## initial feedback

---

---

**From:** Jason Hoffman

There are a couple of things that we didn't see on the document, for example:

Where is data integrity in the framework? In the document only network integrity is described as a control, but a detailed Data classification and the way to protect this data is not specified in the framework.

Also Cryptography is not specified in the framework and cloud services are not in scope or dealing with third parties is not specified.
