Windows Registry Forensic Tool Specification

Public Draft 1 of Version 1.0 for Public Comment

32 **Abstract**

33

34 This specification defines requirements for Windows registry forensic tools that parse the registry
35 hive file format as well as extract interpretable data from registry hive files, and test methods used
36 to determine whether a specific tool meets the requirements for producing accurate results. These
37 requirements are statements used to derive test assertions that define expectations of a tool or
38 application. Test cases describe the combination of test parameters required to test each assertion.
39 Test assertions are described as general statements of conditions that can be checked after a test is
40 executed. Each assertion appears in one or more test cases consisting of a test protocol and the
41 expected test results. The test protocol specifies detailed procedures for setting up the test,
42 executing the test, and measuring the test results. The associated assertions and test cases are
43 defined in the test plan document entitled: *Windows Registry Forensic Tool Test Assertions and*
44 *Test Plan*, located on the CFTT web site, www.cftt.nist.gov.

45

46 As this document evolves updated versions will be posted at www.cftt.nist.gov.

68

70 **1. Introduction**

71 There is a critical need in the law enforcement community to ensure the reliability of digital
72 forensic tools. A capability is required to ensure that forensic software tools consistently produce
73 accurate and objective results. The goal of the Computer Forensic Tool Testing (CFTT) project at
74 the National Institute of Standards and Technology (NIST) is to establish a methodology for testing
75 forensic software tools. We adhere to a disciplined testing procedure, established test criteria, test
76 sets, and test hardware requirements, that result in providing necessary feedback information to
77 toolmakers so they can improve their tool's effectiveness; end users benefit in that they gain vital
78 information making them more informed about choices for acquiring and using computer forensic
79 tools, and lastly, we impart knowledge to interested parties by increasing their understanding of a
80 specific tool's capability. Our approach for testing forensic tools is based on established, well
81 recognized international methodologies for conformance testing and quality testing. For more
82 information on this project, please visit us at: www.cftt.nist.gov.

83 The Computer Forensics Tool Testing (CFTT) program is a joint project of the Department of
84 Homeland Security (DHS), and the National Institute of Standards and Technology Special
85 Program Office (SPO) and Information Technology Laboratory (ITL). CFTT is supported by other
86 organizations, including the Federal Bureau of Investigation, the U.S. Department of Defense
87 Cyber Crime Center, U.S. Internal Revenue Service Criminal Investigation Division Electronic
88 Crimes Program, the National Institute of Justice (NIJ), and the U.S. Department of Homeland
89 Security's Bureau of Immigration and Customs Enforcement, U.S. Customs and Border Protection
90 and U.S. Secret Service. The objective of the CFTT program is to provide measurable assurance
91 to practitioners, researchers, and other applicable users that the tools used in computer forensics
92 investigations provide accurate results. Accomplishing this requires the development of
93 specifications and test methods for computer forensic tools and subsequent testing of specific tools
94 against those specifications.

95 The Windows registry is a system-defined database in which applications and system components
96 store and retrieve configuration data. The Windows operating system provides registry APIs to
97 retrieve, modify, or delete registry objects such as keys, values and data. Note that the Windows
98 registry in this specification means Windows NT registry (i.e. not Windows 3.1 or Windows
99 95/98/ME).

100 From digital forensics point of view, the Windows registry is one of primary targets for Windows
101 forensics as a treasure box including not only configurations of the operating system and user
102 installed applications, but also meaningful data that can be useful for identifying users' behaviors
103 and reconstructing their past events. Although Windows registry analysis techniques are already
104 generally being used in Windows forensics, there is a lack of objective and scientific evaluation
105 efforts on digital forensic tools (dedicated registry forensic tools as well as digital forensic suites
106 having registry-related features), which can parse and interpret Windows registry internals and
107 various traces stored within the registry.

109 **2. Purpose**

110 This specification defines requirements for Windows registry forensic tools that parse the registry
111 hive file format as well as extract interpretable data from registry hive files, and test methods used
112 to determine whether a specific tool meets the requirements for producing measurable results.
113 These requirements were developed through a combination of processes including but not limited
114 to Windows forensics research, personal interviews with forensic investigators, and informal
115 discussions with individuals who are experts in the field of forensic investigation.

116 The Windows registry forensic tool requirements are used to derive test assertions. The test
117 assertions are described as general statements of conditions that can be checked after a test is
118 executed. Each assertion generates one or more test cases consisting of a test protocol and the
119 expected test results. The test protocol specifies detailed procedures for setting up the test,
120 executing the test, and measuring the test results.

121

122 **3. Scope**

123 The scope of this specification is limited to software tools capable of handling the Windows NT
124 registry hive format v1.3 and v1.5 generally used in modern Windows operating systems. The
125 Windows registry forensic tool specification is general and capable of being adapted to digital
126 forensic suites having registry-related features as well as dedicated registry forensic tools.

127 The type of input data for registry-related tools may be one of the follows: hive file(s), hive set(s),
128 and disk image file(s) containing at least one Windows system partition.

129

130 **4. Definitions**

131 This glossary provides context in the absence of definitions recognized by the digital forensics
132 community.

133 **Analysis** – The examination of acquired data for its significance and probative value.

134 **Artifact** – An object created as a result of the use of a digital device or software that shows usage
135 history by users and includes potential digital evidence. Thus, digital forensic activities
136 usually handle a multitude of forensic artifacts stored within various digital data storages
137 including volatile and non-volatile storage devices.

138 **ASCII** – American Standard Code for Information Interchange.

139 **Examination** – A technical review that makes the evidence visible and suitable for analysis; as
140 well as tests performed on the evidence to determine the presence or absence of specific data.

141 **Extraction** – A process by which potential digital evidence is parsed, processed, or interpreted for
142 the examination and analysis.

143 **File system** – A software mechanism that defines the way that files are named, stored, organized,
144 and accessed on logical volumes of partitioned memory.

145 **FILETIME** – A time structure that contains a 64-bit value representing the number of 100-
146 nanosecond intervals since January 1, 1601 (UTC).

147 **Hive file** – An offline registry file that physically stores registry objects including keys, values and
148 data.

149 **Hive set** – A hive set consists of hive files generally including (but not limited to) SAM, SYSTEM,
150 SOFTWARE, SECURITY and pairs of [NTUSER, USRCLASS] for each Windows account.
151 Multiple hive sets can be found from Restore Points (Windows XP and earlier) as well as
152 Volume Shadow Copies (Windows Vista and later) stored within a Windows system partition
153 if relevant features are turned on.

154 **Registry** – A hierarchical database that contains data that is critical for the operation of Windows
155 and the applications and services running on Windows.

156 **Registry Key** – An object within the registry that contains values and additional subkeys like a
157 directory (folder) in a hierarchical file system.

158 **Registry Value** – Registry name/value pair associated with a registry key analogous to a file in a
159 hierarchical file system.

160 **Unicode** – A standard for the consistent encoding, representation, and handling of text expressed
161 in most of writing systems in the world (e.g., UTF-8 and UTF-16).

162 **Volume Shadow Copy** – A technology included in modern Microsoft Windows that allows taking
163 manual or automatic backup copies of volumes, even when they are in use.

164

165

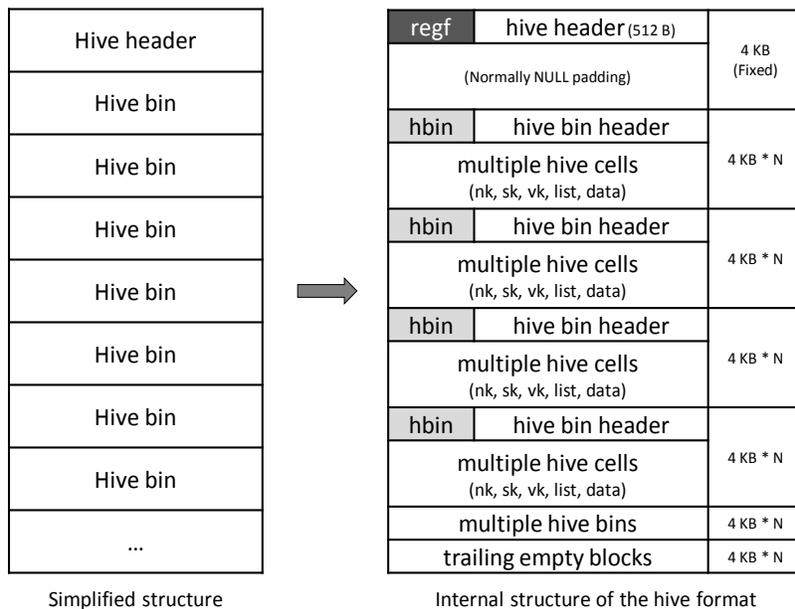

166 **5. Background**

167 **5.1. Windows NT Registry File Format**

168 In modern Windows systems, the registry is composed of multiple registry hives, and each registry
 169 hive that is a group of keys, subkeys and values is actually stored into a Windows NT registry file
 170 (also known as a hive file) as a backup container. The followings are commonly identified registry
 171 hives used in a running Windows OS:

- 172 ✓ HKEY_LOCAL_MACHINE\SAM
- 173 ✓ HKEY_LOCAL_MACHINE\SECURITY
- 174 ✓ HKEY_LOCAL_MACHINE\SOFTWARE
- 175 ✓ HKEY_LOCAL_MACHINE\SYSTEM
- 176 ✓ HKEY_CURRENT_CONFIG
- 177 ✓ HKEY_USERS*

178 The Figure 1 shows the internal structure of a registry file. As depicted in the figure, a registry file
 179 consists of a hive header ('regf' signature) and multiple hive bins, and more specifically each hive
 180 bin has a hive bin header ('hbin' signature) and a multitude of hive cells. We should note, that for
 181 registry formats version 1.3 and 1.5, a hive block of 0x1000 (4,096) bytes is used as the basic unit
 182 of allocation to expand the size of a hive file.

183 **Figure 1. Windows registry file format internals**

186 In this storage format, the hive cell structure consists of a 4-byte cell size (this value is negative if
 187 the cell is allocated or positive if it is unallocated by the deletion operation) and cell data that is
 188 one of the named key (nk), subkeys list (lf, lh, ri, li), value key (vk), value list, security key (sk),
 189 and data block (db). More details about the registry file format are available in literature (refer to
 190 Section 5.4).

191 Forensic tools tailored for registry data extraction and analysis should minimally be able to parse
192 registry objects (e.g., key, value and data) stored in hive files and provide reports of the data in a
193 human-readable format. Because registry hive files as one of important investigative targets,
194 specifically generated by modern Windows OSes, include a variety of forensically meaningful
195 data (potential digital evidence) created during the usage of the operating systems, tools that
196 possess Windows forensics-related features are generally required to provide examiners with the
197 ability to perform proper interpretation of well-known registry files (e.g., hive files having
198 accounts, applications and devices-related registry data) and generate reports in a meaningful
199 format.

200

201 **5.2. Fundamental Characteristics of Registry File Format**

202 This specification considers the following characteristics of the registry file format. Note that there
203 may of course exist more properties about the file format, but the following list is considered as
204 fundamental conditions to define testing strategies for Windows registry forensic tools.

- The format uses little-endian byte ordering.
- The date and time value is stored in a FILETIME (UTC) structure.
- A key name has a limit of 255 characters.
- A value name has a limit of 16,383 characters.
- A registry tree can be 512 levels deep.
- Key and value names are case insensitive.
- ASCII strings are Single Byte Character (SBC) or Multi Byte Character (MBC) string stored with a codepage. Unicode strings are stored in UTF-16 LE without the byte order mark.

205

206 **5.3. Well-known Registry Files on Windows Forensics**

207 As mentioned in Section 5.1, tools that provide Windows forensics-related features may have the
208 ability to recover and extract forensically meaningful artifacts stored in well-known registry files
209 like Table 1 from Windows forensics point of view. The following list shows some examples of
210 those kind of artifacts:

- 211 ✓ User accounts (local and live accounts) and their activities
- 212 ✓ System configurations
- 213 ✓ Directories and files related traces
- 214 ✓ System or third-party application related data
- 215 ✓ External device usage traces
- 216 ✓ Miscellaneous features including keyword search, sharing, network drives, system backup, etc.

217 Given that a Windows system partition has a set of common registry files as listed in Table 1, we
218 should also note that multiple sets can be found from Restore Points (XP and earlier) as well as
219 volume shadow copies (Vista and later).

220

Table 1. Common registry files stored in modern Windows operating systems

Name	File Path (considering only Vista and later)	Description
NTUSER.DAT	%UserProfile%\	- User specific data - HKEY_USERS\<SID>
UsrClass.dat	%UserProfile%\AppData\Local\Microsoft\Windows\	- File associations and COM registry entries - HKEY_USERS\<SID>_Classes
BCD	{Boot Partition}\Boot\	- BCD (Boot Configuration Data) - HKEY_LOCAL_MACHINE\BCD00000000
SAM	%SystemRoot%\System32\Config\	- SAM (Security Account Manager) part - HKEY_LOCAL_MACHINE\SAM
SECURITY	%SystemRoot%\System32\Config\	- Security specific data - HKEY_LOCAL_MACHINE\SECURITY
SOFTWARE	%SystemRoot%\System32\Config\	- Software specific data - HKEY_LOCAL_MACHINE\SOFTWARE
SYSTEM	%SystemRoot%\System32\Config\	- System specific data - HKEY_LOCAL_MACHINE\SYSTEM
DEFAULT	%SystemRoot%\System32\Config\	- Template file for NTUSER.DAT registry - HKEY_USERS\DEFAULT
BBi	%SystemRoot%\System32\Config\	- BBi (Browser-Based Interface) - Windows 8 and later
BCD-Template	%SystemRoot%\System32\Config\	- Template file for BCD registry - Windows 8 and later
COMPONENTS	%SystemRoot%\System32\Config\	- Windows optional components related data - HKEY_LOCAL_MACHINE\COMPONENTS
DRIVER	%SystemRoot%\System32\Config\	- Driver database - Windows 8 and later
ELAM	%SystemRoot%\System32\Config\	- ELAM (Early Launch Anti-Malware) - Windows 8 and later
SCHEMA.DAT	%SystemRoot%\System32\SMI\Store\Machine\	- SMI (Settings Management Infrastructure) - HKEY_LOCAL_MACHINE\SCHEMA
Amcache.hve	%SystemRoot%\AppCompat\Programs\	- Application compatibility database - Windows 7 and later
Syscache.hve	%SystemDrive%\System Volume Information\	- (Possibly) volume shadow copies related data - Windows 7 and later

229 Registry.

230

231

232 **6. Test Methodology**

233 To provide repeatable test results, the following test methodology is strictly followed. Each
234 forensic application under evaluation is installed on a host workstation operating with the required
235 platform as specified by the application. Additionally, a Windows registry dataset developed by
236 the Computer Forensic Reference Data Sets (CFReDS) project at the NIST is used as a common
237 reference dataset with ground truth data during the tool testing procedure. Briefly, the dataset used
238 here consists of two different classes: *user-generated data* that is created experimentally based on
239 the Windows NT registry file format, and *system-generated data* that is generated naturally by
240 Windows operating systems populated along with a multitude of known user actions. The data
241 objects and characteristics described in Section 5 were considered in developing the Windows
242 registry dataset. For more information on this test dataset, please visit us at: www.cfreds.nist.gov.

243

244 **7. Requirements**

245 The Windows registry tool requirements are in two sections: 7.1 and 7.2. The first Section 7.1 lists
246 requirements, i.e., Windows Registry Tool-Core Requirement-01, WRT-CR-01 through WRT-
247 CR-03 that all tools shall meet. Section 7.2 lists requirements i.e., Windows Registry Tool-
248 Requirement Optional-01, WRT-RO-01 through WRT-RO-02 that the tool shall meet on the
249 condition that specified features or options are offered by the tool. If a feature is not present, then
250 requirements for those features will not be tested.

251

252 **7.1. Requirements for Core Features**

253 All Windows registry forensic tools shall meet the following core requirements.

254 **WRT-CR-01** A Windows registry forensic tool shall support at least one of possible input data
255 types, which include an independent hive file, a set of hive files, and a disk image
256 containing Windows system partitions.

257 **WRT-CR-02** A Windows registry forensic tool shall have the ability to notify the user of
258 abnormal information (that can usually be found in corrupted or manipulated
259 registry hive files) detected during data processing without application crash.

260 **WRT-CR-03** A Windows registry forensic tool shall have the ability to perform an interpretation
261 of supported registry objects without modification to the objects.

262

263 **7.2. Requirements for Optional Features**

264 The following Windows registry forensic tool requirements define optional tool features. If a tool
265 provides the capability defined, the tool is tested for conformance to these requirements. If the tool
266 does not provide the capability defined, the requirement does not apply.

267 The following optional features are identified:

- 268 ▪ Deleted registry object recovery
- 269 ▪ Registry forensic artifact extraction

270

271 **WRT-RO-01** A Windows registry forensic tool shall have the ability to identify and recover
272 deleted registry objects such as keys, values and their data from supported registry
273 hive files.

274 **WRT-RO-02** A Windows registry forensic tool shall have the ability to extract registry forensic
275 artifacts.

276

277
