

Service-Oriented Architectures for Smart Manufacturing Project

Nenad Ivezic
Systems Integration Division
Engineering Laboratory
NIST

Agenda

- SOA for Smart Manufacturing Project: An Overview
- Message Standards Development and Use: Problems and Needs
- A Model-Driven Approach: Core Components Standard Approach
- Traditional vs. Model-Driven Approach to Message Standards Use
- NIST Tools in Support of Model-Driven Message Standards
- Summary

Integrability, Interoperability, and Composability

- Integrability
 - Enables correct information exchange by using correct protocols.
- Interoperability
 - Enables correct understanding of meaning by using correct conceptual models.
- Composability
 - Enables correct consequences of interaction by using correct behavior models.

Integrability, Interoperability, and Composability

- Integrability

- Enables correct information exchange by using correct protocols.

- Interoperability

- Enables correct understanding of meaning by using correct conceptual models.

- Composability

- Enables correct consequences of interaction by using correct behavior models.

Message standards are key to achieving services interoperability.

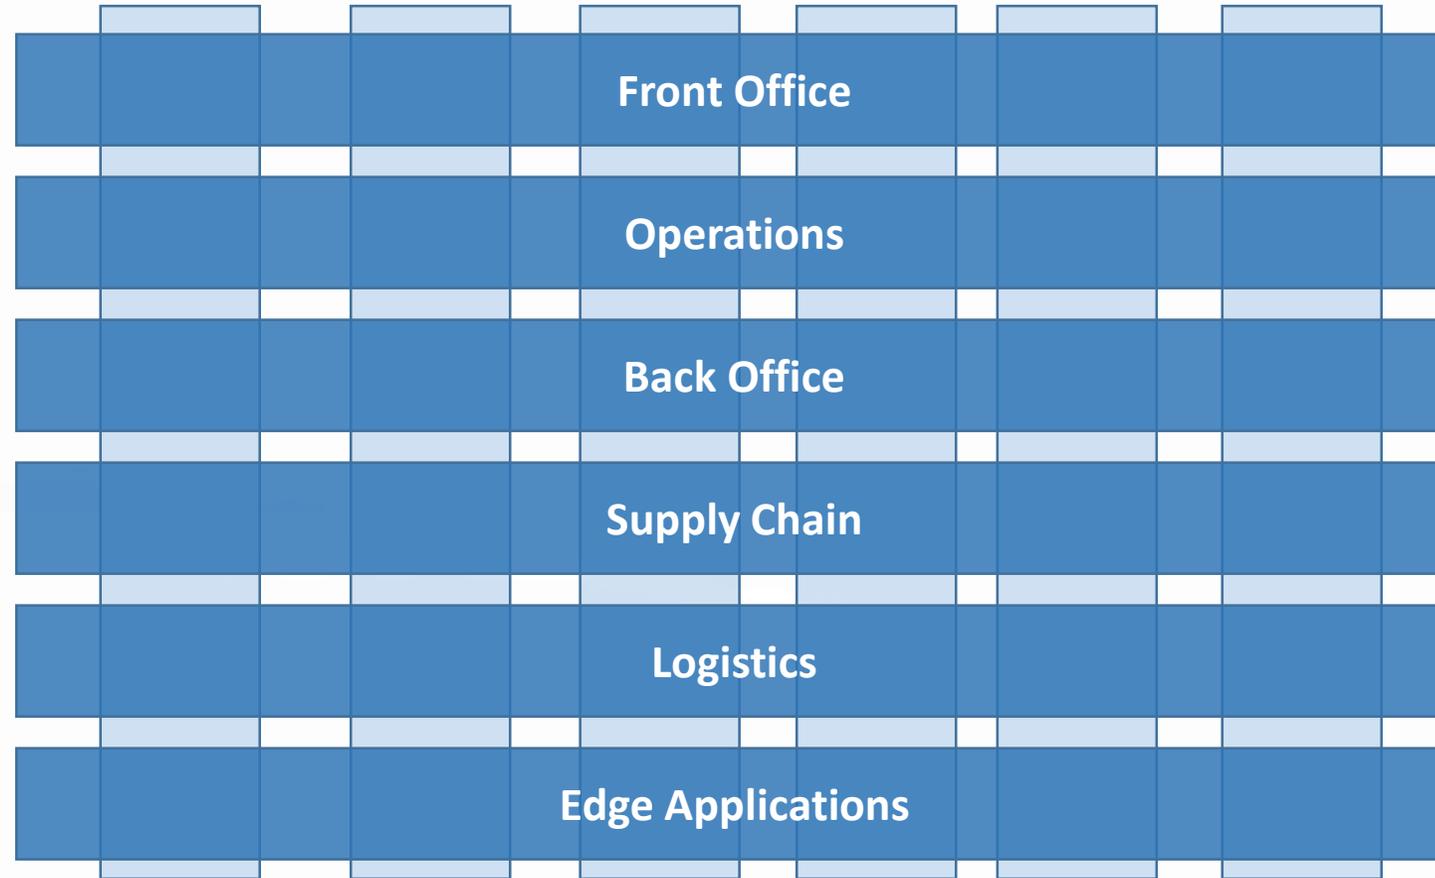

Why is This Significant?

- The number of manufacturing services is growing substantially.
- Soon, all manufacturers will need to be using those services.

Need: Increased Efficiency of Services Integration

- Manufacturers will need to assure their business processes are supported and improved by services
- They will be looking for optimal services out there
 - Ease of integration, configuration, and re-configuration
- The services will need to be interoperable and composable, **based on standards.**

A Leading Message Standards Development Organization: Open Applications Group Inc.

Automotive Aerospace Defense Chemical High-tech Construction

Who Uses Open Applications Group Integration Specification (OAGIS)?

Copyright 2016 Open Applications Group, Inc. All Rights Reserved

Overview of the OAG Integration Specification (OAGIS)

- Specifies message definitions (BODs) for integrations of business and engineering applications (***manufacturing services***)
- Supports many industries
 - Automotive, Aerospace, Defense, Process Manufacturing, Electronic Manufacturing, Construction, etc.
- Supports nearly all operational areas of a manufacturing enterprise
 - Sales, manufacturing, supply, and financials
- Contains 1000+ BODs

Problems

- BOD complexity
- Single syntax support

Problem: A Complex Standard

Front Office - CRM

Operation – MOM, PLM, Project Management

A BOD can contain between 58 and 300k+ data fields!!!

Logistics – Transportation Management

Edge Applications – Business Intelligence/Analytics, Demand Forecast

Automotive Aerospace Defense Chemical High-tech Construction

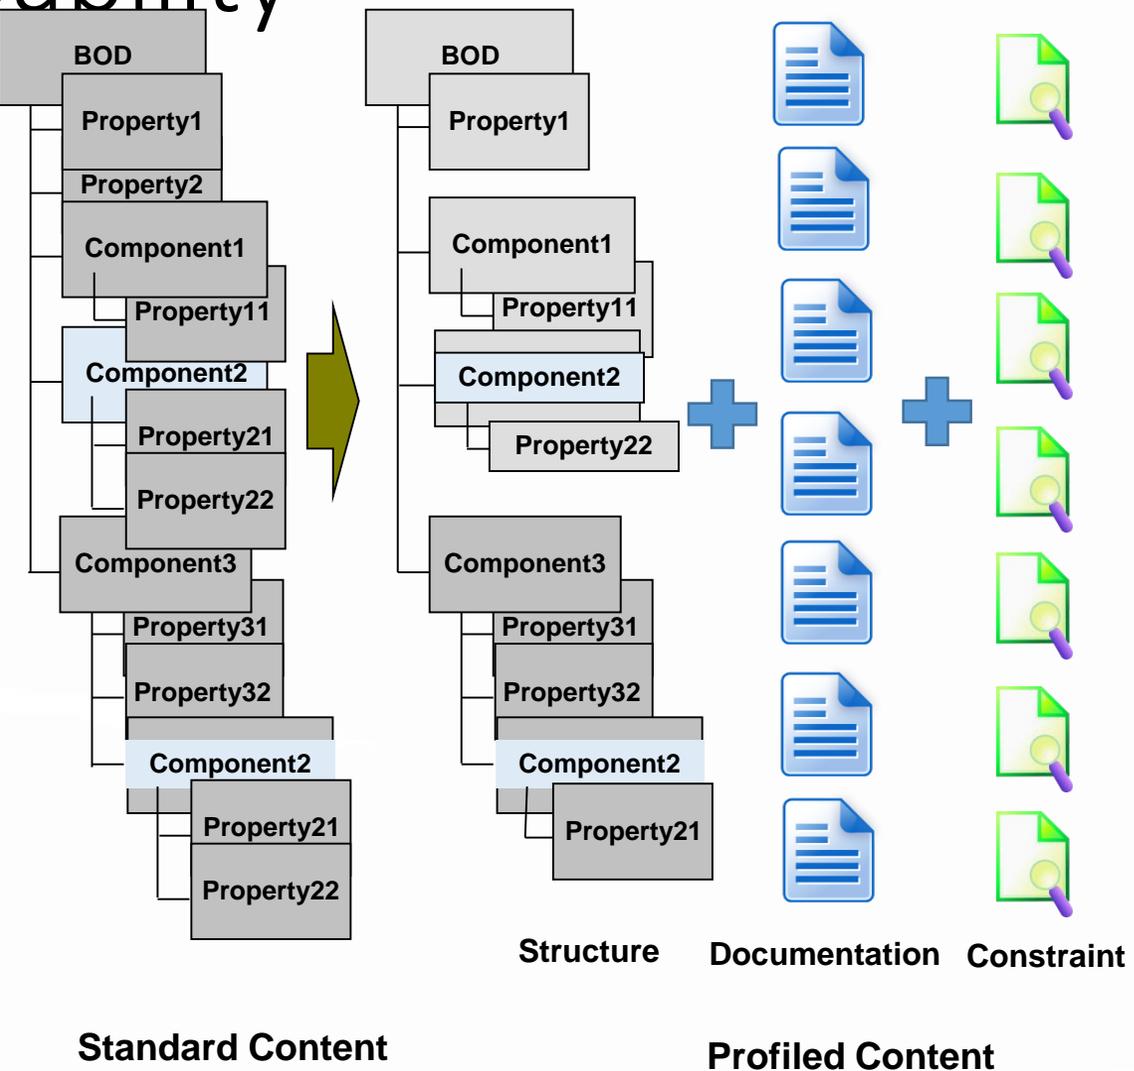

Need: Profiling Capability

The ability to create from a standard BOD

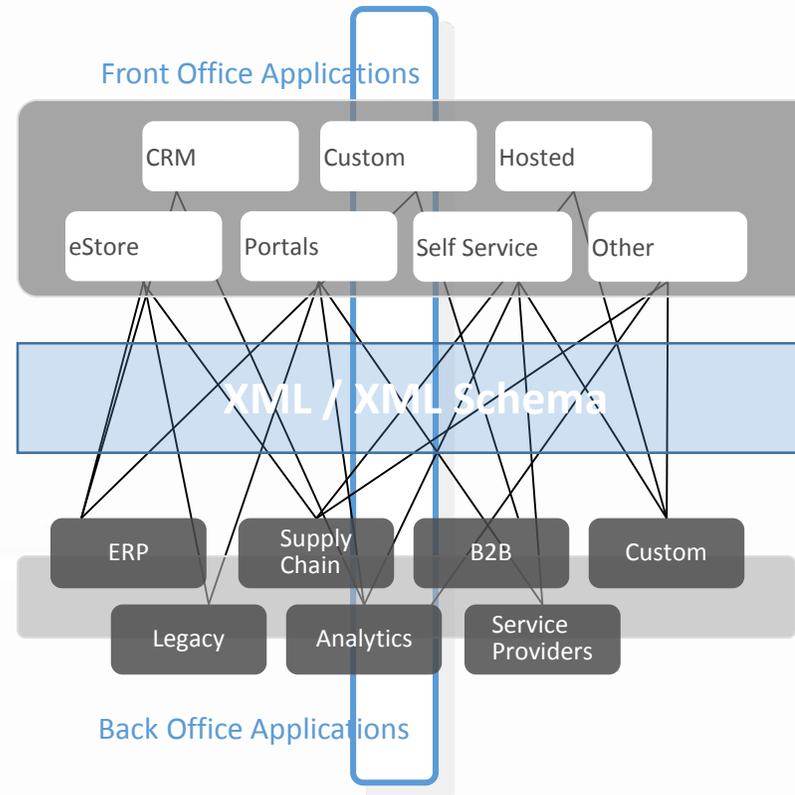

- Simpler
- More specific, and
- More precise

BOD specification, for

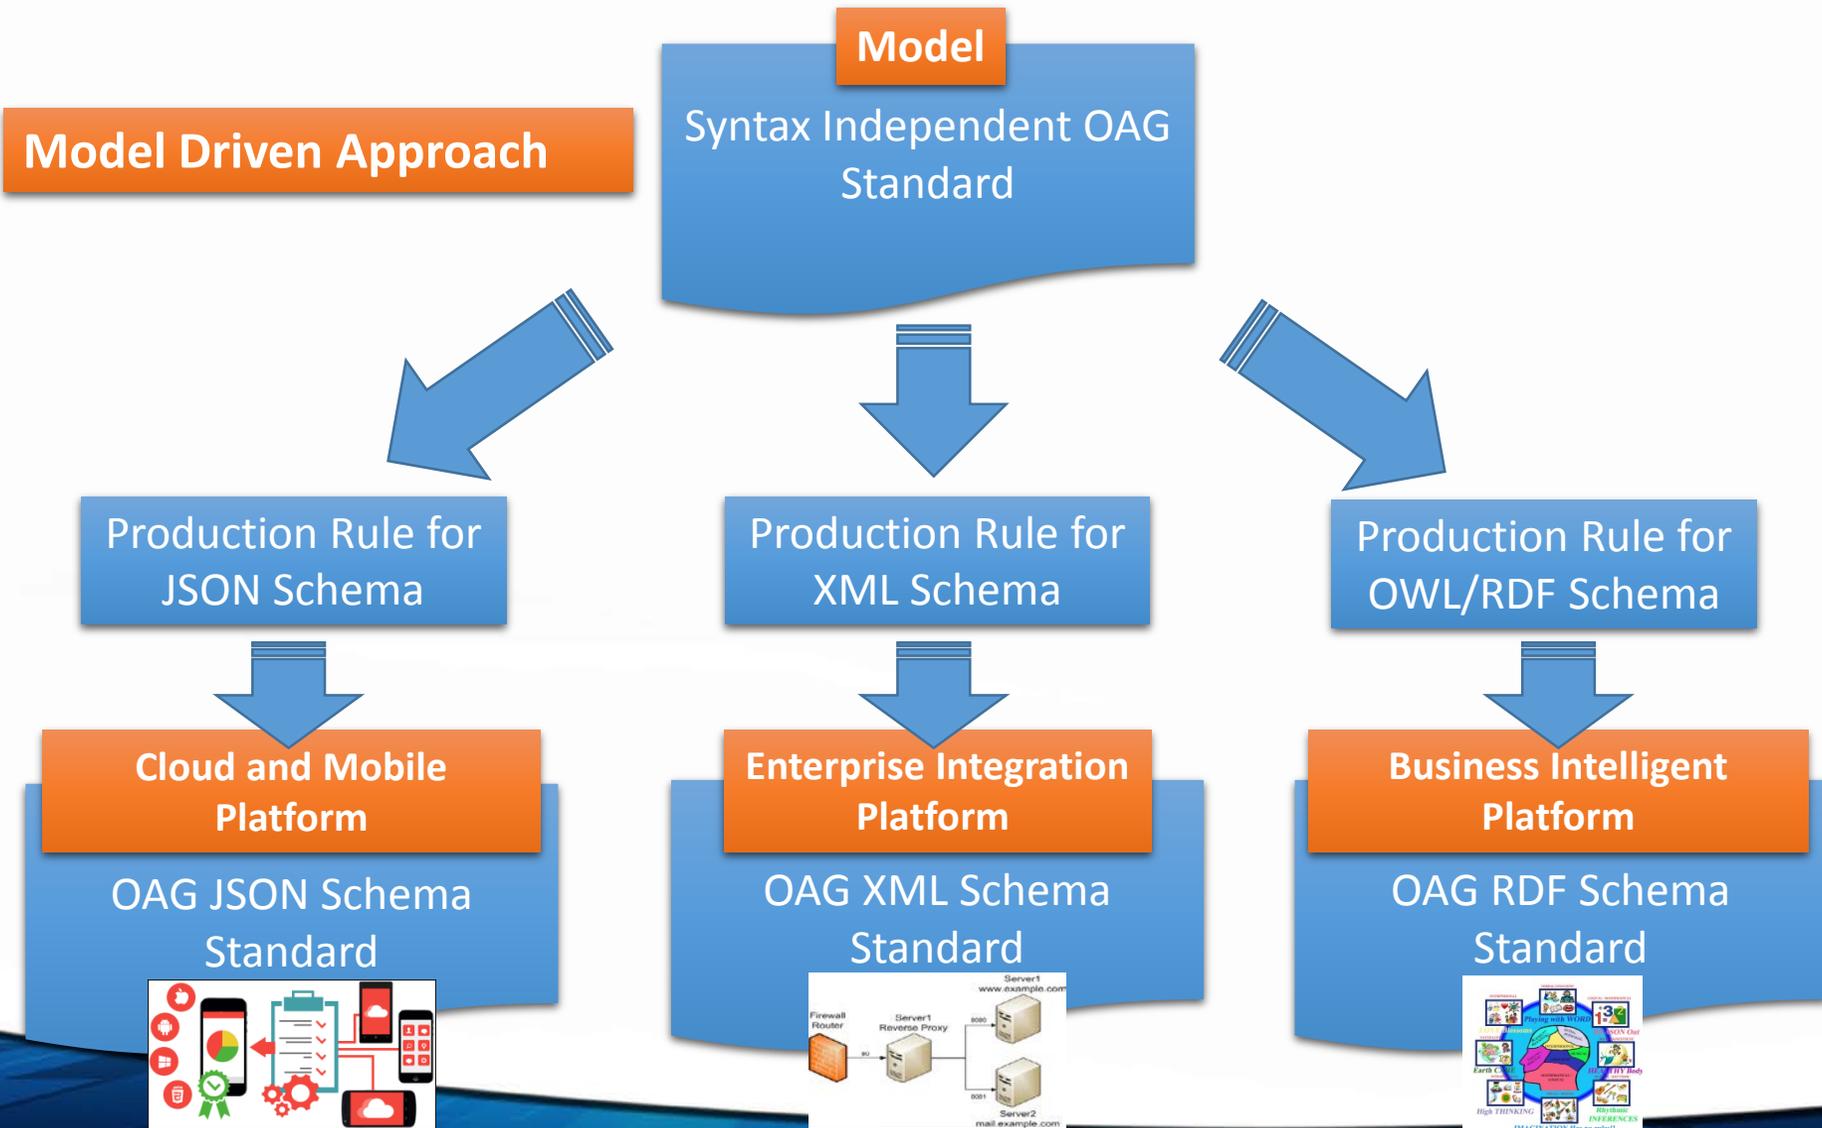

- Each specific industry
- Each specific process
- Other specific aspects

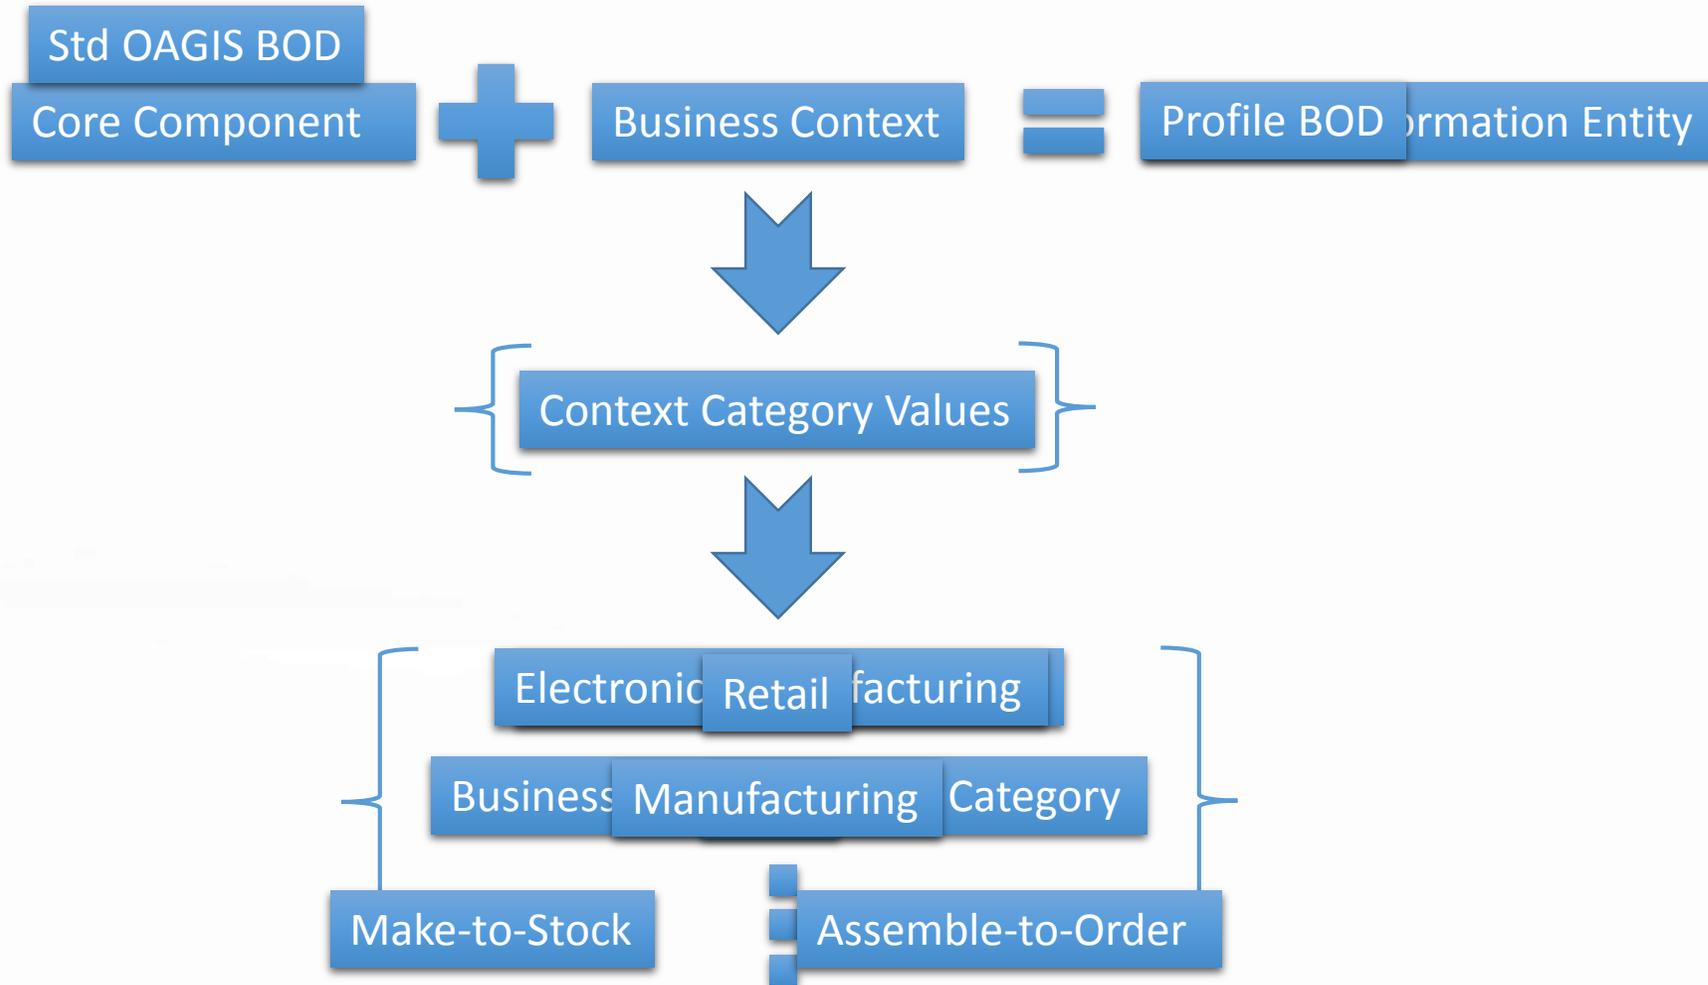

Problem: A Syntax Specific Standard

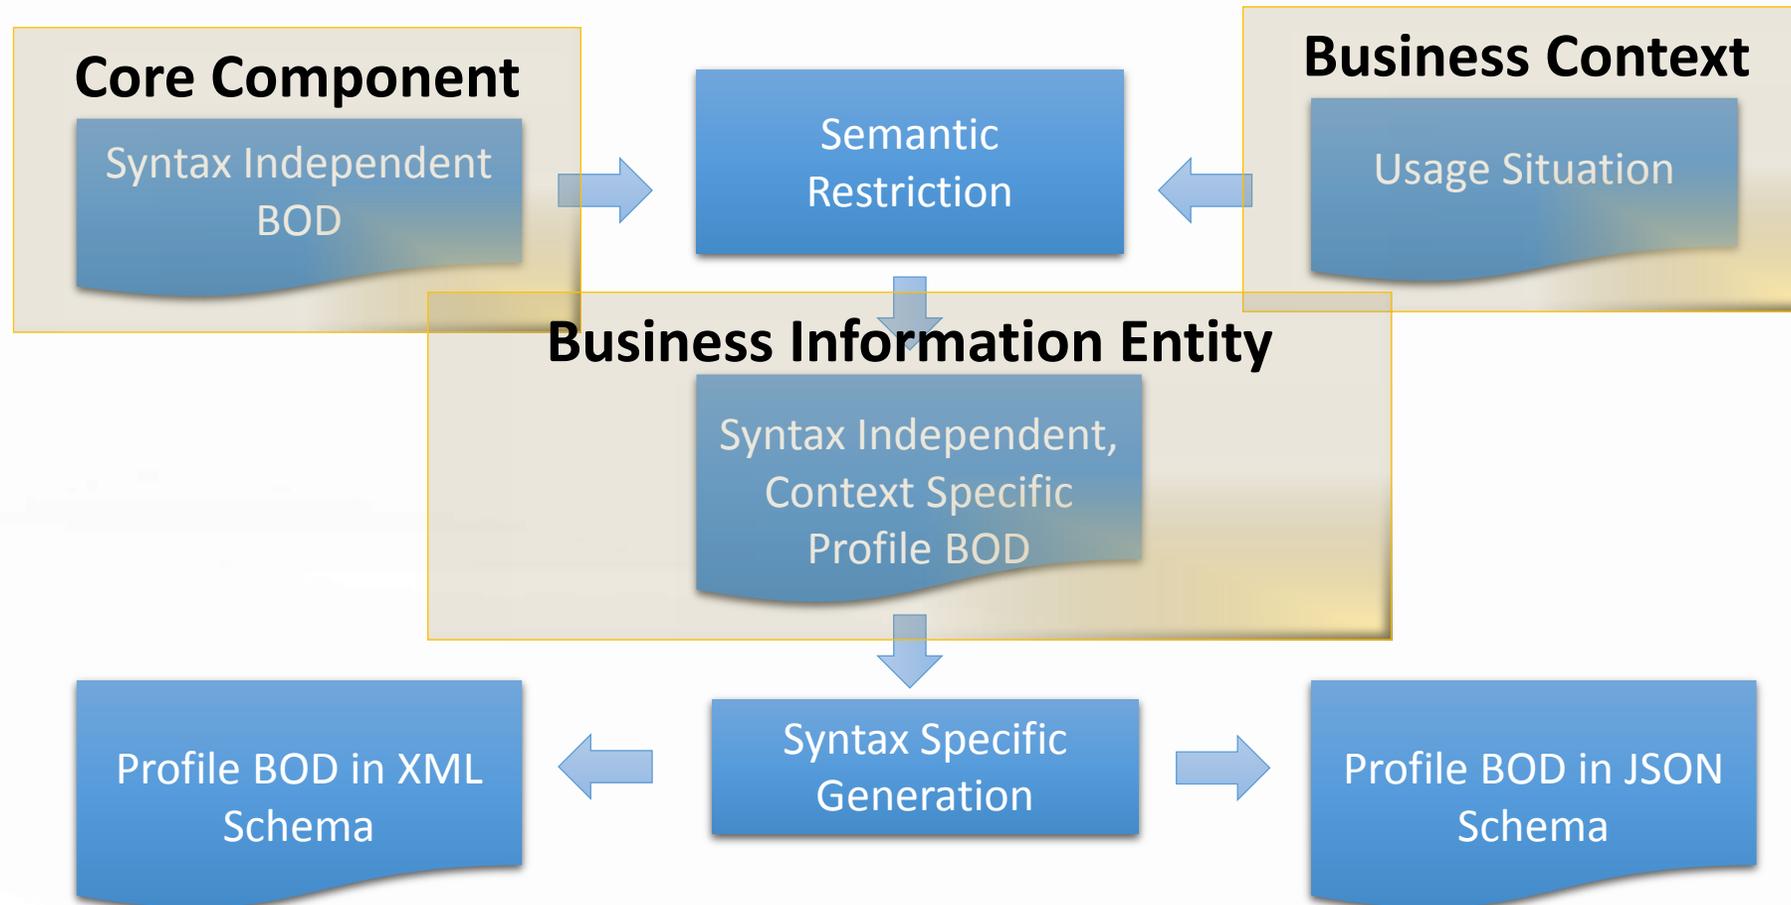

Need: Multiple Syntax Support

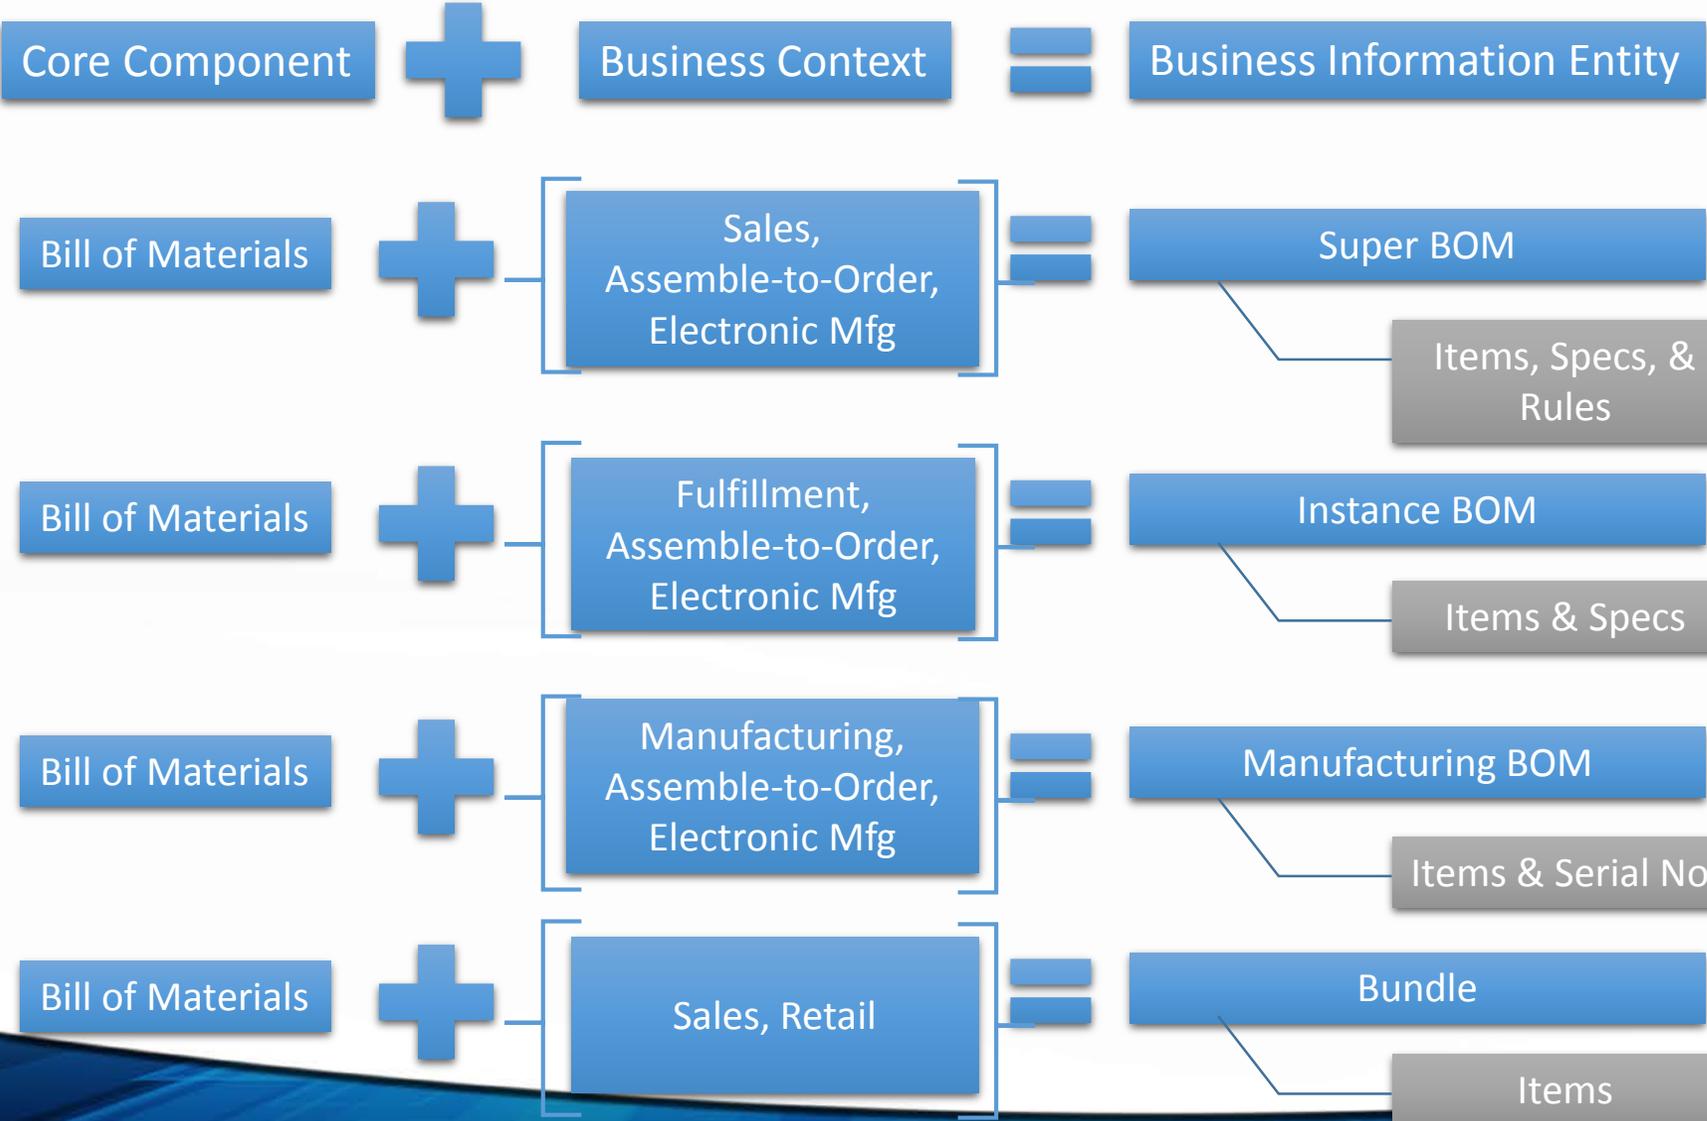

Overview of CCS Modeling Methodology

Functional Requirements to CCS Mapping

Example

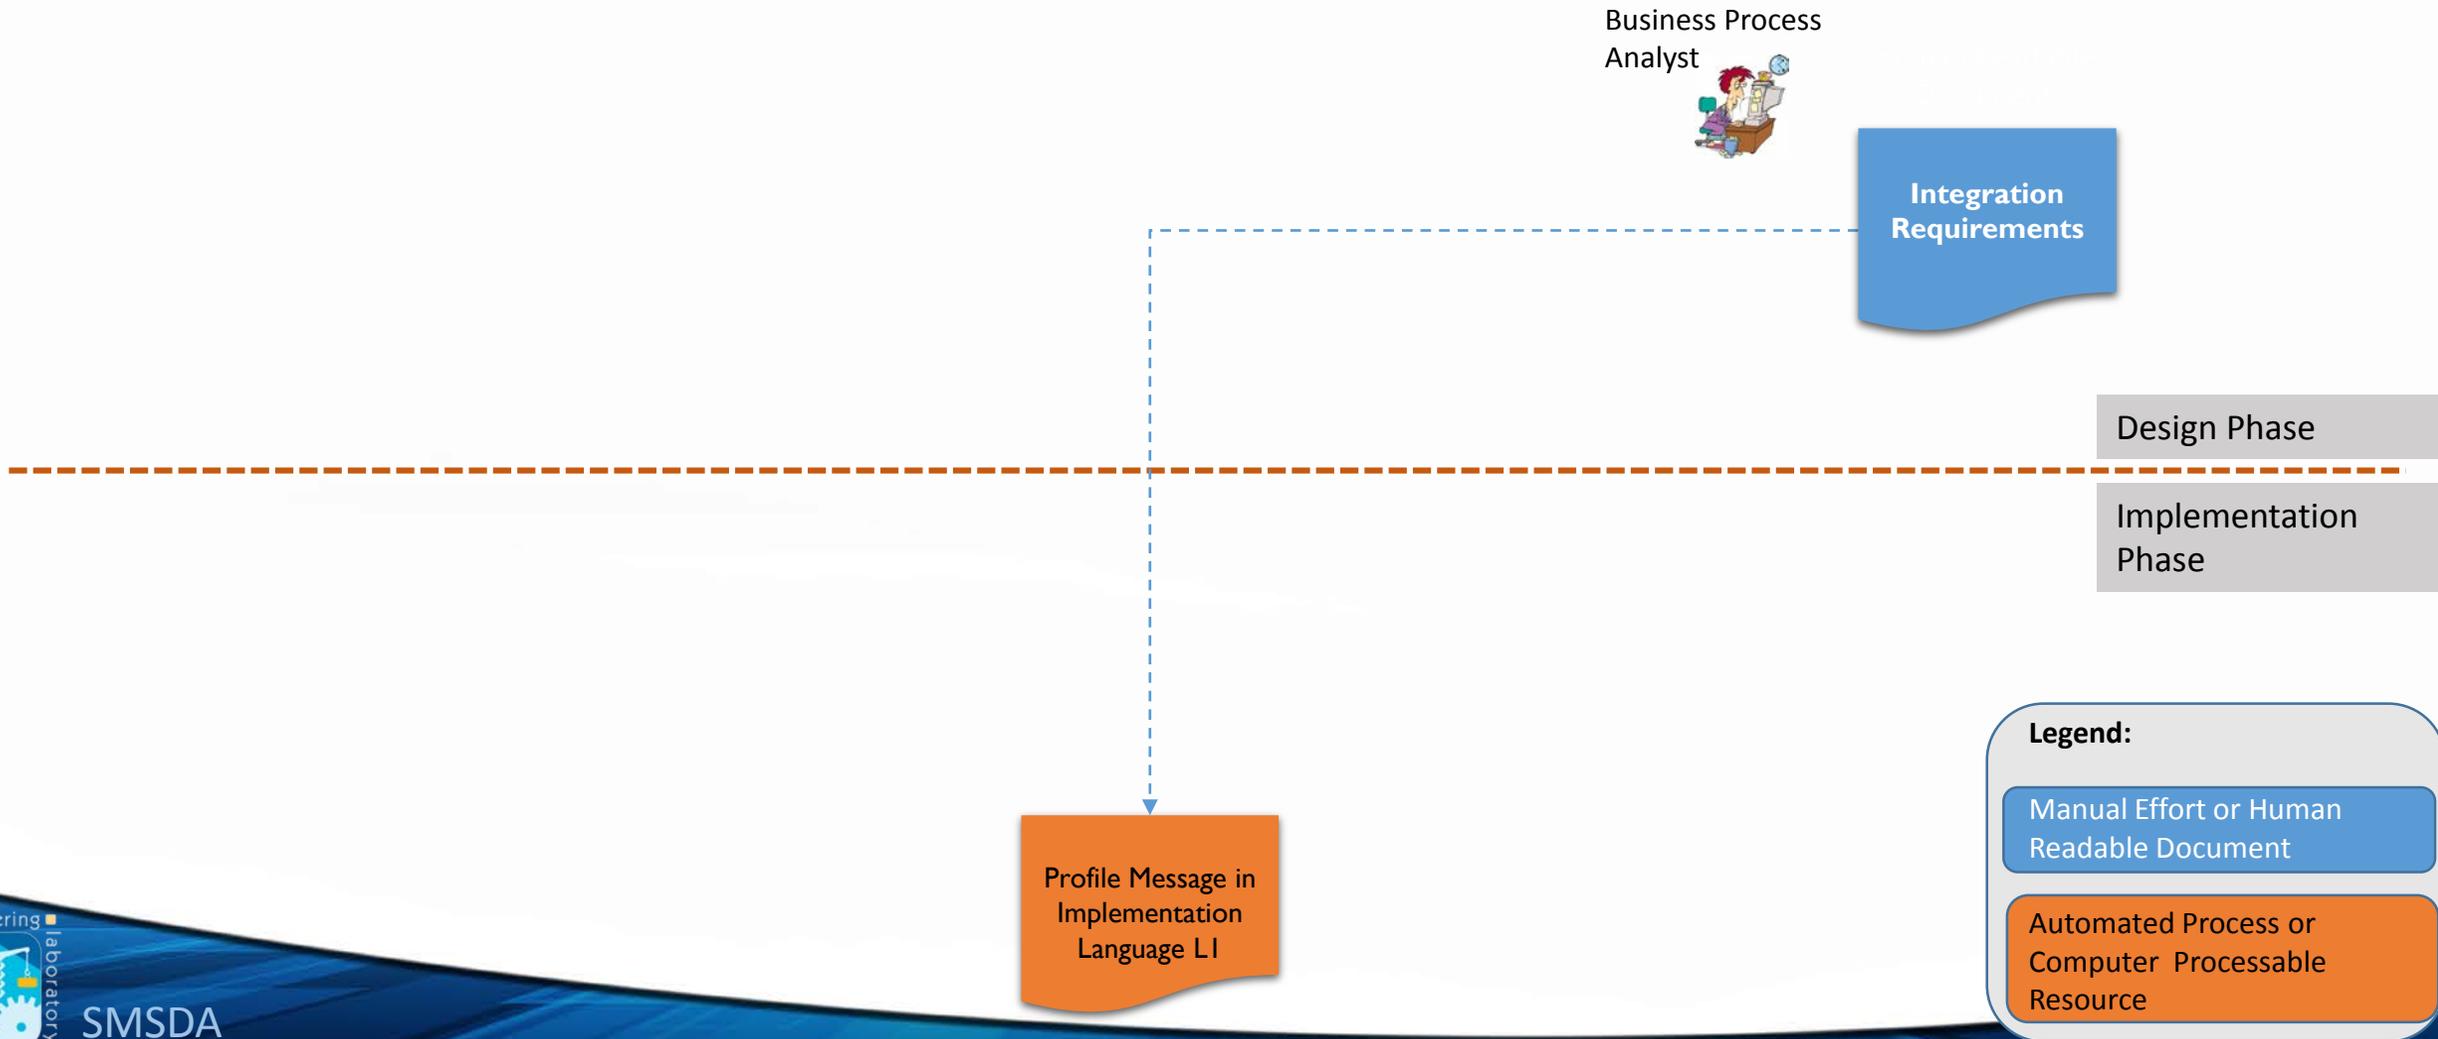

Traditional Message Standards Use (1)

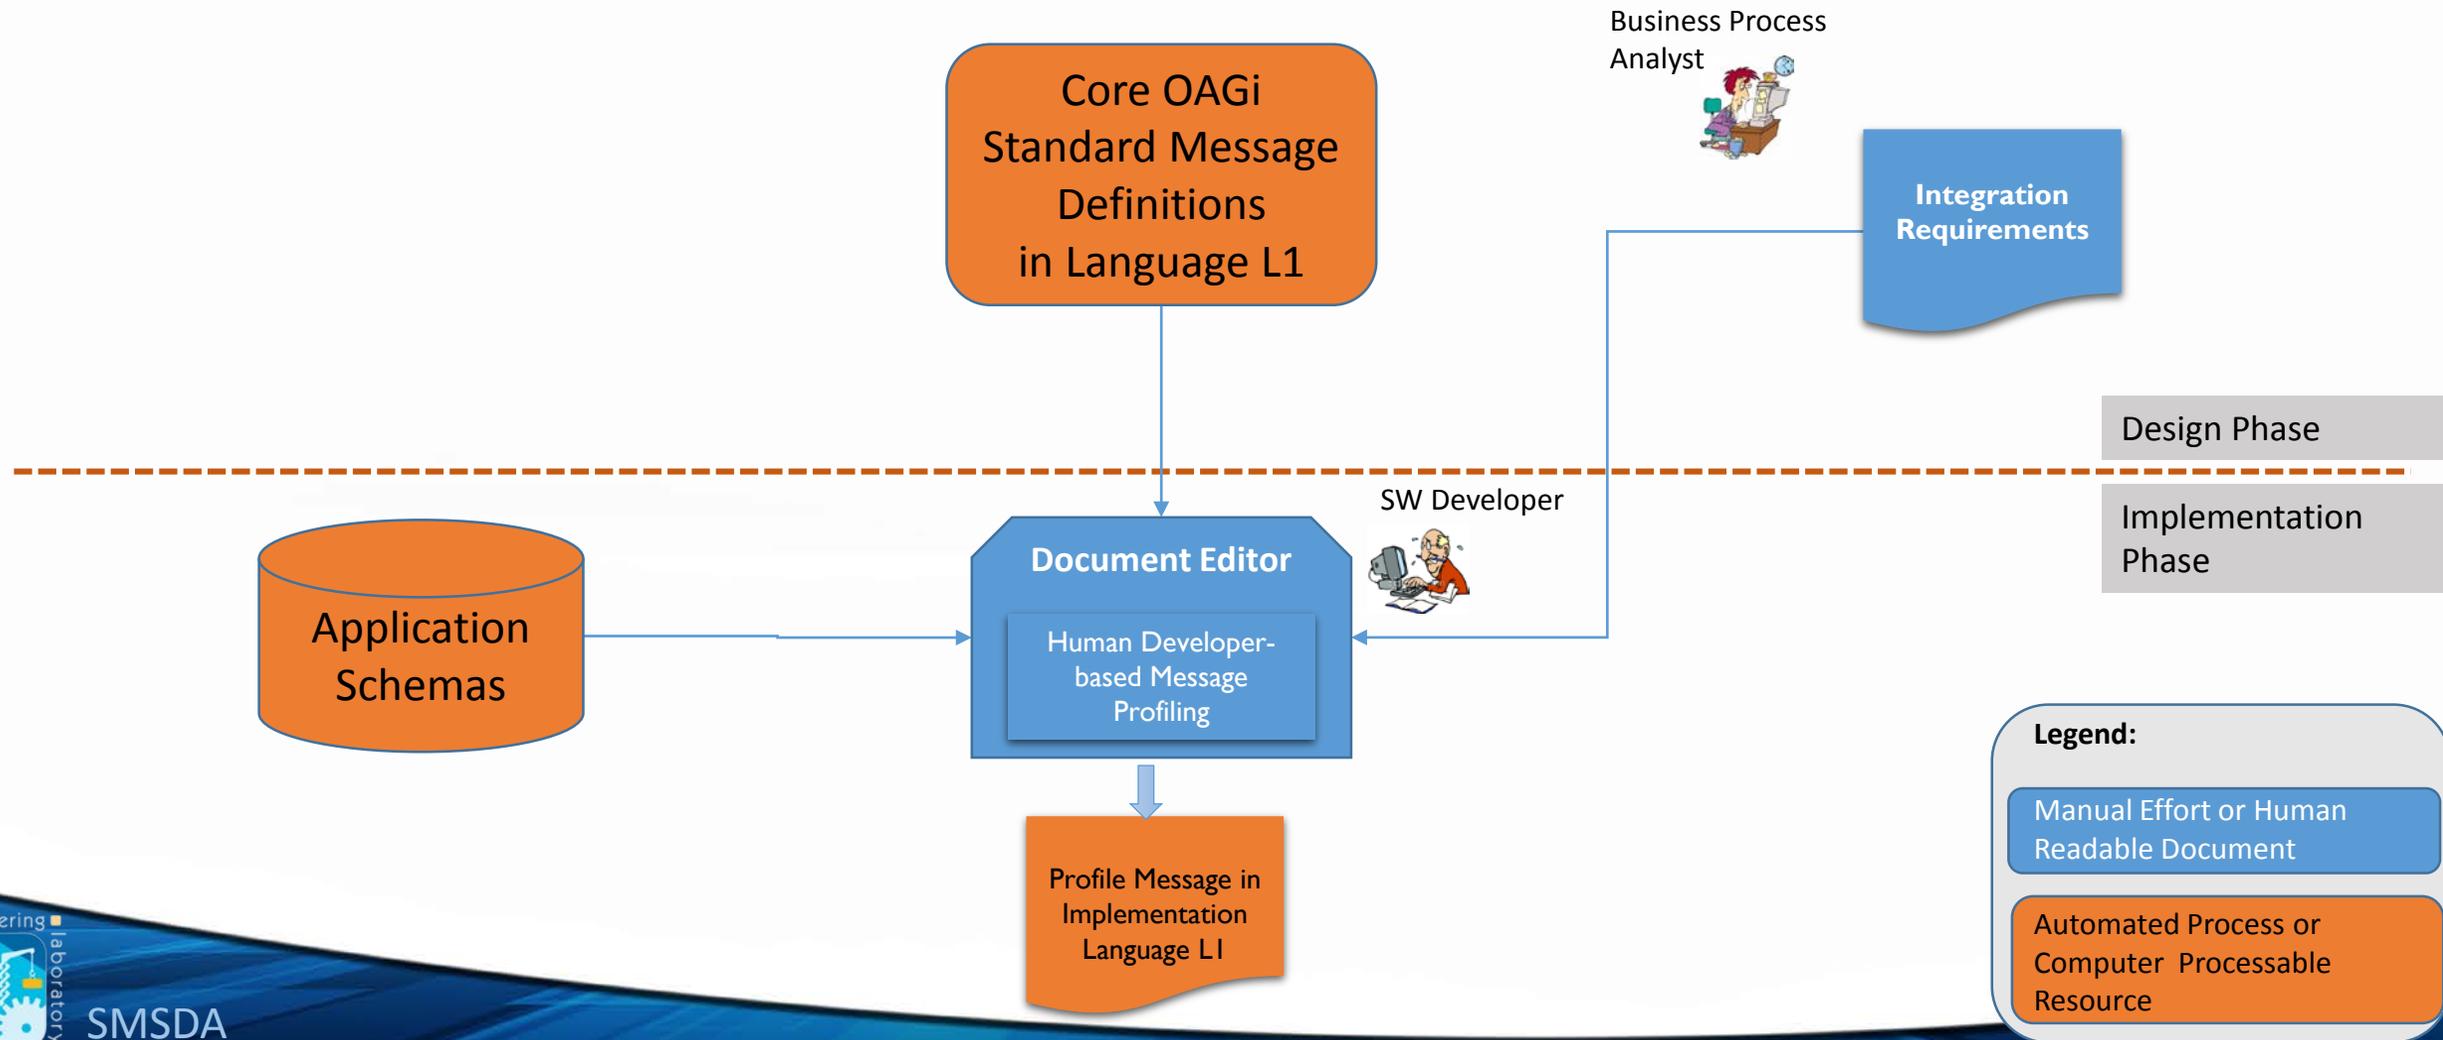

Legend:

- Manual Effort or Human Readable Document
- Automated Process or Computer Processable Resource

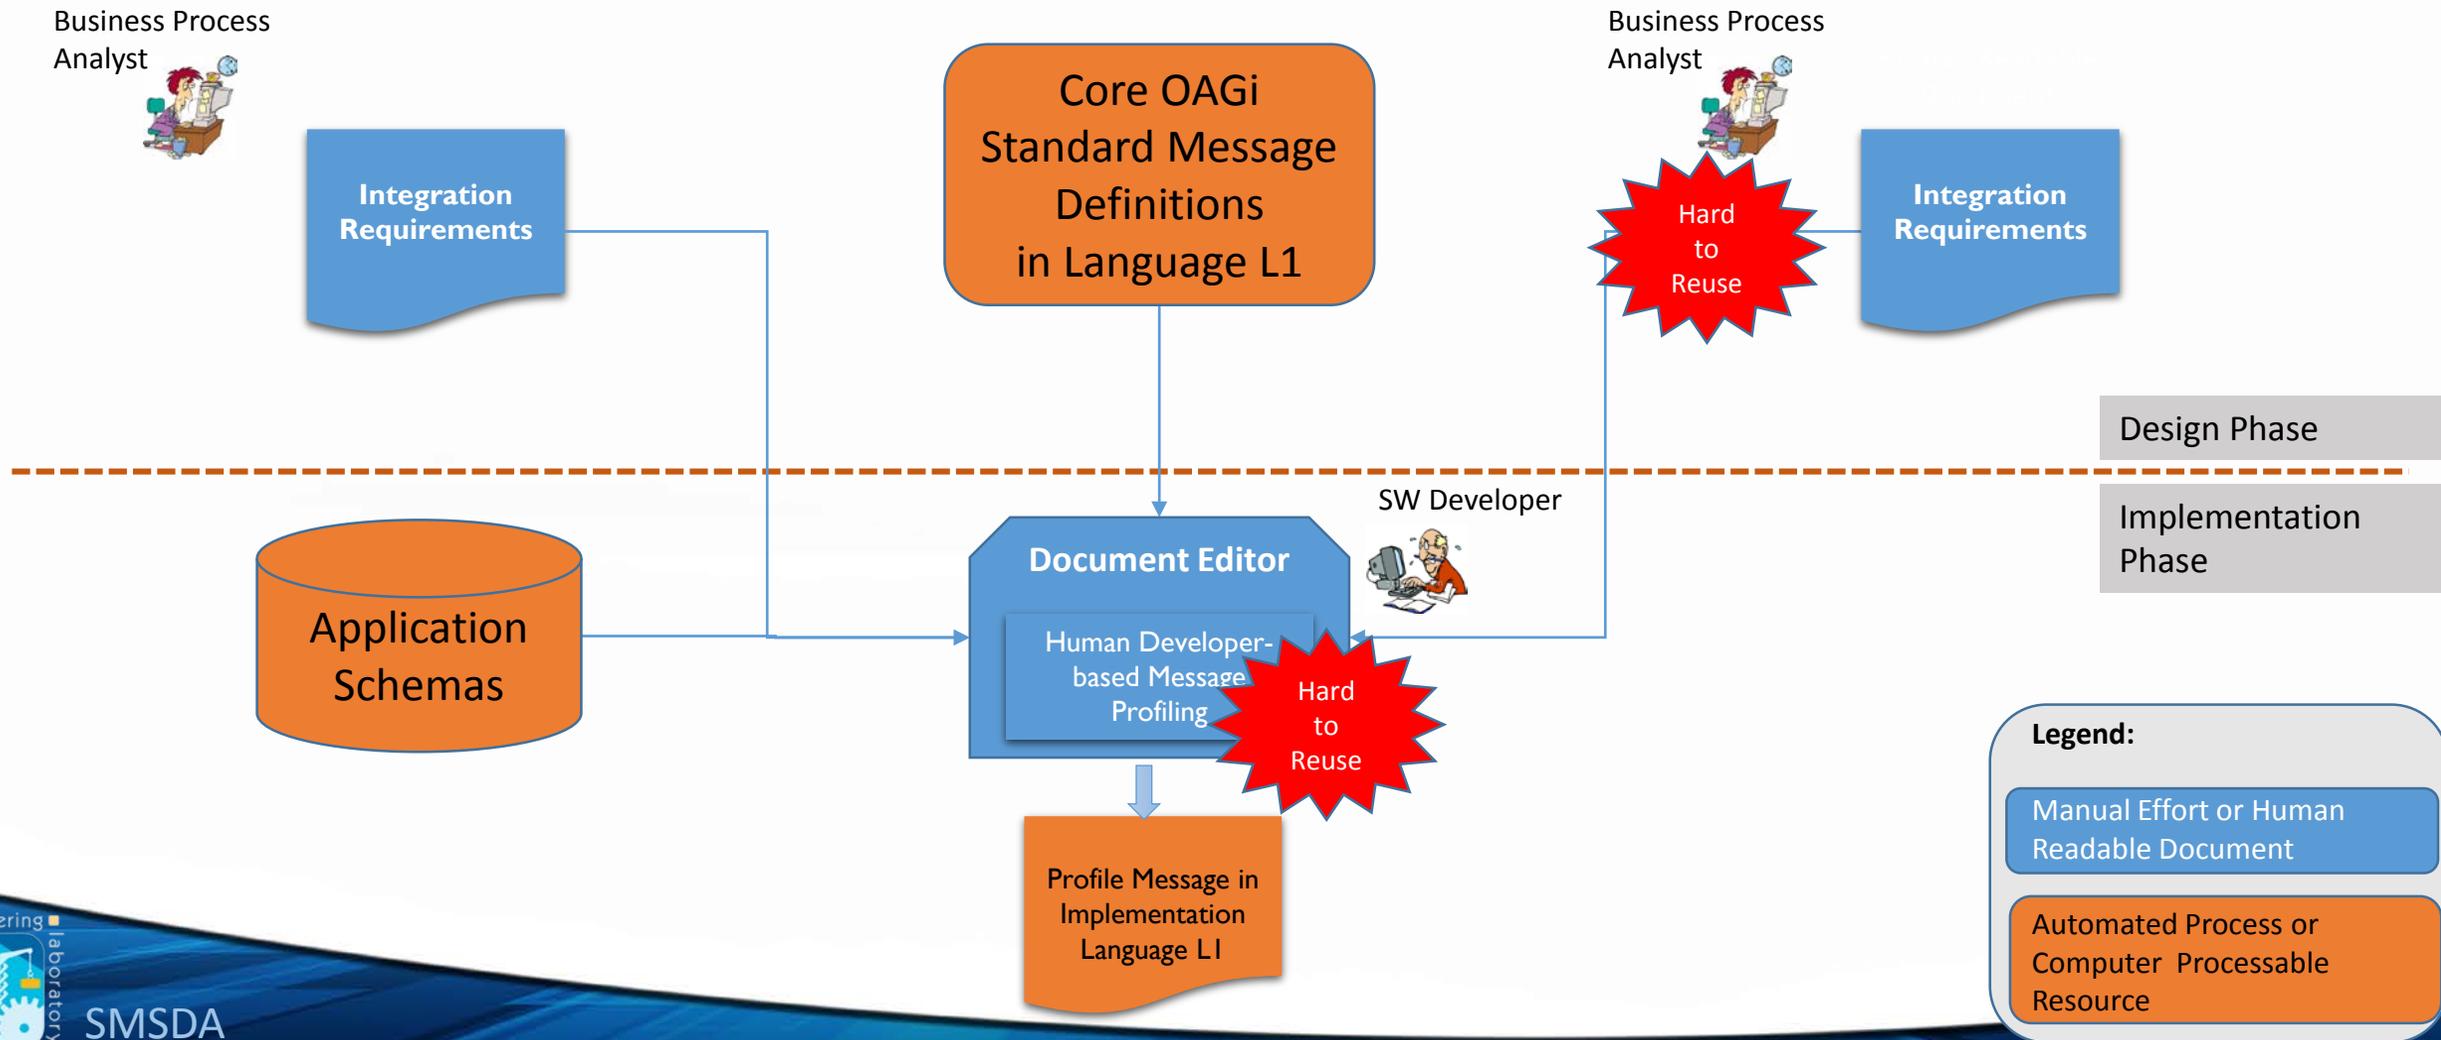

Traditional Message Standards Use (2)

Model-Driven Message Standards Use (8)

Why These Two Tools?

- Semantic Refinement Tool & Business Process Cataloging and Classification System have been selected to
 - Boot-strap Model-Driven approach to message standards
 - Enable low-hanging fruit and engage industry early in the R&D process

Semantic Refinement Tool: Quick Overview

- Developed a new **syntax-independent data model and structure** for OAGIS standard - based on CCS (ISO 15000-5) standard
- Designed a cloud-based architecture for collaborative message specification management
- NIST developed and verified a prototype Semantic Refinement Tool (SRT) with feedback from OAGi members.
- NIST transitioned the prototype to develop a cloud-based multi-tenant implementation

Business Process Cataloging and Classification System: A Quick Overview

- Created the BPCCS meta-model based on ebRIM (ISO/TS 15000-3) standard
- Developed and verified a BPCCS prototype with feedback from OAGi industry members.
- Validating prototype for message profiling and business process search

Summary

- The project helps industry address interoperability challenges for Service-Oriented Manufacturing (SOM)
- Industry requires improved message standards and their development processes
- The project team worked with industry and responded with
 - New model-driven approach to development and use of message standards
 - Software tools in support of the new approach
 - Semantic Refinement Tool (SRT)
 - Business Process Cataloging and Classification System (BPCCS)
