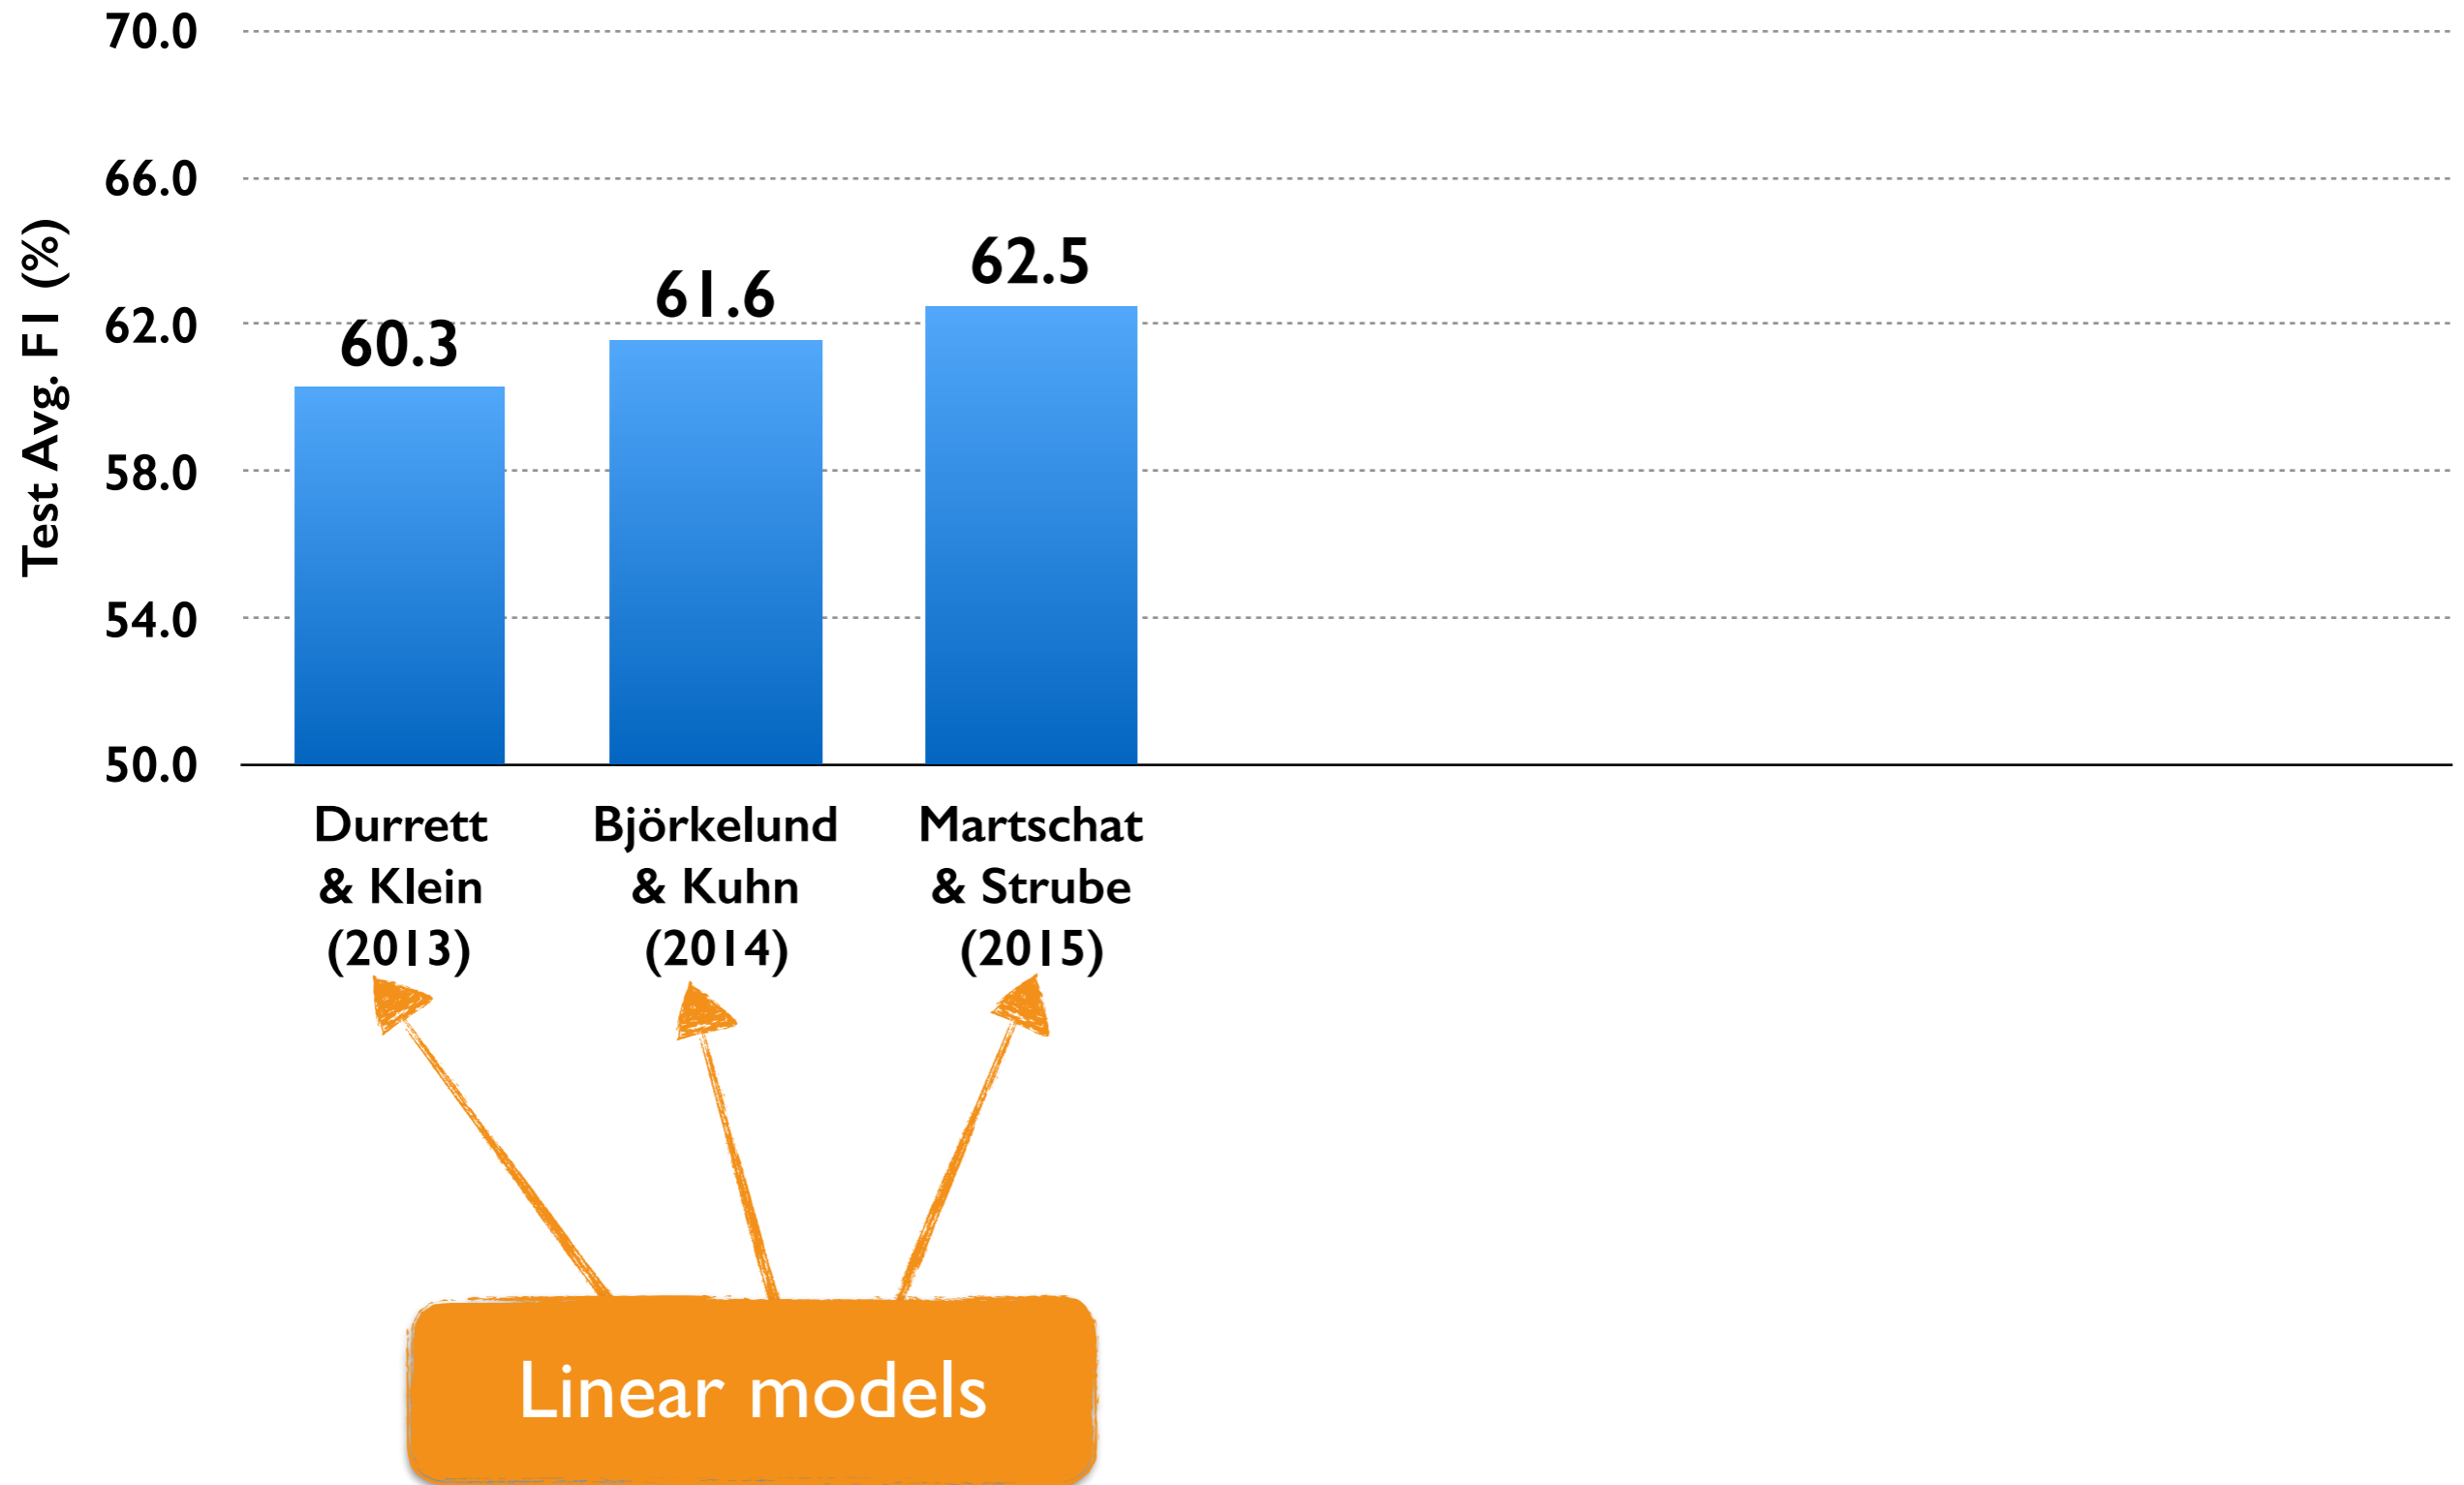

Longest document has 4009 words!

**Aggressive pruning:** Maximum span width, maximum sentence training, suppress spans with inconsistent bracketing, maximum number of antecedents

**Features:** distance between spans, span width

**Metadata:** speaker information, genre

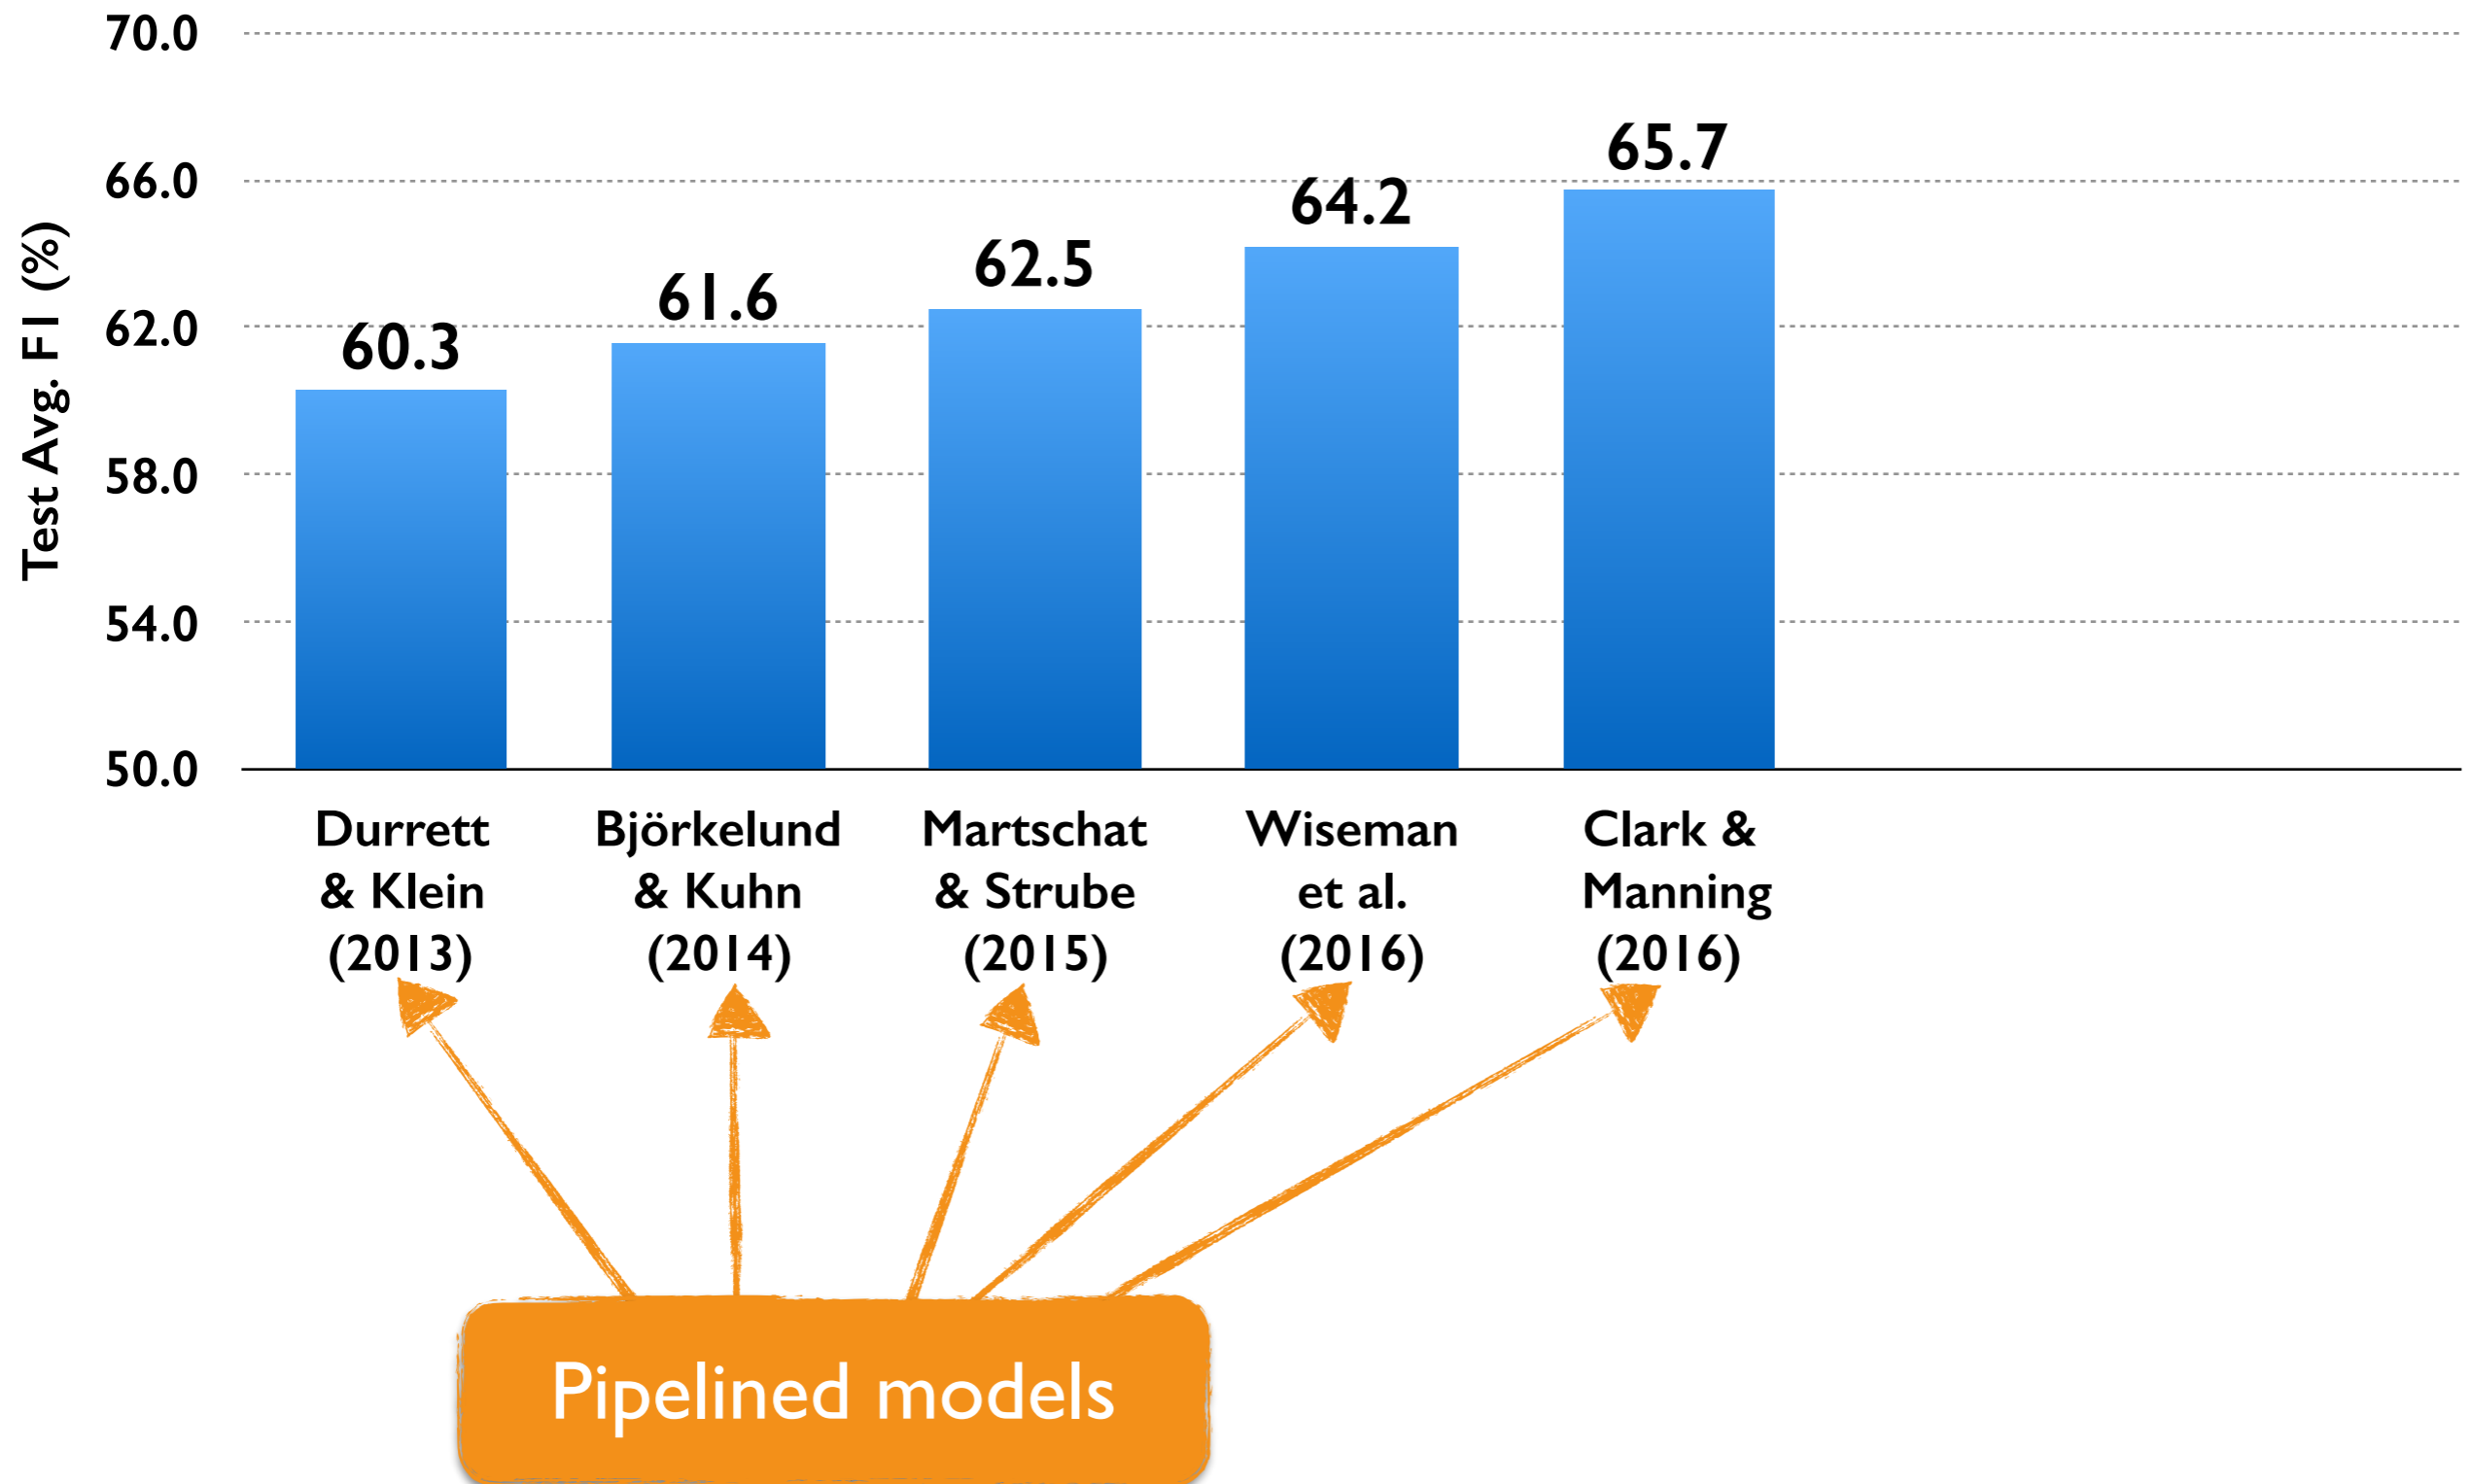

# Coreference Results

# Coreference Results

# Coreference Results

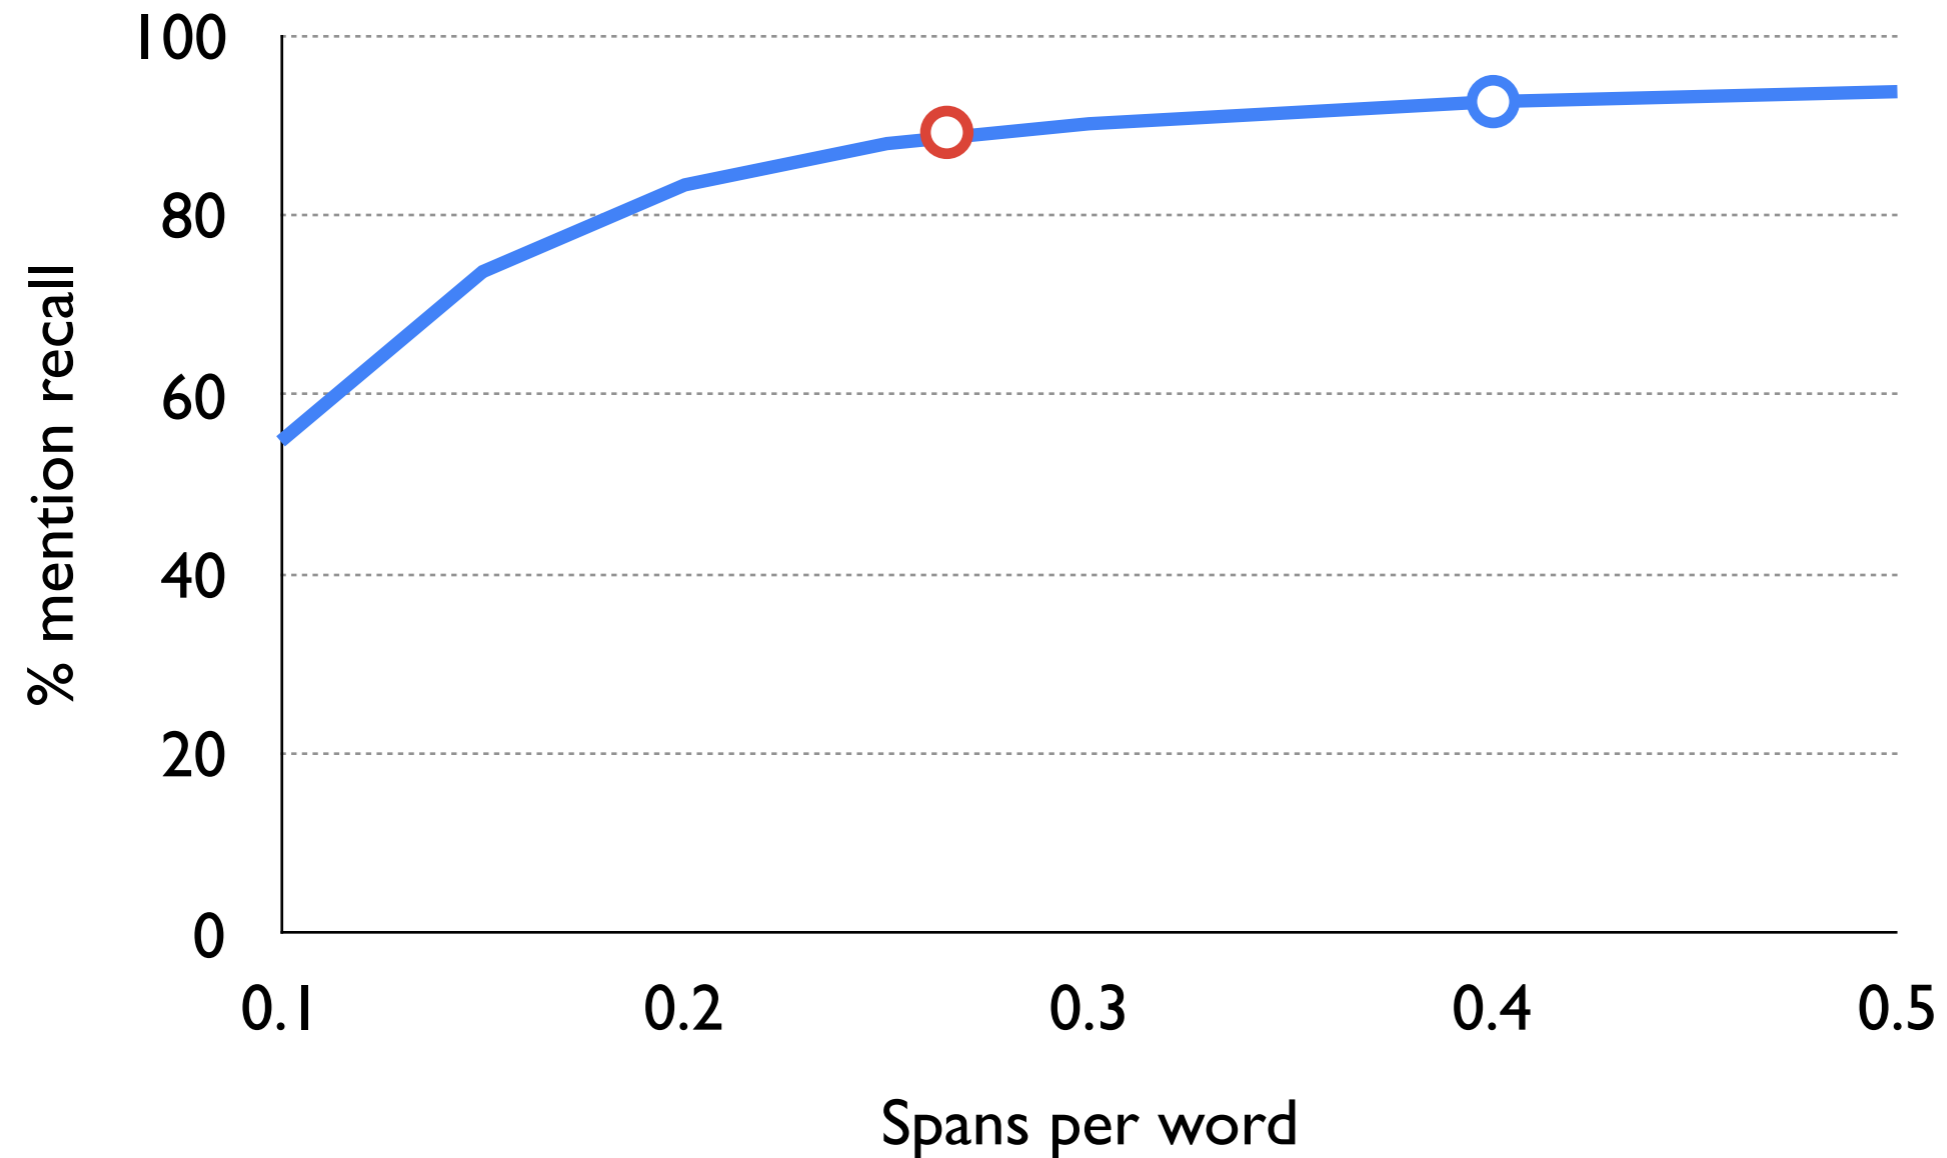

# Coreference Results

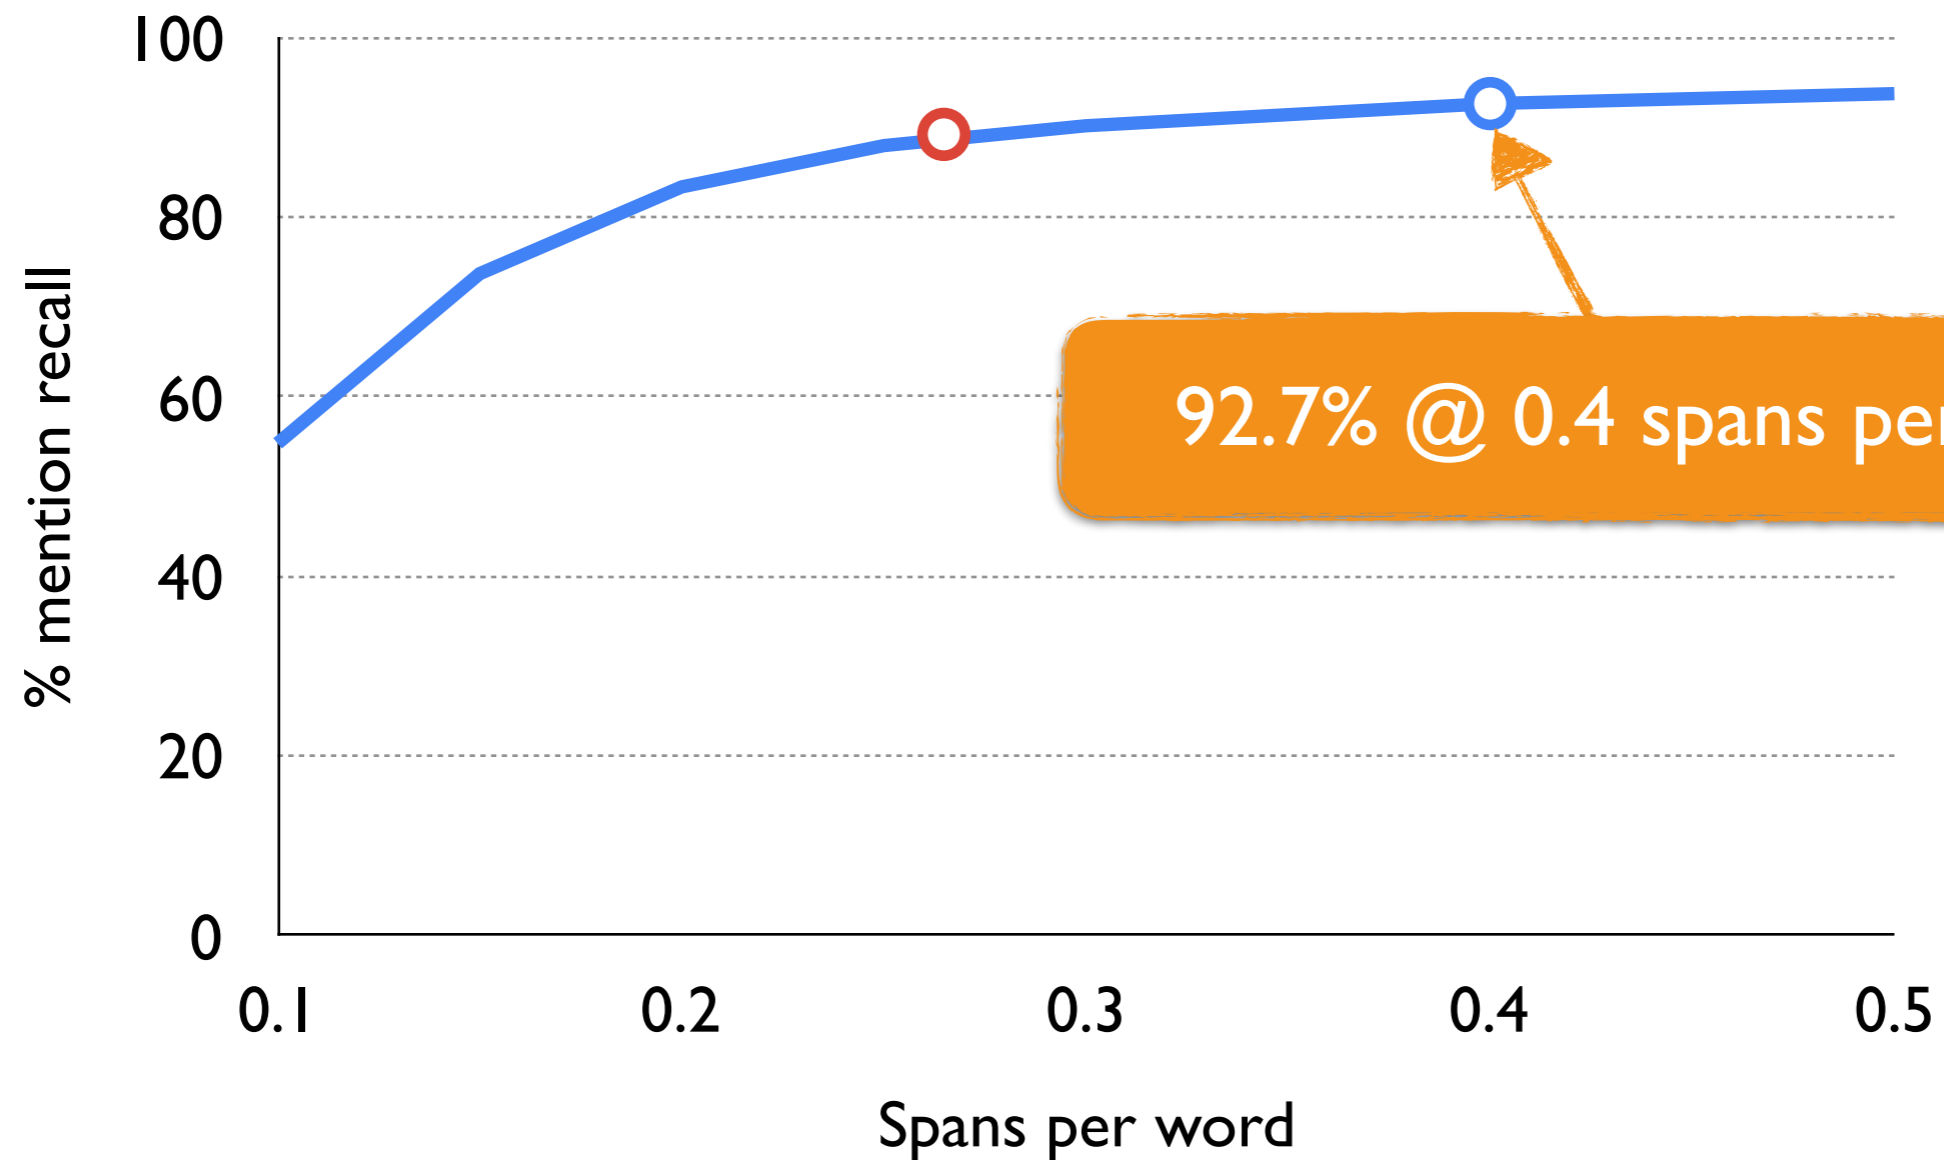

# Mention Recall

○ Raghunathan et al. (2010) ○ Our model (actual threshold) — Our model (various thresholds)

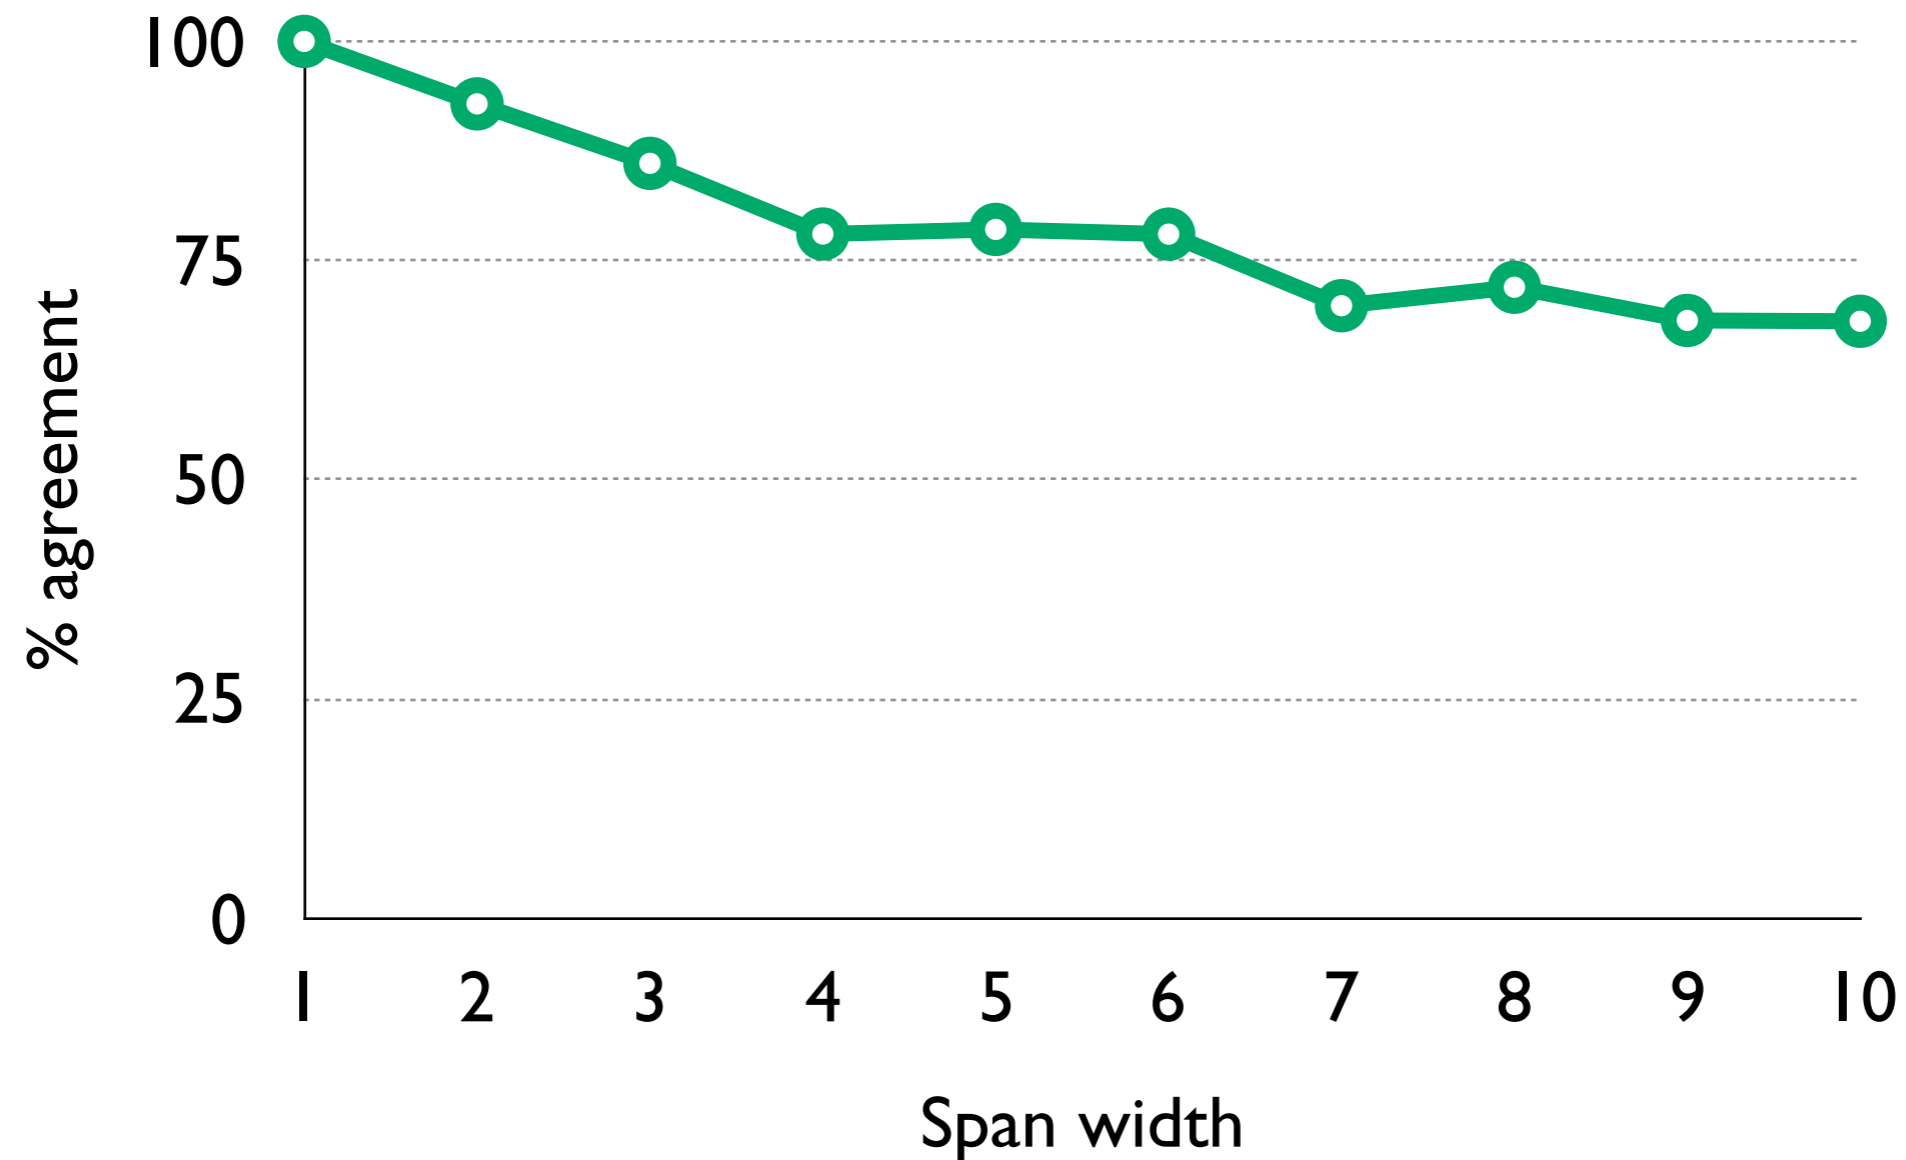

# Mention Recall

○ Raghunathan et al. (2010) ○ Our model (actual threshold) — Our model (various thresholds)

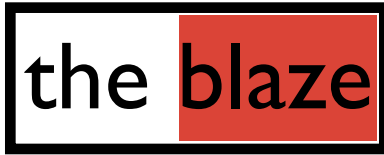

# Head-finding Agreement

% of constituent spans with predicted heads that agree with syntactic heads

# Qualitative Analysis

-  : Mention in a predicted cluster
-  : Head-finding attention weight

A  in a Bangladeshi garment factory  has left at least 37 people dead and 100 hospitalized. Most of the deceased were killed in the crush as workers tried to flee  the  in the four-story building.

# Qualitative Analysis

 : Mention in

 : Head-finding

Attention-based head finder facilitates soft similarity cues

A  in a Bangladeshi garment factory has left at least 37 people dead and 100 hospitalized. Most of the deceased were killed in the crush as workers tried to flee  in the four-story building.

# Qualitative Analysis

 : Mention in a predicted cluster

 : Head

Good head-finding requires word-order information!

A  fire in a Bangladeshi garment factory has left at least 37 people dead and 100 hospitalized. Most of the deceased were killed in the crush as workers tried to flee  the blaze in the four-story building.

# Common Error Case

-  : Mention in a predicted cluster
-  : Head-finding attention weight

The flight attendants have until 6:00 today to ratify labor concessions. The pilots union and ground crew did so yesterday.

# Common Error Case

-  : Mention in a predicted cluster
-  : Head-finding attention weight

The flight attendants have until 6:00 today  
to ratify labor concessions. The pilots  
union and ground crew did so yesterday.

with **paraphrasing**

# Does the Recipe Work for Broad Coverage Semantics?

*Step 1: Gather lots of training data!*

**Challenge 1: Data is costly and limited  
(e.g. linguists required to label  
PennTreebank / OntoNotes)**

*Step 2: Apply Deep Learning!!*

**Challenge 2: Pipeline of structured  
prediction problems with cascading errors  
(e.g. POS->Parsing->SRL->Coref)**

*Step 3: Observe Impressive Gains!!!*

# Where Will the Data Come From???

## **Option 1:** Semi-supervised learning

- E.g. word2vec and GloVe are in wide use  
[Mikolov et al., 2013; Pennington et al., 2014]
- Can we learn better word representations?

## **Option 2:** Supervised learning

- Can we gather more direct forms of supervision?

# Learning Better Word Representations

**Goal:** Model contextualized syntax and semantics

Character convolutions

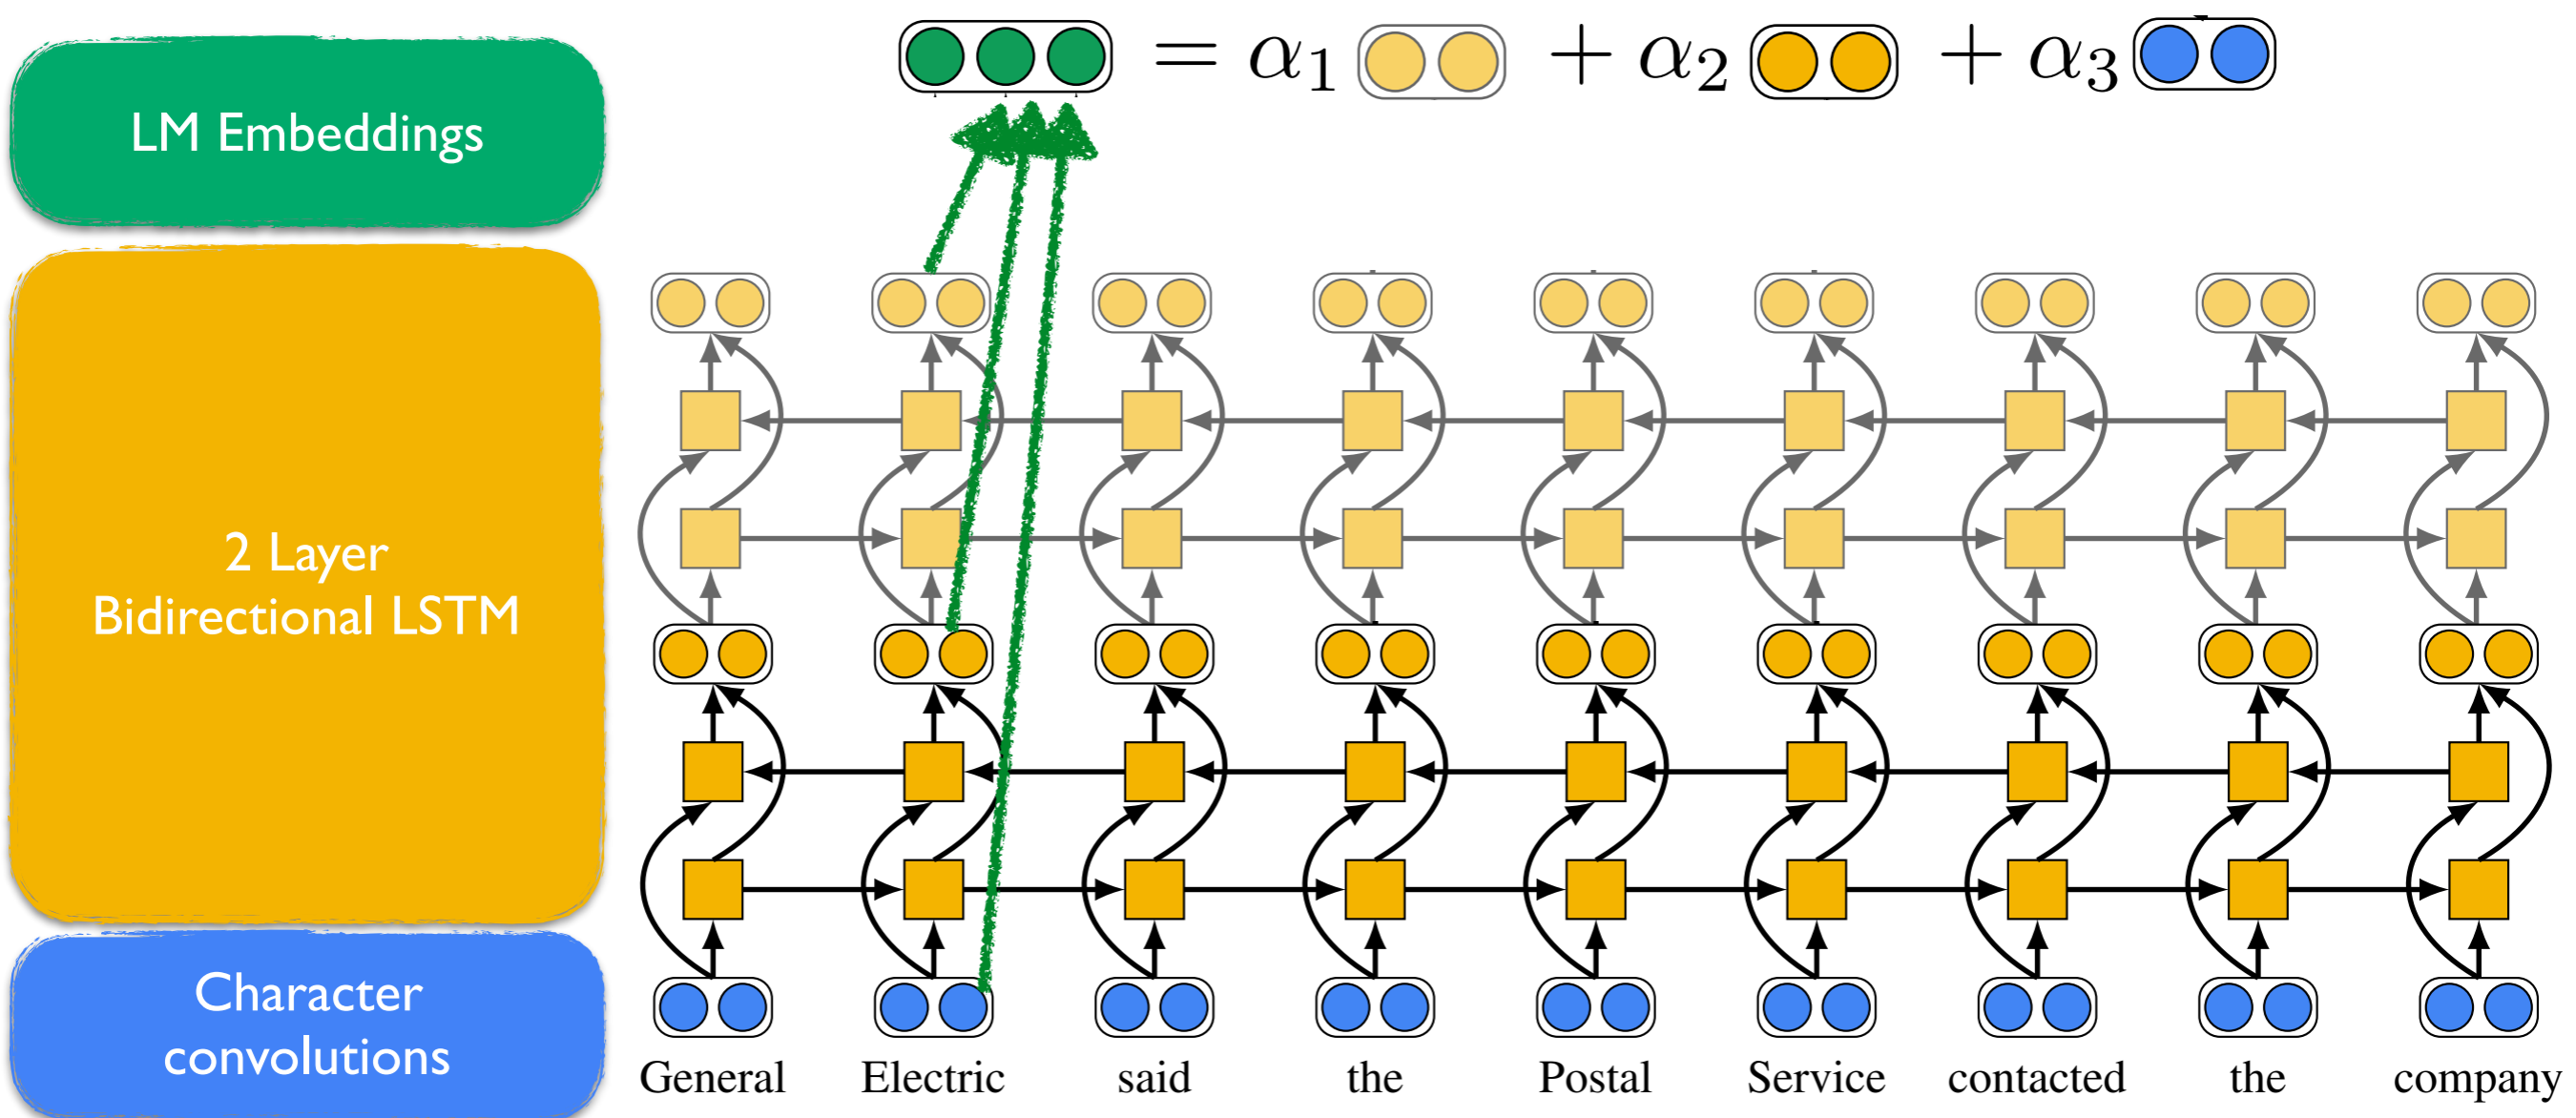

# Word Embeddings from a Language Model

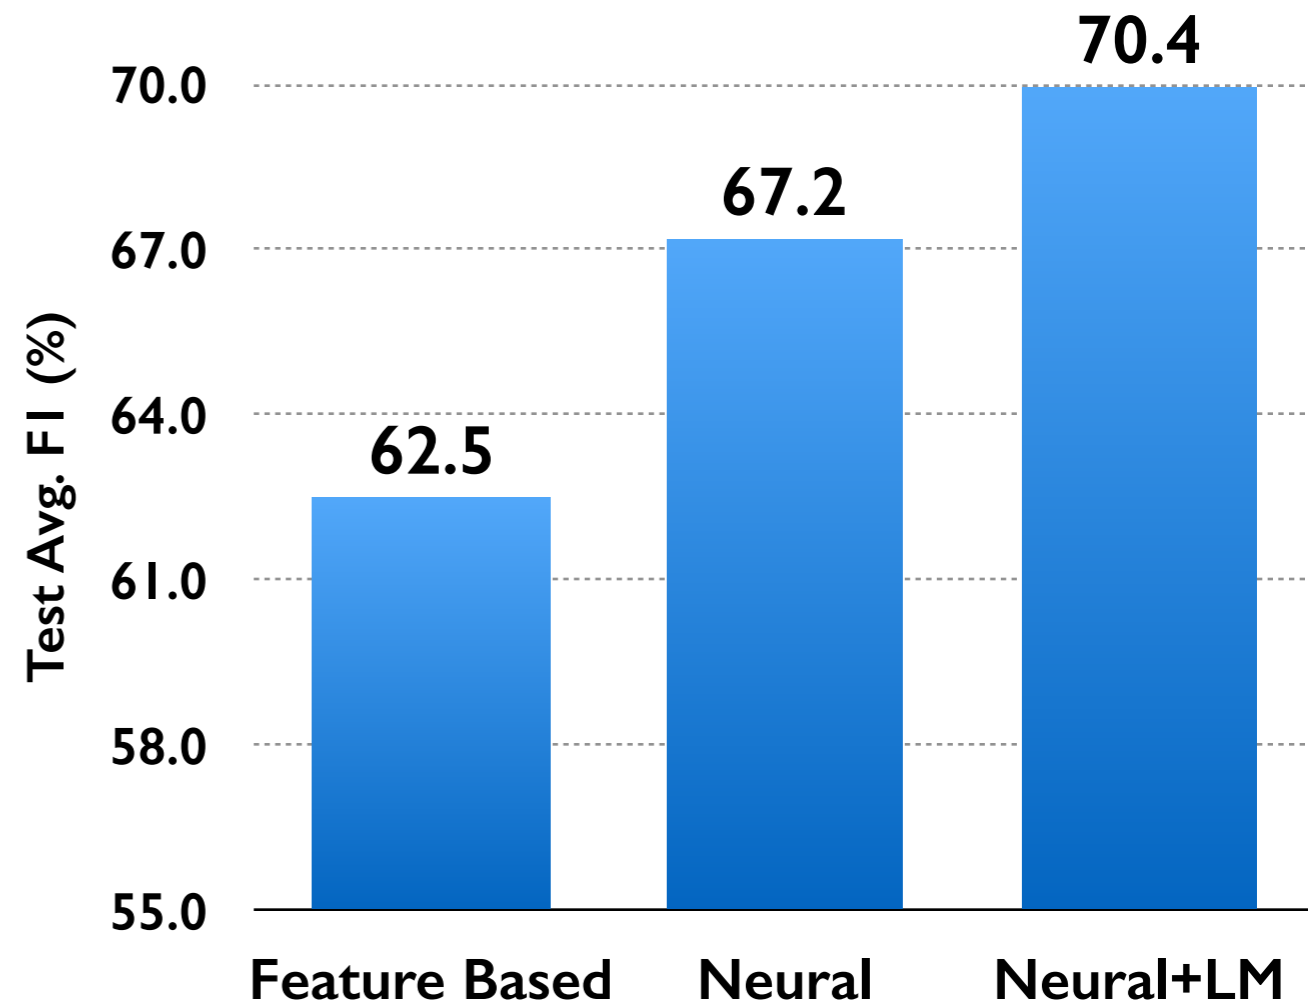

**Step 1:** Train a large BiLM on unlabeled data

**Step 2:** Compute linear function of pre-trained model

**Step 3:** Learn weights for each end task

# Best Single System Results

SRL  
(+2.9 FI)

Coreference  
(+3.2 FI)

# SOTA For Many Others Tasks

Previous SOTA      Baseline      Baseline+LM

# What Does it Learn?

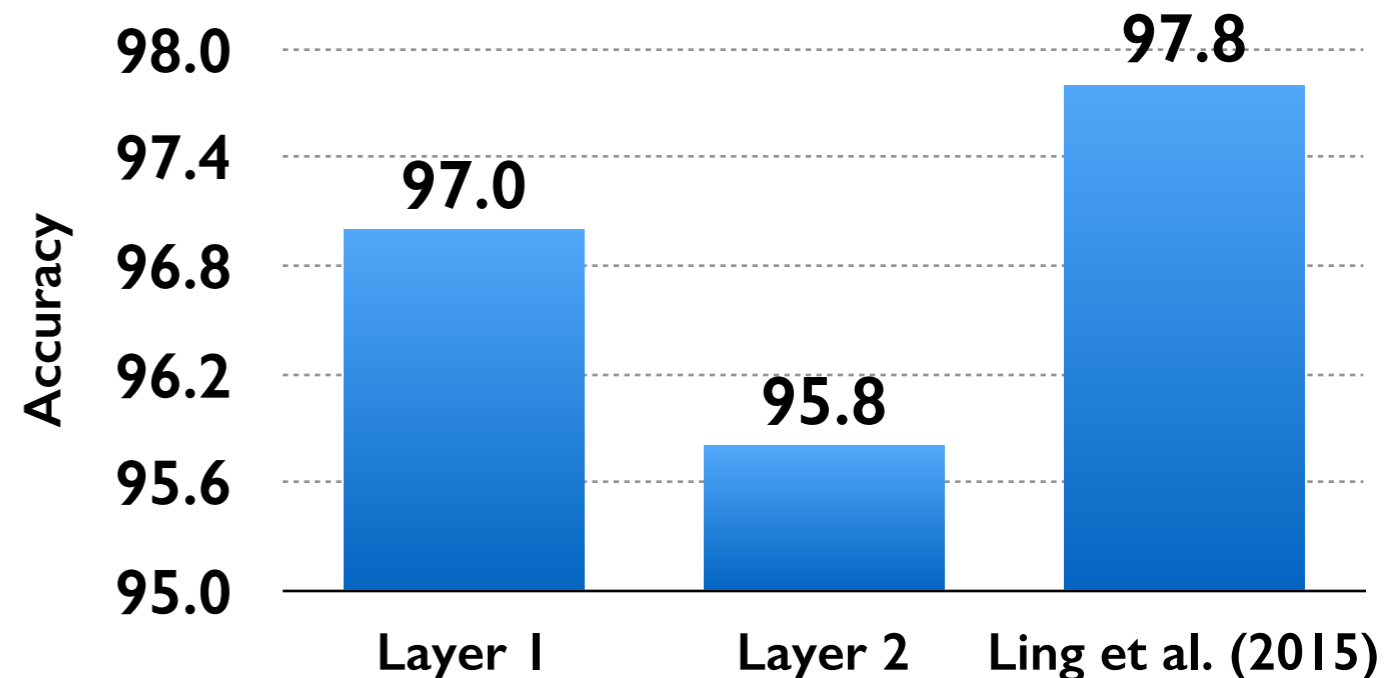

## Semantics:

- Supervised WSD task [Miller et al., 1994]
- Use N-th layer in NN classifier

## Syntax:

- Label POS corpus [Marcus et al., 1993]
- Learn classifier on N-th layer

# Where Will the Data Come From???

## **Option 1:** Semi-supervised learning

- E.g. word2vec and GloVe are in wide use  
[Mikolov et al., 2013; Pennington et al., 2014]

- Can we learn better word representations?

## **Option 2:** Supervised learning

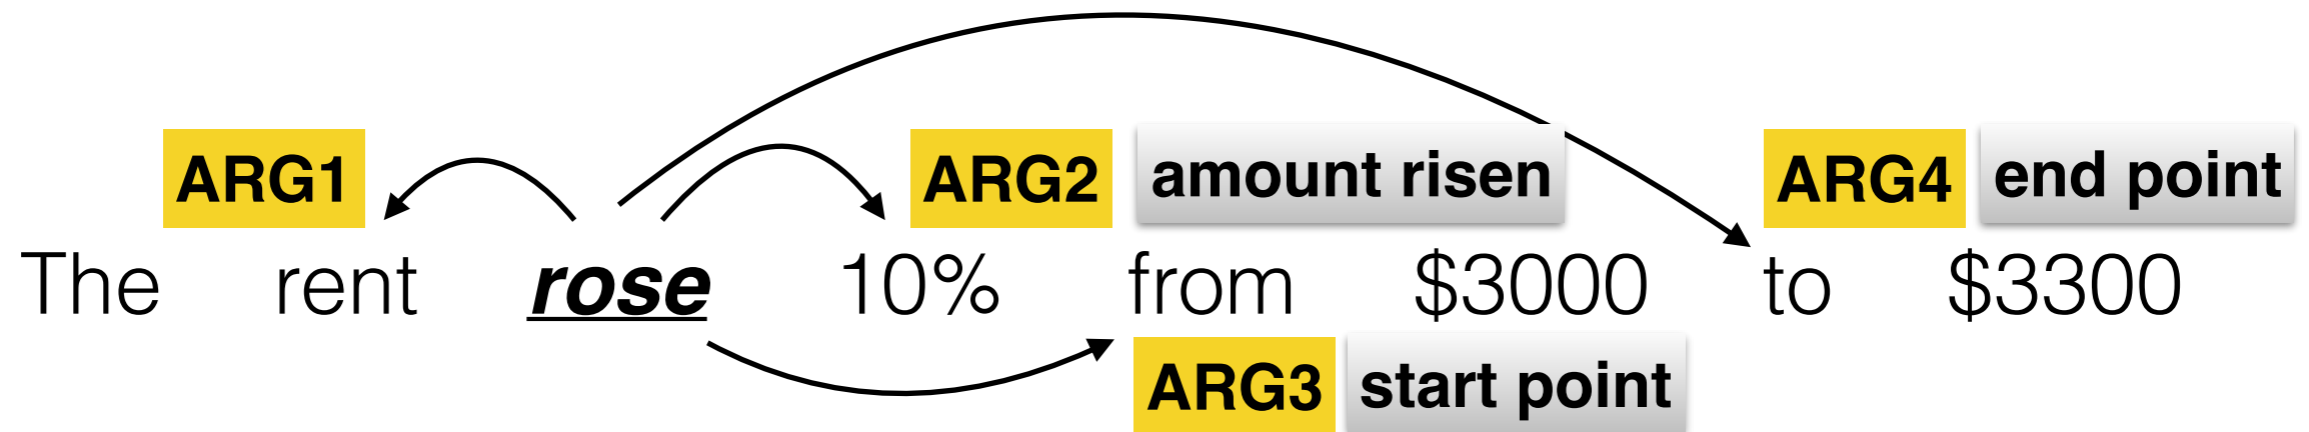

- Can we gather more direct forms of supervision?

# A First Data Step: QA-SRL

- Introduce a **new SRL** formulation with **no frame or role inventory**
- Use **question-answer pairs** to model verbal predicate-argument relations
- Annotated **over 3,000 sentences in weeks** with **non-expert**, part-time annotators
- Showed that this data is **high-quality** and **learnable**

[He et al, 2015]

# Previous Method: Annotation with Frames

**Frameset: rise.01 , go up**

**Arg1-:** *Logical subject, patient, thing rising*

**Arg2-EXT:** *EXT, amount risen*

**Arg3-DIR:** *start point*

**Arg4-LOC:** *end point*

**Argm-LOC:** *medium*

- Depends on pre-defined frame inventory, requires syntactic parses
- Annotators need to:
  - 1) Identify the Frameset
  - 2) Find arguments in the parse
  - 3) Assign labels accordingly
- If frame doesn't exist, create new

# Our Annotation Scheme

**Given sentence and a verb:**

They ***increased*** the rent this year .

**Step 1: Ask a question  
about the verb:**

Who increased something ?

**Step 2: Answer with words  
in the sentence:**

They

**Step 3: Repeat, write as many  
QA pairs as possible ...**

What is increased ?

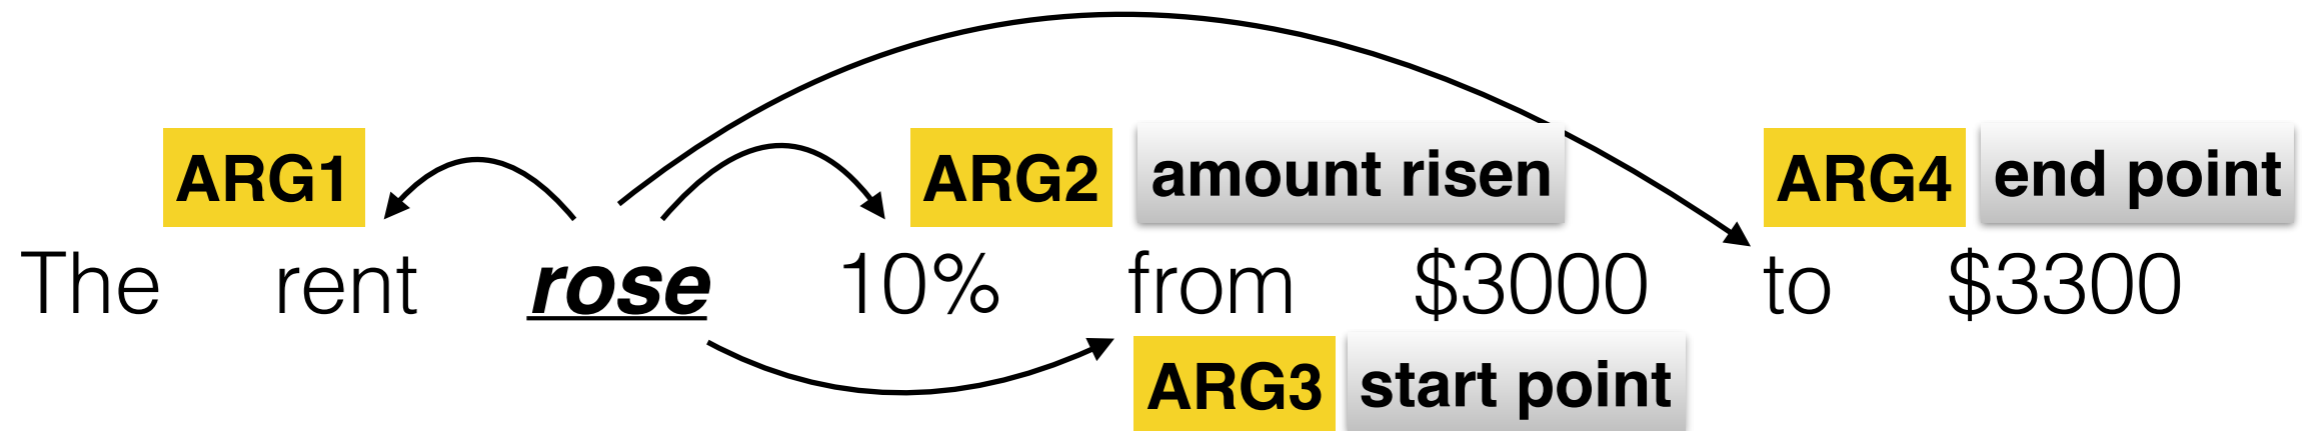

the rent

When is something increased ?

this year

# Our Method: Q/A Pairs for Semantic Relations

## Wh-Question

## Answer

What rose ?

the rent

How much did something rise ?

10%

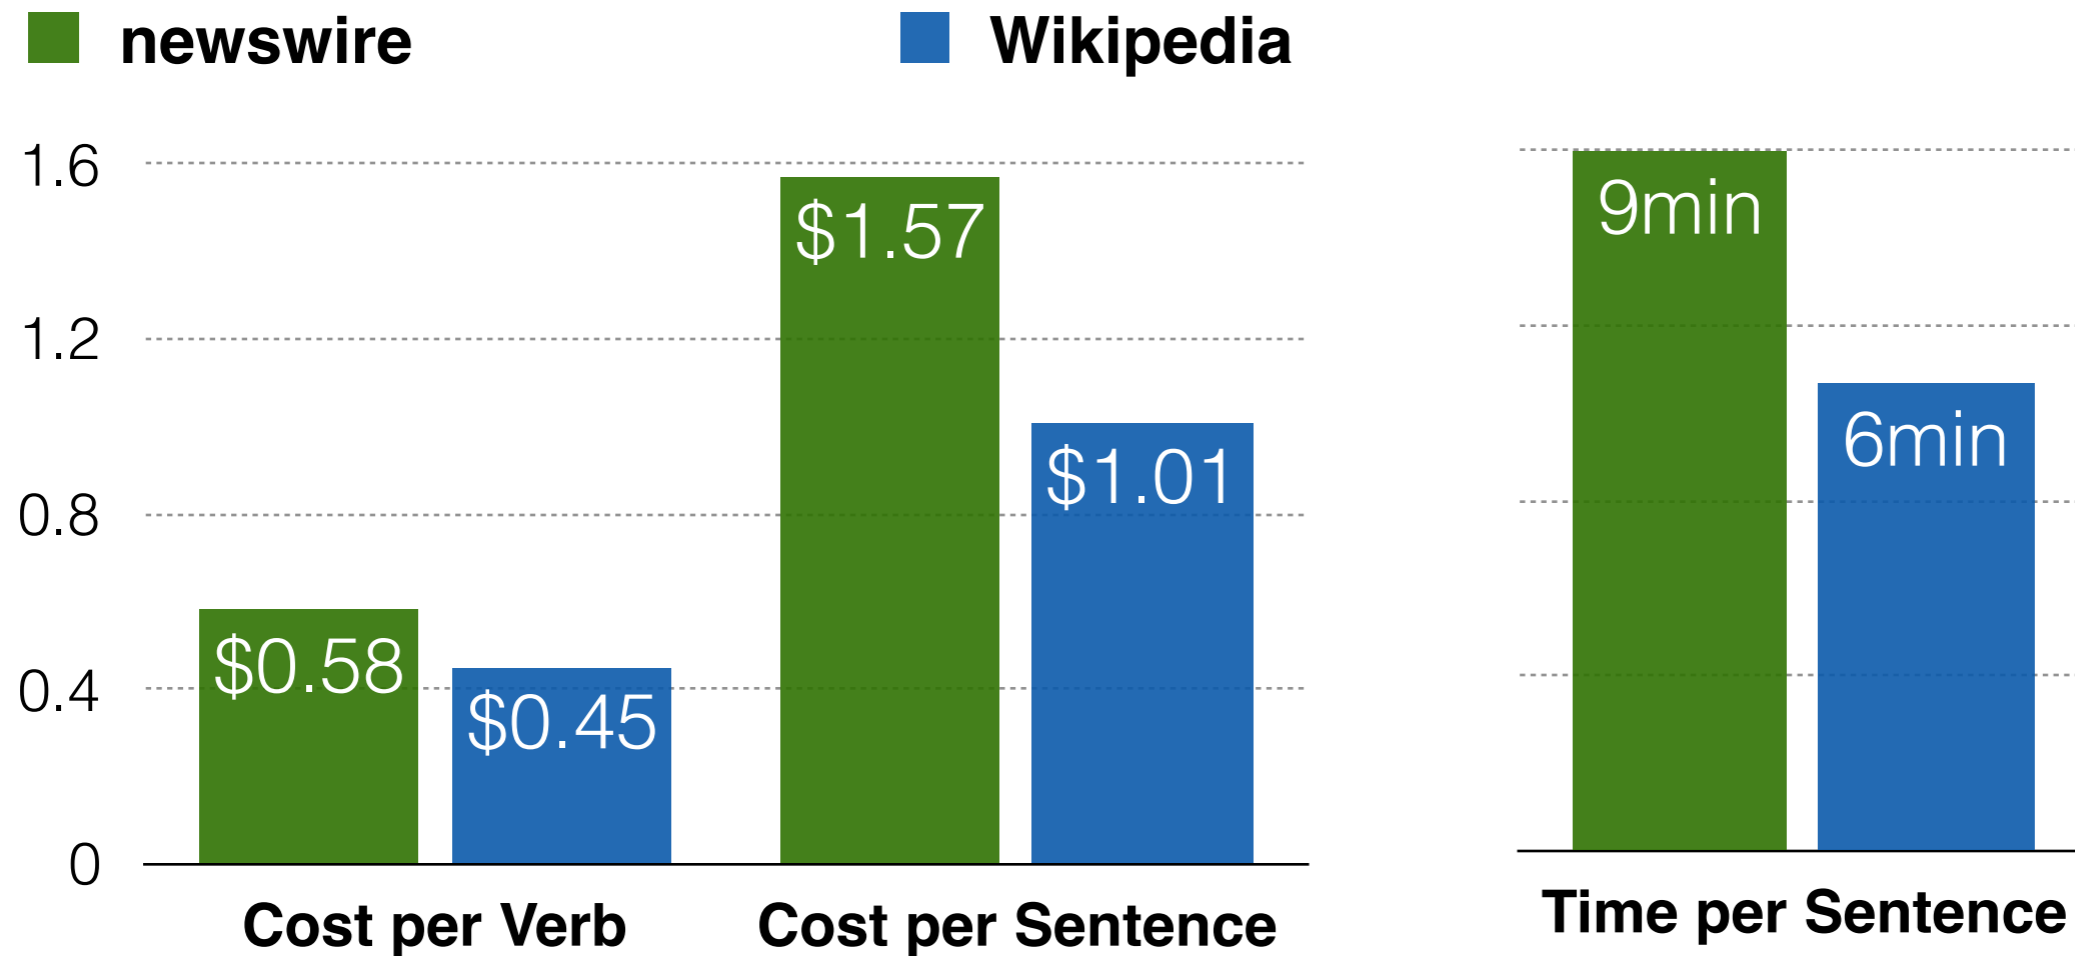

What did something rise from ?

\$3000

What did something rise to ?

\$3300

# Cost and Speed

- Part-time freelancers from [upwork.com](https://www.upwork.com) (hourly rate: \$10)
- ~2h screening process for native English proficiency

# Wh-words vs. PropBank Roles

	Who	What	When	Where	Why	How	HowMuch
<b>ARG0</b>	1575	414	3	5	17	28	2
<b>ARG1</b>	285	2481	4	25	20	23	95
<b>ARG2</b>	85	364	2	49	17	51	74
<b>ARG3</b>	11	62	7	8	4	16	31
<b>ARG4</b>	2	30	5	11	2	4	30
<b>ARG5</b>	0	0	0	1	0	2	0
<b>AM-ADV</b>	5	44	9	2	25	27	6
<b>AM-CAU</b>	0	3	1	0	23	1	0
<b>AM-DIR</b>	0	6	1	13	0	4	0
<b>AM-EXT</b>	0	4	0	0	0	5	5
<b>AM-LOC</b>	1	35	10	89	0	13	11
<b>AM-MNR</b>	5	47	2	8	4	108	14
<b>AM-PNC</b>	2	21	0	1	39	7	2
<b>AM-PRD</b>	1	1	0	0	0	1	0
<b>AM-TMP</b>	2	51	341	2	11	20	10

## **Advantages**

- Easily explained
- No pre-defined roles, few syntactic assumption
- Can capture implicit arguments
- Generalizable across domains

## **Limitations**

- Only modeling verbs (for now)
- Not annotating verb senses directly
- Can have multiple equivalent questions

## **Challenges**

- What questions to ask?
- How much data do we need?
- Can we generalize to other tasks, such as coref?

# Does the Recipe Work for Broad Coverage Semantics?

*Step 1: Gather lots of training data!*

**Challenge 1: Data is costly and limited  
(e.g. linguists required to label  
PennTreebank / OntoNotes)**

*Step 2: Apply Deep Learning!!*

**Challenge 2: Pipeline of structured  
prediction problems with cascading errors  
(e.g. POS->Parsing->SRL->Coref)**

*Step 3: Observe Impressive Gains!!!*

# Contributions

## Models

- End-to-end deep learning for SRL and coreference
- No preprocessing (e.g. no parser or POS tagger)

## Data

- Contextualized word embeddings from a language model
- First steps towards scalable data annotation

# The End: Questions?

## Future Directions

- Multi-task learning, given architectural similarities
- Multi-lingual should work, in theory...
- Need to scale up data annotation efforts, and focus on out of domain performance

## Recent Release
