Oxford

Powder diffraction: the best is yet to come, but...

Bill David,
ISIS Facility, Rutherford Appleton Laboratory, UK &
Inorganic Chemistry Laboratory, University of Oxford, UK

REPORT for Decade ending April 2013

Name: Powder diffraction Age: 97

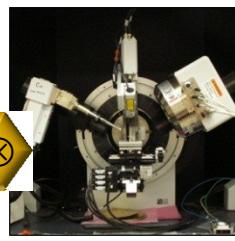

| | |
|----------------------|---|
| General observations | Excellent progress. |
| Technical subjects | Impressive new instruments with particular excellence in detectors and electronics. Has taken full advantage of Moore's Law. |
| Computer studies | Existing programs continue to perform well. Some extremely impressive new programs. Dabbling with new concepts. |
| Creative studies | Comes up with significant new creative ideas. |
| Attitude | Has matured and now has broadened interests. |
| Social skills | Very popular but can attract some unlikely characters with limited crystallographic skills. |
| Future prospects | Great potential - sure to go far. |

Consider the magnitude
of the endeavour ...

Isaac Newton

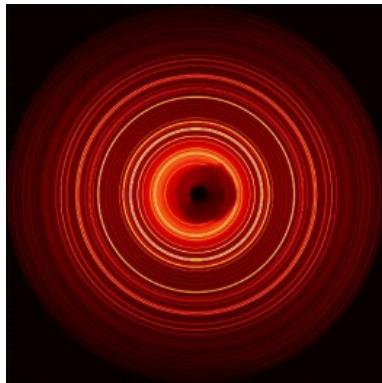

Letter to Robert Hooke (15 Feb. 1676)

*"If I have seen further it is by standing
on ye shoulders of Giants."*

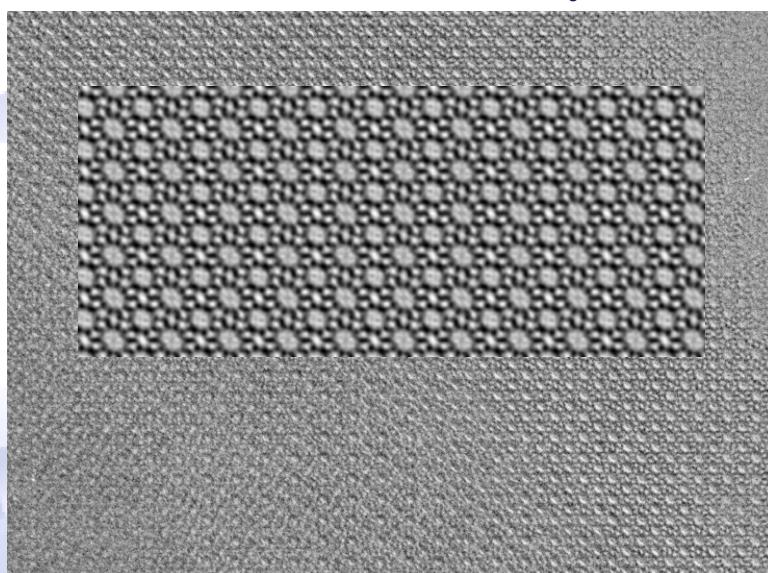

Data collection

Exploring the limits

Real space

$$V_c = abc \sin(\gamma)$$

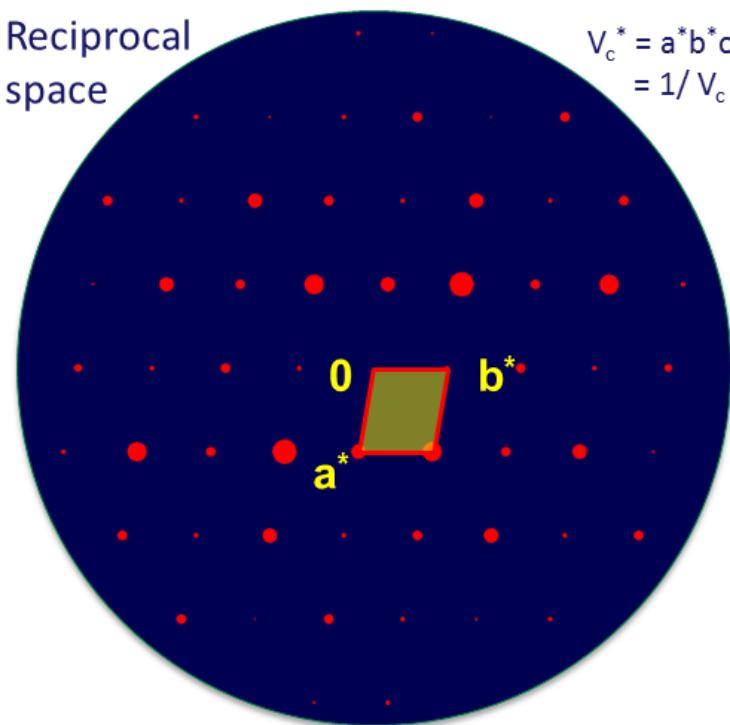

How complicated a structure can I obtain from a powder diffraction pattern? Is there a limit?

How many peaks are there in a powder diffraction pattern?

Jon Wright

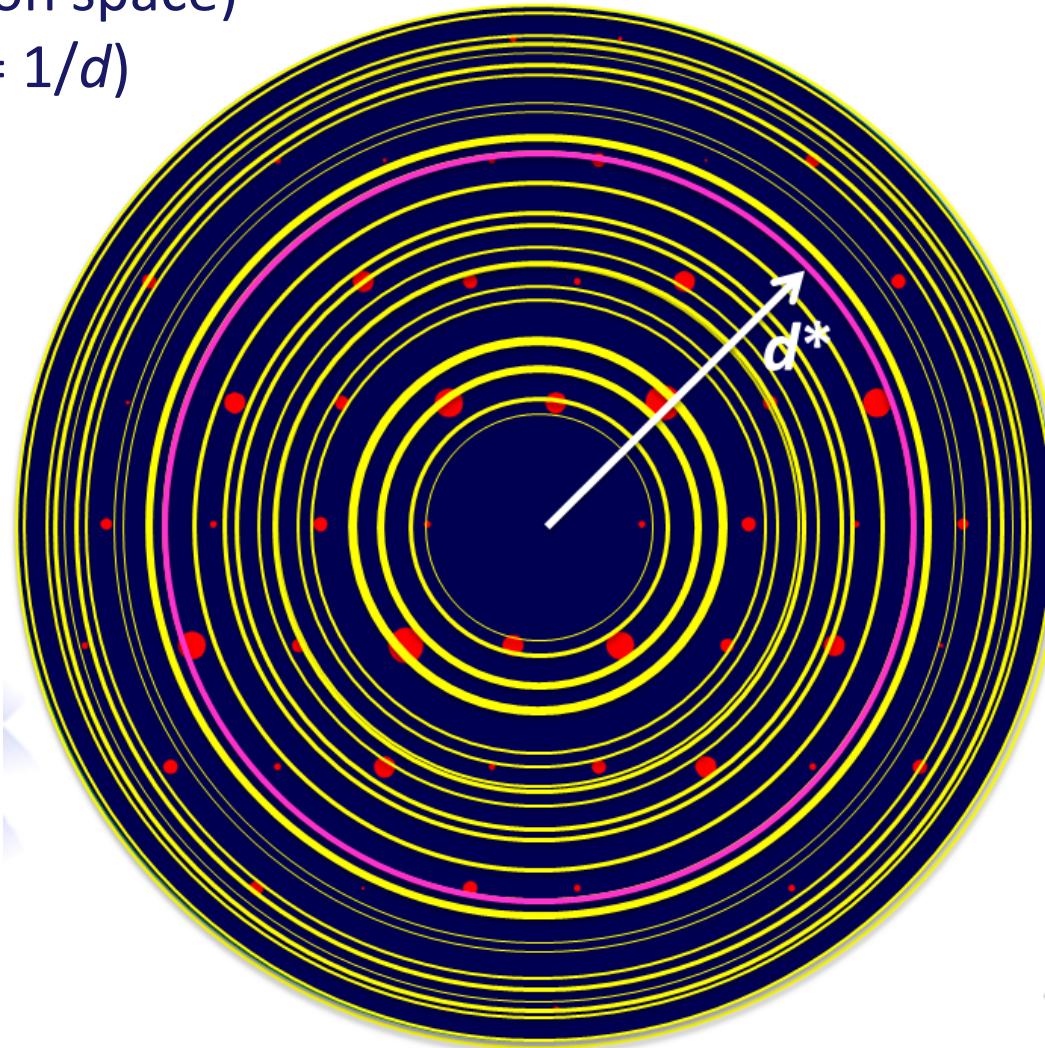

Reciprocal
space

$$V_c^* = a^* b^* c^* \sin(\gamma^*) \\ = 1/V_c$$

Limits

Reciprocal space
(diffraction space)
($d^* = 1/d$)

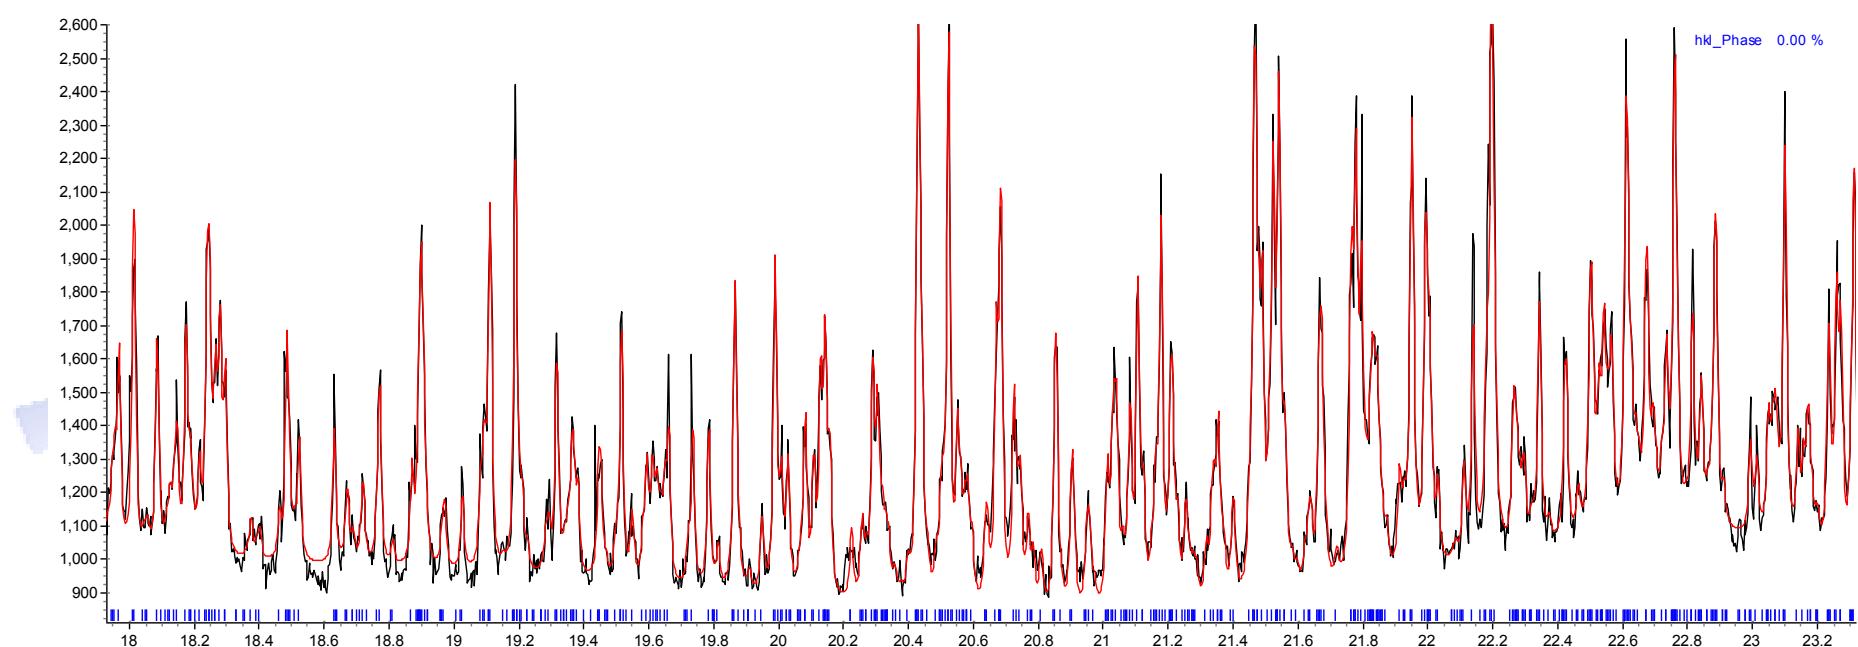

$$V^* = \frac{4}{3} \pi d^{*3}$$

$$N_{\text{ref}} = \frac{4}{3} \pi d^{*3} / V_c^*$$
$$= \frac{4}{3} \pi V_c d^{*3}$$

$$N_{\text{ref}} = \frac{2}{3} \pi V_a d^{*3}$$

$$\Delta N = 2\pi V_a d^{*2} \Delta d^*$$

Limits

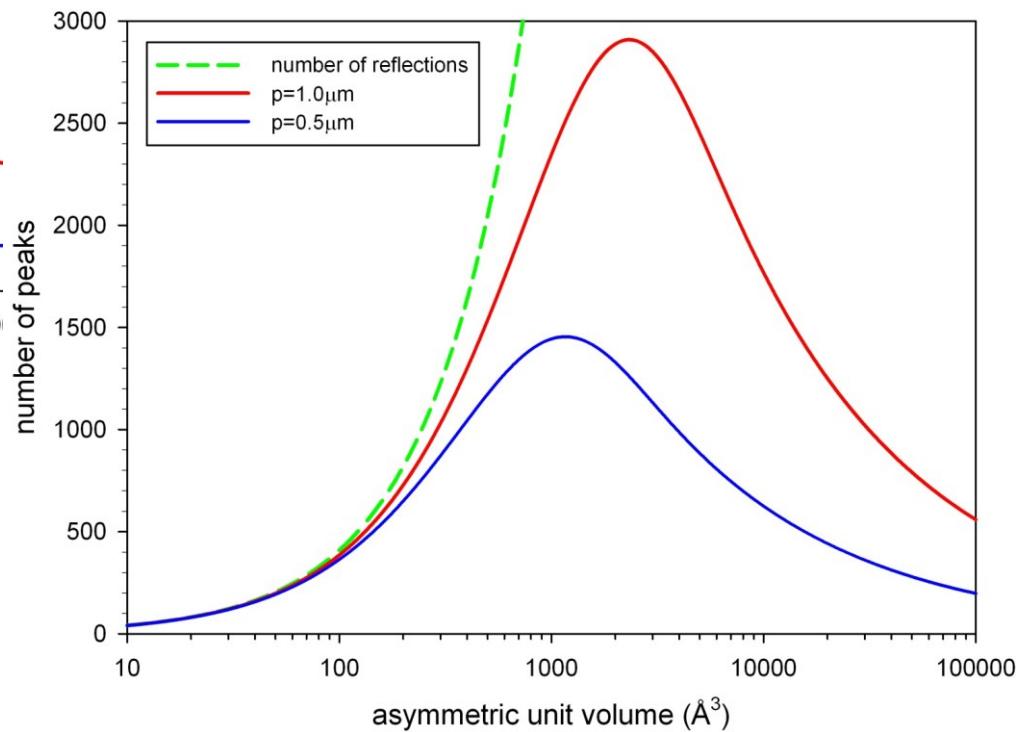

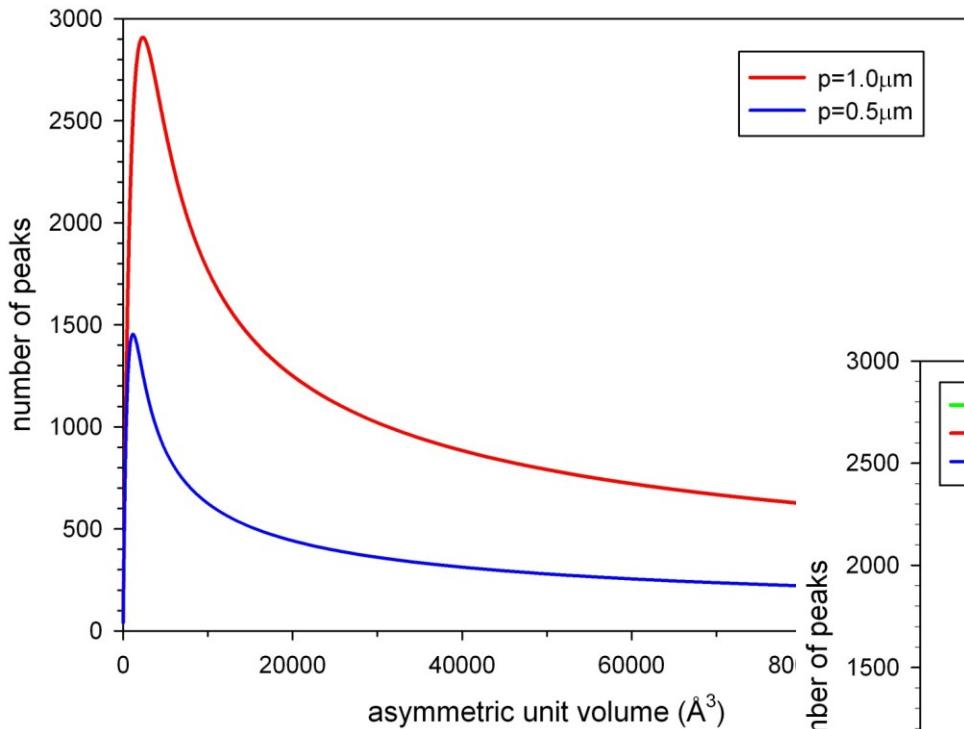

Limits

$$N_{peaks} \approx \int_0^{d_{\max}^*} \Delta N(d^*) \exp(-\Delta N(d^*)/p) dd^*$$

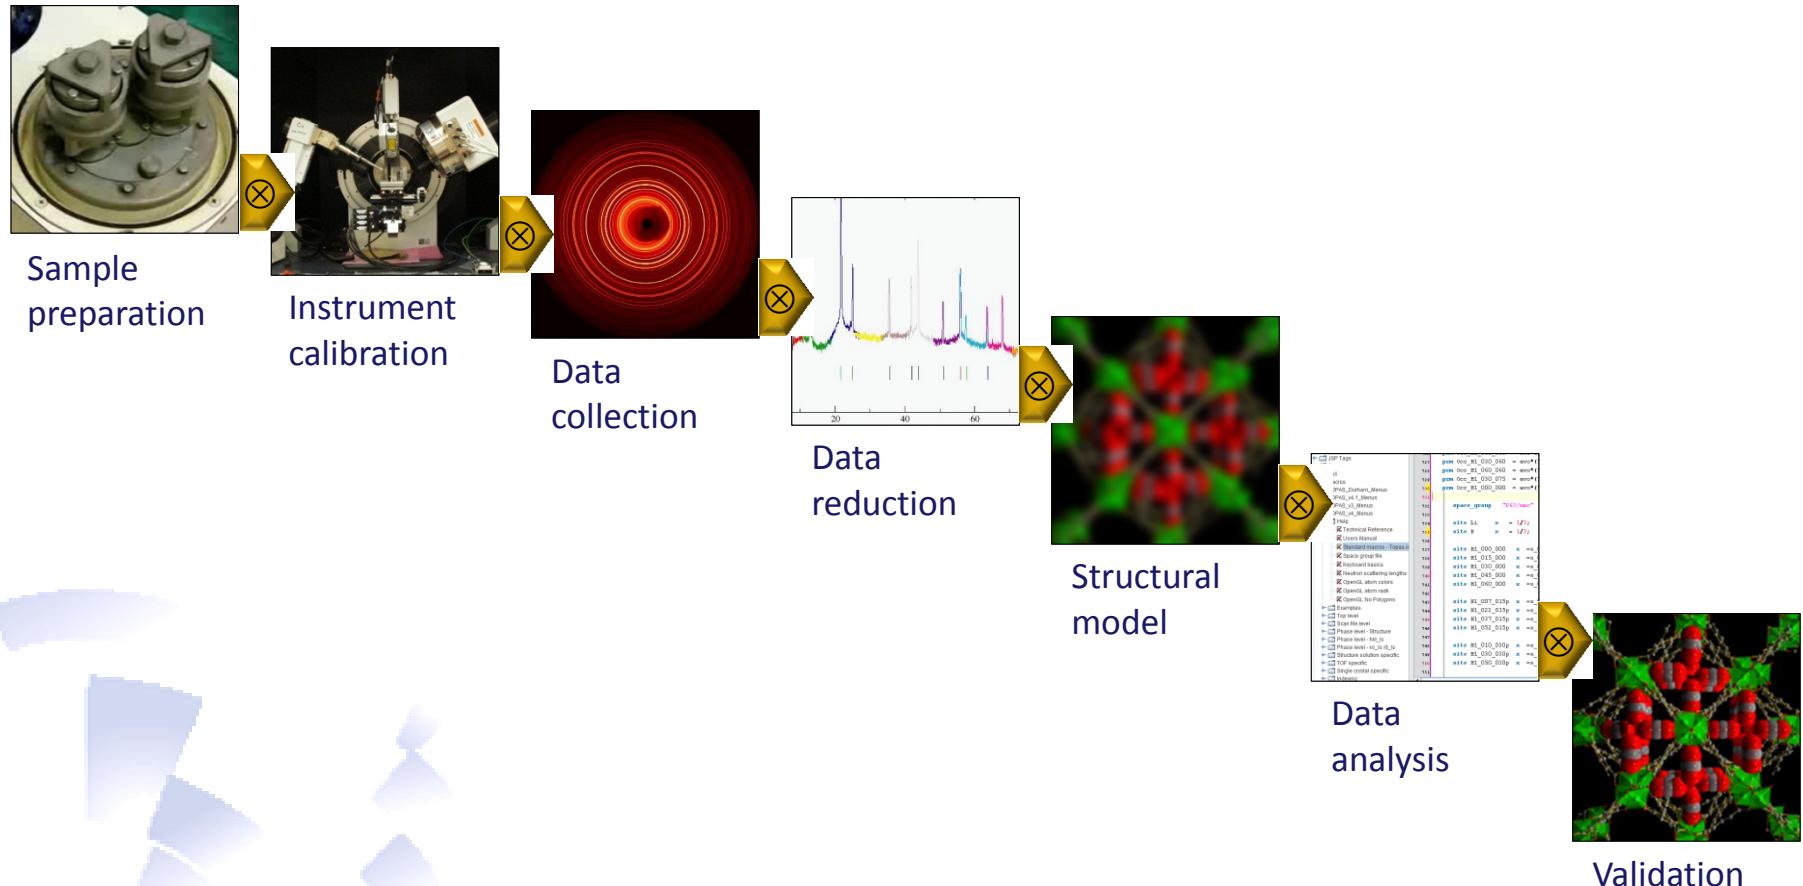

$$p(\delta d^*) = \exp(-\Delta N \delta d^*) \quad \Delta N = 2\pi V_a d^{*2} \Delta d^*$$

Limits

Achieving precision and accuracy

The structural (and microstructural) model

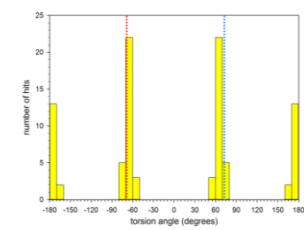

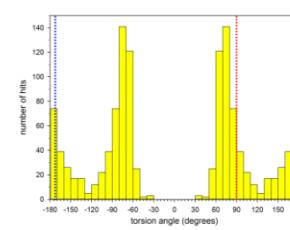

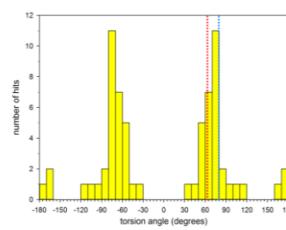

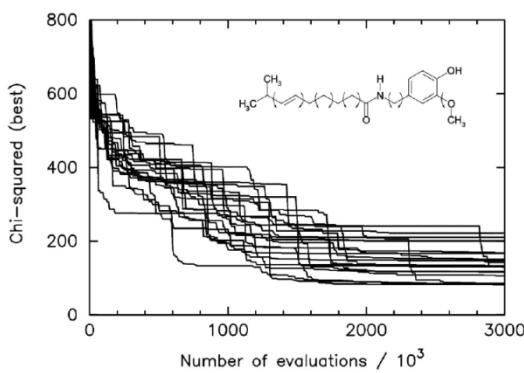

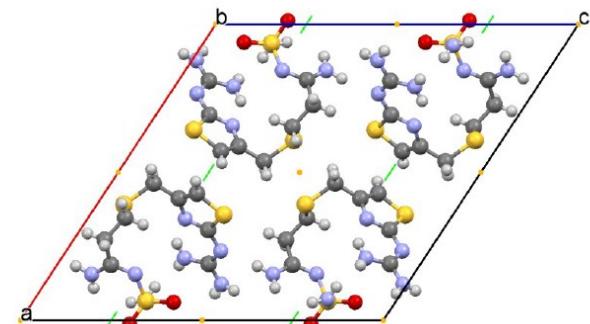

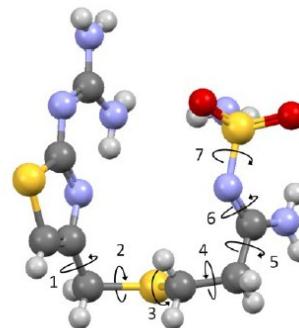

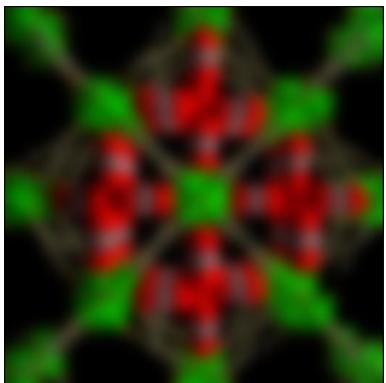

Fig. X.Z.6.3. Frequency distributions for torsion angles 1, 3 and 4 in famotidine as illustrated in Figs. X.Z.4.2 and X.Z.6.1. The values for form A and form B famotidine are indicated by red and blue vertical lines respectively.

Maximum likelihood techniques

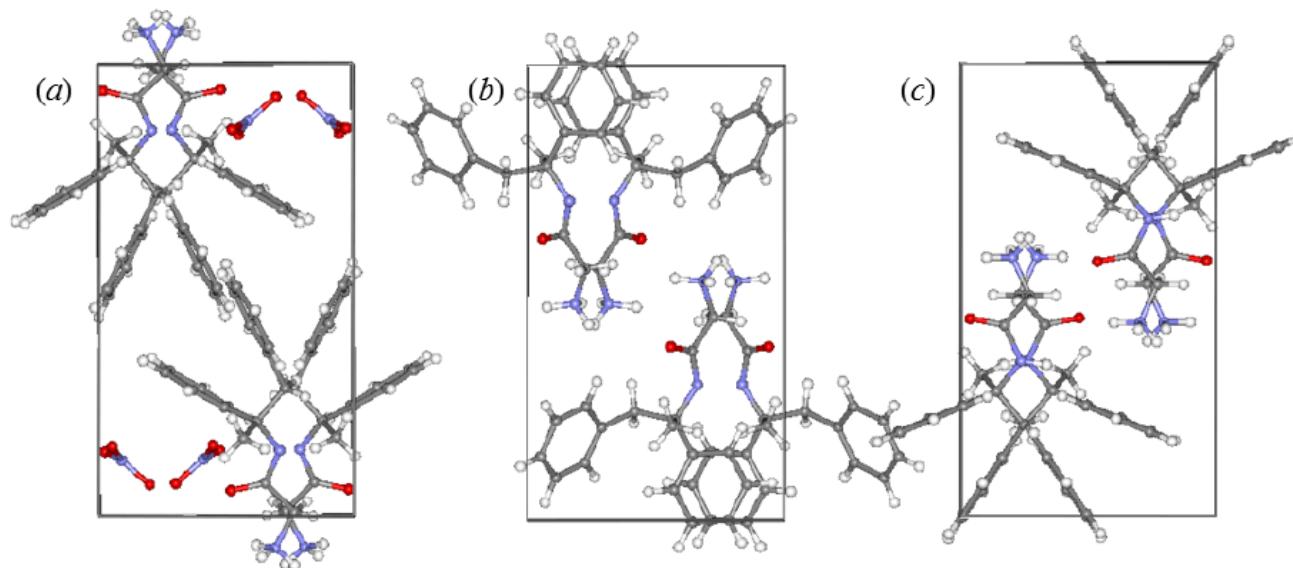

Fig. X.Z.6.7. (a) The correct crystal structure of remacemide nitrate. (b) The best structure determination using a least-squares analysis to compare observed and calculated diffraction data with only the remacemide ion used in the structural model. Note that, although the structural arrangement is completely incorrect, it is clear that the solution has resulted in an optimal correlation of observed and calculated electron density. Note, in particular, that the phenyl group maps closely on to the scattering density associated with the nitrate ion. (c) The best structure determination using a maximum likelihood analysis to compare observed and calculated diffraction data with only the remacemide ion used in the structural model. The structure illustrated in (c) is enantioimetrically related to correct solution shown in (a). The agreement between the remacemide molecular position, orientation and conformation in (a) and (c) is as close as obtained in a standard least squares analysis with the nitrate ion included.

Markvardsen, A.J., W.I.F. David, and K. Shankland, *A maximum likelihood method for global optimization based structure solution from powder diffraction data*. Acta Cryst. A, 2002. **58**: p. 316-326

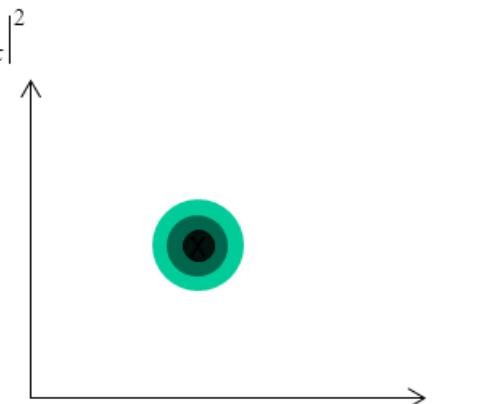

Maximum entropy (likelihood) techniques

- Rietveld method – assumes the observed and calculated phases of the reflections are the same
- In some cases, this can lead to a biased model.
- Combined Fourier difference map and maximum entropy approach:

$$\chi_{CI}^2 = \sum_h \sum_k \left[\left| F_{obs}(h) \right|^2 - \left| F_{known}(h) + \Delta F(h) \right|^2 \right] \times \left(C_{hk}^{-1} \left[\left| F_{obs}(k) \right|^2 - \left| F_{known}(k) + \Delta F(k) \right|^2 \right] \right)$$

↑ data host

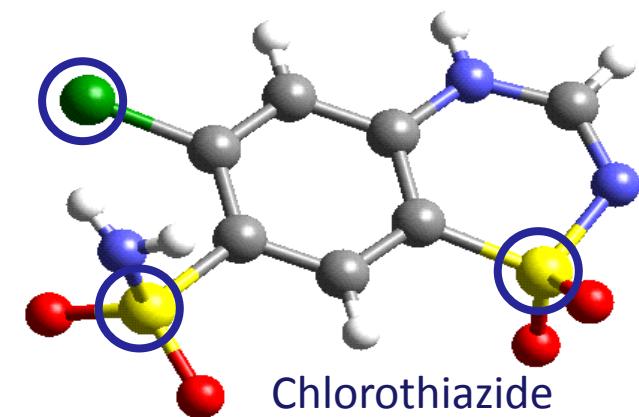

Correlation between reflections

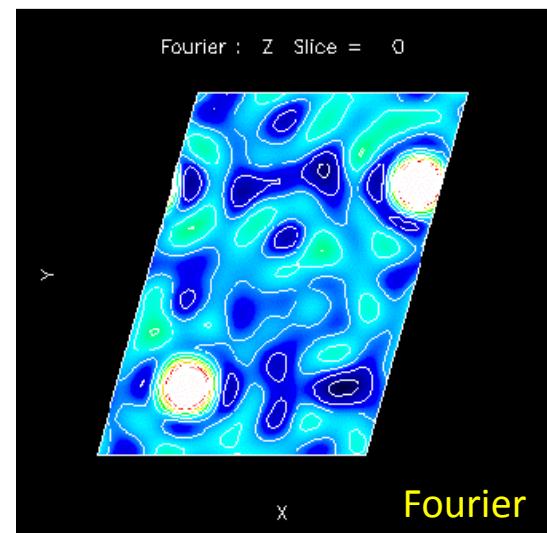

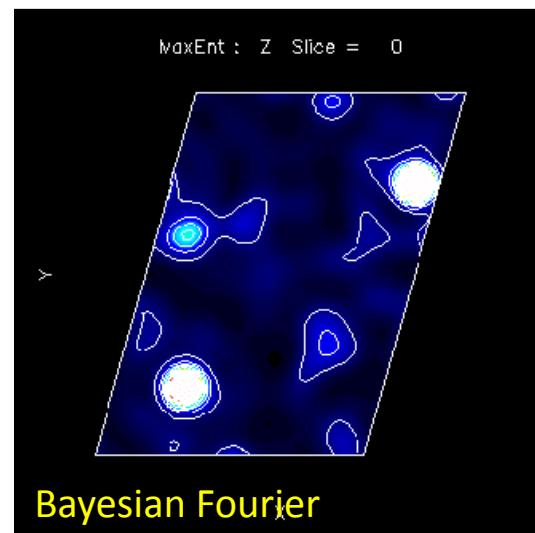

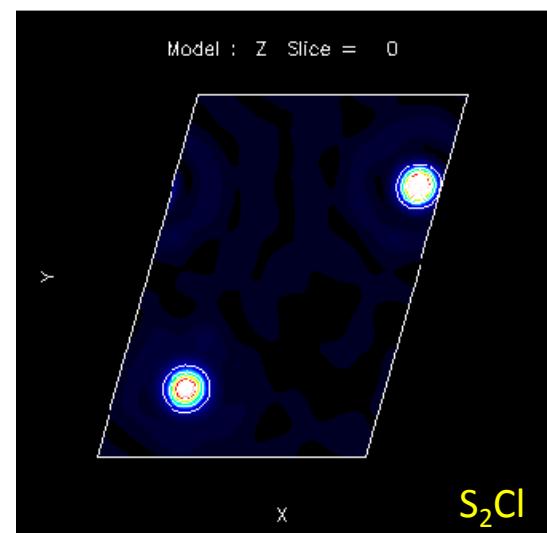

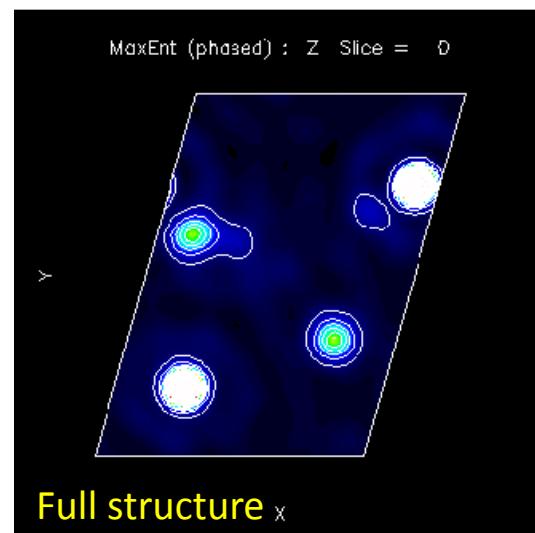

- Does not assume phases of the reflections
- Minimises χ^2 with the minimum number of features that are consistent with the data.

W.I.F. David and D.S. Sivia, *Extracting intensities from powder diffraction patterns* in *Structure Determination from Powder Data*, OUP, 2002.

Achieving precision and accuracy

The heroes (cont.)

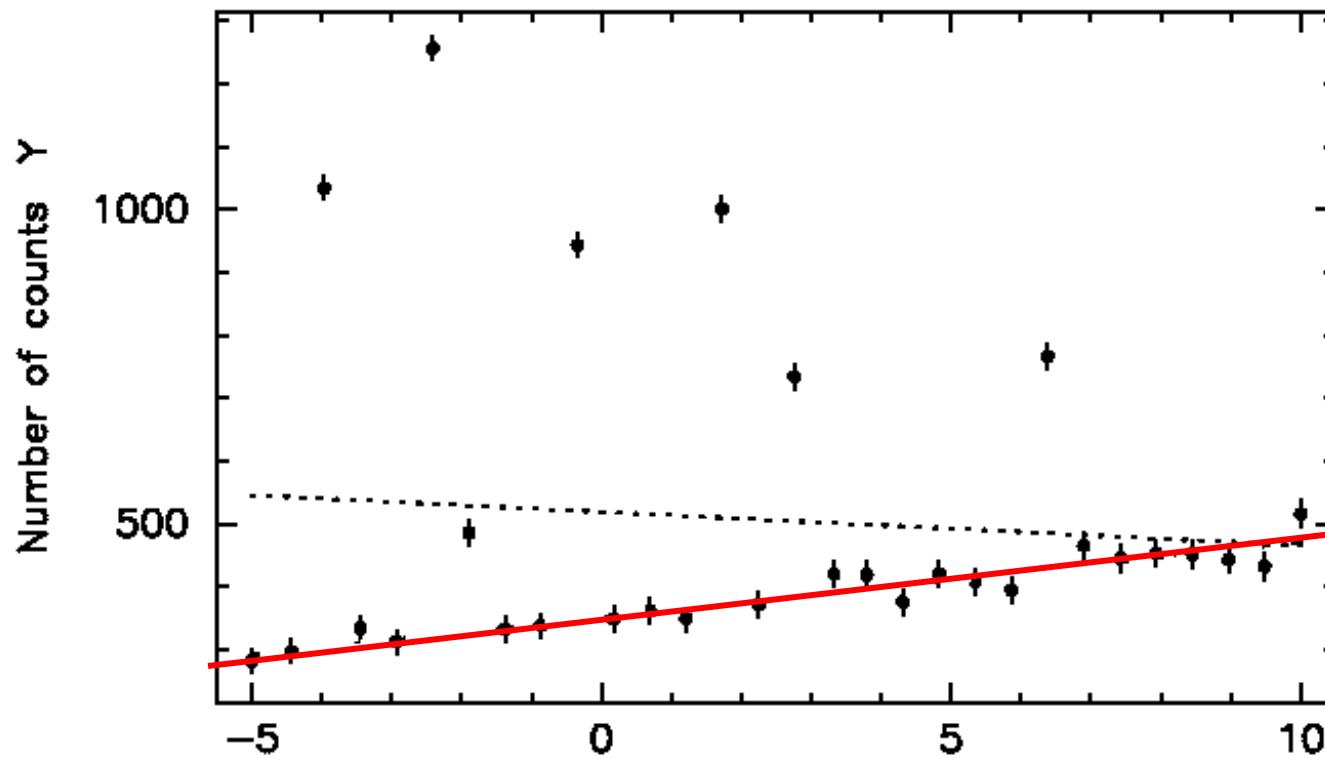

Ted Prince

Be rigorous – do it properly
Excellent instrumentation
Fundamental parameters
Fundamental statistics

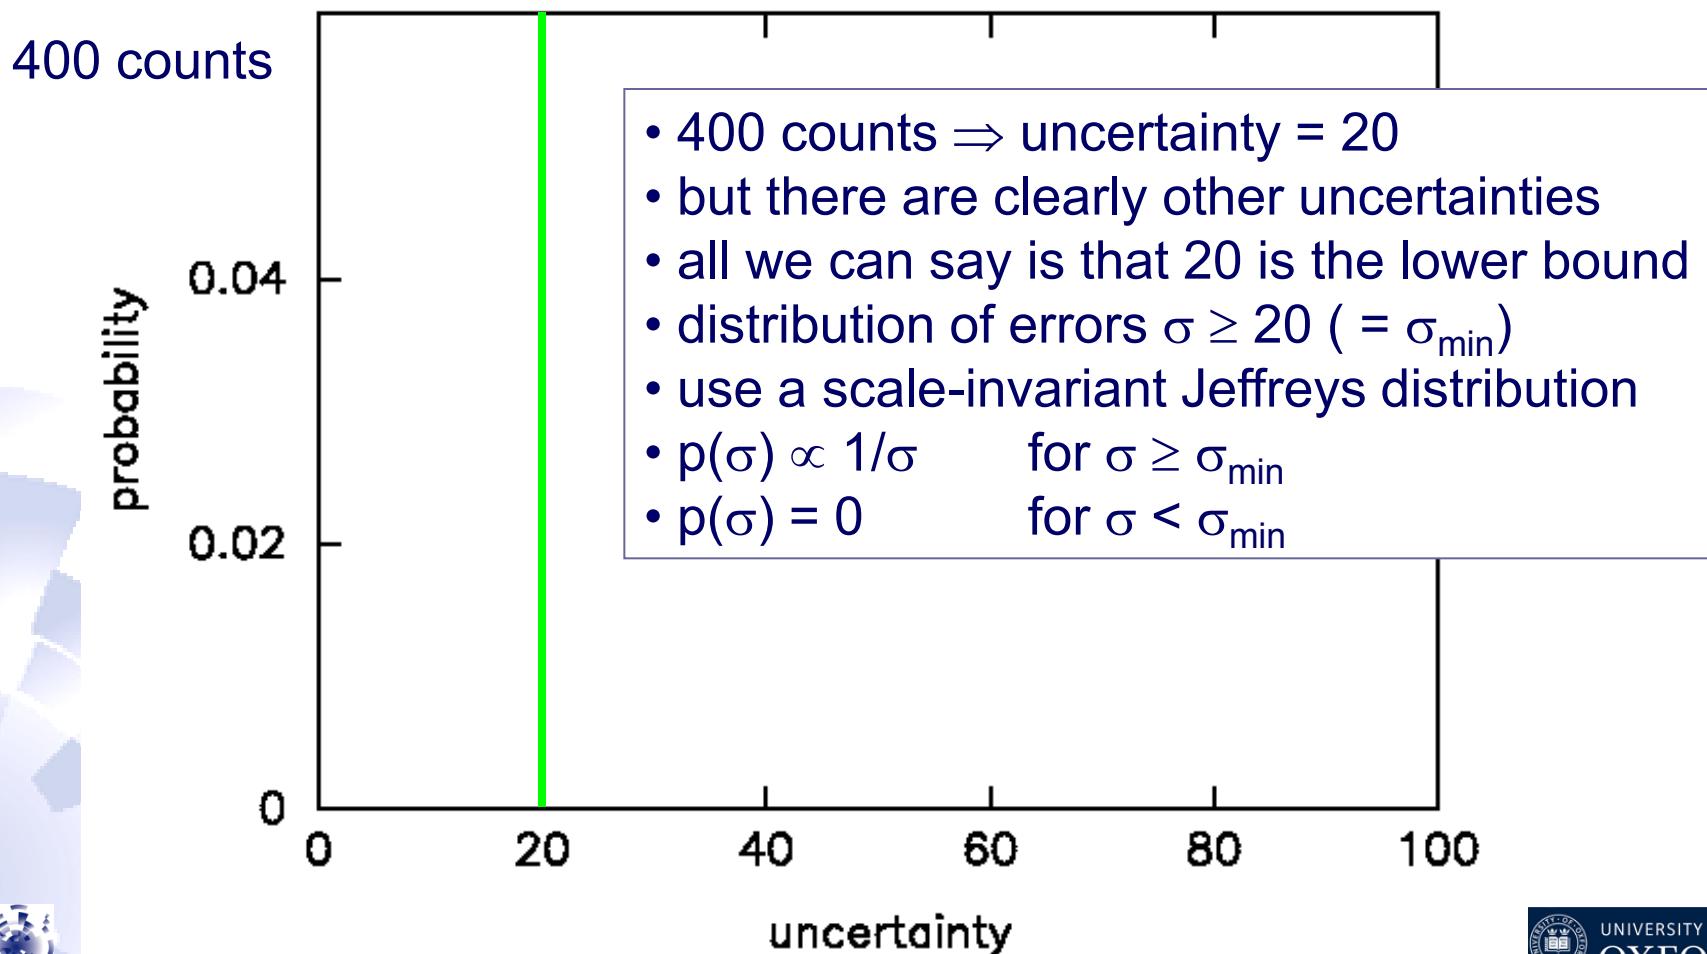

What if the fit is not as good as it could be

- Is it wise to have 150,000 counts in the biggest peak and 5000 counts in a very highly structured background?
 - No! Redo the experiment!
- Collect all Bragg peaks with similar fractional accuracy
 - variable counting time to give $E/\sigma(E)$ constant
- If accuracy and precision are required be prepared to
 - comprehensively model structure and microstructure
 - perform fundamental line-shape analysis
 - undertake detailed “fundamental” background analysis
- If all else fails - use statistics / plausible reasoning!

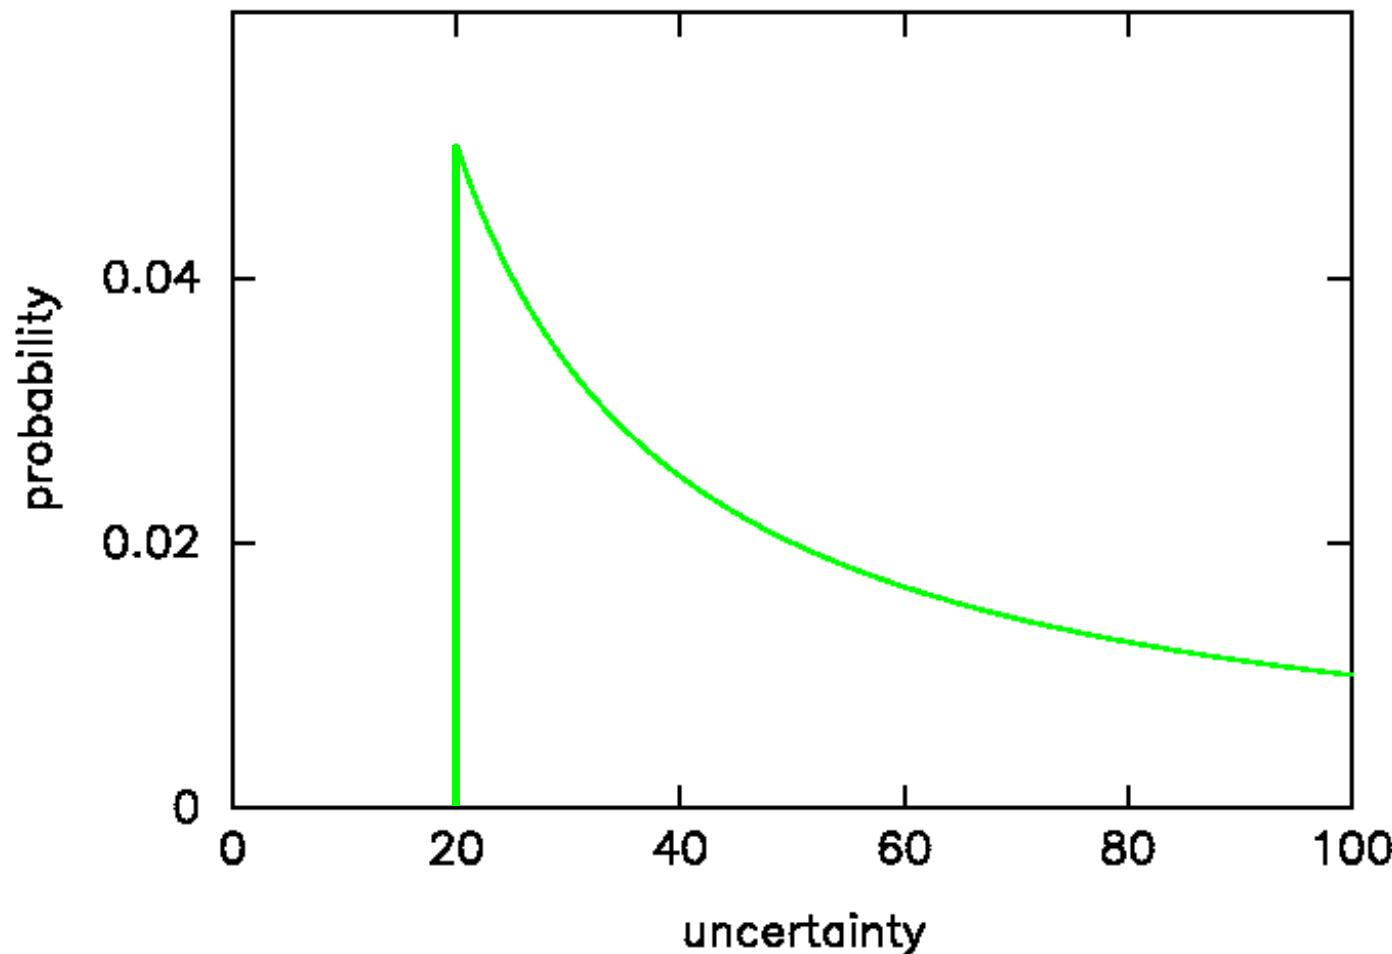

What's gone wrong?

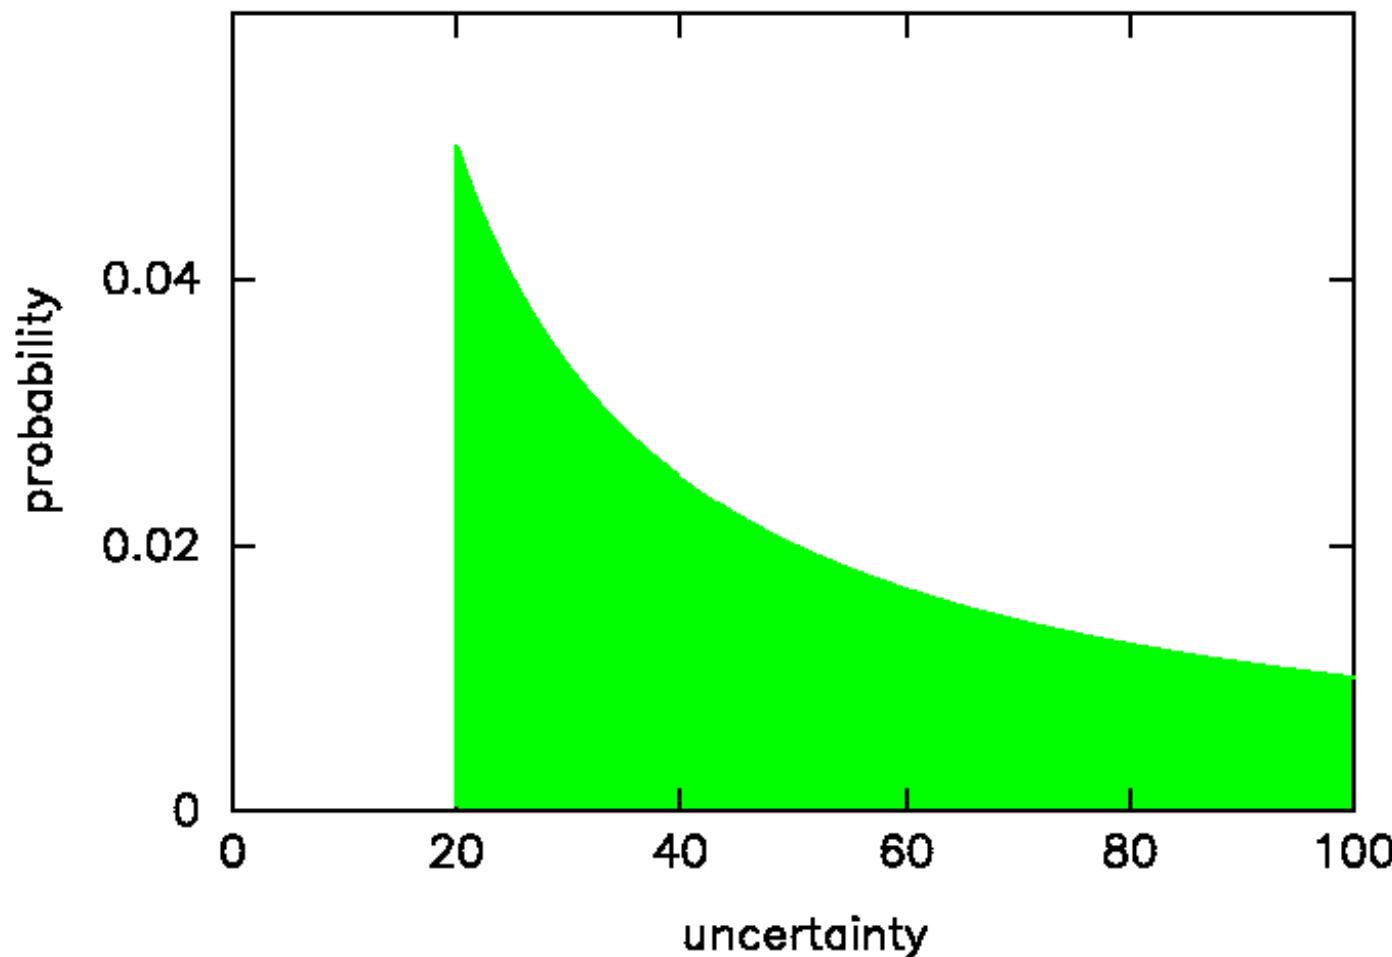

- We've performed a least-squares analysis and implicitly assumed that all errors follow a Gaussian PDF
- We've been certain about our uncertainties!

- Jeffreys prior
- $p(\sigma) \propto 1/\sigma$ for $\sigma \geq \sigma_{\min}$
- $p(\sigma) = 0$ for $\sigma < \sigma_{\min}$

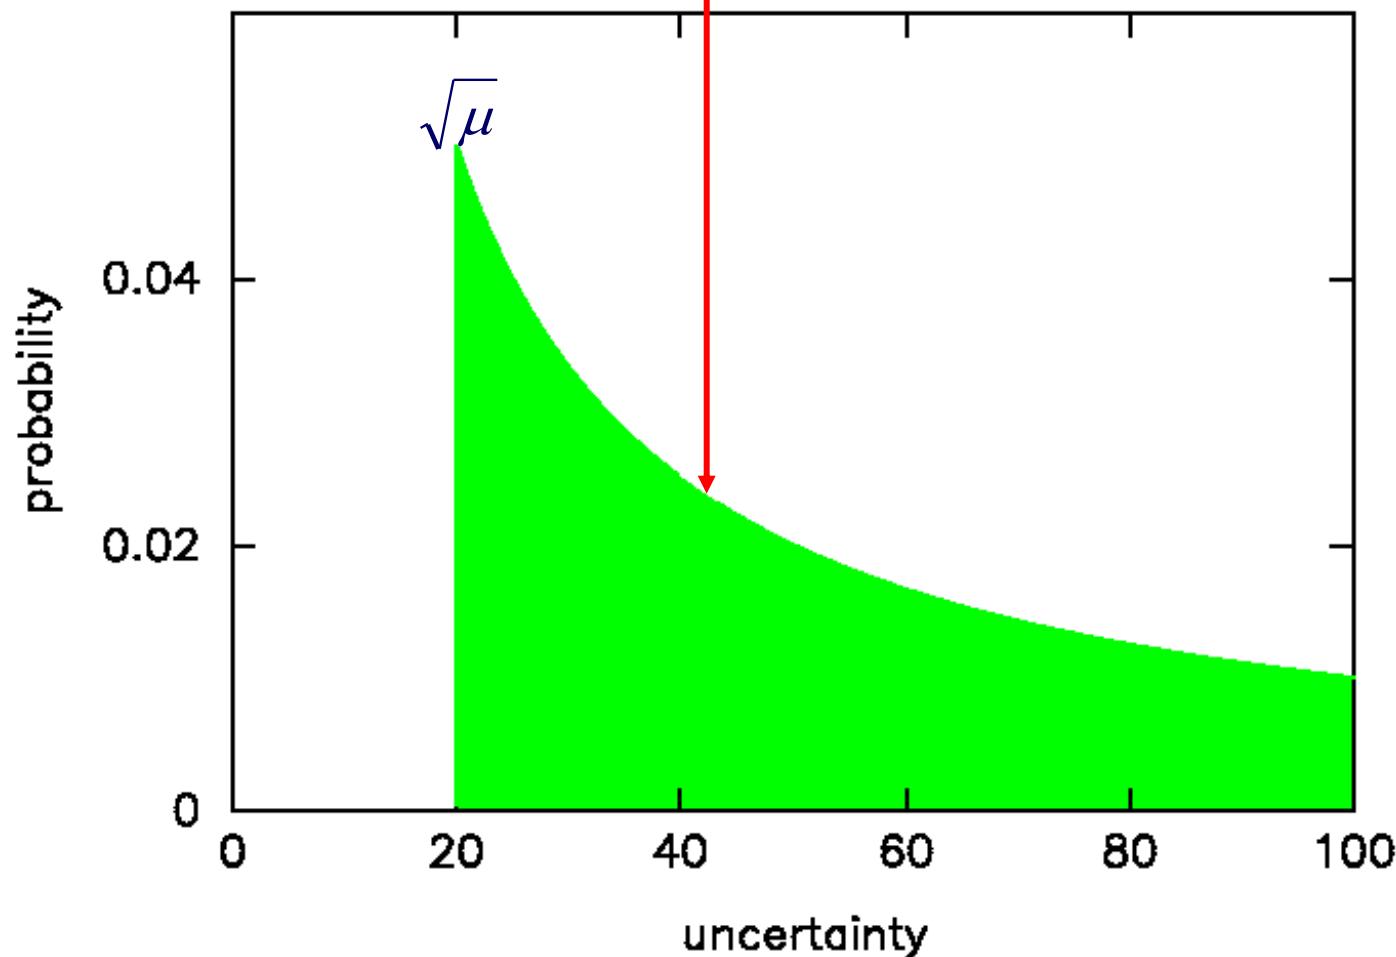

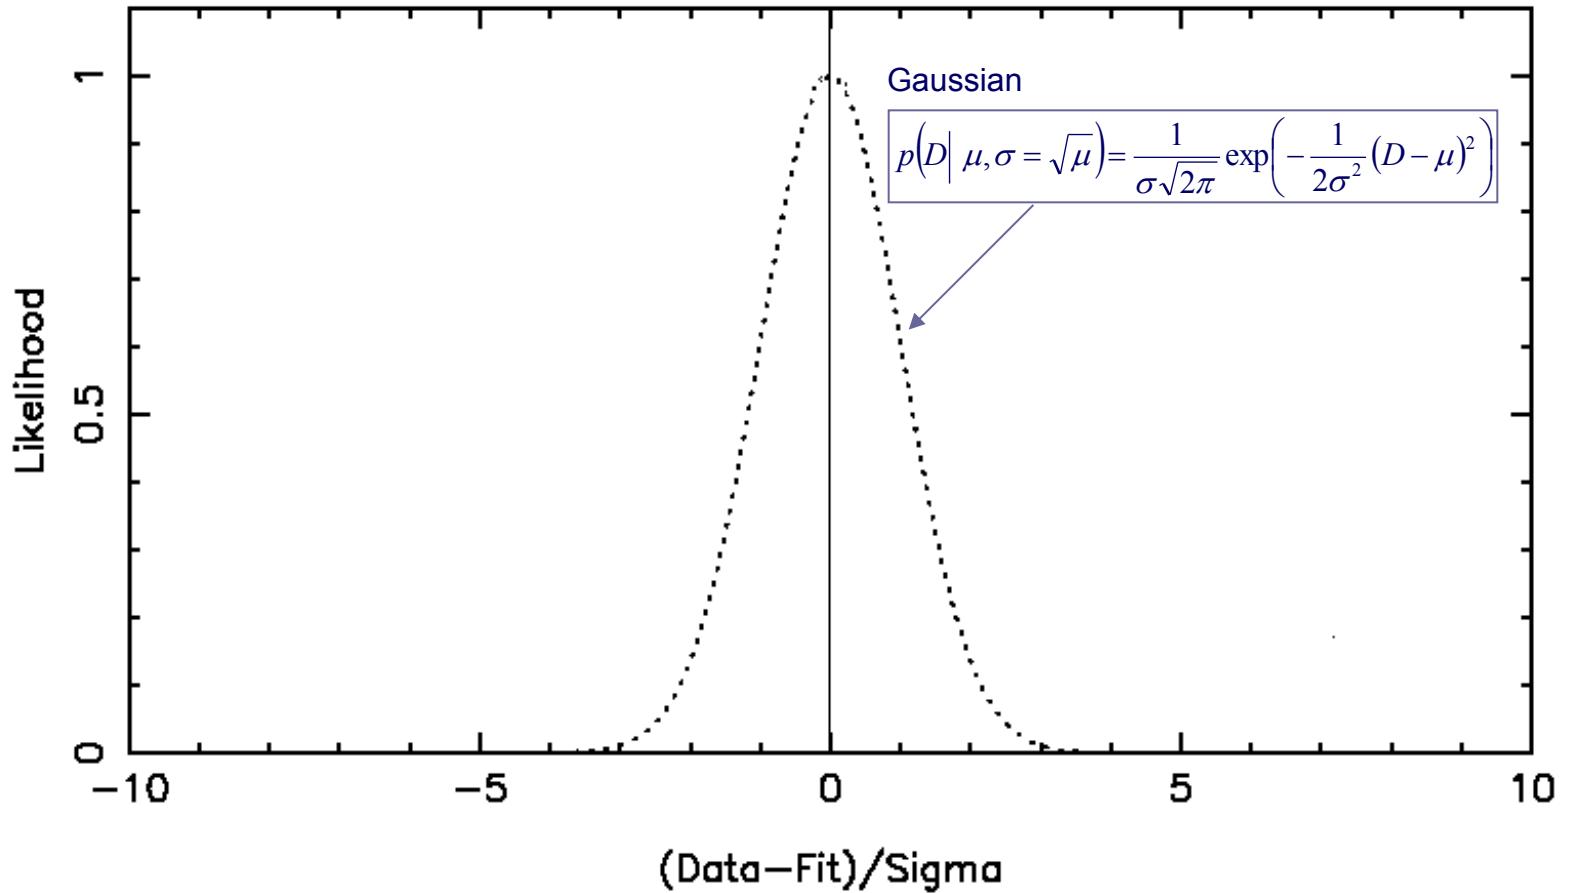

- Jeffreys prior
- $p(\sigma) \propto 1/\sigma$ for $\sigma \geq \sigma_{\min}$
- $p(\sigma) = 0$ for $\sigma < \sigma_{\min}$

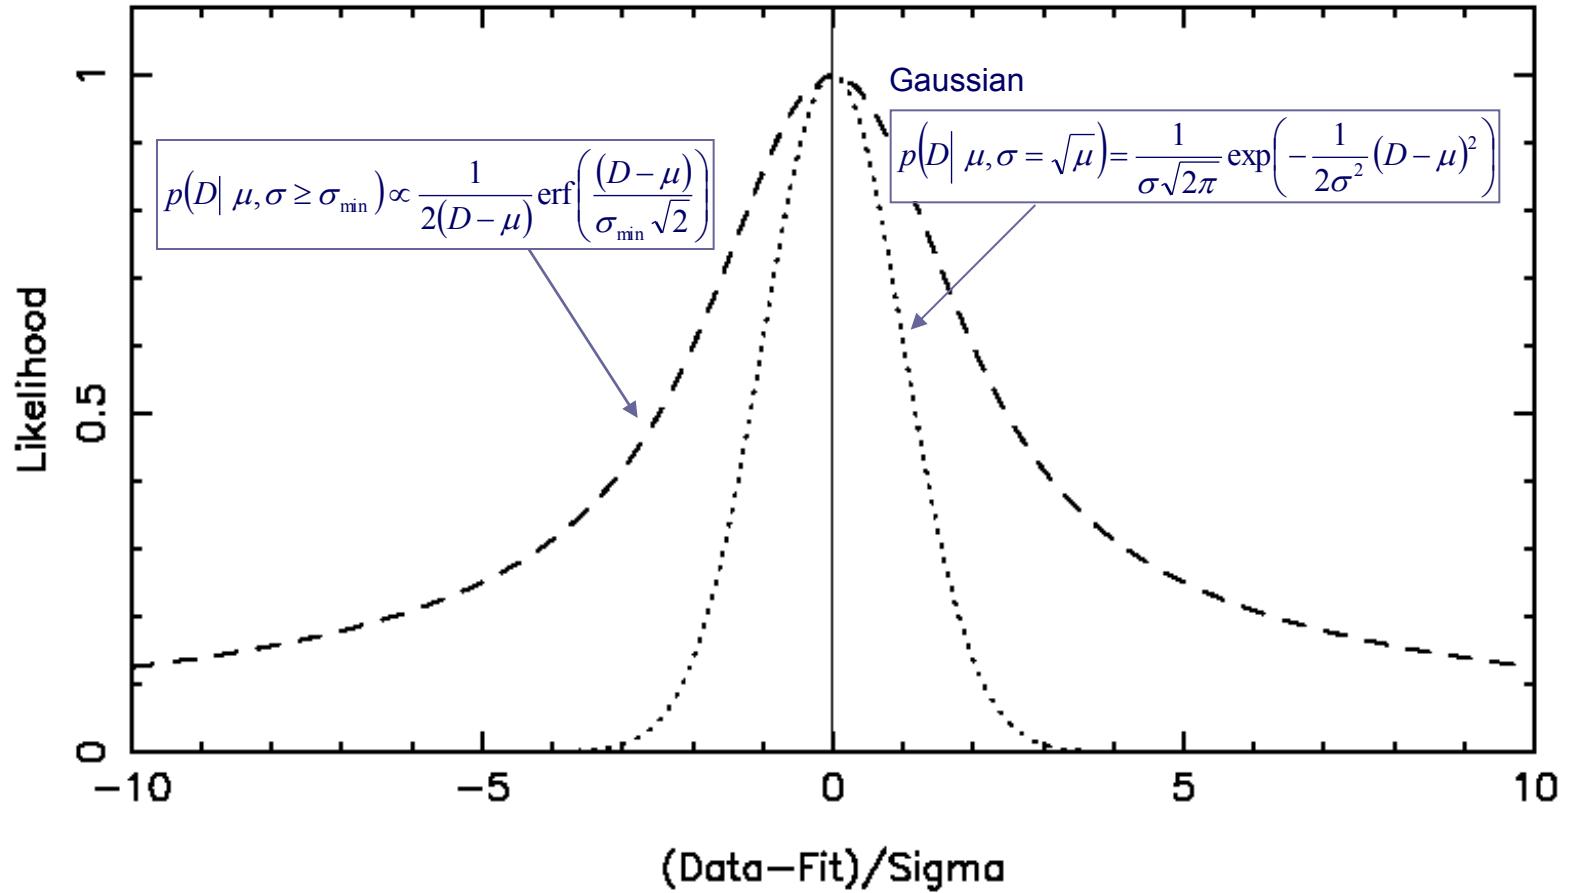

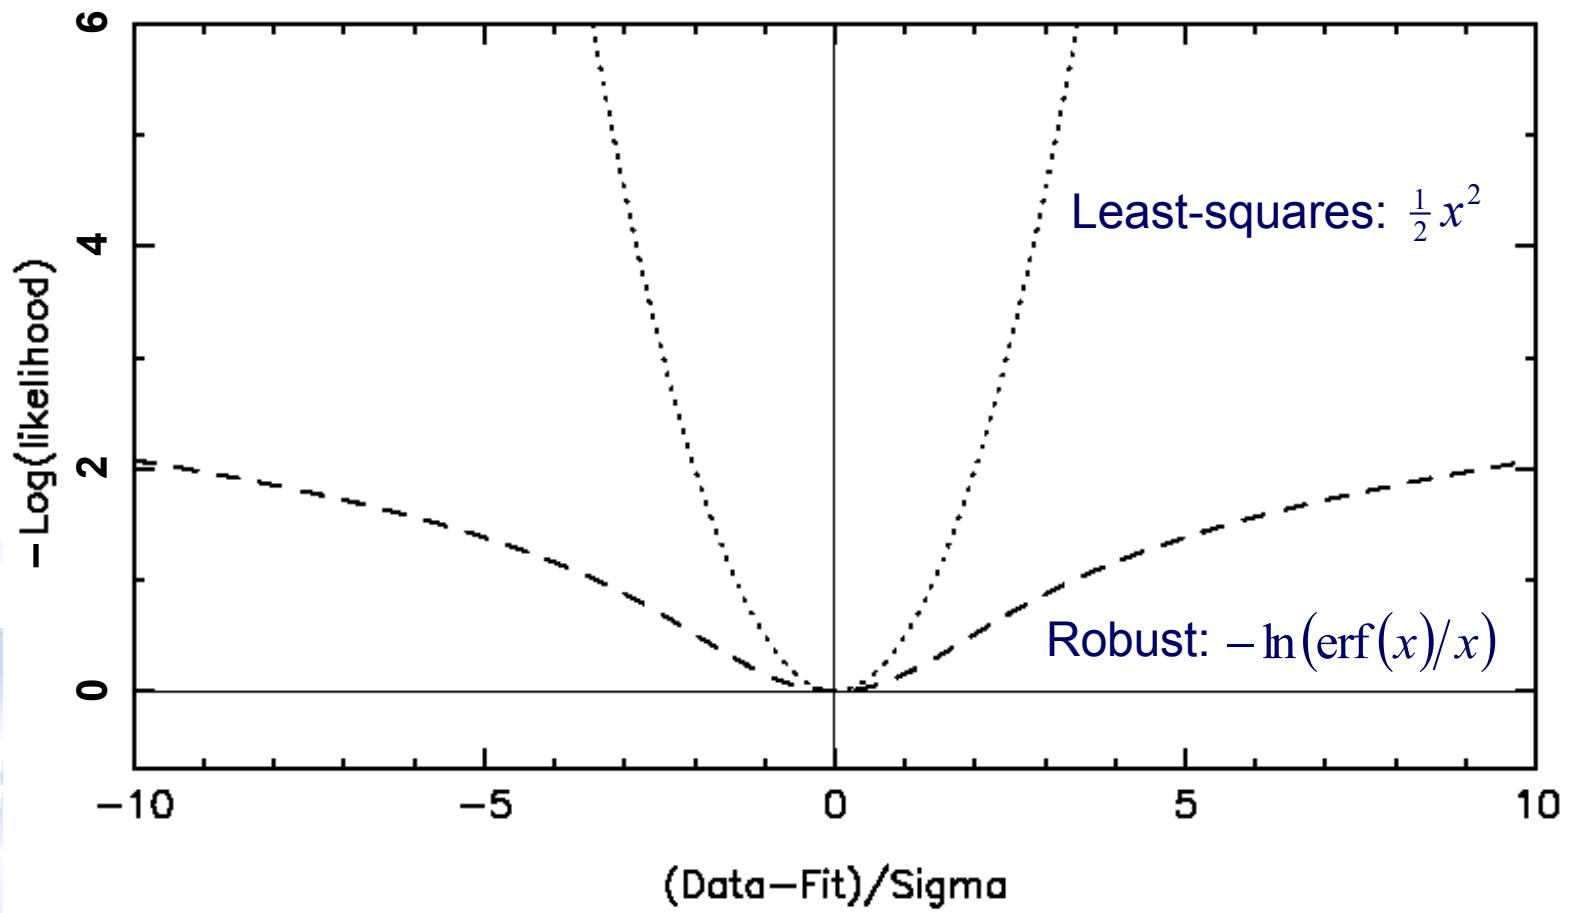

Gaussian

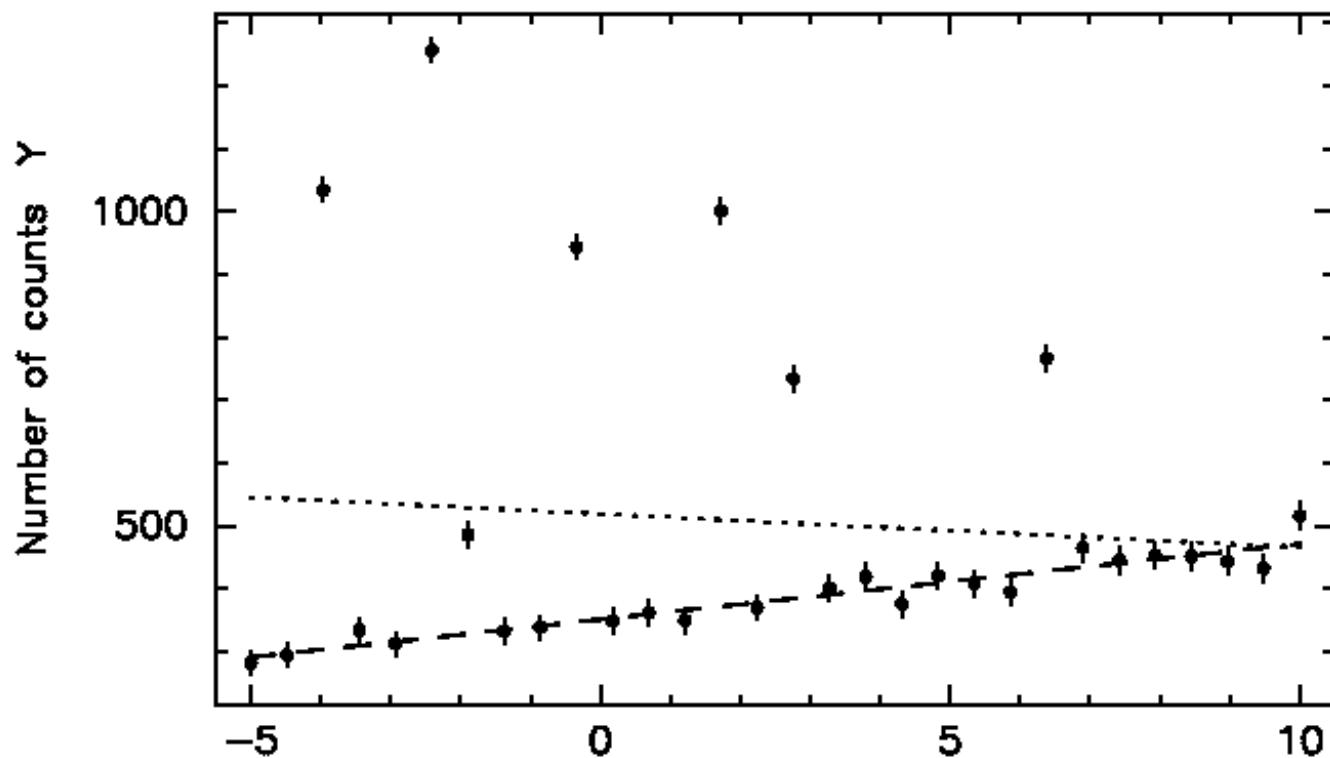

$$p(D | \mu, \sigma) = \int_{\sigma_{\min}=\sqrt{\mu}}^{\infty} prob(\sigma) \frac{1}{\sigma \sqrt{2\pi}} \exp\left(-\frac{1}{2\sigma^2}(D - \mu)^2\right) d\sigma$$

REPORT for Decade ending April 2013

Name: Powder diffraction

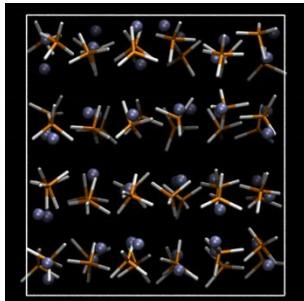

Age: 97

| | |
|----------------------|---|
| General observations | Excellent progress. |
| Technical subjects | Impressive new instruments with particular excellence in detectors and electronics. Has taken full advantage of Moore's Law. |
| Computer studies | Existing programs continue to perform well. Some extremely impressive new programs. Dabbling with new concepts. |
| Creative studies | Comes up with significant new creative ideas. |
| Attitude | Has matured and now has broadened interests. |
| Social skills | Very popular but can attract some unlikely characters with limited crystallographic skills. |
| Future prospects | Great potential - sure to go far. |

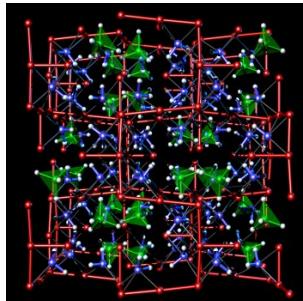

The best is yet to come ...
