- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

B. R. Lemonik

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Abbie Bernstein

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. CHIPS Program Office CHIPS Program Office,

While I recognize the eagerness with which the Governor and other elected officials want to stimulate the economy of central New York, the huge Micron project may bring more drags on the economy and well-being of the region than benefits.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions.

Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

hotep_amen@yahoo.com

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office
CHIPS Program Office,

Micron will destroy our environment, climate, and communities. It's absolutely unacceptable that we're giving billions of dollars of taxpayer and ratepayer handouts to a massive corporation when there's not even a guarantee that the resulting jobs will go to our community or be good, union jobs. Micron will also use more energy than the entire state of Vermont, none of which is guaranteed to be renewable. I urge you to reject Micron's proposal to come to CNY entirely. We need an investment in jobs that our community actually needs instead, like lead remediation and social services.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. I find the 45 day comment period on a 20,000 page document to be an inadequate time frame to purposefully and accurately read and thoroughly understand the depth of this project. I can only assume that this minute time period is due to the many issues that are not positive for the environment and surrounding communities and thus the shortened time frame. What is being hidden here? By being this covert in this response time, it clearly leads to deception being felt by many community members and the truth is not truly being told. Again, there has been no public response to the petition that was signed. Again, what are you hiding? Therefore I am requesting that this comment period be extended to at least October 25, 2025. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** I bet none of you live here and are worried about the flooding from the removal of these wetlands but I do live here and am very concerned about the flooding. Will you be the agency we sue when our yard and home floods from the lack of appropriate watershed? If not, please provide me with the agency or will it be Micron or McMahon himself that will be responsible so I can prepare for such litigation. Yes, I know that you are replacing some watershed/wetlands at a rate of 2:1 or 3:1 but those are not connected and therefore will not assist in the flooding issues. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss. Now, about the displaced animals. Again who do I send the bill to when I have an insane number of animals being displaced and they are now attempting to live under my shed or house. Who shall I send the bill to when I have to hire an animal control specialist to trap and relocate? Please determine the numbers of beavers, weasels, mink,

raccoons, snakes and other animal species and how, what your plan is to assist them in migrating to a safer habitat.

- Protection of Air, Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. What is the plan to prevent transportation accidents from occurring? There must be a safety plan. Please disclose this safety plan and where and how these forever chemicals will be taken for storage. Will Clay NY be the next Love Canal? Will there be litigation for years and millions have been paid out for leakage of these chemicals such as Alcoa, Honeywell, and DuPont? How will Micron protect our community and its workers? Do you know what a million gallons of sludge looks like? I didn't either until I realized that it is the same capacity as 74 24 foot round swimming pools.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. What is Micron's plan to be 'green'. How will they generate the type of power that is necessary to power 1, 2, 3, and then the 4th fab? Has it taken into consideration that CNY does not get much sun in the winter months? How many solar panels will it take or wind turbines will it take to create this 'green' energy? The DEIS report does not address these issues which I would like answered. This report does not address how the upgrades to energy systems or water systems will be paid for. Please address these issues. Again is this something that you want to hide from the public as you need them to pay for these upgrades? Please provide a comprehensive plan from Micron and how they must create a comprehensive plan to generate or purchase renewable energy using wind and solar and geothermal and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront This issue and demand a response from Micron.

Highways:

Has anyone who wrote this DEIS report been through the Rt 11 & Rt 31 exchange during rush hour? What about on weekends? Has anyone been through the Rt 11 corridor between Reis Dr and Bear Rd on the weekends after 10 am? Please provide an extensive report on this traffic situation and how a truck going in and out of this site at the rate of 1 truck a minute during the 16 year construction period will affect the traffic. I have read how Rt 81 will be diverted at the exits but as we know, this takes months, years to complete. Shouldn't this be done first before trucks begin rolling? Yes, there is going to be a RR extension. Again, this takes time. Please provide a more thorough mitigation plan on the traffic with time lines and how it will be mitigated at the start.

With progress comes devastation to our environment. This must be how the Native Americans must have felt with 'Manifest Destiny'. However we need to ensure that we do not become the next largest polluted area of the country. Do we really want another Onondaga Lake on our

hands? Please provide answers to the above requests as well as providing the comment time to extend until October 25, 2025.

Thank you for your consideration of my comments.

Sincerely,

Leigh Swanker

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Judith Ackerman

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Daniel Gremillion

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

John Coffey

Sincerely,

John Coffey

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss. We demand a clear plan for wetland restoration and its continued monitoring to ensure its ecological function is realized and maximized. This project should not result in a net loss for wetland habitat and flood mitigation.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols. We do not want another superfund site de-valuing property and quality of life in upstate NY down the road.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using

wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

I think MICRON should develop a partnership with the City of Syracuse such that the City can apply for cost-share for the renovation, rehabilitation and improved energy efficiency of existing housing stock in the City of Syracuse. If MICRON is truly committed to helping those historically and systematically disadvantaged communities, this public-private partnership could provide a boon to worker enthusiasm, provide a strong base for community relations, and make those City residents working for MICRON, proud to do so.

Perhaps the City and MICRON could implement this for one city block as a demonstration project with the intent of building positive community relations and building housing for their workers.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I am particularly concerned about water pollution with PFAS and other chemicals. My drinking water and that of thousands of other people comes from Lake Ontario where these chemicals will end up. I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy

that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Mark Hollinrake

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Sincerely,

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1600 residents of the region asking for more time.

In addition, I request that you hold additional public hearings at MULTIPLE locations. The hearings held at Liverpool H.S. are a good start, but that location is not accessible to county residents who lack a car. I request that you hold a public hearing in downtown Syracuse--easily accessed via Centro bus service, and several other locations, in the evening.

The Micron project will have major effects on the health and welfare of our region for the next 50+ years. It deserves a thorough review with public engagement.

Sincerely,

Khadeejah Ahmad

CHIPS Program Office
CHIPS Program Office,

Thank you for allowing the public to ask questions that I understand will be answered prior to any ground breaking and building of this plant. I am requesting that you extend the 45 day comment period to be at least 120 days or until October 25, 2025 as it is incomprehensible that someone could read and understand a 20,000 document in this 45 day period.

Second, I urge your consideration and response to the following issues and concerns:

- What specifically are the PFAS 'forever chemicals' that will be used and what is the method of transportation to the plant? Now, even with the best safety plans, accidents occur. So, with this in mind, what are the health risks associated with each chemical within 1 year, 5 year, 10 year and 20 year of exposure such as through ground water seepage etc. Are these chemicals used anywhere else in the county? This 20,000 page document does not disclose the actual chemicals that would be used and it cannot be proprietary as I am not asking for the actual formulas with percentages of each used. I am concerned for the residents, workers and wildlife.

In the other areas of the USA, where Micron has plants, what are the PFAS levels in the air and water? Now comparatively to size, as none of those plants will be this large, please provide what the volume comparison is of these levels with 4 fabs.

Micron is pledging to meet 100% renewable energy. How will this be done? Please be specific as to the number of solar panels and windmills it will take to power one fab. When this is published, then we can all multiply by 4 to understand how many it will take to power 4 fabs. How much energy will it take to power the daycare, water treatment plant, and the offices? Where will all of these solar panels and windmills be placed? Will more land need to be acquired?

Thank you for your consideration of my comments and I look forward to hearing responses from my questions.

Sincerely,
Leigh Swanker

CHIPS Program Office
CHIPS Program Office,

Thank you for your consideration of my comments.

First, the DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. It's important that MICRON create a comprehensive plan to generate or purchase renewable energy credits using wind and solar power.

Also, DEIS doesn't ensure Micron's energy and water use will not affect the affordability of energy and clean water. Ratepayers and tax dollars should not be used for infrastructure upgrades. MICRON certainly has the resources to address this issue.

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

gary maggi

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. I would like to say that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025 at a minimum. Note that there has been no public response to a petition signed by over 1500 residents of the region asking for the same.

Based on my current understanding of the DEIS, I still want to highlight the environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. This is particularly important in light of the historical misuse and contamination of Onondaga Lake by corporate interests--this must never be allowed to happen again.

It's critical that the following considerations issues are addressed and responded to:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy

that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

The cost of living in housing for those who already live in Onondaga County. Wages have not increased, yet houses and apartments are no longer affordable to those who reside within Onondaga county. With the insane raise of the housing market over the last three years, my mother-in-law is no longer able to purchase her own home. I cannot afford to get my own apartment. Once Micron is established, electric bills, water bills will skyrocket on top of unfordable mortgages and rents unless you had purchased a home years ago.

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

PLEASE PAY ATTENTION TO THOSE LOCALS WHO WILL BE MOST AFFECTED!

THERE IS LOTS OF LIFE IN THE CURRENT WATERSHED: PLANTS, ANIMALS, MICROBES. THEY ARE IN A HEALTHY BALANCE THAT HUMANS CANNOT EASILY REPLICATE OR EXPECT TO 'SHIFT' TO ANOTHER PIECE OF LAND.

MICRON ITSELF WILL BE CREATING MORE POLLUTION DURING OPERATIONS, NOT JUST CONSTRUCTION. HOW WILL THAT BE CONTAINED AND PROCESSED SO AS NOT TO CONTINUE HARMING THE ENVIRONMENT AND THE LOCAL LIVES: MICROBES, PLANTS, ANIMALS AND HUMANS?

PLEASE ASK ALL THE LOCALS - NOT JUST THE ONES WITH THE LOUDEST VOICES. WHO IS TELLING YOU ABOUT THE LOW INCOME PEOPLE IN THE AREA. AND ALL THE OTHERS WITH LITTLE VOICE?

ALLOW A LONGER COMMENT PERIOD.

Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- Water and Ecological Resources. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts

(including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- Protection of Air, Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

AGAIN, PAY ATTENTION TO THE LOCAL COMMUNITIES WHO WILL BE STRONGLY AFFECTED!

Thank you for your consideration of my comments.

Sincerely,

Melissa Carlson

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

CHIPS Program Office CHIPS Program Office,

I am extremely disappointed in public officials lack of transparency. They kept the DEIS private while giving themselves 180+ days to read the thousands of pages. The public has just 45 days to take in this report which contains critical, life altering, technological information. It was released when many are on vacation and their attention is naturally elsewhere. One wonders what our officials are trying to hide. How does this restricted time to take in the DEIS serve constituents and the many people affected by this project?

Thank you for your consideration of my comments. There is still time to do the right thing and extend the time for the people to read the report and have public meetings.

Sincerely,

Leslie Lawrence

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York despite the ridiculous short time for public comment. We Central New Yorkers know that this is a done deal, therefore my comments are directed at Micron's sense of responsibility. I went to many of the initial meetings where many promises were made and where I offered feedback and ideas from other organizations that could make positive suggestions to Micron, but never heard back from any of the organizers of these meetings or Micron. We also know President Trump has removed all federal environmental regulations on Micron and is pressuring them to remove any DEI commitments. I urge Micron to maintain its initial commitments. Here are my main concerns:

1. Micron will have a tremendous impact on our water and environment. Micron says it will cut 400 acres of trees and hundreds of acres of wetlands. Increasing tree acreage in the Northeast is the single most important thing we can do to reduce global warming, therefore I urge Micron to limit this destruction as much as they can. I urge Micron to use native plants on its grounds to provide habitat lost to this destruction and to use bird friendly glass in their buildings to mitigate the loss of birds, which are used to using the wetlands in this area.
2. There are many toxic chemicals in the production of microchips. In addition to being a risk to workers, ultimately these chemicals will end up back in our waters and I have not seen how Micron will limit this.
3. This project puts a burden on taxpayers, who are investing large amounts in it and whose sewage and infrastructure bills will skyrocket in the future.
4. How will Micron have zero emissions as they claim?
5. How will Micron offer reasonable housing and limit traffic pollution in the area?

I would like to support this project, but frankly I fear for the future of Central New York.

Sincerely, Diana Green

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

The destruction of wetlands and the damage of nearby wetlands will be an enormous environmental loss. Our county seems to be full of housing and business developments built on wetlands. We are interfering with nature rather than adapting. These wetland store large amounts of carbon and are essential to slow the warming of our planet. What is Micron going to do to make up for the loss of carbon sequestration that the wetlands provide? The wetlands Micron are proposing will not store carbon approaching the amounts the present wetlands do for years. So what are Micron's plans for making up for the loss of carbon sequestration in the present?

Thank you for your consideration of my comments.

Sincerely,

Leslie Lawrence

The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Lynn House

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

Micron's proposed development in Central New York is a welcome recognition of our community's assets and its history in fostering the success of innovative industries. Thank you for the opportunity to comment and pose questions regarding Micron's proposed Draft Environmental Impact Statement (DEIS).

I understand that the DEIS considers known and likely environmental impacts of the development and operation of the project as proposed; however, my question relates specifically to the lifecycle of the project. We here in Syracuse know painfully well, like many Eastern communities, that even the most locally originating industries can and do close, or leave for elsewhere. When they do, the community is left with what gets abandoned and left behind. In reviewing the Summary of the DEIS, I did not find consideration of what non-statutory obligations Micron, or others, are assuming with respect to restoring the site and remediating contamination on and off the project site.

As I understand it, the intent of this DEIS is to meet the permitting requirements for the full projected 46-year development of the project. Given the rapid and seemingly ever-accelerating rate of change, innovation, and consequent obsolescence, the DEIS does not appear to require further environmental impact analysis and remediation actions, as changes in Micron's operations occur. Grandfathering the treatment and remediation standards for a project that isn't expected to be operating at its planned capacity for nearly 50 years is unacceptable, given the certainty of changes in every aspect of plant operations over that timeframe. How will changes in environmental impacts be addressed?

Can you clarify what monitoring and reporting requirements Micron has with regard to planned and unanticipated changes in design, configuration, and operation of the facilities over their construction, operation, and closure?

With respect to the proposed two-to-one replacement of existing wetlands to be paved over for parking. What percent of the existing wetlands, if any, have standing or flowing water for more than a week following a rain event? Are the proposed scattered site replacement wetlands similar in terms of periods of standing or flowing water?

The DEIS catalogues the protected and endangered species affected by the loss of wetlands; however, no inventory or census is provided for other native plant and animal species, and how those will be preserved and protected. Is it Micron's position that only legally protected species are to be considered?

The DEIS identifies the installation of a 16" natural gas line to serve the development, and I believe 8 generators to be operated in groupings, but I did not see consideration, evaluation, or plans to cover the proposed parking area, and/or rooftops with photovoltaics, or wind-power generators as a partial offset to the impact of carbon byproduct release from combustion of natural gas. Why is the minimization of the project's carbon footprint not addressed?

As a global concern, each time the DEIS cites a condition of the project that is expected to have a material environmental impact, it is assumed that there is no feasible alternative, offset, or obligation to maintain a standard of best available technology throughout the project's lifecycle. Is there such an obligation and if not, why not?

The DEIS acknowledges that adaptation of relocated protected and endangered species to scattered-site wetlands will happen slowly. Why wasn't consideration given to the impact of relocation of these species to a consolidated site, or a consideration of what larger alternative sites might be available?

The DEIS makes reference to onsite waste treatment and storage. What provisions are there for the monitoring, securing, and proper disposal of hazardous and non-hazardous wastes?

The DEIS references the landfill disposal of non-hazardous wastes, since landfill space is limited and the demand competitive: what analyses does the DEIS make regarding the availability of adequate volumes of permitted landfill capacity, and or alternatives for waste reduction and reuse?

The DEIS does not consider the impacts of continuing and accelerating change in the climate from increased severity and length of high heat events, the increased flooding, erosion, and site drainage capacity required to deal with more and more severe storm events, and changes in water table height. While such climate effects cannot be accurately predicted, what consideration has been given to establishing a likely range of impacts and their respective offsets or mediation?

The project and community are slated to share utility capacity and infrastructure, and the presumption is that existing and proposed augmentations of such capacities will be sufficient for both project and community needs. Which gets priority if the aggregate available capacity is insufficient to meet the needs of the project and the community?

The DEIS considers both truck and train traffic impacts, but does not consider the impact on

commercial and private air traffic volumes based on project-related travel and the air travel needs of the thousands of added Central New York families employed directly and indirectly in connection with the project. Why not?

Thank you for your consideration of my comments.

Sincerely,

Dennis Lerner

CHIPS Program Office
CHIPS Program Office,

To whom this will concern,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

As a Franciscan friar ecologist and a local minister working with the poor of Syracuse, I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using

wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

"Simple" yet thoughtless gentrification is not the solution. I work with many low-income, poverty stricken families/children who are concerned about their future here in their own hometown. Couldn't Syracuse be a leader in social responsibility and sustainable development in a time like ours?

Thank you for your consideration of my comments.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Judy Schmid

To Whom It May Concern:

We would like to begin our comment by stating we are in favor of the Micron Project. However, considering the scope of the project we would appreciate;

1. More time for public comment before advancing to the EIS, not necessarily into October but an extension, nonetheless,
2. Much clearer and specific mitigation measures to be taken addressing;
 - a. Streams, rivers & lakes degradation
 - b. Water waste/industrial waste minimization
 - c. PFAS control (where will the ~ 100,000,000 tons of PFAS go), asphyxiants, spills (55 million gallons on-site, hazardous waste)
 - d. Utility use & who pays for how much, since we will become a "load pocket" vs. supplier?
 - e. Heat Island Affect (i.e., parking for 12,000 cars, in conventional parking lot = 15-20 acres of asphalt). Stacked structure to reduce footprint?
 - f. Wildlife & endangered species – protection?
 - g. Why use only fossil fuels? Wind? Solar?
 - h. Wetlands – typically take decades to recover.

We have both held various positions in our local Village government. We had a 140 acre parcel of land slated for clear cutting for development re-designated as a CEA. Karen was ZBA Chair & member & chair of our Planning Board. We became familiar with (albeit modest

comparatively) DEIS documents. It became apparent that size and volume became somewhat of a technique to distract.

We are thoroughly impressed with the skilled professionals who took on the challenge of 20,000 pages. They spoke clearly and succinctly regarding some of our concerns mentioned above.

It would be interesting to compare documents with their other sites in Manassas, VA & Boise, Idaho. We discovered that a former applicant to our Planning Board used statistics from an entirely different site with nothing similar.

We know that Micron has the skill and capability to clearly, simply address these concerns without the immense volume of pages. Our area is blessed with ample, clean, fresh water. The Great Lakes hold roughly 20% of the world's surface freshwater. Let's keep our water & air clean and safe for generations to come.

Thank you for your consideration.

Sincerely,

The Ryon's

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

In addition to the comments below I would submit that the location of this facility over karst bedrock is highly questionable. So is the "remediation" for the destruction of the high quality wetland habitat that is being destroyed. And I do believe the influx of workers will make housing in the area LESS affordable at a time when many government programs are going under.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

The size of the buildings and the size of the parking lots mean that rainstorms will result in lots more water onsite and running offsite. As this is an area that already has flooding issues how is Micron going deal with high water close to the site and downstream. With the size of the parking lots one can only imagine the size of the snow mountains and the flooding when they melt. How will Micron deal with super sized flooding events? Are there plans for permeable parking lot pavement?

Thank you for your consideration of my comments.

Sincerely,

Leslie Lawrence

The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. The 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I request that the comment period be extended to October 25, 2025, at a minimum. I note that there has been no response to a petition signed by over 1500 residents of the region asking the same. Despite the aforementioned time limitation I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
 - **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
 - **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- Affordable and abundant water and energy: The DEIS does not ensure Micron's massive

energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Barton Schoenfeld

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Our community killed one lake (Onondaga) over the past 100 years, and it's taken huge amounts of money and time to rectify that. (Some would say the solution is inadequate.). Please let's have the wisdom to avoid repeating past mistakes in Central NY. Please let's be pro-active in developing creative solutions to potential problems.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite my submission of the following comments, I feel that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and I also understand that there has been no public response to a petition signed by over 1500 residents of the region asking the same. This is a lengthy document full of technical terms and it is also written way above the majority of the general public's comprehension or reading ability/level. Many of those people will be the most effected by any adverse impacts.

Having lived in this community for almost 40 years I feel I have a good sense of the area and it's history. I am hoping that we have learned something from what happened at Onondaga Lake when it became an industrial dumping ground in the 19th century. At that time there was not as much information out there about what impacts their actions could have, but we know better now. But we also know we don't know everything about long term effects.

I grew up near the Hanford Atomic Works in Washington State. My dad was a research scientist there. Everyone's dad worked there in some capacity. We used to go in the outer areas of the reservation and pick asparagus. It was the Wonder Years life of the 1960's and 70's with kids riding bikes, chasing tumbleweeds, and skipping stones on the Columbia River. We moved to the east coast when I was 15 for another job opportunity. I missed my life there. Speed ahead to 1999, I was diagnosed with breast cancer. I heard of another former neighbor a few years older than me being diagnosed as well. I was a 37 year old mother of 2 small children with no history of breast cancer in the family and in fact, subsequent genetic testing did not show anything for the known mutations.

I am not adverse to having Micron in the area. God knows the area needs jobs and some money infusion, but is this done at the cost of the next generation? There are so many things we don't know about the chemicals in our lives, but we do know a lot more than folks did in the 1800's.

So how can Micron be a good neighbor or really a good member of this community? Don't rush this assessment through, be transparent in monitoring, have plans to make changes as issues arise, treat the community as they are your family, your loved ones. My son and his family live

near the site. I fear for their continued quality of water, their safety on the roads during construction and operation, their clean air, and any potential flooding on their property which is already an issue due to the Eco-systems in the area.

Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols. M

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. From my experience with other industry growth, many times workers from outside the area are the folks that get the jobs. Not the locals. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate

friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,
Maura Harling Stefl

CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Frankie Rowan

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. First, the comment period should be extended to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge amendments to the DEIS to address the following outstanding problems.

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** Without the due diligence needed to address hydrological and ecological issues Micron's proposed projects could have significant ill effects on our valuable wetlands, watershed, ground water, and the natural habitats of hundreds of species native to this land.
- The Syracuse area in particular has been devastated by water contaminations decades ago resulting in the dead Onadaga lack. We can not afford to jeopardize our clean water with further developments that do not take into adequate account of the fall out of its expansion. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron is should not be allowed to proceed without accountability and re-thinking of their harmful designs for these regions.

We need to be smarter about our future and not succumb to short-sided planning that endangers people, the environment, our water and land.

Thank you for your consideration of my comments.

Sincerely,
Anne Harris Wilcox

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

I urge consideration and response to the following issues and concerns:

Micron plans to fill or drain almost 200 acres of wetlands. Eliminating these will increase the risk of flooding, not only to nearby communities but to the plant itself. While Micron plans to restore wetlands in other areas to compensate for the loss, these new wetlands are not located downstream from the plant - and will therefore not mitigate the risk of flooding. Additionally, the original wetlands currently store considerable amounts of carbon; their elimination will increase greenhouse gases, something the country can ill afford.

Sincerely,

David Friedman

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Syd Kellogg

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

The proposal is vast, vague in many areas that must be more fully considered, has many potentially harmful effects on the environment, its wetlands and the local population and wildlife, is too costly in electricity demands, and will take many years of disruption and billions of dollars to complete. Given the prevalence of flooding in wetlands areas, contamination can be spread at any time and toxics could shoot above allowable levels.

All in all, this is a very dangerous project for the climate, the land, and the people of the area. It should be limited to a smaller project or eliminated altogether, certainly until a proper EIS is completed. More community input and a longer time to comment is required.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including

best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

All of these issues will have a large impact on this area which has been my home since I was born 45 years ago. I don't want to see another corporation come in with false promises and no follow through. Environmental impacts will affect countless generations in the area and it's such a beautiful place to see be destroyed. Please make sure that we aren't giving in to money and we are paying attention to what truly matters which is the people of the community now and for future generations.

Thank you for your consideration of my comments.

Sincerely,
Traci Korbas

Subject: [EXTERNAL] RE: Draft Environmental Assessment EISX-006-55-CPO-001

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

An aquarium? That's your request for work life balance of your employees? How about invest in CNY wastewater infrastructure. City of Syracuse has its jewel of a lake polluted with any rain event due to decades old water treatment facility with combined sewer overflow. Please as an organization that will be coming to CNY STRICTLY for our water resources put in effort to improve water quality across CNY. Invest in the CITY OF SYRACUSE. Not just the suburbs. Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable

energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Sean M. Korbas (lifetime CNY resident)

Sean Korbas

Subject: [EXTERNAL] Your Environmental Assessment (EISX-006-55-CPO-001)

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

I live less than two miles from your proposed campus, and am asking you to extend the comment period to October 25, 2025, at a minimum. There has been no public response to a petition signed by over 1500 residents of the region, including myself, asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I'm most concerned about your planned project's impact on the local environment. The DEIS fails to adequately address these issues. Moreover, it fails to provide specific promises as to remediation of wetlands, let alone assurances as to on site wetlands loss, since flooding is such an issue; we are, as you may have noted, built in a swamp. The DEIS does not address watershed and habitat that will be destroyed. Your company absolutely needs to provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals. The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar – and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act. We have already seen local increases in energy costs; the DEIS does not ensure Micron's massive energy and water use will not further affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project.

Lastly, the company's impact of local traffic, housing, and cost of living. The DEIS does not adequately explain how they plan to address traffic congestion while ensuring access. The DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Christine Herrmann

CHIPS Program Office
CHIPS Program Office,

While I am thankful that the Draft Environmental Impact Assessment for Micron was made available, I am deeply disappointed that only 45 days were allowed for the public comment period. I hope that you make the right choice and extend the comment period to October 25, 2025 to get a full sense of the community's thoughts, hopes, and concerns for the project.

There are many aspects of the projects that concern me, but I want to focus on those that impact me directly.

I am from Central New York. I came back to live in the area and have come to love how much nature and green spaces exist in this area, and the many ways one can enjoy their time in nature. As I have grown older and traveled, I have realized the amount and ease of access to green space like it exists in Central New York increasingly rare. Micron in the DEIS plan is dismissive and does not give due diligence in considering the massive environmental impacts it would have not just in Clay, or Onondaga county, but the larger Great Lakes region. The destruction of wetlands and watershed loss has always, historically, ended poorly. The fact also that the plant and the money it will make take precedent over threatened and endangered species is disappointing, especially in a state like New York that seems to pride itself on taking care of and protecting the natural environment. Additionally, the use of PFAS and other chemicals (that Micron has suspiciously not disclosed) that they may end up in the waste water and in Lake Ontario is deeply concerning. So much work has already been done to restore the damage that industries and pollution have had on the great lakes, and many people, including many of us in Onondaga county rely on the lake for the water we drink. The amount of greenhouses gases that would be produced by the plant, and the lack of information as to how the company plans to comply with NY's goals of becoming a zero emissions state by 2040 are concerning. As it stands, this plan does not account for the ways in which the production of the plant will disrupt and damage the environment, nor what will be done to minimize and repair the negative impact.

This was a place I saw myself spending the rest of my life, where I wanted to and could buy an affordable home, and have a family. But in the time since the Micron Plant announcement was made, I have started to feel this dream slip away. Already I am being priced out of the housing market which my real estate agent tells me is already being influenced by Micron. Each year my rent increases more than my salary does as a teacher, and I am constantly outbid on homes, homes whose sale prices supersede their actual worth. I am not going to be able to afford a

place to live if Micron's estimated influx of people further exacerbates the housing and rental market. How then will the families of my students whose families already struggle with housing costs survive? Micron needs to concretely and explicitly consider the impact on housing, transportation, and poverty especially for the residents already living in the area.

These are the following steps I would like to see taken at a minimum:

Allow and Ensure Community Oversight:

With uncertainties of this long-term project, Micron should be required to create and support a community-expert advisory and oversight committee which can help with on-going monitoring, environmental impacts assessment and response, and community engagement.

Scale Back the Project

Given recent proposals to build more Micron fabrication facilities elsewhere, Micron needs be required to further justify why 4 Fabrication Facilities are needed here. They also could be required to expand the DEIS to fully consider a smaller 2-Fab or 3-Fab (instead of 4-Fab) plan. A 2-Fab or 3-Fab facility would reduce the negative impacts on wetland and habitat loss

Poverty Reduction Plan

Micron needs to commit to actions that help reduce poverty, especially child poverty, in Onondaga County and the City of Syracuse. The DEIS should include an analysis of how the Micron development project will reduce and prevent poverty, especially child poverty.

Analysis of Housing Impacts

Micron needs to complete a housing analysis detailing the impacts of rising housing costs on the local community and plans to mitigate such impacts so that housing remains affordable. This plan could include specific details on how Micron plans to house all of their workers.

Wetland and Habitat Restoration

Micron should increase the wetland replacement ratio from 2:1 to 10 to 15:1, as was done for other projects. These wetlands could be in large continuous tracts that connect to grasslands and forests. Micron could also protect existing, mature wetlands in perpetuity, such as forested wetlands, floodplain forests or shrublands in the Oneida River and nearby watersheds.

Protect Existing Wetlands

Micron needs to commit to purchasing additional large areas of existing wetlands downstream of Micron, such as along the Oneida River floodplain, to protect in perpetuity through the TWT or the CNY Land Trust.

Better Planning for Endangered Bat Protection

Micron must base their endangered bat protection plans off of literature pertaining to the species of bats at their NY site, not common bats from other locations. Specifically, Micron could look at the efficacy of destroying and relocating maternity roosts for endangered bats that return to the same site year after year.

Require Renewable Energy

Micron should build out renewable energy across CNY and NY to support their energy needs. They could commit to putting more solar on their main campus rooftops.

No PFAS in our Water

Micron must commit to using treatment and monitoring technology that assures that no PFAS are released into the Oneida River, Oswego River, Lake Ontario, and our drinking water.

Details on Human Health Risks

Micron must release information produced by independent scientists on the human health risks of working with these chemicals.

Evaluate Air Emissions from Incineration and Consider Alternatives

Micron must review the environmental impacts of incineration and consider the use of alternative technologies within the DEIS.

Monitor Local Air Emissions

Micron must be required to monitor the regional (not Rochester) levels of these pollutants during construction and operation.

Details and Justification for Environmental Justice Conclusions

Micron could provide more details on how their Environmental Justice outreach process was determined and justification for this process. Micron could provide more detail and justification for how they choose the study area for their Environmental Justice review.

Expand Radius for Evaluating Environmental Justice Impacts

Micron could increase the area they evaluate for Environmental Justice impacts to include downstream communities, the Town of Clay, Liverpool, and parts of Syracuse, as well as communities within 5 (not .5) miles of their rail spur, childcare center, and water treatment plant expansion, and around planned roadway changes. Overall, Micron could expand their study area given that this is one of the largest development projects in NYS history.

Evaluate Local Climate Justice Impacts

Micron could evaluate how their contributions to global warming will have adverse local effects, and evaluate how these effects impact environmental justice.

And lastly, if it is too much to ask that the following steps be taken then I request that Micron choose a different site. They could choose a site that was already impacted by legacy industrial development to construct their fabrication facilities, rather than this site which remains as wetland, grassland, and forest habitat and has not previously been developed. Many such sites exist not just in NYS but in the rust belt as well. It is my hope that the opportunity for economic development not come at the cost of our environment.

Thank you for your consideration. I hope you ensure that the CNY I know and love can continue to be my home and the ecologically diverse place I know and love.

Sincerely,

Amanda Boyle

Wetlands. Restored wetlands are rarely as effective or biodiverse as original wetlands, and can take many decades to develop. Micron should do a wetland replacement ratio of 10 or 15:1, compared to Micron's 2:1.

The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's new facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

My main concern centers on wetland plans in the DEIS - while the effort to restore nearby wetlands is laudable,

- **Water and Ecological Resources:** the DEIS does outline efforts to avoid wetland loss, as well as plans for restoration. However, I am curious as to why the 2:1 ratio of restored area to lost wetland area is used, rather than a higher ratio. It is well established that restored wetlands tend to be less biodiverse and fulfill fewer ecosystem functions than mature, well-established ecosystems. Given this, it might be necessary to restore a greater area (e.g. 10:1 ratio as used in other regional projects) of wetland to truly offset the losses from construction.
- **Contamination Issues:** We all know fluorinated and chlorinated compounds pose a major risk to human health. The DEIS outlines the fact that Micron may be considering alternatives to PFAS use in the manufacturing workstream. Can more details be provided about the process by which alternatives to PFAS, OR changes in the treatment protocol for PFAS, will be conducted by Micron in the future? What role will the OCDWEP play in this?

Thank you for your consideration of my comments.

Sincerely,

CHIPS Program Office CHIPs Program Office,

Just writing as I have wearing regarding the Micron plant and the environment.

What precautions are being taken around housing of new employees and the effects on the environment? How will this be tracked and dealt with as an ever evolving issue? That about third homes that are already there?

What about the use of electricity and the increased need for this facility. How does this impact citizens electric bills, who will address these ongoing concerns?

How will increased transportation needs and those effect on the environment be addressed? Who is involved in tracing this and how will it be tracked on going?

What is the implication on the company's /plants water use and as well as wetlands. How will this be monitored and dealt with as an ongoing basis?

Who is coordinating ongoing tracing and community engagement to ensure the prevention of the destruction of our natural resources in CNY?

Respectfully

Lucinda coffin.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, it must be addressed how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents. It also must be assessed whether the average position at Micron will provide a livable wage for workers.

Additionally, the lack of consideration for some key wetlands issues within the DEIS must be addressed. Alongside the plan to drain around 200 acres of initial wetlands, there will most certainly be damage to neighboring ecosystems through dewatering and other processes and mitigation wetlands will be constructed nearby in the Oneida River region. However, the community of Clay has a history of flood concerns; how will wetlands outside this region mediate floodwater? The DEIS must address this issue further. The wetlands that traditionally hold excess water directly in the community will be gone, and that water will not have a place to be stored, likely causing further complications for the community. There is also a lack of clarity within the DEIS as to what type of mediation wetlands will be generated; the area chosen is previous agricultural land, and it will take tens if not hundreds of years to truly generate an ecosystem mirroring the biodiversity of the current habitat. There must be clarity as to the types of wetlands that will be constructed, plant life that will be included, and other specific details. A plan for a potential spill of materials from Micron must also be constructed further within the DEIS, in specific relation to mitigating any potential damage to the local water table and wetland environments.

The ratio of wetlands restored also must rise; to replace the biodiverse rich ecosystem that will be destroyed, a ratio of at least 7:1 in terms of wetlands replacement is incredibly important. The location chosen is a rich wetland that has taken hundreds of years to form; we must ensure the replacement even comes close to replacing the habitat and benefit these wetlands hold. The DEIS must also address monitoring and measures to check mitigation wetlands' health and productivity as they develop. The environments being previous agricultural environments, there must be further monitoring to ensure that they are progressing healthfully in development. The DEIS should also clarify that local housing or development in direct relation to Micron be incentivized or made to cultivate native plant life, and support ecosystems remaining. The current DEIS does not address several key issues completely necessary to even begin to mitigate the loss of the potentially rich wetlands currently at the proposed site.

Thank you for your consideration of my comments.

Sincerely,
Katie Mulligan

Subject: [EXTERNAL] Several Concerns

Importance: Normal

Sensitivity: None

CHIPS Program Office CHIPS Program Office,

I think it's great that Micron is coming to CNY. However I have several concerns:

-Excessive use of Electricity (bringing our residential costs up)

-Excessive need of water

-I don't think there's been clear messaging regarding how waste from the various plants will be handled-these run offs will be in our water, and air with potentially harmful implications
Industry can be a positive thing for an area; but handling the day to day needs have to be carefully planned out.

Thank you for your consideration to my concerns.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Dear Members of the CPO and OCIDA,

Possibly destroying water sources. Taking away areas where we know animals live. Potential danger to people living near the area. All these must first be addressed before moving forward.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- Water and Ecological Resources: The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- Protection of Air, Water, and Workers: Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy

commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] My Concerns about Micron in Clay NY

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Hello. I am very concerned about the impact of Micron on the area I have lived in for the last 58 years. I am concerned about greatly increased traffic and greatly increased housing, such as apartment buildings which will involve the destruction of much of the beautiful natural environment in Clay, NY.

Also, I do not believe that the 45-day public comment period gives the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy

that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Mary Hamlin

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Miss Lorrie Ann Feliciano

Subject: [EXTERNAL] RE: Micron Project Community Impact and Draft Environmental Assessment EISX-006-55-CPO-001

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

I am a resident of the Town of Clay in the County of Onondaga living on a portion of what was my Great Grandfather Albert Hamlin's tobacco farm. In my 74 years living on what is now known as Henry Clay Boulevard, I have witnessed the area in this part of the Town changing from largely rural and farms to include industrial and commercial development, together with expansion of suburban housing including single family residence tracts and apartment complexes. While the rural and farm environment is my preference, until recently, I felt there was a well balanced approach to planning and development. With the prospect of the Micron Project, the proposed development plans I viewed at the Clay Town Hall last year is of grave concern. Besides the obvious environmental impacts, the proposed emphasis on development of multi-family residences to support population growth to support the project development and operation is of grave concern. Traffic on Henry Clay Boulevard which is already difficult for those of us with homes between Wetzel Road and Route 31 is likely to increase to an intolerable level. It seems we are approaching a level of local development where farming and families preferring rural life will be a casualty of such development. In spite of my roots in the area, I fear the ongoing development will force me to dispose of my two remaining single family dwellings and perhaps discontinue my local business (currently employing 25-30) in the interest of progress.

Thank you for your consideration of my comments.

Sincerely,

John H. Hamlin

Subject: [EXTERNAL] RE: Ret. Hon. Chock CHIPS dEIS EISX-006-55-CPO-001

Importance: Normal

Sensitivity: None

CHIPS Program Office CHIPs Program Office,

I retired from the County Legislature after 10 years of service of a County well-within the impact sphere around Syracuse. For many years I chaired the Tompkins County Planning and Economic Development Committee, and I was liaison to the County's Council of (all Tompkins County) Governments, where I chaired our Assessment and Land Valuation Subcommittee. There, we found the assumption,, previously accepted by Both business leaders and environmental advocates, that accepting risk of some harm to air and water quality meant that we'd come out ahead in our town, city, school and county budgets, turned out in our studies to be untrue 95% of the time when we examined a wide range of regional cases.

In another 5-10% of locations, the public sector might eventually break even, but with a lag time of at least 2 years, more often the lag time was 3-5 years. That was because the outlay of public expenditures at all levels to support the roads, bridges, social services, schools, even our administrative staff to handle the influx in many spheres of life (including the permits and processing of applications for secondary-level economic activity—more restaurants, bars, dry cleaners, day care centers, etc. You Name It), had to be laid out while the development is being built, prior to the receipt of sales tax, property tax, and any state/federal support that vines back to us following payment of business and personal income tax, as wellss as corporate or business taxes. Depending on where they fall in the actual cycle, properties get assessed in the year after they've been put into service, then your city, town, County, and school budgets are passed so it's another year before we receive the income. Then Add another year or two for billing, tax or production fee assessments from NYS and federal bodies and then their receipt of the taxes/fees owed, the setting of those budgets, and then the award and processing of payments to our local government offices.

When climate considerations are taken into account, the public sector will be the ones left with the obligation to repair the damage— public health costs, expensive repair of roads and other infrastructure after ever-strengthening storms, in our case we have faced the need to house an increasing number of residents who lose their homes in our 100-year flood plain that now floods every few years or maybe every decade. We were facing a larger potential loss then any of us went into the study expecting to find.

Since my retirement from the Tompkins County Legislature, I have been President of Ratepayer and Community Intervenors, where I m just starting as an official participant in my fifth NYSEG—RG&E Utility Rate Case. I'm quite familiar with the energy implications of the

Micron project. The energy requirements of this project will drive up prices for all of our residential, small business, institutional, and established larger businesses. Residential customers (ratepayers), are facing NYSEG's requested 33% increase in our gas delivery rate and 23.7% requested increase in our electric delivery rate, BEFORE this project is added to the grid. And the electric request doesn't make any significant dent to provide the extra electricity that will be retired once it is up and running.

Our region must be able to find and provide incentives to truly Clean Energy activities. You would be true leaders for the future if you fund this EIS to be inadequate and seek out some of the many many effective clean energy businesses ready to ramp up as soon as there is public support. Public support of a similar magnitude to what is being offered to Micron but directed towards renewable energy activities would make our region a true leader instead of accepting the role of host to dirty energy activities.

For those reasons, I fully support all the comments below on hazards to the environment.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy

that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Doug Couchon

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. However, I feel the 45-day comment period is insufficient for the public to even scan the assessment, which is several thousands of pages long. Please extend the period to late October, or even later.

Also, I am informed a petition, signed by hundreds of residents around Clay, has not been responded to. DEC has a responsibility to address these residents' concerns, before approving any part of the facility construction.

Please respond also to the following matters:

How will Micron manage & control the potential air, water & soil contamination associated with manufacturing semiconductors?

Micron has committed to relying 100% on renewable energy, which is good, but what happens if it doesn't meet this goal? Energy needs of producing semiconductors are massive.

Thank you for your consideration of my comments.

Sincerely, Andrew M Hartley

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Please extend the public comment period to 10/25/25 so more people can read, understand, and engage with the report in a meaningful way.

I want to share what's most important to me as a New Yorker, and that is continued health of our people, workers, and environment.

I don't believe that the DEIS properly addresses the dangers to the health of the public and to our ecosystems that this project would entail.

Our watersheds are our future and our lifeways! The DEIS must address the ways this project would impact our wetlands and watersheds, and must provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project.

A much more deep and holistic analysis is required to properly assess the way this project impacts our water and other ecological features.

I'm also concerned that the plan so far does not explain how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions, or how Micron will comply with New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

The DEIS also does not state how Micron plans to make sure that the people involved are protected- whether that be the workers and how they'll be protected from the chemicals involved in semiconductor production, or how they will handle the toxic chemicals involved for proper disposal.

Not only the workers who come to work at the plant, but also the community that already exists in the area of the proposed project must be considered. How will this affect traffic and housing? We need a comprehensive plan for this.

And lastly, as we continue to see increasing utility rates- I want to know that the usage of water and electricity by micron will not affect taxpayer rates, as has been happening at other data centers and large plants around the country.

Please address each of these issues that hugely impacts our central New York community!

Thank you for your consideration of my comments.

Sincerely,
Madeline

The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

You have the opportunity to do this right.

Thank you for your consideration of my comments.

Sincerely,
JoAnn Cooke

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

However, based on my current understanding of the DEIS, I still want to offer the following comment.

It is not clear to me that Micron is fully aware of the obligations it is incurring under our Climate Leadership and Community Protection Act. To say that it is committed to 100% renewable energy is merely rhetorical if it doesn't have a plan. In pictures of the proposed facility I see vast expanses of flat roofs with nary a solar panel in sight. Are there BESS facilities planned? How about a thermal energy network? As NYISO's recent "Power Trends 2025" report points out, huge projects like this will require far more electricity than NYS currently produces from all sources, not just renewables. If Micron expects to get its renewable energy from existing sources--well, that simply means that the rest of us will need to get it from fossil fuel plants unless we build enough renewables to supply Micron, too. (And on whose dime?) Nor are renewable energy credits a valid substitute. Claiming you planted some trees somewhere else does not get NYS closer to meeting its CLCPA targets. No bookkeeping sleight-of-hand is going to halt the acceleration of global heating.

Micron needs to actually live up to the mandates of the CLCPA if it wants a home in New York State.

Thank you for your consideration of my comments.

Sincerely,

Sara Gronim

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to provide my questions and comments.

I'm trying to understand how this company can be forced onto our community?

How can the government ignore our concerns and choice to now allow this company into our community?

Certainly there are environmental concerns.

However, my concern goes beyond that, and it goes to the adverse economic impact that this company will have in our community.

I do understand that there will be a select group of people who stand to gain from this company moving into our community. However, the great majority of us will not only not gain, we are going to suffer substantially in multiple ways.

First of all, our young people cannot afford to buy homes anymore.

The traffic on our roads is now unbearable. Which is not only a hindrance and inconvenience to our lives, it's also a significant safety concern. Because the people moving here do not respect our traffic etiquette.

The additional expenditure of funds on infrastructure that has nothing to do with our community and solely has to do with this company is completely fiscally irresponsible.

The huge influx of people from communities that do not share our values are destroying our social status quo. And we have no way of predicting what type of people this influx will attract. This is placing our community and our families in danger.

I do not believe that spending more money on police will help this. If anything, it's going to hurt us more. Because it's taking money away from our health and education. And this company will not help any of that. Neither will the people moving here. They will just take from us.

As a military veteran, I believe that I should have a voice. I served our country and our community. Why should a politician have a greater voice than me?

Please reject this company's proposal and request that they move elsewhere.

Very respectfully

Mario Zaja

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Leah Kraus

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

In this time of climate crisis, the most important consideration in all decision making needs to be: preserving the natural systems and communities that provide our human communities with the water, air and soil we need to survive. Please keep this big picture foremost in your minds.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable

energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

I am concerned with the impacts on our environment and upcoming global changes from the uprising proposals of putting in micron. The impacts (which I was unaware prior to reading a report) that it will have in NYS. The wetlands, flooding potentials, endangering natural habitats and wildlife, chemicals from spills and emissions into our air and waterways, and endangering our own health.

The cleanup strategies that micron says it can do is vague and not so transparent. I thought it was going to be good pay for all hired, but now I see, they take great care of higher ups and management but then it really just pays a lot less to the under dog.

I'm not as much excited to having it to come to central NY as I was in the beginning.

Thank you for your consideration of my comments.

Sincerely,
Eileen Quimby

CHIPS Program Office
CHIPS Program Office,

I am grateful there is still time to comment on this Draft version of this Environmental Impact Statement that evaluates how the construction and operation of the Micron facility will effect me, my neighbors, and my community in the next 16 in upcoming years, and beyond that, to the other living things that are affected and may be destroyed as though humans were the only species that mattered here.

Yes, I am concerned that there is a long creep toward making the habitats for creatures that must live in wetlands confined to ever decreasing space, that with every concession made yielding to the desires of humans, this may become too much. We are losing many species everyday. It is my understanding from experts like Catherine Landis that birds and the mosquito-eating Northern long-eared bats may not find sanctuary in a new site to which they are not acclimated. This really concerns me.

Thank you for your consideration of my comments.

Sincerely,

Annette Farley

CHIPS Program Office CHIPS Program Office,

I am grateful there is still time to comment on this Draft version of this Environmental Impact Statement that evaluates how the construction and operation of the Micron facility will effect me, my neighbors, and my community in the next 16 in upcoming years.

I am particularly concerned, knowing that PFAS are part of the manufacturing process that Micron apparently needs to make semi-conductors. I am glad to see that two whole buildings will be dedicated to the processing of this and other toxic waste.

However, I would be far less concerned if there were put into place a ongoing body which citizens can access the ongoing developments in handling this waste, especially with regard to release into the air and water of this, OUR HOME. Those of us who don't drink water from Skaneateles Lake, drink it out of Lake Ontario.

It is encouraging that Onondaga County has the means to expand the treatment plant that will handle the wastewater coming from Micron. But I am concerned that if that facility is inadequate, or mismanaged, us locals will be held responsible as Micron side-steps problems that may well arise.

Thank you for your consideration of my comments.

Sincerely,
Annette Farley

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,
Michaela Frank

Subject: [EXTERNAL] RE: Draft Environmental Assessment EISX-006-55-CPO-001

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

Farmland Loss. Hundreds of acres of farmland will be lost. Farmland is essential to feeding the Syracuse area and with the influx of more people moving to the area this will mean that more food will be necessary. Local farms play a vital economic role in the region. More investment should be made to ensure more farmland is protected in the Central New York Area.

- Protection of Air, Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

IZAAK WALTON PFAS RESOLUTION 2023

In a resolution adopted by the Izaak Walton League of America in 2023, the IWLA noted that PFAS is a general classification of chemicals that contaminate the waters and lands across our country and threaten the health of people, communities, and wildlife.

They have an ability due to their nature to persist and continue their impacts to environment and health of people and wildlife in their presence in water supplies and in the food web and beyond. Exposures in drinking water and foods need to be addressed quickly.

The Izaak Walton League of America supports establishments of mandatory standards for drinking water and groundwater. Since discharges from the Micron chip manufacturing process will be entering Lake Ontario, a source of drinking water for communities in both the U.S. and Canada, Micron needs to verify that their treatment methods for limiting PFAS discharges will meet drinking water standards developed for both countries.

ESTABLISHMENT OF A MICRON COMMUNITY PARTNERSHIP

The Micron Project for Onondaga County has the potential to generate significant economic benefits for our community, and will also demand upgrades and use of our community resources in order to meet Micron's upcoming production goals. This project will require coordinated input and support from both our local community and from the involved federal, state, county and municipal entities involved.

Over the past several decades, a coalition of agencies have worked together with a local industry, Honeywell International, Inc., to undertake the reclamation of formerly polluted Onondaga Lake. The overall cost of this reclamation project, involving both sewage treatment improvements and mitigation of industrial contaminants, totaled over one billion dollars.

A major element leading to the successful restoration of Onondaga Lake was the establishment of an Onondaga Lake Partnership that allowed local community groups and the public to share information about the progress made during the lake reclamation by participating federal, state and county agencies.

Given the significant scale and enormity of the upcoming Micron Project, whose construction may extend over one to two decades, it is the recommendation of our Izaak Walton Central New York Chapter that Micron provide funds for establishment of a Micron Community Partnership,

similar to the former Onondaga Lake Partnership, in order to maintain public communications and outreach between the involved government agencies, Micron officials, and our local community.

We believe that establishment of such a Micron Community Partnership will benefit both Micron's Project development and its interactions with our community members in Onondaga County and Central New York.

Thank you for your consideration of our comments.

Sincerely,

Les Monostory, V.P.
Central New York Chapter

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

Please consider and respond to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, or provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss. It does not address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss. These wetlands are vitally important to all life, particularly human life.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse emissions.

Affordable and abundant water and energy: The DEIS does not address. Micron's massive energy and water use. This will affect the affordability of energy and clean water and likely require more tax dollars and higher rates or tax paid by the public to offset the cost of infrastructure upgrades and higher energy demands as a result of this project.

- The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to

workforce development, training, jobs, and career advancement at Micron specifically for production workers.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Micron will eventually clear 1,000 acres of trees and brush. Micron will cut more than 400 acres of forest. The chart in the DEIS report found there are 30+ kinds of native trees and 6 kinds of native shrubs. My belief is that it would be disrespectful to kill living "senior" native trees without ensuring new planting. As you know trees and to a lesser extent, shrubs have a vital role in protecting us from extreme heat as they absorb and store carbon. We want the jobs and economic growth that Micron promises but if we destroy forests without a solid plan for replanting and replacing them we'll be contributing to earth burn and the eventual suffering of workers. What plan does Micron and Onondaga County have to plant and make up for the lost shrubs and trees?

Thank you for your consideration of my comments.

The wetland restoration sites are scattered and small compared to what will be destroyed. Though their combined area will be twice the size because each one is at a distance and smaller in area they will not store the amount of carbon or make up for the lost wetland. Wetland replacement projects that are succeeding have been 10 to 15 times larger. Micron and the County need to commit to establishing much more wetland. Restored wetlands will take 50-100 years to function as effectively as the lost wetland. In what ways and for how long will the County and Micron monitor the restored wetland areas to ensure that they are developing, that biodiverse plants and animals are becoming established and thriving?

Thank you for your consideration of my comments.

I have some questions about birds that will be losing homes and feeding grounds. When building starts how will grassland birds be encouraged to move to new, safe habitats? Are birds that are forced off their territory fed in areas where it is hoped they will nest? Will the Micron buildings have bird friendly glass which would lower the number bird strikes? Also will Micron minimize exterior lights at night and when lights are necessary install only shielded, downward-directed fixtures or whatever is best to minimize risks to birds flying at night?

Thank you for your consideration of my comments.

Sincerely,

Leslie Lawrence

I am a Syracuse resident and I would love to think that Micron is going to help the city, that there are going to be jobs for the many who deserve/need them. I would love to think housing issues will improve. But if I was hired by Micron and was looking for housing I would go straight down Route 31 to Madison County or straight up Route 81 to Oswego County. Both have easy access, less congestion and possibly lower taxes. So what is Onondaga County doing to encourage people to settle here rather than in nearby counties?

Thank you for your consideration of my comments.

Subject: [EXTERNAL] RE: Draft Environmental Assessment EISX-006-55-CPO-001

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

In 1983, we moved to Grange Road in Clay because of the rural nature. We are on a well. We hope that Micron will prove to be a good neighbor.

Following are our concerns for this project:

Extend the public comment period to 120 days

PROVIDE DETAILED PLANS TO PROTECT THE WATER SOURCES FOR THOSE OF US ON WELLS

Guarantee of continuation of present water quality

Transparency and specificity in project details:

Chemicals used

Specific Sources of fill

Managing Traffic issues

Specific plans for solid waste disposal

Specific plans for disposal of used chemicals

Specific plans for wetlands water displacement

Specific plans for plans for retention ponds

Specific plans for Construction dust control

County's plans for when chips become obsolete

Create a local oversight committee comprised of community members with knowledge of pertinent issues

Micron needs to do much better wetland mitigation or work around existing wetlands as they are presently configured

Provide for public hearings with questions and answers after completion of each FAB

Micron should be financial responsible for adverse effects

Will Micron reimburse Onondaga County for expenses incurred (procurement, etc.) if none or only two FABS are built

When is Ryan McMahon moving onto Caughdenoy Road to enjoy the construction experience with us?

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that

there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Jill and Richard Robinson

CHIPS Program Office
CHiPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

I urge consideration and response to the following issues and concerns:

Both before and after full build-out Micron will require tremendous amounts of energy to operate its facilities. While I understand that the Clay substation will be expanded to meet some of Micron's demands for electricity, where will the rest of its electricity come from? Just as important, how much of this electricity will come from renewable sources? Micron has only said that it will purchase Renewable Energy Credits; but these are already being used to supply power to other customers. In short, Micron has no solid plan to purchase the rest of the electricity it will need, renewable or otherwise. If it competes with other businesses and residential customers for energy it is more than likely rate payers will see increases in their bills - something we can ill afford.

Sincerely,

David Friedman

CHIPS Program Office CHIPs Program Office,

I am grateful there is still time-- though altogether too short---to comment on this Draft version of this Environmental Impact Statement that evaluates how the construction and operation of the Micron facility will effect me, my neighbors, my community, and the flora and fauna that our species tends to forget are needed to maintain a biologically, geologically and environmentally interconnected planetary system.

I was disappointed to learn that Micron's established process requires its use. We all should be concerned about our exposure to PFAS chemicals. Yes, I perhaps I do take this personally since one of the known target tissues is an organ where I am experiencing pathology. These perfluoro alkylating substances are persistent, and as such, have documented bioaccumulation in our bodies. This will be another source adding to the biological burden of those living in this area if this is not addresses in a careful and ongoing manner.

CHIPS Program Office
CHIPs Program Office,

We all hope that the arrival of Micron's semi-conductor manufacturing facilities will have many positive impacts. But it is equally important that every effort be made to limit potential negatives. We are still dealing with the damage that was done to Onondaga Lake. Do we want this to happen to Oneida Lake, the river that leaves the Micron site and enters into Lake Ontario from which many in this area draw their drinking water?

There are plenty of examples of humans exposing others to chemical harm with devastating consequences. Micron has declared the use of perfluoro alkylating substances (PFAS) in their process. Time and exposure have revealed that industry's earliest uses of these chemicals in aqueous fire-fighting foam (AFFF) are too toxic to have continued use sanctioned by the EPA. We need to be very cautious here.

While I understand that it is daunting to list all the potential chemical hazards that may be integral to semi-conductor manufacturing, it is important that a dynamic accounting be made of the most hazardous ones.

OCWA for years published a detailed analysis of the composition of the water they supplied until that was put online (still accessible, but placed slightly out of the casual perusal for many of us). My own employer has copious, OSHA-mandated SDS information (formerly MSDS, material safety data sheets) available to us employees. Micron must also be compliant with OSHA regulations, so the breadth of this information should be shared. But it is not the scope that is most important. Rather, it is what substances leave the manufacturing site, in what quantity, and in which categories does OSHA place them in the required SDS?

The manufacturing process is not likely to change within the construction of the first two fabs, but may by the time the third and fourth fabs are begun ('necessary to achieve economy of scale' Micron states.) But there may be changes and we need to have outside citizens & experts be placed in a position where they can expect knowledge of ongoing dynamics of how waste, waste water is being monitored and controlled. This is not an appeal for regulation, but for monitoring.

Thank you for your consideration of my comments.

Sincerely,

Melleny Hale

CHIPS Program Office
CHIPS Program Office,

Thank you for giving our community at least 45 days to explore the Draft EIS of Micron's future semi-conductor manufacturing plants. It would have been better to have been granted longer for this review. We don't want to repeat the kind of environmental disaster that was imposed on Onondaga Lake by failure to consider the potential downsides of what may well be an overall positive to our region with Micron's arrival.

Wetlands are known geological assets in flood control and absorption. Acres of impervious surfaces (parking among them) are going to be installed at this Micron site. What is this going to do to the potential for flooding?

The replacements for obliteration of 200 acres of wetland that are being offered are not downstream of the Micron site. If this is true, I would like to see more input from designers to address flood mitigation upon downstream concerns. Flooding has been increasing worldwide as climate changes, too.

Thank you for your consideration of my comments.

Sincerely,

MELLENY HALE

Wetlands are known geological assets in flood control and absorption. Acres of impervious surfaces (parking among them) are going to be installed at this Micron site. What is this going to do to the potential for flooding?

The replacements for obliteration of 200 acres of wetland that are being offered are not downstream of the Micron site. If this is true, I would like to see more input from designers to address flood mitigation upon downstream concerns. Flooding has been increasing worldwide as climate changes, too.

Thank you for your consideration of my comments.

Sincerely,

MELLENY HALE

CHIPS Program Office
CHIPs Program Office,

I am grateful there is still time to comment on this Draft version of the EIS that evaluates how the construction and operation of the Micron facility will effect me, my neighbors, and my community in upcoming years, and beyond that, to the other living things that are affected and may be destroyed as though humans were the only species that mattered here.

Yes, I am concerned that there is a long creep toward making the habitats for creatures that must live in wetlands confined to ever decreasing space, that with every concession made yielding to the desires of humans, this may become too much.

We are losing many species everyday. It is my understanding that flying creatures, like birds and bats may not adjust to relocation attempts. They may return and fail to thrive when migrating seasonally

Bat populations have been assaulted by the White-Nose Syndrome fungus. Permanent loss of 200 acres of their wetland habitat is going to stress the population even further, will it not?

What are the chances Northern long-eared bats may not find sanctuary in a new site to which they are not acclimated?

It is further worth noting that bats consume mosquitoes in large numbers. But this very week, West Nile Virus and even more concerning, EEE, Eastern Equine Encephalitis was found in mosquitoes in Cicero Swamp only a few miles east of the Micron site.

Sincerely,

Melleny Hale

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

At the hearing I attended there was a gentleman who lived near the proposed Micron plant. He was legitimately concerned about his well. What are the County and Micron doing to ensure that those living near the fabs are not sickened by chemical spills or contaminated flood water?

Thank you for your consideration of my comments.

Sincerely,

Leslie Lawrence

There is a Great Lakes Water Quality Agreement between Canada and the US which was signed in 1972 and updated in 2012. Have Onondaga County and Micron studied this international agreement and been in dialogue with Canadian officials? Will wastewater that originated with Micron going into Lake Ontario be in compliance with this agreement? with other treaties as well as the laws of nearby counties and NY State?

Thank you for your consideration of my comments.

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

One of the reasons I hope Micron succeeds is the job opportunities that women, veterans and those from disadvantaged groups could have. I am not hopeful that these opportunities are really going to materialize when Micron has made no binding commitments. Why will Micron be allowed to make such vague statements when it could energize the community and itself by stepping up and ensuring a diverse workforce?

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project. I urge consideration and response to the following issues and concerns:

- Water and Ecological Resources: The Micron project stands to destroy hundreds of acres of wetlands harboring complex engaged species habitats and providing natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- Protection of Air, Water, and Workers: Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The community requires clear, transparent and enforceable mechanisms to avoid contamination and degradation of air, surface waters and local wetlands, soil, and protection of worker health and safety.
- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability and availability of energy and clean water for the community, nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project.
- Community and Socioeconomic Impacts: The DEIS does not address if Micron will commit to a diverse, inclusive, and accessible workplace and a family-sustaining compensation package for production workers and community groups to ensure workforce development programs and equitable hiring for marginalized local communities, provide other community benefits to ensure affordable housing and accessible public transit, and mitigate potential socioeconomic harms to the community.
- Transportation: To minimize the need to widen and add roads, and to minimize the noise and pollution of high traffic volumes, especially within the surrounding communities, it is essential that multiple modes of transportation are provided for—buses, bicycles, light rail, as well as cars and trucks.

The DEIS must clearly confront these issues. Thank you for your consideration of my comments.

Sincerely,
Kathryn Downing

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

To whom it may concern,

My name is Katie Purcell and I am a lifetime resident, worker, and community member of Onondaga county. I am also a graduate of Syracuse's own SUNY College of Environmental Science & Forestry (ESF). As a community member and an individual who is personally committed to human and environmental health, I am writing to comment on the Draft Environmental Impact Statement (DEIS) for Micron Technology's proposed microchip fabrication facility.

Frankly, there are numerous issues with the project as it stands dictated by the DEIS. Firstly, the proposed facility requires the decimation and/or alteration of hundreds of acres of natural wetlands that fulfill multiple valuable roles on our planet; wetlands are carbon sinks, natural filtration in our water cycle, sequester water (which mitigates flooding risk), and crucial habitat for valuable wildlife -- particularly endangered & threatened species -- just to name a few vital ecosystem services. While the DEIS proposes to restore wetlands in other areas, this proposal does not account for several pertinent issues: 1) restored wetlands are not as effective in their ecological roles (such as the benefits listed above) nor are they as biodiverse as the original, aged wetlands that will be impacted by Micron's development; 2) the production of microchips requires the use of chemicals (including but not limited to PFAs) that are known to have harmful impacts on the environment, as well as those that exist in it (plants, animals, humans, etc.). Beyond this, there is a complete lack information on how Micron intends to reduce greenhouse gas emissions.

Issues that Micron *must* address, on behalf of the affected community:

- Transparency and details on the types of chemicals used in the microchip production process, as well as how they intend to enforce environmental monitoring and due diligence to not contaminate nearby communities and surface waters with these harmful substances.
- Where are the proposed alternative locations for this project? It is a borderline essential for developers to provide alternative location considerations for proposed projects in their impact assessments, and the pros and cons of said location considerations. Knowing that wetland restoration in other areas is not nearly as beneficial or biodiverse as the wetlands that would be altered for this project, and the current DEIS is not sufficient in a disappointing plethora of ways, what other options have been considered?

To those at Micron or associated with the Semiconductor Manufacturing Project that currently reside in the area or intend to reside here in the future: are you satisfied with the efforts to mitigate harm to humans and the surrounding natural world that are outlined by this DEIS? Would you allow your children to play, live, and drink water in the surrounding areas of the Micron project, knowing that they have not considered any cumulative environmental impacts on communities? Do you intend to live downstream of this facility and its hazardous waste? Do you think that this project's contribution to climate change is a "global and regional issue," and therefore not a relevant local environmental justice issue to address in their DEIS? Do you feel safe knowing that most of the air pollution monitoring data for this DEIS comes from monitors more than 70 miles away from the project site?

From someone who has had to read multiple environmental impacts statements for school, I want you to know that this DEIS is heinously insufficient in addressing impacts of the environment and the surrounding community/individuals that will be subject to the effects of this project for years to come. I am not just a bleeding heart activist who does not understand the realities of the perceived benefits of domestic microchip production or economic growth of the area; I am a scientist and well-read member of this community who took the time to parse through this DEIS only to find that it does not address a multiplicity of concerns and issues surrounding the project as it stands. Moreover, to only allow 45 days for public comment on such a large document detailing one of the biggest construction projects in NYS history is deeply inconsiderate and downright disrespectful to the community that you seek to change forever through this project. If Micron is set on altering our community and cherished ecosystems, I implore them to show more dignified behavior and values moving forward.

Many thanks for your time and consideration,
Katie Purcell

The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Please consider the detrimental effects of filling in these wetlands on the local birds, bats, and other wildlife that will be displaced and have no where to go. These animals will die and that is a tragedy. I urge you to find a way to protect the wetlands, or remediate land close by before destroying what's there now. This will allow wildlife to relocate, provided that the habitat is suitable, accessible, and nearby.

Thank you for your consideration of my comments.

Sincerely,
Dorothy Joiner

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,
Rowan Stout

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. According to Micron and the chips industry, hundreds of PFAS compounds are essential for microchip manufacture; finding replacements may take decades. PFAS are particularly difficult to remove from wastewater. Micron has not disclosed the names or risks associated with many of the chemicals they will use. The plan relies on Onondaga County to construct an industrial wastewater treatment plant to remove PFAS and other chemicals and claims no liability for contamination when the water is returned to the Onondaga County's wastewater treatment facilities. The DEIS mentions several possible treatment technologies, but makes no commitment to complete removal of PFAS. Without knowing the identities and quantities of these chemicals, it is not possible to adequately evaluate the risks to workers, the community, and the global environment. Also, there are specific commitments for monitoring contamination in the waterways, municipal water supplies, or local wells, or for informing the public. Greater specificity and stronger commitments are needed.

Thank you for your consideration.

Wendy Yot

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. CHIPS Program Office CHIPs Program Office,

I have the following concerns about Micron's proposed plant in Clay, NY:

- Loss of wetlands. Serious attention must be paid to the wetlands being built to replace harmed wetlands, including funds for ongoing wetland management.
- PFAS and other toxic chemicals: Central NY has already lived for decades with the results of companies dumping toxic chemicals into Onondaga Lake. Micron must be held to a high standard in protecting our water, soil and air, including helping to fund local water treatment plants.
- Greenhouse Gases: Micron must create a plan to generate or purchase renewable energy, without relying on renewable energy credits or forcing other energy users to buy fossil fuel energy because Micron has used most

Thank you.

Sincerely, Julie Hammer

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). PLEASE PROVIDE DETAILED PLANS FOR HOW YOU WILL EFFECTIVELY ADDRESS THESE ENVIRONMENTAL ISSUES LISTED.
- **Protection of Air, Water, and Workers.** I AM VERY, VERY CONCERNED ABOUT PFAS FOREVER CHEMICALS! HOW ARE YOU GOING TO REMOVE THEM FROM THE WASTE WATER? ONONDAGA COUNTY DOES NOT HAVE THE TECHNOLOGY TO REMOVE THEM & MICRON IS CREATING THEM, SO MICRON MUST REMOVE THEM BEFORE THE WASTE WATER IS PUMPED ONTO OUR SEWAGE & WATER TREATMENT PLANTS. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. ***Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions.

***Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. ***The DEIS must clearly confront these issues.

MICRON SHOULD BE INSTALLING SOLAR ENERGY PANELS ON ALL SURFACES OF BULIDINGS & PARKING COVERS AS WELL AS TO FUND SOLAR PANELS ON A % OF RESIDENTIAL HOMES TO OFFSET THE MASSIVE ENERGY USAGE & NOT CAUSE INCREASED POWER COSTS TO TAXPAYERS & RESIDENTS.

• Job Access, Housing & Transportation. WE ALREADY HAVE A HOUSING CRISIS. WHAT IS MICRON GOING TO DO TO HELP & NOT FURTHER MAGNIFY THIS CRISIS? The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. INVEST IN PUBLIC TRANSPORTATION THAT IS ACCESSIBLE FROM THE INNER CITY AND SURROUNDING COMMUNITIES. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, ***the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments. I will look forward to your response to all comments from concerned residents.

Sincerely,
Christine Herb

The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Hannah Bickom

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to respond to the Draft Environmental Impact Statement.

Micron Technology's planned semiconductor plant will require 20 million gallons of water per day. And the EPA now says that when the huge plant is done in 20 years, it would need 48 million gallons of water a day. That's double the estimate of less than a year ago, and it's more than the 40 million gallons the entire city of Syracuse uses in a day. Providing that much water to the Micron plant would require the construction of that 54-inch diameter line from Oswego to Clay, the company says. That line could cost \$100 million, and it's not clear how much taxpayers would be on the hook for. Risking our water supply to this extent, while adding toxic chemicals to it, is fool hardy. This project should at least be reduced until safer and less water intensive methods can be assured.

CHIPS Program Office CHIPS Program Office,

The regulation of Lake Ontario's water levels and outflows is primarily managed by the International Joint Commission (IJC), a binational organization established by the 1909 Boundary Waters Treaty between the United States and Canada. It has been estimated that when the Micron is fully operational, its water needs will well exceed the amount allowed by this international agreement. What steps are being take to assure that we are meeting our international agreement with specific, commitments, and proven methods of the reducing the amount of water are needed? Does Micron commit to only using the amount of water from lake Ontario that can be withdrawn without damaging this vital water asset?

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the environmental impact study related to Micron development in Clay, New York

The plans addressing the huge energy consumption of the project are insufficient. The completed project will use as much power as all CNY customers in CNY, yet the proposed renewable energy projects on site account for .0003% of Micron's electricity needs. The project proposes to buy renewable energy credits, but available energy credits are already supplying energy to local customers. Soaking up existing energy supply will increase utility costs for local customers. Where will this new demand electricity come from and who is responsible for developing it? Specificity and commitments are needed.

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Local taxpayers are footing the bill for much of the infrastructure for this project. Micron anticipates hiring people from 700 local households and 2600 households outside of the local area. The influx of population is likely to increase housing costs for local residents while the Syracuse has the highest poverty rate of all U.S. Cities and an overall poverty rate of 29%. Micron expects state and local resources to address the housing shortage the project will cause. What specific enforceable commitments is Micron making for local hiring, addressing an anticipated housing shortage, and addressing local poverty, which are stated justifications for investing local resources?

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

According to Micron and the chips industry, hundreds of PFAS compounds are essential for microchip manufacture; finding replacements may take decades. PFAS are particularly difficult to remove from wastewater. Micron has not disclosed the names or risks associated with many of the chemicals they will use. The plan relies on Onondaga County to construct an industrial wastewater treatment plant to remove PFAS and other chemicals and claims no liability for contamination when the water is returned to the Onondaga County's wastewater treatment facilities. The DEIS mentions several possible treatment technologies, but makes no commitment to complete removal of PFAS. Without knowing the identities and quantities of these chemicals, it is not possible to adequately evaluate the risks to workers, the community, and the global environment. Also, there are specific commitments for monitoring contamination in the waterways, municipal water supplies, or local wells, or for informing the public. Greater specificity and stronger commitments are needed.

Thank you.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Micron proposes to restore "some of the wetlands" destroyed by the project and does not account for loss of carbon sequestration from wetland destruction in the evaluation of green house gas emissions. Other development projects have a wetland replacement ratio of 10 to 15:1 compared to Micron's 2:1. Additionally, none of these potential restored wetlands will mitigate flooding caused by the Micron development, as these restored wetlands are not downstream of Micron.

What additional commitments will Micron make to insure adequate mitigation of the impacts of destruction of a wetland site? That is, what commitments will micron make regarding monitoring and mitigation of the the impacts on endangered species, destruction of wetlands' potential for carbon sequestration, and the increased risk of flooding.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response by OCIDA or Micron to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

The issue of the destruction of approximately 300 acres of wetlands habitat is of particular concern to me. Since the late 1700's, more than half of all wetlands in the lower 48 states have been destroyed. Contrary to the characterization of the Town of Clay wetlands in the DEIS as "vacant" land, wetlands are a highly productive and biologically diverse habitat that enhance water quality, control erosion, maintain stream flows, store carbon and provide a home to at least ONE-THIRD of all threatened and endangered species, including birds, fish, amphibians, specialized plants and other wildlife. Wetlands also provide recreational opportunities for fishing, hunting, photography and wildlife observation.

With respect to the wetlands in the Town of Clay on which Micron intends to build its manufacturing plant, there are several endangered and threatened species that breed and live there, including the Indiana, Long-eared and Tri-colored bats, and Northern Harriers and Short-eared Owls. Many other bird species, and other fauna, rely on the wetlands, grasslands and forest in the proposed Micron plant location for their survival. Habitat loss and

fragmentation have contributed significantly to declines in bird populations in the United States. A recent study done by the Cornell Lab of Ornithology concluded that since 1970, the United States and Canada have experienced a staggering loss of 3 BILLION breeding adult birds. Micron's proposed solution to mitigate the destruction of almost 300 acres of wetlands in the Town of Clay is to purchase several fragmented parcels of land which are currently in agricultural use. The proposed ratio of wetlands replacement is 2:1. The replacement parcels are smaller fragments of land that will take decades before they become mature wetlands. Micron's proposal to replace the destroyed wetland is inadequate. Micron should be required to acquire larger nearby quality habitat blocks to help displaced birds and other animals relocate. In addition, the wetland replacement ratio should be at least 7:1 acres (acres replaced to acres lost), not 2:1.

- Protection of Air, Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

I am also very concerned about the effect of the hazardous chemicals Micron uses in its manufacturing process on the air quality and drinking water supply in Onondaga County, and other nearby counties. The manufacture of microchips uses a variety of toxic chemicals, such as Forever Chemicals (PFAS). PFAS can accumulate in the environment and in living organisms leading to widespread contamination. PFAS are associated with several health risks to humans, including increased cholesterol levels, hormonal disruptions, certain cancers, liver damage and developmental issues in children. Micron has not released a list of PFAS and other chemicals they will use their manufacturing process, which makes a full risk assessment impossible. PFAS and other chemicals used in Micron's manufacturing process will be disposed of in contaminated wastewater, which will be treated at an expanded wastewater treatment plant in the Town of Clay. While The DEIS mentions several possible treatment technologies to remove any remaining harmful chemicals from Micron's treated wastewater, it makes no commitment to the complete removal of PFAS. Without regulatory controls, it is very likely that some PFAS compounds will be released into local waterways, including the Oswego River and ultimately, into Lake Ontario.

The Onondaga County Water Authority provides drinking water to most residents of Onondaga, Oswego, Madison, Oneida and Cayuga Counties - a population of almost 1,000,000 people. Almost Fifty Percent (50%) of the drinking water in Onondaga County comes from Lake Ontario. All of the drinking water in Oswego, Madison, Oneida and Cayuga Counties comes from Lake Ontario. The water intake system for drinking water is located in Lake Ontario within two miles of the mouth of the Oswego River. If contaminated wastewater containing traces of PFAS and other chemicals is discharged into the Oswego River and ends up in Lake Ontario, it could easily affect the quality of the drinking water provided to almost 1,000,000 people in Central New York. This would have disastrous results on the health of Central New York residents.

It is imperative that Micron release a list of the chemicals it will use in its manufacturing process. In addition, the treatment of wastewater from the manufacturing process needs to be continually monitored to ensure that harmful chemicals are not released into local waterways

which would negatively affect the drinking water of Central New Yorkers. The monitoring reports must be available to the public so that residents are informed whether the quality of their drinking water has been affected. This includes residents who have private residential wells - an issue that Micron has not addressed.

Finally, the DEIS does not address any issues that may arise under the Great Lakes Water Quality Agreement (GLWQA). The GLWQA is a commitment between the United States and Canada to restore and protect the waters of the Great Lakes. It provides a framework for identifying binational priorities and implementing actions that improve water quality.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Central New York is a wonderful place to live - part of the reason for this includes clean water and good air quality, and an abundance of of wildlife. While the community welcomes the government's and Micron's plans to build a microchip manufacturing plant in Onondaga County, most of us do not want another "Onondaga Lake" experience in which local industry created the most polluted lake in the United States. Thank you for your consideration of my comments.

Sincerely,
Mary Lynn

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

After this DEIS report what information will the public receive concerning Micron? It appears that there are no periodic outside monitors or updates required. Let's say two years from now there's a chemical incident that affects people inside and/or beyond the plant. Will Micron be allowed to hide problems inside the plant and turn the other way when there are problems outside the plant? What is Micron required to make public?

Thank you for your consideration of my comments.

Sincerely,

Leslie Lawrence

The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Subject: [EXTERNAL] RE: Draft Environmental Assessment EISX-006-55-CPO-001

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- Water and Ecological Resources. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

I understand that substituting small separate parcels of land is not an effective way to protect threatened and endangered species that are currently inhabiting a larger contiguous wetland.

- Protection of Air, Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities,

including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office CHIPS Program Office,

We have several serious concerns about the Micron project, but the most serious concerns involve the massive strain on the NYS electrical grid, the huge demand for water resources, and the greenhouse gas emissions resulting from burning natural gas in the plant's operations.

I think there needs to be 1000 acres of wetlands to replace the 200 taken out and the equivalent number of trees taken out should be replaced in an area as close to sites being damaged as possible.

CHIPS Program Office CHIPS Program Office,

I'd like to start by stating that I believe that Micron's project is an incredibly valuable investment for Central New York and the US as a whole. Bringing back domestic manufacturing jobs is incredibly important to rebuilding the local economy. However, I have several concerns regarding the Draft Environmental Impact Report which I would like to address.

CNY residents deserve more information on the impact of chemical runoff from the plant and how Micron plans to safely dispose of it. Chemical byproducts are an inevitable part of the manufacturing process, but Micron needs to be responsibly disposing of these materials so as to not disrupt the local ecosystem—especially considering the massive habitat displacement from building the plant. Moreover, forever chemicals are a huge health and safety hazard for CNY residents and especially children, many of whom are already dealing with the adverse effects of lead in their homes. We need more information on how Micron plans to safely contain and dispose of this waste.

We also deserve a more robust plan of action on how the Micron fab will be powered. Specifically, we need to know that the facility will effectively utilize renewable energy so as to not disrupt the grid or raise prices for locals. Solar and wind power would be great options in the massive open fields surrounding the plant, and pairing those with batteries will allow for short-term power storage to ensure a consistent power supply.

These are the issues I'm most concerned with regarding the semiconductor plant. Again, I'm a huge proponent of the plan and I believe it will be an overall net good for the people of Syracuse. But the point of the CHIPS Act was to invest in the American people—not big business. Central New York deserves a better deal for our economy and for our health. I hope you take these concerns seriously and bring a stronger plan of action to the table.

Sincerely,

Matt Salerno

CHIPS Program Office
CHIPs Program Office,

Im concerned about the water contamination that the plant will generate.

What will Micron do to ensure that the PFAS and other chemical compounds will not harm our drinking water?

Will Micron monitor for these discharges, and act if the quantities exceed expectations?

Thank you.

Craig Russell

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I do not think that the development of a Micron plant will be a positive one in Syracuse. Although it may create more jobs, I believe the environmental impact will be devastating. Particularly the incredible energy usage (5% more for the State of NY) and water requirements make it a huge danger to human life, wildlife, and the earth itself.

I urge consideration and response to the following issues and concerns which many other people and organizations have raised:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Julia Ganson

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. I am submitting a comment within the 45-day public comment period but I must protest that this short window for public participation is ridiculously inadequate given the scope of the project and the 20,000-page report. Are you serious???? I request an extension of the comment period to October 25, 2025, at a bare minimum. By the way, why has there been no public response to a petition signed by over 1500 residents of the region asking the same?

Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

What I have learned about this project has me horrified about the following:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy

that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

This project is a huge monstrosity that threatens the environment (wetlands, water, air), does nothing to help the economic plight of many people in the region, and is wildly oversized. Every time I learn more about it, my heart sinks. Do not allow this to happen!

Thank you for your consideration of my comments.

Sincerely,

Iris Arno

CHIPS Program Office CHIPS Program Office,

I'd like to start by stating that I believe that Micron's project is an incredibly valuable investment for Central New York and the US as a whole. Bringing back domestic manufacturing jobs is incredibly important to rebuilding the local economy. However, I have several concerns regarding the Draft Environmental Impact Report which I would like to address.

CNY residents deserve more information on the impact of chemical runoff from the plant and how Micron plans to safely dispose of it. Chemical byproducts are an inevitable part of the manufacturing process, but Micron needs to be responsibly disposing of these materials so as to not disrupt the local ecosystem—especially considering the massive habitat displacement from building the plant. Moreover, forever chemicals are a huge health and safety hazard for CNY residents and especially children, many of whom are already dealing with the adverse effects of lead in their homes. We need more information on how Micron plans to safely contain and dispose of this waste.

We also deserve a more robust plan of action on how the Micron fab will be powered. Specifically, we need to know that the facility will effectively utilize renewable energy so as to not disrupt the grid or raise prices for locals. Solar and wind power would be great options in the massive open fields surrounding the plant, and pairing those with batteries will allow for short-term power storage to ensure a consistent power supply.

These are the issues I'm most concerned with regarding the semiconductor plant. Again, I'm a huge proponent of the plan and I believe it will be an overall net good for the people of Syracuse. But the point of the CHIPS Act was to invest in the American people—not big business. Central New York deserves a better deal for our economy and for our health. I hope you take these concerns seriously and bring a stronger plan of action to the table.

Sincerely,
Lizmarie Montemayor

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed 16 year project, namely building a semiconductor manufacturing facility in Clay, New York. Even though we were able to submit the following comments, the 45-day public comment period does not realistically give the public enough time to read and fully understand a 20,000-page report. I request that you extend the comment period to October 25, 2025, at a minimum. (Please also note that there has been no public response to petitions signed by residents of the region asking the same.) Based on my current understanding of the DEIS, through reading and attending 3 workshops with area biology professors and experts, I want to highlight a few key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues. There is not a sustainable plan to account for wetland loss and degradation. "Making" new wetlands in Oswego county will not mitigate flooding or storm water runoff from the acres and acres of impervious surface the four fabs will bring. The loss of bird habitat, especially aquatic birds, as well as habitat for endangered bats and other endangered species cannot be easily replaced. And who will tell the bats and birds that their roosting and nesting areas have moved? Nature may not cooperate with Micron's plans.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination and pollution of air, drinking and recreational water, and soil or protect worker health and safety given the intensive use of toxic, hazardous chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols. The water use of the facility as well as the electricity consumption is almost unfathomable.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar without relying on renewable energy credits or using renewable energy that is

already on the grid. Again, this project must be sustainable to survive its permanent stance in Upstate New York. Energy credits and grants can be pulled at any time.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron, particularly for production workers. Most of the jobs typically associated with manufacturing plants like Micron are not "high-paying" jobs as promised. Where will the necessary workers come from, where will they live, how will they be trained, how will they get to work, and will this project lift up the poverty level of our area or make it worse? We have seen presentations from the Micron community and elected officials selling this project. Many of us who have lived here for over 50 years are not convinced that there will be a positive effect in this area. We've embraced change in the past and don't want this huge endeavor to be a disappointment for my grandchildren. The DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Cheryl Matt

CHIPS Program Office
CHIPS Program Office,

I understand that the Micron project will increase demand for electricity by 5% (using all of NY State as a base). This projected increase in demand for electricity will surely lead to higher electricity prices for everyone. This is a consequence of a basic law of economics relating to supply, demand, and price. These price increases will, in turn, be burdensome for many people, the general public, and so on. These cost increases will be widely dispersed and universally experienced, but the benefits of the Micron development may not be so widely dispersed. Please show some consideration of the way costs and benefits are distributed.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Unregulated use of PFAS is an enormous concern. Back when Onondaga Lake was polluted maybe people did not know better but we do now. These chemicals will find their way onto our land through spills, into our water through discharge and/or waste, or will be emitted into the air we breath. History has shown us over and over again that when chemical safeguards are not as strong as they need to be or when accidents happen, disaster follows. People, animals and plants are exposed, become sickened or suffer death by chemicals. Keeping the chemical list secret from workers and the public for profits or for any business reason, is cruel. The public deserves to know the names and amounts of chemicals that will be used. Doesn't the medical community need to know what chemicals are being used so that as people are affected doctors know what they're dealing with and how to treat people? Micron and Onondaga County can do better. Why won't they put people first?

Thank you for your consideration of my comments.

Sincerely,

Leslie Lawrence

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Micron will pretreat wastewater but may not remove all the toxic chemicals. Onondaga County is responsible for removing the toxic chemicals that remain. One question is how will Onondaga County assure us that the toxic chemicals have been removed from wastewater if Micron does not let them have the list of chemicals they need to remove? Why is Onondaga County agreeing to bear the ultimate responsibility for the removal of chemicals in water? Years from now when Micron's chemicals are found in our rivers and Lake Ontario, Onondaga County will be financially responsible for all the damage. This a devil's bargain.

Thank you for your consideration of my comments.

CHIPS Program Office CHIPS Program Office,

I am most concerned about the environmental consequences of the planned Micron plant.

To create the required amount of electricity for Micron's manufacturing of chips it will be necessary to use water from existing wetlands which are habitats for wildlife. The plan is to replace these wetlands with unconnected parcels of land. By the amount of time it will take for these parcels to become wetlands on the scale of today's, it is very likely that many species of flora and fauna will have been brought to extinction locally.

The use of PFAS and other potentially hazardous chemicals will be present in the waste water that will be treated (however unlikely that the toxins will be effectively removed), discharged into public waterways, and potentially threaten the safety of drinking water in the region. Solid waste will also be a threat to the health and safety of local residents.

This project appears to me not to have been thoroughly vetted as to either safety or soundness of implementation. Residents of the region deserve a more well-grounded approach.

Thank you.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

I urge consideration and response to the following issues and concerns:

HOUSING: The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant. The DEIS offers no concrete suggestions or solutions to meet that demand other than to rely on State and County programs. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

TRANSPORTATION: The DEIS includes a study of the traffic in the area around the proposed plant site. The study notes that there is currently little to no bus service in the area near the plant which leaves the only transportation alternative to be cars. The study suggests the widening of Route 31 in addition to changing the type of exit lanes from 481. Increasing the number and frequency of bus routes would lessen the number of cars on the road and make jobs at the site accessible to all potential employees. The DEIS must address how Micron will work with the county and CENTRO to establish these routes including safe and secure bus stops.

Thank you for your consideration.

Sincerely,

Martha Lawson

CHIPS Program Office
CHIPS Program Office,

I am writing in concern of the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

It is unrealistic for residents to have only 45 days to read the 20,000 report. County staff had over 6 months to review the document. We should be given the same consideration as this directly impacts all residents of Onondaga and surrounding communities. The comment period should be extended to February of 2026. In addition there should be additional town halls throughout Onondaga County and presentation to the community outlining the various build phases and how our natural environment will be impacted directly and indirectly.

At this time the county is pushing the promise of new jobs "growth" and is failing to inform residents of the actual details of the project to their communities.

Sincerely,
Matthew J. Denton

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

Engineered wetlands do not provide the connectivity provided by naturally occurring wetlands regardless of how well they are initially constructed. They fail over time. The DEIS states that the engineered wetlands will be monitored, sometimes every other year, for 10 years. The engineered wetlands should function forever. Once the required monitoring stops there is no accountability. This is unacceptable.

One of the functions of wetlands is to reduce and minimize flooding. The engineered wetlands are not in the same sub-watershed where Micron will destroy 200 acres of wetlands. In addition to destroying wetlands there will be a substantial increase in impervious surfaces in the Town of Clay and beyond due to widening of roads as well as housing and business construction which will further increase the risk of flooding in the Town of Clay and beyond.

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use

of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

PFAS is essential to chip making. Although Micron will treat some of its wastewater on site there will be a significant increase in the wastewater flow from Micron to the Onondaga Wastewater Treatment Plant on Onondaga Lake which does not have the technology to remove PFAS or most other industrial chemicals despite assurances to the contrary. As an industrial hygienist for New York State, I spent many weeks there working with WEP to increase the health and safety of the employees of the plant.

Micron will use significant amounts of water in its industrial process. Although Lake Ontario appears as an inexhaustible source of water, it will eventually receive all the contaminants that cannot be removed by the Onondaga Wastewater Treatment Plant. Eventually, maybe sooner than any of us would like to think, one of the sources of drinking water for Onondaga County will become undrinkable. This is not a good trade-off for a short-term gain.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues. Although nuclear energy does not increase our carbon footprint the effects of radiation are significant and not trivial. I am not sure what has made people in this decade think that nuclear energy is without consequences. The concerns that were widely acknowledged 50 years ago have not been removed.

- **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

One question that I would like people to consider is why build Micron in a wetland in a community that already faces increased flooding threats. Why wasn't a location like the Great Northern Mall considered? Malls are failing but have a large footprint that has already been established.

Thank you for your consideration of my comments.

Sincerely,

Mary O'Reilly

CHIPS Program Office
CHIPS Program Office,

This is a multigenerational project that will impact all of Central New York. A 45 day public comment period and 1 public hearing during the summer especially for parents who are extra busy is not enough time to read and fully understand this 20,000 page report. I am asking you to extend the comment period to October 25, 2025, at a minimum.

Transparency

A dedicated website for reporting on air quality, water quality, important updates on this project, a list of where our tax dollars are being spent and more should be created. An example is the outreach and status updates on the I-81 project.

With a project of this size, there should be additional reviews as each fab is built to review the real time impacts of this project.

Environment

I am concerned about chemicals, specifically PFAS or forever chemicals, that could enter Oneida River and discharge to Lake Ontario next to OCWA's water intake pipe affecting our drinking water. How will our drinking water be protected?

Flooding

This area already experiences flooding and with extreme weather events occurring more frequently where will the water that is currently stored in this wetland go? The new wetlands that are being proposed are not downstream and will take decades to form. The wetland replacements ratio should be higher than 2:1 and should include new & mature wetlands. There also needs to be more details about stormwater runoff.

Renewable Energy

Add solar to cover your parking lots to expand solar on this project. Solar should be covering as many areas as possible at this site.

Transportation

I see a proposed shuttle for construction workers but not for the 9,000 employees. By providing a shuttle for Micron workers, this could reduce the need for 12,000 parking spaces reducing the impervious surfaces and help make sure these jobs are available to everyone in our community. Investing in our public transportation is needed to increase access to these jobs.

Traffic

Will this project increase rail traffic at the DeWitt rail yard? An exit to this rail yard from I-481 is needed as trucks continue to use local roads, increasing traffic and safety concerns in the Town of Dewitt & Manlius.

I am also concerned with the suggestions of widening roads, as we know this increases speeds and makes roads less safe. We need to balance the traffic with best practices of complete streets wherever possible to keep transportation options beyond cars.

Housing

Onondaga County is already experiencing a housing crisis. The DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Jobs

What is the percentage of the 9,000 jobs that pay under \$100,000?

Many of these promises from Micron need to be in a community benefit agreement.

Thank you for your consideration of my comments and questions.

Sincerely,

Elaine Denton

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Sue Hammond

CHIPS Program Office
CHIPS Program Office,

Here are my concerns with the Micron fabrication facilities project in Clay, NY.

What efforts to mitigate or counter the effects of the planned hundreds of acres of impervious surfaces created? What will be done to detoxify the water runoff that will occur as rain washes over these unnatural surfaces? Will roof and wall gardens be created to help with this?

What will be done to ensure that the lowest-paid workers at Micron receive a livable wage, allowing them to afford housing, food, transportation, healthcare, adequate leisure?

Wetlands are an important part of CNY's ecosystem. How will Micron work to prevent their industry from damaging the natural assets that has made this area desirable to those who live here?

What will be done to mitigate the noise and light pollution that will drive off wildlife?

How long will the negative effects of this project be monitored, so that unexpected consequences will come to light, and is there a fund from which to mitigate any unexpected damages discovered as time goes on?

Our lakes and reservoirs are an important part of this area. Agricultural and residential lawns create runoff that is toxic to lakes, creating effects such as algae blooms. What protections will be in place to protect the wildlife, safety and beauty of our lakes? What funding will be available to mitigate any unanticipated damage to those ecosystems?

Why has the Micron project been developed with a wetland replacement ration of 2:1, while other development projects have been kept to a ration of 10-15:1?

Clay already has flooding issues in my area. Flood risks are predicted to increase with this project. Why is Micron not being specific in detailing their plans for stormwater runoff and wastewater discharge management, or their plans for mitigating downstream flooding?

The proposed wetland restoration sites seem inadequate in acreage, and are not downstream of their buildings, so where will all this water go??

What protections for the native bat species are there? We already suffer from too many mosquitos, with occasional outbreaks of the diseases they carry, and any danger to the local population of bats that prey on mosquitos will likely have a very negative effect on all the people who live nearby and their enjoyment of their property.

Thank you for your attention to these matters.

Heidi Escobar

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

The wetlands and lakes in the greater Syracuse area are a crucial part of the natural ecosystem. As a resident of the area I am greatly concerned by the threat to natural bodies of water that Micron poses, and not only to the quality of our water sources but the impact it will have on the local wildlife and the greater health of the residents who live here. We have already seen the impacts that factories like these have created in air quality, water quality, and toxins released. These impacts correlate to rises in cancer, asthma, and other harmful diseases in the local communities.

At a time when decreasing the country's carbon footprint is crucial it seems absolutely ludicrous to demolish acres of natural and mature wetlands to build Micron's factory. These wetlands are a huge carbon sink and disturbing them does not only cause the possibility of the wetlands releasing their carbon stores but also take away any possibility of these natural environments continuing to store carbon. No amount of wetland conservation that Micron proposes to do can make up for demolishing acres of mature wetland.

While undoubtedly Micron presents an economic opportunity for the area, the community health and environmental impacts are to great a cost for our communities to pay.

Thank you for your consideration of my comments.

Sincerely,
Devin Burgess

CHIPS Program Office
CHIPS Program Office,

Here are some further comments on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Please extend the comment period to October 25, 2025, at a minimum.

Please address your attention, and respond to the following issues and concerns:

What support for research into the human neurodevelopmental effects of PFA's in our environment will Micro provide, give that PFA's are created as a result of the manufacture of semiconductors? There is already research that shows that PFS's are associated with the increase of ADHD and other neurodevelopment issues we've seen increase in recent decades. This is such a huge problem and I would rather see the community err on the side of caution, than experiment on the babies and children in the area, or on the Micron workers, some of whom will undoubtedly be working while pregnant. What are your comments?

Research into the damaging effects on neurodevelopment amongst children, and other health effects, of PFAs continually being dumped into the environment and therefore increasing their presence in humans, plants and other life, must NOT be suppressed, (as research about tobacco & greenhouse gases, have, for examples), and all possible mitigation efforts should be undertaken at MICRON's expense. What transparency will be supported by MICRON regarding research into effects of PFA's in the environment by various Govt and NGO Scientific organizations? What commitment to help for affected individuals will be made?

What measures will be taken to reduce the greenhouse gas emissions predicted to be the result of Micron operations? Are the renewable energy credits available to actually make up for the damaging emissions predicted from the Micron project? Humans are already DYING because industries like oil and gas have worked hard to discredit climate scientists, who have predicted human caused climate change since the 1950s. We must NOT continue spewing greenhouse gases into the environment.

What support for increasing nuclear power generation, and for research into nuclear power safety improvements will be endorsed or provided by Micron?

Will workers be part of any committees designed to promote worker safety?

How will workers' children be protected in the event of a spill event reaching the proposed worker childcare center?

How will our community be protected from the sludge created as part of the initial construction and continuing manufacturing processes? What funds will be allocated to finding more effective wastewater treatment processes?

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

I urge consideration and response to the following issues and concerns:

Micron will be using a host of chemicals - many of them toxic, like PFAS - in the manufacturing process. Yet it has not released the names of these chemicals. Why? The DEIS mentions several possible treatment technologies to remove PFAS from wastewater but does not, and cannot, guarantee their complete removal. It is therefore almost certain that PFAS will be released into waterways, soil and air; and through these avenues, incorporated into our bodies. The effects of PFAS are just beginning to be understood. It seems that once again an industry wants to play now and let people pay later.

Thank you for your consideration of my comments.

Sincerely,

David Friedman

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

I spent many hours reviewing Micron's DEIS, paying particular attention to the impacts to bats including federally endangered bat species. I have been studying bat species for nearly 15 years, including Indiana and northern-long eared bats. With such a limited amount of time to review this 20,000 page document, it is not feasible for me to provide an in-depth review, summary and response to all of the proposed impacts to bats with the Micron site development, so I will highlight just a few points. Please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

APPENDIX G

G-3.4.1 Mammals

- Table G-2 Mammal Species (Proposed Project)

- o It is difficult to identify what is meant to be bold (actually observed) or not (potential to occur), some of the text is just partially bold (e.g., long-eared bat of Northern long-eared bat).

- o Indiana and Northern long-eared bats were both noted to have been detected with "a significant level of confidence" at multiple locations, yet only the Northern long-eared bat is in partial bold in the table.

- o White-tailed deer are not bold? How do you do surveys and not find any evidence of white-tailed deer?

G-3.5.1

- "The Micron Campus site and the Rail Spur Site are within 1 mile of a known Indiana bat maternity roost, within 3 miles of other known Indiana bat roost trees and capture locations, and within 14 miles of a known hibernaculum." (pdf page 63)

- o The presence of federally endangered Indiana bats were documented at 6 survey site locations (2, 4, 7, 10, 11, and 16).

Indiana bats are a federally protected species in decline due to habitat loss, disturbance, and

white-nose syndrome (WNS). Impacts to Indiana bats from WNS have reached nearly 100% declines in surveys. And yet, this project proposes to disregard creating additional negative impacts to the bat populations in New York. Similar impacts (the steepest of all *Myotis* species) are also shown for the federally endangered northern-long eared bat, which are also noted to be present at the proposed development site.

5.2.1 Background on Noise Sensitivity in Bats

- Although the authors do note that research is limited in this area related to the species of concern, it is important to note that their references are from different regions. It is better than no references and this information should be considered but it should be more clear that one is related to European *Myotis* and another in California. (pdf page 157)

- o This paper should also be considered in this assessment related to noise impacts:

- o ?X Li, Han, Chase Crihfield, Yashi Feng, Gabriella Gaje, Elissa Guzman, Talia Heckman, Anna Mellis, Lauren Moore, Nayma Romo Bechara, Sydney Sanchez, and et al. 2020. "The Weekend Effect on Urban Bat Activity Suggests Fine Scale Human-Induced Bat Movements" *Animals* 10, no. 9: 1636. <https://doi.org/10.3390/ani10091636>

- Even though the little brown bat is in the same genus (*Myotis* species) as the Indiana and northern long-eared bats, the impact of noise and other development to the little brown bat should not be compared to that of the federally endangered species. Little brown bats are known to be more tolerant of using anthropogenic resources and more generalist compared to Indiana and northern long-eared bats. (pdf page 157).

- o See additional references:

- o ?X Bergeson, S.M., Carter, T.C. and Whitby, M.D. 2015. Adaptive roosting gives little brown bats an advantage over endangered Indiana bats. *The American Midland Naturalist*, 174(2), pp.321-330. <https://doi.org/10.1674/0003-0031-174.2.321>

- o ?X Bergeson, S.M., Holmes, J.B. & O'Keefe, J.M. 2020. Indiana bat roosting behavior differs between urban and rural landscapes. *Urban Ecosyst* 23, 79–91. <https://doi.org/10.1007/s11252-019-00903-4>

8. Project Commitment and Mitigation Measures

- This section starts on pdf page 188.

- General comment: The mitigation measures of this project are reminiscent of those related to the Indiana bat and the Indianapolis Airport area mitigation measures. There has been more than a decade of research on this project that may be useful for improving the mitigation measures. There are too many to list here (one is already cited Divoll and O'Keefe 2018), but see additional work out of O'Keefe lab (<https://wildlife.nres.illinois.edu/publications/>) and the Center for Bat Research, Outreach, and Conservation.

- Roost fidelity is not considered even though it is an important factor for endangered bats. A couple of resources, but others are available as well:

- o Lewis, S.E., 1995. Roost fidelity of bats: a review. *Journal of Mammalogy*, 76(2), pp.481-496.

- o Gumbert, M.W., O'Keefe, J.M. and MacGregor, J.R., 2002. Roost fidelity in Kentucky. *The Indiana bat: biology and management of an endangered species* (A. Kurta and J. Kennedy, eds.). Bat Conservation International, Austin, Texas, pp.143-152.

- Artificial Roost Sites are listed as a mitigation measure. It is crucial to review the more recent research publications related to artificial roosts and Indiana bats. Here a few examples but also see additional resources from the O'Keefe lab (<https://wildlife.nres.illinois.edu/publications/>):

- o Crawford, R.D. and O'Keefe, J.M., 2021. Avoiding a conservation pitfall: Considering the risks

of unsuitably hot bat boxes. Conservation Science and Practice, 3(6), p.e412.

<https://doi.org/10.1111/csp2.412>

o Crawford, R.D. and O'Keefe, J.M., 2024. Improving the science and practice of using artificial roosts for bats. Conservation Biology, 38(1), p.e14170. <https://doi.org/10.1111/cobi.14170>

o Tillman, F.E., Bakken, G.S. and O'Keefe, J.M., 2021. Design modifications affect bat box temperatures and suitability as maternity habitat. Ecological Solutions and Evidence, 2(4), p.e12112. <https://doi.org/10.1002/2688-8319.12112>

- Project 2: Dispersal of bats from the Jamesville hibernaculum

- o This type of project will provide important data. However, for this to be done properly and to get the most amount of data from the disturbance to bats that this will cause, providing funding that also covers aerial telemetry, and many stationary antennae will likely improve the amount of data collected and results. I have seen presentations on similar work where researchers attempted to do this with northeastern hibernacula with limited success without aerial support. ?X Roby, P.L., Gumbert, M.W. and Lacki, M.J., 2019. Nine years of Indiana bat (*Myotis sodalis*) spring migration behavior. Journal of Mammalogy, 100(5), pp.1501-1511.

Appendix G-4 Draft Biological Assessment

- “Impacts to population size and viability from the loss of roosting and foraging habitat on the Micron Campus would therefore be possible through potential reductions in fecundity, adult survival, or both.” (pdf page 151)

- o Comment: Bats show roost fidelity (they will return to previous roosting sites), so it is likely that they will return to their previous maternity roosts where they likely had success. Having to find a new available roost, at this critical time of early spring emergence, that provides all of the resources needed to survive will be quite a risk and require a lot of energy. The proposed mitigation sites are miles away and it is unknown if these individuals are aware of these other locations that may or may not provide available suitable habitat.

Attachment 4: Bat mitigation sites (map; pdf page 560)

- There are 9 mitigation sites shown on the map, some of which are >10 miles away from the Micron site. I would like to know more about these sites, and will look for more details within the DEIS. From what I could find, these seem to be farm fields and will take many years to become suitable habitat. The DEIS makes it seem simple to just set aside some mitigation sites and assume the bats will use these and all will be fine. More time, research, effort, resources, and financial support should be put toward these mitigation efforts.

I also want to highlight a summary of other issues that have come to light with a group review of the DEIS. I urge consideration and response to the following issues and concerns:

- Water and Ecological Resources. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- Protection of Air, Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Vanessa Rojas, PhD

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

pamylle1@gmail.com

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Statement for Micron's proposed semiconductor manufacturing facility in Clay, NY. I grew up in the Syracuse area, went to SUNY-ESF for college, and currently live and work in the area.

I am writing to say that the draft does NOT adequately address the ways this project will impact the environment and my local community. The DEIS also needs to contain more robust plans for how Micron will mitigate these impacts.

These are some of my concerns, along with suggestions for the final draft of the EIS:

Time for public comment: The DEIS is 20,000 pages and is highly technical. The public has only had 45 days to read and respond to this document. I am asking you to extend the public comment period to October 25, 2025 at a minimum. There was a petition to extend the deadline that over 1500 residents signed (including me!) and there has been no response to that petition. As citizens, we need time to thoroughly understand the issues and have a chance to voice our concerns, especially given the massive scope of this project and the long-term effects it will have on all of us.

Micron could choose a different site that has already undergone industrial development, rather than a healthy undisturbed area of wetland, grassland, and forest.

Micron could be required to justify why they need 4 Fabs here when they have had recent proposals to build additional facilities in other places. They could make 3 fabrication facilities rather than 4, which would reduce the impacts of the project.

The DEIS does not acknowledge the fact that the area where they plan to build has Karst bedrock. Karst bedrock slowly dissolves with water, so stress on the area could create fractures that eventually lead to sinkholes. Also, even if they use the best precautions, a facility like this will almost inevitably have some amount of chemical spills at some point. The gaps in the rock mean that groundwater contamination would spread quickly to other areas farther away from the fab.

Micron has not specified where they will bring the toxic waste created in production, although one possibility is Middlesex, NJ. The DEIS should evaluate the impacts that the hazardous waste will have on the community where it ends up. Middlesex is ALREADY considered an

“Overburdened Community” that experiences disproportionate environmental and human health stressors, and this isn’t going to help them.

There should be a partnership of scientists, engineers, and citizens to monitor the progress of the project and its environmental impacts and keep Micron accountable, similar to the Community Participation Working Group created for the Onondaga Lake cleanup. They should release a report to the public every couple of years, like the State of the Lake reports.

There are new NYS wetland regulations as of January 1, 2025. The DEIS does not indicate whether Micron plans to adhere to these regulations.

They should be more specific about their plans for de-watering the area and how long they plan to do that. The DEIS says that no one in the area is on wells, but there ARE people who use well water in the vicinity. They should conduct a more robust survey to assess the impacts of the ways that lowering the water table will affect local wetlands and well-water users.

Micron has said that the project will create good jobs for the community. But the DEIS does not specify the salaries of specific positions. In similar facilities in the industry, the engineers and managers make over \$100,000, but the production workers only make about \$40,000 and they are constantly exposed to dangerous chemicals. When I flipped through binders containing the 20,000 pages of the DEIS, I happened to see a page that said that workers will be required to work no more than 60 hours per week and will be required to have one day off per every seven days. This is not what I want for the people in my community! When Micron makes a Worker Safety Committee, it should be worker-led. There should also be ways for workers to voice safety concerns without fear of retaliation.

Micron should be required to disclose the types of PFAS chemicals they will be discharging into our water. I am very concerned about how these will flow into Lake Ontario only two miles away from the source of Syracuse drinking water!

Birds: The DEIS fails to consider use of the site for bird migration stopover habitat. Places to rest and refuel are vital for birds during their journeys. This is something they should assess.

Short-eared Owls live on the site, and they are a Species of Greatest Conservation Concern in NYS. I have been an avid birder for over a decade, and I personally still haven’t seen one because of how rare they are. I would be so excited to get to see one, but if we destroy their important habitat I may never have the chance.

They describe mitigation strategies for grassland birds, but they should also create strategies for ALL the birds, since the site is a mix of grassland, forest, and especially most of all wetlands. But they do not address how they will mitigate impacts to wetland birds.

The bat research they used as evidence is based on different species with different behavior, which are more tolerant of human disturbance. The Indiana and Long-eared Bats found on the site are endangered species whose populations have already declined almost 100% in NYS, which means this particular location is vital for the future success of this species. The DEIS needs to consider the fact that this site has a maternity roost, where bats return to the same place year after year, and whether the bats would realistically be able to use the mitigation sites they have set aside for them.

Air quality monitoring needs to take place close by, not all the way in Rochester. I am very concerned about how this facility will affect our air quality, especially as I am someone with Cystic Fibrosis who has more sensitive lungs than the average person.

Similar development projects have had a wetland remediation ratio of 10 or 15:1. Micron only plans to restore wetland in a 2:1 ratio. And the sites they pick are fragmented, not continuous, which means they will not provide suitable habitat for species that require a large area. Since these sites are currently in soybean production, it will be decades before they provide a mature wetland habitat, IF ever.

The DEIS needs to say more about how it will mitigate flooding to the town of Clay. Clay already experiences flooding. If they remove the 200 acres of wetlands that provide flood protection and replace them with concrete, what will stop the local towns from getting overtaken by water? The areas they have chosen for wetland remediation are not in the right locations to help with this.

These concerns are all based on my current understanding of the DEIS. However, since it is 20,000 pages, I would love to have time to read more of it.

Thank you for reading and considering my comment.

Sincerely,

Rebecca Rolnick

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

CHIPS Program Office CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Micron says it will form Workplace Safety Committees as a requirement of New York labor law. They will use the National Institute for Occupational Safety and Health (NIOSH) Hierarchy of Controls as guidance.

Micron does not provide the chemical exposure limits to the public and does not commit to doing so. Micron does not disclose the human health risks for working with the chemicals they use.

Micron does not commit to making these chemical exposure limits enforceable.

Micron does not indicate if the Worker Safety committee will be worker-led.

Specific answers to these questions should be provided along with an complete list of the the dangerous chemicals that will be used.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report.

I grew up in Clay, and do not want to see the entire area and ecosystem destroyed just so that Donald Trump can claim credit and look good. This is a scam.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
 - **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
 - **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- Affordable and abundant water and energy: The DEIS does not ensure Micron's massive

energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Alyson Shotz

CHIPS Program Office
CHIPS Program Office,

Hello, my name is Heidi Wendel and I am a resident of Cold Spring, in the Hudson Valley, NY.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy

that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Jacob Gigler-Caro

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- Water and Ecological Resources.

The DEIS appears to be far too optimistic about the effects of wetland / grassland destruction upon grassland breeding birds.

The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS notes that "vegetation conditions... are transitioning from old field to early successional, woody habitat at many survey points." Since this transition is not matured, and since wetlands combined with grasslands are far better for grassland bird breeding, Micron's "replacement" of mature wetlands with still-developing grasslands and/or newly developing wetlands (which can take scores, if not a hundred or more, of years to develop) is inadequately developed and should be much improved. At least a 10-to-1 acre-to-acre replacement of destroyed wetlands with grassland and wetlands-in-development should be required.

The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds).

Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- Protection of Air, Lake Ontario Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production.

Especially concerning is the strong likelihood of additional contamination of Lake Ontario water by PFAS, PFOA, and additional other per- and polyfluoroalkyl "forever chemicals." Micron should be required to provide significant funding (in the millions of dollars) to finance additional water purification methods for all surrounding counties (Oswego, Onondaga, Wayne, Jefferson, Cayuga, Monroe, Orleans, Niagara, etc.), including investment in methods that (1) detect PFAS/PFOA and related chemicals at the lowest detectable levels and (2) remove these chemicals from the water supply.

Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

Further, EPA method 1633 is inadequate in the detection of more than 40 PFAS chemicals in soil, water, and biological tissue. Micron should be subject to a broader spectrum testing procedure that can identify scores more PFAS compounds than EPA method 1633, especially since the semiconductor industry reportedly utilizes hundreds, if not thousands of PFAS compounds.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Micron should be required to place solar panels on the roof of every building to assist in powering its daily industrial operation, and to reduce reliance on greenhouse gas output, as well as its probable reliance upon nuclear energy, which produces toxic radioactive waste that is unsafe for hundreds, if not thousands, of years.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project.

The DEIS should require a study of the affordability of energy and clean water resources upon residents in a 50 mile radius in relation to its expected water demands.

- Job Access, Housing & Transportation.

Micron will be situated in Onondaga County, which contains highly distressed, environmental justice communities. One of most significant pressures upon these communities is the quality, affordability, and availability of decent housing for members of these communities. The DEIS should address how Micron will work with state and county governments to expand the

availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,
Paul Ciavarri

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Steven Vogel

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Amy M

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. In fact, the enormous energy use appears like to lead to a surge in climate-heating pollution. Micron must create a comprehensive and BINDING AND ENFORCEABLE plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to

expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents. I also want the Micron development, if approved, to lead to UNION jobs, so there should be labor rights and standards in any agreement.

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

Thank you for your consideration of my comments.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Pamela Strassberg

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

I have lived in Syracuse, NY for 8 years. Over this time, I have learned of the long history of environmental issues in our Central New York region. We have some of the worst pollution in both our water and homes from lead, and in our lakes from past improper disposal of toxic waste into waterways. Much of this history is tied directly to actions from business owners to not adequately protect residents.

One of my biggest concerns about the upcoming Micron development and impact is on healthy air and water for Central New York for years to come. I have great concerns about the amount of water Micron will use and how waste will be disposed of into the water thus impacting the environment.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using

wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Nicole Fonger

CHIPS Program Office CHIPS Program Office,

I have several issues with the impacts of Micron's proposed semiconductor factory on the public health and the Environment.

Please take into effect the following issues:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.
- **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high

poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. CHIPS Program Office
CHIPS Program Office,

I oppose the proposed Micron facility in Clay, New York because of all the water and energy it will consume taking it from existing needs in the state for decades to come. Because the 20,000-page report is so long, please EXTEND the comment period for at least 2 months.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. CHIPS Program Office
CHIPS Program Office,

Hello,

I am opposed to the Micron project and believe it should be rejected. The data center combined with artificial intelligence, and similar facilities elsewhere in the US, will lead to steep job losses in the United States.

An article by Peggy Noonan on Page A-13 of the August 9-10 Wall Street Journal reported that many analysts believe AI will sharply reduce the job market for high-skilled labor, a trend that probably has begun. Why permit and subsidize a massive job-wrecking industry?

Giant data centers use vast amounts of water and electricity. Many who watch and participate in energy policy in New York believe NY can not achieve the renewable energy goals mandated by the 2019 Climate Law. So why license a facility that will greatly increase electricity demand?

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPS Program Office,

You haven't given anyone enough time to absorb all the information necessary to properly respond. It's as if you think this is a done deal and the public doesn't get a say. I appreciate the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. But it's crazy fast! And I don't want it. And you aren't giving us time to respond. I want a clean NYC. I want clean solar. I want you to pivot.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable

energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. I am an active citizen in Syracuse and I have heard both the hopes and fears of this plant - I hope we can avoid mistakes now with planning and discussion and not re-think bad choices in the future.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss. Wetland replacement is not as simple as acres created to match acres lost. There needs to be a higher-level analysis of measuring how the wetland environment is handling the plant.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions.

Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. How will Micron ensure that transportation to the plant is not a barrier for workers within Syracuse?The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Syracuse already has inadequate housing and high rents. It will take significant resources to provide enough housing for plant workers. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Sean Graham

Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

I find this absolutely abhorrent that in our state of climate change and major temperature variations, carbon build up etc that the heads of our government are willing to disturb the mature wetlands that absorb much of the carbon that is released. New wetlands will not do this for hundreds of years. Will our planet be unlivable by then? Also, seriously, who agreed to only a 2 for 1 replacement on the acres of wetlands? Clearly someone who does not live in this area.

I also find it interesting that the DEIS does not address the weather in CNY. The winters can have the roads shut down because of snow and ice. How will snowmelt affect the water runoff problem? I am sure it will only exacerbate it. What about the number of days below zero. How does that affect the process? What about the slippery roads and trucks transporting the PFAS chemicals? I can only imagine there will be more accidents.

- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize

contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols. What about the contamination to the environment? The DEIS does not address that. What guarantees does this community have that we will not become a modern day Onondaga Lake issue with polluted land areas? I bet when Allied Chemical began their project to build here, the politicians were in awe, little did they know what they did to a beautiful lake.

* The DEIS did not address the noise pollution. What about the community members who live in this area? What will the noise decibel level be during construction? Please provide this.

*. I am very concerned about the flooding issues that will occur. The amount of impervious surface that this plant will take, the reduction of wetland that are connected, what guarantee do the residents have that their homes and yards will not flood? Clay doesn't allow water to seep through easily. Why do you think this is called the town of Clay?

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. This is a major concern that the ratepayers rates will escalate to support the power grid changes, the cost of water will escalate and that the county is on the hook to provide a VERY expensive water treatment upgrades at Oak Orchard plant. We have seen how the county has not been effective at managing upgrades to water treatment facilities.

The DEIS does not address the increased cost of living that will occur in this area. How will these 'good paying jobs' fare for those individuals and will those people employed at those jobs still be over the poverty level? The average home price in Boise is over \$400,000 and in Syracuse area almost \$200,000. As this Micron plant develops, what will happen to the cost of living then? I imagine the housing market will skyrocket and become similar to Boise. How does a 'good paying' job employee of \$60,000 a year afford a house at \$400,000? Take a loan for 60 years?

The DEIS does not really address the number of people already unemployed in the Syracuse area and how many jobs are available but still there are not enough workers.

Is this entire project engineered to our politicians have their 'legacy'? I can see their headstones now: McMahan, Mannion, Schumer " he orchestrated the biggest contamination project in CNY and didn't care about their constituents, community or about the environment ".

McMahon, what ever happened to the idea of a sports facility. Between fields, ice rinks, hotels, restaurants, shopping, this would bring in continuous income. People travel to the same areas years and years to attend /participate in sporting events.

If this were in schumer's backyard, would you be excited about it?

With their being ONE comment day in July and only the minimum amount of days to respond to this 20,000 page document, leads a competent person to believe that the politicians and Micron are hiding something. I don't under why Micron would want to build in an area that the residents and communities are not 100% sold on this idea. What kind of reception will they get? If it is going so well in Manassas VA and Boise, ID why come out here?

What about the increase in public services that will be needed: police, fire, ambulance let alone medical care? Who will be paying for this? Will this once again fall on the backs of the already overtaxed New York State/ OnondagaCounty residents? I don't believe the DEIS addresses any of that. Medical services here are already taxed beyond belief. People cannot be seen in emergency rooms without a 12 hour wait, then they wait for several days in the ER before actually getting a room. Again, don't believe the DEIS addresses any of this. What will Micron do to help alleviate this issue since it will be because of them that there is a population increase. Please address this issue.

Thank you for your consideration of my comments.

Sincerely,
Leigh Swanker

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on-site wetlands loss, and address the watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, groundwater, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts of habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety, given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize the use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure that Micron's massive energy and water use will not affect the affordability of energy and clean water, nor does it ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g., education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron, particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower-cost market-rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed-income, affordable, climate-friendly, and safe housing while protecting the affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,
James Mulholland

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Marni Libby

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,
Kitty Kellogg

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

I have family roots in the Finger Lakes Region and currently live in the PFAS-affected community of Newburgh NY. A project of this scale, though so important to the financial future of Syracuse, must also take into account the mitigation of potential environmental future harms, so that this generation's benefit doesn't become the next generation's liability.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. CHIPS Program Office CHIPS Program Office,

Why is it necessary to relocate the Oak Orchard SolarBank farm? While one can see the footprint of the main fabrication structures there isn't sufficient explanation as to why the rest of the space allocation that requires this relocation.

Solar should be an integral part of this project. The energy demand is going to be huge. If the promise of using 100% renewable energy is to be met, then why not explain why this is not an explicitly stated part of the plan?

I understand that there may be ultra-low vibration levels that need to be met for nanoscale fabrication of semi-conductors so that placing solar panels on the roofs of these Fabs is possibly not feasible. But considering the huge acreage that is being cleared for parking, why not commit to solar panels over those areas?

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of these comments.

Sincerely,

emswaine9@gmail.com

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Data from GlobalFoundries in Vermont revealed 17 different PFAS in wastewater and poisonous chemicals are flowing into the Winooski River and Lake Champlain. There are thousands of PFAS chemicals and targeted screening methods only reveal a few of them.

The Chips and Science Act has an opportunity to strengthen and important industry and make it clean and sustainable. Micron must assure our community that PFAS will be removed from wastewater, using technologies designed to remove all PFAS.

Chips Acts funds must be used to research, reduce and eventually phase out the use of PFAS for semiconductor production and the community must be updated through public reporting. workers and those in the Syracuse communities must be assured that our waters and lands will remain clean as a priority over corporate appropriations.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same.

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

The rate at which we are gaining new knowledge and understanding about the consequential direct and indirect negative impacts of human activity on the environment, including human health and safety is accelerating at the same or quicker rate than knowledge generally. How does the DEIS and Micron propose to deal with this new knowledge when it relates to the construction, operation, or closure of the proposed Micron facility? Who decides whether the impact of such new knowledge has consequential impacts on the environment. What obligation does Micron have to mitigate these impacts? Is there the potential to change the Micron operating permit, or to stop all or part of its operations.

For chemical products there is the federal requirement for an MSDS (Material Safety Data Sheet) for each chemical, yet it is my understanding that Micron with use and or produce chemicals that for business reasons have not been disclosed. What checks and measures are provided to equip the public and regulators with knowledge of the chemicals being produced, used, or disposed of in connection with Micron's operations, now and into the future?

It is assumed that Micron will seek longterm supply contracts for natural gas. According to the DEIS, that gas is to be used largely, if not exclusively for the high temperature destruction of regulated hazardous chemicals and waste. Based on these assumptions what incentives or requirements are there for Micron to seek and implement alternative processes for either the use, or destruction and disposal of such hazardous chemicals and waste?

Micron has stated among its reason from siting this facility in Central New York, the quality and

availability of water. The control and treatment of water flows in, around, and under the Micron facility and back into the environment has many dimensions. Wetlands and season flood areas will be lost, to parking and other project uses. Specifically, with regard to the proposed parking lot(s), why is there no provision for covering these spaces with photovoltaics? Why is there no provision for permeable pavements throughout the site, including parking lots? Why is there no provision for groundwater impoundment ponds, as are required elsewhere, to manage building and pavement runoff? These would offer a way of reducing wetland loss/replacement.

Will there be lined impoundment ponds for waste water treated on the Micron site? Why? What provision has been made for preventing leakage or over-running from such ponds? What provisions are there for the periodic safe and permitted disposal of sludges, and contaminated water from such ponds. Will such ponds be secured and covered to prevent persons from entering them and their surroundings? What steps have been provided to prevent fugitive gasses from leaving the Micron site?

Micron has pledged that 100% of its electrical power will come from renewable sources, but not from its own generation of electricity from renewable sources. Is Micron planning to use waste heat from its natural gas fueled generators to produce electricity for lighting, heating and other plant operations? If so, does that qualify as an off set to the environmental impact of the plant's use of natural gas? In any event, why aren't the roof surfaces being used for photovoltaic power generation for sale to the electric grid, especially since Micron's anticipated electric use does appear to have a separate schedule to protect other electric consumers who will see their electric rates climb in an already tight electricity supply environment?

In the past, the State and Federal governments have invested many billions of taxpayer dollars to encourage and support economic development projects, but rarely, if ever, of this magnitude. And in the past, some, perhaps even most of those projects have failed to produce a net positive return anywhere near the level touted. What provision is there for recoupment, direct or indirect, of government investment if Micron does not meet expectations?

Thank you for your consideration of my comments.

Sincerely,
Dennis Lerner

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

CHIPS Program Office
CHIPs Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment for Micron's proposed manufacturing facility in Clay, New York.

Unfortunately I, as an ordinary citizen, could not possibly be expected to digest a 20,000 page report in 45 days, nor could I reasonably assess others' analysis of it in such a short period of time. The comment period needs to be extended. The unreasonable rush does make one wonder what is going on.

As an ordinary citizen, I am concerned. I hate that so often jobs and the environment are pitted against each other, because we need both. I guess the question is, what kind of sacrifices of one or the other are we willing to make, and under what conditions?

I am concerned about the water situation - both the destruction of the wetlands proposed by Micron, and the amount of water that Micron will need and the infrastructure that will be needed to support that. My understanding is that not enough research has gone into that.

Another concern is the possible contamination of the water, air and soil, given the use of (and need to dispose of) toxic chemicals. The wildfire smoke from Canada is a reminder of how far toxicity can travel. What exactly is being done to prevent accidents at the Micron plant, as well as disposal issues, etc. It is scary.

I also think of the workers - exactly how will they be protected? And who will they be? There is a lot of talk about how this will increase jobs for people currently living in Syracuse. Do we have any reason to believe that other than Micron's telling us so? What plans does Micron have to ensure communities with high poverty rates and individuals facing barriers to good jobs will have reasonable access to training, jobs, and career advancement at Micron? How will Micron work with state and local governments to make this happen?

And what about its other effects on the community at large? How will such a mega-company effect local politics? Will they be a "super-player", or will they have as much power as I have - which is some, but one could argue less than a multi-billion dollar company.

I appreciate the opportunity to comment, just wish there had been more time to think about it.

Sincerely,

Carol Baum

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Nick Byrne

CHIPS Program Office
CHIPS Program Office,

There have already been notable failures in NY State at using incineration as a means of destroying PFAS.

I spent time reviewing the failures of the Norlite incinerator in Cohoes, NY with an employee at Johnson Control International, who was absorbed by JCI when it purchased Tyco, the company responsible for manufacture of some of the most notorious PerFluoro Alkylating Substances, those used in Aqueous Fire-Fighting Foam which resulted in serious contamination of the land and water at their Marinette site in Wisconsin.

My understanding has been that incineration itself is a reasonable solution to destruction of PFAS as opposed to shipping it around and sequestering it. Further, that contamination from Norlite may not have occurred if sufficient controls had been in place to maintain an adequate temperature (1400 oC ?) with a residence time of those target molecules at that temperature of at least 2 seconds (?) and appropriate real-time monitoring to assure those conditions were maintained.

It appears that Micron, however, is not intending to use incineration sufficient to demineralize the full complement of the various perfluoro compounds, since they are seeking waste management contracts to ship waste to New Jersey. Will those contracts be made with companies that will offer complete degradation of these toxics?

Are these compounds therefore being utilized without full accounting of the costs of their continued potential to cause harm?

Thank you for your consideration of my comments.

Sincerely,
Melleny Hale

CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

jeanne184490@gmail.com

CHIPS Program Office
CHIPs Program Office,

I am taking this opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. First I ask that you please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report.

I am asking you to extend the comment period minimally to October 25, 2025. I would also note that there has been no public response to a petition signed by over 1500 residents of the region asking the same. This type of disregard for the public's concerns does not reflect well on your commitment to the community at large.

I would like to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using

wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. Micron must provide answers to these concerns.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities.

Please show us that you care about this community. Extend the comment time and listen to the experts before you do irreparable damage to our community. Thank you for your consideration of my comments.

Sincerely,

Lee Cridland

CHIPS Program Office
CHIPS Program Office,

To whom it may concern,

I am excited about the new jobs and economic revitalization that Micron promises to bring to the CNY area; however, I am deeply concerned about the impact of constructing the proposed 9,000 car parking lot on the surrounding wetlands.

I wanted to offer a suggestion for an alternative that may reduce the harm to these important ecosystems: potentially, there could be a shuttle bus transporting people from the abandoned Great Northern Mall parking lot to the Micron plant to eliminate the need for such a large paved area.

Additionally, would it be possible to refrain from paving the entire allotted land and use that time to develop alternatives that would prioritize wetland preservation as much as possible?

Lastly, could you consider constructing a high-rise parking garage to reduce the amount of paved area necessary for this project?

Thank you so much for considering my suggestions and giving the community the chance to voice our concerns about the environmental impact of this project.

Sincerely,

Ron Monsour

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

f.conklin7@gmail.com

CHIPS Program Office
CHIPs Program Office,

Is it true that most of the natural gas that Micron is projected to consume is in incineration of PFAS?

What proportion of this energy is in boiling off water as a carrier medium before the shift to higher temperature required to degrade PFAS?

Are there steps in the manufacturing process that are not performed in aqueous medium that could be removed/separated and decontaminated at the vastly lower temperatures described by B. Trang et al. three years ago? This was a seminal paper in an issue of Science (published by AAAS) that offered far less energy-intensive means of dealing with these forever chemicals than was previously known:

LOW-TEMPERATURE MINERALIZATION OF PERFLUOROCARBOXYLIC ACIDS

Science, 8 Aug 2022, Vol 377, Issue 6608 pp. 839-8,
[<https://www.science.org/doi/10.1126/science.abm8868>]

This innovation requires a decontamination process in a non-aqueous medium. If the PFAS that Micron requires in their manufacturing process are in an aqueous medium, how much of the incineration is just in evaporating water?

Has Micron considered halting the “incineration” of its PFAS-laden waste as soon as the dehydration has occurred and switching to this far-less energy-consuming process where “PFCAs of various chain lengths undergo efficient mineralization in the presence of NaOH in mixtures of water and dimethyl sulfoxide (DMSO) at mild temperatures (80 to 120°C) and ambient pressure”?

These are FAR Milder conditions than the incineration conditions that are cited in most literature to be in the range of 1400 oC to be sufficient for 99.9% destruction of PFAS.

The power consumption of Micron is expected to be immense. Has this been a consideration in reducing that energy?

Competition for our local use of power is daunting and we wonder how that will affect our energy bills.

I further urge you to include a commitment to engage citizen monitors of the Micron process & development in a manner which is more open to public review, open to citizens like myself, who both want to see the success of Micron, but feel compelled to prevent the kind of carte blanche that resulted in the horrific contamination of our Onondaga Lake.

Thank you for your consideration of my comments.

Sincerely,

Melleny Hale

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

I'm wondering the impact on local technology business. What impact is Micron going to have on our well established small technology businesses? When a big business like Micro leave the community (like Carrier/United Technology) a community is economically impacted in a way that leaves destitute.

Thank you for your consideration of my comments.

Sincerely,
Sharon

CHIPS Program Office
CHIPS Program Office,

Serious concerns about the planned Micron project in Clay, NY

The proposal for this project indicates several very serious problems. It will significantly affect many aspects of life in Onondaga County.

All life on this planet is dependent on water. The Great Lakes system, including Lake Ontario, contains TWENTY PER CENT OF THE WORLD'S SUPPLY OF POTABLE WATER! This water is ours to use but it is not ours to degrade. There is no assurance that PFAS and other toxic compounds used in the production of microchips will not contaminate Lake Ontario.

It is anticipated that construction of the factory will necessitate the destruction of at least two-hundred acres of wetlands that have an important ecological role. Destroyed wetlands cannot simply be replaced. They require many years, if not decades, to recreate and the "replacement" wetlands have to be geographically proximate to those that have been destroyed. This is not adequately addressed.

The Micron factory's energy requirements are mind-boggling, said to be as large as that of the combined states of Vermont and New Hampshire. The products of the factory are supposed to be "green" micro-chips. Any "green" energy needed to supply the factory means that a corresponding amount of "green" energy will not be available for other needs in our state. There are no plans for solar collectors on the potential acres of roofs for the parking facilities that will be required.

Micron has been given billions of dollars of scarce public funds to construct and operate this factory. The people of New York will not see any of this returned. If it is proposed that the jobs created by building and operating the factory be compensation to New Yorkers, there is no assurance of the number and quality of those jobs. Micron would not be coming here if they weren't confident that they will earn profits from the work done by those employees, and a commensurate portion of those profits should be returned to the people of New York.

The housing market in Central New York is very tight and there's no assurance that the influx of new workers and their families will not exacerbate this shortage. Also, at the planned size of the factory many aspects of daily life for Central New Yorkers (such as increased road traffic) will suffer. Why must the scale of this facility be so large?

Barry Gordon,
Onondaga County (Lysander) resident

CHIPS Program Office
CHIPS Program Office,

To Whom It May Concern:

First, I would like to begin by saying I am deeply concerned about the potential environmental, social, and ethical impacts of the proposed Micron project in Central New York. Our region's clean water, air, and ecosystems are irreplaceable, and there must be absolute assurance that this project will not result in toxic waste, long-term contamination, or harm to community health.

I am alarmed by the lack of clear, transparent communication about how environmental risks — including wastewater management, chemical storage, and emissions — will be prevented and monitored. Our community deserves full disclosure and meaningful opportunities for input at every stage.

In addition, diversity, equity, and inclusion are core values for me and for many in our region. Micron has yet to make meaningful, enforceable commitments to DEI in its hiring, training, and community engagement practices. Without these commitments, I fear this project risks perpetuating inequities rather than building shared prosperity.

I urge decision-makers to ensure that environmental safeguards, transparent reporting, and binding DEI commitments are non-negotiable conditions for any project approval. Our community is not just a set of numbers on a corporate ledger — we are people who love and protect our home.

I appreciate the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- Water and Ecological Resources. The DEIS fails to adequately address hydrological and

ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- Protection of Air, Water, and Workers. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Kristine Kinsella Zettler

CHIPS Program Office
CHIPS Program Office,

Dear Members of the Environmental Review Committee,

As a resident of Central New York and a deeply invested member of this community, I appreciate the opportunity to submit comments on the Micron 2025 Draft Environmental Impact Statement. The scale and ambition of this project represent a transformative moment for our region, and I believe we have a responsibility to ensure that its development reflects both historical awareness and forward-thinking stewardship.

To that end, I respectfully request that the following goals be considered and integrated into the final EIS:

- **Environmental and Historical Risk Awareness:**

Incorporate lessons from past industrial and environmental disasters—such as the pollution of Onondaga Lake and the Love Canal incident—by embedding robust risk assessment protocols and contingency planning throughout the project lifecycle.

- **Semiconductor Industry Vulnerabilities:**

Address the unique risks inherent to semiconductor manufacturing, including geopolitical instability, climate-related disruptions, and supply chain fragility, through adaptive design and resilient infrastructure planning.

- **Facility Design and Safety Architecture:**

Ensure the facility reflects best-in-class standards for containment, safety, and resiliency. This includes optimizing equipment placement and utility routing to minimize environmental and operational risks.

- **Small Business and Economic Equity:**

Promote inclusive economic growth by supporting small and local businesses in accessing opportunities within the semiconductor supply chain and mitigating barriers to participation.

- **Sustainability and Environmental Stewardship:**

Demonstrate leadership in sustainable development by integrating green building standards, renewable energy sources, and long-term environmental monitoring into the project's design and operation.

- **Community Engagement and Transparency:**

Maintain transparent and ongoing engagement with the local community to ensure public concerns are addressed and that the project reflects shared values of safety, sustainability, and equity.

This project presents an opportunity to set a new standard for responsible development—not just for Central New York, but for the global semiconductor industry. I urge the committee to

ensure that these principles are reflected in the final EIS and in all subsequent planning and implementation efforts.

Thank you for your time and consideration.

CHIPS Program Office
CHIPS Program Office,

As a long-time Syracuse resident, I have serious concerns about Micron's proposed semiconductor manufacturing plant in Clay and its impact on the environment and the quality of life in Central New York (CNY). I, like much of the CNY population, live here because of its beauty and its affordability. Both of these appear to be threatened by this project.

Bottom line, Micron's goal in bringing a chip plant to CNY is to make a profit. Millions of taxpayer dollars have already been committed to the project and we need to ensure that, in return, Micron operates in our best interests and addresses all potential environmental threats in both its construction and its ongoing operation. With our current knowledge about the long-lasting environmental and human damage that industrial development projects can bring, we can't repeat mistakes like those made in the past in service to the profit motive.

Based on my current understanding of the DEIS, I'm submitting the following comments that speak to some of my concerns about:

- the impacts of this project on CNY land, water and air
- the impacts on human and other species currently living on the land or surrounding areas
- the energy and water requirements of the project, and
- the inadequate plans for mitigation provided in the document.

Toxic chemicals – The DEIS does not identify all of the chemicals that will be used in the chip production process or adequately address plans for preventing release of these chemicals into the environment. Micron must provide a list of these chemicals and detailed plans for how all chemicals (including PFSAS and other toxic chemical) discharged during production will be processed in a way that will not pollute our air, land or water. The final DEIS should address how toxic waste captured during this process will be handled and stored. It should also address how toxic chemicals will be stored and handled pre-production to ensure the safety of Micron employees and the environment. And it should identify a plan for oversight and how compliance will be monitored. Micron must ensure that no toxic chemicals will be brought on site before all processes and equipment needed to prevent toxic chemicals from entering the environment are in place, including all county-operated wastewater treatment facilities.

Land use – Construction of the Micron plant will result in major changes to the landscape and significant habitat loss. The project site is home to not only endangered bat species and threatened and near-threatened bird species, but a rich variety of other species that add to the

richness of this area of CNY. With loss of habitat, many of these species will be displaced and some will die. The wetlands that are lost are simply not replaceable by the smaller scattered parcels of land that are planned to compensate for the current habitat. In addition, the proposed replacement wetland sites are yet to be developed and the displaced creatures will need to find someplace to “hotel” while this development occurs; many will not survive. In the final DEIS, Micron should significantly increase the ratio of replacement wetlands to lost wetlands and put a plan in place for incremental destruction of wetlands and aggressive development of replacement environments.

Another land use concern is related to increased flooding risks across the US resulting from climate change. Loss of wetlands and construction of acres of hard surfaces at the Micron site will increase flooding and runoff into the Oneida River and ultimately into Lake Ontario. In light of this, the DEIS should include an assessment of increased flooding risks to downstream communities and address how these risks will be mitigated.

Energy use – Operating the Micron plant will require enormous energy inputs. The DEIS doesn't address how Micron will meet these needs and also meet its 100% renewable energy commitment. The final DEIS should provide a plan for generation or purchase of solar and wind power that will not rely on power already on the grid and being used by other customers and will not increase the cost of energy to households and other energy users. The final DEIS must also address the cost of any infrastructure changes needed to support its energy use in a way that ensures these costs will not fall to utility ratepayers or to New York State or Onondaga County taxpayers.

Water use – Operating the Micron plant will require enormous amount of water pulled from Lake Ontario. The final DEIS must address how these needs will be met and monitored while ensuring water availability and affordability to current users. The final DEIS must also address the cost of any infrastructure changes needed to support its water consumption in a way that ensures these costs will not fall to current customers or taxpayers.

Additionally, the DEIS does not adequately address: increased housing needs and costs (including the impact on current CNY residents), increased traffic and the investment needed in public transportation or increased public service demands.

If Micron is truly committed to CNY, it will ensure that all steps are taken to preserve the integrity of our environment and our community and will seek community engagement in all future decisions that impact our environment and community.

Thank you for the opportunity to comment

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

betsywebster0@gmail.com

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

First of all, I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking for this extension.

Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- PFAS contamination and cleanup responsibilities - PFAS are a class of emerging contaminants that are not yet routinely monitored in the environment and that have high potential to cause adverse ecological or human health effects on workers and those downstream of this project. Thousands of chemicals in this class have not yet been adequately identified and analyzed, and PFAS are essential in current semiconductor manufacturing. Will Micron take responsibility for keeping New York soils and waterways clean for posterity? Who will cover the costs for as-yet-unknown possible cleanup and mitigation of these thousands of "FOREVER CHEMICALS"?
- There are numerous other concerns also in need of more than a 45-day public review and in need of more analysis:
 - water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds)
 - habitat loss
 - worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production
 - how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions
 - analysis of how to ensure that Micron's massive energy and water use will not affect the affordability of energy and clean water AND ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of

this project.

-meaningful access to workforce development, training, jobs, and career advancement for those in the Clay community

-the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities.

-availability of affordable housing for existing residents

Thank you for your consideration of my comments. Please extend the review period!

Sincerely,

Jennifer Hok

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does NOT give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Saran K.

Subject: [EXTERNAL] RE: Draft Environmental Assessment EISX-006-55-CPO-001

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Based on my current understanding of the DEIS, I want to highlight environmental concerns which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Topography:** The proposed site for the project lays atop a karst landscape. It is important that Micron addresses how they plan on preventing damages to the facility given that the landscape is prone to issues such as sinkholes and cave formation. In addition, with karst regions being particularly important to groundwater, Micron needs to address how it plans to prevent any wastewater from contaminating the ground water in the area.

- **Wastewater Treatment:** In the DEIS, there was little to no explanation on which chemicals will be used in the facility. This is a problem because should an emergency occur, the community will not be aware of what chemicals Micron needs to be held accountable to clean. In addition, regarding PFAS, while not at the scale conducive for a large company, such as Micron, the company needs to make the commitment to invest in PFAS destruction technology that will assist in the removal of things forever chemicals are known to be detrimental to human health.

- **Water Usage:** I think it is absolutely appalling that Micron needs to use such a significant amount of water. The company needs to justify the use of water, as it is obviously disregarding how that will create a strain in the community of Clay, in addition to region. Micron also needs to address whether they've explored alternatives ways to meet their water needs than simply extracting it out of the local infrastructure and Lake Ontario.

- **Wetlands:** In DEIS, Micron said it'd replace two acres of wetlands for every one acre destroyed, resulting in at least 400 acres of new wetlands in Oswego county. That proposition is beyond ridiculous as the affected area is in Onondaga county. The animals that will be displaced will have no way of knowing that a new set of wetlands will be in Oswego county. In addition, Micron has made no effort and needs to engage with the community to inform them of who will be in charge of this effort. Lastly, Micron needs to address what will happen to the animals impacted as wetlands cannot be developed overnight and their

replacement sites will need to time to get anywhere close to the biodiversity of the original wetland that they intend to destroy.

Thank you for your consideration of my comments.

Sincerely,

CHIPS Program Office CHIPS Program Office,

I am in favor of the Micron plant, this area needs an economic boost. However, I am deeply concerned about PFAS and all related fluorocarbons. How will you filter these? What level of residue will remain? Can you give an estimated contamination of the effluent in terms of PPB? I await your reply.

CHIPS Program Office CHIPS Program Office,

I'm glad to respond to the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

As a mom, I'm concerned about what chemicals Micron will use and how they will dispose of them. I'm particularly worried about forever chemicals. What is Micron's plan to avoid polluting our water, soil, and air?

I'm also worried about renewable energy. Climate change is humanity's biggest challenge. What is Micron's plan for powering their plant? Will they use 100% renewable energy? Are they building solar or geothermal or wind? The public needs to know.

Finally, what is Micron's plans for restoring the wetlands they are destroying? These are not only important for ecological reasons, but also prevent flooding. The public needs to know how Micron will invest in the environment.

I'm looking forward to hearing the answers to these questions.

Sincerely,

Sari Fordham

RE: Comments on Micron Semiconductor Facility DEIS (Clay, NY)

To Whom It May Concern,

I am submitting these comments regarding the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor fabrication facility in Clay, NY. While I reside approximately 80 miles from the site, the scale of this project raises significant concerns about its regional impacts, including effects on wetlands, water resources, pollution, and downstream communities like Pittsfield. Below are my key questions and comments for the record:

1. Wetland and Habitat Destruction

The DEIS acknowledges the permanent loss of **193 acres of federal wetlands** and **6,283 linear feet of surface water features**, with mitigation proposed at a 2:1 ratio. However:

- How will the mitigation sites be monitored and enforced to ensure ecological equivalence, especially given the irreversible loss of existing wetland functions (e.g., flood control, species habitat)?
- What safeguards are in place to protect federally listed species (e.g., Indiana bat, northern harrier) during and after construction, given the acknowledged "unavoidable" harm to their habitats?

2. Water Resource Strains

The project's water demand and wastewater discharge pose risks:

- How will Micron ensure that wastewater containing **chemical toxins** (e.g., PFAS, heavy metals) from semiconductor manufacturing will not contaminate groundwater or downstream communities?

3. Air Quality and GHG Emissions

While the DEIS states compliance with air quality standards, the project's "**unavoidable**" **GHG emissions** conflict with New York's CLCPA goals:

- How will Micron's "significant adverse effects on climate change" be reconciled with state mandates?
- Will the promised renewable energy credits (RECs) actually reduce regional emissions, or merely offset them on paper?

4. Cumulative Impacts on Surrounding Communities

While the DEIS acknowledges the project's growth-inducing effects, smaller communities like mine—though potentially benefiting from economic spillover—**may lack the financial capacity to absorb sudden strains** on housing, infrastructure, and public services. For example:

- How will Onondaga County coordinate with surrounding towns to ensure **equitable distribution of tax revenues** or state/federal aid to offset costs (e.g., road maintenance, school enrollment surges, emergency services)?

- What mechanisms (e.g., regional task forces, Micron-funded grants) will be implemented to help smaller communities **plan for and manage growth** without overextending local budgets?

The DEIS assumes local governments can adapt, but many lack resources for proactive planning. Clear commitments from OCIDA and project partners are needed to prevent smaller towns from bearing disproportionate burdens.

5. Transparency and Long-Term Accountability

- How will the public access real-time data on pollution, water usage, and mitigation progress?

- What financial assurances (e.g., bonds, penalties) will Micron provide to cover future remediation costs if environmental harm occurs?

I urge the agencies to:

1. **Strengthen mitigation requirements** for wetlands and species impacts, with independent oversight.

2. **Mandate stricter pollution controls** for wastewater and air emissions, including zero-discharge standards for hazardous chemicals.

3. **Expand the environmental justice analysis** to include downstream communities like mine, which may face indirect burdens.

4. **Require a phased construction review** to reassess impacts at each stage, rather than relying on upfront projections.

5. **Create a dedicated conservation area** of equal or greater size (e.g., 250+ acres) within the region, with comparable hydrologic and ecological features to the lost wetlands.

- Partner with local environmental organizations to **permanently protect and restore** this land as a refuge for displaced species (e.g., bats, grassland birds) and a carbon sink.

- Publicly commit to this mitigation upfront**, with transparent monitoring, to demonstrate responsiveness to community concerns about environmental trade-offs.

This would not only address ecological damage but also build trust with residents who fear the project's legacy will be purely industrial. The **permanent loss of 193 acres of wetlands and critical wildlife habitat** demands proactive, compensatory conservation.

This project must not prioritize economic gains over irreversible ecological harm. Thank you for considering these concerns. I request written responses to my questions and notification of any revisions to the DEIS.

Sincerely,
Cindy Taren

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Ms. Kristina Winter

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Ms. Barbara Harrison

The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

It is my opinion that all of the concerns I have would be dramatically reduced if the size of the project were to be reduced from four fabs to two. Thank you.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Mr. Hubert Kimball

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Mr. Stephen Heinzelman

21 Farm Field Ln Pittsford, NY 14534-2863

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

There are many obvious positives to Micron coming there have to be stronger regulations regarding PFAS and other environmental issues.

I live on Skaneateles lake and I understand the importance of protecting our water. It is a continuous effort on our part to keep Skaneateles clean and safe.

I also just had a very unnerving conversation with someone who happens to live in a different state but they have been told that they should not plant crops directly in this ground on their property because the lead levels in the ground are insanely high. They have been told this is the result of the paint on older houses chipping off that contained lead and the use of leaded gasoline in the past contaminating their Earth. They do not live in an industrial area. They live in a quiet, residential City area.

Please strengthen the requirements for Micron to protect our future generations now, before they start causing irreparable damage to our environment. The employment opportunities will be vast but don't make it at vast expense to the environment. And we only have one Earth.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Mrs. Diane Maguire

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Micron must also commit to an on-site pretreatment of wastewater to remove PFAS to the lowest technically achievable levels before discharge.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Mrs. Katherine Graham

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Please address these concerns for the health of all of us!!

Sincerely,

Jennifer Baron

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Ms. Jennifer Baron

The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,
Mrs. Judy Smith

Subject: [EXTERNAL] Micron Project Draft Environmental Impact Statement

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale.
