# Reports on Information Technology

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) stimulates U.S. economic growth and industrial competitiveness through technical leadership and collaborative research in critical infrastructure technology, including tests, test methods, reference data, and forward-looking standards, to advance the development and productive use of information technology. To overcome barriers to usability, scalability, interoperability, and security in information systems and networks, ITL programs focus on a broad range of networking, security, and advanced information technologies, as well as the mathematical, statistical, and computational sciences. Special Publication 500-series reports on ITL's research in tests and test methods for information technology, and its collaborative activities with industry, government and academic organizations.

## **Foreword**

The existence of biometric standards alone is not enough to demonstrate that products meet the technical requirements specified in the standards. Conformance testing captures the technical description of a specification and measures whether an implementation faithfully implements the specification. Conformance testing provides developers, users, and purchasers with increased levels of confidence in product quality and increases the probability of successful interoperability.

Although no conformance test can be comprehensive enough to test all the different combinations of mandatory requirements of a standard and all possible combinations of conditional and optional characteristics that could be included in ANSI/NIST-ITL 2011 (AN-2011) transactions, a well-designed conformance test tool that faithfully implements a standard conformance testing methodology could raise the level of confidence on the test results. Therefore, transactions tested with such a tool (and reported to be conformant to the standard), are more likely conform to the standard.

## **Introduction**

This draft revised version of the Conformance Testing Methodology (CTM) for AN-2011 adds to the initial version test assertions for Section 8.18 Record Type-18: DNA record, Annex C: NIEM Conformant encoding, and Annex G: Mapping to the NIEM IEPD. Modifications to existing assertions in NIST SP 295 were made to address errors and clarify the syntax. A comprehensive list of changes is documented in [Annex B: Version History](#).

This document includes comprehensive tables of AN-2011 requirements and assertions for the selected Record Types supported by this publication. The tables of requirements and assertions indicate which assertions apply to the Traditional encoding format, which apply to the National Information Exchange Model (NIEM)-compliant encoding format, and which apply to both encoding formats. Test assertion syntax is specified to clearly define the assertions associated with each requirement. Some requirements are not supported by the testing methodology, and are identified as exceptions. When an exception is present, the requirement is listed in the tables, but no assertions are defined for that requirement. Justification is provided for each exception.

## 1 Scope

This draft conformance testing methodology includes the concepts and test types necessary to test transactions for conformance to the AN-2011 standard. It defines three levels of conformance testing: Level 1, Level 2, and Level 3 conformance testing (see [Sec. 5.3](#)). This version of the conformance testing methodology specifies requirements and test assertions for the following sections and Record Types of the AN-2011 standard:

- Section 5: Data Conventions
- Section 7: Information Common to Several Record Types
- Section 8.1 Record Type-1: Transaction information record
- Section 8.4 Record Type-4: Grayscale fingerprint image
- Section 8.10 Record Type-10: Facial, other body part and SMT image record
- Section 8.13 Record Type-13: Friction-ridge latent image record
- Section 8.14 Record Type-14: Fingerprint image record
- Section 8.15 Record Type-15: Palm print image record
- Section 8.17 Record Type-17: Iris image record
- Section 8.18 Record Type-18: DNA record (**new in this version**)
- Annex B: Traditional Encoding
- Annex C: NIEM Conformant encoding (**new in this version**)
- Annex G: Mapping to the NIEM IEPD (**new in this version**)

Requirements and assertions for the deprecated Record Types 3, 5, and 6 are also included to ensure nonexistence of the deprecated records. Additionally, an assertion is specified that checks for the nonexistence of reserved Record Types 11, 12, and 22 through 97.

A complete description of support for Record Types and interrelated fields is provided in [Annex A](#). Tables of terms, operands, and operators that are used in specifying the test assertions are included. The assertion tables identify requirements for Level 1 and 2 conformance testing. In addition, the assertion tables identify requirements for Level 3 only when it is necessary to clarify that the requirement is categorized as Level 3.

Only test assertions for Level 1 and Level 2 conformance testing are part of the scope of this conformance testing methodology. Implementation exceptions are identified in [Sec. 6.21](#). Type-A and Type-B conformance testing are defined. Only Type-A testing is specified. Type-B conformance testing is outside of the scope of this edition of the CTM.

This conformance testing methodology does not establish tests of characteristics (i.e., performance, acceptance, security, robustness) of products that generate the transactions.

## **2 Conformance**

AN-2011 conformance test tools that claim conformance to this conformance testing methodology shall satisfy the requirements of the testing methodology specified in [Sec. 5](#) and shall follow the procedures defined by Level 1 and Level 2 test assertions as specified in [Sec. 6](#).

## **4 Terms and definitions**

### **assertion**

A test procedure that represents a specific aspect of a requirement found in the base standard. The assertion is expressed using the operator and operand syntax defined by the conformance testing methodology.

### **base standard**

ANSI/NIST-ITL 1-2011, Data Format for the Interchange of Fingerprint, Facial & Other Biometric Information, NIST Special Publication 500-290.

### **conformance**

The adherence of an implementation to all specified requirements as defined in the base standard.

### **CTA**

Conformance Testing Architecture.

## **CTM**

Conformance Testing Methodology.

## **CTS**

Conformance Testing Suite.

## **implementation**

An ANSI-NIST-ITL 1-2011 transaction.

## **IUT**

Implementation under test. The implementation supplied by a vendor to a laboratory for conformance testing.

## **test**

Also known as a conformance test or assertion test, it is the execution of the testing procedure defined by an assertion or set of assertions in order to obtain a statement of conformance. The result of the test is a Boolean value that determines the implementation's conformity for the assertion. For a given requirement, if all tests pass for the associated assertions, then the implementation is considered to be conformant for that requirement.

### **Type-A testing**

Type-A conformance testing checks the conformance of AN-2011 transactions to the requirements in the base standard.

### **Type-B testing**

Type-B testing checks the ability to use an AN-2011, for example in a software application.

## **5 Conformance testing methodology**

The conformance testing methodology defined in this draft publication addresses only Level 1 and 2 testing and Type-A testing. While some Level-3 requirements are identified in the tables of requirements and assertions, testing methodologies are provided for Level-1 and Level-2 conformance testing only (see “Hierarchy of conformance tests” for information regarding the three levels of conformance testing). Type-B testing is not defined.

### **5.1 Functional documentation of requirements**

The tables of requirements and assertions included in this publication identify requirements defined in the base standard and provide a succinct listing of the information necessary to

facilitate the development of conformance testing tools. Extracting the requirements from the base standard improves the efficiency of conformance test tool development by providing the information required in a consolidated manner.

Each requirement identified in this publication is associated with one or more assertions which collectively form the complete set of test procedures required to test an implementation for conformance to that requirement.

## **5.2 Limitations and exceptions**

While conformance of an implementation to relevant requirements can be determined (e.g., content and relationships between elements), no test tool is guaranteed to be comprehensive and prove that a given system generating or using AN-2011 transactions is conformant under all possible circumstances. Well-designed conformance tests can, however, test the most likely sources of problems and demonstrate non-conformity (i.e., if errors are found, non-conformance of the transaction shall be proven), but the absence of detected errors does not necessarily imply full conformance to the standard.

The tables of requirements and assertions define all normative requirements as well as optional and conditional (dependent) requirements for selected Record Types found in the base standard (AN-2011). Some of the AN-2011 requirements in the tables do not have an associated assertion or set of related assertions due to the fact that some conformance tests require additional research, or that the test of that requirement is not feasible at the present time.

## **5.3 Hierarchy of conformance tests**

Three levels of conformance testing are defined below. See also expanded discussions on these levels of conformance tests in Section 2 of NIST Special Publication 500-290. For each assertion included in the tables of requirements and assertions, a level of conformance testing is indicated.

### ***Level 1 conformance testing***

Level 1 conformance testing deals with the form and structure of the internal content and verifies that data structures exist and have allowable values. Specifically, it checks for the presence, structure, and value of each field, subfield, and information item in a transaction for conformance with the specification of the standard, both in terms of ranges and cardinality. Since Level 1 testing can be performed by a simple field-by-field reading of the standard and comparison to known values and their encoding, only the AN-2011 transactions are required for conformance testing, and not any hardware or software components used to create those transactions.

### ***Level 2 conformance testing***

Level 2 conformance testing deals with explicit requirements that check for internal consistency. Specifically, morphological conformance checks the relationships between fields, subfields, or information items within a transaction, including comparisons of values, as specified in the AN-2011 standard. Level 2 tests involve interactions between multiple values from different parts of the standard and sometimes from implicit observations that are not explicitly stated in the base standard. Thus, Level 2 tests require more complex validation than Level 1. Similar to Level 1 testing, Level 2 conformance testing only requires an AN-2011 transaction(s).

### ***Level 3 conformance testing***

Level 3 conformance testing checks if the biometric transaction is a faithful representation of the parent biometric data and ensures requirements are satisfied that are not merely Level 1 and Level 2 tests. Individual fields may have explicit semantic requirements for which conformance testing is significantly difficult or even impossible to test. Unlike Level 1 and Level 2 testing, Level 3 testing may require software and hardware components used to create the AN-2011 transactions, and may also require the subject and samples from which the biometric information stored in the transaction was collected. The requirements and assertion tables indicate whether Level 1 or Level 2 conformance testing is required to address the assertion identified in the test assertion. Required Level 3 conformance tests are not performed but they are identified in the tables to indicate that the requirement is not addressed or that it is not currently testable.

## **5.4 Conformance statements**

In addition to providing a succinct list of the requirements in the AN-2011 standard, the tables of requirements and assertions provide the means for the developers of implementations under test (IUT) to claim in the tables the list of all the requirements supported including:

- Transaction information
- Encoding requirements
- Each Record Type included in the Transaction
  - Fields
  - Subfields
  - Information Items

This information is useful to the IUT supplier as a checklist on the content of their implementations and also useful to testing laboratories that would evaluate conformance of these IUTs against the supplier's claims. Two columns in the tables are included to provide this information: Implementation Support column (YES/NO/Partial) and Supported Range column (if Implementation Support is "Partial", the supported range should be provided).

If the IUTs are sent to a testing laboratory, the IUT provider shall also submit the information below to the laboratory:

- Provider name
- Provider address
- Transaction identifier
- Transaction version number
- Additional implementation information (optional)

- Submission date
- For each claimed Record Type, provide the Record Type number and whether or not (Yes or No) there are any known deviations from (or exceptions to) the requirements found in the base standard and identified in the Conformance Testing Methodology for the associated Record Types in the IUT. For specific exceptions, the Implementation Support column of the tables of requirements and assertions shall be used to indicate the difference on a per-assertion basis. In addition, if the deviation is general and applies to the entire Record Type, a description shall be provided. This option is useful for cases where there have been modifications to the base standard that are not reflected in the conformance testing methodology, where the IUT provider believes there is a defect in the base standard or conformance testing methodology, and other instances where the implementation does not fully conform to the AN-2011 standard requirements.

The testing laboratory may use testing tools that implement or conform to this conformance testing methodology to provide a determination of the level of conformance of the IUT to the AN-2011 standard.

## 5.5 Test Assertion Syntax

Test assertions are expressed according to the operators and operands found in the tables of Operator Definitions and Operand Definitions, except for those instances where the assertion cannot be clearly or easily represented in a mathematical format. In those cases, English is used to express the assertion, and the text is contained within the < > characters.

### Operators

The table below includes a complete description of the operators used throughout the requirements and assertion tables.

**Table 5.1 - Assertion Syntax: Operator Definitions**

Operator Definitions		
Operator	Name	Description
<b>AND</b>	Logical And	Tests if both values are true.
<b>ELSE</b>	Else	Combined with the IF operator to specify what expressions are evaluated when the IF expression is false.
<b>EQ</b>	Equal To	Tests for equality between two values.
<b>GT</b>	Greater Than	Tests if the first value is greater than the second value
<b>GTE</b>	Greater Than or Equal To	Tests if the first value is greater than or equal to the second value.
<b>IF</b>	Logical If	Determines if the value or expression is true or false.
<b>IFF</b>	IF and Only IF	Tests the bi-conditional where each of the first and second expressions implies the other.
<b>in</b>	Container Specification	For X in Y, selects only those X found in Y.
<b>LT</b>	Less Than	Tests if the first value is less than the second value.
<b>LTE</b>	Less Than or Equal To	Tests if the first value is less than or equal to the second value.

<b>MO</b>	Member Of	Tests if the value is contained within the set.
<b>MOD</b>	Modulo	For X MOD Y, provides the remainder of X divided by Y.
<b>NEQ</b>	Not Equal To	Tests for non-equality between two values.
<b>NOT</b>	Negate	Negates any operator or expression that follows.
<b>OR</b>	Logical Or	Tests if either value is true
<b>P:N in Q</b>	Query	Selects the Nth occurrence of P in Q.
<b>ST</b>	Such That	Enforces a condition upon the specified value or expression.
<b>THEN</b>	Then	Combined with the IF operator to specify what expressions are evaluated when the IF expression is true.
<b>XOR</b>	Exclusive Logical Or	Tests if either value is exclusively true (both cannot be true)
<b>to</b>	Range Selection	For X to Y, selects a set of values Z ST Z GTE X AND LTE Y
<b>#</b>	All	Provides all valid values.
<b>:</b>	Data Element Selection	For X:N, selects the Nth element in X.
<b>,</b>	Range Concatenation	For X,Y, represents the set of values containing both X and Y.
<b>.</b>	Field Selection	For X.Y, selects the field specified by Y in Record X.
<b>&lt; &gt;</b>	English Expression	Contains English text that could not be reasonably expressed mathematically.
<b>{ }</b>	Value	For {X}, provides the value of X.
<b>[ ]</b>	Set	The set to be tested.

## Terms

The table below provides a complete description of the terms used throughout the requirements and assertion tables.

**Table 5.2 - Assertion Syntax: Terms**

Term Definitions		
Term	Name	Description
<b>Element</b>	XML Element	An XML Element defined in Annex G of the An-2011 standard or the associated XML Schema file.
<b>Field(s)</b>	Field	Field structure as defined by the AN 1-2011 standard.
<b>InfoItem</b>	US Separated Information Item	Information Item separated by the ASCII US (0x1F) separator character
<b>Integers</b>	Integer Set	Set of all integers.
<b>NA</b>	Not Applicable	The test or condition is not applicable.
<b>Unsupported</b>	Unsupported	The requirement is not supported in this version of the CTM. This may be the result of the related conformance test requiring additional research, or the result of the test being infeasible (level 3 only).
<b>Record(s)</b>	Record	Record structure as defined by the AN 1-2011 standard.
<b>Subfield</b>	RS Separated Subfield	Subfield separated by the ASCII RS (0x1E) separator character
<b>Transaction</b>	Transaction	Transaction structure as defined by the AN 1-2011 standard.
<b>TRUE</b>	True	The test always evaluates to true because there is no defined value for testing, or there is no value for which the test will fail.

## Operands

The table below includes a complete description of the operands used throughout the requirements and assertion tables. The parameter X may represent any combination of operands, terms, and operators.

**Table 5.3 - Assertion Syntax: Operand Definitions**

Operand Definitions		
Operand	Name	Description
<b>All(X)</b>	All Occurrences	Returns all occurrences of X.
<b>ASCII(X)</b>	ASCII Values	Specifies that all values represented by X are ASCII values. Ex. ASCII(a) is 0x61
<b>Bytes(X)</b>	Byte Data	Returns the set of bytes contained in X.
<b>Cardinality(X)</b>	Cardinality	For use with NIEM-XML encoding only. Returns the Cardinality of the XElm as specified in Annex G of the standard.
<b>Count(X)</b>	Count Occurrences	Returns the number of occurrences of X.
<b>DataLength(X)</b>	Length Of (without Special Characters)	Returns the length of X without counting the characters ASCII( US, RS, FS).
<b>FieldNumber(X)</b>	Field Number	Returns the field number of X.
<b>First(X)</b>	First Occurrence	Returns the first occurrence of X.
<b>For(X EQ A to B) {Expression(s)}</b>	For Loop	Evaluates each Expression for the range specified by A to B.
<b>ForEach(X) {Expression(s)}</b>	For Each	Evaluates each Expression for every occurrence of X found.
<b>Last(X)</b>	Last Occurrence	Returns the last occurrence of X.
<b>Length(X)</b>	Length Of	Returns the length of X.
<b>Max(X)</b>	Maximum Value	Returns the maximum value in the set X.
<b>Min(X)</b>	Minimum Value	Returns the minimum value in the set X.
<b>Next(X)</b>	Next Occurrence	Returns the next occurrence of X. Only for use within ForEach Operand's Expression(s).
<b>Pair(A,B) of X</b>	Pair	Returns all pairs of X. Only for use as a parameter in a ForEach Operand.
<b>ParentField(X)</b>	Parent Field	Returns the Field that contains X.
<b>ParentRecord(X)</b>	Parent Record	Returns the Record that contains X.
<b>Present(X)</b>	Value Present	Returns TRUE if X is present, FALSE otherwise. For subfields and information items in Traditional Encoding, the US and RS separators are always present. Therefore the Present(X) operand returns TRUE if the value between the separators is present.
<b>Previous(X)</b>	Previous Occurrence	Returns the previous occurrence of X. Only for use within ForEach Operand's Expression(s).
<b>Second(X)</b>	Second Occurrence	Returns the second occurrence of X.
<b>Type(X)</b>	Record Type	Returns the Record Type of X.
<b>Var(X) {Selection Statement}</b>	Variable	Assigns the entity specified by the Selection Statement to the name X. The assignment is valid for the remainder of the assertion text.
<b>XElm(X)</b>	XML Element	Returns the XML Element with name X.

## 5.6 Tables of requirements and assertions - Table headers

The following describe the headings of the tables of requirements and assertions found in Section 6:

- **Requirement # and ID:** Defines a unique requirement number and a unique identifier for the requirement and associated assertion or set of assertions. For Record Type requirements, the Requirement # is in the form RTN.M, where N is the Record Type and M is the sequential number of the requirement (for requirements in the annexes the form is AN followed by the Annex letter). For sections not associated with a record type and annexes, the prefix is SEC followed by the section number. If additional requirements must be entered in the future, the new requirement number will be specified using an additional number, as in RTN.M.A, where A is the additional number. The Requirement ID provides reference to the type of requirement (e.g., transaction, record, and field), and is in the form of “Type: Description” where type may be “Transaction”, “Record”, or “Field”. For requirements found in Annex B of the AN-2011 standard, the Requirement ID is preceded by “Traditional-”. For requirements found in Annexes C and G of the AN-2011 standard, the Requirement ID is preceded by “NIEM-”.
- **Ref. in Base Std. (Reference in Base Standard):** Identifies the clause (or section) where the requirement is included in the AN-2011 standard. In some cases the reference includes additional information such as a Table number.
- **Requirement Summary:** Provides a summary of the requirement detailed as textual information or an interpretation of the requirement in the standard. It provides the essentials of the requirement but may not provide all the text necessary to understand it. The < > operator is used in the Requirement Summary column of the tables to represent text not found in the standard, but that may help indicate what requirement is being represented.
- **Level:** Indicates whether Level 1 or Level 2 conformance testing is required to address the assertion identified in the Assertion ID column of the same row. Level 3 conformance tests are indicated only when necessary to show that the requirement is not currently testable or addressed.
- **Status:** Reflects the status specified in the AN-2011 standard:
  - M: Mandatory
  - O: Optional
  - D: Dependent
  - M↑: Mandatory within the optional field/subfield
  - O↑: Optional within the optional field/subfield
  - -: Varying statuses. The assertion addresses many fields or subfields of multiple statuses.
- **Assertion ID:** Defines an identifier of a specific test assertion within the set of test assertions associated with a requirement.

- **Test Assertion:** Provides, whenever possible, a mathematical equation or a procedure using the language specified by the [operators](#), [operands](#), and [terms](#).
  - The <> operator is used to contain plain text whenever a mathematical formula or simple procedure cannot be detailed.
- **Test Note:** Contains the ID of the test note. Test notes provide additional information related to the assertion and are included below the tables.
- **Imp. Support (Implementation Support):** Denotes a supplier's implementation support of a particular requirement ("Y"/"N"). A note can follow the table when providing more details of implementation support (or the lack of it) is required.
- **Supported Range:** Indicates a range of values supported, especially when it is different than the full range of values specified in the standard. When an information item is specified as a single value, or does not address a range of values, a N/A should be used.
- **Test Result:** This column is used to denote the test results. For file and record-level results the results are either "Pass" or "Fail". The field-level results should be indicated as "Ok", "Error", "Warning" and "Note". Explanatory notes can be added below the table.
- **Applicable to (T, X, B, B\* or X\*) – (Applicability):** This table header indicates which assertions differ (in values required or conditions) between Traditional and NIEM encoding. This table header does not indicate which assertions are addressed by the XML Schema and which will need to be addressed in code. Valid values are:
  - T: The assertion only applies to the Traditional encoding as described in Annex B of AN-2011.
  - X: The assertion only applies to the NIEM-conformant (XML) encoding as described in Annex C of AN-2011.
  - B: The assertion is applicable to both Traditional and NIEM (XML) encoding.
    - Following the conventions in the AN-2011 standard, test Assertions are expressed using constructs (fields, records, etc.) found in Traditional encoding (such as xx.002 for the second field of each record type). The same assertion applies for the XML elements that correspond to the Traditional constructs. For example, 10.006 in Traditional Encoding corresponds to XML Element <biom:ImageHorizontalLineLengthPixelQuantity>.
  - Some assertions reference subfields, however, NIEM encoding uses nested elements. Expression of Test Assertions that include subfields in the XML encoding requires further review. These assertions are listed with the following applicability values:
    - X\* indicates that the assertion applies only to NIEM-conformant (XML) encoding.
    - B\* indicates that the assertion is applicable to both Traditional and NIEM (XML) encodings.

For the NIEM-conformant assertions, indicated by X or B, the following values indicate the coverage of those assertions by the Schema:

- C: Covered - the assertion is fully tested by the Schema.
- P: Partial – the assertion is partially tested by the Schema, but not fully covered. If part of assertion is correctly tested and another part is incorrectly tested, it shall be marked as “I” (Incorrect), not “P” (Partial). However, if part is correctly tested, and another part is omitted, then it is Partial.
- I: Incorrect – an attempt to test for the assertion is made by the Schema, but the test is incorrect.
- O: Omitted – the assertions is not tested or addressed by the Schema, nor is there any attempt by the Schema to test for the assertion.

Examples:

- X-C: the assertion is for XML encoding only, and it is fully tested by the Schema.
- B-O: the assertion is for both encodings, but it is omitted by the Schema.
- X\*-P: the assertion is for XML encoding, includes nested XML elements, and is only partially tested by the Schema.
- T-C: invalid. This assertion is for traditional encoding and should not have information related to the Schema.

## **6 Requirements and assertions for AN-2011**

### **6.1 Scope of requirements and test assertions specified in the CTM**

The CTM documents requirements and test assertions for the following Sections and selected Record Types of the ANSI/NIST-ITL 2011 standard:

- Section 5: Data Conventions
- Section 7: Information Associated with Several Record Types
- Section 8.1 Record Type-1: Transaction information record
- Section 8.4 Record Type-4: Grayscale fingerprint image
- Section 8.10 Record Type-10: Facial, other body part and SMT image record
- Section 8.13 Record Type-13: Friction-ridge latent image record
- Section 8.14 Record Type-14: Fingerprint image record
- Section 8.15 Record Type-15: Palm print image record
- Section 8.17 Record Type-17: Iris image record
- Section 8.18 Record Type-18: DNA record (**new in this version**)
- Annex B: Traditional Encoding
- Annex C: NIEM Conformant encoding (**new in this version**)
- Annex G: Mapping to the NIEM IEPD (**new in this version**)

Tables for the deprecated Record Types 3, 5, and 6 are also included to check for nonexistence of these Record Types. Additionally an assertion is specified that checks for the nonexistence of reserved Record Types 11, 12, and 22 through 97.

### **6.2 Field Definitions and Structures**

ANSI/NIST-ITL 1-2011 contains several field types:

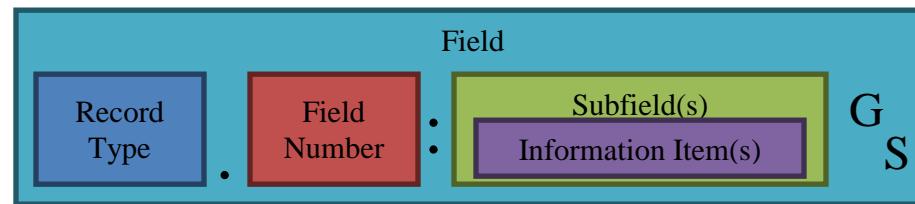

- Single Information Item (Field with data)
- Multiple Information Items (Field with multiple Information Items)
- Subfields Repeating Sets of Info Items

- Subfields Repeating Values

The tables of requirements and assertions represent all field types as a field that contains a list of one or more subfields, each of which contains a list of one or more information items. Fig. 6.1 is a representation of how each field type is represented in the tables.

- Single Information Item: Field with one subfield containing one information item.
- Multiple Information Items: Field with one subfield containing multiple information items.
- Subfields Repeating Sets of Information Items: Field with one or more subfields, each containing sets of one or more information items.
- Subfields Repeating Values: Field with one or more subfields, each containing one information item.

**Figure 6.1 - Generic AN-2011 Field Structure**

Unless otherwise stated, the tables of requirements and assertions express all field structures using the Traditional notation of record type and field number (e.g., 1.001) as well as subfield and information item indices when appropriate. However, the NIEM-XML encoding has no concept of subfields or information items. Instead, the XML encoding uses subelements. Annex G of the base standard can be used to translate the listed values for Traditional structures to the XML equivalent. In some cases the tables of requirements and assertions lists the XML element names when necessary for clarifying an assertion.

### 6.3 Section 5: Data Conventions

**Table 6.1 - Assertions for Data Conventions**

Req. # - ID	Ref.in Base Std.	Requirement Summary	L e v e l	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)

## 5: Data Conventions

SEC5.11 - Record: Type2- Contents	5.3.2	Type-2 records shall contain user-defined textual fields providing identification and descriptive information associated with the subject of the transaction.		M	Type2- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-2: User-defined descriptive text record >	t-2				
SEC5.12 - Record: Type2- DOM/APS	5.3.2	Each entry in a Type-2 record shall have a definition and format that is listed with the Domain owner. Data contained in this record shall conform in format and content to the specifications of the domain name(s) as listed in Field 1.013 Domain name / DOM found in the Type-1 record, if that field is in the transaction. The default domain is NORAM. Field 1.016 Application profile specifications / APS allows the user to indicate conformance to multiple specifications. If Field 1.016 is specified, the Type-2 record must conform to each of the application profiles.	3	M	Type2- DOM/APS	<Unsupported.>	t-3	NA			B-O
SEC5.13 - Transaction: Type3- Deprecated	5.3.3, Table 3	Record Type-3 shall not be contained in transactions conforming to this version of the standard.		M	Type3- Unsupporte d	<The test assertions are included under assertions for <a href="#">Record Type-3: DEPRECATED</a> .>	t-2				
SEC5.14 - Record: Type4- Contents	5.3.4	Type-4 records were designed to convey fingerprint images captured by an Automated Fingerprint Identification System (AFIS) live-scan reader, or other image capture devices operating at a nominal scanning resolution of 500 pixels per inch (ppi). Many systems still use this record type and it will remain an integral part of the standard.		M	Type4- Contents	<The test assertions are included under assertions for <a href="#">Record Type-4: Grayscale fingerprint image</a> .>	t-2				
SEC5.15 - Transaction: Type5-	5.3.5, Table 3	Record Type-5 shall not be contained in transactions conforming to this version of the standard.		M	Type5- Unsupporte d	<The test assertions are included under assertions for <a href="#">Record Type-5: DEPRECATED</a> .>	t-2				

Req. # - ID	Ref.in Base Std.	Requirement Summary	L e v e l  I	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
<b>5: Data Conventions</b>											
<b>Deprecated</b>											
<b>SEC5.16 - Transaction: Type6- Deprecated</b>	5.3.6, Table 3	Record Type-6 shall not be contained in transactions conforming to this version of the standard.		M	Type6- Unsupporte d	<The test assertions are included under assertions for <a href="#">Record Type-6: DEPRECATED</a> .>	t-2				
<b>SEC5.17 - Transaction: Type7- Contents</b>	5.3.7	Type-7 is a legacy record type. It was intended as a temporary measure to enable the exchange of image data that would be defined by specific record types in later versions of the standard. Since some older systems still use this record type, it is included in the standard.		M	Type7- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-7: User-defined image record .>	t-2				
<b>SEC5.18 - Record: Type8- Contents</b>	5.3.8	Type-8 records shall be used for scanned binary or vectored signature image data. Each Type-8 record shall contain data representing the signature of the subject from whom the biometric sample is being collected and/or the operator capturing biometric data.		M	Type8- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-8: Signature image record.>	t-2				
<b>SEC5.19 - Record: Type9- Contents</b>	5.3.9	Type-9 records shall contain and be used to exchange minutiae or other friction ridge feature data. Each record shall represent the processed (automated and/or manual) image data from which the characteristics are stated. The primary use of this record type shall be for remote searching of latent prints. New to this version of the standard is the Extended Feature Set (EFS) for latent print markups. There is also a capability to have additional vendor-specified feature sets. Workstation logs may also now be transmitted in this record type.		M	Type9- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-9: Minutiae data record .>	t-2				
<b>SEC5.20 - Record:</b>	5.3.10, Table 58	Type-10 image records shall contain and be used to exchange textual and image		M	Type10- Contents	<The test assertions are included under assertions for <a href="#">Record Type-10: Facial, other body</a>	t-2				

Req. # - ID	Ref.in Base Std.	Requirement Summary	L e v e l s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
-------------	------------------------	------------------------	----------------------------	----------------------------	-----------------	-------------------	--------------	-----------------	--------------------	----------------	--

## 5: Data Conventions

Type10- Contents		data from the face, scars, (needle) marks, and tattoos (SMT). New to this version of the standard is the extension of the record type to handle images of other body parts. See Table 58 for a list of the images types possible in a Type-10 record. Textual and analytic information pertinent to the digitized image is also contained in this record type.				<a href="#">part and SMT image record.&gt;</a>					
SEC5.21 - Transaction: Type11- Reserved	5.3.11	Type-11 records are reserved for future use.		M	NA	<See Requirement ID “ <a href="#">Transaction: Reserved Records</a> ”>	t-2				
SEC5.22 - Transaction: Type12- Reserved	5.3.12	Type-12 records are reserved for future use.		M	NA	<See Requirement ID “ <a href="#">Transaction: Reserved Records</a> ”>	t-2				
SEC5.23 - Record: Type13- Contents	5.3.13	Type-13 image records shall contain and be used to exchange variable-resolution latent friction ridge image data (fingerprint, palmprint and/or plantar) together with fixed and user defined textual information fields pertinent to the digitized image. In all cases, the scanning resolution for latent images shall be at least 39.37 ppmm (1000 ppi). The variable resolution latent image data contained in the Type-13 record shall be uncompressed or may be the output from a lossless compression algorithm.		M	Type13- Contents	<The test assertions are included under assertions for <a href="#">Record Type-13: Friction-ridge latent image record</a> . >	t-2				
SEC5.24 - Record: Type14- Contents	5.3.14	Type-14 image records shall contain fingerprint image data. It should be noted that as the class resolution is increased, more detailed ridge and structure information becomes available in the fingerprint image. However, in all cases the class resolution shall be at least 19.69		M	Type14- Contents	<The test assertions are included under assertions for <a href="#">Record Type-14: Fingerprint image record</a> .>	t-2				

Req. # - ID	Ref.in Base Std.	Requirement Summary	L e v e l s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
-------------	------------------------	------------------------	----------------------------	----------------------------	-----------------	-------------------	--------------	-----------------	--------------------	----------------	--

## 5: Data Conventions

		ppmm (500 ppi).									
<b>SEC5.25 - Record: Type15- Contents</b>	5.3.15	Type-15 image records shall contain and be used to exchange palm print image data together with fixed and user-defined textual information fields pertinent to the digitized image. ...in all cases the class resolution shall be at least 19.69 ppmm (500 ppi) The variable-resolution palm print image data contained in the Type-15 record may be in a compressed form.	M	Type15- Contents	<The test assertions for this type are included under assertions for <a href="#">Record Type-15: Palm print image record</a> .>	t-2					
<b>SEC5.26 - Record: Type16- Contents</b>	5.3.16	The Type-16 image record is designed for developmental purposes and for the exchange of miscellaneous images. This record shall contain and be used to exchange image data together with textual information fields pertinent to the digitized image.	M	Type16- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-16: User-defined testing image record.>	t-2					
<b>SEC5.27 - Record: Type17- Contents</b>	5.3.17	Type-17 image records shall contain iris image data. Field 17.018 (Global unique identifier) from the 2007 and 2008 version of the standard has been deprecated in this version.	M	Type17- Contents	<The test assertions are included under assertions for <a href="#">Record Type-17: Iris image record</a> .>	t-2					
<b>SEC5.28 - Record: Type18- Contents</b>	5.3.18	The Type-18 record (new to this version of the standard) shall contain and be used to exchange DNA and related data. It was developed to provide a basic level of interoperability with the draft format of the <i>ISO/IEC 19794-14 DNA data interchange format</i> . With full consideration to privacy, this standard only uses the non-coding regions of DNA. The regions of the DNA that encode phenotypic information are deliberately avoided.	M	Type18- Contents	<The test assertions are included under assertions for <a href="#">Record Type-18: DNA record</a> .>	t-2					
<b>SEC5.29 - Record:</b>	5.3.19	Type-19 image records (new to this version of the standard) shall contain and	M	Type19- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are	t-2					

Req. # - ID	Ref.in Base Std.	Requirement Summary	L e v e l s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
<b>5: Data Conventions</b>											
Type19- Contents		be used to exchange variable-resolution plantar print image data together with fixed and user-defined textual information fields pertinent to the digitized image. ...in all cases the scanning resolution used to capture a plantar image shall be at least as great as the minimum scanning resolution of 19.69 ppm (500 ppi). The variable-resolution plantar image data contained in the Type-19 record may be in a compressed form.				supported, they are included under assertions for Record Type-19: Plantar record.>					
SEC5.30 - Record: Type20- Contents	5.3.20	The Type-20 record (new to this version of the standard) shall contain the source representation(s) from which other Record Types were derived. Typically, one Type-20 source representation is used to generate one or more representations for use in other record types. When a source representation (in a Type-20 record) is processed and the derived representation is to be used as the source for further derivations, then the derived representation is contained in a Type-20 record.	M	Type20- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-20: Source representation record.>	t-2					
SEC5.31 - Record: Type21- Contents	5.3.21	The Type-21 record shall contain an associated context image, audio / visual recording or other related data. This record type does NOT contain information used to derive biometric information contained in other records. Record Type-20 serves that function. Record Type-21 may be used to convey contextual information, such as an image of the area where latent fingerprints were captured.	M	Type21- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-21: Associated context record.>	t-2					
SEC5.32 - Record: Type98-	5.3.22	The Type-98 record shall contain security information that allows for the assurance of the authenticity and/or integrity of the	M	Type98- Contents	<The test assertions for this type may not be supported in this version of the CTM. ## 5: Data Conventions

Contents		transaction, including such information as binary data hashes, attributes for audit or identification purposes, and digital signatures.			Record Type-98: Information assurance record.>						
SEC5.33 - Record: Type99- Contents	5.3.23	Type-99 records shall contain and be used to exchange biometric data that is not supported by other ANSI/NIST-ITL record types. This provides a basic level of interoperability and harmonization with other biometric interchange formats. This is accomplished by using a basic record structure that is conformant with <i>ANSI INCITS 398-2005, the Common Biometric Exchange Formats Framework (CBEFF)</i> and a biometric data block specification registered with the International Biometrics Industry Association (IBIA).	M	Type99- Contents	<The test assertions for this type may not be supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-99: CBEFF biometric data record.>	t-2					
SEC5.34 - Transaction: Deprecated Entities	5.4	Deprecated records for this version are Record Types 3, 5 and 6. Field 17.018 is deprecated. There are two deprecated values in Field 17.016: Image property code / IPC (2: for interlace frame, and 3: for interlace field).	1	M	Deprecated Entities	<See Requirement IDs: " <a href="#">Field: Type17-CondCode</a> " and " <a href="#">Field: 17.016-Image Property Code Value</a> ".>  <See Sections " <a href="#">8.3: Record Type-3: DEPRECATED</a> ", " <a href="#">8.5: Record Type-5: DEPRECATED</a> ", and " <a href="#">8.6: Record Type-6: DEPRECATED</a> ".>	t-2				
SEC5.35 - Transaction: Legacy Entities	5.4	There is a special category called 'legacy' for a record type, field, subfield, information item or value that was valid in previous versions of the standard, but shall not be used for new data. 'Legacy' indicates that if there is existing data using this record type, field, information item or value it may still be transmitted in a transaction conformant to this version of the standard. In this version 'legacy' applies to Fields 9.005 through 9.012, Field 10.022 and to the value '1' in Table 4	3	M	Legacy Entities	<Warning provided only. It is not feasible to determine if the data is new or legacy. However, a warning will be displayed if legacy entities are present for the supported record types. >	t-2	NA

			1	M	NIEM-Reserved Character Types	(All(Characters)) NOT MO [0x02, 0x03, 0x1C, 0x1D, 0x1E, 0x1F]		Y		X-O	
SEC5.37 - Record: Type1-ASCII	5.6, Table 93	Record Type-1 shall always be recorded in all encodings using the characters that can be represented by the 7-bit American National Standard Code for Information Interchange (ASCII) found in table 93 with the exception of the reserved values.	1	M	Type1-ASCII	ForEach(Field in Record ST Type(Record) EQ 1) { ForEach(InfoItem in Field) { {Bytes(InfoItem)} MO [0x20 to 0x7E] } }		Y			B*-O
	C.4.1, 5.6	For compatibility with existing implementations of the standard, implementers may wish to limit content to the 128 characters that can be represented by 7-bit ASCII. Nevertheless, senders and receivers of XML packages using this standard may agree on other character sets, including international character sets.  The default in XML is UTF-8	1	M	NIEM-Type1-User Defined	TRUE	t-4	Y			X-C

Req. # - ID	Ref.in Base Std.	Requirement Summary	L e v e l	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
<b>5: Data Conventions</b>											
<b>SEC5.38 - Transaction: Encoding- Base64</b>	5.6	Base-64 shall be used for converting non-ASCII text into ASCII form, where required and noted in the standard.	1	M	Data- Encoding- Base-64	<These assertions are addressed in the record type tables where Base-64 encoding is required.>					
<b>SEC5.39 - Field: SEC5.40 - Encoding- CharSets</b>	5.6, Table 4	Field 1.015 Character encoding/DCS is an optional field that allows the user to specify an alternate character encoding... Field 1.015 Character encoding/DCS contains three information items: the character encoding set index/ CSI, the character encoding sent name/CSN, and the character encoding set version/CSV. The first two items (CSI and CSN) are selected from the appropriate columns of Table 4 .	3	O	Data- Encoding- CharSets	<Unsupported.>	t-4	NA			B

## 6.4 Section 6: Implementation Domain and Application Profiles

**Table 6.2 - Assertions for Implementation Domain & Application Profiles**

Req. # - ID	Ref. in Base Std.	Requirement Summary	L e v e l	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
<b>6: Implementation Domain and Application Profiles</b>											
<b>SEC6.1 - Field: Domain</b>	6	An implementation domain, coded in Field 1.013 Domain name / DOM of a Type-1 record as an optional field, is a group of agencies or organizations that have agreed to use preassigned data fields with specific meanings (typically in Record Type-2) for exchanging information unique to their installations. The implementation domain is usually understood to be the primary application profile of the standard.	3	O	Fields-Domain	<Unsupported.>	t-3	NA			B
<b>SEC6.1 - Field: APS</b>	6	Field 1.016 Application profile specifications / APS allows multiple application profiles to be referenced. The organization responsible for the profile, the profile name and its version are all mandatory for each application profile specified. A transaction must conform to each profile that is included in this field.	3	O	Fields-APS	<Unsupported.>	t-3	NA			B

## 6.5 Section 7: Information Associated with Several Records

**Table 6.3 - Assertions for Information Associated with Several Records**

Req. # - ID	Ref. in Base Std.	Requirement Summary	L e v e l	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
<b>7: Information Associated with Several Records</b>											
SEC7.1 - Field: xx.001-Record Header	7.1 C.4.7, C.7	<p>The record header appears as the first field (xx.001) in each Record Type. It contains information particular to the encoding format chosen, in order to enable proper reading of the record. In Traditional encoding, this field contains the record length in bytes (including all information separators).</p> <p>Record Length. There is no corresponding XML element. See Section 7.1.</p> <p>In NIEM-conformant XML encoding, this field contains the <i>RecordCategoryCode</i>, which is the numeric representation of the Record Type.</p> <p>The first element in all XML encoded records shall be labeled &lt;biom:RecordCategoryCode&gt; and contain the type (category) number of the record.</p>	1	M	Typexx-Field001First	ForEach(Record in Transaction { FieldNumber(First(Field in Record)) EQ 1 })		NA			T

<b>7: Information Associated with Several Records</b>											
<b>Required</b>		as the scanning resolution. However, the transmitting resolution shall be within the range of permissible resolution values for that record type.									
<b>SEC7.59 - Field: Type4 NTR</b>	7.7.6.3.1	Field 1.012 Nominal resolution / NTR shall specify the transmitting resolution in pixels per millimeter. It is expressed as two numeric characters followed by a decimal point and two more numeric characters (e.g. 19.69). The transmitting resolution shall be within the range 19.30 ppmm (490 ppi) to 20.08 ppmm (510 ppi) for a Type-4 record . This range reflects the 2% tolerance from 500 ppi allowed for PIV certified devices. (SeeTable 14). For example, a sensor that scans natively at 508 ppi would list both NSR and NTR as 20 ppmm (= 508 ppi). These images should not be sampled down to exactly 500 ppi. This field is set to "00.00" if no Type-4 records are present in the transaction. Given that the transmitting resolution shall not be greater than the scanning resolution, images meant for identification applications, such as those from Appendix F certified devices (See Table 14) are restricted to a 1% deviance from 500 ppi.	1	M	1.012-CharCount	Length(1.012) EQ 5		NA			T

<b>7: Information Associated with Several Records</b>											
		image. If unusual or unnatural, such as is the case when colored contact lenses are present and the 'real' eye color cannot be ascertained, then the color shall be labeled as "XXX". For near infra-red (NIR) images, if this field is entered, it shall be 'XXX'. Values for these fields shall be the alphabetic entries in the "Attribute code" column of Table 17.									
<b>SEC7.97 - Field: Image-Paths</b>	7.7.12	A path may not have any sides crossing. No two vertices may occupy the same position. There may be up to 99 vertices. An open path is a series of connected line segments that do not close or overlap. A closed path (polygon) completes a circuit. The closed path side defined by the last vertex and the first vertex shall complete the polygon. A polygon shall have at least 3 vertices. The contours in Record Type-17: Iris image record can be a circle or ellipse. A circle only requires 2 points to define it (See Table 19).  There are two different approaches to the paths in this standard. The 2007 and 2008 version of the standard used paths for Field 14.025: Alternate finger segment position(s) / ASEG.  That approach has been retained in this version for all paths except in the Extended Feature Set (EFS) of Record Type-9.	-	-	Fields-Image-Paths	<The test assertions are included under assertions for the respective record types.>	t-2				
<b>SEC7.98 - Field: Image-EFS Paths</b>	7.7.12.1 Table 30	The vertices for paths in the EFS Type-9 records are defined in a single information item27 for each of the following fields (See Table 30 Type-9	-	-	Fields-Image-EFS Paths	<The test assertions are included under assertions for the respective record types.>	t-2

Req. # - ID	Ref. in Base Std.	Requirement Summary	L e v e l s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
-------------	-------------------	---------------------	----------------------------	----------------------------	--------------	----------------	-----------	--------------	-----------------	-------------	------------------------------------

### Annex B: Traditional Encoding

<b>ANB.5 - Traditional-Transaction: Separators</b>	Annex B, Table 93	In the Type-1, Type-2, Type-9 through Type-99 records, information is delimited by the four ASCII information separators. The delimited information may be items within a field or subfield, fields within a logical record, or multiple occurrences of subfields.	1	M	Traditional: Separators FS	ForEach(Record in Transaction ST Type(Record) MO [1,2,9 to 99]) { Last(Byte in Record) EQ 0x1C }	NA	NA	NA	NA	T
											T
											T
<b>ANB.6 - Traditional-Transaction: FS Separator</b>	Annex B	Multiple records within a transaction are separated by the “FS” character, which signals the end of a logical record.		M	Traditional: FS Separator	<See Requirement ID: “ <a href="#">Traditional-Transaction: Separators</a> ”.>	t-2	NA	NA	NA	T
<b>ANB.7 - Traditional-Transaction: US, RS, GS, Separators</b>	Annex B	The “US” separator shall separate multiple items within a field or subfield; the “RS” separator shall separate multiple subfields, and the “GS” separator shall separate information fields.		M	Traditional: US, RS, GS Separators	<See Requirement ID: “ <a href="#">Traditional-Transaction: Separators</a> ”.>	t-2	NA	NA	NA	T
<b>ANB.8 - Traditional-Transaction: US Separator Present</b>	Annex B	In general, if one or more mandatory or optional information items are unavailable for a field or subfield, then the appropriate number of separator characters should be inserted. It is possible to have side-by-side combinations of two or more of the four available separator characters. When data are missing or unavailable for information items, subfields, or fields, there shall be one fewer separator characters present than the number of data items, subfields, or fields required.	1	M	Traditional: US Present	<All Information Items, Mandatory and Optional, defined in the standard are separated by the US character—even if the value is missing. All “Presence” and “Count” tests for Information Items first check for the US separator, and then that there is data. For Information Items, presence is defined by the presence of data and the US separator. For Optional Information Items, the US separator is required, but not the data, since their presence is not required.>	NA	NA	NA	NA	T
<b>ANB.9 - Traditional-Transaction:</b>	B.1	Each information item, subfield, field, and logical record shall contain one or more bytes of data	1	M	Traditional: Data Length	<This assertion is tested during the Character Count and Byte Length testing for each Record Type, which test for 1 byte of data at a	t-2	NA	NA	NA	T

Req. # - ID	Ref. in Base Std.	Requirement Summary	L e v e l s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
<b>Annex B: Traditional Encoding</b>											
<b>Data Length Minimum</b>					Minimum	minimum. See the following Type-10 Requirement ID's as an example: <a href="#">Field: Type10-CharCount</a> and <a href="#">Field: Type10-Subfield CharCount</a> .					
<b>ANB.10 - Traditional-Transaction: Big-Endian</b>	B.1.1	Within a file, the order for transmission of both the ASCII and the binary representations of bytes shall be most significant byte first and least significant byte last otherwise referred to as Big-Endian format. Within a byte, the order of transmission shall be the most significant bit first and the least significant bit last.	2	M	Traditional: Data Big-Endian	<Use Big-Endian format when processing transactions. Also, provide warning if Little-Endian format is discovered.>	t-13	NA			T
<b>ANB.11 - Traditional-Transaction: Date Format</b>	B.1.2	Dates shall appear as eight digits in the format YYYYMMDD. The YYYY characters shall represent the year of the transaction; the MM characters shall be the tens and units values of the month; and the DD characters shall be the day in the month.	1	M	Traditional: Date Format	<This assertion is tested for each field or subfield that requires a date entry. For example, see Requirement ID " <a href="#">Field: 1.005-Local Date Value</a> ".>	t-2	NA			T
<b>ANB.12 - Traditional-Field: Agency Code Subfield 2</b>	B.1.3	The 2007 version of the standard included only agency identifier fields (See Section 7.6). The 2008 added the option of entering an organization name. This capability of the 2008 version is retained in this version of the standard by adding new fields (Field 1.017 Agency names / ANM and Fields xx.993 Source agency name / SAN)		M	Traditional: Agency Code Subfield 2	<See Requirement ID: " <a href="#">Field: Agency Codes</a> ".>		NA			T
<b>ANB.13 - Traditional-Transaction: GMT/UTC</b>	B.1.4	GMT/UTC shall be represented as YYYYMMDDHHMMSSZ, a 15-character string that is the concatenation of the date with the time and concludes with the character nal enco YYYY characters shall represent the year of the transaction. The MM characters shall be the tens and units values of the		M	Traditional: GMT/UTC	<This assertion is tested for each field or subfield that requires a GMT/UTC entry. ### Annex B: Traditional Encoding

<b>Binary</b>		binary data recorded as ordered fixed-length binary fields. The entire length of the record shall be recorded in the first four-byte binary field of each record. For these binary records, neither the record number with its period, nor the field identifier number and its following colon, shall be recorded. Furthermore, as all the field lengths of these three records are either fixed and specified, none of the four separate characters ("US", "RS", "GS", or "FS") shall be interpreted as anything other than binary data. For these binary records, the "FS" character shall not be used as a record separator or transaction terminating character.			Type8-Binary	supported in this version of the CTM. If they are supported, they are included under assertions for Record Type-8: Signature image record.>					
<b>ANB.17 - Traditional-Record: Types 10 to 99 Format</b>	B.1.5	The Type-10 through Type-99 records combine ASCII fields with a single binary sample field. Each ASCII field contains a numeric field identifier and its descriptive data. When Field 999 is present in a record it shall appear as the last entry in the record and shall contain the data placed immediately following the colon (er and its descriptive data. When record length field shall contain the length of the record. The ASCII File Separator "FS" control character shall follow the last byte of the compressed or uncompressed sample data. The "FS" character shall signify the end of the logical record or transaction and shall be included as part of the record length.		M	Traditional: Types 10 to 99, xx.999 last	<See Requirement ID: " <a href="#">Traditional-Field: xx.001, xx.002, xx.999 Ordered</a> " .>	t-2	NA			T

<b>Annex C: NIEM-conformant Encoding</b>											
<b>ANC.1 - NIEM- Transaction: Schema Validation</b>	C.2, C.4, C.5.1	The XML schema referenced for this encoding define the structure and order of the elements in the information exchange package. To the extent possible, the schema define data types and constraints that enforce the allowable content rules of the base standard. Nevertheless, the XML schema may not strictly enforce the allowable content. The base standard defines allowable content, and its requirements shall be met by implementers regardless of encoding method.  All of this standard's required elements shall be present in a conforming instance document even if the schema referenced by this annex do not strictly enforce the requirement.  The base standard defines allowable content, and its requirements shall be met by implementers regardless of encoding method.	2	M	NIEM-Schema Validation	<Perform and report Schema validation. Note that the schema does not strictly enforce the standard, so the conformance of a transaction cannot be claimed from the result of schema validation.>		Y			X-O
<b>ANC.2 - NIEM- Element Presence</b>	C.3	All of this standard's required elements shall be present in a conforming instance document even if the schema referenced by this annex do not strictly enforce the requirement.	1	M	NIEM-Element Presence	<The validation of the schema is not enough to test for requirements for element presence. Test the presence of the elements independently.>		Y			X-O
<b>ANC.3 -</b>	C.4.1	Each XML information element, tags and	1	M	NIEM- XML	<Encoding specified in XML Declaration> MO		Y			X-O

Req. # - ID	Ref. in Base Std.	Requirement Summary	L e v e l  s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
-------------	-------------------	---------------------	--------------------------------	----------------------------	--------------	----------------	-----------	--------------	-----------------	-------------	------------------------------------

### Annex C: NIEM-conformant Encoding

NIEM-Transaction: XML Encoding		data content, shall be represented by a character set that is a subset of Unicode and that is allowable by W3C XML. Characters shall be transmitted using a Unicode encoding.			Encoding	["UTF-8", "UTF-16", "UTF-32"]					
ANC.4 - NIEM-Transaction: XML Declaration	C.4.1	XML packages shall include an XML declaration that specifies the encoding.	1	M	NIEM- XML Declaration	First(XElm in Transaction) EQ <XML Declaration>		Y			X-O
ANC.5 - NIEM-Transaction: Image Base-64	C.4.2, C.4.3, C.5.8	Binary data so constructed as to represent a grayscale image shall be converted to ASCII characters prior to transmission using Base-64 encoding. Binary image data may be constructed in either compressed or uncompressed form, then shall be converted to ASCII characters prior to transmission using Base-64 encoding. Image data shall be converted to ASCII characters using the Base-64 encoding algorithm.	1	M	NIEM- Image Base-64	<Interpret all images as Base-64>		NA			X-O
ANC.6 - NIEM-Transaction Required Record Types	C.5.1, C.6.3	An exchange package shall consist of two or more logical records. This exchange package shall contain two or more logical records. One of those records shall be the Type-1 <itl:PackageInformationRecord>.	1	M	NIEM- Required Record Types	<See <a href="#">Transaction: Required Record Types</a> >	t-2				X-O
ANC.7 - NIEM-Transaction Well-Formed XML	C.5.2, C.5.3	All separators are defined by the W3C XML recommendations. The characters "<" and ">" are reserved exclusively for enclosing XML element names. Every element with a start tag <Name> shall have an end tag of format </Name>. For all logical records – including Types 4, 7, and 8 that do not have field tags in the traditional encoding -- data elements are	1	M	NIEM- Well- Formed XML	<Test that the XML is well-formed according to W3C XML recommendations. This includes record types that do not have field tags in Traditional Encoding (4, 7, 8).>		Y			X-O

Req. # - ID	Ref. in Base Std.	Requirement Summary	L e v e l  s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)
-------------	-------------------	---------------------	--------------------------------	----------------------------	--------------	----------------	-----------	--------------	-----------------	-------------	------------------------------------

### Annex C: NIEM-conformant Encoding

		tagged according to XML rules. The format for each element shall consist of a start tag enclosed in angle brackets followed by data followed by an end tag.									
<b>ANC.8 - NIEM- Transaction Element Hierarchy</b>	C.5.3	The ordering of elements is strict. The schema referenced by this annex define the order and nesting structure of elements. The schema also provide a W3C representation of the order and hierarchical structure of the XML content.	2	M	NIEM-Element Hierarchy	<Use the schema validation to test for XML element hierarchy and ordering.>		Schema			X-C
<b>ANC.9 - NIEM- Transaction Common Date</b>	C.5.4	Common dates (other than GMT) shall be represented in the form YYYY-MM-DD, YYYY-MM, or YYYY.	1	M	NIEM-Common Date	<This assertion is addressed on a per-field basis>.	t-2, t-6				X-I <The schema allows UTC/GMT formats for common dates.>
<b>ANC.10 - NIEM- Transaction UTC/GMT Date</b>	C.5.5	GMT date/time values shall be represented in the form YYYY-MM-DDThh:mm:ssZ	1	M	NIEM-UTC/GMT Date	<This assertion is addressed on a per-field basis>.	t-2, t-6				X-I <The schema allows common date format for UTC/GMT dates.>
<b>ANC.11 - NIEM- Transaction Abstract Elements</b>	C.5.6	The abstract elements listed in Section C.3 Scope, purpose, and conformance allow implementers to extend the specification by supplying substitution elements of their own design. Implementers shall define, in an extension schema, a substitution element containing user-defined child elements.	2	O	NIEM-Abstract Elements	<The user-defined schema shall be used to validate elements substituted for abstract elements. Note: Conformance for user-defined elements are not part of the scope of this CTM.>	t-3				X-P
<b>ANC.12 - NIEM-</b>	C.6	If the base specification and schema define an element as optional, it should	1	M	NIEM-Optional	<All elements present in a transaction shall be tested for conformance, even optional		Y			X-O

Req. # - ID	Ref. in Base Std.	Requirement Summary	L e v e l s	S t a t u s	Assertion ID	Test Assertion	Test Note	Imp. Support	Supported Range	Test Result	Applicable to (T, X, B, B*, or X*)

## 6.20 Test notes

The following test notes provide clarification of the assertion text provided in the Test Assertion column. The test notes contain various types of information including:

- Additional information to help clarify complex assertions such as image metadata and IDC comparisons.
- Explanations of decisions made when the base standard is not clear or contains possible discrepancies.
- “Exception” which refers to any AN-2011 requirement that does not have an associated assertion defined in this document.

- t-1. Semantic (Level 3) assertions are not included in the tables except to intentionally clarify that the assertion is L3. An explanation may be given regarding the assertion’s categorization as L3.
- t-2. The assertions for this requirement are listed in another section of the table as described in the “Test Assertion” column.
- t-3. Assertions related to Domain Names, Application Profile Specifications, and other user-defined types are outside the scope of this CTM.
- t-4. Assertions related to Character Sets other than 7-bit ASCII or binary are not addressed in the tables.
- t-5. For fields with matching IDC’s, refer to the tables below to determine the test result based upon the biometric sample types being compared. For matching IDC’s that belong to record types not listed below, the test reports a warning.

**Table 6-16 - IDC ID Location Comparison**

IDC: ID Location Comparison		
Record Type	Biometric	Field For Comparison ID
4	FINGER	{Byte:1 in 4.004}
9	MINUTIAE	NA
10	{10.003} <SCAR, MARK, TATTOO, or FACE>	IF {10.003} MO [ASCII(SCAR,MARK, TATTOO)] THEN  {InfoItem:1 in 10.040}

<b>PLANTAR</b>	MINUTIAE	NA		Ok
<b>PLANTAR</b>	NOT MO [PLANTAR, FRICTION RIDGE, MINUTIAE]	NA		Error
<b>UNKNOWN</b>	ANY	NA	UNKNOWN represents any types that are currently not supported.	Warning
<b>ANY</b>	UNKNOWN	NA	UNKNOWN represents any types that are currently not supported.	Warning

- t-6. UTC has replaced GMT. Date and time are defined in section 7.7.2 of the standard. The set of values ValidUTC/GMT is described in section 7.7.2.2 of the standard and is always less than the current date and time. ValidUTC/GMT is in the form YYYYMMDDHHMMSSZ; NIEM-ValidUTC/GMT is in the form YYYY-MM-DDThh:mm:ssZ. The ValidLocalDate is in the form YYYYMMDD; NIEM-ValidLocalDate is in the form YYYY-MM-DD, YYYY-MM, or YYYY.
- t-7. Assertions for alternate coordinate systems are not included in the tables.
- t-8. Refer to <http://earth-info.nga.mil/GandG/coordsys/grids/utm.html> to determine valid values for the band of latitude and grid zone.
- t-9. L2 and L3 assertions associated with SAP, FAP, and IAP are not included in the tables. Some of the assertions, such as determining the conditions under which the samples were collected to ensure the SAP, FAP, or IAP levels, are not feasible to test.
- t-10. IBIA Vendor Registry is a registry that maps the QAV value to a registered CBEFF Biometric Organization. Since the standard does not require that the value be registered with IBIA, the test assertions will accept any values for QAV.
- t-11. All assertions associated with compressed image types use the image metadata and not the image data itself. Metadata features from each image type are defined in the “Image Metadata” table below. Combining the “Term” with the “Image Type” provides the specific implementation. For example, {Image Height-PNG} is equivalent to “2<sup>nd</sup> parameter of the IHDR chunk”. Note that for NIEM encoding, the image data must first be converted from Base-64.

**Table 6-18 - Image Metadata**

Image Metadata		
Term	Image Type(s)	Implementation
Image Width	JPEG, JPEGL	4 <sup>th</sup> parameter of the Frame Header not counting the SOF marker
	JP2, JP2L	2 <sup>nd</sup> parameter of Image Header box
	PNG	1 <sup>st</sup> parameter of IHDR chunk
	WSQ	5 <sup>th</sup> parameter of SOF not counting the SOF marker
Image Height	JPEG, JPEGL	3 <sup>rd</sup> parameter of the Frame Header not counting the SOF marker
	JP2, JP2L	1 <sup>st</sup> parameter of Image Header box
	PNG	2 <sup>nd</sup> parameter of IHDR chunk
	WSQ	4 <sup>th</sup> parameter of SOF not counting the SOF marker

<b>Sampling Units</b>	JPEG, JPEGL	4 <sup>th</sup> parameter in JFIF Header not counting the APP0 Marker
	JP2, JP2L	Undefined
	PNG	3 <sup>rd</sup> parameter of PHYS chunk
	WSQ	Undefined
<b>Horizontal Density</b>	JPEG, JPEGL	5 <sup>th</sup> parameter in JFIF Header not counting the APP0 Marker
	JP2, JP2L	Undefined
	PNG	1 <sup>st</sup> parameter in PHYS Chunk
	WSQ	Undefined
<b>Vertical Density</b>	JPEG, JPEGL	6 <sup>th</sup> parameter in JFIF Header not counting the APP0 Marker
	JP2, JP2L	Undefined
	PNG	2 <sup>nd</sup> parameter in PHYS Chunk
	WSQ	Undefined
<b>BPX</b>	JPEG, JPEGL	2nd parameter of the Frame Header not counting the SOF marker
	JP2, JP2L	7 LSB of 4 <sup>th</sup> parameter of ImgBox + 1 if 4 <sup>th</sup> parameter of ImgBox is not 255
	PNG	3 <sup>rd</sup> parameter of IHDR chunk
	WSQ	Undefined
<b>CSP</b>	JPEG, JPEGL	Undefined
	JP2, JP2L	4 <sup>th</sup> parameter of Colour Specification box
	PNG	4 <sup>th</sup> parameter of IHDR chunk
	WSQ	Undefined
<b>SOI</b>	JPEG, JPEGL	Start of JPEG type image.
	WSQ	Start of WSQ image.
<b>SOF</b>	JPEG, JPEGL	Start of frame in a JPEG type image.
	WSQ	Start of WSQ image.
<b>EOI</b>	JPEG, JPEGL	End of a JPEG image.
	JP2, JP2L	End of JP2 image.
	WSQ	End of WSQ image.
<b>SOB</b>	WSQ	Start of block in a WSQ image.
<b>SigBox</b>	JP2,JP2L	Signature Box that marks the start of a JP2 type image.
<b>HeadBox</b>	JP2,JP2L	Header Box in a JP2 type image.
<b>ImgBox</b>	JP2, JP2L	Image Header Box in a JP2 type image.
<b>PNGSig</b>	PNG	Signature of a PNG image.
<b>IHDR</b>	PNG	Image Header Chunk in a PNG image.
<b>IDAT</b>	PNG	Image Data Chunk in a PNG image.
<b>IEND</b>	PNG	Image End Chunk in a PNG image.

<b>JFIF Header</b>	JPEG, JPEGL	Frame for specifying JPEG type image metadata. Its inclusion is required by the standard.
<b>PHYS Chunk</b>	PNG	An optional Chunk in a PNG image that may be used if present to verify image attributes.

- t-12. Some image formats (such as PNG) use scale units other than pixels per inch (ppi) or pixels per centimeter (ppc), which are the measurements used in the requirements of the base standards. For those image formats, the use of a conversion factor is necessary to convert the pixel scale to the correct units (either ppi or ppc). This conversion may result in a decimal value that cannot be held in the THPS or TVPS fields, which hold Integer values only. In all such cases, the AN-2011 standard does not state which method should be used to round the result. The CTM suggests using both the mathematical floor and ceiling functions of the converted value as acceptable values for comparison to the field value to account for various rounding methods.
- t-13. The assertion is addressed during parsing.
- t-14. Further research is needed to determine the feasibility of testing for ASEG requirements related to the polygon structure.
- t-15. These requirements are related to record types currently not supported.
- t-16. WSQ specification version 2.0 or higher is required, but there is no known method for determining the specification version of a WSQ image. Therefore, this is a level 3 requirement. The Ev field specifies the encoder version, but there is no requirement for WSQ specification versions to contain certain encoder versions (other than 3.1 containing an Ev of 2).
- t-17. The NCIC codes are available at <http://oregon.gov/OSP/CJIS/NCIC.shtml>. Any values found in Annex E of NIST SP 500-271 are also valid.
- t-18. Table 79 in NIST SP 500-290 lists possible values as “integer > 0; or real number with one digit to the right of the decimal”. Negative integer values are a subset of real numbers and would conflict with the requirement “integer > 0”, so negative values are not allowed by this conformance testing methodology.
- t-19. Some Value Constraints in the record layout tables in NIST SP 500-290 list “positive integer” or “integer” but do not define the minimum value for these terms. In this case, the CTM assumes the minimum value to be 1.
- t-20. The term “sequentially assigned” has several interpretations. The first version (Release 1.0) of this CTM indicated that the values must be in sequential order within the Transaction. The CTM now clarifies that order within the Transaction is not important. However, when rearranged and viewed in numeric order, the values must be sequential and incremented by 1.

## 6.21 Test assertions exceptions table

An “exception” refers to any AN-2011 requirement that does not have an associated assertion defined in this document. Table 6.19 identifies and provides justification for all exceptions present in the tables.

**Table 6.19 - Exceptions Table**

Exception	Section	Requirement Summary	Justification
<b>Domain Names / Application Profile Specifications</b>	5.3.2	<p>Data contained in this record shall conform in format and content to the specifications of the domain name(s) as listed in Field 1.013 Domain name / DOM found in the Type-1 record, if that field is in the transaction. The default domain is NORAM. Field 1.016 Application profile specifications / APS allows the user to indicate conformance to multiple specifications. If Field 1.016 is specified, the Type-2 record must conform to each of the application profiles.</p> <p>A DOM or APS reference uniquely identifies data contents and formats. Each domain and application profile shall have a point of contact responsible for maintaining this list. The contact shall serve as a registrar and maintain a repository including documentation for all of its common and user-specific Type-2 data fields. As additional fields are required by specific agencies for their own applications, new fields and definitions may be registered and reserved to have a specific meaning. When this occurs, the domain or application profile registrar is responsible for registering a single definition for each number used by different members of the domain or application profile.</p>	<p>The format and content of the record are defined by the DOM or APS. Each DOM and APS has related record-content definitions that may be updated. The evolving nature of the DOM and APS definitions and nature of using registrars means that the requirements are not defined in the base standard.<sup>1</sup></p>
	6	<p>An implementation domain, coded in Field 1.013 Domain name / DOM of a Type-1 record as an optional field, is a group of agencies or organizations that have agreed to use preassigned data fields with specific meanings (typically in Record Type-2) for exchanging information unique to their installations. The implementation domain is usually understood to be the primary application profile of the standard.</p> <p>New to this version of the standard, Field 1.016 Application profile specifications / APS allows multiple application profiles to be referenced. The organization responsible for the profile, the profile name and its version are all mandatory for each application profile specified. A transaction must conform to each profile that is included in this field. It is possible to use Field 1.016 and / or Field 1.013. A specified implementation domain and specified application profiles must all</p>	<p>Since the “transaction must conform to each profile” included in the field, and those profiles are defined by the listed agency, the CTS would have to retrieve the latest requirements from the agency.<sup>1</sup></p>

<sup>1</sup> Requirements related to user, profile, or domain-specific information are not within the scope of this CTM.

		have the same definition for fields, subfields and information items that are contained in the transaction.	
<b>Alternate Character Sets</b>	5.6, Table 2	Field 1.015 Character encoding/DCS is an optional field that allows the user to specify an alternate character encoding... Field 1.015 Character encoding/DCS contains three information items: the character encoding set index/CSI, the character encoding sent name/CSN, and the character encoding set version/CSV. The first two items are selected from the appropriate columns of Table 2.	Table 2 lists ASCII, UTF-16, UTF-8, and UTF-32 as possible encodings. However, the table also allows "User-defined" character encoding sets. <sup>1</sup>
<b>Alternate Coordinate System</b>	7.7.3, Table 4	The ninth information item is the geodetic datum code / GDC10. It is an alphanumeric value of 3 to 6 characters in length. This information item is used to indicate which coordinate system was used to represent the values in information items 2 through 7. If no entry is made in this information item, then the basis for the values entered in the first eight information items shall be WGS84, the code for the <i>World Geodetic Survey 1984 version - WGS 84 (G873)</i> . See Table 4 for values.	Table 4 lists 22 coordinate systems and the option to include "Other" types as well. It is not feasible for the CTM to define conformance to coordinate systems listed by the user under "Other". <sup>1</sup> The CTM lists requirements for conformance to WGS84 because it is the default coordinate system used in the base standard.
	7.7.3	A fourteenth optional information item geographic coordinate other system identifier / OSI allows for other coordinate systems. This information items specifies the system identifier. It is up to 10 characters in length. Examples are: <ul style="list-style-type: none"> <li>• MGRS (Military Grid Reference System)</li> <li>• USNG (United States National Grid)</li> <li>• GARS (Global Area Reference System)</li> <li>• GEOREF (World Geographic Reference)</li> <li>• LANDMARK (e.g. hydrant) and position relative to the landmark.</li> </ul> A fifteenth optional information item, is the geographic coordinate other system value / OCV. It shall only be present if OSI is present in the record. It can be up to 126 characters in length. If OSI is LANDMARK, OCV is free text and may be up to 126 characters. For details on the formatting of OCV for the other coordinate systems shown in OSI as examples, see <a href="http://earth-info.nga.mil/GandG/coordsys/grids/referencesys.html">http://earth-info.nga.mil/GandG/coordsys/grids/referencesys.html</a>	While some examples of other coordinate systems are listed in the standard (MGRS, USNG, GARS, GEOREF, LANDMARK), those values are not all-inclusive, and the user may indicate other coordinate systems that are not listed. <sup>1</sup>

<b>Subject Acquisition Profiles SAP/FAP/IA P</b>	7.7.5, Table 8, Table 9, Table 10	A subject acquisition profile is used to describe a set of characteristics concerning the capture of the biometric sample. These profiles have mnemonics SAP for face, FAP for fingerprints and IAP for iris records.	It is not feasible to test if the image was captured under the conditions specified by the SAP, FAP or IAP level as defined in Tables 10 through 13. However, the fields will be tested for valid level values (with the exception of Type 10 Compression values, which are dependent upon the SAP level and are not currently tested).
<b>Open and Closed Paths</b>	7.8	<p>Several Record Types define open paths (also called contours or polylines) and / or closed paths (polygons) on an image. They are comprised of a set of vertices. For each, the order of the vertices shall be in their consecutive order along the length of the path, either clockwise or counterclockwise. (A straight line of only two points may start at either end). A path may not have any sides crossing. No two vertices shall occupy the same position.</p> <p>There may be up to 99 vertices.</p> <p>An open path is a series of connected line segments that do not close or overlap. A closed path (polygon) completes a circuit. The closed path side defined by the last vertex and the first vertex shall complete the polygon. A polygon shall have at least 3 vertices. The contours in Record Type-17: Iris image record can be a circle or ellipse. A circle only requires 2 points to define it (See Table 16).</p> <p>There are two different approaches to the paths in this standard. The 2007 and 2008 version of the standard used paths for Field 14.025: Alternate finger segment position(s) / ASEG.</p> <p>That approach has been retained in this version for all paths except in the Extended Feature Set (EFS) of Record Type-9. The EFS adopted an approach expressing the path in a single information item, which is different than that used in other record types.</p>	<p>Further research is needed to determine the feasibility of testing for:</p> <ul style="list-style-type: none"> <li>-simple, plane figure</li> <li>-no sides crossing</li> <li>-no interior holes</li> </ul>

## Annex A: Support for AN-2011 Record Types and Interrelated Field

### A.1 Support for Record Types

The following table outlines the conformance testing support for each of the record types defined by the AN-2011 standard.

**Table A.1 - AN-2011 Record Type Support**

Support for AN-2011 Record Types		
Number	Record Contents	Support
1	Transaction Information	Full Support. See <a href="#">Record Type-1: Transaction information record</a> .
2	User-defined descriptive text	None.
3	Low-resolution grayscale fingerprint image (Deprecated)	Deprecated requirement only. <a href="#">See Record Type-3: DEPRECATED</a> .
4	High-resolution grayscale fingerprint image	Full Support. See <a href="#">Record Type-4: Grayscale fingerprint image</a> .
5	Low-resolution binary fingerprint image (Deprecated)	Deprecated requirement only. <a href="#">See Record Type-5: DEPRECATED</a> .
6	High-resolution binary fingerprint image (Deprecated)	Deprecated requirement only. <a href="#">See Record Type-6: DEPRECATED</a> .
7	User-defined image	None.
8	Signature image	None.
9	Minutiae data	None.
10	Face, other body part, or scar, mark tattoo (SMT) image	Full Support. See <a href="#">Record Type-10: Facial, other body part and SMT image record</a> .
11	Voice Data (future addition to the standard)	Reserved requirement only. See <a href="#">Reserved Record Types</a> .
12	Dental record data (future addition to the standard)	Reserved requirement only. See <a href="#">Reserved Record Types</a> .
13	Variable-resolution latent friction ridge image	Full Support. See <a href="#">Record Type-13: Friction-ridge latent image record</a> .
14	Variable-resolution fingerprint image	Full Support. See <a href="#">Record Type-14: Fingerprint image record</a> .
15	Variable-resolution palmprint image	Full Support. See <a href="#">Record Type-15: Palm print image record</a> .
16	User-defined variable-resolution testing image	None.
17	Iris Image	Full Support. See <a href="#">Record Type-17: Iris image record</a> .
18	DNA data	Full Support. See <a href="#">Record Type-18: DNA record</a> .
19	Variable-resolution plantar image	None.
20	Source representation	None.
21	Associated context	None.
22-97	Reserved for future use	Reserved requirement only. See <a href="#">Reserved Record Types</a> .
98	Information assurance	None.
99	CBEFF biometric data record	None.

It is necessary to provide support for some fields contained in unsupported record types because of structural requirements and relationships to supported record types. These fields are outlined in the table below.

## A.2 Interrelated Field Support

**Table A.2 - AN-2011 Interrelated Field Support**

Support for AN-2011 Interrelated Fields		
Number	Field Contents	Support
<b>xx.001</b>	Record header	All Record Types. See <a href="#">Field: xx.001-Record Header</a>
<b>xx.002</b>	Information designation character / IDC	All Record Types except Record Type-1. See <a href="#">Field: xx.002-IDC</a>
<b>xx.995</b>	Associated Context / ASC	Record Types 10 and above, not including 21 and 98. See <a href="#">Field: xx.995-ASC</a> through <a href="#">Field: xx.995-ASC-ASP</a>
<b>xx.997</b>	Source Representation / SOR	Record Types 10 and above, not including 18, 21, and 98. See <a href="#">Field: xx.997-SOR</a> through <a href="#">Field: xx.997-SOR-RSP</a>
<b>xx.016</b>	Segments / SEG	Record Types 20 and 21. See <a href="#">Field: xx.997-SOR-RSP</a> and <a href="#">Field: xx.995-ASC-ASP</a>
<b>xx.021</b>	SRN, ACN	Record Types 20 and 21. See <a href="#">Field: xx.997-SOR-SRN</a> and <a href="#">Field: xx.995-ASC-ACN</a>

## **Annex B: Version History**

### **B.1 Release 1.0, August 2012**

- Initial version of the conformance testing methodology which specified requirements and test assertions for the following sections and Record Types of the AN-2011 standard:
  - Section 5: Data Conventions
  - Section 7: Information Common to Several Record Types
  - Section 8.1 Record Type-1: Transaction information record
  - Section 8.4 Record Type-4: Grayscale fingerprint image
  - Section 8.10 Record Type-10: Facial, other body part and SMT image record
  - Section 8.13 Record Type-13: Friction-ridge latent image record
  - Section 8.14 Record Type-14: Fingerprint image record
  - Section 8.15 Record Type-15: Palm print image record
  - Section 8.17 Record Type-17: Iris image record
  - Annex B: Traditional Encoding

### **B.2 Release 1.1, October 2013**

- Specified requirements and test assertions for the following sections and Record Types of the AN-2011 standard that were not included in Release 1.0:
  - Section 8.18 Record Type-18: DNA record
  - Annex C: NIEM Conformant encoding
  - Annex G: Mapping to the NIEM IEPD
- For all assertions named “Valid WSQ Encoder Version”:
  - Changed assertion name to “Valid WSQ Specification Version”
  - Changed test level to 3
  - Modified test note t-16 to describe the reason for the changes
- Name changes for all assertions:
  - The prefix Transaction denotes that the data is referenced from multiple Record Types (and/or entities within several Record Types) to determine the result of the assertion.

- The prefix TypeXX, where XX is a Record Type, denotes that data is referenced from multiple entities within the Record Type to determine the result of the assertion.
- Added test note t-20 to describe a change related to “sequentially assigned” values (IDC, SRN, ACN). The order of the values in the Transaction is no longer important, but the sequential nature of the values after being viewed in numeric order is still important.
- Added “Notes” column to table in test note t-5 to explain comparisons of matching IDC values.
- Reformatted Section 6 to facilitate navigation of the tables of requirements and assertions:
  - Repeated the table headers for the Tables of requirements and assertions on each page
  - Placed each table of requirements and assertions into its own section. An entry for each table was added to the table of contents
- The Assertion ID description in section 5.6 was modified to provide more information on the formatting of Assertion ID’s.
- Added Cardinality(X) to Table 5.3 (Test Assertion Syntax Operands) for use with XML cardinality values in Annex G or the base standard.
- Added XOR to “Table 5.1 - Assertion Syntax: Operator Definitions”.
- Added Element to “Table 5.2 - Assertion Syntax: Terms”.
- Added test note t-19 to address undefined terms “positive integer” and “integer”
- Added “Type10-10.031-10.029-CondCode Dependent” with assertion text “IF Present(10.031), THEN Present(10.029)”
- Modifications of test assertions
  - Reviewed all Level-2 assertions to determine whether or not the presence of the entity (field, XML Elements, etc.) is required before assessing the assertion. In all such cases, the presence conditions were added. For example, “10.025-YAW- 10.021- Opposite” was modified to include “IF Present(10.021)” so that the assertion is only tested if field 10.021 is present.
  - Split “Type13-13.008-Conditional” into two separate assertions: “Type13-13.008-Conditional-SHPS” and “Type13-13.008-Conditional-SVPS”
  - Renamed “Transaction-IDCsRelate” to “Transaction- MatchingIDCValues-ComparableBiometricTypes”
  - Added NIEM-xx.999-CharType and NIEM-4.009-CharType assertions.
  - Removed WSQ20 from “13.011-Value” allowable values because WSQ20 is not a lossless type.
  - Table 6-17 - IDC Comparison Results: added support for allowing Type-9: Minutiae data records to share IDC values with Type-4, Type-13, Type-14, Type-15, and Type-19 records (Finger, Palm, Plantar, and Friction Ridge). Also added support for Friction Ridge (Type-13) to share IDC values with Type-4, Type-9, Type-14, Type-15, and Type-19.
  - “17.995-InfoItemCount”: Changed to allow 1 or 2 information items per subfield, not 2 or 3 as stated in the previous version
  - “[17.001 to 17.005, 17.013]- Mandatory CondCode”: changed name to “[17.001 to 17.005]- Mandatory CondCode”

- “Field: Originating Agencyey”: changed name to “Field: Source Agency” and added assertion “[10,13 to 21, 98, 99].004-CharType”.
- “Field: Source Agency Name”: added assertion “xx.993-CharType”
- “NIEM-xx.902- Subfield CharType” (where xx is 10, 13, 14, 15, 17) name changed to “NIEM-xx.902-GMT- CharType” and assertion text changed to: “Bytes(XElm(biom:ProcessUTCDate) in xx.902) MO [0x30 to 0x39, 0x2D, 0x3A, 0x54, 0x5A]”
- “NIEM-xx.998- Subfield CharType” name changed to “NIEM-xx.998-UTE- CharType” and assertion text changed to: “Bytes(XElm(biom:CaptureUTCDATe) in xx.998) MO [0x30 to 0x39, 0x2D, 0x3A, 0x54, 0x5A]”
- “NIEM-xx.998-UTE-Value” assertion text changed to: “{XElm(biom:CaptureUTCDATe) in xx.998} MO [NIEM- ValidUTC/GMT]”
- “NIEM-xx.998-Subfield CharCount” name changed to “NIEM-xx.998-UTE- CharCount” and assertion text changed to: “Length(XElm(biom:CaptureUTCDATe) in xx.998) EQ 20”.
- “xx.998-[UTE, LTD, LTM, LTS, LGD, LGM, LGS, ELE, GDC, GCM, GCE, GCN, GRT, OSI, OCV]” removed UTE, added separate assertion: “xx.998-UTE- CharCount”
- “NIEM-17.902- Subfield CharCount” name changed to “NIEM-17.902- GMT- CharCount” and assertion text changed to: “Length(XElm(biom:ProcessUTCDate) in 17.902) EQ 20”
- “17.995-ASP-CharCount” changed to test for range 1 to 2, not 1 to 3 as stated in the previous version.
- “17.995-ACN-CharCount” changed to test for range 1 to 3, not 1 to 2 as stated in the previous version.
- Occurrence assertions for Type-10, Type-15, and Type-17 were updated to allow field xx.993 to occur one or fewer times.
- RecordCategoryCode value restrictions for Type-1, Type-2, and Type-4 were changed from “01”, “02” and “04” to “1”, “2”, and “4”.
- Added “Schema Coverage” to the “Applicability” column of the tables of requirements and assertions found in section 6.3.
- In Requirement “Field:xx.002-IDC”, assertion “NIEM- IDCSeqValues” level was changed from 1 to 2.
- In Requirement “Field:xx.002-IDC”, assertion “xx.002-Value” changed to address all record types except Type-1.
- “13.024-FRMP-Value” updated to allow any value from Table 8.
- “NIEM-T10-DiffDC” changed to "NIEM-T10-DiffIDC" and the assertion was altered to state that the IDC values are NEQ.
- “NIEM-xx.902-ANN-GMT” changed to “NIEM-xx.902-GMT-Value” and assertion text changed to test for valid GMT/UTC value.
- “18.902- GMT- CharCount” changed to T (Traditional) and “NIEM-18.902- GMT- CharCount” changed to X (XML).

- “NIEM-xx.996-RecordTypes” and “xx.996-RecordTypes” changed to allow record type to be “MO [10, 13 to 17,19,20,21,99]” instead of “GTE 10”
- All record, field, subfield, and information item count assertions changed to T rather than X or B.
- All record, field, subfield, and information item count assertions: added cardinality for XML elements based on Annex G.
- “14.031- Values” Added value 45.
- “Type10-10.031-10.033-CondCode Dependent” assertion changed from “{ 10.031 } EQ 5 IFF Present(10.33)” to “IF { 10.031 } EQ 5, THEN Present(10.033)”
- “13.024-FRMP-Value” removed values 60 to 79, 81 to 84.
- “[xx.008,xx.016, xx.017]-Conditional” changed to level 2.
- “[20.008, 20.017, 20.018]-Conditional” and “[17.008, 17.022, 17.023]-Conditional” changed to level 2.
- “10.011-Value” changed to level 2.
- Added “NIEM-xx.998-GDC-Value” assertion.
- Text added to the end of Section 6.2: “Unless otherwise stated, the tables of requirements and assertions express all field structures using the Traditional notation of record type and field number (eg. 1.001) as well as subfield and information item indices when appropriate. However, the NIEM-XML encoding has no concept of subfields or information items. Instead, the XML encoding uses subelements. Annex G of the base standard can be used to translate the listed values for Traditional structures to the XML equivalent. In some cases the tables of requirements and assertions us the XML element names when necessary for clarifying an assertion.”
- “10.019-CharCount” changed from “MO [1 to 3]” to “EQ 1”
- “Transaction: Encoding-Base64” changed text to “<These assertions are addressed in the record type tables where Base-64 encoding is required.>” instead of “<unsupported>”
- Changed “10.023-Value” to “10.023-PAC-Value”, added “10.023-VSD-Value”.
- Changed “[13.004, 13.020, 13.993]- CharType” to TRUE.
- Removed “15.025-CharType”.
- Requirements and assertions table added for Annex C
- Modified test note t-6 to include YYYY-MM and YYYY for NIEM-ValidLocalDate.
- All UTC/GMT values were modified to allow the “-“ character (ASCII value 0x2D).
- Assertions for Requirement ID “Field: xx.999-Reserved” changed from Level 1 to Level 2.
- “17.040-Value” was changed to allow value 1 to 9999999 instead of 0 to 9999999
- The following assertions changed from Level 1 to Level 2:
  - xx.995-RecordTypes
  - xx.996-RecordTypes

- xx.997-RecordTypes
  - xx.998-RecordTypes
  - xx.999-RecordTypes
- Assertion “NIEM-ImageRecordCategoryCode” renamed to “NIEM-xx.999-RecordType” and changed from Level 1 to Level 2
- Assertion “NIEM-SOR-RecordTypes” renamed to “NIEM-xx.997-RecordType” and changed from Level 1 to Level 2
- Assertion “NIEM-ASC-RecordTypes” renamed to “NIEM-xx.995-RecordType” and changed from Level 1 to Level 2
- Assertion “NIEM-HAS-RecordTypes” renamed to “NIEM-xx.996-RecordType” and changed from Level 1 to Level 2
- Assertion “NIEM-GEO-RecordTypes” renamed to “NIEM-xx.998-RecordType” and changed from Level 1 to Level 2
- Changed name and assertion text:
  - xx.995-RecordTypes to Type[ActualRecordType]-Field995NotPresent
  - xx.996-RecordTypes to Type[ActualRecordType]-Field996NotPresent
  - xx.997-RecordTypes to Type[ActualRecordType]-Field997NotPresent
  - xx.998-RecordTypes to Type[ActualRecordType]-Field998NotPresent
  - xx.999-RecordTypes to Type[ActualRecordType]-Field999NotPresent
- Applicability changed from B to T, and new XML-versions were created for each of the following assertions:
  - “[1.001,1.012]-Conditional Applicability”
  - “1.011-NSR-Length”
  - “1.011-NSR-Value”
  - “1.012-CharCount” -RecordTypes
  - “1.012-Value”
- Assertion ID “1.013-DOM-Value” changed to “1.013-[DVM, DVN]-Value”
- Assertion ID “1.015-DCS-CSI-Value” changed to “1.015-CSI-Value”
- Assertion ID “1.015-DCS-CSN-Value” changed to “1.015-CSN-Dependent”. In addition, the Test Assertion text was modified to use If/Else statements and to allow user-defined values.
- New Assertion “1.015-CSN-Value” added.
- Assertion ID “1.015-DCS-CSV-Value” changed to “1.015-CSV-Value”
- Assertion ID “1.016-APS-Value” changed to “1.016-[APO, APN, APV]-Value”
- Assertion ID “1.017-ANM” changed to “1.017-[DAN,OAN]-Value”
- Assertion IDs “NIEM-4.[001 to 009]-ByteCount” renamed to “NIEM-4.[001 to 009]-CharCount”.
- Added Assertion “NIEM-4.004-Occurrence”.
- Added Assertion “4.009-DATA-Value”
- Modified Test Assertion text in Assertion “NIEM-Transaction-Required Records”.

- Modified “NIEM-1.005-CharType”, “NIEM-1.005-CharCount”, and “NIEM-1.005-Value” to account for Date, YearMonth, or Year format allowed in NIEM encoding.
- Changed Assertion “1.003-REC-Matches Records” to Level 2
- Changed Assertions “NIEM-Records Reserved” and “Records-Reserved” to “Transaction-NIEM-Records Reserved” and “Transaction-Records Reserved” respectively.
- Split assertion “Reserved Character Types” into one Assertion for Traditional and one for XML to provide clarification for XML encoding, now found in “NIEM-Reserved Character Types”.
- Appended “TypeX-” to the beginning of Record-level assertions for consistent naming.
- Changed the following assertion names for consistency:
  - “NIEM-IDCExists” to “NIEM-Typexx-Field002-Exists”
  - “NIEM-RecordCategory First” to “NIEM-Typexx-Field001-First”
  - “NIEM-IDC-Second” to “NIEM-Typexx-Field002-Second”
  - “IDCSequentialValues” to “Transaction-IDCSequentialValues”
  - xx.002-IDCRelate to Transaction-IDCsRelate
  - xx.002-SameDimension to Transaction-MatchingIDCSameImageDimension
  - xx.995-ASC-ACN to Transaction-ASC-ACN-Match
  - xx.995-ASC-ASP to Transaction-ASC-ASP-Match
  - xx.995-ASC-ACN-SeqValues to Transaction-ASC-ACN-SequentialValues
  - xx.997-SOR-SRN to Transaction-SOR-SRN-Match
  - xx.997-SOR-RSP to Transaction-SOR-RSP-Match
  - Type1-Occur Once to Transaction-Type1-OccursOnce
  - Type1-First to Transaction-Type1-First
  - Type3-Zero Occurrences to Transaction-Type3-ZeroOccurrences
  - Type5-Zero Occurrences to Transaction-Type5-ZeroOccurrences
  - Type6-Zero Occurrences to Transaction-Type6-ZeroOccurrences
  - 10.039-T10-DiffIDC to Transaction-SameT10-DiffIDC
  - 1.003-CRC-Transaction Record Count to Transaction-CRCEqualsRecordCount
  - xx.001-Record Header to Typexx-Field001EqualsRecordLength
  - xx.001-First to Typexx-Field001First
  - xx.002-Exists to Typexx-Field002Exists
  - xx.002-Second to Typexx-Field002Second
  - 1.xxx-Mandatory CondCode to Typexx-MandatoryCondCode (and added NIEM-Typexx-MandatoryCondCode based on cardinality in Annex G)

- 1.xxx-Occurrence to Typexx-FieldOccurrences
- Assertions 1.001 to 1.017-Occurrence were condensed and named Type1-FieldOccurrences
- 10.022-Occurrence Legacy to 10.022-PXS-Legacy
- 4.004-Occurrence to Type4-Field004Occurrence
- Field Record Type to xx.xxx-FieldNumberMatchesRecordType
- 10.011-Value to 10.011-ValueDependent
- 14.011-Value to 14.011-ValueDependent
- Added new Level 1 10.011-Value and 14.011-Value assertions
- Changed “xx.997-SRN-OneTo255” to “xx.997-SRN-Value”
- Changed “xx.997-RSP-OneTo99” to “xx.997-RSP-Value”
- Modified “10.042-TSC-Value” to test only Level 1 values
- Added “10.042-TSC-ValueDependent” to test Level 2 previously found in 10.042-TSC-Value

## Acknowledgements

Draft Revision 1 of NIST Special Publication 500-295 documents the test assertions implemented in BioCTS for ANSI/NIST-ITL 1-2011 Traditional and NIEM XML Encoding conformance test tools which was released in August 2013:

<http://www.nist.gov/itl/csd/biometrics/ansi-nist.cfm>

This publication was the result of work sponsored, in part, by the Department of Homeland Security/Office of Biometric Identity Management (OBIM).

The Information Technology Laboratory (ITL) of the National Institute of Standards and Technology (NIST) sponsored the development of the initial version NIST SP 500-295 under the Conformance Testing Methodology Working Group (WG) comprised of members from NIST, other US Government agencies, and industry. Elham Tabassi of the NIST/ITL Information Access Division (IAD) led that effort.

NIST/ITL CSD's staff Fernando L. Podio, Dylan Yaga, and Christofer J. McGinnis who were the editors of NIST SP 500-295 and developed the initial version of an ANSI/NIST-ITL 1-2011 conformance test tool contributed the test assertions implemented in that test tool for use in NIST SP 500-295.

The following individuals participated in the Conformance Testing Methodology Working Group and contributed to the development of the initial version of NIST SP 500-295:

Name	Organization
Anne Wang	3M Cogent
Scott Hills	Aware
Chris White	Booz Allen Hamilton
Matthew Young	Booz Allen Hamilton
Kim Woods	CTR Biometric Image Management Agency
William R. Graves	DHS

Ryan L. Triplett	DoD
Jennifer Stathakis	FBI
B. Swann	FBI
Charles Schaeffer	Florida Dept. of Law Enforcement (FDLE)
Christofer J. McGinnis	ID Technology Partners
Mike McCabe	ID Technology Partners
Kaustubh Deshpande	L1
Adam Rosefsky	MaxVision
Michael D. Garris	NIST
Patrick J. Grother	NIST
Michael D. Hogan	NIST
Kevin C. Mangold	NIST
Fernando L. Podio	NIST
Elham Tabassi	NIST
Bradford Wing	NIST
Dylan Yaga	NIST
Brian Finegold	Noblis
Austin Hicklin	Noblis
John Mayer-Splain	Noblis
Bonny Scheier	SABER
C. J. Lee	SAIC
