**Subject:** Proposed Advanced Manufacturing Technology Consortia

Some "manufacturing" takes place not in a factory, but in place, such as commercial and residential construction. There are great opportunities in the construction industry to create skilled, high-wage jobs. Many products that have construction applications are not developed because State regulations required huge capital outlay, just like factory developments, and very few in the construction industry have the necessary impitous to take these leaps of faith. There are natural disaster mitigation/protection processes and materials at the ready, but the construction industry is forced to stay with the old methods because the cost of testing and obtaining state approval is too great. Florida has just announced that homes with aluminum wiring must rewire this year to get home owner's insurance. We need a quick, acceptable solution, and there's no research. We'll get whatever is most expedient.

I suggest category(ies) of in-place manufacturing be included in your call.

Thanks, Joe Baudendistel
