Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,
Mr. Joseph Serigano

Subject: [EXTERNAL] Micron Project Draft Environmental Impact Statement

Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Dear Onondaga County Industrial Development Agency,

I am writing to express serious concerns about the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility. As one of the largest industrial developments in New York State's history, this project must be held to the highest standards of environmental responsibility and public health protection.

Micron must commit to phasing out the use of all PFAS chemicals and prioritizing safer, non-toxic alternatives wherever technically feasible. Numerous other companies in the semiconductor industry have already adopted effective substitutes to PFAS chemicals. The DEIS should ensure full transparency on the presence and use of PFAS at the manufacturing facility. The public has a right to know if toxic PFAS chemicals may be used and discharged into their environment.

Also, Micron has only simplistically addressed risks to the safety of our local water supply. The EIS should have a more fully developed vulnerability assessment/risk management approach to addressing any potential accidental spills that could easily enter the Oneida River and ultimately impact OCWA's water intake.

Additionally, the destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable, particularly in a region as water-rich and ecologically sensitive as Central New York. Wetlands provide essential services like water purification, flood mitigation, and habitat for wildlife. The proposed 2:1 mitigation ratio does not come close to replacing these losses of high value wetlands. The DEIS should require a minimum 10:1 mitigation ratio and prioritize restoration efforts near the impacted areas to preserve watershed integrity.

Micron must also go much further in maximizing on-site renewable energy generation. The proposed 4 megawatts of solar energy is a fraction of what is needed to power a facility of this scale. All viable rooftop, parking, and adjacent land areas should be evaluated for solar deployment, and geothermal energy options should be fully explored. Finally, I urge Micron to avoid relying on speculative new or advanced nuclear development to meet its energy needs. New nuclear power is costly, unproven in this timeframe, and carries long-term environmental risks. Clean, proven renewable technologies like solar, wind, and geothermal are the right path forward for this project and for New York's climate goals.

Micron has the opportunity to be a leader in sustainable technology and corporate responsibility. I urge you to strengthen the final EIS to reflect meaningful action on limiting PFAS, pretreating wastewater for PFAS chemicals, protecting wetlands, and maximizing clean, local renewable energy solutions.

Sincerely,

Mrs. Susan LeBlanc

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Doreen Tignanelli

Comments regarding Micron:

In 1998 Hyundai, which became Hynix, opened a semi-conductor chip plant in Eugene, Oregon. At \$1.5 billion dollars, it was the biggest private project to have ever been built in the state of Oregon. It was welcomed by both the townspeople and government for all it would do for the local economy and growth of Eugene. Hynix was given \$27 million dollars in tax breaks in exchange for the promised creation of over 1000 new jobs and a robust presence in the community. When the temporary construction jobs were finished, there were about 900 permanent new jobs remaining. In 2001, just 3 years after opening, an economic downturn and rapid changes in technology resulted in a layoff of 600 of those jobs. A year later, the plant closed to retool at a cost of \$156 million dollars and an additional \$2.2 million dollar tax break from the city. Micron then tried to buy the plant but the deal didn't materialize. In 2006 Hynix said they would invest another \$250 million and create 100 jobs. We all believed it would happen because why would they abandon a project in which they were already heavily invested? Well it didn't happen. And in 2008 it was permanently abandoned and still sits empty today. Ten years from opening to permanently shut down, only half of which were in production.

How did the Eugene community benefit from this? The city lost money having provided nearly \$30 million in tax breaks. Hynix used huge amounts of the seemingly endless water, some of the purest in the country, and benefited from the proximity to the Columbia River for power at a low rate while the public incurred utility rate increases. Those employed by Hynix were now on unemployment insurance and looking for work. It did not bring great prosperity to the area. A few people got very rich but most of the community did not feel any trickle down and nothing got to those most in need.

Now we have Micron selling itself to Central New York. It is on a massive scale compared to the project in Eugene, Oregon, so the problems and effects from it, though reminiscent, will be more far reaching and impactful. The DEIS fails to address many of the issues and impacts of this huge project. It will devastate multiple environments, from the loss of valuable wetlands to the source of Onondaga County's drinking water.

A wetlands takes dozens, if not hundreds of years to become an established and viable habitat. Restoration and replacement will not mitigate the loss of the hundreds of acres of wetlands. The endangered species in these wetlands will likely not survive.

Huge amounts of clean water are necessary to meet Micron's production target, water to be taken from Lake Ontario. The production waste water will be processed and returned to Lake Ontario via the Oneida and Oswego Rivers. It will then be discharged into Lake Ontario a mere two miles from Onondaga County's source of drinking water. Since the effectiveness of the cleaning process is not clear in the DEIS, the water may contain contaminants, including PFAs, that have yet to be identified by Micron or the DEIS.

The electricity usage will also be enormous, yet no renewable energy component is included in Micron's project other than an insignificant amount of solar that will provide .0003% of the fabs' electricity. This enormous use of power and water will ultimately be underwritten by us, the general public, in higher rates and compromised resource quality.

There are so many additional issues and questions to be answered: Traffic, air quality, water quality, storm water

runoff from 600 acres of impermeable surfaces, impact on wildlife, not to mention community quality of life issues. The time period for public education and comments is horribly inadequate. Please extend it for another 60-90 days to allow for more community outreach and input. With so many issues still unanswered and unclear in the DEIS, allowing time for a more complete document seems extremely reasonable.

Will Micron be of huge benefit to the CNY community? Like in Eugene, it will make some people very rich and provide others with steady employment. But the impact felt by most of the population of CNY will more traffic, a higher cost of living, and the loss of a quality of life that has always made CNY so very, very special.

And who is to say they will even complete the project? Technology and markets change faster than plans are drawn or fabs are built. The technology for which the fabs are designed and tooled will likely be obsolete before the project is complete in 2041. Will they retool the fabs or abandon them? And how many of the 9000 jobs will have been replaced by AI? Would it not be wiser to build one or two fabs, then assess technology and market changes rather than to commit to build four fabs that may be a much bigger impact than necessary? This proposal from Micron is far from being ready to implement as seen by the many holes in the DEIS.

Thank you,

Judy Granatstein

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Nia Delardi

Dear Members of the CPO and OCIDA,

As a local grandfather, pediatrician, and public health physician I would like to be sure that we are able to protect our environment and promote health in our area while building to meet the needs of the future. Please address potential water, air, energy, and PFAS problems before they cause health problems?

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Phillip Gioia

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

My family and my in-laws, including very young nieces and nephews, continue to live in the CNY area: Bridgeport, Liverpool, Geddes and Onondaga Hill. We swim regularly in Oneida Lake, and value protecting that watershed. The health and sustainability of the area remains near and dear to my heart. I grew up in the shadow of Onondaga Lake, whose ecological destruction is a testament to the harms business can do without appropriate precautions. I fully support the idea of Micron bringing industry to the area. But I would want every effort given to sustainability and placing Micron as a model for how to make an area better with business. I encourage you to invest in monitoring and compliance, in addition to minimizing waste and building renewable energy sources that are likely better for business in the long term anyway. The DEIS warrants a full exploration of these concerns.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Dear Members of the CPO and OCIDA,

Some actions are not reversible. Please protect my young sons' future. Be leaders, not followers.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Lisa Pasch

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

People cannot live on andquot;microchipsandquot; they cannot eat them or nourish their bodies with microchips. And there isnandapos;t enough money to clean up the waste from their manufacturing process. We just had the hottest year on record. Water is essential for humans to live, for pets/livestock to live, for food crops to grow. If you destroy vital water resources to make an unnecessary product, have no plan to stop environmental disaster or have no sizeable multi-billion \$ bond to fix any disaster, then we will create yet another cycle of destruction. You must insist on a full EIS, which includes not just how flooded areas will be economically compensated, but how water -- on those 102 days when animals, plants and people -need it -will be adversely affected. And you MUST extend the comment period and advertise it widely in NY.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

I live in Troy, NY where we have seen the horrible, immediate problems with habitat destruction. The scale of the development that caused these disruptions is minuscule compared to the intervention proposed in Clay. Now, more than ever, we need to be incredibly mindful of how proposed developments will impact not just the environment itself but the people and animals that live around it. I urge you to look into this matter deeply, and to investigate if there is not an already developed site that is laying unused that could be the site of the facility instead.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

All these factors must be addressed before moving forward with such a project.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Donna Keem

Dear Members of the CPO and OCIDA,

This is a wonderful project. Let's make sure that it has and causes minimal negative environmental impact.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Jamie Johnson

Dear Members of the CPO and OCIDA,

I am especially concerned about the enormous amounts of water and electricity that Micron will use. Outside of Atlanta, people living near a data center lost the water for their homes. In NY, our electric rates already are sky high. The huge demand for electricity from a data center will raise those rates. Energy from nuclear reactors is higher per kilowatt hour than energy from renewable sources like wind, solar, geothermal and hydro power. Yet Hochul andapos;s plan is to power the Micron plant with nuclear energy. Lastly, if a new nuclear reactor is built, it will become a permanent nuclear waste dump because there is nowhere to put the waste.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or

substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

I have a number of Tonawanda Seneca friends who will be negatively affected by this proposed semiconductor project. The area chosen for the build out is literally adjacent to their reservation and apos;s nature preserve. The waters and tolls that will be negatively affected include theirs not to mention many persons and their families down stream from them. Maybe you all need to actually be friends will and identify yourselves as friends of these Senecas before you can have compassion for the destruction of their ONLY REMAINING lands, this after it was already taken over by white colonist New Yorkers. WHY allow more of their acres to be toxically affected? Can you imagine why not?

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Dear Members of the CPO and OCIDA,

Although we are all excited to welcome Micron and the jobs and economic contributions to the area, I am concerned about our natural resources and the environmental impacts. These wetlands are home to so many species of plants and animals. We are hopeful that you can address these concerns.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Ruth Davidowitz

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Please show us in detail how a great economic opportunity can be considerate of environmental—and therefore human—concerns.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS “forever chemicals,” but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

I am echoing the concerns raised by the Atlantic Chapter of the Sierra Club. I feel strong connection to Syracuse and the Finger Lakes region, having lived there while I earned my degree in geography at Syracuse University. It is so important to protect that environment.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Dear Members of the CPO and OCIDA,

Microchip Manufacturing is a must for the good of the nation. If some grief must be accommodated, remember it is for the good of the nation. Therefore, I am for the construction of this Factory.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Robert Rose

Dear Members of the CPO and OCIDA,

ANOTHER SO-CALLED "JOB CREATOR" AT THE EXPENSE OF VITAL ENVIRONMENT WETLANDS, WATER, ETC...!!!! THESE PROJECTS SHOED IN BY HEADLINE GRABBING POLITICIANS WITH NO REGARD TO THE DESTRUCTION ALWAYS ARE HIDDEN, NOT MADE PUBLIC OR IGNORED...!!!! POLITICIANS ALWAYS "CLAIMING" (N.Y. DEMOCRATS) TO BE CONCERNED WITH PLANET DAMAGING ISSUES (FOSSIL FUELS, ELECTRIC VEHICLES and SCHOOL BUSES, AIR POLLUTION, ETC...!!) IGNORE THE DESTRUCTION WHEN A "JOB CREATOR" COMES ALONG...!!! PATHETIC, LYING FRAUDS...!!!! JUST THANKFUL THAT I DO NOT LIVE ANYWHERE NEAR THIS CHIP PLANT AND ALL IT'S POISON PRODUCING SIDE EFFECTS...!!!! OF COURSE POLITICAL STOOGES WILL PUSH THIS PROJECT AHEAD FOR PUBLICITY. CAMPAIGN DONATIONS, AND B.S. !!!! BOTTOM LINE = WE CAN NEVER ...!!!! TRUST OR BELIEVE ANY POLITICIAN , LEFT OR RIGHT , ANY LONGER...!!! THEY'RE IN IT FOR THEMSELVES = SCREW THE PUBLIC, SCREW OUR ENVIRONMENT , SCREW THE FUTURE OF ALL OUR CHILDREN/GRANDCHILDREN...!!!!!!!!!!!!!!!!!!!!!!!!!!!!

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Dear Members of the CPO and OCIDA,

my voice as a person in the future 1. will it destroy the wetlands, thus affecting the biodiversity and water table?

2. will they ask for nuclear power? there is no safe plant

in the world (no place to put the waste, vulnerable to terror attacks--think 9/11 by plane and now drones) think about what Russia is doing to Chernobyl. Think about where the uranium is mined from. usually indigenous land.

3. I want to live in an environmentally safe place. this will pollute the air, water and land. We only have one planet how could anyone want to destroy it and expose the people to sickness and high expenses.

look at the track record for Dan Foss ,and Wolfsped.

When will Micon go the same way?

What will their pilot program from IDA be(30 years of no payments while I and the community suffer.

Who and for how much will the plant be insured for?

If an accident, how will the people be helped? We see the state of Fema now.

So, how will my life be changed in 50 years if this goes through?

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

The Micron Project poses risks to the environment and health of citizens, please do a complete assessment of the negative impacts of the project. The project will have profoundly negative impacts and could cause significant harm to human health and the environment. It could violate New Yorkandapos;s environmental and public health standards.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Although the Micron project slated for Clay, N.Y can be looked upon as a potential economic boon for a large portion of Central of Central New York, production of the micro chips would cause numerous and far reaching deleterious environmental problems that have been detailed in a review of the DEIS. In the face of the Projectandapos;s environmental damage, the Micron Project oil Clay, NY will do far more harm than good.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

I grew up in Central New York and its environment and taxpayers are important to me.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

As a professional in the semiconductor industry for 25 years, I know the impacts that a fab can have on the local environment. I also know that chip manufacturers in the past have taken the correct measures to protect the environment from the hazards associated with this type of manufacturing. It's exciting to see the semiconductor industry come back to the US but let's do it the right way take care of the community and the people first and it will pay off for your business and everyone. Let's not trash our environment for the sake of the dollar. Think of the future of our cities, towns, and planet, and add world-class mitigation and prevention if you want to be world-class.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or

substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Dear Members of the CPO and OCIDA,

To put it bluntly, the DEIS is woefully inadequate. It does not address key question on the impact to ground and surface water, environmental impacts and worker safety. If these concerns cannot be addressed, the project should not go forward.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Dear Members of the CPO and OCIDA,

Substitute a nuclear energy for other resources is not a sustainable alternative. It's just trading the problem of climate change for the problem nuclear waste, which is also unsustainable. Nuclear energy is excessively expensive and we have other forms of renewable energy that are not radioactive and are not so expensive and troublesome to the supplier and the public. We need to conserve what water we have left for human consumption, not for radioactive cooling systems. The environmental effects are not clear as much as we wish they were. Public subsidizing private companies with taxpayer money is not OK this company Should be working on reducing energy usage not drawing from the grid that is so desperately overused.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

As a retired NYS science teacher, resident on the mainland St; Lawrence River for over 50 years and grandmother, and Board member of Save The River in Clayton NY, I have grave concerns regarding the health of not just waters of the immediate facility but the effects on Lake Ontario and ultimately the St. Lawrence River. PFAS and other regulated or not chemicals in manufacture must be monitored continually in the air, water and facility. In house workers deserve semi annual health monitoring for the same. Have you set alternative energy plans now not after, geothermal, wind, solar. Wetlands lost can be replaced with auxiliary created elsewhere acre for acre.

Time to ecologically MAGA UP. Make America Great Again environmentally!!

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and

disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Janet Burrows

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Amendment to the Bill of Rights of the NYS Constitution: "Each person shall have a right to clean air and water, and a healthful environment." I worked incredibly hard, especially during the Fall of 2021, to ensure that voters understood what the proposed "Green Amendment" was all about and to ask for their YES vote on the November ballot. And they DID vote YES - overwhelmingly - regardless of political party.

At the heart of this monstrous project with its woefully inadequate DEIS are critical questions about the rights of the people of NY to clean air, clean water, and a healthful environment. People must be given adequate time to comment on a project that will remove 445 acres of trees and shrubs, 200 acres of wetlands, and 8,000 linear feet of streams! It will affect lives, flora, and fauna in unimaginable ways, with lasting effects.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Any negative environmental impact should mandate this project be canceled.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Robert Goetz

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Jim Long

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Americans value our clean air, water and natural green spaces. It is important to protect our natural resources as well when preparing and building new businesses!

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

The Micron project would destroy hundreds of acres of wetlands that provide habitat for at risk species as well as natural flood mitigation. The DEIS fails to properly address water systems and ecological concerns, nor does it provide satisfactory plans to restore nearby wetlands and mitigate on site wetlands loss.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Dear Members of the CPO and OCIDA,

WE MUST PROTECT the habitat and the diversity of environment to maintain a healthy biodiversity,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Given the challenges facing the environment we should be providing incentives for ecologically positive (or, at least, benign) industries. Our water, air and soil are endangered by pollution, exploitation and over use. NY must make sure that Micron is mindful in their use of our natural resources.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

As a hiker, swimmer, and long-term resident of the Finger Lakes region, I care deeply about maintaining its reasonably decent environmental quality. We need to ensure that Micron Technology does not act in a way that threatens our land and water resources.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Madeleine Glick

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

As an aquatic biologist who studies wetlands, I am particularly distressed that this project would destroy hundreds of acres of wetlands, which provide habitat for many species and serve to prevent/reduce flooding. These issues are not addressed in the DEIS.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

New York appreciates progress and employment opportunities. However, the potential risk to human life because of toxic substances, and harmful environmental impacts. Serious consideration should be given to all stakeholders and input before any final decisions are made.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Carol Mcloughlin

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

This plant must not be approved if they cannot show how they will protect the environment from "forever" chemicals. Furthermore, it should not be allowed to destroy 100s of acres of wetlands! Wetlands are important ecological features that help mitigate storms and excess rainfall, and which provide habitat for 100s of species of wildlife. If this plant cannot be built without destroying these habitats, then it should NOT be built, period!

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that

is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Dear Members of the CPO and OCIDA,

I am asking you (corporate America) to consider for a moment, just one moment and ponder why? Those in power the billionaires of America, are scrambling to find sustainable life on Mars. It is because they know we are destroying our planet here on Earth.

No doubt!

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Judy Friedman

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Dear Members of the CPO and OCIDA,

The draft environmental impact statement submitted by the Onandaga IDA and the U.S. Department of Commerce regarding the proposed Micron industries facility in Syracuse N. Y. does not address the environmental impacts, environmental restoration or worker safety issues related to the proposed plant's construction and operation. It is shoddy and incomplete and in no way is it the basis for proceeding with the issuance of permits

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

The DEIS will destroy what makes CNY great- clean air and water. As well as impacting the agribusiness, which benefits both CNY and the broader US. This project is causing me to rethinking of staying in CNY and a Clay resident because the impact of this project will remove all the benefits and reasons for staying.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Dear Members of the CPO and OCIDA,

While many of us CNY citizens are excited about Micron - we are also very worried about all pollution it will create and how it will be responsibly disposed of. Water and air pollution in particular are big worries. While welcome the economic pluses - we also dread the toxic side effects! Please in the name of all that is good - do not let them off the hook in dealing with these long lasting issues. We the People do not want cancer clusters just to create some decent paying jobs.

Thank You,

Christopher in Syracuse, NY

Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Barbara Reukauf

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

As a New York State resident I am concerned about the environmental impacts of the new microchip facility being constructed by Micron Technology in Clay. I believe that the draft DEIS must provide additional analysis to protect water quality, ground water, and surface water. It must also provide more information on what kinds of chemicals will be used in the microchip production, and how these chemicals will be monitored and enforced in order to minimize contamination of air, water and soil, and also to protect workers and the public's health and safety. And DEIS does not ensure that Micron and the public's massive energy and water use will not make energy and clean water less affordable and pass the cost of infrastructure upgrades and higher energy demands resulting from the project on to rate payers. Thank you for your attention to my concerns. Sincerely, Ms. Araby Parsons

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Jim Eigo

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

I am extremely concerned about the impact of this project on our environment here in NY State. More needs to be done to protect the habitat in the area as this project develops. Please make sure Micron does everything possible to limit their adverse impact on the environment.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Please protect the quality of life for those of us living in beautiful central New York by addressing the environmental impacts of Micron's proposed facility. Please hold strong for us against a corporation that seems to want to shift the costs of its environmental impacts to the people.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

I urge you to stop Micron's project from progressing until we the people have more time to review the very lengthy report. In particular, I want answers about why wetlands will be destroyed when these areas need protection so that humans and all species can thrive and survive. And, adding chemicals including PFAS to the environment is unacceptable and we need answers about how Micron will minimize exposure to the public.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Maintenance of habitat services and elimination of greenhouse gasses are most important to me.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Boyce Sherwin

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Dear Members of the CPO and OCIDA,

First of all, for the public trying to write comments on a 20,000 page document in a 45 day period is not attainable. This comment period must be extended for at least 90 more days.

Once wetlands and habitata are destroyed - they can never be brought back.

Without a complete list of the toxic chemicals - including PFSandapos;s that will be emitted into the air, water and soil, it is not possible to even write comments. Once agin, once these toxins are released - they can never be undone. Mitigation is not the answer. Not allowing this monstrosity to move forward is the answer.

regarding Green House Gases - one can not pollute and create dirty energy and then receive andquot;creditandquot; for planting trees or using solar in some ridiculously small way.

This project pits the peoples right to clean water and affordable , renewable energy against corporate greed - for profit with benefiting the people. Water is life and it does not belong to a corporation.

A totally destructive project. Donandapos;t do it.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Our environment is already threatened. Please make sure to address all of the concerns brought up here especially in regards to destroying the wetlands.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Patricia Vineski

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

Hey...any interest in saving the only planet any.of us have anymore...? Oh yeah...andquot;Invaders From Earthandquot;

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Dear Members of the CPO and OCIDA,

I welcome a new semiconductor facility on US soil, but ask that additional effort be placed on ensuring that the plant will use a new source of renewable energy, and not hijack an existing supply, driving up prices and delaying the CLCPA schedule for removal of fossil fuel based energy sources.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green

CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

It's important to maintain the ecology of the planet.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Dear Members of the CPO and OCIDA,

My name is Mary Finneran and I live in Greene County NY. I did live in the Syracuse area for 15 years and have a fair knowledge of the environs. I am very concerned about the extreme energy use and how that energy might be taken from the people and its needs, including renewable energy use. I am also concerned about the energy source if it is natural gas upstream and downstream impacts must be considered especially the methane emissions which are the worst GHG emissions. I would be equally concerned if nuclear were to be considered the energy source due to the radioactivity, affordability lack, and the serious waste issues from the start to the end of the process, from uranium mining tailings to the spent fuel rods. I am not aware whether the US fish and wildlife eagle takings have been considered. They are now common near Onondaga lake and have likely spread into Clay. Remember the prime DEC mission is to protect the environment.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

- Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

- Affordable and Abundant Water and Energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Mary Finneran

Subject: [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001; Micron Project in Clay, NY

Importance: Normal

Sensitivity: None

Dear Members of the CPO and OCIDA,

The Micron project is not inherently a bad thing, but the environmental impacts must be understood, presented clearly to the public and mitigated before and as an ongoing requirement to the facility's operation. There's a lot of money to be made here; environmental responsibility must be considered and factored into the operating budget.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. The 20,000-page DEIS report leaves many questions unanswered about the potential impacts and mitigation measures associated with Micron's Central New York Project.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources:** The Micron project is slated to destroy hundreds of acres of wetlands that provide habitat for species and provide natural flood mitigation. The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds. Ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers:** Microchip production requires numerous toxic chemicals, including PFAS "forever chemicals," but the DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the use of thousands of tons of hazardous chemicals in semiconductor production every year. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar, and without relying on renewable energy credits or using renewable energy that is already on the grid, to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
- **Affordable and Abundant Water and Energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of

infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

Thank you for your consideration of my comments.

Sincerely,

Sincerely,

Martha Lynch

Subject: Extend the comment period

To whom it may concern:

Out of respect for the future generations of the CNY region and for the safety and peace of its current residents and children, please do the right thing and extend the comment period to at least 120 days. Make this a collaborative process that includes the voices of those most impacted by the proposed Micron development. It won't be successful unless the right and just thing is done. If the past has taught us anything, haste makes waste and destroys our most vital natural gifts. Onondaga Lake is proof of that. Our community deserves better and Micron and our elected officials can do better!

Respectfully,

--

Ms. Qiana Williams

Subject: Micron EIS - Clay NY

Thank you for the opportunity to review the EIS for the proposed semiconductor fabrication facility being built by Micron in Clay NY. I plan on submitting comments and have accessed all the available documents. I am a retired chemical engineer, spending the early part of my career working at a semiconductor facility as a facilities chemical/environmental engineer so I have a keen interest in reviewing the EIS. In my personal planning to review the EIS, I observed the following:

1. The main body of the EIS is 719 pages
2. The appendices are in numerous files (18 total Appendices (A-R) in 19 files) totaling 19,251 pages. Note the Transportation appendix is 12,369 pages alone which may be of most interest to general public.
3. The total number of pages to review is 19,970 pages

I believe the proposed review period of 45 days is not sufficient for the public to be able to review such a consequential document. If I (or anyone else in the public) had nothing else to do we need to read 444 pages/day to get through the entire document in 45 days, which leaves no time to write up comments. We are now in summer season and most people, including myself, have many other things going on so in my opinion 45 days is woefully insufficient to be able to adequately review the report and develop meaningful comments. The public deserves more time and it would be helpful if the EIS team could hold several public sessions to present their findings (consider covering different specific topics each session) and answer questions. I realize you all have a desire to start construction but this important investment in our community deserves ample time for the public to fully understand what the impacts are expected to be, and it's in Micron's and the public agencies' interest to have the public fully prepared for what's to come, so I respectfully request we be provided 120 days to review the documents and submit comments. This would take the pressure off having to sacrifice vacation or family time over the summer and allow some review time in the fall. Thank you for the opportunity to review and comment on the documents as well as your consideration to extend the public review period.

Subject: Public comment MICRON

Hello,

This email is to serve as public comment on the Micron project and the newly released DEIS document.

It is my understanding that on June 25, 2025, the Onondaga County Industrial Development Agency (OCIDA)- a major sponsor of Micron Technology's microchip manufacturing project in New York- released [the Draft Environmental Impact Statement \(DEIS\)](#) for the project.

The **public comment period** for this massive factory project, which will use more water than the city of Syracuse and as much energy as the states of Vermont and New Hampshire combined, is only 45 days long- open **until Monday, August 11, 2025-** with only one day of public hearings announced on July 24, 2025.

This is not nearly enough time or opportunity for members of the public to carefully review and provide meaningful input on the lengthy DEIS (it has almost 20,000 pages of appendices!) for Micron's \$100 billion plan- the largest industrial development project in NY State history and the largest microchip fabrication facility in US history. Micron is receiving \$5.5 billion in NY Green CHIPS Act subsidies and upwards of \$20 billion in total public subsidies.

Therefore, as a community member and taxpayer, I am formally requesting that at least 120 days be provided for the public to review the massive Micron DEIS document and allow time for us all voice our concerns about the impact on our local environment.

Thank you for your attention to this very important matter.

Kelly Forsyth

Subject: Micron DEIS document

I am requesting at **LEAST 120 days for our communities to review** the Micron DEIS document. The time provided is too short to review such large findings. One town hall for one hour is not enough to discuss concerns. This shows that you really don't care what local citizens have to say about something that will affect their homes and lives.

I am wondering what considerations, if any, were made when selecting the sites regarding mosquito borne diseases that are endemic to this area? Adding wetlands to areas of Oswego County such as Hastings that have regularly tested positive for both Eastern Equine Encephalitis and West Nile Virus seems concerning in this regard. Will these new wetlands be constructed to minimize mosquito production by managing water flow, vegetation, depth, etc? Will there be disease vector monitoring done at these new sites?

Subject: Extend Micron Comment Period

Hello Onondaga County Industrial Development Agency,

Our community in Onondaga County needs more time to review what Micron has proposed. There is far too much for us to read and understand as community members before August 11th. Please extend the comment period to 150 days. Many of us are likely to be affected by the proposed changes to our natural environment, and we have a right to know about what exactly Micron is planning before that plan is approved.

It is also a well known fact that many members of our community have difficulty accessing these comments, and thus their opinions often are brushed aside. This is especially true for our most affected members of the community, who frequently show up in person but do not have access to or a thorough understanding of the necessary technology to make comments online.

Scheduling multiple meetings, please include at least five, would allow the community to fully participate.

Best,
MoAde M. Jagusah

Request for Extension of Comment Period for the Micron Project

To whom it may concern:

We are writing on behalf of our client Jobs to Move America (“JMA”). JMA is a strategic policy center that advocates for climate policies that center worker and community voices. Our client recognizes that public investments in advanced technologies and critical climate infrastructure can create millions of good jobs for workers, especially those who have historically been denied good jobs in the manufacturing sector.

Yesterday, the CHIPS Program Office (“CPO”) and the Onondaga County Industrial Development Agency (“OCIDA”), as Lead Agencies for National Environmental Policy Act (“NEPA”) and State Environmental Quality Review Act (“SEQRA”), review, released the Draft Environmental Impact Assessment (“DEIS”) for the Micron Project. According to the Notice of Availability comments must be provided by August 11, 2025. In addition, oral public comments will be taken on July 24, 2025.

As a matter of law, SEQRA contains a “statutory obligation to provide a **reasonable and meaningful opportunity** for public comment.” *Matter of West Village Committee v Zagata*, 242 A.D.2d 91, 98 (3d Dept. 1998). While regulations specify a **minimum** comment period, no upper limit is stated. 6 NYCRR 617.12(a)(2)(iii). Similarly, under NEPA, the public must be provided an opportunity for meaningful participation through the comment process. *Florida Power & Light Co. v. United States*, 846 F.2d 765, 771 (D.C.Cir.1988) (holding that, not only must an agency give adequate time for comments, but it also “must provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully”). A month and a half is an unreasonably short period of time for written comments on a project and a DEIS

of this magnitude. Even more unreasonable is the expectation that the public make oral comments less than one month from the publication of the availability notice.¹

The DEIS is approximately 20,000 pages in 22 volumes. The pdf files are collectively over 1 GB in size. Seven large engineering firms were engaged to complete the DEIS, along with CPO, OCIDA, and Micron staff. Micron submitted an early draft of the DEIS to CPO and OCIDA in late December 2024. CPO and OCIDA then took approximately six months to make the report complete enough to present to the public. In total, the DEIS took Micron, CPO, and OCIDA over a year and a half to complete following the Final SEQRA Scoping issued in December 14, 2023. The scale of the assessment is not surprising because the Micron Project is one of the biggest, if not the biggest, projects in New York ever assessed under SEQRA and NEPA. What is surprising is that CPO and OCIDA expect the public to read, analyze, and meaningfully comment on this huge report in such short time periods.

The issues to be addressed are complex. The DEIS identifies the following 16 areas of environmental analysis: Land Use, Zoning, and Public Policy; Geography, Soils, and Topography; Water Resources; Biological Resources; Historic and Cultural Resources; Air Quality; Greenhouse (GHG) Emissions, Climate Change, and Climate Resiliency; Solid Waste, Hazardous Waste, and Hazardous Materials; Human Health and Safety; Utilities and Infrastructure; Transportation and Traffic; Noise and Vibration; Visual Effects and Community Character; Community Facilities, Open space, and Recreation; Socioeconomic Conditions; and Environmental Justice. It identifies Unavoidable Significant Adverse Effects to Water Resources, Biological Resources, Climate Change, Transportation, and Noise.

A project and investment of the size of the Micron Project will create far reaching secondary impacts. As a subset of those effects, the power consumption is projected to be approximately 11% of New York's total supply. Although Micron has committed to using 100% renewable energy it is unclear how this will be provided. This additional demand for electricity could have major consequences. It is probably not coincidental that Governor Hochul directed state agencies to develop an upstate nuclear plant two days ago.² In addition, there are Disadvantaged Communities ("DACs") in Syracuse close to the project site. Without careful management, the effect of creating 40,000 jobs in the area could worsen conditions for DACs and affordable housing. These issues and many others, such as wetlands mitigation, PFAS treatment, and analysis of alternatives, are complex. A careful review of how they are addressed in the DEIS will take time

As mentioned above, SEQRA and NEPA requires agencies to provide a reasonable and meaningful opportunity for public comment. What is reasonable is somewhat subjective. However, we note that a 41-day comment period was provided for the scoping of this project.

¹ There is a strong precedent for extensions of DEIS comment periods as there are numerous examples of extensions in New York of DEIS comment periods for smaller projects over the decades that SEQRA has been governing environmental review of projects in New York State.

² <https://www.governor.ny.gov/news/governor-hochul-directs-new-york-power-authority-develop-zero-emission-advanced-nuclear-energy>

June 26, 2025

Page 3

The DEIS is a massive document that is far more voluminous and complex than the draft scope. Therefore, a 45-day comment period is wholly unreasonable and fails to provide the “meaningful opportunity for public comment” that SEQRA and NEPA require.

We therefore respectfully request that the comment period be extended to 120 days or October 22, 2025.

Thank you for your consideration.

Yours sincerely,

A handwritten signature in black ink, appearing to read "R. Webster", with a long, sweeping flourish extending to the right.

Richard Webster, Esq.

Subject: Micron

To Whom It May Concern:

Relative to the MICRON Draft EIS 2025, a few things should be addressed:

- the Micron fabs will draw massive amounts of electrical power. With the footprint (i.e., roof space) of the fabs, solar panels should be installed to cover as much of the roofs as possible. This will help alleviate some of the load on the grid and actually helps cool roofs and, consequently, interior spaces.
- the Micron fabs are going to draw massive amounts of water. Gray water systems should be installed to alleviate some of the water draw. While gray water cannot be used for manufacturing the chips, it can be used for toilets and basic cooling.
- it seems, as stated in the EIS, numerous endangered species are present where the fabs will be built. For example, certain bat species will be displaced. Bat boxes should be placed on site. Bats are important to the ecosystem (e.g., they eat mosquitos). Native plants should be used in any landscaping. Trees should be left in place where possible instead of just clear-cutting the entire site. Wetlands should be implemented into the design; removing wetlands and recreating them elsewhere is overall detrimental to long-term viability of species.

Thank you for your time.

Subject: Attn: Micron Project -- Please extend comments

Dear Chips Office,

Chips Communities United urges you to extend the period for public comment for the Micron Project in Clay NY. 45 days is nowhere near long enough for the public to read and respond to the almost 20,000 pages of documents in the draft EIS. (Note that city and county officials, whose job it is to address this matter, extended their own period of reading and processing the comments before releasing them to the public.) We call on you to provide 120 days of public comment with public hearings on more than one day.

This is a massive project that will have an enormous impact on the community and natural resources: please proceed in a responsible, accountable manner.

Yours,

Judith Barish

Micron and officers of CHIPSNEPA government agency

I is disturbing that an over 20,000 page document is made available with only a 45 day period to review and comment

This shows that Micron and its enablers do not want transparency and we the public must just accept it is 'for our own good'

This document supposedly addresses Air, Water, Waste, Transportation and other issue that will surely come from its plans if allowed to stand as is.

I Urge and in fact Demand that the review and comment period be extended to more than 45 days and certainly there should be more than one open hearing with comments from the public. What is Micron and government officers afraid might be exposes?

If all is well then good but I doubt this could be any better obtusfiscated so what is not being said. Give the public a chance to find the hidden dangers of this massive project so that if any benefits accrue to the good of the community they will not be tainted by poorly executed project.

Subject: Re: Micron EIS - Clay NY

I wanted to follow up on the comment I provided last week. First I was hoping you could confirm you received my comment, and I think it would be helpful if you would send confirmation of receipt to all commenters.

Secondly I recognize the desire to begin clearing activities this winter to accommodate the environmental window for disturbance to endangered species. However as noted in my original comment I believe an extension to the public comment period is warranted based on the magnitude of this project and its importance to our community, the state of New York as well as our national security. As such, one option to consider is for the regulatory agencies to issue a conditional approval for clearing activities prior to final issuance of the full EIS. The agencies could initially focus their review of public comments on clearing-related elements and then issue an approval for clearing with any conditions typically employed along with any to address public comments. The issuance of the final EIS for the entire project could then follow under the typical process. I recognize this isn't ideal for the regulatory agencies but it would facilitate a way to provide the public with ample time to review, digest and comment on the EIS while allowing the construction to commence in 2025.

Finally I would point out that NEPA provides for a minimum of 45 days of public review, and recognizes that extensions can be provided based on numerous factors. I would argue that this project absolutely warrants a longer comment period. Thank you again for the opportunity to comment on this transformative project in Central NY.

On Jun 25, 2025, at 5:48 PM, Paul Doody <pauldoody1978@gmail.com> wrote:

Thank you for the opportunity to review the EIS for the proposed semiconductor fabrication facility being built by Micron in Clay NY. I plan on submitting comments and have accessed all the available documents. I am a retired chemical engineer, spending the early part of

my career working at a semiconductor facility as a facilities chemical/environmental engineer so I have a keen interest in reviewing the EIS. In my personal planning to review the EIS, I observed the following:

1. The main body of the EIS is 719 pages
2. The appendices are in numerous files (18 total Appendices (A-R) in 19 files) totaling 19,251 pages. Note the Transportation appendix is 12,369 pages alone which may be of most interest to general public.
3. The total number of pages to review is 19,970 pages

I believe the proposed review period of 45 days is not sufficient for the public to be able to review such a consequential document. If I (or anyone else in the public) had nothing else to do we need to read 444 pages/day to get through the entire document in 45 days, which leaves no time to write up comments. We are now in summer season and most people, including myself, have many other things going on so in my opinion 45 days is woefully insufficient to be able to adequately review the report and develop meaningful comments. The public deserves more time and it would be helpful if the EIS team could hold several public sessions to present their findings (consider covering different specific topics each session) and answer questions. I realize you all have a desire to start construction but this important investment in our community deserves ample time for the public to fully understand what the impacts are expected to be, and it's in Micron's and the public agencies' interest to have the public fully prepared for what's to come, so I respectfully request we be provided 120 days to review the documents and submit comments. This would take the pressure off having to sacrifice vacation or family time over the summer and allow some review time in the fall. Thank you for the opportunity to review and comment on the documents as well as your consideration to extend the public review period.

Subject: Micron Project public comment

Onondaga County IDA
Attn. Micron Project
Syracuse, NY

Please extend the public comment period on the Draft EIS to 120 days, 45 days is insufficient for the deep dive necessary to study and comment on a project that would use more water than the city of Syracuse and as much energy as the states of Vermont and New Hampshire combined.

To quote from an email sent to me

This is not nearly enough time or opportunity for members of the public to carefully review and provide meaningful input on the lengthy DEIS (it has almost 20,000 pages of appendices!) for Micron's \$100 billion plan- the largest industrial development project in NY State history and the largest microchip fabrication facility in US history. Micron is receiving \$5.5 billion in NY Green CHIPS Act subsidies and upwards of \$20 billion in total public subsidies.

To be truly a public comment period enough time must be provided. Please extend the comment period and increase the number of in person public hearings to at least three.

Thank you.

Subject: Comment on CNY Micron project & DEIS

To whom it may concern, as a constituent of Central New York and Onondaga county, I strongly oppose the plan to bring Micron to Clay. The project will create many problems for the community and surrounding areas, as laid out in the 2,000 page DEIS released for public examination. Some of these problems include the massive consumption and redirection of public water sources to Micron, and the carbon waste that will be created as a result of their chip production. As a resident of the area and opponent of the project, it is only fair that my voice, along with the many other residents', are heard and allowed a chance to speak. Which is why I request that OCIDA and Micron extend the review period from 45 days to 120 days, and allow at least 5 public hearings for comment. Many residents aren't happy with the proposed consequences of bringing this project to CNY, and as taxpayers who are funding the project, they have a right to receive the most time and opportunity possible to read the statement, and make comments on the project. I hope that you will take these comments seriously and make appropriate accommodations that are truly in the best interest of the people who live here. Thank you for your time.

Subject: Extend period for public comment on Micron plant to 120 days

I am a New York resident. When a huge project such as the Micron Chip plant proposed for Onondaga county is being considered, I believe that the community affected should have adequate time to study the EIS and carefully consider the impact of the project. If it is a good fit for the community, then almost everyone will be supportive. If it is not, it should be modified, or in extreme cases, should not be built.

Here in Orange county where I live, we are saddled with a huge gas power plant that was never properly permitted but was built anyway. Once something is built, it is very hard to undo the momentum, so despite ongoing hardship and protest, we everyday residents are forced to live with it.

Give people time to learn about what is proposed and make suggestions so that the best possible plant with the least negative consequences is the one that is built.

Thank you for taking my comment.

Martha Lain

We cannot replace the earth's deep underground reservoirs of water. Rain doesn't do that, it only replaces surface water, streams, lakes, oceans, evaporation, clouds, more rain. The ground water is not replenished, and we have already taken so much of it that we have measurably changed the tilt of her axis.

We do not need chips. Corporations and governments and the uber rich think we need chips, but what we actually need is clean air, clean water, and planet compatible with our survival, and those are things we are destroying at an unbelievable rate.

Our grandchildren will never forgive us for putting profit and "keeping up with China" ahead of protecting the only home they'll ever have.

The harm done by building micron, the PFAS forever chemicals, the guzzling of water, the displacement of wildlife and clearing of carbon storing trees and wildlands—it's shortsighted, selfish, greedy, and unforgivable.

I have 13 grandchildren and 3 great grandchildren who are going to have to live on this planet for the next eighty years, and they'll have kids who will go on longer. But only if humans change their perspective immediately.

We are out of time. We can't wait around for the slow-witted to wake up. We must put the planet first NOW.

I would like to share my opinion on micron impact on the environment. I hope people's opinions matter. I worry about the effects it will have on wildlife, wetlands, water quality of life and global warming. It seems to me there are many more negatives than good things to this project. Can our area really support more people living here without ruining more of the green space displacing more wild life that would have to happen so that land could be developed to put in more homes to house people who would in turn maybe who would have children who might need more housing in the area, and by the time your done there would be no green space left which would lead to more global warming which I thought our governor was trying to fight with her initiatives. Also what if on some odd chance the technology changes or if Micron goes out of business like companies do sometimes .we destroyed land trees and habit for nothing. I don't know if you can get that back. I hope this is read and peoples opinions are given some consideration.

Subject: I am requesting AT LEAST 120 days for our communities to review the Micron DEIS document.

The **public comment period** for this massive factory project, which will use more water than the city of Syracuse and as much energy as the states of Vermont and New Hampshire combined, is only 45 days long- open **until Monday, August 11, 2025-** with only one day of public hearings announced on July 24, 2025.

This is not nearly enough time or opportunity for members of the public to carefully review and provide meaningful input on the lengthy DEIS (it has almost 20,000 pages of appendices!) for Micron's \$100 billion plan- the largest industrial development project in NY State history and the largest microchip fabrication facility in US history. Micron is receiving \$5.5 billion in NY Green CHIPS Act subsidies and upwards of \$20 billion in total public subsidies.

- [All major traffic improvements](#), including a brand-new exit on Interstate 81 in Cicero and a complete redesign of the I-81/Route 31 intersection, would be done by 2031. The state has estimated previously [that would cost \\$350 million](#).
- While Micron and public agencies will do their best to ease some impacts, there would be "unavoidable significant adverse effects." Among those: a huge increase in greenhouse gas emissions, destruction of more than 200 acres of wetlands, noise from construction and traffic, and loss of habitat used by five species of rare bats and birds.
- Local firefighters would be trained on how to deal with potential construction hazards, and Micron would establish a medical clinic on site staffed with a doctor and other healthcare professionals.
- While Micron pledges to use 100% renewable electricity, it would also burn as much natural gas as 107,000 typical New York state households.
- Onondaga County could add 23,500 households by 2041. The city of Syracuse could see an increase of 7,500 households.

Thank you for your consideration of these serious concerns.

I have so many questions and concerns about the impact Micron will have on the Central New York environment. What about habitat destruction? What about the huge amount of water that would be used? What about the loss of wetlands?

The public needs a lot more time to be able to read and digest the report and then be able to comment. The present time frame is totally unrealistic.

And where is the planning for schools and health care facilities and housing for all of these new residents? Where's the plan for public transportation so 9000 employees don't drive to work adding to the congestion and pollution?

Micron will dramatically transform Central New York. Why not make sure the transformation is one that benefits everyone who lives here?

Subject: Hazardous waste disposal

The public needs to understand in plain English not scientific jargon the following:

1. What impact will the building and start up will have on water supply to surrounding communities?
2. The transporting of hazard material - is it done by rail?
3. If it is done by rail what is the impact on communities if the materials are leaked into the environment; and how would the derailment impact the air quality for those immediate communities?
4. Are there cancer causing / other health possible concerns to workers and communities
5. If so is Micron willing to be responsible for medical bills of those impacted by the harmful effects of hazardous materials.
6. Will there be a stipulation that Micron will be responsible for cleaning up areas that would be impacted by hazardous materials.
7. A list of possible health issues that workers/ or community will be exposed to and the sharing of health information that other micron workers or communities who work in similar facility as the one projected for our community .

The above questions are what I would like answered. I also have suggestions on how to create a sustainable work force. Pease contact me if you have question regarding the questions presented, how to create sustainable quality work force.

Thank you,

Subject: MICRON Draft EIS 2025 Comment

Hello,

Please accept the following comment on the MICRON Draft EIS.

New York State's signature climate law, CLCPA, contains the following:

"The department shall . . . establish a statewide greenhouse gas emissions limit as a percentage of 1990 emissions, as estimated pursuant to section 75-0105 of this article, as follows:

1. 2030: 60% of 1990 emissions.
2. 2050: 15% of 1990 emissions.

Greenhouse gas emission limits shall be measured in units of carbon dioxide equivalents and identified for each individual type of greenhouse gas."

My overriding concern is that the Micron project stands in direct opposition of the state's greenhouse gas (GHG) emissions goals, and much more needs to be done to both clarify the true likely emissions of the Micron project, and to mitigate those emissions so that it is not a barrier to CLCPA law by both 2030 and 2050.

The DEIS clearly states that the facility requires 698,112 MCF of natural gas per month by full build-out in 2041. However, Appendix J, Greenhouse Gas Emissions, Climate Change, and Climate Resiliency, only accounts for part of Scope 1 emissions, using the language of the Greenhouse Gas Protocol. Emissions sources are listed as:

- Natural gas-fired boilers;
- Natural gas-fired water bath vaporizers;
- Diesel-fired emergency generator engines;
- Diesel-fired emergency fire pump engine;
- Semiconductor process tools and thermal oxidation systems that emit GHGs;
- Use of heat transfer fluids (HTFs) that contain GHGs; and
- Use of Circuit Breakers that contain SF6.

This analysis did not include other emission sources, including:

- Scope 1 - company vehicles.
- Scope 2 - purchased energy (natural gas, electricity); purchased heating and cooling.
- Scope 3 Upstream activities: leased upstream assets; employee commuting; purchased goods and services (e.g. raw materials from mining, etc.); business travel; emissions from waste; transport and distribution into the Micron facility.
- Scope 3 Downstream activities: transport and distribution out of Micron; processing of sold product; use of sold products; leased downstream facilities; end-of-life treatment of the fabrication plants.

Nor did it appear to include the anticipated carbon footprint of construction.

Without an analysis of the true scope of emissions over the lifetime of this project, it is impossible to understand the climate impact, and impossible for New York State to meet its goals under CLCPA law.

Aside from that observation, no efforts appear to be made on electrification of industrial processes. Why can the boilers and vaporizers not be electrified? At an absolute minimum, if the technology does not exist today, work with partners to develop it by Phase 2 of the project. Without a plan for significant electrification, New York State cannot hope to approach carbon neutrality or help combat the worst effects of global heating.

Thank you,

Gavin Landless

Subject: Micron DEIS Document

Hello.

I am writing as a resident of Onondaga County to express my concern over the implications of the upcoming Micron project. It is projected to cause environmental damage like increased carbon emissions and destruction of wildlife and natural habitats, as well as diverting public water. I am disturbed that OCIDA and Micron gave the public only 45 days to review the DEIS document, and I request that this decision be changed to allow for at least 120 days of review by local communities and 5 public hearings to comment on the plan.

Thank you for your consideration.

Dear team,

I want to submit a comment about this project. Why is the comment period so short? Please adjust it to at least 120 days so that the community can fully review the DEIS document. This is a major project, with major impact on the local community, ecosystems and local power infrastructure. It should not be rushed.

Thank you!

Best,
Iben Falconer

To whom it may concern,

The CNY community needs more time to review and comment on the Micron project, and the ways that it will environmentally impact our area. Communities need AT LEAST 120 days to review the Micron DEIS document, and allow for 5 public hearings for comment on the proposed plan.

We cannot allow this factory to decimate public water supply, disrupt local wildlife and ecosystems, or put unnecessary carbon emissions into our atmosphere.

Thank you for your time,

Jessica Jones

Subject: Comment on CNY Micron project & DEIS

Dear whomever it may concern,

As a constituent of Central New York and Onondaga county, who will be affected by Micron's arrival to the area, I oppose the project's arrival and demand that you make necessary accommodations to combat the project's proposed damages to the environment and community before starting construction. As outlined in the 2,000 page document, that you have only allowed the public 45 days to read and comment on, Micron's arrival will bring unnecessary and costly challenges to the surrounding areas: air and noise pollution, water consumption and contamination, and destruction to rare wildlife. These are problems the people of Central New York, and Syracuse specifically, already face on top of issues of lead poisoning in public water systems, homelessness and poverty. These issues must be addressed first, if you wish to see economic prosperity for the region. Giving the people a chance and a better future will strengthen and grow the region better than any project or corporation will, especially when that corporation is projected to do more harm than good. Micron's proposed benefits will not reach the community in the next few years, as Micron will not even be fully built in that time, however, the communities tax money and resources will be used for the creation of Micron. In the time it takes Micron to be built and for "prosperity" to emerge, these resources could be used instead to address some of the problems listed above, and will have a greater benefit on the community. This is what the people want. I am sure if you extend the comment period on the DEIS to 120 days and allow more public hearings for the public to comment on the plan, you will see that the public does not want Micron here, or at least requires accommodations to be met before Micron's implementation. I urge you to make these considerations and to hear out the voices of the people before moving forward on this project. It is in your best interest.

Sincerely,

Syd Kellogg - (They/Them)

To:
Robert Petrovich, Executive Director
Onondaga County Industrial Development Agency
Micron@ongov.net

CHIPS Program Office – CHIPSNEPA@chips.gov
New York State Department of Environmental Conservation
U.S. Army Corps of Engineers
U.S. Environmental Protection Agency

Subject: Formal Comment Opposing the Micron Semiconductor Manufacturing Project – Legal and Environmental Concerns

1. Destruction of Federally Jurisdictional Wetlands – Clean Water Act §§ 401 & 404

The DEIS acknowledges that the project will permanently destroy approximately 193 acres of federally regulated wetlands, with additional stream impacts. This constitutes a significant adverse effect under NEPA and SEQRA, and directly implicates Clean Water Act permitting. The proposed mitigation is inadequate relative to the scale of destruction and fails to address long-term ecological loss.

Request: Deny the Section 404 permit and associated Water Quality Certification under Section 401 based on the failure to demonstrate avoidance and minimization of impacts.

2. Irreversible Harm to Federally Protected Species – Endangered Species Act §7

The project poses unavoidable adverse effects to Indiana bats and northern long-eared bats, both federally listed species. Construction-related habitat destruction and lighting will disrupt foraging and roosting. The DEIS fails to provide binding mitigation measures that satisfy the 'no jeopardy' requirement under ESA Section 7.

Request: Delay any Record of Decision until formal consultation with the U.S. Fish and Wildlife Service is completed, and a Biological Opinion is made public. Deny approvals if the Biological Opinion finds likely jeopardy.

3. Incompatibility with New York's Climate Law – CLCPA

The project's greenhouse gas emissions are substantial and long-term, directly conflicting with the goals of the Climate Leadership and Community Protection Act (CLCPA). There is no clear demonstration that the project will comply with emission reduction pathways or offset its significant carbon footprint.

Request: NYSDEC must evaluate the project's compliance with CLCPA requirements in all relevant permits. No permit should be issued without a firm showing compatibility with the 2030 and 2050 climate targets.

4. Disproportionate Burden on Disadvantaged Communities – Environmental Justice Concerns

The project site borders multiple Disadvantaged Communities (DACs), as defined under state and federal screening tools. While the DEIS asserts minimal EJ impacts, it fails to conduct a cumulative burden analysis as required under NYSDEC Commissioner Policy 29 (CP-29) and pending SEQRA revisions.

Request: Require a Supplemental EIS that evaluates cumulative burdens on DACs and propose enforceable mitigation or denial if burdens are excessive.

5. Significant Adverse Traffic and Infrastructure Effects

The DEIS admits that even with mitigations, long-term traffic congestion will result from the 16-year construction timeline. These disruptions will have secondary environmental and public health impacts. The analysis lacks adequate long-term planning or funding assurances for transportation infrastructure.

Request: Deny local and state land use approvals until enforceable transportation improvement agreements are in place.

Conclusion

The DEIS fails to satisfy the legal standards of NEPA, SEQRA, the Clean Water Act, the Endangered Species Act, CLCPA, and EJ requirements. These deficiencies must be addressed through permit denials, supplemental review, or project cancellation.

I strongly urge the lead agencies to consider these legal and environmental concerns and reject or suspend the Micron Semiconductor Manufacturing Project until these fundamental concerns are resolved.

Sincerely,
Isaac Matlock

Subject: [EXTERNAL] Fw: MICRON Clay, NY

Hello,

I live at 5232 Caughdenoy Rd in Clay, NY. I'm very concerned about the traffic making a negative impact on our quality of life. I'd like to see "local traffic only" from the Caughdenoy off-ramp from 481 to Rt 11 in Cicero. It's very residential, and would help take away from the stress of noise pollution in my immediate community. I'd also like to see micron plant trees to help the endangered species survive, from whom they're taking their environment from. They should give residents trees that the bats are native to, to plant on their property. Thank you for your consideration.

Hello,

I am submitting a comment in regards to the Micron project.

It is my understanding that a report outlining Micron's impact on the community and environment was released and is approximately 20,000 pages. It is also my understanding that only 45 days were provided for this report to be reviewed, which is an obscenely short amount of time for an expert to review 20,000 pages, and much harder for those of us who are not experts.

The comment period should be extended to a minimum of 120 days, with more public hearings taking place over a number of days.

While I don't live in Clay anymore, my parents live on Riverside Rd, off Oak Orchard. Micron will significantly impact them in terms of the changes to local infrastructure, their ability to get around, as well as the environmental repercussions from chemicals being released into the water that will flow through their backyard.

They, as well as every Central New Yorker deserve a reasonable amount of time to understand how Micron will change their lives and provide public comments on it.

Sincerely,
Sandy Wilson

To: CHIPSNEPA@chips.gov
Subject: [EXTERNAL] Micron Project Public Comment

To whom it may concern,

As a NY state resident and a friend of people who live in a lovely home in Clay along the Oneida River, I am extremely concerned about the environmental impact of Micron Technology's microchip manufacturing project. I am also concerned that the public--especially the people who will be directly negatively affected by this project--do not currently have enough time to properly review and comment on this project.

Currently, the public comment period for this massive factory project, which will use more water than the city of Syracuse and as much energy as the states of Vermont and New Hampshire combined(!!!), is only 45 days long-with only one day of public hearings announced on July 24, 2025.

This is not nearly enough time or opportunity for members of the public to carefully review and provide meaningful input on the lengthy DEIS (it has almost 20,000 pages of appendices!).

Please extend the public comment period to at least 120 days and please schedule a minimum of 5 public hearings before going forward with this project.

Thank you,
Kirsten Hopkins

From: Bob Peters <sretepbob@yahoo.com>
Sent: Thursday, July 10, 2025 9:29 PM
To: chipsnepa
Subject: [EXTERNAL] I'm Robert Peters and I have a long and important comment about Micron.

I'm Robert Peters of Jamesville, NY, and I'm commenting against Micron for several reason. One reason I'm against it, is that it will ruin an irreplaceable natural environment, for a company that will probably not keep any of their promises, in letter or in spirit, and probably leave once the tax breaks expire. Everything else that this County has given tax breaks or other benefits to, has never worked out like the people who want the tax breaks and benefits claim. DestinyUSA has to be the biggest example of this in this County that I have heard of. They promised, among other things, an aquarium and a replica of the Erie Canal. What we got instead was a rather standard mall with a mishmash of flooring, that also bounces when people walk by. Also other places have had private projects supported by the government not work out. Examples include that Foxconn factory in Mount Pleasant Wisconsin that never got used, damaged the village's credit rating, and ended up becoming a data center site, and that research facility expansion in New London, Connecticut that was canceled after a merger that lead to the research facility being closed and the area looking like a slum.

Another reason that I'm against it, is that it will take 20 years to build and that is a long time in real terms, and an eternity in tech terms. For example a child born today, could be in their 2nd year of college in 20 years, if they decide to go to college. Who knows what innovations in technology there will be in 20 years, innovations that could render the plant obsolete before it's even half way finished. People didn't expect 20 years ago that the computer company that uses a logo that is a piece of fruit with piece bitten out of it, wouldn't be using the architecture that they had transitioned to at the time, 20 years later. Nor that they would radically change what we thought of a cell phone, nor that they would have developed their own CPU chips for their computers. That also applies to other businesses, as I wasn't thinking at the time that the last new brand to be introduced by a major automaker, wouldn't actually be around 20 years later.

It's entirely possible that a completely new way of making chips emerges that renders the current technology obsolete overnight. It's also possible that memory and storage starts getting put on the CPU die in 20 years, to save board space.

Also Micron also only makes commodity chips, and not anything that is really unique, so they are also easily replaced with another company's chips. Other companies actually make chips with some differentiation in functionality and performance. Micron only makes chips that have to be made to a standard, so there isn't any product differentiation between them and other makers of the same kinds of chips.

Another reason that I'm against it, is that 20 years is a long time in both political and business terms. A lot can change in both the business and political worlds in a day or two, let alone 20 years. A modern publicly traded business goes quarter-by-quarter basis, and not on a long term plan. A tech company can go from being on top to being bankrupt and out of business in a couple of years, as the competition can become better, the products in development don't end up working out, they ended up making bets that didn't work out, somebody else did something to make their product obsolete, or a combination of things. Also tech companies tend to not be very long lived if they make hardware, as hardware is both a fickle and difficult environment to be in, as they have a lot of physical inventory

and processes. The computer company that uses a logo that is a piece of fruit with piece bitten out of it, uses software to sell hardware and they actually haven't made their any of own hardware in over 20 years.

Most if not all of the successful chip makers now, actually only design the chips and off load the actually manufacturing to somebody else. One of the chip makers that actually makes the chips, the one that used to advertise with three blue colored men, is actually subcontracting out some of it's chip manufacturing to somebody who actually specializes in making chips as the one doing the contracting is having problems with their newest process. Also there is no point in building more fabs here, as most of the chips have to be exported to be used, as most of the plants that put chips into assemblies are overseas, which is more expensive and takes more time than making the chips close to where the devices that use them are assembled. The devices also aren't generally conducive to being assembled without the chips in them, so you can't ship them and install the chips here. Also the products made in factories sited because of government encouragement and subsidies, tend to be garbage quality. There's a reason why that nobody else has tried to build cars in New Brunswick, Canada or in Northern Ireland again, as the cars built there weren't all that good, quality wise. The products of Volkswagen plant in Pennsylvania were considered to be not as good as the ones from Germany. And the MBTA has had a lot of problems with subway cars assembled in the Quincy, Massachusetts plant, that was located in Massachusetts, because somebody wanted subway cars assembled in Massachusetts.

Also the political climate can change rapidly. Five people can be president over a 20 year span. That means that major changes in policy and how other countries view us, are possible. Also both the County Executive and Governor could be dead, out of power, or something in between, in 20 years. For that matter the County Executive could have a stroke that could either incapacitate or kill him tomorrow, as he has had a mini-stroke before and probably isn't in the best of health. The next person might not be supportive of the Micron project.

In 20 years the reason to build a fab here could go away for one reason or another. It's possible that in 20 years that the People's Republic of China either implodes or gets peaceably gets taken over by Taiwan, like how West Germany took over East Germany in 1990, something that would end the need for more fabs here, as the People's Republic of China is no longer a threat. Also tariffs could make using chips made here even more expensive, because they could incur tariffs in both directions, because they would be exported as chips and imported in finished devices. Also in 20 years countries might not be willing to deal with us anymore, because we still have problems with civil rights and decide to both boycott and embargo the US in a way that makes what Apartheid South Africa faced look like free trade. The US needs the rest of the world, more than the rest of the world needs the US.

I'm also against it for both military strategy and national security reasons. For one it would be a nice juicy target for aerial bombardment and long-range, missile attacks by any enemies with the capability who are at war with us, as it's planned to be big, important, and the site can be located on any Syracuse road map with Burnet Rd in Clay on it. It would be easily to take out or at least severely damage it, by simply bombing the area around where Burnet Rd is on the map, as you're bound to hit something vital at some point. Even if the situation is only a cyberwar and not a kinetic one, it's still a nice juicy target for a cyberattack, as it would be easy to cause a lot of damage to production and maybe even to the facility itself because being so big, a small network or personnel compromise could be leveraged to actually attack a lot of production equipment. A successful social engineering or cyber attack would have really big rewards for a adversary, as it would cripple a large amount of chip manufacturing capacity. Also it's being built on a wetland and an area with a high water table, which means the possibility of soil liquefaction exists, which can be induced by an explosion. Also

that means that the soil is probably very soft and may not actually be able to support the weight of the fabs, which would mean that the project would be a colossally expensive mistake, as they would sink and possibly not sink level. Soft ground can't support a lot of weight, which is why heavy things sink in it. All the dirt they want to bring in, probably will end up getting saturated and being made useless. Also where are they going to get all of that dirt from, as it's soil and not the stuff used to get leverage over someone.

Also if National Grid is going to install smart metering, somebody at National Grid could turn off the power accidentally or accidentally on purpose, which would ruin a lot of production. Somebody might turn off the power because they want to reduce the load on the grid and not realizing what they are turning off the power to, or they want to sabotage production. A hacker or cyberwarrior could also get into National Grids systems and do the same thing, possibly to a wider area as well.

I'm also against it because it will use way too much electricity and will ruin our quality of life. The governor is trying to reduce the state's carbon emissions, which this facility is going to increase if built. One of the things she is doing to achieve that goal, is by replacing fossil fuels with electricity. That is going to increase the demand for electricity by a very large amount, as a heat pump is an air conditioner that can also operate normally in reverse, to take in heat from outside. The heating elements inside of the air handler of ducted heat pump systems, also take quite a bit of power. It also take quite a bit of power to charge all of the electric vehicles in a reasonable amount of time, or at all in some cases. The average house may end up needing a 300 amp service to handle all of those loads. That size of service is not all that common even now. This means that we probably can't handle both all of those demands and Micron, because there won't be enough generation and distribution capacity. And people will revolt if only Micron and the local elites can get electricity, as they didn't sign up for an Authoritarian state. I don't see National Grid beefing up the distribution infrastructure or increasing generation capacity, as they are surprisingly encouraging energy conservation. It's probably cheaper to do that, than to actually make upgrades. Micron will probably cause electricity prices to skyrocket, as they will use a lot of electricity and not pay for any upgrades. Micron will also mean that power outages will become more frequent, as National Grid's priority will be to keep Micron supplied with power, at the expensive of everybody else. That also means that natural gas service may end up getting interrupted because at least some compressor stations are electric, and that grid-tied solar systems without battery backup won't work.

Also they probably aren't going to hire any local people even if they say they will, which means the population will skyrocket which will strain local services and infrastructure, and make the Syracuse area an awful place to live. The Syracuse area can't deal with anymore garbage that it supplies now, and they apparently don't have any contingency plans for when the incinerator breaks down. People were actually panicking when it broke down the first time, and that place is beyond it's design life anyway and apparently they don't stock more than one of any given spare part. What happens if they end up breaking something that they don't have more of, and that part has a six month lead time. We might not be able to supply enough water and sewer capacity for everybody and Micron. You might be able to kick the sewer capacity problem down the road for 4 years, depending on how many septic systems are installed and how big they are, but the water problem would be immediate.

They also say that it will create "up to" jobs and not a fixed number of jobs, which means they could hire either nobody, or only 4 security persons to watch the site after they have abandoned it, and technically keep their promise. The phrase "up to" is a scary thing in this kind of thing, as it's easy for them to weasel out of it and still keep all of the government benefits that they received. It's like when they use "up to" in the reward for the apprehension of a criminal. The only way that they are going to pay out the full reward, is if you bring them in yourself and are shrewd negotiator. They are going to try to do anything to get out of paying the reward.

Personally if I was in charge of Micron, I wouldn't build the fab as it's a very poor use of company money. It would be better to abandon the project now and take a small hit to the price of the stock, or even possibly a boost to the price of the stock, then end up tanking the stock and the quarterly report because you essentially flushed a ton of money down the drain. There are way too many unknowns for spending money on this to be a sensible thing to do. This project is going to be like playing Jenga in bed or in a moving vehicle, as you don't know what's going to bring the whole thing crashing down, or when it's going to happen.

I don't know if anybody will even read this, or any comment on this project as they don't care about what the constituents want. They only care about who is lining their pockets. Now you may think that I'm cynic for thinking that, but a cynic is what an idealist calls a realist. I've heard rumors that say that the Onondaga County Executive takes kickbacks. That is true, one way or the other. I bet if you did a through investigation of most politicians, you would find that they have unexplained income or income that they don't want to tell you where it comes from, as it would incriminate them.

It's almost like we live in an Authoritarian state already, as stuff that the people don't like gets shoved down their throats. It's not their jobs are all that important anyway. If it all hit the fan, most of them would be useless in the situation anyway, as they don't know how to do anything. The jobs of garbage people, and the people who keep the water supply and sewer systems working, have jobs that are way more important than the jobs of the politicians. When the politicians stop working correctly nothing really changes, but when garbage people go on strike, it can bring a city to it's knees, both literally and metaphorically. A non-functional water supply or sewer system can cause major problems too, as a modern city can't function well without both. As long as everything gets funded, you really don't need politicians, because things can be setup to fund operations and the repairs and replacements of infrastructure automatically. Nothing has really changed much since the 1950s or 1960s anyway, so it's not like the politicians are actually doing anything useful. It's no wonder why people vote for the Authoritarian, since democracy doesn't appear to behave any differently, if we get stuff shoved down our throats anyway. Since the County Executive is an R-Word anyway, he feels that he has carte blanche to be an Authoritarian, since the orange man in the white house is one, or at least acts like one.

If this project goes through, it will ruin the lives of the people who live in the Syracuse area. The cons outweigh the pros, so it would be best for all involved to abandon the project before starting. It would a massive environmental disaster and a massive waste of money for no benefit, so why even bother doing it. Everybody involved in starting the project may actually be out of office or dead in 20 years, but the environmental damage and the reduced quality of life would be permanent. The environment and quality of life is a lot more important than money and jobs that probably won't actually come. When it comes to projects like this in this day and age, you can't trust corporations to hold up their end of the bargain.

Subject: [EXTERNAL] MICRON Draft EIS 2025 Comments

Date: July 10, 2025
To: OCIDA and US Department of Commerce
From: John Przepiora, Syracuse, NY
Re: MICRON DRAFT EIS 2025 COMMENTS

ATTN: Micron Project

The deadline for submitting comments on the just released DEIS for the Micron, Clay, NY project is too soon to allow sufficient and effective public input. I am requesting a 120 day (4 months) public comment period be established. The DEIS is 719 pages plus 19 thousand pages as appendices. It is difficult for me, and I presume the public in general, to easily understand even one section without hours of study. In the time available I will not have adequate time to read the complete document; even trying to make sense of limited portions is challenging in the short time frame that is offered. It is outrageous that Micron, OCIDA and the CPO had upwards of two years to prepare this material and the public is given just a fraction of that time for its review. Further, based on my reading of portions to date, the document is written in such a manner that makes comprehending the environmental, social and economic impacts difficult. We have construction phase impacts that will span 16 or more years, we have operational phase impacts which overlap construction impacts; and then there are growth induced impacts and cumulative impacts which from my reading so far are simplistically dismissed as being short term and not to be concerned over, that all will work out in time. Wading through this overlapping, twisted story will take more than 48 days for even the most intelligent and experienced planning and development expert.

The allowed 48 day review period from June 25 to August 11 is a period which includes just 34 'business' days and 14 weekend days during the summer season when many Onondaga County residents are on summer vacation and out of town, making it virtually impossible for them to participate in this important DEIS review. I am requesting 75 additional days—just over 10 weeks additional time to October 23. Estimating that Micron, OCIDA, and DOC would require three additional months to review comments, respond, revise and issue the final EIS, plus allowing time for involved agencies to issue appropriate permits, it is conceivable that

construction could begin by late January or early February of 2026. An additional 75 days for public review will not significantly impact this project, which has a 20 year estimated buildout and potentially a 100 year lifetime. An additional 75 days may even help to improve the project and avoid potential negative impacts which otherwise may put our community at risk.

OCIDA and US DOC have been working on the Micron DEIS for over two years. And while I understand the eagerness to move forward quickly and without public controversy, disregard for the public's valid participation in a meaningful way is untenable and potentially dangerous. Cutting the review process short disregards the public's right and responsibility to give informed input on something that will affect my future and the future of generations to come.

This is not a simple project. It will be transformative for CNY. It includes several major components (water system, wastewater systems, significant population growth, massive energy consumption and GHG emissions, to mention a few), each of which deserves public scrutiny of 30 to 45 days. Lumped together, and with the overlapping multi-phase impacts, this project and this DEIS deserve additional time for public input beyond 48 days.

Respectfully,

John Przepiora

Subject: [EXTERNAL] MICRON - HOW ARE YOU GOING TO KEEP PFA's OUT OF OUR WATER

Onondaga County Industrial Development Agency,

How can you, in good conscience, proceed with this MICRON project that will pollute and release toxic "forever" chemicals into our treasured water source?

Wasn't the demise of Onondaga Lake enough of lesson to understand the impact of industrial pollution that continues to impact generations of Onondaga County residents?

Perhaps if you and your loved ones were forced to drink and bathe in Micron's wastewater you would have a different perspective than sheer greed.

More time is needed to review the environmental impacts (specifically water integrity).

Do what is right!!

Subject: [EXTERNAL] Comments on EIS No. 20250091, Draft, DOC, NY, Micron Semiconductor Manufacturing Facility, Clay, NY, Comment Period Ends: 08/11/2025, Contact: David Frenkel 240-204-1960.

Regarding: EIS No. 20250091, Draft, DOC, NY, Micron Semiconductor Manufacturing Facility, Clay, NY. The public comment period of 45 days is insufficient. Under NEPA, the public must be provided an opportunity for **meaningful participation through the comment process**. See Florida Power & Light Co. v. United States, 846 F.2d 765, 771 (D.C.Cir.1988). Fortyfive days to review a 20,000-page document which is dense with technical language clearly does not fulfill this standard. I therefore request that the public comment period be extended to October 31, 2025.

I reserve my right to make additional comments on this huge project.

Re: Request for Extension of Public Comment Period for Micron Project

Dear OCIDA and CHIPS Staff:

On behalf of the Onondaga Nation, I am submitting this request for an extension of the public comment period on the Draft Environmental Impact Statement (DEIS) issued for the Micron project. The DEIS was issued on June 26, 2025 for a 45-day public comment period ending on August 11, 2024. However, for a project of this complexity, the federal minimum of 45 days for public comment is far too short. The Nation supports the community request for a 120-day public comment period to allow for meaningful public engagement. This would extend the date for public comments to October 22, 2025.

The Micron DEIS is being issued to satisfy obligations under the New York State Environmental Quality Review Act (SEQRA) and the federal National Environmental Policy Act (NEPA). Both laws require that the public have the opportunity for meaningful and effective engagement with the DEIS. See *Friends of P.S. 163, Inc. v. Jewish Home Lifecare, Manhattan*, 30 N.Y.3d 416, 426 (2017) (finding that “public participation and engagement is an essential and mandatory part of the SEQRA process”); *Brodsky v. US Nuclear Regulatory Commission*, 704 F.3d 113, 120 (2d Cir.) (identifying “public scrutiny” as an essential component of NEPA’s environmental review process).

The Micron DEIS contains almost 700 pages of analysis in the narrative section alone, which is more than twice the maximum length established by the Fiscal Responsibility Act of 2023 for a NEPA DEIS, 42 U.S.C. §4336a(e)(1), and presumed to

be reviewable in 45 days. The document relies on over 19,000 pages of technical appendices to explain its assessment. To fully understand the scope of review already conducted, the environmental impacts identified, and any gaps in that review or additional information that should be considered, the public must scrutinize thousands of pages of complex narrative and technical analysis. Simply reading this enormous document may take more than the minimal 45 days allotted for many reviewers.

Public scrutiny is particularly important in this case, given the profound, long-term, and wide-ranging impacts that the Micron project is expected to have. Micron will consume all of the current excess electricity production capacity in the region. The construction process with its attendant traffic, noise, and dust will continue for 16 years. The final project is expected to draw thousands of workers to the area, changing traffic and housing patterns across several neighboring villages, towns, and cities. The Micron Campus alone will destroy or disturb hundreds of acres of wetlands, disrupt existing surface and groundwater flows, generate enough greenhouse gases to interfere with state-wide climate goals, and produce enormous volumes of waste. As a result, Onondaga County will be required to build a new industrial wastewater treatment plant. These impacts will be felt throughout the region.

Extensions of the public comment period are routinely granted for comparable projects. For example, for the I-81 Viaduct Project, the Federal Highway Administration and the New York Department of Transportation initially provided a 60-day review for its DEIS. This was extended to 90 days based on public requests. While the I-81 DEIS was comparable in length, project impacts weren't nearly as wide-ranging as those generated by Micron.

The affected public deserves a meaningful opportunity to learn about the project, review its impacts, and provide input to ensure the careful and complete environmental review that this project requires. For these reasons, the Nation supports an extended public comment period of 120 day and multiple public hearings at locations across the affected area.

Sincerely,

Subject: [EXTERNAL] Request for Environmental Accountability and Community Review – Micron Project

Dear CHIP CNY Team,

As a lifelong Central New York resident—born in Solway and now living in Baldwinsville—I am writing to express serious concerns about the potential environmental impact of the proposed Micron industrial project.

My family and I deeply value the natural beauty, clean water, and abundant wildlife that define our region. The lakes, rivers, land, and ecosystems of Upstate New York are irreplaceable, and they must be protected for the health and wellbeing of both current and future generations.

We respectfully urge you to:

- Hold Micron fully accountable to the highest environmental and community standards.
- Ensure that the DEIS (Draft Environmental Impact Statement) review period is extended to at least 120 days, so that community members, scientists, and advocates have time to review and respond thoughtfully.
- Schedule a minimum of 5 public hearings, distributed across impacted communities, to allow for diverse voices and concerns to be heard and recorded.

This project will shape the future of our region. It is vital that we proceed with integrity, caution, and community engagement—not just corporate ambition.

Thank you for your attention to this matter and for ensuring that local voices are honored in this process.

Sincerely,

Kristin and Don Onderdonk

RE: Request to Extend Public Comment Period and Increase Public Hearings for Micron Draft Environmental Impact Statement

On behalf of Citizens Campaign for the Environment (CCE) and our 120,000 members across New York State, we respectfully request that the Onondaga County Industrial Development Agency (OCIDA) extend the public comment period for the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor facility from the current 45 days to a **minimum of 90 days and schedule at least 3 public hearings**. This proposed comment period and single public hearing is extraordinarily short for a project of this unprecedented scale, complexity, and potential impact on the Central New York region's environment, infrastructure, and communities.

The Micron project is expected to bring profound changes to land use, water resources, energy demand, air quality, traffic, and the surrounding communities. A 45-day comment window does not offer residents, organizations, experts, and stakeholder sufficient time to thoroughly review the thousands of pages of documentation and offer informed, substantive input. For a project of this magnitude, the public must be given a meaningful opportunity to participate in the environmental review process.

In addition to extending the comment period, CCE urges OCIDA to hold at least three public hearings on separate days and in different locations across the affected area. Holding a single public hearing on one day is simply inadequate and risks excluding many concerned residents who deserve to be heard. Multiple hearings will ensure more equitable access, allow working families and other stakeholders to participate, and promote greater transparency.

OCIDA has a responsibility to ensure this process is not merely procedural, but truly participatory. The legitimacy of the environmental review, and the public trust in its outcomes, hinges on the integrity, accessibility, and transparency of the public engagement process. Rushing public input for one of the largest industrial projects in New York State history sends the wrong message to the communities who will be living with the consequences.

An extended comment period and multiple public hearings are not only reasonable, but they are also essential to uphold the standards of public accountability, environmental justice, and responsible development.

Thank you for your consideration of this urgent request. **CCE respectfully asks that you take immediate action to extend the DEIS comment period to at least 90 days and schedule at least three public hearings to ensure full and fair public engagement.**

Sincerely,

Hanna Walier

To: CHIPSNEPA@chips.gov
Subject: [EXTERNAL] Downstream Flooding Risk

Micron,

Please be a good neighbor and fully evaluate and mitigate flooding risks. You cannot replace 200 acres of wetlands and 8,000 feet of streams with 645 acres of impervious surfaces (parking lots, roads, roofs) and 58 acres of semi-impervious surfaces without severely impacting the downstream area. There is already a problem with sump pumps and basements and the Micron project will only exacerbate the matter.

I live on Oneida Lake and believe your pollution will damage the river that feeds the lake, posing a serious threat to the fish and birds that are part of the environment.

How will your millions of gallons of required water not impact the sources you intend to draw from? And how will your toxic waste be neutralized before being released back into the environment?

Jobs are important, but preserving our living space and the gifts of beauty and life that have been given to this area are MUCH more important.

Please clean up the plan. I won't suggest that you take it elsewhere, as the same issues will move with you wherever you go. Make it right please. Dollars aren't everything, and when the area is lost to shortsighted industry, it very likely is lost forever, long after Micron has made its money.

Thank you,

Mary Burgess

Subject: [EXTERNAL] Micron impact on downstream floods

As a concerned resident in the town of Clay, I am writing to ask for consideration and clarity on flood mitigation in regards to the micron project. Wetlands and streams are planned to be filled by the hundreds of acres. This flood prone area will likely be at much higher risk of these disasters, specially downstream in Clay, Phoenix, Fulton, etc.

From my reading of the recently released environmental impact report, I do not see any coverage of this concern. It is clear the impact of flooding can do based on recent examples both near and far.

So again, I am asking for this concern to be addressed before it's too late.

Thank you for the time and consideration

I am a resident of the city of Syracuse in Onondaga County, NY.

I stand with many others as I request additional time to understand and comment on the environmental impact of. The region. It has been difficult for me to obtain information and what I have read is very concerning. There should be no way that industry of this magnitude be permitted to deposit any waste into our environment, our streams, water ways.

Everyone needs more time to fully grasp and debate Microns long term impact. At the very least, the contamination of Onondaga Lake demands additional thought around destructive industry in this area.

Dear OCIDA,

I am writing to you concerning the issues surrounding Micron's plant coming to Clay. As a resident within just miles of the location, I am very concerned for my family's and neighbors health and impact upon us by this massive project.

Micron will impact our health, safety, socioeconomic and environmental lives of each of us. Please extend the time for us to review this massive project and reports.

I would also like to ask that you have Micron take on the responsibility of spills - not our Onondaga County sewer system. It shouldn't fall on the taxpayers. These types of plants are prone to accidents and I see no plan for when this happens. It's completely foolish to not plan for that. Will OCIDA be ready, willing and able financially and otherwise handle such an incident? Will OCIDA be responsible for turning Town of Clay into the next Brownfield site similar to Solvay? Where is the plan concerning this? I would like to request that OCIDA give the responsibility back to Micron and have them fund a comprehensive plan to save Town of Clay from becoming the next Brownfield site on the map.

I would like to see Micron go above and beyond what is "by-law" and do much more to restore our environment and habitat for the wildlife. Not just paying money into a fund but doing actually local restoration.

I would like to see Micron funding Town of Clay, Onondaga County energy and clean water to keep our community from suffering from lack and increased costs. Micron will be making a LOT of money over the years from our limited precious resources of

water, air and land. The very LEAST they could do is help the local communities by removing the high costs we will be experiencing.

I would like to see some kind of independent test (funded by Micron) that on a weekly or daily basis tests our water, air and soil for the levels of toxic chemicals which Micron will be using, that are so very common to that industry. Similarly, have Micron fund local cancer treatment centers for those of us who will suffer from their toxic sludge and chemicals, so care will be low or no cost.

There are more things we can ask of Micron but I see the rushing by OCIDA and the limiting input from the public with shortened review times as problematic.

Please take my concerns into consideration.

Sincerely yours,

I would like to see Micron go above and beyond what is "by-law" and do much more to restore our environment and habitat for the wildlife. Not just paying money into a fund but doing actually local restoration.

I would like to see Micron funding Town of Clay, Onondaga County energy and clean water to keep our community from suffering from lack and increased costs. Micron will be making a LOT of money over the years from our limited precious resources of

water, air and land. The very LEAST they could do is help the local communities by removing the high costs we will be experiencing.

I would like to see some kind of independent test (funded by Micron) that on a weekly or daily basis tests our water, air and soil for the levels of toxic chemicals which Micron will be using, that are so very common to that industry. Similarly, have Micron fund local cancer treatment centers for those of us who will suffer from their toxic sludge and chemicals, so care will be low or no cost.

There are more things we can ask of Micron but I see the rushing by OCIDA and the limiting input from the public with shortened review times as problematic.

Please take my concerns into consideration.

Sincerely yours,

Dear OCIDA,

I am writing to you concerning the issues surrounding Micron's plant coming to Clay. As a resident within just miles of the location, I am very concerned for my family's and neighbors health and impact upon us by this massive project.

Micron will impact our health, safety, socioeconomic and environmental lives of each of us. Please extend the time for us to review this massive project and reports.

I would also like to ask that you have Micron take on the responsibility of spills - not our Onondaga County sewer system. It shouldn't fall on the taxpayers. These types of plants are prone to accidents and I see no plan for when this happens. It's completely foolish to not plan for that. Will OCIDA be ready, willing and able financially and otherwise handle such an incident? Will OCIDA be responsible for turning Town of Clay into the next Brownfield site similar to Solvay? Where is the plan concerning this? I would like to request that OCIDA give the responsibility back to Micron and have them fund a comprehensive plan to save Town of Clay from becoming the next Brownfield site on the map.

I would like to see Micron go above and beyond what is "by-law" and do much more to restore our environment and habitat for the wildlife. Not just paying money into a fund but doing actually local restoration.

I would like to see Micron funding Town of Clay, Onondaga County energy and clean water to keep our community from suffering from lack and increased costs. Subject: [EXTERNAL] Micron project in Central NY

I am a New York State resident and I support the following:

SustainCNY is requesting a **minimum of 120 days for public review and comment**. Furthermore, we request that the US Department Of Commerce and the Onondaga County Industrial Development Authority (OCIDA) **convene a minimum of five public hearings** to be held at various locations throughout central New York, including Syracuse, Clay, and Oswego. All of this is needed to explain or offset existing questions:

How are the 'Forever' chemicals (PFAS) used in manufacturing process going to be handled?

How is the water demand going to be supplied?

How is the energy required going to impact all of us?

We already have a housing crisis.... Is there a reasonable plan that doesn't put this even more out of reach for our citizens?

Re: Micron Semiconductor Manufacturing Project, Clay, NY Draft Environmental Impact Statement EISX-006-55-CPO-001

Dear Ladies & Gentlemen:

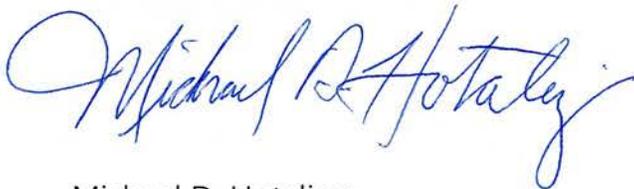

C&S Companies supports the Micron Semiconductor Manufacturing Project and the meaningful long-term impact it will deliver for Central New York.

We applaud Micron's commitment to invest in Onondaga County where C&S was founded in 1968. The Semiconductor Manufacturing Project will improve the livelihood of thousands as it develops and drives other sectors of the local economy.

The County's bold vision to attract this robust opportunity will reinvigorate not just the local economy but that of the State of New York and the nation. We look forward to the vibrant future that will unfold as this vision takes shape and our community thrives.

Sincerely,

C&S COMPANIES

RE: Draft Environmental Assessment EISX-006-55-CPO-001

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to **extend the comment period to October 25, 2025, at a minimum**, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

In particular I am concerned about: the many forever chemicals (PFASs) used in the production of microchips. MICRON should be transparent about which chemicals will be used and commit to their complete destruction before waste water enters the county water treatment system. I am also concerned about MICRON's impact on greenhouse gas emissions. Our area is currently an exporter of electrical power, but MICRON's energy needs will turn us into a net importer unless there is a plan and commitment to generate or purchase renewable energy without relying on renewable energy credits.

I also urge consideration and response to the following issues and concerns:

1. **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
2. **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
3. **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
4. **Affordable and abundant water and energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.
5. **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge

Subject: [EXTERNAL] Public comment for Micron Hearing

To whom it may concern:

I wish to add my suggestions for this major development project.

While Micron is a great job opportunity for Onondaga and surrounding counties, it behooves all agencies and local and county legislatures to ensure that the construction and energy and water usages of Micron does not irreparably harm the fabric of our community.

Despite consistently hearing that Micron's plant will use more energy and water than neighboring New Hampshire and Vermont combined, I have not heard of a substantial plan to ensure that surrounding communities do not foot the bill for higher energy and water costs. Likewise, I have seen no plans to force Micron to build solar arrays on its massive roofs to reduce energy consumption.

Both the high water and energy use are very concerning to me, as several communities that have seen AI data centers and Bitcoin mining centers have already raised the alarms regarding the negative impacts these massive facilities bring.

I also have noted in the plans that Micron will be filling in several hundred acres of wetlands. Why is this being allowed? Does this not go against New York wetland protections and climate goals? I encourage all agencies to fight against these plans and assist Micron to redesign its facilities to protect these wetlands (that will be ever more important to absorb the runoff from the massive plant and parking lots).

As we move forward through this decade, climate change effects are increasingly present. Ensuring that a massive development such as Micron falls in line with the CLCPA is of utmost importance. We cannot develop as usual, we must pivot to sustainable development and water/energy use. I strongly urge all agencies, legislatures, and Micron executives to redesign to accommodate these concerns.

Many thanks,

Dominic Gambaiani

Subject: [EXTERNAL] Fwd: July 24: Public Hearing on Micron Facility in Liverpool, NY

To whom this may concern,

As a resident, the planned construction and operation of Micron as stated in the EIS cause me concern:
(1) PFAS are unregulated and there is no need to even monitor these chemicals' entry into our waterways and groundwater. These chemicals have been found in studies to be harmful to humans and not just to the environment we commonly think has no impact on us. If we don't monitor, we will not know, but public health hazards will be the outcome and will cost public money.

(2) Only 700 jobs are projected to hire from local households - less than a third of the jobs expected to be shipped in! Kindly consult historical records to grasp that economic development does not by itself alleviate poverty. This curious result stems from rising prices due to the newly created higher paying jobs, increased property prices, and higher taxes due to public remediation of public health and environmental impacts of economic "development". In short, without enforceable commitment by Micron, its presence will not lift the community out of poverty (i.e. the highest child poverty rate in the state?!), but will push more people into poverty and homelessness. The social responsibility of Rockefeller times we can only dream of today, so much for "progress".

(3) Restoration of lost ecosystems takes a long time and thus any development is a setback for the community. Impacts need more than shallow, unenforceable commitments. Wetlands are crucial in cleaning water for human use, so that their diminishment and degradation in favor of a development that uses considerable more water is outright dumb. Not only will Micron use considerably greater amounts of water that are being used now in the region, it will also release harmful chemicals into the water for us all.

(4) The loss of species due to (for the region and the people living in it) questionable development is not only heartbreaking and disrespectful, but could also significantly degrade the environment for human use.

Overall, I would encourage critical thinking rather than blindly accepting the myth that economic development of any kind is beneficial. Just as freedom does not come for free, economic development needs careful planning, because historical (and present) case studies show that it often widens income gaps, creates rather than alleviates poverty, and causes inflation for all residents. The times of ownership and accountability of companies is sadly over, so that community impact is restricted to degradation of environment causing increased public health costs as well as inflation.

The EIS needs to be revised to reflect enforceable commitment to the community and its environment to include that Micron cleans up after itself (an elementary manner taught to every child).

Sincerely,
J. Lange

Subject: July 24: Public Hearing on Micron Facility in Liverpool, NY

To: <noire.fade@gmail.com>

Dear Jana,

Micron - an American semiconductor company - is planning to build an enormous \$100 billion chips manufacturing complex just north of Syracuse, NY. **The public has until August 11th to weigh in on the [draft Environmental Impact Statement](#)**, which presents the many environmental and community implications of this massive project. It will:

- employ thousands of workers to build the four "fabs" over the next 16 years, and thousands more to run them
- consume one-third the amount of electricity used by New York City
- consume as much water as the city of Syracuse
- use thousands of tons/year of hazardous chemicals

A [daylong public hearing](#) — with sessions in the morning (10am-1pm), afternoon (2pm - 5pm) and evening (6pm - 9pm) — **will be held Thursday, July 24, at Liverpool High School, 4338 Wetzel Road Liverpool, New York 13090** ([map](#)).

[See this community website for a user-friendly summary of the many implications of this project, shortcomings of the DEIS, and pointers on how to submit comments.](#) Many experts who have been reviewing the DEIS have identified significant gaps in the analysis. You can also visit SustainCNY.org for more background information.

We hope you are able to join us in person at one of the hearings on Thursday, July 24th. If you are unable to join us in person, you can still submit written comment through August 11th. [See here on how to submit your written comments.](#) This is an opportunity to voice your concerns and opinions to Micron and urge them to be a leader in semiconductor manufacturing that puts sustainability and innovative green chemistry above pollution and overconsumption!

Thank you for all you do to protect NY's environment!

Sent: Tuesday, July 22, 2025 1:55 PM
To: CHIPSNEPA@chips.gov
Subject: [EXTERNAL] Comment on Micron's plan for chips manufacturing complex

I have serious environmental and health concerns about Micron's plan for chips manufacturing.

193.38 acres of wetlands will be permanently lost on the project site along with 78.86 acres of associated building. Resulting carbon sequestration loss is not accounted for in Micron's evaluation of green house gas emissions. Restoring some wetlands as they propose rarely is as effective and diverse as keeping the original wetlands, and we don't have the luxury of decades to wait.

We are talking HOW MUCH electricity?!? It is astounding that this project will consume one-third the amount of electricity used by New York City.

HOW MUCH water?!? It is fantastical that this project will consume as much water as the city of Syracuse.

HOW MANY PFAS chemicals?!? Thousands of tons/year of hazardous chemicals are essential in this type of manufacturing. Industrial wastewater and sludge will contain PFAS. Where is the list? Where is the concern about more PFAS in our waterways? Nothing is being said about how the Onondaga city drinking water will be affected. You can be certain it will. It is inevitable. What then?

Where will the Oak Orchard solar array be moved to?

We are ONE species on the planet. Wildlife can't talk and take us to task. This project will wipe out a heron rookery, and habitat destruction for endangered Indiana, Long-eared, Tri-colored bats, Northern Harriers and short-eared owls, not to mention populations of birds migrating on the flyway. Haven't we done enough habitat destruction?

We need to think about the impact on the environment and health for people, wildlife, and our nest - Planet Earth. Thank you for this opportunity to comment.

July 23, 2025

To Whom It May Concern,

On behalf of NBT Bank, we are writing to express our enthusiastic support for the Micron Technology project in the Town of Clay, New York. This transformative initiative represents a once-in-a-generation opportunity for our region and our state, and it is the result of years of thoughtful planning, rigorous environmental review and meaningful community engagement.

Since Micron's \$100 billion investment announcement in October 2022, our region has experienced a surge of optimism and momentum. The Draft Environmental Impact Statement (DEIS), developed through extensive expert analysis and public input, confirms that Central New York is uniquely positioned to lead the nation in advanced semiconductor manufacturing.

The economic impact of this project cannot be overstated. With 4,200 construction jobs, 9,000 permanent positions, and up to 40,000 additional jobs expected, Micron's investment will drive meaningful population growth and generate an estimated \$16.7 billion in annual economic output for New York State.

The Micron project is a bold and visionary undertaking that will position Central New York as a global leader in semiconductor innovation, and NBT Bank fully supports this initiative.

Respectfully,

A handwritten signature in black ink that reads "Scott Kingsley". The signature is written in a cursive, flowing style.

Subject: [EXTERNAL] Micron is environmental disaster

Micron is potential for absolute environmental disaster in Onondaga County. The use of forever chemicals near vulnerable wetlands and water resources alone should halt this project immediately. Elevated levels of forever chemicals in Lake Ontario and St. Lawrence river have already been recorded. Skaneateles lake is in danger of needing a water treatment plant. Three key rivers the Oneida , Seneca and Oswego river meet with in miles of the Micron project.

The amount of water and electricity required will contribute to all types of climate change issues. The Oneida river watershed is going to be decimated. Our Governor wants to focus on electric school buses while promoting a project that no number of electric vehicles will ever come close to offsetting. Proceeding with Micron will cause more damage and environmental harm than Solvay Process, Crucible Steel and Onondaga County sewage combined.

Syracuse and Onondaga County allowed Onondaga Lake to become the most polluted lake in the world. The lake still is not used as the swimming and boating center like it was at one time. As a lifetime resident I felt the shame and humiliation of growing up in a community with one of the greatest man made environmental disasters in U.S. history. My grandfather told me stories of sailing on Onondaga lake as a child. I'm 65 years old and the lake was a smelly, stinking mess most of my life. The pollution of Onondaga Lake should be evidence enough that Micron should not be built in Onondaga County.

We sold our sole as a community once with all the knowledge we have gained since we polluted Onondaga Lake how as a community can we let Micron come in and devastate our most valuable resource, our lands and water.

Brian Cappon

Subject: [EXTERNAL] MICRON DEIS public comment

Importance: Normal

Sensitivity: None

Dear Sir or Madam:

I am writing in reference to the publicly stated request by many concerned citizens of Onondaga County to extend the public comment period on the MICRON-related Draft Environmental Impact Statement (DEIS). I fully support the request to extend the public comment period to at least 120 days.

Given the length of the DEIS, the time of year it is being released when less attention is being paid to public affairs, and the tremendous implications for social, environmental, and economic transformations from the MICRON project upon this region, a 120 review period makes a lot of sense.

Should such a review not be afforded the community, I will understand those who may come to question the purpose of conducting the DEIS at all, especially given that many professionals who are used to in-depth study of difficult issues are calling for an extended review.

Finally, it will be understandable if public interest turns to public opposition should the community be denied a fair chance to review and respond to the tremendous implications of MICRON's proposed project. Governance of this project in a way to easily sideline a widely felt, common-sense set of concerns would be evidence of an unacceptable set of governance standards for representative government anywhere in New York State.

I hope the DEIS will be extended at least 120 days for fuller community review.

Sincerely,
Paul Ciavarri

Subject: [EXTERNAL] Public Comment in Support of Micron's Environmental Review

To whom it may concern,

I am writing to express strong support for Micron's proposed semiconductor manufacturing project in Central New York and to affirm the importance of the environmental review now underway. I serve in a leadership role at a university deeply engaged in workforce development and economic innovation. My work connects me regularly with partners across the semiconductor ecosystem—from global firms like Micron to emerging startups and equipment manufacturers. I also live in Upstate New York and care deeply about the region's long-term health and prosperity.

Micron's project is far more than a construction initiative. It is a generational investment in American manufacturing, a strategic national asset to bolster critical supply chains, and a rare opportunity to shape Central New York's future in ways that are inclusive, resilient, and collaborative.

With a project of this magnitude come serious, legitimate questions about environmental impact. The scale is unprecedented. The timeline is ambitious. The scrutiny is warranted. New Yorkers deserve confidence that this project will align with the region's environmental priorities—protecting water, air, energy systems, and natural ecosystems. This review is not a roadblock; it's a building block for lasting success.

What gives me confidence is both the process and the people. Micron has engaged consistently with local leaders, educators, and community partners. This is not a company looking to rush approvals and vanish. It is making twenty-year decisions—and laying the groundwork for long-term presence and accountability.

Nowhere is this more evident than in workforce development. Institutions like mine are working with Micron and the Micron Foundation to reimagine engineering education, expand pathways for underserved students, and connect local talent to global opportunity. This is about more than jobs. It's about building a durable ecosystem of innovation, education, and inclusion.

This is a rare and vital opportunity for our region. It must be done responsibly—and it must move forward. I offer my full support and remain committed to helping ensure the project lives up to its promise.

Sincerely,

Chris Harris

“As the executive director for New York State’s first ever regional STEAM High School in the Syracuse City School District, I want to express our sincere appreciation for Micron’s unwavering commitment to education in our region. From day one, Micron has been a wonderful partner in helping us get this transformative project off the ground. Their support has gone far beyond just funding, they have brought vision, collaboration, and a genuine investment in our students’ futures. Thanks to Micron, we are building more than just a school, we are building a launchpad for the next generation of innovators, right here in Central New York. They’ve shown up at the table not just as sponsors, but as true thought partners. This is the kind of public-private partnership that redefines what’s possible for our schools, our students, and our community. Thank you.”

Dr. J. Francis Manning, MBA, Ed.D.

Public Statement from Alan Marzullo
Business Manager / Financial Secretary, IBEW Local 43
On the Micron Project in Clay, New York

As the Business Manager of the International Brotherhood of Electrical Workers Local 43, I am honored to represent over 1,500 dedicated members and 200+ apprentices who power the backbone of Central New York's infrastructure. Today, I speak with extraordinary pride and optimism about the Micron Project in Clay, New York, a project that is not only historic in scale, but transformative in its potential to reshape the economic and social landscape of our region for generations to come.

Micron Technology's decision to invest up to \$100 billion in a state-of-the-art semiconductor manufacturing campus in Clay is a once-in-a-century opportunity. This is not just a facility, it is a cornerstone of a new era for Central New York. It is projected to create up to **9,000 direct high-tech jobs**, and tens of thousands more in construction, supply chain, logistics, and support services. For IBEW Local 43, this means **up to 3,000 electricians** will be needed during the peak of construction, and **400 to 600 permanent positions** will be required to operate and maintain the facility once it is fully operational.

This is the largest private investment in New York State history, and we are ready to meet the moment.

Investing in Our Workforce

To prepare for this unprecedented demand, IBEW Local 43 is making bold, strategic investments in our workforce. We are more than **doubling our apprenticeship intake**, expanding our training center with a **\$7 million facility upgrade**, and working to **accelerate our training program** from five years to four without compromising the quality and rigor that define our craft.

With the support of a **\$1 million state workforce development grant**, we will be able to train over **100 new apprentices annually**, ensuring that our region has the skilled electricians needed not only for Micron, but for the wave of development that will follow in its wake. This is about building careers, not just filling jobs.

A Catalyst for the Construction Industry

The Micron Project is a game changer for the construction industry in Central New York. From site development and power infrastructure to cleanroom technology and advanced automation systems, this project will require the full spectrum of skilled trades. It will elevate industry standards, introduce innovative technologies, and provide long-term employment opportunities for thousands of union workers.

This is more than a job site, it is a living classroom. It will serve as a training ground for the next generation of tradespeople, offering real-world experience on one of the most advanced construction projects in the country.

A Lifeline for Our Communities

Micron's commitment to Central New York extends far beyond its campus. Through the **\$500 million Green CHIPS Community Investment Fund**, Micron, the State of New York, and local partners will invest in **education, workforce development, housing, transportation, and infrastructure**. This means:

- **Stronger schools** and STEM programs to prepare our youth for high-tech careers.
- **Affordable housing** to support working families and reduce displacement.
- **Improved public transit and infrastructure** to connect communities and job centers.
- **Expanded community services** that enhance quality of life for all residents.

This project gives our young people a reason to stay in Central New York. It gives families hope for a better future. It gives our region a renewed sense of purpose and pride.

A Strategic Win for New York State

At a time when global supply chains are under pressure and national security is tied to technological independence, the Micron Project positions New York as a **national leader in semiconductor manufacturing**. It will attract a robust ecosystem of suppliers, research institutions, and innovation hubs, creating a **high-tech corridor** that stretches from the Mohawk Valley to the Finger Lakes.

The economic ripple effects will be felt across the state from increased tax revenues and small business growth to expanded educational partnerships and global investment. This is not just a regional project, it is a strategic asset for the entire state and the nation.

A Call to Action

IBEW Local 43 is ready. We are expanding, training, and preparing for the future. But we cannot do it alone. We call on our partners in **government, education, and industry** to continue investing in workforce development, to support career and technical education, and to ensure that **union labor remains at the heart** of this historic project.

Let us be clear: this is more than a construction job. It is a legacy. It is a turning point for Central New York. And we are proud, deeply proud to be building it together.

Respectfully,

Alan Marzullo

Subject: [EXTERNAL] Comments on micron EIS

I live off Caughdnoy Road at the Country Meadows development. My name is Jeffrey Norensky and my address is 8231 Fuchsia Path, Clay, New York.

I am writing you to Address my concerns on the planned Traffic patterns to the new Micron facility. The two major highways that people and construction equipment will use in transit to the newMicron Facility, I believe are route 81 which will have a special road built from the highway directly into the micron property. However, people traveling on route 481 most likely will get off at the Caughdnoy Road exit.

My concern is that Caughdnoy Road between Maple Road and route 31 Is totally inadequate for heavy traffic and commercial trucks. The road is only two lanes and has no shoulder. About 5 feet off the road are drainage ditches.

It is basically a rural Road with many bends. It also has many housing developments on it and people jogging and bicycling on this section of the road. And more recently I have seen numerous adolescents riding on electric bikes and scooters.

This area has no walking or bike paths. It is not suitable for the traffic you are anticipating to use this road. I would suggest you encourage traffic to use Route 31 or Henry Clay blvd. Particularly truck traffic.

CHIPSNEPA@chips.gov

**COMMENT FROM NY SMART I-CORRIDOR CO-CONVENORS
RE: DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR
MICRON'S CLAY, NY SEMICONDUCTOR MANUFACTURING PROJECT**

On behalf of the NY SMART I-Corridor, we appreciate the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for Micron Technology's proposed semiconductor manufacturing site in Clay, New York.

This project aligns with the priorities of the NY SMART I-Corridor, a federally designated Tech Hub that connects Buffalo, Rochester, Syracuse, and surrounding communities to build a resilient semiconductor manufacturing ecosystem. Supported by \$40 million in federal funding and significant investment from New York State, the NY SMART I-Corridor exists to ensure this region leads in domestic chip production, workforce development, and supply chain expansion. Micron's historic investment in Onondaga County will transform this vision into reality.

We commend Micron and the Town of Clay for the transparency and detail demonstrated in the DEIS. The document includes detailed plans for managing water use, protecting wildlife, reducing traffic impacts, and limiting air emissions. The plan lays the foundation for a long-term partnership between Micron and the surrounding communities that is built on accountability and shared progress.

As global demand for semiconductors grows, the question is no longer *if* facilities like this will be built, but *where*. Building in New York State, under strong state environmental

Building America's Semiconductor Future in Upstate New York | NYSMARTiCorridor.com

standards, ensures the carbon footprint of this project will be minimized. New York's electric grid is significantly less carbon intensive than that of other states, and CLCPA-related mandates will limit both the project's direct and indirect emissions. Locating this project elsewhere would risk significantly more carbon emissions and fewer environmental protections. Welcoming Micron to Onondaga County isn't just an economic opportunity; it's an environmentally responsible choice.

While the proposed development carries environmental impacts that must be carefully managed, it also presents significant opportunities, including thousands of well-paying jobs, strengthened national security, and long-term economic growth that will establish Upstate New York as a national leader in this critical industry.

Micron's impact will be substantial: up to 9,000 direct jobs, more than 50,000 additional regional jobs, and \$100 billion in private investment over the next two decades¹. With thoughtful mitigation strategies in place, these economic benefits can be achieved in an environmentally responsible way.

We urge each department to advance this project and continue working with Micron to ensure this economic engine comes to fruition in an environmentally sustainable way.

Sincerely,

Dottie Gallagher

Syracuse, New York 13202

MICRON,

Please choose human safety and quality of life in your decisions on the industrial impact from the work at the new facility.

Sustainability is important for us all in that today's children will live with the effects of your actions.

You have the opportunity to be a leader in the example to put people and planet as priority vs secondary thoughts.

Please choose a better future for the residents near the factory.

If you don't choose safety and sustainable practices then know that people will be harmed by you and you will be at fault. So please please please choose to the right thing for all of us.

As always - Let me know how I can help!

Have a great day!

Subject: [EXTERNAL] Micron Project

I am writing to add my input in the community comment stage of this project.

We do not need a behemoth industrial building in our area. I read that 10 years will be required for build out and finishing to production. In 10 years this industry will have changed so much the unfinished project is defunct. Business has to be more flexible these days.

I am very surprised MICRON hasn't realized that and is proposing their manufacturing with a different paradigm. This is obvious.

It would be far more useful and practical for our area and for the company if the production were broken down into segments, and yes, placed in multiple locations. This disperses traffic patterns, could build to infill spaces in existing 'industrial' or business areas, etc. The company will claim this isn't financially feasible or reasonable. But it is. Make them think outside their box, which is nothing but a box designed for their convenience, with no thought to where they will be or what they leave behind. Make them build chips so it helps the Syracuse area, not further blight it down the road.

If you aren't willing to require smaller components to be created of the process, it would be great to require them to build this big manufacturing building with the infrastructure that could be adapted to condos when they are through with it. Require them to put in wiring and plumbing accesses while they are building, so options for reuse are possible when it becomes an abandoned shell, as it will.

Smaller manufacturing buildings are the smart way to go, for sustainability and practicality, and for less environmental impact and for easier reuse after the company leaves. This is not a radical, new management idea. This has become the obvious planning principle by now in companies.

And at the end point, if MICRON can't come in here, doing their business in a way that supports our area, rather than just provides what they want to take, they aren't worth it. Hard conclusion I know, but this project has some very big holes in it, or another way to put it, big assumptions that are built in. And they need to be challenged and not accepted.

We need a public transportation plan. Successful, flourishing metropolitan areas have robust, easy to use, convenient, and efficient public transportation. There must be convenient ways for people to at least get to/from micron, downtown Syracuse, the airport, and each of the suburban town centers, as well as around the city of Syracuse. Reliance on individual motorized vehicles and the need for parking is one major hindrance for our area's growth and success.

RE: Comments on Micron Semiconductor Facility DEIS (Clay, NY)

To Whom It May Concern,

I am submitting these comments regarding the Draft Environmental Impact Statement (DEIS) for the proposed Micron semiconductor fabrication facility in Clay, NY. While I reside approximately 80 miles from the site, the scale of this project raises significant concerns about its regional impacts, including effects on wetlands, water resources, pollution, and downstream communities like Pittsfield. Below are my key questions and comments for the record:

1. Wetland and Habitat Destruction

The DEIS acknowledges the permanent loss of **193 acres of federal wetlands** and **6,283 linear feet of surface water features**, with mitigation proposed at a 2:1 ratio. However:

- How will the mitigation sites be monitored and enforced to ensure ecological equivalence, especially given the irreversible loss of existing wetland functions (e.g., flood control, species habitat)?
- What safeguards are in place to protect federally listed species (e.g., Indiana bat, northern harrier) during and after construction, given the acknowledged "unavoidable" harm to their habitats?

2. Water Resource Strains

The project's water demand and wastewater discharge pose risks:

- How will Micron ensure that wastewater containing **chemical toxins** (e.g., PFAS, heavy metals) from semiconductor manufacturing will not contaminate groundwater or downstream communities?

3. Air Quality and GHG Emissions

While the DEIS states compliance with air quality standards, the project's "**unavoidable**" **GHG emissions** conflict with New York's CLCPA goals:

- How will Micron's "significant adverse effects on climate change" be reconciled with state mandates?
- Will the promised renewable energy credits (RECs) actually reduce regional emissions, or merely offset them on paper?

4. Cumulative Impacts on Surrounding Communities

While the DEIS acknowledges the project's growth-inducing effects, smaller communities like mine—though potentially benefiting from economic spillover—**may lack the financial capacity to absorb sudden strains** on housing, infrastructure, and public services. For example:

- How will Onondaga County coordinate with surrounding towns to ensure **equitable distribution of tax revenues** or state/federal aid to offset costs (e.g., road maintenance, school enrollment surges, emergency services)?

- What mechanisms (e.g., regional task forces, Micron-funded grants) will be implemented to help smaller communities **plan for and manage growth** without overextending local budgets?

The DEIS assumes local governments can adapt, but many lack resources for proactive planning. Clear commitments from OCIDA and project partners are needed to prevent smaller towns from bearing disproportionate burdens.

5. Transparency and Long-Term Accountability

- How will the public access real-time data on pollution, water usage, and mitigation progress?

- What financial assurances (e.g., bonds, penalties) will Micron provide to cover future remediation costs if environmental harm occurs?

I urge the agencies to:

1. **Strengthen mitigation requirements** for wetlands and species impacts, with independent oversight.

2. **Mandate stricter pollution controls** for wastewater and air emissions, including zero-discharge standards for hazardous chemicals.

3. **Expand the environmental justice analysis** to include downstream communities like mine, which may face indirect burdens.

4. **Require a phased construction review** to reassess impacts at each stage, rather than relying on upfront projections.

5. **Create a dedicated conservation area** of equal or greater size (e.g., 250+ acres) within the region, with comparable hydrologic and ecological features to the lost wetlands.

- Partner with local environmental organizations to **permanently protect and restore** this land as a refuge for displaced species (e.g., bats, grassland birds) and a carbon sink.

- Publicly commit to this mitigation upfront**, with transparent monitoring, to demonstrate responsiveness to community concerns about environmental trade-offs.

This would not only address ecological damage but also build trust with residents who fear the project's legacy will be purely industrial. The **permanent loss of 193 acres of wetlands and critical wildlife habitat** demands proactive, compensatory conservation.

This project must not prioritize economic gains over irreversible ecological harm. Thank you for considering these concerns. I request written responses to my questions and notification of any revisions to the DEIS.

Sincerely,
Cindy Taren

Subject: [EXTERNAL] Comment on the Micron DEIS

I am writing to comment on the DEIS on the impacts of the construction and operation of the set of semiconductor fabrication plants that are planned in the Town of Clay, Onondaga County, State of New York. I am a resident of Onondaga County, as I live in the Town of LaFayette south of Syracuse. I am a clinical psychologist who is devoting my time in retirement from the Syracuse Veterans Administration to understanding the human impacts of climate change and environmental degradation. I am a former Treasurer and Member of the Board of Directors of Onondaga Audubon, the local chapter of the National Audubon Society, an organization whose mission is the preservation of the birds of North America and their habitats. I am also a volunteer with Citizens' Climate Lobby, an organization that works toward bipartisan solutions to the climate crisis. While these affiliations inform my opinions, the comments below are my own.

In 2025, at the end of a decade that saw the highest world temperatures in recorded history, and in the wake of a recent report that documented the loss of 3 billion North American birds in the past 50 years primarily due to habitat loss, the construction of fabrication plants that will destroy over 200 acres of wetlands, pour a virtual sea of highly carbon polluting concrete over many additional acres secured by similarly highly polluting steel, and consume an ungodly amount of power once up and running, seems ill-advised to say the least. But I understand that the interests of individual, private citizens will not outweigh the economic forces that will result in the construction of the plants. So, my request is that Micron be taken to task on the environmental remediation that will be necessary to secure the habitats of endangered bats, threatened grassland birds, countless turtles, snakes, and other reptiles, amphibians, and mammals whose habitats will be destroyed. I trust you have been noting the highly informed comments that have been appearing in the Opinion pages of the Syracuse Post-Standard that explain why simply setting aside a limited amount of land for wetland restoration will fall short of the intended outcomes.

My recommendation is that the plan for environmental remediation of the huge impacts of the construction of these fabs be revisited with the comments of the environmental community in

mind. We need more land set aside to accommodate the needs of the bats, birds, and other creatures to adapt to, in hopes of their populations not be significantly or entirely decimated. We need these properties to be thoroughly repurposed, including the proliferation of native plants and water features to resemble the destroyed tracts of land as much as possible. And we need a team of biological and botanical experts to oversee the construction of these repurposed properties and their curation for at least two decades into the future. We will never undo the damage caused by the construction of the facility, but we can require that the economic beneficiaries devote a modicum of their profits to the best remediation possible.

Subject: [EXTERNAL] Micron

I have concerns regarding the new Micron plant that is planned in the Town of Clay. My first concern is the air quality and the effect it will have on the health of the people who live in that area. It is a very populated area and I have family member who live within three miles of the plant. Another concern is the waste water that will be given off by the plant that will be emptied into the rivers that flow into Lake Ontario. Lake Ontario is used as a source of drinking water in this area. Lastly has there been any published research on both of these concerns.

Please pay particular attention to the “Post Standard” opinions by two PhD’s: Catherine Landis, an ESF field botanist, and Madeline Nyblade, an ESF hydrologist. Both articulate significant concerns and suggest potential alternatives, which are particularly cogent to the long term success of the Micron project.

As a retired pathologist with natural history interests, I could send you an email on water and air pollution risks by the Micron project, plus damage to fragile wetland and forest inhabitants. However, Drs. Landis and Nyblade are both remarkably thorough in their letters, which should be seriously read and heeded.

Thank you.

RE: Public Comment on the Micron Project DEIS (Clay, NY) – Request for SEIS

Dear SEQRA Lead Agency and Reviewing Authorities,

I am submitting this comment regarding the Draft Environmental Impact Statement (DEIS) for the Micron Technology semiconductor fabrication facility proposed in Clay, New York under the Green CHIPS program. Upon review of the DEIS, it is evident that the analysis as presented is incomplete, inadequate, and procedurally deficient in multiple respects under the standards required by the State Environmental Quality Review Act (SEQRA).

Accordingly, I urge the agency to issue a Supplemental Environmental Impact Statement (SEIS) and withhold any permit approvals until the following fundamental deficiencies are fully addressed:

1. Traffic Modeling Inadequacy

The DEIS traffic analysis lacks sufficient granularity and fails to provide disaggregated modeling of peak-hour congestion impacts, particularly along Route 31, Interstate 481, and local connector roads in the North Syracuse and Liverpool communities. Furthermore, the analysis does not incorporate cumulative impacts from induced growth, school bus patterns, and concurrent construction traffic. A supplemental review must address:

- Multi-modal transportation impacts (including freight and rail logistics),

- Specific infrastructure upgrades required, and
- Long-term regional congestion patterns during phased build-out.

2. Stormwater and Groundwater Risks

Despite the scale of site disturbance, the DEIS does not offer sufficient analysis of stormwater retention, soil permeability, or flood risk associated with extreme weather events. The project lies in proximity to sensitive watershed areas and a growing number of impervious surfaces raise concerns of runoff pollution and downstream flooding.

We request detailed hydrological modeling, engineered mitigation plans, and public disclosure of soil stability assessments before proceeding.

3. Endangered Species – Bat Habitat Disruption

Micron’s construction timeline may conflict with federal and state protections for endangered bat species, including the Northern Long-Eared Bat and Indiana Bat. The DEIS provides only cursory habitat screening and fails to define seasonal clearing restrictions, tree survey protocols, or bat presence verification.

Without a detailed assessment, including a Habitat Conservation Plan (HCP) and seasonal tree-clearing enforcement framework, this omission risks violating federal Endangered Species Act protections and must trigger a supplemental review.

The DEIS fails to adequately address impacts on federally and state-listed endangered bat species, including the Northern Long-Eared Bat. The site includes potential summer roosting habitat, yet no formal tree surveys, acoustic monitoring, or Section 7 consultation results have been disclosed. The absence of this data represents a critical deficiency under SEQRA’s ‘hard look’ requirement and the federal Endangered Species Act.

If seasonal restrictions apply, clearing must be postponed until after November 1 or delayed until the following spring, thereby rendering the current construction schedule infeasible.”

4. Displacement and Housing Pressure

The DEIS fails to analyze the direct and indirect housing market impacts resulting from a projected influx of 9,000 construction workers and thousands of permanent fab workers. These pressures are particularly acute in low-income renter communities in Onondaga County and surrounding municipalities.

No clear methodology is offered to assess displacement risks, rental inflation, or demand on affordable housing infrastructure. A full housing impact analysis, conducted by independent experts, is essential to mitigate socioeconomic harm.

5. Air Quality Impacts – Insufficient Modeling

The DEIS lacks clear modeling of volatile organic compounds (VOCs), particulate matter, and other emissions related to fab operations, diesel construction fleets, and chemical deliveries. Furthermore, cumulative exposure analysis, including hazardous air pollutants (HAPs) under Clean Air Act thresholds, is not sufficiently addressed.

The public has a right to understand long-term exposure risks, particularly for children, elderly residents, and immunocompromised individuals in nearby residential zones.

6. Non-Enforceable Community Investment Commitments

Micron’s much-touted \$500 million Community Investment Fund (CIF) and related benefits (education, housing, workforce development) are non-binding and not legally enforceable. The DEIS fails to explain how these commitments will be upheld, monitored, or adjusted if unmet.

Without transparency around the so-called “Green CHIPS Community Plan”, there is no public accountability

mechanism for CIF deployment, nor any third-party oversight requirements. The SEQRA process must evaluate mitigation credibility and enforceability, not just stated intentions.

Conclusion and Demand for Supplemental Review

For the reasons stated above, the current DEIS does not satisfy SEQRA's "hard look" standard, nor does it allow the public and reviewing agencies to fully assess the environmental, social, and economic impacts of the project. We therefore respectfully request that:

1. A Supplemental Environmental Impact Statement (SEIS) be prepared to correct the above deficiencies,
2. No permits or final approvals be issued until such review is completed, and
3. Future review processes include clear enforcement provisions, independent third-party oversight, and robust community input mechanisms.

Sincerely,

HeeWon Brindle-Khym

I am seeking to comment on the Micron Project in the Town of Clay in New York. I am very concerned about the health of myself, my family and my friends and neighbors living in this area. I believe that the particles that will come from this plant are going to be harmful to people especially the elderly and those with chronic health issues immediately. And in the future people of the all ages will be affected by these in the long term. I am also concerned about the wastewater that will be put in Lake Ontario which is where most of our drinking water comes from. With the way technology changes so quickly will the chips micron makes be phased out by updated technology? So is it worth building this plant and possibly endangering the health of so many people? I'm sure the people that decided the plant should be built here do not live here or even visit here. So why would they care about us!

SUBJECT: Public Comment to the Micron Semiconductor Manufacturing Project, Clay, NY
Draft Environmental Impact Statement (EISX-006-55-CPO-001)

Dear OCIDA,

I am writing to you today as a resident of the Onondaga County and the Town of Clay. I am providing you with comments on the DEIS from Micron, with a particular focus on the management of hazardous chemicals that are expected to be used on site. Enclosed are general comments regarding the DEIS, as well as specific annotated comments on portions of the document (Part 1 and Part 2, respectively).

Sincerely,

Catherine Rudisill, MS

Part 1 – General Comments

- Micron’s DEIS does not provide sufficient detail regarding the hazardous chemicals that may be present in the generated wastewater once the facility is operational.
 - They acknowledge that PFAS will be used in their facilities, once completed. They do not specify which PFAS specifically will be used. This is important to know as the type of PFAS will dictate the appropriate treatment technology and if it is being managed properly.
 - Micron does not discuss any other hazardous chemicals that may be present in the wastewater, how likely they are to be removed, and how they will be managed.
- Micron’s environmental protection policies appear to be largely dictated by regulatory restrictions and policies, which do not equate to a sustainability program.
 - Regulatory compliance is a low bar, as it represents the absolute minimum that a company must achieve to legally operate.
 - Only a small subset of PFAS have established federal water quality limits. Most federal and state restrictions are focused on the two legacy PFAS, PFOS and PFOA. Since these two PFAS were voluntarily phased out of the market years ago, it’s unlikely that Micron is using these specific PFAS in their processes. This means the PFAS they are using are largely unregulated with regards to water quality standards.
 - We are currently in an era of regulatory backsliding with regards to federal protections. NY State offers a robust environmental regulatory framework, but like many states, it is resource constrained. We need to know how Micron’s environmental practices will not only meet but exceed regulatory standards and how they will hold themselves accountable to the community in which it operates.
- Micron is not being transparent about the well-documented challenges regarding the treatment and removal of PFAS from wastewater [Ref: <https://cen.acs.org/environment/persistent-pollutants/Getting-PFAS-drinking-water/102/i20>].
 - PFAS are notoriously difficult to remove from water.
 - Micron has listed several treatment technologies that have been proposed to treat PFAS to the “ppt” level, but it has not addressed which of these technologies it may use and what the potential drawbacks are given that PFAS water treatment is developing field with many uncertainties. Are these technologies even capable of treating semiconductor wastewater to this level?

- Management of PFAS at these facilities needs to be a top priority for Micron, as accidental releases or mismanagement means the contamination of the Oneida River, the primary catchment for treated wastewater, and associated watersheds with hazardous “forever chemicals”.
- Micron has disclosed where the planned IWWTP will discharge but does not specifically state if discharging to the Oneida River will directly impact intake for surrounding municipal water treatment facilities and who’s drinking water is at risk should their treatment plan fail.
- Micron as disclosed that over 14 million gallons of hazardous liquids and over 1 million lbs of hazardous gases will be stored on site per fabrication facility.
 - Micron should consider extensive onsite and local monitoring of environmental media to monitor accidental leaks.
 - Continuous monitoring approaches using GIS or remote-sensing offer more extensive monitoring of contaminant inputs than traditional grab-sampling. Micron should adopt these practices in their environmental management plan.
- The best way to manage the risks of PFAS is to stop using PFAS. This is consistent with the “hierarchy of controls” reported in Figure 3.9-1, which prioritizes the elimination of a hazard rather than controlling exposure.
 - While substitution of PFAS in certain processes may, in fact, be years away. There has already been documented success with substituting fluorosurfactants in semiconductor etching processes (see annotated comments below).
 - Eliminating PFAS is also advantageous for Micron as this eliminates difficult-to-treat substances from wastewater and a manufacturing process which requires immense amounts for ultrapure water. Micron stated they are essentially building separate outflows that would immediately separate PFAS from waste streams. In essence, they’re building around the PFAS they’re committed to using, but restructuring their process to eliminate PFAS is too cumbersome?

Part 2 – Annotated Comments on the Document

P 3-83

Micron lists numerous technologies claiming to be effective at removing various emerging contaminants like PFAS. Various types of water treatment technologies were named, but it's not clear if these are examples of what may go into the Clay site or the specific technologies planned. PFAS is an umbrella term that encompasses many thousands of substances which require different types of water treatment to effectively remove. It would be helpful to know specifically which types of PFAS are being used on the site, at the very least by sub-class, to determine whether these technologies are effective at removing the respective PFAS present in wastewater.

A recent publication by [Chen et al. 2024](#) reported the detection of various fluorosurfactant byproducts and reaction products in chip fabrication wastewater. These included perfluorobutane sulfonamido ethanol (FBSE) and its various derivatives. In total 83 different PFAS were detected including 29 newly discovered compounds likely formed from the various chemical and physical processes involved in semiconductor manufacturing. It's clear semiconductor manufacturing generates its own unique set of PFAS, which will require a specialized approach to wastewater and environmental protection. These types of PFAS are outside the scope of recent regulatory restrictions on water quality and are currently only subject to federal disclosure requirements.

Micron states that some of these WWT technologies would transform certain PFAS into "less harmful, shorter chain PFAS". The fluorochemical industry has been promoting this nonsense for years, but the scientific literature contradicts this notion. Shorter chain PFAS are *not safer* and promotion of this assumption has resulted in regrettable substitutions in many industry sectors (e.g. firefighting foams). The following is a sample of resources indicating that shorter chain PFAS pose similar health concerns and are, at best, understudied:

- Ateia et al. 2019 <https://doi.org/10.1016/j.chemosphere.2018.12.186> - Review the available literature which found that short and ultra-short PFAS are difficult to remove from wastewater, are increasingly detected in the environment, and remain largely under-studied with regards to their transport and impact. **The authors state that conventional water treatment technologies are not likely sufficient to remove these types of PFAS from wastewater streams.**
- Kwiatkowski et al. 2020 [ref: <https://pubs.acs.org/doi/10.1021/acs.estlett.0c00255>] - Propose the scientific basis for managing PFAS as a class, which includes shorter chain PFAS. Mounting evidence suggests that short chain and ultra-short chain

PFAS are not less harmful to environment as they are still highly persistent and mobile, as well as understudied compared to PFOA and PFOS.

- The National Toxicology Program (NTP) published studies in 2019 (revised 2022) which found that both long and short-chain PFAS affected the liver and thyroid in tested animals, although higher doses of the shorter-chain PFAS were needed to elicit similar effects. [ref: https://ntp.niehs.nih.gov/research/topics/pfas?utm_source=chatgpt.com]
- The European Chemicals Agency (ECHA) continues to develop regulations that would restrict PFAS as a class with only a few notable derogations. These regulations approach their actions on the assumption that all PFAS are harmful to human health and the environment as per the precautionary principle. [ref: <https://echa.europa.eu/registry-of-restriction-intentions/-/dislist/details/0b0236e18663449b>]

It is disappointing that Micron is working on such faulty and outdated assumptions concerning one of the most notorious pollutants in the 21st century. This does not inspire confidence that Micron has the best interests of the local community and quality of the water we are graciously providing to expand its business. If not properly managed, the PFAS used at these chip fabs could seep into water, sediment, and soil, causing expensive and time-consuming remediation and harmful exposures to the public. Under our “polluter-pays” regulatory structure, the public may have to wait decades for remediation, restoration, and compensation for any damages. We’ve experienced this with the Onondaga Lake clean up, and I personally don’t want to see this happen again at Micron.

Certain technologies using materials like activated carbon would also contribute to the generation of hazardous waste, as the activated carbon, or other treatment materials, becomes contaminated with the removed PFAS and other hazardous chemicals. A large amount of uncertainty surrounds the efficacy of PFAS hazardous waste disposal. EPA’s current interim guidance suggests that disposal options are limited to only certain methods like incineration (at capable facilities only, not municipal incineration), hazardous waste landfill, and or underground injection, and only if these facilities meet certain testing requirements. It cannot be assumed, for example, that any hazardous waste incinerator can completely incinerate PFAS. [Ref: <https://www.epa.gov/system/files/documents/2024-04/2024-interim-guidance-on-pfas-destruction-and-disposal.pdf>]

What is Micron's plan for ensuring that additional hazardous waste generated during water treatment is properly disposed of and does not impact the local or regional environment?

Micron acknowledges where PFAS are used but does not disclose the types of PFAS that will be used on site -surfactant-based PFAS, fluoropolymers, soluble, insoluble? Micron states that they will require vendors to disclose chemical constituent data, but this can be difficult even under NDA. Suppliers are not legally mandated to provide information that compromises their intellectual property. What is Micron's vendor chemical disclosure policy for chemical suppliers? Will Micron not purchase from a supplier that is unwilling to provide adequate chemical disclosure? These disclosures are paramount to adequately managing risks from wastewater and worker health.

Micron's stance on PFAS substitution is similar to that of the [Semiconductor Industry Association](#): there are no known substitutes for PFAS in semiconductor manufacturing. Substitution will require extensive re-designing of their processing facilities. They claim that substitutes may be as far as 25 years away. However, there has been fruitful work from a fellow chip manufacturer that challenges this statement. Transene partnered with academic researchers at UMASS Lowell to develop alternatives to safer etching solutions without the need for PFAS. According to the published, peer-reviewed article released in 2023, these safer etching solutions were tested at ca. 100 facilities without any reports of reduction in performance. (Ref: <https://transene.com/wp-content/uploads/PFAS-Article.pdf>)

What is Micron's plan for finding PFAS alternatives and what is the expected timeline for substituting PFAS in its fabrication facilities? Are they acquiring strategic partnerships to develop resources? Are they doing active testing and piloting alternatives? What is the likelihood that the fabs planned for later development in Clay will be designed without the need for fluorochemicals?

P 3-240

Micron acknowledges that PFAS analytical methods are still under development and there are only validated methods to detect ca. 40 of 10,000 PFAS available. How likely are these 40 methods to adequately detect the type PFAS that will be used at the Clay facility? How can the facility be sure they are adequately removing PFAS at their IWWTPs if there are limited analytical methods available? How can they meet the regulatory monitoring requirements under SPDES and other authorities to ensure the local surface water is protected?

Micron should consider using analytical screening methods that detect total organic fluorine (TOF) and other non-targeted screening methods in wastewater effluent. These methods do not detect specific types of PFAS but qualitatively detect the presence of any

PFAS. While these methods are still being standardized, they represent the best methods currently available to monitor PFAS in many environmental media.

Micron mentions NY drinking water limits for PFOS and PFOA, but these are not likely to present anyway as C8 and C10 fluorochemicals were voluntarily phased out of the market. Micron should clarify that most drinking water standards currently in place manage only a small subset of PFAS.

Micron should clarify whether these drinking water standards would protect the public from the PFAS expected to be used on site. What is Micron's plan to ensure that their wastewater treatment technologies will exceed regulatory standards, particularly with regards PFAS and other under-regulated hazardous materials?

The TRI reporting rule was also mentioned. Will Micron be exempt from these reporting standards when they are operational? If not, and Micron will likely have to disclose the PFAS used at this facility once it's operational. Then why not disclose this now to the public?

Subject: [EXTERNAL] Extend the comment and review period on Micron's DEIS

Dear whomever it may concern,

As a constituent of Central New York and Onondaga county, who will be affected by Micron's presence in the area, I oppose the project's arrival and demand that you make necessary accommodations to combat the project's proposed damages to the environment and community before starting construction. As outlined in the 2,000 page document, that you have only allowed the public 45 days to read and comment on, Micron's arrival will bring unnecessary and costly challenges to the surrounding areas: air and noise pollution, water consumption and contamination, and destruction to rare wildlife. These are problems the people of Central New York, and Syracuse specifically, already face on top of issues of lead poisoning in public water systems, homelessness and poverty. These issues must be addressed first, if you wish to see economic prosperity for the region. Giving the people a chance and a better future will strengthen and grow the region better than any project or corporation will, especially when that corporation is projected to do more harm than good. Micron's proposed benefits will not reach the community in the next few years, as Micron will not even be fully built in that time, however, the communities tax money and resources will be used for the creation of Micron. In the time it takes Micron to be built and for "prosperity" to emerge, these resources could be used instead to address some of the problems listed above, and will have a greater benefit on the community. This is what the people want. I am sure if you extend the comment period on the DEIS to 120 days and allow more public hearings for the public to comment on the plan, you will see that the public does not want Micron here, or at least requires accommodations to be met before Micron's implementation. I urge you to make these considerations and to hear out the voices of the people before moving forward on this project. It is in your best interest.

sincerely,

--

Subject: [EXTERNAL] MICRON Draft EIS 2025 Comments
Attachments: Micron Comments_August 3 2025.pdf

To: CHIPS Program Office and OCIDA

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. I advocate for an extension of the comment period from 45 days to 120 days (October 25, 2025), and to hold additional public hearings beyond the one held on July 24 to include additional in-person and virtual hearings. The 20,000-page DEIS is a lengthy report that takes time to read and fully understand. Given the size and impact of the Micron project, it is important that the public have ample time to read the report.

I want to highlight key environmental, social, and economic impacts and mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

Water and Ecological Resources: The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

Furthermore, Micron must not pollute our air, soil, fish & wildlife, and drinking water with any of the hundreds of chemicals used in their production process, including toxic ones such as PFAS ("forever chemicals"). There are currently no easy and cost-effective means of removing PFAS from our environment. Thus, preventing PFAS pollution in our communities is vital.

While Micron proposes to create more wetlands than it destroys, restored wetlands are rarely as effective or biodiverse as original wetlands. Restored wetlands seldom replicate the important functions of natural wetlands and can take decades to reach peak functionality. With the potential restored wetlands being upstream of Micron, they will not mitigate flooding caused by Micron's development. Lastly, the proposed wetland replacement ratio could be higher, especially considering the lower functionality of created wetlands compared to natural wetlands.

Protection of Air, Water, and Workers: A good job is a safe job. The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect workers' health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols. In addition to workers, Micron must commit to keeping workers' families and community members safe from toxic chemicals by implementing state-of-the-art health and safety protocols, especially from exposure to large quantities of toxic chemicals used during production.

Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

In past presentations, Micron promises to use “state-of-the-art technology” to mitigate greenhouse gas emissions and claims they “aim to achieve zero waste to landfill.” However, no specifics are offered as to the technology that will be used to mitigate and control greenhouse gas emissions. Furthermore, no details are provided on how Micron plans to achieve zero waste to landfill. These are great ideas in theory, but the lack of specifics makes them empty promises.

Job Access, Housing & Transportation: The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Micron must commit to measures such as pay equity and transparency, fair schedules, childcare and other supportive services, inclusion and anti-bias training, and protections against discrimination and harassment to ensure accessibility for and retention of women, people of color and other marginalized populations. Micron must also commit to ongoing training and professional growth of employees to ensure equitable promotion and advancement in a highly technical work environment. Micron must guarantee that a meaningful percentage of new hires come from marginalized local communities, particularly within the City of Syracuse, so that those who need good jobs the most have access to them. Micron must create a workforce development process focused on census tracts with the highest concentration of poverty in the CNY region.

Furthermore, the DEIS does not sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Additionally, the impact of a larger population and need for more housing mean that land costs will increase. This will further exacerbate the affordable housing crisis. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed-income, affordable, climate friendly, and safe housing while protecting the affordability of existing housing for current residents.

Social & Cultural Impacts: Connection to water is culturally important to many living in the Central New York region, including the Onondaga Nation. The Onondaga Nation has worked so hard to protect our local waterbodies, and fight for cleaning up waters that non-indigenous communities have destroyed. Almost everyone in the Syracuse-area knows the story of Onondaga Lake, and its legacy of extreme pollution caused by companies.

While some improvements have been made to Onondaga Lake's water quality, I fear we have learned nothing from the whole experience by allowing Micron to come into the region. We have already seen what happens when companies pledge to protect water resources and fail – do we want a repeat of Onondaga Lake?

Thank you for your consideration of my comments.

Sincerely,

Camille Marcotte

In addition to workers, Micron must commit to keeping workers' families and community

members safe from toxic chemicals by implementing state-of-the-art health and safety protocols, especially from exposure to large quantities of toxic chemicals used during production.

Greenhouse Gases: The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

In past presentations, Micron promises to use “state-of-the-art technology” to mitigate greenhouse gas emissions and claims they “aim to achieve zero waste to landfill.” However, no specifics are offered as to the technology that will be used to mitigate and control greenhouse gas emissions. Furthermore, no details are provided on how Micron plans to achieve zero waste to landfill. These are great ideas in theory, but the lack of specifics makes them empty promises.

Job Access, Housing & Transportation: The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Micron must commit to measures such as pay equity and transparency, fair schedules, childcare and other supportive services, inclusion and anti-bias training, and protections against discrimination and harassment to ensure accessibility for and retention of women, people of color and other marginalized populations. Micron must also commit to ongoing training and professional growth of employees to ensure equitable promotion and advancement in a highly technical work environment. Micron must guarantee that a meaningful percentage of new hires come from marginalized local communities, particularly within the City of Syracuse, so that those who need good jobs the most have access to them. Micron must create a workforce development process focused on census tracts with the highest concentration of poverty in the CNY region.

Furthermore, the DEIS does not sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Additionally, the impact of a larger population and need for more housing mean that land costs will increase. This will further exacerbate the affordable housing crisis. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed-income, affordable, climate friendly, and safe housing while protecting the affordability of existing housing for current residents.

Social & Cultural Impacts: Connection to water is culturally important to many living in the Central New York region, including the Onondaga Nation. The Onondaga Nation has worked so hard to

protect our local waterbodies, and fight for cleaning up waters that non-indigenous communities have destroyed. Almost everyone in the Syracuse-area knows the story of Onondaga Lake, and its legacy of extreme pollution caused by companies. While some improvements have been made to Onondaga Lake's water quality, I fear we have learned nothing from the whole experience by allowing Micron to come into the region. We have already seen what happens when companies pledge to protect water resources and fail – do we want a repeat of Onondaga Lake?

Thank you for your consideration of my comments.

Sincerely,

Camille Marcotte

Subject: [EXTERNAL] Comments on Micron report

Hello,

I believe adding Micron to CNY will overall be a positive addition to the region even though there will be some minor environmental and economic changes we have to work through.

I fully support the work your doing bringing Micron to area.

Thanks,
Dean Powell

Subject: [EXTERNAL] Micron Draft EIS 2025 Comments

Submitted by Raymond D'Hollander, P.E., 7887 East Ridge Pointe Drive, Fayetteville, NY 13066

General Comments

I strongly support the Micron project. I believe it should move forward this fall with only minor tweaks to the Draft Environmental Impact Statement (DEIS). In general, the DEIS is thorough and provides sufficient detail to assess the project for decision-making. I have not identified any fatal flaws or significant gaps.

I note that most aspects of the project will have a specific permitting step where detailed plans will be reviewed for regulatory approval prior to implementation of that construction phase. Since the project will be in construction for two decades and then in operation for several decades after that with periodic permit renewals during operations, I assume there will be future regulatory changes and technology evolution that will need to be incorporated into the design and operation of those project phases.

The comments below are relatively minor and focus on environmental impacts that Micron has direct control over. Many of the environmental impacts assessed in the DEIS are not under Micron's control, such as transportation improvements, off-site power suppliers, induced economic growth, and housing developments. The DEIS does an excellent job of providing information for awareness of the basis of what needs to be addressed. Resolution of those impacts will need to be done through the local and state political processes.

In general, I believe that the environmental regulations for wetland and bat habitat mitigation, and stormwater management should be followed without waivers for Micron and other developments such

as housing, industry, and commercial. Our biggest current surface water quality impacts generally come from agricultural runoff now that there is a high degree of sanitary and industrial wastewater treatment such as proposed for the Micron project. I strongly support NYS permitting more renewable energy sources.

Section Specific Comments

Section 2.1.1.2 – This section states that there will be 445 acres of tree clearing and grubbing at the Micron site. Consideration should be given to saving a significant number of cleared trees and stumps for reuse in the wetland and stream mitigation activities to be executed concurrently. Incorporation of downed wood and large woody debris features in ecological restoration is very valuable, particularly since it takes decades to grow trees of the size that will be cleared. Stumps and root wads are very useful in ecological restoration and will be available due to the grubbing required as part of the Micron site clearing. Rot resistant trunks with root wads (e.g. hemlock) are particularly valuable in stream restoration as they can provide benefits for decades. Stumps and root wads are generally not available from commercial logging operations because they increase soil disturbance which is not desirable. The cleared wood is near the wetland and stream mitigation sites, so it also reduces the potential impacts of disease and insect movement that could occur if woody debris were brought from other sites further away.

Section 3.3.4.2 – This section states that the permanent stormwater design will meet the *New York State Stormwater Management Design Manual* (NYSDEC 2024) requirements. Since the design and construction phase will extend over two decades, I suggest amending this sentence to commit to meeting the requirements of the design manual version in effect at the time of the design of each phase of permanent stormwater features. It is likely that this would be required anyway as part of the NYS permitting process for later phases of the project. Hopefully, NOAA Atlas 15 will be completed in the next few years which will likely prescribe greater stormwater intensities for design.

Section 3.3.4.2 - This is a very large project with a lot of impermeable area. Much of the development in this watershed occurred before implementation of stormwater detention requirements and has led to increased flooding potential. Current development projects are opportunities to create additional stormwater detention. The *New York State Stormwater Management Design Manual* recommends designing stormwater detention in permanent features for a 100-year, 24-hour storm. I suggest that the Micron project target creating more extended stormwater detention in ponds where space allows without increasing the limits of disturbance, say for the 1,000-year, 24-hour storm or the upper bound of 100-year, 24-hour storm predicted range which would be an additional 1.5 to 2 inches of precipitation in the current NOAA Atlas 14 predictions. This provides buffer for the very large intense events and would also likely cover some of the changes that will likely occur in the upcoming NOAA Atlas 15. If open space is available, creating additional extended stormwater detention is inexpensive during the initial construction compared to attempting to retrofit existing facilities.

Section 3.3.4.2 – I suggest that emergent wetland and pond portions of the wetland mitigation areas be designed to provide extended stormwater detention for at least the 100-year, 24-hour storms for the watershed of the wetland mitigation area since those are largely being constructed in farmlands that have likely been augmented with ditches to expedite stormwater drainage. Creation of vernal pools in the forested wetlands would also count towards these retention volumes.

Section 3.13.4.2 4th paragraph – This paragraph states that there will be 50- to 100-foot-wide landscaped buffers with perennials, shrubs, and trees. Micron should commit to predominantly native plants in these buffers along the roadway as these will be important migration corridors of insects, birds, and animals along the edges of this large property as well as providing habitat. Douglas Tallamy and others have documented the substantial impact to wildlife ecology when non-native plantings replace native plants. It is still possible to have functioning ecosystems around industrial plants and subdivisions simply by providing significant native plantings. Similarly, Figure 2.1-5 shows 17 separate stormwater management practice areas. These stormwater management practice areas are also excellent locations to establish native emergent marsh and floodplain plant species that will both improve stormwater discharge quality and provide ecological habitat on the Micron site. The nature of these areas will depend on their design as dry basins or wet detention ponds, but the areas are large enough that they could support numerous species of migratory birds in either scenario. Some of the underlying soils are clay, so it is likely that at least some of the ponds will end up being wet ponds, whether intentional or not.

Section 5.1 Water Resources – Unfortunately, large projects such as this invariably severely impact valuable water and other resources, often by paving them over. Historically, these resources were lost forever. However, laws and regulations over the past half-century have required mitigation of these impacts. Large projects like this require large mitigations which create opportunities for large contiguous area mitigations that are simply not possible for small projects. It is good to see that proposed mitigations in Appendix F are generally large contiguous areas for either permanent protection or construction of mitigation features.

Section 5.1 – Biological Resources – Much of the loss of habitat for the threatened and endangered species listed has occurred one farm or housing lot at a time in the region. Small landowners, such as farmers and homeowners, have limited resources and poor nursery availability of critical species that could be planted on their properties, such as shagbark hickory. These large restoration and mitigation projects provide a valuable opportunity to plant a significant quantity of difficult-to-source materials, such as shagbark hickory. These valuable species should be identified and prioritized for inclusion in the plantings, or they will slowly dwindle in the region as other properties get developed. Waiting for squirrels and blue jays to plant them is a very slow process if there aren't any nut-producing trees within a few hundred yards.

Appendix F-7 Compensatory Mitigation Plan – I suggest adding shagbark hickory into the Red Maple Hardwood swamps to provide future high quality live tree bat roosting sites. Shagbark hickory should also be incorporated into other forest development areas, such as wetland buffers and streambanks.

Appendix F-7 Compensatory Mitigation Plan - Considering that many of the large contiguous areas requiring mitigation within the Micron site are impacted by invasive species, this project provides a rare opportunity to generate high quality large contiguous areas focused on specific wildlife species that are generally not accommodated by smaller mitigations. In particular, grasslands in this region tend to undergo succession to woodlands in the absence of a wildfire cycle. A commitment to creating and maintaining some areas as large contiguous grasslands (>50 acres in size) and preventing woodland succession will be valuable for species that require large grassland plots to maintain breeding populations.

Subject: [EXTERNAL] Comment, bird migration: Micron development New York State

Thank you for providing the opportunity for the public to comment on the proposed Micron chip building facility. A concern is the lighting at the proposed facility location may negatively impact wild bird migration, including song birds. Artificial lighting can negatively impact birds in flight. This is a recognized concern as evidenced by “lights out” media messaging during spring migration, March 1 to June 15, and fall migration, August 15 to November 30. Agencies supporting “lights out” to aid bird migration include Audubon Society, New York State Department of Environmental Conservation, New York State Office of General Services. Target audiences of such messaging includes “home” and “business” and “State-owned and managed buildings”. Will Micron support “lights out” to protect migrating birds and, if so, what is the planned methodology for doing so?

Respectfully,

JoAnne Oliver

To Whom It May Concern:

We would like to begin our comment by stating we are in favor of the Micron Project. However, considering the scope of the project we would appreciate;

1. More time for public comment before advancing to the EIS, not necessarily into October but an extension, nonetheless,

2. Much clearer and specific mitigation measures to be taken addressing;

a. Streams, rivers & lakes degradation

b. Water waste/industrial waste minimization

c. PFAS control (where will the ~ 100,000,000 tons of PFAS go), asphyxiants, spills (55 million gallons on-site, hazardous waste)

d. Utility use & who pays for how much, since we will become a "load pocket" vs. supplier?

e. Heat Island Affect (i.e., parking for 12,000 cars, in conventional parking lot = 15-20 acres of asphalt). Stacked structure to reduce footprint?

f. Wildlife & endangered species – protection?

g. Why use only fossil fuels? Wind? Solar?

h. Wetlands – typically take decades to recover.

We have both held various positions in our local Village government. We had a 140 acre parcel of land slated for clear cutting for development re-designated as a CEA. Karen was ZBA Chair & member & chair of our Planning Board. We became familiar with (albeit modest comparatively) DEIS documents. It became apparent that size and volume became somewhat of a technique to distract.

We are thoroughly impressed with the skilled professionals who took on the challenge of 20,000 pages. They spoke clearly and succinctly regarding some of our concerns mentioned above.

It would be interesting to compare documents with their other sites in Manassas, VA & Boise, Idaho. We discovered that a former applicant to our Planning Board used statistics from an entirely different site with nothing similar.

We know that Micron has the skill and capability to clearly, simply address these concerns without the immense volume of pages. Our area is blessed with ample, clean, fresh water. The Great Lakes hold roughly 20% of the world's surface freshwater. Let's keep our water & air clean and safe for generations to come.

Thank you for your consideration.

Sincerely,

The Ryon's

Subject: [EXTERNAL] Micron DEIS review

Please accept these comments and recommendations from Climate Change Awareness and Action, Inc. Please note that I will be submitting additional comments on behalf of other Dewitt Advisory Conservation Commission and myself using this email. All should be considered independently. Thank you, Dr. Sonia Y Kragh, MD

 DEIS response from CCAA Sonia edit

Respectfully accept these comments and suggestions for mitigation from the board members of Climate Change Awareness and Action, Inc.

We are writing in response to your request for the Central New York Community to respond to the Draft Environmental Impact Statement (DEIS) related to the Micron Project proposed for the Syracuse area.

We are Climate Change Awareness and Action, Inc.(CCAA). We organized 10 years ago for the purpose of educating others and actively working towards reversing the human caused climate disruption that threatens the earth. We are a local 350.org group, centered in Syracuse, New York.

Our mission is to reduce the amount of greenhouse gases in the atmosphere through individual and community education and action while supporting fair and just public policies and legislation. It is in this vein that we are responding and commenting. Specifically, we are referencing Chapter 3.7 (3-183-3-215), Greenhouse Gas Emissions (GHG), Climate Change, and Climate Resiliency.

Your lead statement references:

"The effects of climate change are driven by the combined emissions from various sources across the globe, rather than from any single event or emission. Each contribution, whether large or small, adds to the overall warming of the planet. As such, when assessing the impact of a specific project, it is essential to consider how its emissions across alternative scenarios (including a scenario with no project) fit in relevant context into broader global and regional emissions, its contribution to the ongoing accumulation of GHGs in the atmosphere, and how the project and alternatives may impact climate commitments and goals. This approach allows an agency to present the environmental and public health effects of a proposed action in clear terms and with sufficient information to make a reasoned choice among the alternatives and consider appropriate mitigation measures. This section describes the environmental setting of the Proposed Project, and assesses, to the extent practicable, GHG emissions from the semiconductor industry broadly and, more specifically, from the Proposed Project alternatives, and considerations of ongoing climate change effects."

This statement acknowledges the DEIS attempt to include many relevant concerns about the Proposed Project, but fails to address the impact of Connected Actions on GHG emissions and Climate Change. The net finding of the DEIS is that there will be harmful impact to Climate change from the Proposed Project construction and operations. These will be commented on separately below.

Proposed Project:

1. The boundaries set to analyze greenhouse gas emissions at the construction site seem arbitrary and the radius unlikely to capture the plume of emissions resulting from GHG emissions during construction and operations. The Environmental Justice (EJ) Screening Tool on the Environmental Protection Agency website is not operational under the current federal administration. This is a key "real time" monitoring tool used by the public and science community to determine what is happening in our region related to emissions and climate change, as well as other environmental effects from the Proposed Project.

Recommend:

1. Repeat the GHG assessment using a 5 mile radius from the center of the Proposed Action. Modify monitoring sites and frequency based on this new radius.

2. Restore the EJ screening tool on the EPA website. If not possible, ask that NYSDEC develop an EJ screening tool with the same parameters and data as was available on the federal EPA site.

3. As part of GREEN CHIPS legislation which is funding Micron, they are required to achieve 100% renewable energy for electricity use. The DEIS is vague on the source of renewable energy, listing solar on some buildings. Currently we are concerned that the Micron Proposed Project plans to draw from existing hydro, solar, wind, and nuclear sources. These energy sources are barely adequate to support existing developments and communities. (According to the Climate Leadership and Community Protection Act (CLCPA), nuclear energy is a non-carbon energy source, and is a non-renewable energy source.)

Recommend:

- a. Transparency related to proposed renewable energy sources to support electricity involved in building and operations of the Proposed Project. (Consider hydro, solar, wind, geothermal, biofuels as clean renewable energy.) Introduce clean renewable energy at the beginning of the project and throughout the project, including new technologies as they emerge. These should be independently sourced and funded by Micron and not regional or state taxpayers. The information provided is that carbon free electricity will be needed equivalent to 2 million households or 2 billion kilowatt hours per year.
- b. What is the timeline for the achievement of 100% renewable energy electric that does not rely on the current electric grid renewable energy sourced in Central New York?
- c. Look at electric battery storage instead of diesel generators for back up sources of energy

4. The DEIS lists natural gas as the energy source to operate the 4 fabs in an amount equivalent to run 107,000 households. Fossil fuel is not a renewable energy source. The DEIS has concluded that GHG Emissions will have a negative impact on climate change.

Recommend:

a. Is natural gas the only possible fuel to operate fabs? As technology evolves and each phase of construction occurs, Micron should commit to reassess the possibility to use

renewable energy to operate the fabs and thereby reduce GHG emissions as part of climate resiliency and mitigation of climate change. The Climate Leadership and Community Protection Act is clear that a transition to renewable energy is required to lower greenhouse gas emissions and reverse and mitigate climate change.

b. Can biofuels or other alternatives such as anaerobic digestion be used in part or 100%? State University of New York Environmental Science and Forestry, located in Syracuse, NY, has a biofuels program using willows, so biofuels could potentially be sourced locally. See #6 below, Food scraps regarding anaerobic digestion.

c. What mitigation is proposed to reduce emissions of greenhouse gas into the air?

d. When GHG emissions occur that have a negative effect on climate change, what financial or other penalty will Micron incur?

5. Natural gas used for other purposes is not clear. Operation of natural gas boilers is listed, and if this is for heating, is a source of carbon and greenhouse gas emissions that could be mitigated by choosing a renewable energy source for heating and cooling, especially with Micron committing to a carbon free future and 100% renewable electric.

Recommend: could cold climate heat pump technology be used in place of natural gas?

6. New York State has a House Energy Rating System (HERS) HERS is a widely recognized system for measuring a home's energy efficiency. It is the industry standard for assessing a home's energy performance and is often required for new construction and some renovations in many towns and villages.

Recommend: Conduct an energy rating assessment of current Proposed Action and adjust Proposed Action to comply with 2020 HERS guidelines which are minimum standards set for the state. Net goal for the state is set within the Climate Leadership and Community Protection Act and is net zero or negative carbon. Net-zero carbon – construction refers to achieving zero or negative carbon emissions during a building's construction, from product manufacturing to practical completion. This can be achieved through carbon offsets or by exporting on-site renewable energy.

7. Food Waste for a large facility construction and operations can be substantial. Food Waste becomes GHG Emissions which affects climate change. NYS has a Food Scraps Donation and Recycling Law, which will be expanding in 2027. <https://dec.ny.gov/environmental-protection/recycling-composting/organic-materials-management/food-donation-scraps-recycling-law>

Recommend:

a. Establish an on-site anaerobic digester, or composting facility during Phase I. Having a facility on site will allow for immediate disposal of food waste, and lessen hauling and generation of GHG emissions from hauling and landfills. If there is a composting facility, compost could be used on the landscape as part of mitigation. Anaerobic digestion could produce energy for the Proposed Action.

b. Establish a plan for food scraps donation, while keeping further GHG emissions from hauling food waste low.

c. Do the right thing by the community, don't wait to "measure" that you have to do this based on food waste mass.

8. Wetlands will be removed as part of the Proposed Action. All wetlands sequester carbon from the atmosphere. Removal of wetlands will result in GHG emissions from the demolition process, as well as destroy a source of carbon sequestration.

Recommend:

a. DEIS should include a GHG emissions inventory considering loss of wetlands and its impact on climate change. That assessment should widen the considered corridor as adjacent waterways/agricultural lands/forests will also be affected.

b. The Climate resiliency plan should consider details of all mitigation efforts related to loss of wetlands, including cascading effects to waterways/flooding, effects on GHG emissions, regional impact on flora and fauna, change in habitat to bats and other animals which could result in an increase in insects hazardous to health of people and other animals, , such as mosquitoes that carry diseases like eastern equine encephalitis and west Nile virus https://www.health.ny.gov/press/releases/2025/2025-07-22_west_nile.htm or insects that eat agricultural crops. Ultimately mitigation efforts of lost wetlands should result in net zero carbon or negative carbon.

8. Energy choices appear to have been made by Micron employed personnel.

Recommend: An Independent third party assess the Proposed Project for renewable energy source options and mitigation of Greenhouse Gas Emissions

9. DEIS and other information indicates that by the time the Proposed project is completed, there will be an estimated 5 million tons of greenhouse gas emissions.

Recommendation: What is the over time mitigation and climate resiliency strategy for these emissions that will cause climate change as admitted by the DEIS review? How will this be followed over the lifetime of the design, construction and operation of the Proposed Project?

10. Parking spaces are listed as 12,000.

Recommendation:

a. What are the greenhouse gas emissions and impact on climate change associated with filling these parking spaces to operate the plant?

b. Review the possibility of carport solar for all parking spaces as a renewable energy source on campus.

11. The DEIS public comment period of 45 days is inadequate to do justice to the size of this project.

Recommend: extend the comment period to 120 days as requested by numerous environmental organizations and the public.

12. Environmental impacts will be immediate and ongoing as a result of the Proposed Project. There are consequences and needed actions that are impossible to consider over the duration of the project, especially given how quickly technology changes.

Recommend:

a. Establish an advisory conservation council that includes local public experts in conjunction with Micron that meets regularly to review design, construction, operations throughout the life of the Proposed Project and its operation.

b. Request additional review open to public comments if there are any approval decisions requiring upgrades and improvements during buildout of Fab 1 and 2.

c. Request a rigorous supplemental DEIS review with public comment prior to the design and construction of Fab 3 & 4.

Connected Actions:

1. The Connected Actions DEIS review established corridors to assess environmental impact that do not capture the reality of GHG emissions being in the air and "mobile". The connected actions include rail spurs, highway interchanges which will require extensive transportation during demolition, construction, and eventual operations. Secondly, because of the large employment at the facility, there will be additional environmental impacts from daily transportation, and building of necessary housing and support. The Environmental Justice (EJ) Screening Tool on the Environmental Protection Agency website is not operational under the current federal administration. <https://ejscreen.epa.gov/mapper>.

This is a key "real time" monitoring tool used by the public and scientific community to determine what is happening in our region related to emissions and climate change, as well as other environmental effects from the Proposed Project. A temporary and incomplete private site does not contain adequate data on the Connected Action corridors. <https://pedp-ejscreen.azurewebsites.net/>. What data is there, indicates that Syracuse is already in the 95-100% level on toxic releases to the air, and that Clay-Dewitt corridor along Highway 481 is 50-90% depending on location. This is before the I-81 diversion to 481 that will increase traffic on Highway 481.

Recommend:

a. Repeat the GHG emissions assessment using a 5 mile radius from the center of all Connected Actions. Modify monitoring sites and frequency based on this new radius. Reassess annually and after each phase. After reassessment, Generate recommendations about energy sources in order to further lower GHG emissions to mitigate climate change.

b. Restore the EJ screening tool on the EPA website. <https://ejscreen.epa.gov/mapper>. This will allow the public and environmental groups and scientists to remain fully active in the process throughout the Connected Actions construction. If not possible, ask that the NYSDEC develop an EJ screening tool using the same parameters and census data that was on the EPA website

2. Rail Spur Connected Action -

- a. What is the projected environmental impact/GHG emissions from the operation of 60x60x60 rail cars daily to build Micron?
- b. What fuel will be used in this process?
- c. What monitoring is proposed?
- d. What will be the projected rail traffic pattern related to Micron in terms of volume of rail cars, time of operations, GHG emissions from the Rail Spur Connected Action travel to and from the CSX Dewitt Rail Yard East End , 434 Ellis St, Syracuse NY 13210?
- e. What is the impact of Rail Spur construction on wetlands/other surface water using the 5 mile radius? See discussion of wetlands above
- f. What are the plans to use non fossil fuel options to reduce GHG emissions?

3. Highway Interchanges -

- a. What are the projected GHG emissions related to construction and daily traffic at each new Highway interchange that is being built as a Micron Connected Action? Include as much detail as possible.
- b. What is the impact of Highway interchanges construction on wetlands/other surface water using the 5 mile radius? See discussion of wetlands above
- c. What are the plans to use non fossil fuel options to reduce GHG emissions?

4. Electricity conduit -

- a. What are the projected GHG emissions related to construction and management of new electricity conduits?
- b. What is the impact of electricity conduit construction on wetlands/other surface water using the 5 mile radius? See discussion of wetlands above
- c. What are the plans to use non-fossil fuel options to reduce GHG emissions?

5. Water conduit

- a. What are the projected GHG emissions related to construction and management of new water conduits? What is the energy consumption to move the water used in Micron building and operations?
- b. What is the impact of water conduit construction on wetlands/other surface water using the 5 mile radius? See discussion of wetlands above
- c. What are the plans to use non-fossil fuel options to reduce GHG emissions?

6. Natural Gas conduit

- a. What are the projected GHG emissions related to construction and management of new natural gas conduits?
- b. What is the impact of natural gas conduit construction on wetlands/other surface water using the 5 mile radius? See discussion of wetlands above
- c. What are the plans to use non-fossil fuel options to reduce GHG emissions?

7. Energy choices for connected actions appear to have been made by Micron employed personnel.

Recommend: An Independent third party assess the Connected Actions for renewable energy source options and mitigation of Greenhouse Gas Emissions.

8. There are 12,000 parking spaces at the Proposed Action location. What is the expected traffic and patterns and the expected Greenhouse Gas Emissions of that traffic? What effect on climate change will there be from that traffic?

In summary, the Micron Project is vast. All aspects of the lives of Central New Yorkers will be impacted. We have just scratched the surface of some of the issues that still need to be addressed, focusing on the responsibility that Micron bears in view of the climate policies and laws of New York State.

As part of the GREEN CHIPS legislation championed and signed into law by Governor Kathy Hochul, Micron will be required to manufacture semiconductors under leading-edge sustainability commitments designed to mitigate its greenhouse gas emissions and environmental impact, including utilizing 100% renewable energy, attaining LEED Gold status, and committing to greenhouse gas emission targets and reporting. In addition to Micron's responsibility to follow the letter of the law, it is also the responsibility of New York State to monitor and enforce its own stated environmental laws and policies. NYS is one of the few states that has an Environmental Amendment to the Constitution. We take it seriously. Thank you for your prompt and thorough attention to our review and comments.

Each person shall have a right to clean air and water, and a healthful environment.

Subject: [EXTERNAL] Support of Micron Development

To whom it may concern,
I am writing to provide my very strong support for the Micron project. I believe that this is a transformative project that will positively impact the area for years to come.

I was a founder and owner of the company JADAK Technologies in N. Syracuse and our goal was to grow to provide good paying jobs and to attract highly qualified technical people to the area. While we had much success Micron will dwarf this and provide what we had always wanted to achieve.

I understand that there are wetlands involved however because of the new wetlands law the state has already added over 1 million acres of wetlands to their informational maps. The tradeoff of 200 acres of wetlands for a development such as this should be a non-factor.

I sincerely and strongly support this project and hope it goes forward.

Warm regards,
David Miller

Subject: [EXTERNAL] Comments from David Babcock on the Micron Draft EIS (OCIDA, June 2025)

From David Babcock, Liverpool, NY, 13090, dave.babcock21@gmail.com

These comments are directed to Micron or to the appropriate agency involved with the Micron Clay project.

D. Babcock Comments on the Micron Semiconductor Manufacturing Project, Clay, NY, Draft Environmental Impact Statement (OCIDA, June 2025)

A. A. Natural Resources

1. Given the habitat value and carbon capture capabilities of trees that will be removed during plant construction, for each tree cleared, provide funds to Onondaga Earth Corps, Onondaga Audubon, CNY Land Trust, and/or other qualified not-for-profit initiatives to plant an equivalent number of 3-foot tall or so trees within Onondaga County and/or Oswego County in proportion to the types of trees to be removed.
2. Evaluate whether any of the significant existing wetlands and mature trees on the Micron site designated for clearing and grubbing could be saved by constructing chip fabrication facilities around certain existing wetlands and forested areas on the site.
3. Document the basis for selecting the preferred wetland replacement sites.
4. What from the wetland mitigation plan is included to replace the 154 acres of palustrine forested wetlands? (DEIS Table F-1.)
5. Effectively construct, monitor, and maintain the proposed replacement wetland sites to maximize wetland functions and values consistent with the functions and values of the wetlands on the Micron site that will be destroyed. Long-term monitoring and maintenance would likely be done best under the supervision of the NYSDEC Division of Fish and Wildlife.
6. Include in plans to construct replacement wetlands the efforts to be conducted to plant and monitor-maintain suitable various wetland plants at the replacement sites. Otherwise,

aggressive, and potentially invasive plant species that thrive in wet areas could easily overwhelm other desired vegetation types at these replacement sites thereby resulting in a net long-term loss of overall wetland function and value.

7. In lieu of replacing the onsite wetlands, consider using funds otherwise needed to construct, monitor, and maintain replacement wetland sites to significantly enhance the function and value of nearby Hamlin Marsh and/or Cicero Swamp.
8. Hire one or more qualified, independently employed (third-party) Natural Resource Monitors (NRMs) for the site, its vicinity, and any natural resource replacement areas. The NRM needs to assess project impacts on natural resources, water quality, air quality, and effectiveness of resource replacement measures and long-term monitoring working with the most relevant NYSDEC scientists and engineers familiar with this project. The NRM needs to work on a regular basis and report primarily and directly to the most appropriate NYSDEC Division with headquarters in Albany.
9. Evaluate installing one or more horizontal passageways or tunnel-like structures for migrating animals along a typical migration path for these animals to traverse such as is done in many other developing areas.

B. Hazardous Materials and Their Management

1. Explain why the use of PFAS and PFCs are essential for Micron's chip manufacturing process and why alternative substances and chemicals are not to be used in their place. Also, justify the quantities of these substances and chemicals that are "essential" for Micron's manufacturing of chips.
2. Provide to an appropriate environmental oversight agency an inventory of all the chemicals to be used at the Micron Clay site along with projected annual use quantities, chemical formulations, and treatability assessments. Monitoring and management of less regulated chemicals leaving the plant site as sludge, water discharges and air releases is a significant concern. Monitoring needs to be regular and frequent (daily to weekly) depending on chemical usage and treatment fluctuations experienced.
3. The appropriate NY State agency and/or corresponding Federal agency need to work together with Micron and its competitor manufacturers of chips to identify alternatives to PFAS and PFCs that are less harmful to humans and the natural environment and, in the future if identified and marketed, agree to use PFAS and PFC replacement substances and chemicals if overall benefits exceed costs.
4. Specify how waste PFAS and PFCs are to be managed at the Micron site. Include a focus on recycling these compounds followed by partitioning the insoluble compounds not recycled to treatment sludge that needs to be managed to minimize adverse impacts. After one or more sludge disposal locations are proposed, an analysis of Environmental Justice needs to be conducted for that (those) disposal location(s). Any incineration of hazardous materials needs to include careful oversight by NYSDEC or an otherwise appropriate agency with reports to the public at least twice annually about treatment effectiveness and releases to the environment.

5. Hire a qualified, independently employed (third-party) Hazardous Materials Monitor (HMM) for the duration of this project. The HMM needs to work with appropriate NYSDEC professionals headquartered in Albany to assess project impacts associated with material management, waste management techniques, and wastewater treatment measures. The NRM can best report primarily and directly to the NYSDEC Division of Solid and Hazardous Materials or other particularly relevant division within New York State government.
6. Specify industrial wastewater treatment technologies to be used and their projected treatment efficiencies for each type of waste chemical being managed. Include how unknowns and uncertainties are factored into the wastewater treatment analysis, such as compositions of compounds not able to be measured.
7. Financially support research and pilot-scale applications warranted to better understand interactions of PFAS and PFCs with the natural environment as well as low-cost methods to treat and eventually eliminate need for their use.

C. C. Energy Use and Emissions

1. Hire a qualified, independent third-party professional or firm to provide an assessment of potential current and future renewable sources of energy available to Upstate New York compared to Micron's energy needs in Clay. This qualified professional should report to a qualified and authorized third party such as NYSERDA.
2. Evaluate the feasibility of tapping onsite geothermal energy available beneath the ground surface at or near the Clay site to help meet Micron's energy needs.
3. Evaluate placing additional solar panels on rooftops and/or on-the-ground at additional locations at and near the Micron plant site and support facilities to help supply local energy needs.

D. D. Site Development

1. Evaluate using porous pavement products for parking lot placement to reduce runoff and associated flooding potential.
2. Use construction materials formulated in ways that significantly reduce greenhouse gas emissions / carbon footprints.
3. How significant would daytime rail traffic be over each rail route during construction and during chip manufacturing operations? Many at-grade rail crossings exist within a few miles of the Micron site. Long waiting times at rail crossings will not be tolerated by the local public over the long term.

E. E. Environmental and Social Justice

1. Working with an appropriate government agency, establish an alternative Environmental Justice screening tool based, as appropriate, on USEPA's screening tool that can be applied by Micron in the next few years for its Clay operations.

2. Specify local hiring goals and ways to assure that local workers from various income levels are provided with job opportunities.
3. The Town of Clay and the Town of Cicero need to collaborate with each other to implement incentives for building affordable housing within a few miles of the Micron plant in Clay where lower-paid support workers and their household members could safely live.
4. Hire one or more independent (third-party) health and safety professionals trained in Micron's semiconductor fabrication processes to monitor worker health and safety and be allowed to interact with workers about health and safety protections.
5. Micron should not discourage chip fabrication workers from being able to unionize if they wish to do so. My father was a dues-paying union member which significantly assisted him with obtaining a livable wage, health care benefits, and safe working conditions which all workers and their families deserve.

F. F. Transportation

1. Evaluate the viability of providing an express bus service and/or a new rail line service between the CENTRO hub in Syracuse and the Micron Clay site. It seems using existing rights-of-way to route a new rail line along what is now Interstate Route 81 would reduce rail line implementation challenges.

Subject: [EXTERNAL] response to Micron's June 2025 DEIS

To Whom It May Concern:

Regarding the impending development of Micron's chip fabs near Cicero, NY, my main concerns are about the loss of the sustaining air, water and environmental quality upon which we and all life depends.

I was born in 1958 and grew up in Westvale, NY, close by Onondaga Lake, able to directly observe that poisoned body of water. My hope is that we have learned from that environmental disaster to be more prudent in the future, but the world has grown more complicated since it seemed like a good idea to dump untreated effluent directly into the lake for decades.

Although I may not live to see the long-term effects of Micron's operations, they, too, will doubtless not be good for the environment.

I ask that the gaps in mitigation plans pointed out by those who have studied the DEIS be seriously considered and thoroughly addressed.

Thank you.

Regards,

-Carol Biesemeyer

Empire State Development
Attn: Micron DEIS Public Comments
633 Third Avenue, 37th Floor
New York, NY 10017

To Whom It May Concern,

My name is Rodney Cooper. I live at and own the property located at 5009 State Route 31 in Clay, New York, which is in close proximity to the ongoing construction related to the Micron semiconductor project.

I am writing to request clarification on whether my property or residence will be directly impacted by the construction or any future phases of this project. If there are plans that would affect my home—whether through road expansion, utility work, or other components—I would like to know when and how this may occur.

As a homeowner in the immediate area, I believe it is important to be informed of any potential disruptions or risks to my property and quality of life.

Thank you for your attention to this matter, and I request that my concern be addressed in the Final Environmental Impact Statement (FEIS).

Sincerely,
Rodney Cooper
5009 State Route 31

Subject: [EXTERNAL] Micron DEIS

Dear neighbors at Onondaga County IDA,

I am concerned about the rushed comment period for the Micron microchip factory. The proposed manufacturing plan is huge, with lots of implications for all of us in NYS. What will be the impact on climate change? Will it fully comply with our CLCPA? What will be the effect on waterways and the lake, on communities nearby, on air pollution? How will it affect our NYSEG bills?

The Draft EIS is HUGE and full of technicalities in the appendices. Several groups that I am a member of want to understand what is being proposed and what the impacts will be, but we are struggling to wade through the hundreds of pages.

We The People need to weigh in on this project, because it is we the people who will be living with its impacts for decades to come.

We need more time. Please extend the deadline.

More people need to be informed and engaged, more understanding needs to be cultivated, we need clarity and an opportunity to suggest changes.

Please just do the right thing. Please don't just pay attention to the money. Pay attention to the people. US. Your neighbors.

We need you to work with us, not against us.

Thank you for your attention,

Anne Rhodes

Office of the Mayor • Syracuse Common Council • Syracuse Planning Commission • CenterState Corporation for Economic Opportunity • New York State Department of Transportation • New York State Department of Environmental Conservation • Empire State Development • New York State Thruway Authority • Office of the County Executive • Onondaga County Legislature • Onondaga County Planning Board • Central New York Regional Transportation Authority • Central New York Regional Planning and Development Board • Federal Transit Administration • Federal Highway Administration

The staff of the Syracuse Metropolitan Transportation Council (SMTC), as a SEQRA Interested Agency, respectfully submit the following comments on the Micron Semiconductor Manufacturing Project, Clay, NY, Draft Environmental Impact Statement (DEIS), dated June 2025. These comments are focused on the Traffic Impact Study included as Appendix M of the DEIS.

Text comments:

- Section 2.1.7.1: The SMTC's planning area no longer includes "a small portion of the Granby." (Removed with the latest MPA update in 2023, based on 2020 Decennial Census data.)
- Table 3-1: First column states that roadways are listed by jurisdiction. Why is Onondaga County not included as a jurisdiction? Caughdenoy Road, Verplank Road, Morgan Road, Henry Clay Boulevard, Soule Road, Bartel Road, Lake Shore Road, South Bay Road, and Thompson Road are owned by Onondaga County. Stearns Road and Hamilton Road are local (Town of Clay) roads. Bear Road between South Bay Road and Route 11 is a New York State facility. Circle Drive between Route 11 and the NY 481 ramps is owned by New York State, between the ramps and South Bay Road it is a local (Town of Cicero) road. See SMTC MPA Road Ownership map here: https://smtcmpo.org/wp-content/uploads/2019/05/MPA_Road_Ownership.pdf
- Section 3.4: It would be helpful to have a map/graphic summarizing the trip distribution.
- Section 4.3: How were the crash reduction statistics identified? What is the source of that analysis?
- Section 6.1.4: Is the North, South, East, West Interconnect project referring to the City of Syracuse's signal interconnect? Why is this relevant? This would not include any intersections in the Transportation Evaluation Area.
- Section 9.5.1: The sentence "The addition of the ramp from southbound Caughdenoy Road to southbound NYS Route 481 provides a more direct exit from the campus to the southeast" implies that it is Micron-generated trips that will utilize the new 481 SB ramp, but this would seem to run counter to the intent of the new access road and interchange that are part of Scenario B. A more likely explanation is that residents of the areas around Stearns Rd and Caughdenoy Rd would utilize this new 481SB on-ramp.
- Each of the mitigation scenarios (A, B, and C) is compared to the Preferred Action scenario but since the scenarios are additive it seems that it would be fairer to compare the incremental value of each mitigation scenario to the prior (less intensive) scenario, i.e B vs. A, C vs. B. Comparing Mitigation Scenario C to Mitigation Scenario B

shows little additional incremental benefit in terms of level of service and delay. Tables 9-13 and 9-10 show that three intersections move from LOS C/D to LOS E between Scenario B and Scenario C, although LOS F is mitigated at two intersections; overall, this seems like just moving some congestion around rather than actually mitigating overall issues.

Comments on sheet plans shown in Chapter 10:

General:

- Will all existing unsignalized side streets and driveways still have full access to Route 31? Some unsignalized intersections are shown in detail on the plan sheets, while others are not.

Sheet 1:

- The plan shows a widening to three travel lanes in each direction (plus additional turn lanes at major intersections) on Route 31 west of NY 481. However, the list of mitigation measures on p. 0-12 (and throughout the DEIS) only mentions widening Route 31 between Morgan Rd and Route 11. What is the justification for widening west of NY 481? Also, the plan indicates a raised median in this segment, but does not indicate turn restrictions at the remaining unsignalized driveways, which presumably will become right-in/right-out only driveways (with U-turns allowed at signalized intersections).

Sheet 2:

- Consider a future connection to Sutcliffe Dr in the design of the Carling Rd extension, which would allow residents of the Pine Gate area better access to Route 31 while reducing trips on Soule Rd. Coordinate with the Town of Clay, and incorporate traffic calming measures on Sutcliffe Dr to alleviate any potential concerns about through traffic.
- Is it necessary to move the bike path to the south side of Route 31 in the segment between the NY 481 interchange and the westernmost Great Northern Mall driveway?

Sheet 2a:

- The proposed NY 481/Verplank Rd interchange has a very large footprint. Were alternative designs considered that would utilize less land?

Sheet 4:

- Dead-ending Caughdenoy Rd north of Route 31 reduces the connectivity of the street grid. As this area continues to develop, we suggest building a more complete local street network to provide travel choices. Use other design tools to encourage traffic to/from the Micron facility to utilize the new access road, while maintaining connectivity of Caughdenoy Rd (i.e. traffic calming on Caughdenoy Rd, perhaps limiting to right-in/right-out access at Route 31).
- Suggest continuing the share-use path along the access road into the site along the Micron entrance road.

Sheet 4a:

- Clarify the intent for the Connector Road/Micron Access Rd. As shown, this appears to be a limited-access facility with a raised (grass) center median and sidewalks along the full length. While we commend the inclusion of pedestrian facilities, it seems unlikely that anyone will walk here without connections to the adjacent neighborhoods.
- Suggest adding a bicycle facility to this road.
- This could present an opportunity to build a more connected local street grid for future residential development south of Route 31 between Maple Rd and Stearns Rd (acknowledging challenge of the railroad tracks). East-west connectivity is lacking south of Route 31. Connecting a future east-west collector to the new access road (while keeping in mind principles of good access management) would support future development in this area. Also consider access to the connector road from existing local roads such as Lilith Lane or Johanna Dr with appropriate traffic calming measures on these residential streets.
- There should be coordination with the Town of Clay and Onondaga County Planning Department on a comprehensive vision for land use and transportation development for this area.

Sheet 6:

- Widening at Route 31/Route 11 is substantial. What alternatives were considered (roundabout)?
- Plans show on-road bike lanes in addition to the shared use path in the segment of Route 31 between Lakeshore Rd and Route 11. Public preference is for separated bike facilities. Suggest removing the on-road bike lanes through this busy and complicated segment.
- There is an existing designated snowmobile trail along Route 31 through the I-81 interchange area. It does not appear that this was incorporated into the designs. Consider relocating this trail to Sneller Rd to cross I-81.

Sheet 6a:

- Label the new site entrance road on Route 11. Was there any consideration of a roundabout instead of a new signal at this location?

Sheet 6b:

- Suggest continuing the shared-use path along Sneller Rd through the proposed interchange with I-81.

[MICRON ENVIRONMENTAL STATEMENT QUESTIONS](#)

petehuntley@aol.com

-
[SCHROEPEL WETLANDS](#)

CHIPSNEPA@chips.gov

Over 400 acres of forest and farm land in the Town of Schroepel (& surrounding towns) are to be flooded to replace wetlands taken for the Micron development. Taxes on these areas are now being paid each year to the Town, but once they become wet lands they are non-taxable and the Town will lose this income. I have not seen anywhere where this lost revenue is being replaced by Micron or Onondaga Co... Oswego Co. and its Towns will not only lose income from the loss of tax revenue, but its residences will at the same time be burdened

with the added expenses of houses, schools, roads, etc. needed to support Micron. Oswego Co. residences will also be forced to deal with the problems associated with these additional wetlands (not only mosquitos and the diseases they bring, but also spending less time enjoying their yards. These diseases have been in the county for years, killing horses and infecting humans. Spraying is now taking place for an outbreak of EEE & West Nile in Cicero & Oswego Co.. While Onondaga Co. seems to be getting reimbursement from various sources, neighboring counties seem to be void of many of these benefits.

I have heard that combining with existing wetlands in the Town, when this project is completed 40% of the Town of Schroepfel will be wetlands. These new wetlands will bring an additional array of problems that the Town will have to deal with for years to come. Are the Schroepfel taxpayers going to have to pay all this additional expence without reimbursement from Micron or Onondaga Co.? I would also like to know what type of compensation is going to be paid to the taxpayers of Schroepfel

for having their quality of life greatly reduced.

All areas so far purchased for wet lands are within short distances from many homes, both single homes and developments. One of those areas contains a major Paleo Indian site which was the location of four archaeological digs and has been featured in two books. Some of the land already purchased for flooding includes the area on Rt # 264 which contains the Potts Site (an 11,000-year-old Paleo Indian site) that is featured in two books and has had around four archaeological digs done by Dr. William A. Ritchie in the 1960s and Richard Michael Gramly in the 1980s. A mastodon rib /or whale bone from this period was also found in this area.

Another area purchased is somewhere on Perry Rd. where it has long been rumored to contain two pioneer family graves.

There are many archaeological and historic sites throughout the Town of Schroepel. I have not seen where the information on these sites and their locations is being preserved before they are destroyed.

Importance: Normal

Sensitivity: None

Waste water:

My final concern is with the waste water being dumped into the Oneida River. It is my understanding that when the Micron plant is up and running there will be twice the amount of waste water dumped into the river systems than is currently being discharged.

In talking with my father several years ago (I believe in the 1980s) he stated that the Oneida River (and the other rivers) were at near capacity as far as waste water they could handle. He stated that it was getting to the point that the rivers could not hold much more waste that wasn't 100% treated (pure water). It does not make sense that the rivers can now handle such an increase in volume. My father was the temp head for Region 7 of the D.E.C. for a while whose main focus was on waste water, etc.

Subject: [EXTERNAL] Micron Environment Statement

Importance: Normal

Sensitivity: None

There aren't any archeological or historic sites located within the area where the Micron plant is to be constructed. Yet the area nearby contains over a dozen of these sites. My concern is that these areas will not be fully explored with their information and locations being preserved before they are completely destroyed by related development.

Most of these sites (in the Town of Clay) are located along the Oneida River from Three-Rivers to Brewerton. The early Onondaga encampment is located at Three-Rivers on the Clay side of the river. On the Schroepfel side of the river is the location of an early fort as well as the encampment of 10,000 troops. This area also is the location of where early Circle Mounds were located.

The location of the Great Stone Bowl makers was at Horseshoe Island. The Oak Orchard area contains many sites including three native burial grounds, camping and fishing sites. This also was the location of the Paleo Indians and the Greenland Eskimos. Oak Orchard is also the site of an early massacre. The Great Flint Rock was located at nearby Caughdenoy. There is also at least one booklet on the burials from there to Brewerton. The Town of Schroepfel on the other side of the river also has many sites. A lot of work needs to be done to save this historic information, perhaps by New York college students.

To: CHIPSNEPA@chips.gov
Subject: [EXTERNAL] Concerned about environmental impact of Micron in CNY - please slow down!!

The Micron project stands to destroy hundreds of acres of wetlands harboring complex engaged species habitats and providing natural flood mitigation, and microchip production in general requires toxic chemicals, including PFAS, or “forever chemicals.” I am EXTREMELY concerned about the health consequences of unregulated PFAs in our local ground water, surface and drinking water.

The DEIS does not provide sufficient detail on the types of chemicals that will be used or how continuous environmental monitoring and compliance will be enforced.

We must have clear, transparent and enforceable mechanisms to avoid contamination and degradation of surface waters, drinking water, and local wetlands.

Thank you,
Leah Kraus

Sent: Thursday, August 7, 2025 11:04 AM
To: CHIPSNEPA@chips.gov
Subject: [EXTERNAL] RE: Draft Environmental Assessment EISX-006-55-CPO-001
Attachments: McManus Comments on DEIS.pdf

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

In addition to my comments below, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025.

Based on my current understanding of the DEIS, I still want to highlight key environmental impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. I am including my comments below, and attaching them as a PDF. Though not directly addressed in my comments, the degradation of the environment and ecosystem functioning will impact human health through increased flooding, forever chemicals released into our drinking water, increased GHG emissions exacerbating climate change, and increased harmful algal blooms.

On July 23, 2025, The International Court of Justice ruled that governments have an obligation to protect the environment from greenhouse gas emissions, prevent climate harm, protect human rights, and to act with urgency and cooperation. (<https://news.un.org/en/story/2025/07/1165475>)

Additionally, the Inter-American Court of Human Rights has recently officially recognized that nature has rights in its Advisory Opinion OC-32/35, and that the loss of biodiversity (as proposed in the DEIS) threatens both nature and human well-being. Governments now have obligations to protect ecosystems. (<https://www.garn.org/inter-american-court-of-human-rights-rights-of-nature/>)

I urge consideration and response to the issues and concerns included below.

Sincerely,
Hilary A. McManus, Ph.D.

Director of Environmental Sciences
Professor of Biological and Environmental Sciences
Le Moyne College
1419 Salt Springs Rd
Syracuse, NY 13214-1301

McManus Comments on the DEIS

1. Loss of Wetlands

- "Construction of the Proposed Project would result in the permanent loss of approximately 193.38 acres of wetlands being treated as Federal jurisdictional wetlands, or approximately 174.77 acres of wetlands being treated as State jurisdictional, (p. 3-72) ..."
- "78.86 acres of wetlands will be lost during the proposed connected actions." (Page 3-66, section 3.3).
- "Construction of the Proposed Project would result in the direct loss of wetlands and their functions and services from site development. In addition, wetland buffers (typically 100 feet from the edge of a wetland in the New York State) would be lost. Increased impervious surfaces could lead to indirect effects from increased stormwater runoff and decreased groundwater recharge."
- "11,600 parking spaces, four bus stops, and seven access roads would be constructed on the campus, including four 500-space surface parking lots. (Table 2.1-3, p. 2-13.)"

Response

- ***How will the release of CO₂ and CH₄ during the destruction of the wetlands, and the loss of the sequestration value, be mitigated?***

Wetlands are essential to our health and environment. They support more than 1/3 of the country's threatened and endangered species, filter pollutants, and buffer communities from floods. They also store vast amounts of carbon, making them powerful tools in the fight against climate change. In fact, 300 acres of freshwater wetlands store ~305,000 metric tons of carbon dioxide, roughly equal to the yearly emissions of 66,000 cars. Destroying these wetlands will release this CO₂ into the atmosphere and remove future carbon storage, further contributing to climate change. This release of CO₂ is not accounted for in Micron's Draft Environmental Impact Statement (Nahlik & Fennessy, 2016; Watson et al. 2000).

According to the EPA and peer-reviewed literature (e.g., Bridgham et al., 2006), drained freshwater wetlands in temperate regions can release approximately 3-10 metric tons of CH₄ (methane, a potent greenhouse gas) per hectare over the short term following destruction (via oxidation and disturbance). This will further exacerbate climate change.

- ***How will the impacts of wetland dredging, filling, and installation of impervious surfaces on surrounding streams and other water resources be mitigated?***

If the percent catchment impervious surface cover (ISC) increases to 10-20%, runoff increases twofold; 35-50% ISC increases runoff threefold; and 75-100% ISC increases surface runoff more than fivefold over forested catchments.

Imperviousness has become an accurate predictor of urbanization and urban impacts on streams, and many thresholds of degradation in streams are associated with an ISC of 10-20% (Meyer and Paul 2001).

Nearby wetlands are sure to be degraded by these indirect effects. The wetlands on site are good quality, including red maple swamps, hemlock-hardwood swamps, floodplain forests, and dogwood and willow shrub swamps. These wetlands contain a high proportion of native species that benefit insect production that serves as the basis of food webs. Construction and operation of Micron will decimate these food web connections. Wildlife will be driven off by noise, lights, and increased human traffic. Road salt and other runoff will degrade remaining wetlands into monocultures of Phragmites or invasive cattails, which support minimal animal and plant diversity.

Removing water to lower the water table on the site for 15 years will impact surrounding streamflow and aquatic ecosystems, leading to unintended consequences such as elimination of small streams and wetlands from the landscape. Such developments typically bring a cascading sequence of negative landscape impacts that the Plan aims to reduce and mitigate, but fails to do enough.

Further, we can expect these impacts to be multiplied in subsidiary development in the Clay, Cicero, and greater Onondaga and Oswego County areas, with the increase in impervious surfaces associated with thousands of new housing units, office and business spaces. These impacts just continue the trend of decades of wetland draining and filling in the northern part of Onondaga County.

Recommendation

Because of these and other indirect and cumulative impacts (subsidiary development predicted to occur in the watershed, for example) we strongly urge regulators to increase the wetland replacement ratio from ~2:1 to ~10-15:1, as was done for the Seneca Meadows wetlands restoration project (see <https://res.us/projects/seneca-meadows-wetland-restoration-design-build-mitigation-for-landfill-impacts-to-wetlands/>).

****Ideally, the location of the proposed plant should be relocated so that wetlands are not destroyed.****

Note: Indirect effects on adjacent wetlands and ones connected hydrologically, all the way out to Oneida River floodplain.

2. Wetland Mitigation Plan

Wetland Mitigation Work Plan, Appendix G.

Section 4.1 Selection and Design Criteria

- “Work areas contain few, if any, existing wetlands, which allows for focus on reestablishment and are near or adjacent to existing DEC wetlands. Delineated wetlands will be subsumed into the work area and will be either registered as rehabilitation if the area is marginal, which is usually the case, or will otherwise be subtracted from the total acreage built and corresponding credits generated. The agencies decide which option is selected.”
- “2. Sites are in active soybean production. The sites will stay in active agriculture until construction commences, which helps prevent invasive species and incompatible land uses.”

Response

- ***Creating/restoring replacement wetlands that are fragmented is not equivalent to the functioning of the current wetlands that will be destroyed. How will this be accounted for?***

The wetland mitigation sites are currently in soybean production, for the most part. That's a major problem since it means there will be a gap of decades before the wetlands (especially the forested ones, 70 acres direct loss) can provide the similar ecological services that the current ones provide (though studies have shown they never reach the same functional capacity as original wetlands - see Moreno-Mateos et al. (2012) - summary below). The sites are also closer to disturbance (roads, farms, homes).

The mitigation sites are also smaller, isolated fragments, not the integrated whole of the Micron site (with its matrix of forest, grassland, and wetland intertwining— See Fig.F-3, for example).

A meta-analysis by Moreno-Mateos et al. (2012) of 621 restored or created wetlands worldwide found that, even up to 100 years after restoration, biological structure (primarily plant communities) remained about 26% lower and biogeochemical function (driven by soil carbon storage) about 23% lower than in undisturbed reference wetlands. The authors conclude that current restoration practices are often unable to fully recover the original ecosystem functions.

Recommendation

To address these issues, we strongly urge regulators to require Micron to purchase large acreage of existing wetlands (especially forest and shrublands) such as any remaining floodplain forest along the Oneida River. These areas should be protected in perpetuity and held by TWT or the CNY Land Trust.

****Ideally, the location of the proposed plant should be relocated so that wetlands are not destroyed.****

3. Impacts of the Connected Actions on wetlands

Page 3-66, section 3.3:

“A total of 78.86 acres of wetlands have been mapped or delineated within the Connected Action LODs, including the Clay Substation expansion area and the natural gas, water supply, and wastewater improvement LODs, and are being treated as jurisdictional. However, jurisdictional determinations have not yet been issued for these features, with the exception of the Clay Substation (USACE only). For additional information on these wetlands, see Appendix F-3.1.”

F-3.1.4:

“The presence and extent of wetlands within each Connected Action LOD were delineated in the field and evaluated in the same manner as those conducted for the proposed Micron Campus, except for wetlands within the proposed water supply improvement LODs, because those improvements are currently scheduled too far in the future for wetland delineations conducted at this time to be valid by the time construction begins.”

“Further, the total amount of non-jurisdictional wetlands present within the LODs cannot be determined at this time because not all of the LODs have been delineated. Except as described below for the proposed Clay Substation expansion area, functional analyses of wetlands within the remaining Connected Action LODs also have not yet been conducted, for various reasons, including because field delineations have not yet been performed, wetlands have yet to be assessed by USACE or NYSDEC, or losses of jurisdictional wetlands within the remaining LODs are anticipated to be negligible.”

F-3.2.2

“Connected Actions The presence and extent of rivers and streams within each Connected Action LOD were delineated in the field and evaluated in the same manner as those conducted for the Proposed Project components, except for rivers and streams within the

proposed water supply improvement LOD, because those improvements are currently scheduled too far in the future for delineations conducted at this time to remain valid by the time construction begins.”

Response & Recommendation

78.86 acres of wetlands and surrounding rivers and streams that will be impacted by future connected actions have not been evaluated yet - these need to be evaluated before any construction begins so that impacts of development can be tracked over time. Also, we need an understanding of total impact (over the entire period of construction) on wetland function, wildlife and plant communities.

****Ideally, the location of the proposed plant should be relocated so that wetlands are not destroyed.****

4. Effects on Reptiles and Amphibians (3-118)

- “Mass mortality of reptiles and amphibians, including salamanders, frogs, turtles, and snakes, would be expected to occur during construction as a result of site clearing, grubbing, and grading, as these taxa are not mobile enough to avoid the paths of most site clearing and earthmoving activities. Noise and lighting disturbances also would potentially affect reptiles and amphibians in immediately adjacent areas. In addition, construction could indirectly affect amphibians and aquatic reptiles by altering the water balance and water quality of the Youngs Creek basin. However, as described in Section 3.3 (Water Resources), Micron would implement stormwater BMPs and would be required to undertake SMPs that would be documented in a SWPPP as part of its SPDES CGP. Micron also would implement the ESCP described above. Together, these measures would help minimize adverse effects on reptiles and amphibians. Construction effects on special status species are described under Special Status Species below.”
- *Connected Actions:* “As described in Chapter 2, National Grid, OCWA, and OCDWEP would undertake construction of the Connected Actions at various times over the course of the Proposed Project’s 16-year construction period. As noted in Section 3.4.3.1, because the Connected Actions remain at various design stages, the ecological community acreages within the Connected Action LODs were estimated based on wetland delineations where available and were otherwise identified using field mapping and reviews of aerial imagery, under the conservative assumption that Connected Action construction effects would occur across all wetland and upland cover types within the LODs. Therefore, this section assumes that construction of the Connected Actions would disturb the ecological communities in all 594 acres across the Connected Action LODs as identified in Table 3.4-2 and Table 3.4-3, although actual disturbance to existing ecological communities and land cover types would likely be less than the full extent of all the LODs, given that actual construction activity would not be anticipated to occur across the entire footprints of existing utility properties or the entire widths of existing utility easements.

Response & Recommendation

- ***What is the plan for moving displaced fauna to new homes?***
- Mortality of frogs, toads, turtles, salamanders will be high without some sort of rescue plan. To facilitate animal movement into these scattered sites, and limit road mortality, we urge regulators to require Micron to construct road crossings for fauna such as turtles, salamanders, snakes, frogs, toads.
- Micron needs to provide studies of other developments where their proposed measures (stormwater BMPs, SMPs, ESCP) were successful in minimizing adverse effects on reptiles and amphibians.
- For wildlife in general, support conservation housing (for example, <https://res.us/projects/prairie-crossing-sustainable-conservation-development/>) to reduce habitat loss due to subsidiary development; require native plant landscaping (not just on Micron site, but new construction)
- Provide financial support for Native plant nurseries to help mitigate extensive regional habitat loss, estimated at 10,000 acres of forest and grassland (Glenn Coin article, May 11, 2025 Post Standard).

****Ideally, the location of the proposed plant should be relocated so that wetlands are not destroyed.****

5. Aquatic Life

3.4.4.2 (page 3-119)

“The filling of wetlands and surface waters during construction of the Micron Campus would reduce the Youngs Creek wetland complex on the site and associated aquatic habitat. The elimination of wetlands and headwater streams, as described in Section 3.3 (Water Resources), could permanently alter the transport of sediment, organic matter, nutrients, and macroinvertebrates that are critical to downstream physical, chemical, and biological attributes and processes, including species composition and food web dynamics (Gomi et al. 2002, Meyer et al. 2007). Vegetation clearing and other construction effects may elevate stream temperatures, which could cause temperatures to exceed the tolerance levels of sensitive species, including many cold-water fish and macroinvertebrates (Nelson and Palmer 2007). Changes in topography and soil exposure may temporarily increase soil erosion, which could increase sediment, turbidity, and nutrient loading in receiving waterbodies. This could lead to harmful algal blooms and decreased dissolved oxygen levels, which could lead to fish kills, increased establishment and spread of invasive plants, or other adverse effects on aquatic biota (Driscoll

2003, Fleming and Dibble 2015). As described in Section 3.3 (Water Resources), Micron would conduct water level and flow monitoring during construction to assess surface water and groundwater inflow and outflow in response to seasonal variations and precipitation events. In addition, Micron would implement the stormwater BMPs and SMPs and the ESCP described above to prevent discharge of sediment into wetlands and waterbodies during construction. These measures would help minimize adverse effects on the Youngs Creek complex downstream of areas of disturbance and on aquatic life in the complex.”

Response

- ***What studies have been done that indicate the measures proposed here will in fact minimize the stated effects?***

The proposed mitigation measures do not address the impacts of "vegetation clearing and other construction effects" on stream temperatures which are predicted to elevate and therefore exceed tolerance levels of sensitive species (cold-water fish, macroinvertebrates, aquatic plants) and cause potentially toxic algae blooms.

Recommendation

Perform the necessary studies and find methods that reduce the impacts on aquatic life.

****Ideally, the location of the proposed plant should be relocated so that wetlands are not destroyed.****

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025.

Based on my current understanding of the DEIS, I still want to highlight key environmental impacts as well as mitigation measures, which are insufficiently addressed in the DEIS. Though not directly addressed in my comments, the degradation of the environment and ecosystem functioning will impact human health through increased flooding, forever chemicals released into our drinking water, increased GHG emissions exacerbating climate change, and increased harmful algal blooms.

On July 23, 2025, The International Court of Justice ruled that governments have an obligation to protect the environment from greenhouse gas emissions, prevent climate harm, and protect human rights, and to act with urgency and cooperation. (<https://news.un.org/en/story/2025/07/1165475>)

Additionally, the Inter-American Court of Human Rights has recently officially recognized that nature has rights in its Advisory Opinion OC-32/35, and that the loss of biodiversity (as proposed in the DEIS) threatens both nature and human well-being. Governments now have obligations to protect ecosystems. (<https://www.garn.org/inter-american-court-of-human-rights-rights-of-nature/>)

I urge consideration and response to the following issues and concerns:

1. Loss of Wetlands

- "Construction of the Proposed Project would result in the permanent loss of approximately 193.38 acres of wetlands being treated as Federal jurisdictional wetlands, or approximately 174.77 acres of wetlands being treated as State jurisdictional, (p. 3-72) ..."
- "78.86 acres of wetlands will be lost during the proposed connected actions." (Page 3-66, section 3.3).
- "Construction of the Proposed Project would result in the direct loss of wetlands and their functions and services from site development. In addition, wetland buffers (typically 100 feet from the edge of a wetland in the New York State) would be lost. Increased impervious surfaces could lead to indirect effects from increased stormwater runoff and decreased groundwater recharge."
- "11,600 parking spaces, four bus stops, and seven access roads would be constructed on the campus, including four 500-space surface parking lots. (Table 2.1-3, p. 2-13.)"

Response

- ***How will the release of CO₂ and CH₄ during the destruction of the wetlands, and the loss of the sequestration value, be mitigated?***

Wetlands are essential to our health and environment. They support more than 1/3 of the country's threatened and endangered species, filter pollutants, and buffer communities from floods. They also store vast amounts of carbon, making them powerful tools in the fight against climate change. In fact, 300 acres of freshwater wetlands store ~305,000 metric tons of carbon dioxide, roughly equal to the yearly emissions of 66,000 cars. Destroying these wetlands will release this CO₂ into the atmosphere and remove future carbon storage, further contributing to climate change. This release of CO₂ is not accounted for in Micron's Draft Environmental Impact Statement (Nahlik & Fennessy, 2016; Watson et al. 2000).

According to the EPA and peer-reviewed literature (e.g., Bridgham et al., 2006), drained freshwater wetlands in temperate regions can release approximately 3-10 metric tons of CH₄ (methane, a potent greenhouse gas) per hectare over the short term following destruction (via oxidation and disturbance). This will further exacerbate climate change.

- ***How will the impacts of wetland dredging, filling, and installation of impervious surfaces on surrounding streams and other water resources be mitigated?***

If the percent catchment impervious surface cover (ISC) increases to 10-20%, runoff increases twofold; 35-50% ISC increases runoff threefold; and 75-100% ISC increases surface runoff more than fivefold over forested catchments.

Imperviousness has become an accurate predictor of urbanization and urban impacts on streams, and many thresholds of degradation in streams are associated with an ISC of 10-20% (Meyer and Paul 2001).

Nearby wetlands are sure to be degraded by these indirect effects. The wetlands on site are good quality, including red maple swamps, hemlock-hardwood swamps, floodplain forests, and dogwood and willow shrub swamps. These wetlands contain a high proportion of native species that benefit insect production that serves as the basis of food webs. Construction and operation of Micron will decimate these food web connections. Wildlife will be driven off by noise, lights, and increased human traffic. Road salt and other runoff will degrade remaining wetlands into monocultures of Phragmites or invasive cattails, which support minimal animal and plant diversity.

Removing water to lower the water table on the site for 15 years will impact surrounding streamflow and aquatic ecosystems, leading to unintended

consequences such as elimination of small streams and wetlands from the landscape. Such developments typically bring a cascading sequence of negative landscape impacts that the Plan aims to reduce and mitigate, but fails to do enough.

Further, we can expect these impacts to be multiplied in subsidiary development in the Clay, Cicero, and greater Onondaga and Oswego County areas, with the increase in impervious surfaces associated with thousands of new housing units, office and business spaces. These impacts just continue the trend of decades of wetland draining and filling in the northern part of Onondaga County.

Recommendation

Because of these and other indirect and cumulative impacts (subsidiary development predicted to occur in the watershed, for example) we strongly urge regulators to increase the wetland replacement ratio from ~2:1 to ~10-15:1, as was done for the Seneca Meadows wetlands restoration project (see <https://res.us/projects/seneca-meadows-wetland-restoration-design-build-mitigation-for-landfill-impacts-to-wetlands/>).

****Ideally, the location of the proposed plant should be relocated so that wetlands are not destroyed.****

Note: Indirect effects on adjacent wetlands and ones connected hydrologically, all the way out to Oneida River floodplain.

2. Wetland Mitigation Plan

Wetland Mitigation Work Plan, Appendix G.

Section 4.1 Selection and Design Criteria

- “Work areas contain few, if any, existing wetlands, which allows for focus on reestablishment and are near or adjacent to existing DEC wetlands. Delineated wetlands will be subsumed into the work area and will be either registered as rehabilitation if the area is marginal, which is usually the case, or will otherwise be subtracted from the total acreage built and corresponding credits generated. The agencies decide which option is selected.”
- “2. Sites are in active soybean production. The sites will stay in active agriculture until construction commences, which helps prevent invasive species and incompatible land uses.”

Response

- ***Creating/restoring replacement wetlands that are fragmented is not equivalent to the functioning of the current wetlands that will be destroyed. How will this be accounted for?***

The wetland mitigation sites are currently in soybean production, for the most part. That's a major problem since it means there will be a gap of decades before the wetlands (especially the forested ones, 70 acres direct loss) can provide the similar ecological services that the current ones provide (though studies have shown they never reach the same functional capacity as original wetlands - see Moreno-Mateos et al. (2012) - summary below). The sites are also closer to disturbance (roads, farms, homes).

The mitigation sites are also smaller, isolated fragments, not the integrated whole of the Micron site (with its matrix of forest, grassland, and wetland intertwining— See Fig.F-3, for example).

A meta-analysis by Moreno-Mateos et al. (2012) of 621 restored or created wetlands worldwide found that, even up to 100 years after restoration, biological structure (primarily plant communities) remained about 26% lower and biogeochemical function (driven by soil carbon storage) about 23% lower than in undisturbed reference wetlands. The authors conclude that current restoration practices are often unable to fully recover the original ecosystem functions.

Subject: [EXTERNAL] Comments on Micron Draft Environmental Impact Statement - Central New York

Hello:

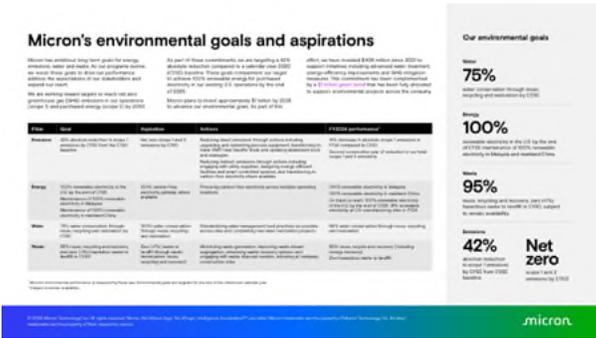

There are many questions still left unanswered by Micron's massive DEIS document, but of particular concern are their use/reuse of our water resources, including wetlands, and the effect of their processes on our air.

Water: Micron has already acknowledged that pfas will be released into wastewater. They need to be fully responsible for ensuring that **all** of their wastewater is free of pfas and other harmful chemicals before it is released into central New York waterways and back into our drinking water, particularly given the massive amounts of water that they will be using each year. They want to locate here in large part because of our water resources; we want Micron to maintain the same high standards of water purity that we have always maintained here. Ideally, Micron should be cleaning and reusing all of the water they initially use.

Additionally, their proposed wetland creation falls far short of the standard 10 to 1 ratio (created wetland to wetland loss). It also proposes using land currently under soybean production, with associated herbicide/pesticide use, some of which remains in the soil for years. This is a poor siting choice for a wetland.

Air: Micron needs to contain and treat any chemicals that their processes release into the air, including but not limited to pfas and greenhouse gasses. Such purification must be monitored by independent parties from either NY state or Onondaga County.

Micron has already set their own goal of 100% renewable energy in all their US operations by 2025 (see chart below), yet plans for installation of renewable energy equipment such as solar and use of alternatives to natural gas in their DEIS are minimal at best. New York's Green Chips Act requires companies receiving NYS funding to power their semiconductor manufacturing with 100% renewable energy, achieve LEED Gold status for buildings, reduce greenhouse gas emissions, and return zero hazardous waste in landfills by 2030. There is no mention of these goals in Micron's DEIS.

[Micron-environmental-goals-and-aspirations-2025](#)
[PDF Document · 38 KB](#)

<https://assets.micron.com/adobe/assets/urn:aaid:aem:94c92463-9bf1-4311-9465-d057307c8955/renditions/original/as/Micron-environmental-goals-and-aspirations-2025.pdf>

Let’s not forget the mess that was made of the Onondaga Lake area by previous industries which were initially viewed as “economic boons” to our area. Central New York has already experienced the environmental degradation and destruction that was left behind by past industrial development, always preceded by the promise of economic growth and job creation (e.g., Solvay Process, Allied Chemical).

Micron needs to develop and implement far more comprehensive plans to protect and preserve central New York’s environment, natural resources, and quality of life than what they have offered in their DEIS.

Subject: [EXTERNAL] Micron concerns

My concern has to do with the water that will be displaced by filling in the wetlands. I own property immediately adjacent to the north of the site. I am concerned that the water will flow from there to my property and cause flooding and excess water. During the summer there is little to no water and my expectation is that there will be no change. I have current pictures to validate this. This concern was expressed at an earlier meeting at the Clay town hall about a year ago and I have never heard anything I would appreciate a response to my concern. Thank you

To: Onondaga County Industrial Development Agency

Syracuse, N.Y. 13202

August 8th 2025

I am submitting the following comments with regards to the Micron EIS. I have read the local newspaper and watched the local news to keep up-to-date. I have to state right from the beginning of my comments I fervently oppose the location of the proposed Micron factory. I will list the reasons for my stance.

1st The 3 species of birds which are endangered species . To destroy these birds natural habitat is in my opinion wrong. You can't through remuneration create that which God created.

2nd The fact that OCIDA voted to give itself the power of Eminent Domain, while the normal definition of that is land acquired by Eminent Domain is after the owner is fairly compensated and the land is for Public purposes. Such as a park, highway ,etc. Now the definition according to Cornell's Law library and is 67 pages long and does discuss the use of Eminent Domain for economic reasons . But it does not take into account endangered species .

When did OCIDA become a real estate agent or company the land that you acquired you then sold to Micron. See attached page { New York Eminent Domain Laws} See Kelo V. New London. You will notice it states that the land acquired will bring in additional taxes, didn't Micron get a \$249 million dollar tax break? So what tax revenue is gained? The other is jobs it is stated that Micron will bring some 9000 jobs to the area. With the current advances in AI and robotic technology and the 17 year time line to build the factory I see maybe 900 jobs there when finished.

3rd The infrastructure that Micron wants to include , electric infrastructure, wastewater treatment facility, rail spur , water delivery system from Lake Ontario, highway expansion of I-81, 481, and then Rt. 31 from Cicero to Rt. 57. I have not seen any figures on the cost to Taxpayers . We the taxpayers didn't get to vote on this. Do you have the land for all of this or is more Eminent Domain going to be used?

4th I also want to bring up the fact County legislators seem to think they can do what they choose despite what the voters say. My point the \$100 million dollar aquarium that is currently being constructed, that the voters said NO too. Yet it's being built . Why I heard from sources in the electrical and Hvac trades that Micron wanted a tourist attraction for their employee's. What is this Field of Dreams build it and they will come. This county is number 1 in the Nation in childhood poverty and we're getting an Aquarium.

T .Armstrong

pg -1-

5th The fact Micron wants to store 55 million gallons of chemicals on site proposes a significant potential for a huge environmental catastrophe, I think I read that each gallon of these chemicals have the volatility of 5 gallons of gasoline. These chemicals are called forever chemicals and require very state of the art wastewater treatment facilities. I also read that the amount of greenhouse gases emitted by said factory could potentially make it **IMPOSSIBLE** for New York state to achieve it's clean air goals. This project starts with cutting down 400 acres of trees, do you realize how much these trees clean the air?

6th The remuneration is only a feeble attempt to placate we the taxpayers. Let's be honest I wouldn't trust the NYSDEC with a bucket of tadpoles. This is the agency that seized Peanut the squirrel and Fred the raccoon and killed them both. This is also the agency that issued an invasive species letter with regard to Faye the swan. Whom was killed and grilled by her killers then eaten. That letter allowed the DA to give what I believe was a slap on the hand punishment to Faye's killers.

7th Please see New York Eminent Domain Laws included.
You'll notice that the state got an "F" for eminent domain abuse which I believe is the case here.

New York Eminent Domain Laws

WHAT IS EMINENT DOMAIN?

In New York, eminent domain gives the government the power to take your property, even if you don't want to sell. But under the Fifth Amendment, eminent domain must be for a "public use," which traditionally meant projects like roads or bridges. Meanwhile, the government must pay the owners "just compensation" for their property.

THE SUPREME COURT DECISION, *KELO V. NEW LONDON*, MADE IT MUCH EASIER TO ABUSE EMINENT DOMAIN

Unfortunately, the U.S. Supreme Court gutted federal protection against unconstitutional eminent domain when it handed down its decision in *Kelo v. New London* in 2005. By a vote of 5-4, the Supreme Court dramatically expanded the definition of "public use" to include private economic development. In other words, local governments can condemn homes and businesses and transfer them to new owners if government officials think that the new owners will produce more taxes or jobs with the land.

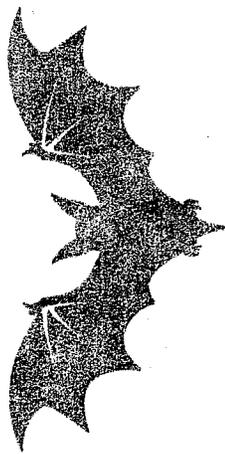

As Justice Sandra Day O'Connor warned in her dissent: "The specter of condemnation hangs over all property. Nothing is to prevent the State from replacing any Motel 6 with a Ritz-Carlton, any home with a shopping mall, or any farm with a factory."

NEW YORK RESPONDS TO *KELO*

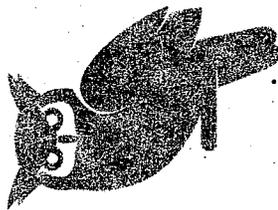

Unfortunately, New York has completely failed to pass any eminent domain reform after *Kelo*, receiving a F in a report by the Institute for Justice. New York still has some of the worst laws in the nation for eminent domain abuse, which continues throughout the state.

Subject: [EXTERNAL] MICRON EIS COMMENT

Snowmobile Trail C7L crosses OCIDA, soon to be Micron property, within the National Grid right-of-way and is shown as such on the maps in the EIS. I don't see anything in the report, however, addressing this recreational resource. This trail is a corridor trail, which is the highest classification in the statewide network of trails. It is well used as a connection to Oneida Lake as well as any destination on the statewide trail network. The Snow Owls snowmobile club, of which I am president, has signed and groomed this trail since about 2002 and we were hoping the trail would continue to use the NAGRID service road or other location within the OCIDA/Micron property.

Thank you in advance for consideration of my comment.

Subject: [EXTERNAL] Public Input to the Micron Technology Draft Environmental Impact Statement
Attachments: PFAS article April 2024.docx; Micron PFAS chemical user discharger article April 2024.docx; PFAS airborne article June 2024.docx

Concerns to be addressed:

- 1) We are a business situated in very close proximity to the proposed Micron facility. I am concerned for the health of our employees as it relates to the potential exposure to the wide array of chemicals utilized and disposed of and/or released into the air and water by Micron. I implore you to carefully and thoroughly research and review all of the chemicals to be used by Micron, and also to receive specific information as to how all chemicals will be treated for disposal in a manner that can be proven to be safe to human health. Air Quality and Water Quality in this rural area has been pure and pleasant for at least the 50 years of our existence here – it would be negligent and unacceptable to allow our Air Quality to deteriorate to noxiously unsafe levels (or even olfactorily unpleasant levels, specifically relative to locations of proposed on-site water and waste water treatment facilities). What will be done to ensure that the Air Quality in the immediately surrounding area does not degrade to levels that are unsafe to human health, and also to levels that are unpleasant/unbearable levels to the smell?
- 2) Further, I am extremely concerned about the fact that Micron intends to fill in approximately 200 acres of federally regulated wetlands on the proposed White Pine site and adjacent Rail Spur site. In addition to unavoidable and permanent wildlife habitat displacement (including the Indiana bat – both a state and federally listed endangered species which have been confirmed to currently exist in numbers on the proposed Micron site and Rail Spur site), as a neighboring land owner, we are also very concerned about the potential for water displacement to immediately adjacent properties such as ours (and others nearby). Though Micron proposes to offset the environmental impact of filling in the wetlands with a “compensatory wetland mitigation plan to offset permanent losses”, this unfortunately does not address the impact of water displacement in the immediately surrounding area during and upon completion of the proposed projects. Further, there will surely be extensive soil excavation to sizable depths in order to accommodate the weight and scope of the Micron facility – this presents very serious concerns about water table displacement issues. For over 50 years we have had no concerns or issues with any flooding, water runoff or water pooling of any nature on our property at 8721 Caughdenoy Road. Due to the vast degree of wetland removal and hard surface construction relative to the Micron and the Rail Spur projects, what will be done to ensure that the immediately adjacent properties and buildings are not negatively impacted or damaged by water displacement runoff?

- 3) Lastly, I point to the three articles attached to this email pertaining to PFAS “forever chemicals”, which have become pervasive in our natural environment. On the one hand, the Federal Government is in the process of allocating substantial financial resources (taxpayer dollars) to address and correct years of PFAS pollution in the air and in our waterways, and on the other hand the Federal Government and New York State are simultaneously providing billions of taxpayer dollars to subsidize a manufacturer that knowingly utilizes and releases PFAS “forever chemicals” in its production processes. As it relates to the Micron project, what is the response to these two diametrically opposed perspectives in relation to the PFAS chemicals that will be released into the atmosphere and into bodies of water?

Thank you for the opportunity to relay these concerns. Though we see potential value to this project in various respects, we trust that you will perform precise and necessary due diligence while considering the short term and long term Environmental impacts of a proposed project of this magnitude.

Thank you,

Russ

US sets first-ever limits on ‘forever chemicals’ in drinking water

- Updated: Apr. 11, 2024, 5:58 a.m. |
- Published: Apr. 11, 2024, 5:47 a.m.
- [The Associated Press](#)

The Biden administration on Wednesday finalized strict limits on certain [so-called “forever chemicals” in drinking water](#) that will require utilities to reduce them to the lowest level they can be reliably measured. Officials say this will reduce exposure for 100 million people and help prevent thousands of illnesses, including cancers.

The rule is the first national drinking water limit on toxic PFAS, or perfluoroalkyl and polyfluoroalkyl substances, which are widespread and long lasting in the environment.

Health advocates praised the Environmental Protection Agency for not backing away from [tough limits the agency proposed last year](#). But water utilities took issue with the rule, saying treatment systems are expensive to install and that customers will end up paying more for water.

Water providers are entering a new era with significant additional health standards that the EPA says will make tap water safer for millions of consumers — a Biden administration priority. The agency has also proposed [forcing utilities to remove dangerous lead pipes](#).

Utility groups warn the rules will cost tens of billions of dollars each and [fall hardest on small communities with fewer resources](#). Legal challenges are sure to follow.

EPA Administrator Michael Regan says the rule is the most important action the EPA has ever taken on PFAS.

“The result is a comprehensive and life-changing rule, one that will improve the health and vitality of so many communities across our country,” said Regan.

PFAS chemicals are hazardous because they don’t degrade in the environment and are linked to health issues such as low birth weight and liver disease, along with certain cancers. The EPA estimates the rule will cost about \$1.5 billion to implement each year, but doing so will prevent nearly 10,000 deaths over decades and significantly reduce serious illnesses.

They’ve been used in everyday products including nonstick pans, firefighting foam and waterproof clothing. Although some of the most common types are phased out in the U.S., others remain. Water providers will now be forced to remove contamination put in the environment by other industries.

“It’s that accumulation that’s the problem,” said Scott Belcher, a North Carolina State University professor who researches PFAS toxicity. “Even tiny, tiny, tiny amounts each time you take a drink of water over your lifetime is going to keep adding up, leading to the health effects.”

PFAS is a broad family of chemical substances, and the new rule sets strict limits on two common types — called PFOA and PFOS — at 4 parts per trillion. Three other types that include GenEx Chemicals that are a major problem in North Carolina are limited to 10 parts per trillion. Water providers will have to test for these PFAS chemicals and tell the public when levels are too high. Combinations of some PFAS types will be limited, too.

Regan will announce the rule in Fayetteville, North Carolina, on Wednesday.

Environmental and health advocates praised the rule, but said PFAS manufacturers knew decades ago the substances were dangerous yet hid or downplayed the evidence. Limits should have come sooner, they argue.

“Reducing PFAS in our drinking water is the most cost effective way to reduce our exposure,” said Scott Faber, a food and water expert at Environmental Working Group. “It’s much more challenging to reduce other exposures such as PFAS in food or clothing or carpets.”

Over the last year, EPA has periodically released batches of utility test results for PFAS in drinking water. Roughly 16% of utilities found at least one of the two strictly limited PFAS chemicals at or above the new limits. These utilities serve tens of millions of people. The Biden administration, however, expects about 6-10% of water systems to exceed the new limits.

Water providers will generally have three years to do testing. If those test exceed the limits, they’ll have two more years to install treatment systems, according to EPA officials.

Some funds are available to help utilities. Manufacturer 3M recently agreed to [pay more than \\$10 billion to drinking water providers](#) to settle PFAS litigation. And the Bipartisan Infrastructure Law includes billions to combat the substance. But utilities say more will be needed.

For some communities, tests results were a surprise. Last June, a utility outside Philadelphia that serves nearly 9,000 people learned that one of its wells had a PFOA level of 235 parts per trillion, among the highest results in the country at the time.

“I mean, obviously, it was a shock,” said Joseph Hastings, director of the joint public works department for the Collegetown and Trappe boroughs, whose job includes solving problems presented by new regulations.

The well was quickly yanked offline, but Hastings still doesn’t know the contamination source. Several other wells were above the EPA’s new limits, but lower than those the state of Pennsylvania set earlier. Now, Hastings says installing treatment systems could be a multi-million dollar endeavor, a major expense for a small customer base.

The new regulation is “going to throw public confidence in drinking water into chaos,” said Mike McGill, president of WaterPIO, a water industry communications firm.

The American Water Works Association, an industry group, says it supports the development of PFAS limits in drinking water, but argues the EPA's rule has big problems.

The agency underestimated its high cost, which can't be justified for communities with low levels of PFAS, and it'll raise customer water bills, the association said. Plus, there aren't enough experts and workers — and supplies of filtration material are limited.

Work in some places has started. The company Veolia operates utilities serving about 2.3 million people across six eastern states and manages water systems for millions more. Veolia built PFAS treatment for small water systems that serve about 150,000 people. The company expects, however, that roughly 50 more sites will need treatment — and it's working to scale up efforts to reduce PFAS in larger communities it serves.

Such efforts followed [dramatic shifts in EPA's health guidance](#) for PFAS in recent years as more research into its health harms emerged. Less than a decade ago, EPA issued a health advisory that PFOA and PFOS levels combined shouldn't exceed 70 parts per trillion. Now, the agency says no amount is safe.

Public alarm has increased, too. In Minnesota, for example, Amara's Law aims to stop avoidable PFAS use. It's been nearly a year since the law's namesake, Amara Strande, died from a rare cancer her family blames on PFAS contamination by 3M near her high school in Oakdale, although a connection between PFAS and her cancer can't be proven. Biden administration officials say communities shouldn't suffer like Oakdale. 3M says it extends its deepest condolences to Amara's friends and family.

Losing Amara pushed the family towards activism. They've testified multiple times in favor of PFAS restrictions.

"Four parts per trillion, we couldn't ask for a better standard," Amara's sister Nora said. "It's a very ambitious goal, but anything higher than that is endangering lives."

Toxic forever chemicals detected in Lake Ontario, all other Great Lakes

- Updated: Jun. 05, 2024, 4:03 p.m. |

- Michael Hawthorne | Chicago Tribune (Tribune News Service) | Tribune News Service

Toxic forever chemicals are on the rise in Lake Michigan, an alarming finding that reflects how the Great Lakes — including Lake Ontario in Upstate New York — act like sponges soaking up pollution from near and far.

Rain and contaminated air are major sources of the contamination detected by a team of researchers from Indiana University and Canada’s top environmental agency. So are discharges from sewage treatment plants and industries.

The new study found airborne concentrations of PFAS — per- and polyfluoroalkyl substances — are much higher near Chicago and other urban areas than at rural monitoring stations in northern Michigan and Upstate New York. Previous research recorded similar patterns for flame retardants and other toxic chemicals.

Read more: [Micron would bring a new era of manufacturing to Central NY – and fears of new pollution](#)

But unlike many other contaminants, PFAS in rain were consistent throughout the Great Lakes region, likely because the chemicals are so widespread in the environment.

Levels detected in rain were the same near Chicago and at Sleeping Bear Dunes National Lakeshore, 223 miles northeast across Lake Michigan near Traverse City.

As the most comprehensive tracking of PFAS in the lakes to date, the study provides another example of how it is impossible to avoid exposure to the chemicals — some of which build up in human blood, cause cancer and other diseases and take years to leave the body.

“We need to take a broader approach to control sources releasing PFAS into the atmosphere and into bodies of water,” Marta Venier, an environmental chemist at Indiana University and co-author of the study, said in an interview. “Eventually that pollution ends up in the lakes.”

PFAS are called forever chemicals because their bonds of carbon and fluorine are nearly impossible to break — a quality that makes them attractive to manufacturers of products resistant to grease, heat, stains and water. But for decades 3M, DuPont and other PFAS makers hid from government regulators and the public what the corporations knew about the health risks.

In April, President Joe Biden’s administration required every U.S. water utility to begin routinely testing for several PFAS in drinking water. Any utility that exceeds newly adopted federal limits will get five years to overhaul treatment plants to filter the compounds out of tap water.

Based on limited testing conducted by the U.S. Environmental Protection Agency and some states, thousands of utilities face expensive upgrades to their treatment plants. For now, though, it appears Chicago and other Illinois communities that depend on Lake Michigan for drinking water will not be required to do anything other than test for the chemicals.

Testing by the Chicago Department of Water Management and the Illinois EPA detected forever chemicals in treated Lake Michigan water but at levels below the new federal standards.

All told the Great Lakes provide drinking water to more than 40 million people in the United States and Canada, including 6.6 million in Illinois.

The new study found all of the lakes are contaminated with two PFAS that initially drew attention from scientists and regulators: perfluorooctane sulfonic acid (PFOS), used by 3M for decades to make Scotchgard stain repellent, and perfluorooctanoic acid (PFOA), sold to DuPont by 3M to manufacture Teflon coatings for cookware, clothing and wiring.

PFOS and PFOA no longer are made in the United States. Chemical manufacturers claimed other versions containing fewer carbon-fluorine bonds would be safer, but their own studies found the alternatives are just as dangerous, if not more so.

Levels of two alternative PFAS, known as PFBA and PFBS, are increasing in Lake Michigan and Lake Superior, the Indiana University and Canadian researchers found. PFOS, the original Scotchgard chemical, also is on the rise in the two lakes.

Lake Ontario had the highest PFAS concentrations, likely because it is downstream from the other Great Lakes. The chemicals also are flushing out of Lake Ontario more rapidly because it empties into the St. Lawrence Seaway and the Atlantic Ocean.

Venier said she welcomes the Biden administration's drinking water regulations for PFOA, PFOS and a handful of other forever chemicals. At the same time, she noted, industry has put some 15,000 PFAS into the marketplace during the past half-century and federal regulators have continued to approve new versions.

"We know enough about these chemicals," Venier said. "It's a matter of how much is enough to decide to stop putting more of them into our environment."

Micron would bring a new era of manufacturing to Central NY – and fears of new pollution

- Updated: Apr. 23, 2024, 6:19 a.m. |
- Published: Apr. 23, 2024, 6:00 a.m.

Micron Technology plans to build a semiconductor manufacturing complex on this site in the town of Clay, at the northeast corner of Route 31 and Caughdenoy Road. The company says it will break ground next year and open two fabrication plants by 2029. N. Scott Trimble | strimble@syracuse.com

-

🔗 🔗 🔗 By

- [Glenn Coin | gcoin@syracuse.com](mailto:gcoin@syracuse.com)

Syracuse, N.Y. – Central New York’s long-standing legacy of manufacturing everything from auto parts to soda ash has had a dark side: environmental pollution, still being cleaned up today.

So along with the progress and economic development promised by [Micron Technology](#) come renewed fears of long-lasting pollution from a new industry.

“We’ve been abandoned by tons of corporations that took away really good jobs and left us with incredible amounts of pollution,” Tom Judson, a co-founder of the Alliance for a Green Economy, said at a public hearing recently. “We’re not going to let that happen here again.”

As Micron promises to build a semiconductor manufacturing complex in Clay and revive the region’s role as a manufacturing center, activists say they’re worried most about the semiconductor industry’s widespread use of what are known as “forever chemicals,” so named because they don’t break down in the environment or the human body.

“The release of toxic contaminants through water pathways is one of the most serious threats of semiconductor productions,” said Lenny Siegel, executive director for the Center for Public

Environmental Oversight, in Silicon Valley. “There’s so many of these chemicals that have been untested, and we don’t know the quantities that are used.”

Many of these forever chemicals, referred to collectively as PFAS, are essential to making computer chips. They’re used in many stages of the complicated process that turns silicon wafers into chips.

More than 3,000 PFAS chemicals are in use in the U.S. They have been used since the 1950s in consumer products and fire-fighting foam, yet many PFAS compounds are not well-studied. Of those that have undergone scientific scrutiny, some are linked to high cholesterol, several kinds of cancer, damaged immune systems and liver damage.

Plus, there are not effective laboratory tests to detect the presence of most PFAS compounds, and there are few regulations for this ever-growing group of chemicals.

In early April, [the EPA for the first time issued PFAS standards](#) for drinking water, despite them being a waste product of manufacturing for decades. The agency is still working on regulations for PFAS discharges in industrial wastewater for local treatment plants, like Onondaga County’s, that are the front line of defense against PFAS contamination of waterways from industry.

With Micron and other chipmakers, there’s an extra conundrum: Many chemicals used in chip-making will be kept secret from the public and even Micron itself. Chip makers and suppliers guard their trade secrets in the name of competition and national security. We may never know all the chemicals Micron will use.

Yet there’s a possibility that forever chemicals could end up in our waterways. That’s according to everyone with a stake in the industry, from environmental activists to the federal government to the semiconductor industry itself. Without proper precautions, we could have a new generation of toxic chemicals seeping into our lakes, rivers and groundwater.

Even the U.S. Commerce Department, charged with awarding \$52 billion to jumpstart semiconductor manufacturing in the U.S., is worried.

“Wastewater discharge from semiconductor manufacturing facilities presents the greatest risk for PFAS contamination of the environment,” the department’s CHIPS Program office in December.

That potential puts pressure on Micron and local and state officials to ensure that toxic chemicals don’t make their way into our rivers and lakes. The front line will be Onondaga County’s Oak Orchard wastewater plant, which will have to undergo dramatic expansion to handle Micron, let alone the business and residential development expected to follow.

Micron says it will comply with all local, state and federal standards for discharging wastewater into Onondaga County’s sewage treatment system. The company says it will build a treatment plant on site to remove chemicals from wastewater before sending it to the public sewage system.

“It will be treated to the appropriate standard or better, and then discharged,” said Carson Henry, Micron’s senior director of strategic U.S. expansion.

Yet it’s not clear how well fab treatment systems even work because most PFAS can’t be detected with current lab tests, the CHIPS office said.

“Analytical methods for the detection of PFAS compounds in wastewater are needed to determine the removal efficiency of such treatment technologies.” the office said. “The current detection methods are limited to a few PFAS compounds.”

Government regulations lag behind

There are few regulations at the state or local level for Micron to comply with.

State and federal regulators are playing catch up to understand and regulate semiconductor chemicals even as the federal government pushes chipmaking plants to open in the U.S. in the interest of national security. Micron is expected to get \$6.1 billion in CHIPS funding to build fabs in Clay and Idaho that will produce leading-edge memory chips used in everything from cell phones to fighter jets.

The New York state Department of Environmental Conservation is only now proposing its first PFAS regulations for local wastewater plants. Those regulations would apply to three PFAS chemicals; Micron says it has already stopped using two of them.

The federal Environmental Protection Agency just this year finalized a new test that can detect a few dozen kinds of PFAS. And even if many PFAS chemicals could be detected, EPA is still hasn’t set guidelines on how much industries should be allowed to discharge. EPA plans to issue guidelines on those limits later this year.

The semiconductor industry employs PFAS chemicals in many of the 2,000 steps it takes to transform silicon wafers into the tiny computer chips. The semiconductor industry says it can’t live without PFAS.

“No known alternatives exist for many of the industry’s uses of fluorocarbon-containing material,” said the Semiconductor Industry of America’s PFAS Consortium said last year. And while the industry is looking at non-PFAS alternatives, those could take years or decades to develop them and put them into widespread use, the consortium said.

The industry also admits it needs to be a better job of removing PFAS from wastewater.

“Most PFAS are not regulated pollutants and therefore unless company specific provisions are in place, the wastewater from processes that use aqueous wet chemical formulations that contain PFAS would likely be discharged to the publicly owned treatment works without substantive removal,” the SIA said.

PFAS stands for poly- and perfluoroalkyl substances. They are synthetic compounds that bind together carbon and fluorine atoms. The chemical bonds between those elements are extraordinarily strong, making them valuable for industry but also long-lasting in the environment.

A 2021 study by Cornell University professors found that three unnamed fabs in the U.S. discharged dozens of types of PFAS into wastewater.

“Little is known about the PFASs discovered in this study, and future work should focus on the occurrence, persistence, and toxicity of these PFASs,” said the study, co-authored by Damian Helbling, a professor in Cornell’s civil and environmental engineering school.

Local treatment plants are first line of defense

While state and federal regulators scramble to develop guidelines, local wastewater treatment plants like Onondaga County’s will be the first line of defense against PFAS pollution. The EPA says that local plants don’t have the technology to test for or neutralize any PFAS that does get into treatment plants and eventually into waterways.

Before Micron can start production, it would need a permit from the county’s Water Environmental Protection department to discharge wastewater into Oak Orchard Wastewater Treatment plant, in Clay. The plant’s effluent empties into [the Oneida River and ultimately Lake Ontario](#).

Shannon Harty, commissioner of the department, said she expects that Micron will process chemicals on site.

“We’re anticipating that it’s going to be Micron’s responsibility to manage and remove PFAS before their wastewater gets to us,” Harty said.

Micron will have “significant water treatment infrastructure so that wastewater leaving the site meets or exceeds applicable water quality standards,” the company said in a statement to [syracuse.com](#). “Micron will comply with local regulatory standards before wastewater is sent for further treatment at the Oak Orchard Treatment Plant.”

The company also said it will comply “with all legal requirements to sample wastewater in accordance with EPA’s evolving sampling methodologies and analytical procedures.”

But as of now there are no local standards in place for most of the chemicals that fall under the PFAS umbrella. On the standard application for industries who want to discharge into the local treatment system, Onondaga County asks industries to indicate which of 120 “substances of concern” they might discharge.

PFAS is not on the list.

Harty said she will rely on the federal Environmental Protection Agency for guidance.

“EPA is really going to be the one that’s going to be helping us develop, what those constituents are and what the permit limits will be,” she said.

That guidance has been slow in coming. EPA concedes that it knows so little about how much PFAS wastewater treatments are already dealing with that it needs to do more testing. The agency just last

month announced it would take steps to require up to 2,000 wastewater plants across the country to test incoming flow from industrial plants.

“This collection effort is necessary because there is only very limited publicly accessible data on PFAS discharges from industrial categories,” the EPA said in March.

EPA also conceded that most treatment plants “do not operate processes and technologies that effectively reduce or destroy PFAS, (which) are subsequently discharged into surface waters.”

“That’s proprietary”

[Micron said it plans to build](#) four fabrication plants, or fabs, over the next 20 years at the corner of Route 31 and Caughdenoy Road, in Clay.

When all four fabs are operating by 2041, Micron says it could discharge 42 million gallons of industrial wastewater per day into the Oak Orchard plant. That’s more than four times the plant’s current design flow.

The county plans to spend more than \$400 million to upgrade the Oak Orchard treatment plant to accommodate Micron and the explosion of development it could generate.

Micron has not said what kinds of chemicals it will use in Clay. In an exchange with [syracuse.com](#) last summer, Henry, the key public face of Micron’s Clay project, said the company will not release information on all of the chemicals it discharges and emits.

[Syracuse.com](#): “Are we going to know what all the chemicals are there, or is that proprietary?”

Henry: “That’s proprietary.”

[Syracuse.com](#): “So we won’t know what you’re using there, what’s going into the air and water?”

Henry: “Correct.”

In fact, Henry said, Micron itself won’t be aware of all of the chemicals that will enter its factory doors.

“In some cases, our suppliers don’t tell us what (the chemicals) are, because they have their own intellectual property and trade secrets,” Henry said.

All that secrecy has activists worried.

“At this point, there are many more questions than actual facts,” said David Sonnenfeld, a retired SUNY College of Environmental Science and Forestry professor who has studied the electronics industry for more than 30 years. “The tricky stuff is, what do we not know?”

PFAS are ubiquitous

What we do know is that PFAS compounds were once widely used in manufacturing firefighting foams and in consumer products like non-stick pans. PFAS compounds have been in use since the 1950s, and were banned from many consumer products in 2002.

In areas where PFAS were used intensively and dumped, dangerous levels built up in groundwater. In the New York village of Hoosick Falls, decades of PFAS dumping led to a \$65 million settlement and a new water line. More than 700 military sites, including Hancock Field, in Syracuse, were being studied for potential PFAS contamination in soil and groundwater.

Despite many PFAS compounds being phased out in the past 20 years, they remain ubiquitous in the environment. One study found that 97% of Americans have some PFAS in their blood.

Fish in the Great Lakes have high levels of PFAS. And the chemicals are found closer to home: Refugees who ate fish from Onondaga Lake had “markedly elevated” levels of PFAS in their blood – as much as 27 times higher than the U.S. median, a [state Department of Health study found](#).

The Onondaga County Water Authority and the city of Syracuse have detected low levels of some PFAS compounds in drinking water drawn from Lake Ontario and Skaneateles Lake. The levels are well below the EPA’s new drinking water standards.

Micron said it no longer uses two major classes of PFAS, called PFOA and PFOS. The company said it is working to find alternatives to the PFAS compounds it does use.

“We are actively working on identifying alternative PFAS chemistries as part of our focus on responsible chemical stewardship,” the company said.

The CHIPS office said coming up with suitable alternatives to PFAS could take 15 to 20 years.

PFAS are just part of the chemicals in fabs

PFAS is just one group of chemicals semiconductor plants use. The CHIPS office says that about 170 chemicals used in semiconductor manufacturing are listed on the federal Toxic Substances Control Act.

At Micron’s fab in Manassas, Virginia, it stores nearly 300 kinds of chemicals, according to a 2018 report filed with the Virginia Department of Environmental Quality. Micron last year provided the New York DEC with a list of chemicals it might emit into the air. The total was 96.

In Silicon Valley, where dozens of Superfund sites are still being cleaned up after decades of pollution from the semiconductor industry, advocates for the environment and worker safety said they remain skeptical, but hopeful, that chip companies can avoid a repeat.

“I’m not arguing that they can’t do their work relatively safely,” Siegel said. “It’s not that they don’t care. It’s that they’ve introduced chemicals without adequate concern about the environmental impact, and now they have to play catch up.”

Subject: [EXTERNAL] Micron DEIS review by Dewitt Advisory Conservation Commission

Importance: Normal

Sensitivity: None

attached please find submission from Dewitt Advisory Conservation Commission. For questions and reply, use soniakragh@gmail.com. Thank you.

<https://docs.google.com/document/d/12JCqU-6XO16vfw7hEb9wBhFbnTAmVx8MGw2q-P5b6oU/edit?tab=t.0>

Sonia Kragh, member, DACC

DACC response to Micron DEIS

Respectfully accept these comments from the members of Dewitt Advisory Conservation Commission (DACC) about Micron's Proposed Action and Connected Actions regarding potential harm to the environment and suggestions for mitigation.

The **Commission** consists of members who are residents of the Town of **DeWitt**. They are individuals with diverse backgrounds and concerns willing to dedicate themselves to the preservation and improvement of the environmental quality of the Town of **DeWitt**.

Dewitt endeavors to offer strong support of Businesses and Residents while simultaneously being a good Steward of the Environment.

Here are Examples:

Dewitt made a Renewable energy pledge to be 100% electric by 2020, achieved with installation of the solar array, with an additional pledge to have renewable energy in all sectors by 2035.

Dewitt has a Sustainability Plan 2014 with ongoing action items and achievements and a Climate Change Plan.

An update to the 2010 Sustainability Policy passed unanimously in draft format and is being used in day to day decision making.

Dewitt has looked closely at the environmental effects on the town of Highway 81-481 changes.

DACC presented to the Dewitt Supervisor/Town Board on 7/14/25, naming environmental concerns related to Micron DEIS review. Below follow those concerns and others identified since the meeting by commission members.

The DEIS did not look at a meaningful radius of environmental impact of connected actions, nor did it consider that greenhouse gas emissions travel by air and will go in different directions and distances day by day, that noise travels by air and related vibration by water and earth, impacting surrounding environment, and that surface water disruption will likely have impacts well beyond the immediate build site in the decades to come.

Greenhouse Gas Emissions(ES-0-9 p 38) - The DEIS has concluded that there will be significant increases in GHG and potentially significant contributions to Climate Change.

The Micron plant in Singapore has piloted a central abatement system as part of a plan to achieve net zero carbon emissions.

Are there plans to use a central abatement system at the plant, and to what degree will this be expected to lower GHG emissions? Provide details related to the life of the project.

Provide details on GHG emissions expected in the Town of Dewitt.

Set up monitoring for repeat GHG emissions assessment at regular intervals as part of the Sustainability Plan to assess compliance and success of proposed actions.

Fossil fuel (natural gas and gas generators) is presented as the fuel source for chip manufacturing and running other operations with plans for a large gas line installed. What non fossil fuel energy options has Micron considered, or will they consider during the life of the project?

I - 481 Traffic (ES-0-11 p. 40)-. The DEIS concluded that there will be significant adverse effects on transportation and traffic during construction and operations. They presented traffic mitigations but ultimately state that recommended traffic mitigations are within jurisdiction of federal, state and local transportation agencies. Traffic along 481 which runs through Dewitt is estimated to increase 7-39 times depending on the timeline of design, construction and operations of Proposed and Connected Actions. Exit 3 leads to the CSX Dewitt Rail Yard, and Exit 2 leads to the Jamesville Quarry. Both exits lead to surface roads likely to be used in commuting to Micron.

What will traffic implications be for the Town of Dewitt in terms of air and noise pollution, Greenhouse Gas Emissions, Wait time at highway interchanges, and congested surface roads?

What other environmental impacts may occur?

Will there be environmental justice impacts from the new traffic patterns within the municipality?

Electricity (3-214) - Micron indicates that it will use renewable energy for its electricity operations. They reference purchasing 100% carbon free electricity utilizing power purchase agreements and renewable energy credits. There are plans for solar panels on some buildings, (p. 80 rooftop

solar 4 MW roofs of parking garages, WWT buildings and Bio buildings) but not on the majority of available roof space. It appears that Micron plans to draw from the existing renewable energy grid, which is already stressed to meet the needs of the central ny region. We are concerned that Dewitt residents will not have adequate electricity if Micron uses it. The credits that they consider purchasing are likely already accounted for and no new significant renewable energy projects have been started in Central or Upstate New York. Purchasing energy credits is not the same as using 100% renewable energy sourced/paid for by Micron. The infrastructure to develop and supply the high amounts of electricity that the project will consume, seems to be based on outside sources.

The Sustainability highlights from the Micron Singapore plant indicates that they installed 36,000 solar panels on the fabrication and car port solar.

Explain why Micron is not making use of more solar technology for renewable energy. Is it possible to develop a coalition of local solar operations to support Micron as well as other Central New York electricity needs?

What are Micron's plans to achieve 100% renewable energy electric without purchasing credits? Fossil fuel is presented as the fuel source for chip manufacturing and running other operations with plans for a large gas line installed. What non fossil fuel energy options has Micron considered, or will they consider during the life of the project? Request details.

Water - Micron design, construction and operations expect to use water equivalent to that used by the city of Syracuse daily, with some plans for reclamation. Water used will go through a wastewater treatment process and be discharged into the Oneida River, travelling to Oswego Rivers and Lake Ontario, which is an international body of water. Water intake for the Town of Dewitt supply is located a few miles from the mapped site of Micron water discharge into Lake Ontario. There are numerous hazardous chemicals used in the chip fabrication process and details of ability to permanently and safely dispose of these chemicals is unclear. The potential mix of intake and outflow waters in close proximity is unclear, and could vary based on weather, ice build up, wave action, and climate change which is predicted to potentially increase based on the DEIS.

Micron should commit to using/supporting treatment and monitoring technology that assures that no PFAS or other toxic chemicals are

released into the Oneida River, Oswego River, Lake Ontario, and our drinking water. Constant upgrades should occur as new technology emerges to ensure safe water discharge.

What guarantees can you provide Dewitt residents that the source of its drinking water will remain safe?

Should the Lake Ontario discharge location of Micron water be moved further from the clean drinking water source ?

Wetlands and other habitat disturbance- wetlands removal will affect carbon sequestration, release greenhouse gases, affect surface waters and potentially the water table. The construction process will also remove DEC prime farmland and grasslands/forest that harbor endangered and protected species and species of concern. The DEIS did not look at a long enough or wide enough corridor of Proposed and Connected Actions to capture effects of disturbing habitat in terms of species effects, water effects, and potential harm to health. For example, if fewer bats roost, we would expect that fewer mosquitoes would be eaten and mosquito born illnesses might increase. Mitigation by wetlands replacement will take a long time and not replace what is lost, especially for bat endangered species which may not find the home they return to to roost. Disturbance and removal of wetlands and surface waters while replacing them with impermeable surfaces like fabrication plants and parking will lead to higher risk of flooding, rechanneling, potentially into developed areas. Because construction needs to be deeper than the shallow surface water, Micron proposes to “dewater” i.e. pump out water into some kind of holding space over the 16 years of construction. This process will likely drain additional nearby wetlands, streams, and private wells for long periods of time. Because the entire region has interconnecting wetlands, swamps and surface waters, and the DEIS area studied was narrow, it is unclear what impact this will have on the waters running into, through and out of Dewitt.

Please answer what effects wetlands and surface water disturbance will have for the Town of Dewitt and what mitigation is suggested.

Include Wetlands, Stormwater Runoff and Flooding in your response.

Use an adjusted wider corridor of potential impact please.

Wetlands mitigation is currently considering land that was used for soybean agriculture that may contain pesticides and herbicides which is not ideal for wetland habitat. Please review and comment.

Geology of building locations - the site that Micron has selected for its Proposed Action and possibly for some of the Connected Actions is located over karst aquifer, meaning the underlying rock contains conduits for water passage. <https://pubs.usgs.gov/publication/sir20205030>. The DEIS states that the Proposed Action main campus is not over a karst region. If it is over a karst region, this has implications for the soundness of construction over time. Dewatering could result in weakening of karst structure and subsequent sinkholes, as well as potential for groundwater contamination should there be any chemical spills or other contamination during building and operations of the plant over its lifetime. Pollution that seeps into this rock can be transported quickly over long distances without much filtration, resulting in pollution of nearby waters like swamps, ponds, lakes, streams, rivers, and wells. It is not inconceivable that negative impact could be experienced as far as Dewitt, as the karst geology is regional and is present at Clark Reservation State Park in Dewitt. Please reference information regarding mud boils as a complication of water extraction in chemical processing south of Syracuse.

<https://www.onondaganation.org/land-rights/onondaga-creek-mud-boils/>

Please review geology related to proposed and connected action construction over karst regions as published.

Please evaluate the connected surface and ground water flow paths of the sites to determine environmental consequences to the Town of Dewitt that the Proposed Action and Connected Actions could have in case of spills containing hazardous substances of any kind. Research used and unused wells in this review.

Please evaluate the implications of drilling into karst/bedrock, then dewatering, then repeating the process in subsequent phases and the possibility that the ground will become unstable and sink holes or other ground disturbance will develop in the town of Dewitt over the expected lifetime of the Micron plant i.e. 100 years.

Air Quality/Monitoring(ES 0-8 p 37-38) - The DEIS indicates no significant effect to air quality, other than temporary related to construction. Air pollutants will be generated during the building and operation of Micron. Some byproducts of incineration may be toxic, hard to measure, or are not regulated as of 2025. Current Air pollution data used by Micron for their

assessment comes from monitors in Rochester NY. This is no where near Syracuse/Clay/Cicero/location of Proposed or Connected Actions. There is no data to determine if there are toxic air levels expected to travel along the I-81/481 corridor from Proposed and Connected Actions that will impact Dewitt.

Perform Air Quality environmental impact assessment using on site monitoring equipment pertinent to the Micron main campus and connected action involving the rail yard.

Have an independent third party determine other regional locations for air monitoring and reporting frequency.

Reevaluate as project design decisions and building phases progress.

Note - it is unclear how robust Micron is being with following through with checking and/or posting quality results. The air quality data on the Boise Micron site is sparse and not updated. For the Proposed and Connected Actions, Micron needs to do more robust monitoring and reporting on publicly available online sites.

Transportation Services - Micron has 12,000 parking spaces and must be expecting to fill them.

What Carpooling and Public Transportation services will be accessible in Dewitt? Please involve Dewitt in the conversation. Transportation Plans involving Micron campus and the County should align with municipal plans.

Connected Action Rail Spur 2.1.2 p 83 , figure p. 85 - Micron will be removing 1.5 mill cubic yards of material and importing 9 million cubic yards. In order to reduce truck transport emissions, noise and traffic, they are constructing a CSX Railroad line to deliver/remove materials to begin in the 4th quarter of 2025 and last for 7 months. The DEIS describes a process of 60 x 60 x 60 rail cars in operation from 6am to 10 pm (if time is approved by the City of Clay) to transport, off load and pick up materials. The spur & trucking will also be used to deliver to the Micron fabs and childcare center.

All of this material will be coming from and going to somewhere before it gets to the Connected Action rail spur/ rail cars.

How will material be transported to the Connected Action Rail Spur? by trucking/rail? Over what roadways? What municipalities/counties will be affected? What are the environmental impacts of moving the

***material described above and how might it affect Dewitt specifically?
What is the environmental justice impact of this activity? (Dewitt has an active quarry at I-481 exit 2 and is the location of the CSX Dewitt Railyard exit 1 I-481 which is the area hub for commercial rail.)***

Hancock Airport - The DEIS did not include any potential environmental impact from air transportation. Hancock Airport resides in Dewitt and provides both passenger and commercial flights.

What potential changes to the Airport might be needed to handle transportation related to Micron development and operations?

Recommend involving the Town of Dewitt in conversations related to Hancock Airport and transportation.

What are the potential environmental impacts of any changes in Air Transportation Commercial and Passenger related to Micron development and Operations? Include potential Environmental Justice Impacts related to flight paths, air pollution, traffic, housing, other.

Waste Disposal - it is unclear where waste that Micron generates will be transported, both hazardous and non hazardous. Both types of waste are likely to travel by truck or rail through Dewitt using I-481, I-690, CSX Rail Hub, and surface roads.

Provide details of waste disposal travel corridors and potential environmental impacts on the Town of Dewitt including during all phases of construction and eventual operation.

Housing - there is an expectation that upwards of 25,000 new households will reside in the region as a result of Micron.

What is the estimated Greenhouse Gas Emissions and Climate Change impact of these households? What will be the impact on Dewitt?

Environmental Justice (ES p 44)

Micron DEIS looked at a 5 mile radius of the proposed project and ¼ mile radius of connected actions and concluded that there are no significant adverse effects from the project. Micron outlines benefits to the region extending for 5 counties. *If they claim benefit for 5 counties, then they should look at the potential for environmental justice impact for 5 counties. Analysis of Environmental justice impacts should include a 5 county look for potential harm caused by connected actions (rail, highways,*

extending water/fossil fuel/electric services), air and water pollution, changes to water flow, climate change from higher greenhouse gas emissions, longer traffic wait times, new housing developments, change in traffic flow, to name some potential impacts.

Dewitt is within the 5 county area expected to benefit from Micron. What is the potential for adverse environmental justice impact for Dewitt over the lifetime of the project?

Other Sustainability Concerns related to the DEIS:

Lack of a Sustainability Plan (Micron has a published table of goals and aspirations, but these are not robust in detail to constitute a Sustainability Plan)

<https://assets.micron.com/adobe/assets/urn:aaid:aem:94c92463-9bf1-4311-9465-d057307c8955/renditions/original/as/Micron-environmental-goals-and-aspirations-2025.pdf>

DACC review of the DEIS finds that Micron is not fulfilling Requirements of Green CHIPS legislation. Please provide a Sustainability Plan that is based on criteria below, with plans to update it in a meaningful way as design plans and construction and operations change, and before each Phase begins, as well as if new technology becomes available.

As part of New York State's **Green CHIPS** legislation, championed and **signed into law** by Governor Kathy Hochul, **Micron** will be required to manufacture semiconductors under leading-edge sustainability commitments designed to mitigate its greenhouse gas emissions and environmental impact, including utilizing 100% renewable energy, attaining LEED Gold status, and committing to greenhouse gas emission targets and reporting.

Micron will be required to submit a Green CHIPS Sustainability Plan in compliance with the Green CHIPS program regulations, subject to the approval by ESD. Micron will strive for the highest standards practicable and that, at a minimum, will include commitments to:

- Utilize 100% renewable energy for electricity and maintain that 100% renewable energy for electricity supply for the duration of the expected 20-year duration of the project
- Achieve a minimum Gold LEED status for all chip fabs and office buildings, with commercially reasonable efforts made to achieve Platinum status at all Fabs and office buildings
- Commit to meeting applicable and mutually agreed GHG emissions standards specific to the Fab Complex that are reasonable and achievable given the state of technology advancements
- Install on-site renewable energy systems and on-site battery storage systems to contribute to the project's energy needs to the extent practicable, including for resilience, peak-shaving, grid benefits, and other applications
- Where feasible and cost effective - utilize green hydrogen to displace/replace natural gas and gray hydrogen consumption, support /participate in New York's federal Hydrogen Hub proposal; and pursue other clean measures such as geothermal heat pumps for space heating and cooling loads
- Adopt other mitigation measures for GHG process emissions where practicable
- Incorporate energy efficiency and electrification where feasible throughout the term
- Encourage contractors to utilize, to the extent practicable, low-carbon construction vehicles and equipment and incorporate low-carbon building materials (green steel, green cement, etc.) into construction
- Commit to environmentally sound practices, including green infrastructure such as permeable pavement, stormwater runoff management solutions, and sustainable wastewater management
- Report annually the project's progress related to the commitments made in the agreement and on its greenhouse gas emissions

Community Expert Advisory Conservation/Sustainability Commission-

In early days of community engagement, Micron involved community members and environmental organizations in conversations about Sustainability. These conversations have ceased to occur in any meaningful way. Micron has indicated a desire to build and operate sustainably, but there is much that could be sustainable that is not present in the DEIS. Micron has an obligation of sustainability as part of receiving financial support through the NYS Green CHIPS Act.

<https://esd.ny.gov/micron-green-chips-sustainability-requirements#:~:text=As%20part%20of%20New%20York,impact%2C%20including%20utilizing%20100%25%20renewable>

Require formation of a Community Expert Advisory Conservation/Sustainability Commission involving Micron, community members, municipalities, and environmental organizations to convene regularly to review sustainable solutions in keeping with the goals of the Climate Leadership and Community Protection Act and New York State Environmental Amendment to the constitution, NYS Green CHIPS Act and others that may guide best sustainable practices for a project of this magnitude. This project will be 16 years in design and construction, with decades of operation. It is impossible to know what technology and other avenues there will be to achieve net zero carbon building, pollution free combustion in chip fabrication, clean wastewater, reduced and reclaimed water use, as some examples.

Require that new technologies be implemented as they become available.

In summary, these are the final conclusions and recommendations of the Dewitt Advisory Conservation Commission. Central New York has experienced and continues to live through the aftermath of environmental exploitation and destruction from industrial development, always preceded by the promise of “economic growth” and “job creation” (e.g. Solvay Process, Allied Chemical). Micron needs to develop and implement more comprehensive Sustainability and Conservation plans for their project that will both protect and preserve central New York’s environment and quality of life throughout the duration of construction and operations of the project. The estimates of resources that will be consumed on a daily basis are staggering and have been increased in recent weeks (<https://www.nyruralwater.org/news/micron%E2%80%99s-unmatched-environmental-impact-clay-chip-fabs-doubles-latest-estimates>)

A reconsideration of alternative actions, or a final decision of no action may be reasonable conclusions after review of this and other DEIS comments.

We appreciate your review of these comments and detailed responses.

Respectfully submitted by Sonia Y Kragh, MD and Angela Weiler, MLS, on behalf of Dewitt Advisory Conservation Commission, Town of Dewitt, New York.

Please reply to soniakragh@gmail.com.

Subject: [EXTERNAL] Statement on the Micron DEIS

Good evening,

Please see below a statement from MACNY, The Manufacturers Association of Central New York. Please let me know if you have any follow up questions. Thank you.

The Micron Technology Draft Environmental Impact Statement (DEIS) for the planned construction of a mega semiconductor fabrication plant in the Town of Clay, required under state and federal law, marks a significant milestone for this transformative project. Under CHIPS legislation, Micron is required to operate under rigorous sustainability standards, including greenhouse gas reduction and reporting commitments.

MACNY welcomes the report's release and the opportunity for crucial community input. This document reflects years of careful collaboration among Micron and public agencies to drive the Micron project forward while safeguarding the region's vital natural resources through research, accountability, and public engagement.

Micron has the potential to create thousands of good-paying, advanced manufacturing jobs, establish our region as a hub for semiconductor manufacturing, and attract a robust network of supply chain companies. Beyond its economic impact, the Micron project will significantly strengthen national security and bolster U.S. competitiveness. The DEIS is a vital step to ensure that the project moves forward responsibly, balancing economic growth with community well-being.

Tiffany Latino-Gerlock

Life in CNY will change with micron coming in. The additional traffic, population and industrial growth I can adapt to and live with as it will ultimately be a plus for the area I believe. (Although I'm stumped as to how an already failing electric grid, sewer system and water system will handle this added strain???)

What I'm truly worried about is the impact of micron on our air and water. We have some of the most abundant, clean water in the country! Our many lakes, rivers and streams are a huge plus to living here and growing our tourism. We can not risk becoming another Flint, Michigan! I hope that the government is taking a full and careful look at ways to SAFELY bring micron to CNY so it is a positive for our area.

Thank you, Elizabeth Levernosh

**Re: Comments of the County of Oswego Concerning the
Micron Draft Environmental Impact Statement (DEIS)**

To Whom it May Concern:

The County of Oswego welcomes the opportunity to comment on the DEIS for the Micron project (hereinafter "Project") and would offer the following by way of comment. Also attached is a spreadsheet, incorporated herein by reference, with more specific comments and concerns regarding the DEIS.

By way of background, Oswego County supports investment in Central New York and the attendant economic drivers, jobs and opportunities investment can bring to the region. However, any development must also be considerate of the natural bounty this region offers and take steps to protect the vital natural resources we all enjoy and rely upon. Tourism is a huge portion of the local economy of Oswego County and a large part of tourism relies upon our abundant natural resources including our rivers and lakes. Visitor spending in Oswego County totaled \$228 million in 2023.

Oswego County estimates approximately 2,748 jobs were supported by direct and indirect tourist expenditures in 2022. Anglers (including local residents) generated \$192,734,697 in total economic impact in Oswego County in 2023, supporting 934 jobs. Oswego County values its abundant natural resources including the Oswego River and Lake Ontario and, as such, believes that any development should be mindful of potential impacts upon those resources. Minimizing potential environmental impacts in Onondaga County and burdening neighboring jurisdictions with new, or other, impacts stemming from the Project should, at a minimum, require input and review together with the affected jurisdictions.

The Oswego River crosses Oswego County and portions of the Seneca and Oneida rivers flow into the Oswego River. The majority of the surface of Oneida Lake lies within the boundaries of the County of Oswego which reaches the southern shoreline of that lake. Oswego County values its water resources and is concerned about possible impacts stemming from the Project and inadequate consideration as to how those activities may affect this county and surrounding areas.

DEIS Procedural Concerns

Oswego County and the towns, cities and villages comprising same, were neither listed as an involved party nor an interested party in the Project's review process which was cloaked under secrecy until released by

the County of Onondaga Industrial Development Agency (COIDA). The lack of information to, and input from, Oswego County is a concern as the magnitude of this Project and its impacts upon electricity, water, wastewater, housing, traffic, infrastructure and the environment stretch far beyond the borders of Onondaga County.

Not all consequences from a Project of this size are welcome and some cannot be avoided. However, at a minimum, adjoining jurisdictions should have been involved in the environmental review process from the onset and the failure to include those jurisdictions in the County of Oswego from the onset is a significant oversight. It is difficult to posit there was a hard look at all potential environmental impacts for the Project when part of the solution to potential problems in Onondaga County was to have the Project look outside of municipal boundaries to mitigate impacts in surrounding areas and, thereby, causing potential adverse concerns/issues in other locations.

DEIS Substantive Concerns

Wetlands Studies and In-Lieu Wetland Banking

Of primary concern, the DEIS presupposes that wetland impacts for the Project will be mitigated, in whole or in part, by in lieu/banking projects in Oswego County. Oswego County would submit that there has been insufficient review of the impacts of this program as concerns this county. Further, there has been insufficient notice to and/or involvement of impacted jurisdictions within Oswego County.

Oswego County has already seen hundreds of acres acquired by a third party, The Wetland Trust, in connection with the Project. The Wetland Trust is not a trust in the traditional sense of the word but, rather, is a non-profit corporation with apparently no memberships and a small board of directors. This county understands the Trust has received direct funding in connection with this Project to acquire lands outside of the County of Onondaga. The Trust wetlands in this county are also located within the Oswego County Soil & Water Conservation District which was not consulted by the Trust specifically as to this Project.

The Trust approached the Soil and Water Conservation District in 2023 and there was no mention of the Project. Further, this was prior to the Trust's wetland mitigation purchases for the Project becoming public knowledge. In the Trust's conversations with the Oswego County Soil & Water Conservation District, the Trust stressed that their "clients" were the various species of wildlife which would benefit from wetlands. The Trust's representatives asked about specific properties and, if the District knew of any landowner whom may be interested in selling, to pass along the contact information for the Trust. It was later realized that the inquiry was connected with the Project but not through any formal DEIS notice. It is unknown, at this point, whether the Trust has independently complied with SEQRA and other regulations regarding its proposed actions in Oswego County. It is also unknown whether these new wetlands will be open to public recreation or hunting.

The removal of viable agricultural lands from production, and their conversion into permanent wetlands, harms the agriculture sector in Oswego County. Further this also hinders any possible future development of these lands for housing or other uses. Lastly, this also serves to remove acreage from the taxable portion of the rolls. The future fiscal impact upon the county and towns in which the wetlands are being acquired for the Project is manifested through not only the loss of current tax revenues but the potential loss of future development and revenues in those towns where the wetlands are being created. There are no plans in the DEIS regarding host community benefits in Oswego County for the potential losses. Oswego County and local jurisdictions are also exploring options regarding the wetlands recently obtained by the Trust.

By way of illustration, the following is a list of properties held by The Wetlands Trust in the County of Oswego a large portion of which are located in one town, the Town of Schroepel:

SWIS

Tax Map Owner
Taxable Value Acres

353289	292.00-01-10	The Wetland Trust Inc.	13,671	30.41
353289	292.01-01-15	The Wetland Trust Inc.	50,000	1.27
354400	257.00-01-08	The Wetland Trust Inc.	0	100.9
354400	239.00-03-08	The Wetland Trust, Inc.	25,000	85
355489	257.00-01-06.02	The Wetland Trust Inc.	0	32.5
355489	315.00-01-29	The Wetland Trust Inc.	0	80.11
355489	315.01-01-04	The Wetland Trust Inc.	0	181
355489	256.00-04-14	The Wetland Trust, Inc.	0	174.55
355489	256.00-04-14.01	The Wetland Trust, Inc.	0	10
355489	304.00-02-03.1	The Wetland Trust, Inc.	0	350.22
355489	274.00-02-04.09	The Wetland Trust, Inc.	0	52.2
355489	274.00-02-04.11	The Wetlands Trust Inc.	500,000	96.69
355600	149.00-01-19.15	The Wetland Trust Inc.	30,000	31.23

Note: Due to the timing of acquisition and taxable status date, some properties may have a taxable value because an exemption has not been triggered; exemptions also vary by assessing unit.

Under the pre-2025 DEC wetlands criteria, Oswego County hosted approximately 135,521 acres of mapped and informational wetlands and an additional 79,694 acres of regulated adjacent wetland zones. Approximately thirty-four percent of the total acreage of those 215,215 acres of Oswego County was already covered in regulated wetlands. The total herein is likely much higher due to unmapped areas meeting additional wetland criteria (i.e. urban areas, etc.) and the newly adopted, expansive DEC wetlands definitions. It is unknown why prime agricultural and development lands were acquired in part to convert to wetlands instead of simply acquiring existing wetlands in this county.

From the DEIS, Oswego County is expected to see growth of households up to 9.7%, or approximately 4,500 homes, by 2041. (DEIS, Table 3.15-5, p3-492). It is noted that the Town of Schroepfel is expected to see growth of households up to 10.4%, or approximately 350 homes. (EIS, 3.15.3.2, p. 3-492). The Trust acquiring wetlands in connection with the Project removes that acreage from the potential for future development. Additionally, the new, expansive DEC wetlands regulations further hinder the ability to develop lands in proximity to those wetlands in the Town of Schroepfel.

From Oswego County's perspective, the DEIS should have employed mitigation measures and considered reasonable alternatives within Onondaga County, and the within the same watershed, for the Project instead of pursuing them in other areas.

Public Health Concerns Specific to Additional Wetlands Being Created

Additionally, the DEIS did not solicit information about, nor does it consider, the impact upon public health in Oswego County as concerns the creation of new wetlands connected to the Project. Oswego County has conducted surveillance for mosquito-vectored diseases for over thirty years through its Department of Public

Health. Mosquitoes can carry diseases or viruses which can impact the health of the public at large and livestock. These include Eastern Equine Encephalitis (EEE) and West Nile Virus. With global warming, it is anticipated that other mosquito-borne illnesses not previously seen in this county may also appear and, in turn, drive additional public health related costs.

The Oswego County Health Department regularly conducts aerial spraying of parts of Oswego County including to mitigate the potential harm to the public and livestock from these viruses. Other initiatives such as public education and the distribution of “dunks” are also undertaken by the Health Department. Presently, this county is spraying about 10,000 acres for EEE and West Nile Virus.

The proximity of the new wetlands related to the Project to existing and future residential developments in this county is a concern and does not appear to have been considered under the DEIS. Also, no consideration in the DEIS was given to the potential increased costs which could be incurred by Oswego County in mosquito surveillance and spraying programs in connection with the additional 400 acres of wetlands to be created and along with adjoining acreage.

Historical mosquito vector spraying costs alone are included in the chart below. This does not include other, related costs such as testing, surveillance, outreach and public health education/ response.

Oswego County Mosquito Spraying Costs and Events Summary (2013–2024)

Year	Spraying Cost		Number of
	Spray	Locations	
2024	\$34,348	1	
	TH		
2023	\$38,178	1	
	TH		
2022	\$64,561	2	
	TH (1), Palermo (1)		
2021	\$73,206	2	
	TH (1), Palermo (1)		
2020	\$34,097	1	
	TH		
2019	\$108,962		3
		TH (2), Palermo (1)	
2018	\$34,416	1	
	TH		
2017	\$28,046	1	
	TH		
2016	\$0		0
	—		
2015	\$55,524	2	
	TH (2)		
2014	\$219,415		Unknown
		Not specified	
2013	\$194,310		Unknown
		Not specified	

N.B.: TH = 3 Mile Bay Wildlife Management Area in Hastings, West Monroe & Constantia
Palermo = Portions of Palermo, Mexico & Hastings

In that time-frame, there have also been various exposures to livestock and humans and one human case which resulted in a fatality from Eastern Equine Encephalitis in 2014.

SOLID WASTE

The DEIS mentions several regional resources for solid waste including Bristol Hill Landfill and the Oswego County Energy Recovery Facility both located in the Town of Volney in Appendix K-2. The County of Oswego has, under local law, implemented Flow Control and bars the importation of solid waste from outside of Oswego County. This local law was challenged after adoption and the U.S. Court of Appeals for the Second Circuit subsequently upheld the local law in 2013 in the matter of *JWJ Industries, et al. vs. Oswego County*.

The DEIS appendix is a silent on the existence of flow control in Oswego County and the fact Oswego County prohibits the importation of out-of-county waste. Further, Oswego County's Solid Waste Management Plan makes no assumptions or forecasts for the Project in particular or out-of-county wastes in general. To the extent the Project relies upon other counties for solid waste disposal (and the attendant environmental impacts to haul and dispose of solid waste to other locations), Oswego County would submit that the DEIS review is inadequate and any reliance insofar as Oswego County's solid waste system is misplaced.

COUNTY AND TOWN ROADWAYS

Oswego County maintains over 500 lane miles of county roads and approximately 120 county bridges or culverts including all bridges or culverts over 25 feet on town roads. Oswego County maintains, in part, the Minetto Bridge spanning the Oswego River and the Hinmansville Bridge, under state jurisdiction and near the county line, connects to County Route 46. State Routes 48 and 481, and County Route 57, also cross county lines into Oswego County. Oswego County would submit that the DEIS should have considered the impact from increases in traffic counts and accelerated maintenance schedules related to the Project in this county. Infrastructure related improvements from Project-related traffic within this county will likely be necessary given the proximity of the Project to Oswego County and its local jurisdictions.

WATERWAYS/WATER QUALITY

Oswego County's reliance upon its waterways for public water, recreation and fishing is of paramount importance. It is submitted that the DEIS process is lacking information regarding potential impacts upon rivers within Oswego County as the discharge from new wastewater facilities in Onondaga County ultimately will end up in waterways in Oswego County.

The county understands, from initial estimates, the Project's daily needs for water range from 20 million gallons per day at the onset to 48 million gallons per day when the project is completed. This county further understands that the Project's projections for industrial wastewater range from 8 million to 20 million gallons per day and when fully operational that could increase to 42 million gallons per day.

This county has seen a resurgence in many protected species due to, in part, improvements in water quality and fish stocks. Many migratory waterfowl stop in Oswego County and this county believes that further study of the potential impacts of the Project within Oswego County is warranted to ensure there are no adverse impacts on rare or state-listed avian species and fish stocks.

Even a slight change in water quality or temperature can have major impacts upon fish stocks and the environment. Oswego County submits there has been insufficient review as to potential impacts of these discharges into the waterways which flow in and through Oswego County. This county is also concerned about potential increases in contaminants from the Project such as PFAS, increases in water temperatures and decreases in overall water quality. The potential impacts upon public water sources, water quality and fish stocks in the waterways of Oswego County merit thorough review and input from jurisdictions in this county which is lacking in the DEIS.

STANDARD OF REVIEW

In compliance with the substantive and procedural requirements of SEQRA and other applicable regulations, a lead agency must prepare a DEIS and FEIS to analyze the environmental impact and any unavoidable adverse environmental effects of the project under review.

In assessing compliance with the substantive mandates of SEQRA, of critical concern is whether the lead agency COIDA identified the relevant areas of environmental concern, took a "hard look" at them, and made a reasoned elaboration of the basis for its determination. Literal compliance with both the letter and spirit of SEQRA is required and substantial compliance will not suffice.

When viewing the DEIS under a rule of reason approach, Oswego County views the wholesale disregard or discounting of potential impacts in Oswego County from wetland banking in connection with the Project as an error. Oswego County's position is that the mitigation of adverse impacts from the Project should have occurred in Onondaga County. COIDA knew or should have known wetland banking was occurring in other jurisdictions and should have, at a minimum, sought input and included those jurisdictions in the process from the onset. Oswego County does not believe there was due regard in the DEIS about other impacts in Oswego County stemming from the Project such as potential changes in traffic, discharges to the waterways of Oswego County, public health impacts and the like.

Oswego County does not believe it is the only surrounding government sharing this opinion and would like to see revisions to the DEIS to better account for adverse impacts in surrounding jurisdictions. Our disagreement with some of the alternatives proposed for the Project stems from the fact we do not believe OCIDA undertook the required hard look at all reasonable alternatives to the Project which is evident in the lack of notice to local jurisdictions from the onset.

Thank you for the opportunity to comment on the DEIS for the Project.

Sincerely,

A handwritten signature in cursive script that reads "Jim Weatherup".

James Weatherup, Chair

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

Number	Page	Section	Title	Comments
1	60	Table 1.2-1	State and Local Involved Agencies	Oswego County and its local jurisdictions in proximity to the Project are not listed.
2	124	3.1.2.3	Protected Farmland	Omits farmland impacts in Oswego County.
3	141	3.1.3.2	Farmland Conversion	Omits farmland impacts in Oswego County.
4	145	3.1.3.2	Growth Inducing Effects	DEIS should address substantial housing impacts upon local municipalities, including in Oswego County.
5	148	3.1.4	BMP and Mitigation Measures	There are no mitigation measures for direct and ancillary Project impacts in Oswego County.
6	205	Figure F-24	Proposed Compensatory Mitigation Sites	Oswego County, Oswego County Soil & Water Conservation District and Oswego County Farmland Protection Board should have been involved/better informed.
7	246	Table 1.2-1	Projected Land Cover Loss Due to Induced Growth by 2041	DEIS omits land cover losses in Oswego County.
8	600	3.15.3.2	Funding for Local Governments and Taxing District	The Project will result in growth in Oswego County but also related Oswego County and local costs relating to infrastructure, traffic/roads, police, fire etc. and no funding is earmarked for Oswego County.
9	606	Table 3.15-5	Induced Household Growth Projections Exceeding	It would appear the ten percent cap will be exceeded in Oswego County based upon similar estimates in Onondaga County and Oswego County's proximity to the Project.
10	607	3.15.3.2	Real Property and Housing	The Project will cause short-term challenges in the local and regional housing markets and, in turn, will require additional municipal investment in infrastructure which will outpace existing municipal plans, budgets/capital projects for repaving, bridge replacement, etc.
11	612	2.15.3.2 2nd Paragraph	Funding for Local Governments and Taxing Districts	It is unknown whether anticipated growth and the tax revenue generated from same will exceed the new and additional costs to be incurred by Oswego County and its local governments because of the Project.
12	616	3.15.4	Mitigation Measures	The only local initiatives identified are in Onondaga County, none in Oswego County as a neighboring/adjacent jurisdiction.

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

13	624	3.16.2.2	Low-Income Communities in Study Area	Low income areas have not fully been reviewed as only Onondaga County considered. Oswego County has low income areas in proximity to the Project.
14	645	Table 3.17-1	Summary of Effects	Additional necessary utilities like water and sewer should also have been considered along with electricity.
15	659	4.3.3	Water Resources- Wetland	Mitigation of the disturbed wetlands by wetland banking in Oswego County locates wetlands to a different watershed than the Project.
16	680	4.3.15.4	Local Governments and Taxing Districts	There will be delays in new development caused by the need for new infrastructure and the need to fund same. Current residents will likely be burdened with additional taxes/fees to fund infrastructure improvements.
17	682	5.1	Unavoidable Significant Adverse Effects- Water Resources	It is stated that the wetland mitigation will be in the same watershed but this does not appear to be the case.
18	716	8.3 & 8.4	Involved and interested Agencies	Oswego County should be included.
19			General Questions/Comments	The need for high density development will be hindered by how quickly infrastructure and other services can be put in place.
20			General Questions/Comments	The Project DEIS states there are substantial impacts in Oswego County, but does not sufficiently consider or identify them.
21			General Questions/Comments	Traffic studies stop at the Oswego County line. Obviously the potential impact from increased traffic crosses into Oswego County.

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

Section	Report Page	PDF Page	Header	Quote	Notes/Thoughts/Questions
0.3	0-5	34	No Action Alternative	"The Existing utility authorities would not undertake utility improvements or need to obtain easements for the Connected Actions."	Admits that local utilities would not need to conduct any utility improvements (including water and sewer) if this project were to not happen. Whereas later on in the report it says that these utilities have identified improvement and would be conducting these improvements regardless of the project and therefore there are no significant impacts. Conflicting statements.
0.3	0-7	36	Water Resources	Speaks to wetland mitigation within 9-miles of the site	The discussion of the construction of these wetland sites is centered around the need for mitigation. The report does not expand upon the proposed mitigation to consider the impacts on the areas where the wetland mitigation is occurring - loss of land use, potential rezoning of the land, loss of potential future tax revenue or use for residential housing
0.3	0-7	36	Biological Resources	"The Preferred Action Alternative has low potential to result in significant growth inducing effects on biological resources in the five-county region over time."	The report states that the growth inducing impacts of the project will result in continued development of the 5-county region, resulting in additional land use/clearing which the report states has the potential to affect historical architectural properties and archaeological resources. This same development will also result in impacts to threatened and endangered species due to the clearing of land and trees to support this development (residential and otherwise), but the report does not identify/mention these potential impacts instead stating that there will be no impact.
0.3	0-8	37	Biological Resources	Additionally micron proposes purchasing property for permanent protection and restoration of habitat.	The report does not consider the environmental impacts on the areas where the grassland/habitat mitigation is occurring - loss of land use, potential rezoning of the land, loss of potential future tax revenue or use for residential housing
0.3	0-11	40	Utilities and Infrastructure	The Proposed Project would have no significant adverse effect on water usage and capacity, as necessary system upgrades, permitting, and infrastructure development led by OCWA and local water authorities are expected to maintain adequate capacity. Wastewater treatment needs, including both sanitary and industrial wastewater, would be accommodated by existing and planned infrastructure, including construction of the IWWTP, avoiding any significant adverse effects on wastewater treatment capacity.	The report speaks to the potential water and wastewater impacts of the proposed project only and does not speak to the potential water and wastewater impacts the Connected Actions or growth inducing effects. The report mentions "planned upgrades" by OCWA and OCDWEP but does not consider potential upgrades necessary to support the growth inducing effects on other smaller municipal utilities, including those in Oswego County. What other local water/wastewater authorities has the author coordinated with? None were specifically mentioned in Oswego County, though the report later states that these areas of Oswego County are likely to see growth inducing effects which may strain existing public water and wastewater infrastructure, or produce a need for expanded infrastructure. The Report does not discuss wastewater treatment capacity or water capacity significant adverse impacts of development in areas without public infrastructure

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

0.3	0-12	41	Transportation and Traffic	<p>Report speaks to multiple significant measures needed to mitigate transportation and traffic impacts - including construction or widening of roads. Report also states that the recommended mitigation measures are within the jurisdiction of federal, state, and local transportation agencies and would be subject to detailed design and approvals</p>	<p>Report does not seek to quantify the other environmental impacts of these mitigation measures - widening of roads is likely to have wetland impacts, impacts to trees and habitat for threatened and endangered species etc which was not discussed in the report.</p> <p>Furthermore, the report states that local agencies may be responsible for these mitigation efforts. Impacts on local municipalities which will be responsible for this work has not been identified.</p> <p>The report speaks to significant traffic along Caughdenoy Road but only discusses traffic mitigation measures within Onondaga County. It does not mention potential mitigation measures necessary to facilitate increased traffic patters at the intersection of Caughdenoy Road, County Route 12 and County Route 33 (the hamlet of Caughdenoy) which may serve as a major intersection for traffic heading to the micron campus from areas north of the Proposed Project. It also does not speak to potential widening of the County Route 33/Caughdenoy Road bridge crossing Oneida River from Onondaga County into Oswego County, including addition of sidewalks and bike lanes. The Report does not discuss potential traffic mitigation measures necessary in Oswego County and the resulting environmental impacts of these mitigation measures.</p>
0.3	0-13	42	Visual Effects and Community Character	<p>Report states that the preferred action will result in changes to community character by increasing traffic, visual effects, and the effects of inducted growth by changing from low-density, rural, undeveloped area to a site with a large manufacturing facility.</p>	<p>This does not speak to the significant adverse impacts of the induced growth of the area - including not just the construction of the preferred action but the spin-off impacts of other commercial and residential growth in the area - added density, less rural character etc. This also does not speak to the impacts on the community character of other surrounding areas which may experience a significant increase in density due to residential growth near the site (including Oswego County).</p>

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

0.3	0-13 and 0-14	42 and 43	Community Facilities, Open Space, and Recreation	<p>"Construction and operation of the Proposed Project would not result in any significant adverse effects on police services, fire services, EMS, healthcare facilities, or schools, nor would construction and operation of the Proposed Project and Connected Actions have any significant adverse effects on open space or recreational resources. The Preferred Action Alternative would not result in significant adverse growth inducing effects on police services, EMS, healthcare facilities, schools, or open space or recreational resources, but would potentially have significant adverse effects on volunteer fire services in the five-county region. ... Micron would engage closely and collaboratively with local fire departments, including Clay Fire and Cicero Fire, to familiarize local fire service personnel with any potential Proposed Project construction hazards... To address the potential significant adverse effect on volunteer fire services due to the induced growth associated with the Proposed Project, including on Clay Fire and the Town of Clay's fire response capacity, Micron would commit to pay for and support ongoing Micron-related training efforts with Clay Fire and other local fire departments as a mitigation measure."</p>	<p>1. Police Services - The Report states that there is no impact to police services. Increased residential and commercial growth, increase in the temporary construction workforce may result in increased need for police services. The report speaks to significant traffic impacts which may result in increased accidents requiring police response. Additional population may also increase need to respond to other police related matters.</p> <p>2. EMS - similar response. Will result in increased need for trained EMS personnel and additional EMS resources, which are limited in the area.</p> <p>3. Healthcare Facilities and Schools - Report states that the project will result in an increased population of 60,000+ people which may tax the existing healthcare systems and schools. Schools may need additional teachers, resource staff, and transportation staff. Transportation routes may need to be altered to facilitate transportation of students through more densely populated areas (induced growth) or around increased traffic patterns. Additional healthcare staff including doctors, nurse practitioners, and nurses may be necessary to treat the increased population. Similarly, there will be a similar impact on childcare facilities, which is not mentioned. These environmental impacts are not mentioned.</p> <p>4. Fire Services - There is no mention of the Caudhdenoy Fire Department, Central Square Fire Department, or Hastings Fire Department, which are all located within 5-miles of the Proposed Project and will likely be first responders in the case of an emergency. These departments will also need training and potentially specialized equipment to respond to needs at the Proposed Project Site. This is not mentioned. Additionally, these departments are supported mostly by volunteers and the local townships, and already struggle with membership and funding. Further, as mentioned for police and EMS services, increased population, traffic, and residential density will increase the need for fire personnel and will likely result in an increase in calls which departments must respond. These environmental impacts are not addressed.</p>
0.3	0-15	44	Environmental Justice	<p>Report looked at environmental justice and low income disadvantaged communities within a 5-mile radius of the project area</p>	<p>Report states that there will be impacts to these communities by an increased demand for housing and increased rent - but identifies these impacts as temporary. The facility will be permanent, and the need for housing within a short commutable distance will be permanent, therefore these impacts on these communities should be considered permanent. Increased housing demand and increased rent prices may impact these communities and potentially impact their presence in the project area. These permanent environmental impacts are not discussed.</p>

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

0.5	0-15 and 0-16	44 and 45	Cumulative Effects	<p>"Across all the environmental resources analyzed in this EIS, none of the ongoing or future projects with effects that are cumulative with the Preferred Action Alternative would meaningfully alter or amplify the effects of the Preferred Action Alternative, because the Proposed Project and Connected Actions are the most significant drivers of the environmental effects identified in this EIS. None of the other ongoing or future projects, either individually or cumulatively, would transform an otherwise insignificant effect of the Preferred Action Alternative into a significant effect. Nor would any of the other projects, individually or cumulatively, meaningfully exacerbate any significant effect of the Preferred Action Alternative. Accordingly, there are no significant adverse cumulative effects. "</p>	<p>The report concludes that the Proposed Project will not have significant adverse impacts on environmental resources such as utilities, wetlands, habitat, community resources (except Fire Services which the report states has a significant impact) etc. However, the report only typically considers the impacts of the Proposed Alternative and not the added cumulative impacts of the induced growth. While the report states that there are no impacts to water resources because OCWA already plans upgrades to meet the sites needs, it previously stated that OCWA would not undergo those upgrades should the No Action Alternative be pursued. Therefore, those environmental impacts due to the planned OCWA upgrades are an environmental impact which should be considered. Further, it does not consider the needs of the surrounding areas and the potential water demand impacts of increased development density outside of the OCWA service area. Similarly, the report states that there are no impacts to wastewater treatment resources because OCDWEP already plans upgrades to meet the site's needs. However, it does not consider the added wastewater treatment needs of the surrounding areas given increased development pressure and density. Specifically, it does not consider the wastewater treatment impacts/enviornmental impacts on areas that have increased development and no access to public wastewater infrastructure which rely on private septic systems. Further, it does not consider the impact on public wastewater utilities outside of the OCDWEP service area which will also be impacted by increased growth, demand, and density. These environmental impacts are not considered. Following discussion of these environmental impacts, it may be determined that there are significant cumulative effects which turn a "no impact/no significant impact" into a significant impact.</p>
0.6	0-16	45	Unavoidable Significant Adverse Effects	<p>Water Resources, Biological Resources, Transportation etc.</p>	<p>The report does not consider the adverse impacts of the mitigation efforts discussed including the transformation of usable land into wetlands and habtiats for permanent protection, which will not be able to be used for agricultural, residential or commercial purposes which they may currently be zoned for. Additionally, the report speaks to the efforts of NYSDOT to mitigate transportation impacts within the County and region but does not reference the adverse impact on local authorities who must mitigate local roads for the increased traffic and differing traffic patterns. These environmental impacts are not identified and discussed.</p>

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

0.7	0-18	17	Irreversible or Irretrievable Commitments of Environmental Resources	The report speaks to the development of the Micron campus site making it irretrievably lost lands which could no longer available for development. It also says that a majority of the proposed utility upgrades will provide capacity which will be irretrievably lost because it is essentially earmarked for use by the proposed project.	The report does not speak to the lands which are irretrievably lost because they will be used as part of the mitigation efforts and will be turned into wetlands or habitat sites and will no longer be available for development. It doesn't speak to the tax monies which will be irretrievably lost to those municipalities (including Oswego County, townships, and schools) because those sites will never be used for a development purpose, residential, commercial or otherwise. Regarding the utilities, the report states that the capacity increase of water and wastewater treatment will be lost because it is to be used by the proposed project, meaning those capacity increases will not benefit additional development/spin-off growth and therefore potential future upgrades may be needed to serve those additional developments. The report identifies traffic mitigation measures including the widening of roads, which makes the land irretrievably lost lands, which are not identified as an environmental impact.
1.2.3	1-14	61-62	State and Local Agencies	Table 1.2.-1 State and Local Involved and Interested Agencies	Not Listed: <ul style="list-style-type: none"> - Any agency in Oswego County including Oswego County, Oswego County Highway Department, Oswego County Community Planning, Town of Hastings, Town of Schroepfel, Village of Central Square, Village of Pheonix, Town of Volney, Town of West Monroe, Town of Constantia - Any other county in the 5-county region identified - Impacts to snowmobile trails identified but no snowmobile club is listed as an interested agency. -Oneida County which is not listed within the 5 county region studied but is located within 30 minute commuting distance of the proposed Micron site
1.4	1-16	63	Permits, Approvals, and Consultations	Table 1.4-1 Permits, Approvals, and Consultations	No agencies are listed as needing to provide permits, approvals, or consultations for the identified mitigation measures including wetland/habitat construction, roadway resconstructions etc. County and local highway departments would need to provide permits for work on county and local roads. Planning departments would need to provide approvals for land rezoning, parcel subdivisions or merges, and planned projects. This includes Oswego County and the Towns of Hastings and Schroepfel where the proposed wetland mitigation is to occur.
2.1.3.3	2-23	89	Components	Figure 2.1-8 Childcare Site	The Report speaks to wastewater upgrades conducted by OCDWEP to serve the project site. Why is Micron proposing a sewage leach field at the Childcare site? Why wouldn't this site be connected to public wastewater utilities?
3.1.2.1	3-3	117	Current Land Use	Land Use Study	Why did the land use study only look at the 1-mile radius of the Micron Site? The report identifies a 5- county region which will experience growth inducing effects. It is likely that induced commercial and residential growth will occur outside of the 1 mile radius. These impacts are not studied or included in this report.

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

Appendix F	F-72	73	Figures	Figure F-24 Proposed Compensatory Mitigation Sites	The map shows the proposed mitigation sites. The environmental impacts of creating mitigation sites at these locations have not been addressed in the EIS. Although these sites are located within the HUC-10 boundary, they are not included in the HUC-12 boundary. Sites within the HUC-12 boundary should be considered in depth. Although the proposed wetland mitigation sites are located in the same Oneida River watershed, notably they are located north of the Oneida River, on the other side of the river from the impacted Micron area, and therefore there is a detrimental impact on the southern region of the watershed since all water flows towards the river. The benefits of these wetlands and habitats will be lost to that area, irreversibly. This environmental impact is not considered in the EIS.
Appendix F	Compensatory Wetland/Stream Mitigation Plan Page 23	130	Mitigation Site Selection Process	Micron Hired The Wetland Trust, and TWT prioritized the acquisition of large, active agricultural sites	The report does not consider the impacts of lost agricultural production/ability within these agricultural sites which will be lost by converting them to wetlands as part of the mitigation efforts identified. These environmental impacts is not considered in the EIS.
Appendix C	Growth Inducing Effects C-3	136	Overview and Study Area	2022 REMI Study found that 85% of induced job growth and 90% of induced residential growth will occur in the 5 county region including Oswego, Onondaga, Cayuga, Madison and Cortland.	How was this determined? Why is Oneida County excluded from this, located less than a 30 minute drive from the Micron site, having rural nature and room for residential growth? Growth inducing effects within Oneida County should be examined and the resulting environmental impacts of induced growth within that County is not included in the EIS.
Appendix C	Growth Inducing Effects C-3	136	Overview and Study Area	The induced growth could lead to changes in population density and land use patterns, and increased residential, commercial, and industrial activity that could produce additional effects on the surrounding human and natural environment.	The study acknowledges these impacts but the DEIS does not consider, mention, or quantify these potential impacts. Additionally, the report admits that the location of Micron is likely to impact residential density patterns, but then later makes the assumption that increased residential growth is likely to occur in areas with existing density, and fails to acknowledge that these density patterns are likely to change. The changes in density patterns should be studied and the resulting environmental impacts is not included in the EIS.
Appendix C	Growth Inducing Effects C-6	139	C-1.2 Methodology and Modeling	Micron construction workers, operational workers were distributed based on existing population densities within the 5-county region	This ignores the previous statement that Micron is likely to change current densities. See previous comment.
Appendix C	Growth Inducing Effects C-6	140	C-1.2 Methodology and Modeling	SMTC met with local planning agencies to identify areas of growth in Onondaga County plus Towns of Hastings, Schroepfel, and West Monroe in Oswego County	No Oswego County planning agencies were met with or included in these discussions or projections. Results may be inaccurate or skewed to Onondaga County. Oswego County should be further considered with regards to the growth inducing impacts and these environmental impacts is not included in the EIS.

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

Appendix C	Growth Inducing Effects C-8 through C-	141-151	C-1.2 Methodology and Modeling	Growth Inducing Houshold Estimates	<p>All of these projected growth estimates are admittedly based on current residential densities and do not take into account the Report's previous statement that the location of the Proposed Project is likely to change current residential density patterns. The February 2024 Syracuse.com article "Commuting in Syracuse: Drivers enjoy some of the shortest commute times in U.S." by Kevin Trampone found that 15.3% of workers have a commute time less than 10 minutes, 16.9% of workers have a commute time 10-14 minutes, 19.8% have a commute time of 15-19 minutes, 17.3% have a commute time 25-29 minutes. In total, the average commute time was 33 minutes and 76.9% of working adults have a commute of 30 minutes or less (52% of which have a commute time of 20 minutes or less.) The EIS and Induced Growth study does not take proposed commute times and current commute time patterns into account when projecting the areas which would receive the greatest impact from Micron.</p> <p>- Micron construction workers and Micron Operational Workers (totaling up to 12,436 employees total at the peak, may try to reside within a 30 minute commute distance. This could skew the projected density towards the northern portions of Onondaga County, Madison County, most of Oswego County, and portions of Oneida County which were not even included in the 5-County study region. These impacts are not further studied and the environmental impacts of this are not included in the EIS. The growth inducing impacts on Oneida County are not included in the study and EIS.</p> <p>- Furthermore, the projected increase in residential density within those areas due to Micron construction in-migration and Micron jobs may also potentially skew the increase in induced worker density since those areas may need increased community services (healthcare, childcare, education, fire, ems, and police services), municipal workers needed, and other spin off businesses. The induced growth study found that areas in Southern Onondaga County including LaFayette, Tully, Marcellus will see close to a 10%+ population increase based on the existing population density in those regions. Similarly, the report states earlier that the Towns of Hastings, Schroepfel, and West Monroe are likely to see increased population growth due to proximity to the Micron location (less than 5 minutes commute from Micron) but the Induced Growth Study states these areas will see an average increase of 150 households (9.9%). The</p>

OSWEGO COUNTY COMMENTS REGARDING MICRON DEIS

Appendix C	REMI Report			<p>Report estimates 4200 construction workers needed daily, of which the local area already has estimated 2000. Meaning additional 2,200 area needed to in-migrate for the project</p>	<p>-Report states that approximately 2200 construction workers will need to migrate to the area to support the construction of Micron. This does not take into account the construction workers that are necessary to construct the various mitigation projects identified including the transportation projects, wetland mitigations, and also the additional housing that will need to be constructed (both temporary and permanent) to support the increased temporary and permanent population. Additional construction workers may come to the area simply to support these added construction projects. This does not take into account the additional construction workers which may be needed to construct off-shoot commercial and industrial growth resulting from Micron, though this may lag it will most certainly follow the construction of Micron or run concurrent. The population growth and resulting environmental impacts of this are not included in the EIS.</p> <p>-Additionally the report needs to take into account the length of construction and how this may impact the habits of the construction workers. Micron is estimated to take 20+ years to construct. These construction workers may choose to bring their families with them for that period of time (averaging 2.31 persons per household) which will impact the population for the entire duration of the project. Furthermore, due to the length of time, these workers may choose to stay in the area even following the construction of Micron. These potential population impacts have not adequately been considered as an environmental impact of Micron.</p>
Appendix C	REMI Report Page	155	Executive Summary	<p>Report estimates that 9000 new Micron jobs will be created directly at the site, but then assumes that 28% will in-migrate</p>	<p>This assumes that a lot of the workers will come from the existing workforce. However, the Report does not identify if the current workforce population has the ability to support this many jobs in the field of the proposed project. A study of the current workforce and ability to support these jobs should be conducted before making this assumption. The resulting population impacts and environmental impacts should then be identified and discussed in this report. Furthermore, with the assumption that a significant number of the workforce will come from the existing workforce in Syracuse result in a need to fill jobs in other industries, and potentially could result in added workers moving to the area for these other jobs. These discrepancies are not acknowledged, discussed, and the environmental impacts of these increased populations are not discussed in the report.</p>

Subject: [EXTERNAL] micron report

I'm a resident of Jamesville, NY, and I would like to share my opinion on micron impact on the environment. I hope people's opinions matter. I worry about the effects it will have on wildlife, wetlands, water, quality of life and global warming. It seems to me there are many more negatives than good things to this project. Can our area really support more people living here without ruining more of the green space displacing more wild life that would have to happen so that land could be developed to put in more homes to house people who would in turn maybe who would have children who might need more housing in the area, and by the time you're done there would be no green space left which would lead to more global warming which I thought our governor was trying to fight with her initiatives. Also what if on some odd chance the technology changes or if Micron goes out of business, like companies do sometimes, we destroyed land, trees and habitat for nothing. I don't know if you can get that back. I hope this is read and peoples opinions are given some consideration.

Subject: [EXTERNAL] Draft DEIS Comments

In 1983, we moved to Grange Road in Clay because of the rural nature. Our water source is a drilled well. We hope that Micron will prove to be a good neighbor.

Following are our concerns for this project:

Extend the public comment period to 120 days

PROVIDE DETAILED PLANS TO PROTECT THE WATER SOURCES FOR THOSE OF US ON WELLS

Guarantee of continuation of present water quality

Transparency and specificity in project details:

- Chemicals used
- Specific Sources of fill
- Managing Traffic issues
- Specific plans for solid waste disposal
- Specific plans for disposal of used chemicals
- Specific plans for wetlands water displacement
- Specific plans for plans for retention ponds
- Specific plans for Construction dust control
- County's plans for when chips become obsolete

Create a local oversight committee comprised of community members with knowledge of pertinent issues

Micron needs to do much better wetland mitigation or work around existing wetlands as they are presently configured

Provide for public hearings with questions and answers after completion of each FAB

Micron should be financial responsible for adverse effects

Will Micron reimburse Onondaga County for expenses incurred (procurement, etc.) if none or only two FABs are built

When is Ryan McMahon moving onto Caughdenoy Road to enjoy the construction experience with us?

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. We are asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, we still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

We urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is

already on the grid – to meet New York State’s climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron’s massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of our comments.

Sincerely,

Incarcerated Individual Letter Head

Good morning, Good Afternoon, or Good ~~Afternoon~~^{Evening} to whom it may

concern and or Executive McMahon or Micron, it self.

I Am, Kyle Nicholay Rouleau

It has come to my attention that not just four micro-chip factories, waste water plants, Pumping facilities, transportation in-frastructure, and Pipelines your planning on building and dig-ing up there land for your own intrest.

Not like the American / Canada pipeline thats in the intrest of the people to give cleaner and cheaper energy cost to both countries. Your news Paper Artist's rendering of what you are doing is a facade. Your building more than four Buildings. To have 45-48 days more or les, time to review the information is not long enough. To organize a coherent argument with our city representatives, our fellow city-man, and town people, Also to alert our local reservations is difficult to do.

I have spoken with fire fighters who are appalled and have very little patience for your "forever" chemicals" Dont lie and tell me they are not. They tell me they contribute to the fires. It gets into the soil...

I have taken upon myself to talk and tell the teachers and parents of the community about the implication that this will have on their children's health and Environment. They worry about the chemicals this major operation will cause on the land and Air, we all breathe because it cause's toxic cancer-causing chemicals where their kids play. You already said you'll have to re-create and make a new endanger'd species list. Does that sit right with you? What's next? windmills that Kill the birds! I hike and my child plays in this land your attempting to pollut There are a ton of un-used, abandoned factories, cant you re-purpose one of those? — Do you not understand that your building a town with-in a town? That to do this, your redirecting water from the wet lands, your putting wild life, little creatures on an endanger'd list! Does that sit well for you? The chemical you will Dis-purse, the Pollution you will cause will last longer than your, ~~100~~ year, operation time. The population can not handle this type of funding. It's better of going to bus drivers and to have longer routes to pick up Kids for School.

3

Onondaga County Justice Center
Incarcerated Individual Letter Head

Pollution travels hundreds, if not thousands of miles, infects like a locus and kills all that it touches. Have you not heard of the "train explosion" in Palestine, OH IO? The toxic fumes traveled to the Mississippi river, infected the water supplies for the country, killing the fish & poisoning the citizens.

Contributing to birth defects and creating 3 eye'd fish, believe it or not.

The sound of vibration of your construction and pollution travels and disturbs the community, let alone...

it'll destroy parts of other sovereign nations. I have checked and spoken to members and the chief of the Onondaga Reservation; the chief said he is not pleased to hear this. It has a direct conflict with his sovereign land. Where will the wet lands be relocated too and the migration of wildlife go? let alone the forever chemicals. It will invade his reservation, his wildlife, his waters, that he the chief has taken an oath to protect. His land is set apart from the United States.

4) Just cause you do not have Manners For Gods Country. Does not give you the right to pollute his portion, by air or by water, since our waters run as one, Think before you act. Is what the chief of the Onondaga nation wanted me to tell you. There has been no attempt to arrange notice to that nations people or chiefs. A newspaper BLURP Does not cut it.

NOT ON A ISSUE THIS BIG.

THANK YOU FOR HEARINN ME OUT.

HAVE A GOOD DAY

Subject: [EXTERNAL] Micron Public Comment

I am submitting this as a public comment around the Micron environmental impact statement as a farmer and land manager concerned about water.

I am not opposed to the micron facility in general, but feel that the environmental impact statement shows areas of concern that the company (who is slated to earn a lot of money from this project) should be made to address.

In particular, I am concerned about how the waste water handling, especially for any batches of water that have PFAS or other proprietary chemical mixes will be handled. We know these chemicals are toxic, and other states are now dealing with the repercussions of having allowed PFAS to be in their water system. I personally know farmers who have lost their farms in Maine due to PFAS contamination.

Letting a massive company come in, use a ton of our shared New York State resources, and potentially pollute our water and land with known hazardous chemicals, is a shortsighted way to bring in some jobs and money to the state. Even if you don't care about farmers or poor people drinking water through the Andy water system, the potential future litigation risk to New York State for allowing something like this to go through as it stands, seems astronomical.

If Micron wants to come in and make a lot of money making chips in New York, they should be liable for removing 100% of the chemicals and heavy metals they're putting in any water before they release it. Anything short of this feels like negligence on the part of Micron and New York State.

SUBJECT: “Kicking the Can Down the Road”: Comments on the Micron New York 2025 Draft Environmental Impact Statement

FROM: Lenny Siegel, Executive Director, Center for Public Environmental Oversight

By e-mail at: Lsiegel@cpeo.org

DATE: August 8, 2025

Thank you for the opportunity to comment on the June, 2025 Draft Environmental Impact Statement for the Micron Semiconductor Manufacturing Project in Clay, New York.¹ We have shared earlier versions of this document with several other organizations, so you may find redundant or similar language in their submissions.

Micron, like other semiconductor producers, has always utilized and released into the environment a wide range of hazardous substances. In fact, the industry introduces hazardous substances into wafer fabrication faster than researchers can determine their toxicity and government agencies can regulate them. The Clay environmental review provides an opportunity to address potential semiconductor pollution in advance.

Unfortunately, the draft Environmental Impact Statement (DEIS) is vague, providing the public and relevant agencies insufficient information to determine if best practices will be used to prevent human and environmental exposure to chemicals from the Micron factory. The technical term for this is “kicking the can down the road.”

¹ *Micron Semiconductor Manufacturing Project, Clay, NY Draft Environmental Impact Statement, (DEIS)*, CHIPS Program Office and Onondaga County Industrial Development Agency, June, 2025, EISX-006-55-CPO-001. <https://ongoved.com/wp-content/uploads/2025/06/Micron-Draft-EIS.pdf>

One does not expect chipmakers to stop using hazardous substances that are intrinsic to their production. However, since the costs—health, environmental, and financial—of releases of these substances are borne by others, they have an obligation to reduce the use of such substances and prevent their release into surface water, groundwater, and the atmosphere, as well as comply with state and federal regulations and statutes.

Furthermore, the sixteen-year-plus timeframe in the Micron EIS does not appear to provide a mandatory mechanism for updating the review. The semiconductor industry is constantly upgrading its products and modifying its processes, so approval of the EIS should include a requirement for periodic updates to ensure that the additional impacts do not become significant.

Finally, the semiconductor industry, through organizations such as the Semiconductor Research Consortium, is sponsoring research with the objectives of understanding and addressing the potential environmental impacts of the use and release of PFAS “Forever Chemicals.” I believe that this is because the companies expect PFAS to be both monitored and regulated. Therefore, careful review and documentation, in the EIS, of the current state of PFAS impacts of semiconductor production is key to promoting better management practices as well as beneficial substitution of other substances.

Forever Chemicals

The DEIS language on per- and polyfluoroalkyl substances (PFAS) “forever chemicals” is sketchy and general, providing little information about the PFAS to be used and/or discharged from the facility. Even the CHIPS program June, 2024 *Final Programmatic Environmental Assessment for the Modernization and Expansion of Existing Semiconductor Fabrication Facilities* contains more detail about the use of PFAS in wafer fabrication. It reported, “Semiconductor manufacturers use PFAS as an essential material in multiple steps in the fabrication process.”² However, the entire semiconductor industry, including Micron, has stopped using PFOA and PFOS, the only two PFAS with federal drinking water standards.

The bottom line is that Micron will be using and potentially discharging a wide range of PFAS, only a few of which are identified, and none of which are currently regulated. Much more information is required to assure the public, as well as officials, that Micron will not significantly impact the environment by adding PFAS to the already PFAS-contaminated environment. Furthermore, Micron should adopt more protective PFAS management than what is promised in the draft EIS.

The DEIS says Micron will request “detailed chemical constituent documentation from its chemical vendors, including PFAS content, which often requires the use of non-disclosure

² *Final Programmatic Environmental Assessment [PEA] for Modernization and Internal Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program*, (Final PEA), Chips Program Office, June 28, 2024, p. C-13.

<https://www.nist.gov/system/files/documents/2024/06/28/Final%20PEA%20for%20Modernization%20and%20Expansion%20of%20Semiconductor%20Fabs%206-28-2024%20-%20OGC-508C.pdf>

agreements to obtain such information.”³ Non-disclosure is unacceptable. The public has a right to know the identity of hazardous substances used and released in their communities. Most assuredly, Micron’s competitors rely on the same chemical suppliers, so it’s difficult to justify anything but full disclosure of the constituents of the industry’s process and product chemicals.

Fortunately, wastewater analysis provides valuable information about the PFAS found in semiconductor fabs. For example, a Cornell University analysis of chipmaking wastewater found, “Nontarget analysis revealed the presence of 41 homologous series of PFASs comprising 133 homologues.”⁴ The same study found that concentrations of non-targeted PFAS—that is, chemicals not detected using official analytic methods—significantly exceed the concentrations of known, “targeted” compounds in chip plant effluent. Furthermore, wastewater may include transformation products not found in chemical inputs.⁵ It is important to recognize that “forever chemicals” may transform into other “forever chemicals.”

The wide range of PFAS in Micron’s wastewater will end up in one or more of four places: the Oneida River; biosolids shipped from the Oak Orchard plants for landfilling or land application; filtering media, or air emissions from treatment. All such pathways should be monitored and eliminated.

The DEIS promises, “The indirect discharge permit would be anticipated to include limits for PFOA and PFOS derived from the existing Oak Orchard WWTP’s SPDES permit limits.”⁶ That’s not enough. Analytic methods and treatment strategies based upon those relatively well understood compounds are inadequate for addressing wafer fabrication wastewater. The PFAS to be used by Micron are not currently regulated at the Oak Orchard plants, and treatment methods that remove long-chain PFAS such as PFOA and PFOS do not necessarily remove the hundred or more PFAS found in typical fab wastewater.

Furthermore, while the *persistence* of all forever chemicals is a given because of the strong carbon-fluorine bond, the *toxicity* of most of them varies, and for many, it is largely unknown. The state of Hawaii prepared the following chart, showing the relative non-cancer risk of several PFAS compounds. In general, it shows that short-chain PFAS—that is, where the molecules have fewer carbons than long-chain PFAS such as PFOA and PFOS—tend to be less toxic than PFOA and PFOS. However, they are still as toxic as other well-known contaminants of concern. And one PFAS found widely in the environment and chip plant wastewater, HPFO-DA (also known as Gen-X) ranks with the long-chain compounds even though it has fewer carbons

⁵ See Paige Jacob and Damian Helbling, “Exploring the Evolution of Organofluorine-Containing Compounds during Simulated Photolithography Experiments,” *Environmental Science & Technology*, August 17, 2023, <https://doi.org/10.1021/acs.est.3c03410>

⁶ DEIS, p. 3-241

per molecule. Thus, concludes Brewer, to adequately assess the risk of PFAS exposure, one must measure all PFAS in mixtures, not just the top two or even EPA’s target list.⁷

Relative PFAS Toxicity (noncancer Reference Dose) (based on references in HIDOH PFAS guidance February 2025)

Supporting Brewer’s findings, decades of research have shown that exposure to mixtures of different PFAS chemicals can result in cumulative adverse health effects. Even if the individual chemicals are at levels considered to be “safe,” a mixture may cause significant adverse health effects. EPA recognized this in developing the Hazard Index approach to Safe Drinking Water Act limits on four PFAS, which states, “The high likelihood for different PFAS to co-occur in drinking water; the additive health concerns when present in mixtures; the diversity and sheer number of PFAS; and their general presence and persistence in the environment and the human body are reflective of the environmental and public health challenges the American

⁷ Roger Brewer, “Testing and Risk Assessment of Complex Mixtures of PFASs in Wastewater and Sludges,” Healthy Water Solutions, May 2025. <https://www.youtube.com/watch?v=AqNNY3F358o>

public faces with PFAS, which poses a particular threat for overburdened communities that experience disproportionate environmental impacts.”⁸

The DEIS reports, “The IWWTP [Industrial Wastewater Treatment Plant] also would include technologies specifically designed to remove emerging contaminants, such as per- and polyfluoroalkyl substances (PFAS), including reverse osmosis and nanofiltration (membranes used to filter out PFAS, effectively removing them from the water), granular activated carbon (an effective method for removing PFAS through adsorption), ion exchange resins (which selectively capture and remove PFAS from wastewater)...”⁹ Including such a statement in the EIS does not guarantee the adequacy and reliability of the treatment technologies. Their effectiveness depends upon the other constituents of the waste stream, water volume, and PFAS concentrations. There is no single best method for removal, and none of the filtration methods actually destroys PFAS.

While other factors may influence the choice of technology, the starting point should be the measurement of all PFAS in source wastewater as well as removal system effluent. The DEIS promises, “To comply with its SPDES permit for the IWWTP, OCDWEP [Onondaga County Department of Water Environment Protection] would be required to perform regular analytical testing of surface water and effluent samples collected using NYSDEC-approved methods and would be subject to ongoing sampling, monitoring, and reporting requirements.”¹⁰ The same requirements would apply to Micron’s wastewater pretreatment system, governed by an indirect discharge permit negotiated with the OCDWEP.

To measure PFAS in wastewater, Qiao *et al* recommend using the TOP [Total Oxidizable Precursor] Assay method: “The TOP assay results emphasize the importance of implementing an integrated PFAS monitoring strategy that incorporates the TOP assay, along with routine monitoring of ultrashort-chain PFAS (e.g., TFA and PFPrA).”¹¹ Going further, Jacob *et al* concluded: “However, this [the elevated levels of combined target and non-target PFAS] does reinforce the idea that PFAS monitoring should incorporate complementary target and nontarget analyses or otherwise include measures of total organic fluorine to accurately assess PFAS abundance and potential environmental impacts. These data also support the recent push by policymakers to regulate total PFASs, rather than individual compounds, underscoring the importance of total PFAS concentration monitoring.”¹²

In short, Micron’s plan for monitoring discharges is vague and inadequate.

¹² Jacob, p. 2353

To understand how to address wastewater from the Micron Clay facility, the company and agencies need not wait for production to begin. Micron’s new fab in Boise, Idaho will be using the same or similar chemicals. The New York’s evaluation could begin with analysis of Boise effluent.

Recommendations

All PFAS discharge pathways from the Micron plant should be monitored and eliminated.

The Oak Orchard plants and Micron should commit to using, and the New York State Department of Conservation should require, sampling and analysis methods that capture all PFAS in wastewater from Micron, starting with samples from the Micron Boise plant.

In addition to the removal technologies cited above, the DEIS reports:

“Micron also would segregate process solvent waste containing PFAS from facility wastewater streams to closed bulk storage systems for off-site management by licensed and permitted treatment and disposal facilities.... Micron would dispose of or otherwise manage waste known to contain regulated PFAS in accordance with applicable regulations and as appropriate given its content and characteristics.”¹³ The DEIS names Veolia, all of whose disposal facilities are outside of New York State, as the primary waste disposal vendor.

Even if Micron is able to segregate a portion of its PFAS-laden wastewater, these provisions are inadequate:

First, there is no assurance that the permitted treatment and disposal facilities—likely incinerators located in communities of color—would destroy the particular mixtures transferred from the Micron plant without creating toxic transformation products. In fact, mixing chipmaking wastes with other hazardous wastes would increase the likelihood that new hazardous substances would be emitted. If such off-site “disposal” is allowed, Micron should be responsible for proving that PFAS and other hazardous substances from its waste streams, such as solvents, are destroyed. It should also be required to show that thermal treatment does not create hazardous products of incomplete combustion.

The DEIS promises, “Micron would continue to review the waste and reuse facilities to which it would send hazardous waste,”¹⁴ but there is insufficient detail to assure the public and regulators that PFAS, PFAS-containing media, and PFAS byproducts will be destroyed safely.

Second, the promise to comply with regulations is hollow. Of course, Micron should be expected to obey the law. However, we are unaware of any regulations governing the treatment and disposal of collected PFAS wastes, particularly when they are shipped out of state.

¹³ DEIS, p. 3-341

¹⁴ DEIS, p. 3-353

Similarly, removal technologies such as Granular Activated Charcoal, Anion Exchange Resins, and Foam Fractionation do not destroy PFAS. In general, the filtration media and gas emissions contain essentially the same PFAS that were contained in the original liquid. The filtration media are typically sent off site for landfilling or thermal treatment, neither of which is environmentally acceptable.

Fortunately, the federal government, through the Department of Defense, has been supporting the development of new technologies that actually destroy PFAS, breaking down the otherwise persistent molecules into non-toxic substances. The DEIS actually mentions one category of these technologies, Advanced Oxidation. These technologies may either treat the wastewater directly or destroy concentrated PFAS removed from wastewater through technologies such as foam fractionation. This is the most protective approach to treating wastewater that contains a wide range of PFAS compounds.

Recommendation

Micron should commit to, and NYS DEC should require that Micron evaluate available PFAS destruction technologies for use on site with the goal of implementing one or more as close to the points of use as feasible. NYS DEC should regulate these systems.

The DEIS points out that New York state has guidance values for PFOA and PFOS in “raw water.” However, there are no standards for the PFAS that Micron will actually be using. In fact, even in the best of cases there will not be standards or guidance values for the preponderance of PFAS used or released by Micron.

Yet current science demonstrates that all PFAS are toxic as well as persistent. Any release of PFAS into the environment adds to the already unacceptable load on the environment.

Recommendation

The goal of any program of removal, treatment, or destruction for PFAS should be ZERO releases, as much as practical. That is, technologies, not numerical standards—which do not exist—should be the basis of the approach to eliminating PFAS in chipmaking wastewater.

Fluoropolymers

Fluoropolymers are PFAS that should be regulated like other PFAS, not only at the Micron project but throughout their life cycle. Still, the EIS should document their massive use by the semiconductor industry. Mark Newman, CEO of Chemours, explained:

“You cannot make chips without a whole PFA infrastructure,” he said. “We estimate that in a modern-day fab, there’s a half-kilo of PFA in every square foot. So in a 400,000- to

600,000-square-foot fab, that’s 200 to 300 metric tons of this stuff.” It’s not just valves, of course, but all types of pipes, tubes and pumps in semiconductor equipment.¹⁵

The article continues, “On its website, Chemours says flat-out that “without PFA, domestic semiconductor manufacturing would not be possible.”

Chemours is the only domestic producer of PFA. In fact, in 2024 it announced the expansion of its notorious Washington Works plant in West Virginia to meet increased demand from the semiconductor industry.¹⁶

Fluoropolymers are particularly hazardous where they are manufactured, and at the end of their useful life. Lohmann *et al* concluded:

The evidence reviewed in this analysis does not find a scientific rationale for concluding that fluoropolymers are of low concern for environmental and human health. Given fluoropolymers’ extreme persistence; emissions associated with their production, use, and disposal; and a high likelihood for human exposure to PFAS, their production and uses should be curtailed except in cases of essential uses.¹⁷

Furthermore, the semiconductor Industry has introduced and embedded a wide variety of PFAS into semiconductor packaging and packages with no consideration of the potential environmental and worker safety risks. Chipmakers have little idea how much of which PFAS are contained in their final products. In fact, they admit that the absence of regulation is responsible for their lack of knowledge of the use of these chemicals. Chips produced at the Micron plant may end up in such packages. Since those products end up distributed in electronic equipment throughout the country and the world, there is no accounting of the environmental impacts of their disposal when no longer used. The Semiconductor Industry PFAS Consortium speculated, “it is unknown if end of life controls are necessary during the reclamation of electronic products.”¹⁸ In fact, the safe disposal of electronic equipment in general is a significant unsolved environmental problem. In this case, however, there are emerging alternatives, such as *glass substrates*, that may reduce the need for reclamation.

¹⁷ Rainer Lohmann *et al*, “Are Fluoropolymers Really of Low Concern for Human and Environmental Health and Separate from Other PFAS?” *Environmental Science & Technology*, October 12, 2020. <https://dx.doi.org/10.1021/acs.est.0c03244>

¹⁸ “PFAS-Containing Materials Used in Semiconductor Manufacturing Assembly Test Packaging and Substrate Processes,” Semiconductor PFAS Consortium Assembly, Test, Packaging and Substrates Working Group, June 2, 2023. <https://www.semiconductors.org/pfas-containing-materials-used-in-semiconductor-manufacturing-assembly-test-packaging-and-substrate-processes/>

Recommendations

The final EIS should contain an estimate of the quantities of fluoropolymers in each Micron fab, by category of use.

The final EIS should contain a life-cycle analysis of the environmental impacts of fluoropolymers, including:

- 1. Analysis of the environmental releases and occupational exposures at fluoropolymer production plants. Since Chemours uses the “essentiality” of its products to the semiconductor industry to justify continuing, indeed expanded production of PFA, chipmakers should be held accountable for those environmental impacts.*
- 2. Analysis of any Micron on-site releases caused by the use or machining of fluoropolymers.*
- 3. Information about the likely end-of-life impacts from the fluoropolymer-containing equipment used at the Micron plant.*
- 4. Information about the use and release of fluoropolymers in packaging the chips produced from wafers fabricated at Micron, as well as their end-of-life environmental impacts. There are emerging substitutes, such as glass substrates, that should be used where feasible.*

Occupational Exposure to PFAS

Micron “promises to apply the most protective occupational exposure limit (OEL), based on published industry standards, for each individual chemical or hazardous substance that would be used in the facility manufacturing process...”¹⁹ This is by no means reassuring. **Are there published OELs for the full spectrum of PFAS? Mixtures of PFAS?** How do existing limits compare to *environmental* standards for the same substances? Historically, OELs are less protective than environmental standards, in part because of dated science, in part because it was assumed that workers would have adequate health and safety training and personal protective equipment, where called for.

Since much of the Micron wafer handling will be automated, machine operators might suffer less exposure to hazardous substances than in older, less automated plants. Rather, maintenance and supply personnel, including contractors, will be on the frontlines of exposure. The DEIS should identify these at-risk workers, who may include people who do not routinely work in hazardous areas. Unless they are adequately trained and provided with protective equipment, the more protective chemical-specific environmental standards should be applied.

¹⁹ DEIS, p. 3-258

Recommendation

The DEIS should identify any occupational exposure limits currently (or soon to be) published for PFAS used in the semiconductor agency.

Greenhouse Gases

The DEIS concluded, “The GHG [greenhouse gas] emissions that would result from construction and operation of the Proposed Project are expected to be **unavoidably significant**. Even with significant avoidance and minimization efforts as well as mitigation, GHG emissions associated with operation of the Micron fabs and related facilities will represent a significant increase in overall GHG emissions in the Five County Area and New York State.” [emphasis added]²⁰

To their credit, the authors of the DEIS find that the GHG emissions will significantly contribute to climate change. But we are shocked that less has been done to make them avoidable, given the local and global efforts to combat climate change.

The most significant GHG emissions from semiconductor processing, as opposed to energy use by Micron, are fluorinated gases, which are extremely potent and persistent greenhouse gases. Some of these gases last tens of thousands of years in the atmosphere. The DEIS estimates that the project will release 881,699 metric tons CO_{2e} per year of such gases, even after thermal oxidation (incineration) on site.²¹ Furthermore, the stack emissions are treated by wet scrubbing to reduce acid releases. These scrubbers may send pollutants, including PFAS, into wastewater, where it must be removed and/or treated.

The DEIS, again to its credit, identifies another category of process greenhouse gas emissions, heat transfer fluids. The DEIS projects annual fugitive (HTF) emissions of 199,699 MT/y CO_{2e}.

The DEIS also reports that the semiconductor industry is researching ways to halt such releases, but it offers few details. For now, Micron expects to externalize the environmental costs of its greenhouse gas emissions.

Recommendation

The state of New York should incentivize the reduction of Micron’s GHG process gases by withholding incentives or penalizing the emissions. If officials accept the “unavoidable” impact, Micron will have a blank check to contribute significantly to climate change while others—residents, companies, and government agencies—struggle to make less significant reductions.

Extremely Hazardous Substances

The DEIS states, “Pending further review based on evolving Micron Campus designs, Micron would expect the RMP [Risk Management Plan] to cover eight regulated chemicals (ammonium

²⁰ DEIS, p. 5-2

²¹ DEIS, p. 3-205

hydroxide, anhydrous ammonia, hydrogen, hydrogen chloride, silane, chlorine, dichlorosilane, and HF [hydrogen fluoride] and would evaluate and add additional chemicals to the RMP on a case-by-case basis.” Earlier it mentions sodium hydroxide, and it promises, “hazardous chemicals and materials would be properly stored in containers and drums in storage areas with secondary containment to provide added protection in the event of a spill or release.”²² This is good, but it’s not enough. Leaks and spills may still occur during transport or use, so it’s important that employees, neighbors, and government agencies be fully aware of the presence of extremely hazardous substances.

Semiconductor fabs typically also use arsine and phosphine, which are extremely toxic gases, even lethal, and diborane, which is highly toxic and pyrophoric. Perhaps they aren’t mentioned because the EIS uses EPA’s reporting thresholds, which are generally an order of magnitude less protective than California’s.²³ Even in low volumes, a leak or spill of extremely toxic gases may necessitate the evacuation of buildings as well as warnings to nearby properties.

This information is important to be included in the environmental review, because local planners need to know how close sensitive uses should be located to the potential toxic release site. For example, in Mountain View, California, the city banned childcare centers in parts of town with semiconductor production.

The DEIS reports, “Clay Fire and Cicero Fire coordinate with the City of Syracuse Fire Department for responses to incidents involving potential hazardous materials, as the Syracuse Fire Department employs a specialty hazardous material response unit.”²⁴ More detail should be provided. Does the Syracuse Fire Department have the expertise and resources to handle the emergencies associated with semiconductor manufacturing? How close, by both time and distance, are personnel and equipment from the specialty unit to the Micron campus? The dangers of hazardous gas releases are so severe that “anticipating adequate capacity to respond to future incidents,” without full transparency is a hollow promise.

Recommendations

The final Micron EIS should include a complete list of extremely hazardous substances expected to be used on the property, regardless of anticipated quantity. The public has a right to know even if the federal thresholds for storage are not exceeded.

Micron or DEC should conduct dispersion modeling for the most hazardous of the gases, to guide decisions on the location of sensitive use. For example, would an arsine release from Micron put children at its nearby childcare center at risk?

²² DEIS, pp. 341-344

²³ Compare the tables at “CalARP Program Resources,” viewed July, 2025. <https://calepa.ca.gov/california-accidental-release-prevention/california-accidental-release-prevention-program-resources/>

²⁴ DEIS, p. 560

Other Hazardous Substances

Other than the extremely hazardous substances mentioned above, the DEIS does not specifically name hazardous chemicals. The Final PEA, on the other hand, contains a short list in Section 3.8 and a longer list in Appendix D.²⁵

The DEIS does not address the long-standing environmental threat caused by solvents used in production. Once again, the Final PEA provided more detail: “For example, traditional solvents used in fab cleaning processes contain N-Methylpyrrolidone (NMP), which is known to cause harm to reproductive systems.”²⁶ It noted that some companies—in this case a Taiwan-based producer was using alternatives.

Recommendation

The DEIS should provide complete list of hazardous substances used in production, their function, and possible exposure pathways. Once again, the public has a right to know which hazards are present and may be released from semiconductor production.

Cumulative Effects

The DEIS fails to assess the cumulative impacts of PFAS, industrial Greenhouse Gases, and Extremely Hazardous Substances in its Cumulative Effects analysis. The Micron project is expected to attract related activities, including research and development, chemical suppliers, and even competitors to the area. That is, other facilities may release hazardous substances to the environment, and in particular to Onondaga County’s wastewater system, in addition to the PFAS discharges from other, unrelated industries.

Therefore, the DEIS should analyze and mitigate the cumulative impacts associated with hazardous substance use, storage, and release. Without a comprehensive understanding of the types and amount of PFAS discharges on site and for anticipated sites across the region, cumulative impacts for surface water, groundwater, air emissions, and environmental justice cannot be understood.

Recommendation

The DEIS should include a comprehensive analysis of the cumulative impacts of Micron’s PFAS discharges to the environment, with a focus on the releases to the Oak Orchard wastewater plants and, in turn, to surface water and wastewater biosolids. As stated earlier, Micron should commit to zero discharge of all PFAS, and its industrial pre-treatment permit should make this an enforceable requirement. Because the cumulative impacts are regional in nature, the environmental justice assessment (Section 3.16) should consider these regional impacts.

²⁵ Final PEA

²⁶ Final PEA, p. 69.

Inequality

I was asked to analyze the Micron DEIS because of my expertise in addressing the hazardous substances used and released by the semiconductor industry, but in reviewing the document I noticed a significant shortcoming in the section on Socioeconomic Conditions. As background, I have been living and studying California’s Silicon Valley for nearly six decades. I have served as City Council member and Mayor of Mountain View, the birthplace of the commercial semiconductor industry.

Silicon Valley, as well as other areas with concentrations of high-tech employers, suffers from significant inequalities in income and wealth.²⁷ To a large degree, this is a result of the influx of well-paid managers and professionals, leaving lower-paid production and service workers to compete for housing. The upper tiers can afford to live near centers of employment, while the lower socioeconomic tiers not only must struggle to pay their bills, but they end up with longer, time-swallowing commutes and weaker public schools. We call this the “jobs-housing imbalance.”

Plans to build more housing and hire union construction workers are commendable, but they are likely to be inadequate in enabling equitable income and wealth distributions. Creating large numbers of jobs, without sufficient mitigation, can create more problems than it resolves.

Recommendations

The draft EIS should expand its section on Socioeconomic Conditions to consider the direct and indirect impacts of the Micron development on the distribution of income and wealth, as well as the resulting impact on lower-income workers and residents. This should include wage and salary projections for each class of worker, whether directly employed by Micron or its contractors and suppliers. Typical categories including managers, professionals, production workers, and service workers such as janitors, security guard, and cafeteria workers.

Micron should explore mechanisms for leveling pay levels, such as the recognition of labor unions for production and service workers.

In Summary

The draft Environmental Impact Statement for Micron New York contains valuable information, but in the case of hazardous substances it does not provide enough detail to satisfy the public’s right to know or to guide decisions designed to protect worker health, public health, and the environment. If the final EIS fails to disclose essential details, members of the public may find

²⁷ See Rachel Massaro and Daniel Wessler, “2025 Silicon Valley Index, Joint Venture Silicon Valley, March, 2025. <https://jointventure.org/publications/institute-publications/2706-2025-silicon-valley-index> and Anji Buckner-Capone et al, “2025 Silicon Valley Pain Index,” San Jose State University Human Rights Institute, July, 2025. <https://www.sjsu.edu/hri/docs/SVPI%202025%20Annual%20Report%20-%20Press%20Release%20.pdf>

the only way to influence the project is to oppose it outright as it moves through the permitting process—much which will take place after construction has started.

More than a decade ago, I served as a consultant to the Bronx Committee for Toxic Free Schools, which successfully sued the New York City School Construction Authority to require a detailed maintenance and monitoring plan to ensure that children at the Mott Haven Campus would not be exposed to toxic substances in the long-term and submit the plan for public review. The courts found, “In essence, the position of petitioners here, and the holding of the courts below, is that the methods chosen by the Authority for long-term maintenance and monitoring of its engineering controls were too important not to be described in an EIS.”²⁸ I recognize that the Micron project is subject to different regulatory authorities. Nevertheless, I believe the same principle applies: Where public health and safety is expected to be at risk due to unacceptable hazardous substance exposure from a project under SEQRA review, detailed plans for monitoring should be included in the EIS, not left for subsequent permitting processes.

Furthermore, the semiconductor industry for decades has been characterized by Moore’s Law, which projects significant periodic improvements in circuit density. For this and other reasons, over the course of the sixteen-year project Micron is expected to constantly update its production technology. This will include the introduction of new, un-assessed, process chemicals.

In addition, the DEIS notes the likelihood of advances in environmental analysis and treatment. Therefore, there should be a mechanism to revisit key elements of the EIS. That is, impact analysis and the protection of workers, neighbors, and the environment should keep up with the remarkable progress of semiconductor chips, their applications, and associated environmental technologies.

Recommendations

The Final EIS should contain detailed plans for monitoring the release of hazardous substances, including all forms of PFAS, from the Micron plant.

The Final EIS should contain “triggers” for updating portions of the EIS, based upon advances in production and environmental technologies as well as environmental and land use conditions at the Micron site.

Subject: [EXTERNAL] ATTN: Micron Project - Re: Submission of Supporting Documents and Attachments

Importance: Normal

Sensitivity: None

Good Morning,

We are currently preparing comments on the Micron Draft EIS. The comments will contain dozens of supporting documents and attachments that we will be submitting to the administrative record, some of which are too large to send via email. For the convenience of OCIDA staff, we are planning to send those attached documents via an FTP file transfer link (most likely DropBox). Please confirm that OCIDA is able to receive documents via FTP.

Thank you,

Kadijah Sutton

Subject: [EXTERNAL] Town of Clay Town Board Comments on Micron DEIS
Attachments: ToC Micron DEIS Comments.pdf

Hello,

On behalf of the Town Board of the Town of Clay, please find attached our formal public comment letter on the Draft Environmental Impact Statement (DEIS) for the Micron project.

We respectfully request a written acknowledgment of your commitment to work with the Town of Clay to address these areas, including a timeline and responsible parties for each, so that accountability is clear from the outset.

Ryan Pleskach, Councilor
Town of Clay, NY

- The Honorable Kathy Hochul, Governor of New York
- Mr. Sanjay Mehrotra, Chief Executive Officer, Micron Technology
- The Honorable J. Ryan McMahon II, County Executive, Onondaga County
- Mr. Robert Petrovich, Executive Director, Onondaga County Industrial Development Agency (OCIDA) & Deputy County Executive – Economic Development and Planning

Re: Town of Clay Comments and Expectations Regarding the Draft Environmental Impact Statement for the Micron Project

On behalf of the entire Town Board of the Town of Clay, we respectfully submit this letter as our formal public comment on the Draft Environmental Impact Statement (DEIS) for the Micron project. This letter is a unified statement of the Town's expectations, responsibilities, and guiding principles. It sets the framework as we prepare for the unprecedented growth and change that this project will bring.

Micron's decision to locate its landmark semiconductor manufacturing campus in the Town of Clay represents the most significant economic opportunity in our history. We are proud to serve as the host community and deeply appreciate the leadership demonstrated by Micron, New York State, Onondaga County, and the Onondaga County Industrial Development Agency (OCIDA) in bringing this investment to Central New York. The promise of this project is transformational, and the Town of Clay stands ready to be a full and responsible partner in ensuring its success.

At the same time, the DEIS makes clear that the project will have far-reaching impacts on the Town's infrastructure, municipal services, environment, traffic operations, public safety, and long-term planning responsibilities. Identified effects include significant increases in traffic volumes along major corridors and changes to roadway configurations. Other impacts include potential constraints on emergency service response times, expansion of hazardous materials handling and transport, relocation of utilities, and measurable changes in community noise exposure. The scale of construction activity, combined with the operational footprint of four large semiconductor fabs, will also create sustained demand for expanded municipal capacity in areas such as engineering, planning, code enforcement, stormwater management, snow removal, and public safety readiness.

While we have taken an important first step through the execution of a reimbursable expenses agreement with Micron, that agreement alone cannot address the timing or magnitude of the impacts identified. This project is unique among CHIPS Act investments. While others are dispersed across large metropolitan regions or involve expansions of existing facilities, Micron will construct four massive fabrication plants entirely within a single community, transforming the Town of Clay over a period of up to 16 years. This pace and concentration of change is unlike anything any other municipality in the nation has ever experienced. Many of these impacts fall directly on the Town and its residents, and we are committed to managing them responsibly and in good faith.

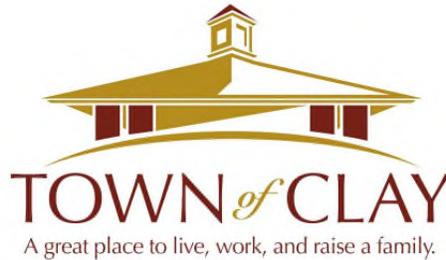

As a matter of public policy, the cost of accommodating this project shall not be placed on our current taxpayers or local businesses. We expect Micron, New York State, Onondaga County, and OCIDA to provide the Town of Clay with the resources, coordination, and authority necessary to proactively mitigate and manage the impacts described in the DEIS and expanded upon in the comments below.

Supervisor

Damian M. Ulatowski

Deputy Supervisor

Joseph A. Bick

Councilors

David Capria

Ryan Pleskach
Edward Wisnowski
Eugene Young

Comment #1: Unfunded Service Impacts Require Upfront Investment

The Micron project will create immediate and sustained demands on core Town services. These include expansion of the highway garage and equipment fleet, additional planning, engineering, and code enforcement staff, upgraded permitting and recordkeeping systems, enhanced maintenance of parks and community facilities, and major improvements to snow removal and stormwater infrastructure. These are not distant possibilities. They are obligations that will begin as soon as site preparation and related development activity increases.

Traffic, utility, and hazardous materials considerations will further compound these demands. Roadway and intersection reconfigurations, utility relocations, and the introduction of raised medians will require close coordination with emergency services to maintain acceptable response times. The DEIS does not currently evaluate potential delays to fire and EMS stations located on Route 31 and Caughdenoy Road, nor does it address operational impacts to surrounding communities. Maintaining access during construction will require municipal oversight and technical capacity beyond our current staffing levels. Mitigation measures must include signal coordination or adaptive signal timing and emergency preemption at traffic signals.

In addition, the receipt, handling, and storage of large volumes of hazardous chemicals and petroleum products will necessitate specialized planning, training, and equipment at the local level. Federal- and state-mandated Spill Prevention, Containment, and Countermeasure (SPCC) Plans, Spill Prevention Reports (SPR), and Risk Management Plans (RMP) will govern Micron's on-site operations, but spills or releases during transport to and from the facility may occur on local roadways and in nearby neighborhoods. Effective response to such incidents will require our volunteer fire departments and other first responders to receive specialized training in the specific hazards posed by these materials. They must also be equipped with the necessary protective gear, containment tools, and monitoring equipment.

The Town of Clay is not seeking permanent subsidies. Over time, a growing tax base will restore fiscal self-sufficiency. However, to responsibly meet the early demands of this project, the Town requires a significant upfront investment to expand capacity in parallel with Micron's development. This funding must be committed prior to key construction milestones, with clear sources, disbursement schedules, and scope aligned to the actual service demand and facility impacts identified above. It must come through grants and direct appropriations from Micron, New York State, Onondaga County, or OCIDA.

The Town will not shift the financial burden of Micron-related impacts onto existing taxpayers or businesses, borrow or issue long-term debt for capital improvements or operations associated with this project, or divert resources from existing services to subsidize new development. The scale, speed, and complexity of this undertaking require early, sustained, and externally funded investment in municipal capacity to ensure that public health, safety, and quality of life are protected from the outset.

Comment #2: Regulatory Barriers Are Limiting Housing Capacity

The Town of Clay is facing a significant and growing challenge in meeting future housing demand due to recent changes in wetland setback regulations. Since the New York State Department of Environmental Conservation (NYSDEC) assumed jurisdiction from the U.S. Army Corps of Engineers, regulated wetland setbacks have expanded, sharply reducing the buildable area on key parcels throughout the Town. This constraint affects multiple sites already identified for residential growth and located near planned transportation improvements, making it more difficult to align housing development with infrastructure investments.

Supervisor

Damian M. Ulatowski

Deputy Supervisor

Joseph A. Bick

Councilors

David Capria
Deborah Magaro-Dolan
Ryan Pleskach
Edward Wisnowski
Eugene Young

This loss of developable land comes at a time of substantial workforce housing demand from the Micron project. The DEIS acknowledges the need for new housing but does not account for the combined effect of wetland setback restrictions, infrastructure capacity, and transportation network changes on where and how housing can be built. For example, concept roadway improvements on Route 31 introduce raised medians and cul-de-sacs that alter local access patterns, potentially impacting the viability of nearby residential development sites. Without careful coordination, new roadway configurations combined with reduced buildable acreage could further limit the number of suitable parcels for housing.

The Town of Clay supports responsible environmental stewardship and has demonstrated this commitment by earning recognition as a 2-Star Clean Energy Community under New York State's Clean Energy Communities program, with over 3,400 points from high-impact sustainability actions. However, the current regulatory framework is unintentionally working against the State's goals for housing supply and affordability. Local homebuilders have indicated that the expanded setbacks are preventing viable projects from moving forward, even in areas already served by utilities and transportation. If unaddressed, this will push workforce housing demand into adjacent communities, placing additional pressure on the regional housing market and increasing commuter traffic.

Public engagement during the Town's recent Land Use Study made clear that residents want future residential growth to reflect Clay's character as a suburban, family-friendly community. Survey results showed strong support for single-family homes at a range of densities, and far less support for high-density apartment complexes or urban-style infill. This preference is not solely a matter of aesthetics. It is tied to the Town's infrastructure capacity, preservation of neighborhood character, and long-term sustainability. Any solution to the current housing constraint must allow the Town to deliver housing types consistent with these priorities while ensuring that transportation, emergency services, and environmental protections are fully integrated into the planning process.

We therefore request targeted regulatory relief that balances environmental protection with the flexibility required to meet both local and state housing objectives. This relief should be paired with coordinated transportation and infrastructure planning to ensure that available parcels are accessible, serviceable, and compatible with community character. Without such action, the Town will be unable to provide sufficient housing to support Micron's workforce needs while maintaining the quality of life expected by our residents.

Comment #3: Townwide Noise Impacts Require Equitable and Lasting Mitigation

The DEIS identifies more than 520 individual receptors within the Town of Clay that are expected to experience significant increases in noise levels, primarily from traffic along major corridors such as Route 31, Caughdenoy Road, Route 11, and Interstate 481. However, this number underrepresents the full extent of the impact. The cumulative effect of employee commuting, freight movement, construction activity, and regional development linked to the Micron campus will raise baseline noise levels across much of the Town. This includes neighborhoods that have historically been insulated from high-intensity traffic or industrial operations.

Traffic pattern changes outlined in the DEIS will amplify this effect. New interchanges, access road reconfigurations, and raised medians will redirect traffic flows in ways that may concentrate noise along certain corridors and at key residential interfaces. The Verplank interchange, for example, is likely to draw additional east-west traffic through Clay, while cul-de-sac conversions and modified on/off-ramp designs may push more vehicles onto alternate local routes. These shifts have not been fully modeled to show their long-term noise implications.

Supervisor

Damian M. Ulatowski

Deputy Supervisor

Joseph A. Bick

Councilors

David Capria
Deborah Magaro-Dolan
Ryan Pleskach
Edward Wisnowski
Eugene Young

Noise mitigation must therefore go beyond the limited commitments currently described. Permanent sound barriers should be installed in all feasible locations, including residential areas near Barcaldine Drive, Route 31, Route 11, Caughdenoy Road, and the neighborhoods surrounding the I-481/Route 31 interchange. Where right-of-way or design constraints prevent barrier installation, alternative methods such as vegetated berms, low-noise pavement surfaces, or building façade improvements should be deployed.

Mitigation must also address construction-phase noise, which will occur over many years and could involve pile-driving, heavy vehicle traffic, and large-scale material handling. Best practices should include use of properly muffled and acoustically insulated equipment, restrictions on nighttime activities, and selection of lower-impact construction methods where feasible.

To protect public health and maintain accountability, the Town expects continuous noise monitoring at representative receptor locations during both construction and operation, with results made publicly available. This should be paired with adaptive mitigation measures—if monitored noise exceeds modeled levels, additional controls must be deployed. The monitoring network should also be integrated with the Town’s broader communication strategy, enabling residents to access up-to-date information on noise conditions in their neighborhoods.

The Micron project’s duration and scale make noise impact a permanent quality-of-life issue for the Town. Addressing it equitably from the start will require full funding for both physical infrastructure and ongoing operational controls, not temporary or piecemeal measures.

Comment #4: Best Management Practices Must Be Enforced and Fully Funded

The DEIS outlines a comprehensive set of Best Management Practices (BMPs) intended to protect public health, safety, and the environment during the construction and operation of the Micron campus. While these measures are essential, several critical gaps and clarifications are needed to ensure they are effective, enforceable, and fully funded.

Hazardous Materials and Spill Response

The facility will handle significant quantities of hazardous chemicals and petroleum products during operations, delivered by truck and rail. Compliance with federal and state requirements will require development and maintenance of a Spill Prevention, Containment, and Countermeasure (SPCC) Plan, a Spill Prevention Report (SPR), and a Risk Management Plan (RMP) under Section 112(r) of the Clean Air Act. Each plan must detail storage vessel specifications, operational safeguards, worst-case release scenarios, employee training, and emergency response protocols.

Each plan must include provisions for adequate on-site containment materials, such as manhole covers, absorbents, and temporary dikes, and must be reviewed by NYSDEC and USEPA. The Town also expects confirmation that Micron will maintain on-call contracts with trained private spill-response contractors capable of mobilizing quickly for on-site or off-site incidents. Given the complexity of materials involved, local fire departments will require additional specialized training and equipment to respond effectively to chemical emergencies.

Stormwater, Wastewater, and Water Quality

Stormwater and wastewater management systems must be designed, constructed, and operated to ensure that all discharges meet or exceed applicable federal and state water quality standards. This includes full

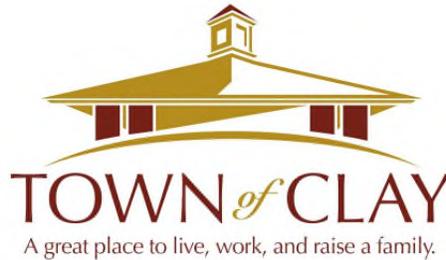

Office of the Supervisor

Supervisor

Damian M. Ulatowski

Deputy Supervisor

Joseph A. Bick

Councilors

David Capria
Deborah Magaro-Dolan
Ryan Pleskach
Edward Wisnowski
Eugene Young

implementation of proven best practices such as swales, check dams, detention facilities, and complete compliance with the State Pollutant Discharge Elimination System (SPDES).

The Oak Orchard Wastewater Treatment Plant (OWWTP) will require phased upgrades to handle wastewater from Micron's operations, with Phase 1 improvements in place before initial operations and a new treatment train completed prior to Phase 2. Air permitting modifications must also be completed as necessary. These upgrades must be fully funded by Micron and its partners to prevent any financial or service impacts on existing customers and to safeguard downstream water quality.

The same standard of protection must apply to winter maintenance of all roadways serving the Micron campus and surrounding neighborhoods. Many of these roads are maintained by New York State or Onondaga County, and both agencies need to work directly with the Town to develop and implement a coordinated, science-based strategy for snow and ice control that reduces environmental impacts. Consistent with the recommendations of the 2024 Adirondack Road Salt Reduction Task Force Report, this strategy must include brine and pre-wetting technologies, calibrated spreaders, alternative deicers, and comprehensive operator training to minimize salt use. These measures, already in use in sensitive areas such as Lake George, Wilmington, and Keene, have been proven to protect drinking water sources, prevent chloride contamination, and preserve aquatic ecosystems. This salt reduction strategy should be incorporated into and measured against the DEIS-proposed water quality monitoring program to ensure that its effectiveness is documented, and corrective actions are taken when necessary.

Traffic, Transportation Demand Management, and Multimodal Access

Transportation BMPs must go beyond current DEIS commitments. Traffic signal coordination, particularly along Route 31 from Oswego Road to I-481, is needed to improve peak-hour flow and reduce congestion. Adaptive signal control should be deployed both during construction and permanently. Preemption systems should be installed to prioritize emergency and transit vehicles. Transportation demand management (TDM) measures, such as employee shuttle programs, carpool incentives, and parking management, must be implemented early to reduce single-occupancy vehicle trips. Side street pedestrian and bicycle connections, bus pull-off bays, and improved lighting at intersections should be added to ensure safe and efficient multimodal travel.

Construction Practices and Local Access

Construction staging and sequencing must be planned to minimize disruptions to local businesses, residents, and emergency service access. Raised medians, cul-de-sac conversions, and ramp reconfigurations, such as those proposed for Route 31, Caughdenoy Road, and the I-81/Route 31 interchange, must be evaluated for their impact on fire department response times and neighborhood connectivity before implementation. Where negative impacts are identified, alternative designs or mitigation measures must be adopted.

Enforcement and Local Oversight

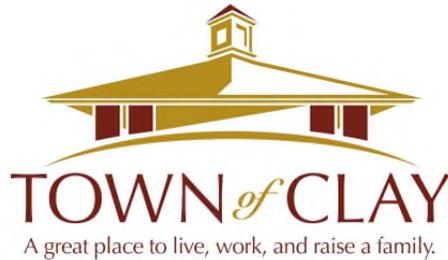

The Town of Clay will use all available planning, zoning, and permitting authority to ensure compliance with BMPs throughout the life of the project. When uncertainty arises, the Town will prioritize public health and safety over cost or schedule considerations. To meet these responsibilities, Micron, Onondaga County, New York State, and OCIDA must provide funding and technical support to train, equip, and maintain the readiness of the Town's volunteer fire departments, police, and code enforcement staff.

Supervisor

Damian M. Ulatowski

Eugene Young

BMPs for the Micron project must be treated not as optional guidelines but as binding commitments, backed by enforceable agreements and sufficient funding. Without full implementation and oversight, the scale of the project poses unacceptable risks to community health, safety, and quality of life.

Comment #5: Community Engagement and Public Accountability Must Be Built In

The Micron project will have generational impacts on the Town of Clay, and its success will depend not only on technical execution but also on long-term transparency, responsiveness, and collaboration with the community. The scale and duration of this development requires a permanent structure for public engagement that is proactive, measurable, and accessible to all residents.

Micron must establish and maintain a formal community outreach and engagement program to serve as a direct and permanent channel between the company, its public partners, and the people of Clay. This program should include:

- Regular project updates on construction progress, operational changes, and anticipated impacts.
- Public reporting on compliance with key mitigation measures in areas such as transportation operations, environmental safeguards, hazardous materials management, and emergency response capacity.
- Clear and accessible channels for residents to raise concerns, receive timely responses, and track resolution of issues.

The outreach program must be staffed and funded for the life of the project and beyond. Public reporting should include measurable performance indicators. These may include traffic flow data, noise monitoring results, air and water quality compliance reports, and emergency response readiness metrics. These metrics will allow residents to independently verify that commitments are being met.

This level of transparency is not unprecedented. Other communities hosting large semiconductor manufacturing facilities, such as New Albany, Ohio, have implemented dedicated public engagement programs to keep residents informed and involved. Clay expects the same standard of practice with the added requirement that the Town play an active role in oversight and communication.

Trust will be built through visible action and open sharing of information. By formalizing and funding a permanent community engagement framework before major construction begins, Micron and its partners can ensure that public accountability is not an afterthought but a core component of the project's long-term success.

Conclusion

The Town of Clay is proud to serve as the home of Micron's historic investment. We believe in the mission behind this project and the future it represents for our region, our workforce, and our economy. We are committed to being a proactive and responsible partner in its success.

At the same time, we have a clear responsibility to protect the interests of our community. The scale, speed, and intensity of the changes ahead are unlike anything a single town has faced in the history of modern economic development. The comments outlined in this letter reflect the practical needs and core values of our residents, who have welcomed this opportunity with open minds and high expectations.

We respectfully request written acknowledgment of your commitment to working with the Town of Clay to address the five key areas identified in this letter: service impact mitigation, housing flexibility, noise relief,

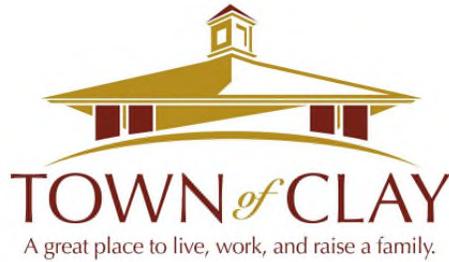

Office of the Supervisor

enforcement of best practices, and long-term public engagement. This acknowledgment should include a timeline and responsible parties for each area so that accountability is clear from the outset. With these expectations in place, we believe this project can become a national model for public-private collaboration and shared success.

We look forward to working together to make this vision a reality.

Sincerely,

Damian Ulatowski, Supervisor

Subject: [EXTERNAL] DEIS Comment re: Micron Project Town of Clay
Attachments: Micron DEIS Review for ToC.docx

Good afternoon -

Please find attached comments for inclusion in the public record regarding the Draft Environmental Impact Statement (DEIS) for Micron. These comments are submitted in accordance with the public comment deadline of August 11, 2025.

Thank you for your attention to this matter.

Sincerely,

Judy Rios
HR Executive/Administrator

Supervisor Damian M. Ulatowski
4401 State Route 31
Clay, NY 13041

These sections and associated appendices were evaluated on potential impacts on the residents, businesses, and infrastructure in the Town of Clay, the municipality where the Micron facility will be located.

The following sections were included in the review:

Section 0.0 – Executive Summary

Section 3.6 – Air Quality

Section 3.7 - Greenhouse Gas Emissions, Climate Change, and Climate Resiliency

Section 3.8 – Solid Waste, Hazardous Waste, and Hazardous Materials

Section 3.11 – Transportation and Traffic

Appendix I – Air Quality

Appendix J - Greenhouse Gas Emissions, Climate Change, and Climate Resiliency

Appendix K – Solid Waste, Hazardous Waste, and Hazardous Materials

Appendix M – Transportation and Traffic

Based on our review of the above sections and materials, we offer the following comments which are organized by technical discipline.

Waste and Hazardous Materials Comments

Comment #1: Receipt, handling, storage, and use of various hazardous chemicals are expected in operations. The appropriate plans and policies meeting State and Federal requirements will need to be adhered to.

The DEIS describes Micron’s plan to comply with State and Federal requirements associated with the receipt, handling, storage, and use of various hazardous chemical expected to be used in its operations. This will involve the preparation, review and update, and adherence to various plans and policies, including but not necessarily limited to the following plans and policies.

- *Spill Prevention, Containment and Countermeasure (SPCC) Plan:* An SPCC that will identify the number, size, location, and operational details for on-site oil storage vessels, oil-filled electrical equipment, and oil-filled operational equipment and provide procedures for preventing and controlling releases from these vessels;

- *Spill Prevention Report (SPR)*. An SPR that will identify the number, size, location, and operational details for on-site chemical storage vessels and process equipment and provide procedures for preventing and controlling releases from these vessels

The SPCC and SPR plans should include provisions for adequate on-site petroleum and chemical control equipment and materials, such as manhole covers, spill containment adsorbent materials, temporary dikes, etc. These must be addressed in the SPCC and SPR plans and are subject to NYSDEC and USEPA oversight.

- *Risk Management Plan/Program (RMP)*: An that will apply to listed Regulated Substances identified by the USEPA under section 112[®] of the Clean Air Act and that will include a “hazard assessment that anticipates the potential effects of any accidental chemical release that could occur at the Micron Campus, with an evaluation of worst-case and alternative accidental release scenarios; a chemical accident prevention program including safety precautions, maintenance and monitoring measures, and employee training; and a chemical accident emergency response program detailing the emergency response procedures Micron would provide for emergency employee care and notify relevant agencies, local first responders, and the public should an accident occur.”

These plans are all specific to the on-site operations of Micron. The various chemicals and petroleum products that are expected to be required will be delivered to the facility by over-the-road vehicles or by rail. An accidental release of a regulated substance, whether at the plant or in the nearby communities during transit, has the potential to impact the surrounding community and will rely on the expertise and training of local emergency response agencies and resources. This must include emergency response and incident command knowledge that is specific to the nature and quantity of chemical materials that may be involved. This may require additional training of local responders in the specific risks posed by these materials, as well as procurement and maintenance of additional response resources at the local level.

Comment #2: Emergency response services for spills or releases.

Clarification is requested if Micron will maintain on-call contracts with appropriately trained and equipped private emergency response and cleanup contractors that would be prepared to mobilize and address any spills or releases on an emergency basis.

Comment #3: The facility may be required to prepare and submit to USEPA a Facility Response Plan.

Based on the anticipated combined petroleum and oil storage capacity of 1.55 million gallons, the facility may also be required to prepare and submit to USEPA a Facility Response

Plan if all petroleum storage vessels are not equipped with adequate secondary containment, per the requirements of 40 CFR Part 112.

Transportation and Traffic Comments

Comment #1: Town of Clay land use should be considered for transportation improvements.

The Traffic Impact Study (TIS) mentions future land use, but it is unclear what was used for the analysis in the TIS. Requesting clarification if the land use, speed, and conceptual locations considered for the Three Rivers along Maider Road, the Complex along Morgan Road and the Historic Clay Center at Willer Canning Road.

Comment #2: Impacts to emergency services is not addressed.

The Clay Fire Departments are located at NYS Route 31 near McNamara Dr and Caughendoy Rd near the NY Route 481 off ramp. For context the Cicero Fire Department is at NYS Route 31 at US 11, and the Moyers Corner Fire Department is at NYS Route 31 at Oswego Road. These emergency services use of NYS Route 3, Maple Road, and Caughdenoy Road are crucial to maintain emergency response times. The TIS contains no content on impacts to emergency services. Clarification is requested if the following were considered.

- Evaluation on an impact to response times therefore impacting the need for additional fire department facilities.
- Coordination during construction for impacts to emergency services and their facilities.
- The impacts to the fire department building at US 11.

Comment #3: Verplank Interchange

The improvements show a Verplank interchange but no traffic data results are shown. This new interchange will assist drivers with alternative east and west connections without having to use NYS Route 31, especially during busy construction activities.

Comment #5: Impacts to Traffic Signals on Route 31

Currently the tightly spaced signals along NYS Route 31 from Oswego Road to the NYS Route 481 interchange appear to not be coordinated during the morning and afternoon peak hours. Local drivers complain often of the inefficiency of these signals due to their lack of coordination. Traffic signals should be coordinated to improve flow efficiency, especially with the potential increase in traffic volumes. Additional congestion

management technology should be explored such as adaptive signal timings for construction and as permanent measures.

Traffic signal preemption for emergency services and transit would improve emergency response times and assist in emergency vehicles navigate through traffic congestion. Transit priority at signals would also encourage the use of other modes. Transit should be coordinated with the ongoing SMTC Route 31 Corridor Study.

Comment #6: Lighting should be considered at additional locations while balancing light pollution.

The TIS mentions improved roadway lighting to enhance safety. The Project Cost sheets in Appendix M show lighting is not an improvement at intersections and only at interchange ramps. With the increase in pedestrian and bike enhancements it would be beneficial to have increased roadway lighting or pedestrian lighting. Additional information is requested at where lighting is expected to be placed, and should be considered for intersections and at locations to enhance safety for pedestrians and bicyclists.

Comment #7: Proposed improvements are mainly focused on state roads.

It appears that most of the roadway improvements are being made along State Roads. Additional work should be considered for side streets, County Roads, and those at a local level. Construction staging and sequencing are a concern for how that will occur and the impacts at each implementation stage. The following are comments focused on specific proposed improvement locations,

NYS Route 31: Transportation Appendix M shows concept improvements with a raised median along most of NYS Route 31. This is a major change to access management and would mean side streets and driveways for businesses and residents that previously had direct access would now require to u-turn at signalized intersections. The traffic analysis does not appear to show increased u-turns at these intersections, and so the improvement concepts do not match the traffic analysis. A raised median should be discussed with emergency services to understand the impacts that would have on response times.

The Appendix M concept improvements show a standard sidewalk and a wide shared use path along NYS Route 31 but not along side streets. Pedestrian and bicycle accommodations should be considered along side streets to connect to residential and commercial areas. While these roads are outside of NYS jurisdiction, other jurisdictional owners and agencies should be coordinated with to connect and build improvements for other modes.

Concept improvements do not show bus pull-off bays, transit improvements should be considered if transit will be used and accommodated along NYS Route 31.

Concept improvements at Caughdenory Road show current access to NYS Route 31 becoming a cul-de-sac, no longer providing direct access. Drivers now have longer travel times and additional distance to travel traveling from NYS Route 31 to Caughdenory. Justification should be provided for this change.

Interchange at NYS Route 31 and I-81: The new interchange at NYS Route 31 at I-81 shows the northbound on-ramp is cutting off Pardee Rd access.

- How will vehicles along RT 31 and the surrounding neighborhoods access the business and residences along Pardee Road?
- How will drivers coming from NYS Route 31 and visiting the businesses to the east of the interchange, for example Dunkin' Donuts, return to Lakeshore Road or other residential neighborhoods to the east along NYS Route 31?

New Access Road: Caughdenory Road currently feeds many residential homes, because of this, large tractor trailers and dump trucks should be discouraged from using Caughdenory Road. The increased noise, pollution, and vibration would not be a welcome addition to this neighborhood.

- Will signage and commercial vehicle navigation try and encourage the use of the new Access Road that is likely zoned for this use, or alternative routes be proposed?

Comment #8: Utility Relocation Impacts

Major utility work is being performed, the impacts to the power line poles should be described and what those impacts will be to proximity to the road, residences, and businesses.

There is no mention of EV charging facilities which should be considered to help reduce emissions and entice alternative vehicle types.

Information for the Town:

Air Quality Impacts

The potential air quality impacts associated with the Micron project include temporary impacts associated with construction, long term operation of the facility, and mobile emissions associated with additional vehicles traveling to the Micron location both during construction and operation of the facility. As with any construction project, the emissions of criteria pollutants such as particulate matter (PM) associated with soil disturbance and material handling as well as carbon monoxide (CO), oxides of nitrogen (NOx), volatile organic compounds (VOCs), and sulfur oxides (SOx) associated with the combustion of fuels in both on-road and non-road vehicles will increase. According to the DEIS, construction emissions associated with the project would have a temporary adverse impact on air quality. Micron has proposed controls (such as the rail spur) and best management practices (BMPs) to reduce the emissions of criteria pollutants during construction.

The operational facility will increase the emissions of criteria pollutants, non-combustion PM and VOCs and hazardous air pollutants (HAPs), such as hydrochloric acid, hydrofluoric acid, and organic HAPs. Based on Federal and State regulations, the Micron facility will employ control equipment, including acid and ammonia scrubbers, thermal oxidizers, and point of use systems. Based on the DEIS, it appears that Micron has addressed the applicable Federal and State regulations, conducted the necessary ambient air quality modeling, and will implement the necessary air pollution controls.

There will also be an increase in vehicular traffic in the vicinity of the proposed facility associated with the project as well as induced population growth. Transportation modeling was conducted at various intersections indicated that PM and CO are not expected to have a significant adverse effect on local air quality.

Despite the increase in criteria pollutants and HAPs, the DEIS indicates that the ambient air quality in the area of the proposed Micron facility from both stationary and mobile sources is not expected to result in significant adverse air quality and not expected to exceed any National Ambient Air Quality Standards (NAAQS), NYSDEC Short-term Guideline Concentrations (SGCs) or Annual Guideline Concentrations (AGCs). Micron will obtain the necessary Title V Air Permit and comply with applicable Federal and State air regulations. The facility will utilize Best Management Practices (BMPs) to control of fugitive dust associated with on-site and offsite activities and transport, controls for the reduction of both criteria or HAP pollutants as well as minimize sulfur compound emissions.

It should be noted that the operation of the railroad spur would emit particulate matter due to material handling, while the childcare site and warehouse would have criteria pollutant

emissions associated with combustion. These emissions would be insignificant compared to the emissions from the Micron site.

In addition, Onondaga County's Oak Orchard Wastewater Treatment Plant (OWWTP) will be upgraded to receive process DRAM wastewater from Phase 1 (first two units) operations of the Micron facility. For Phase 2 (Units 3 and 4), Onondaga will construct new WWTP treatment train to handle pretreated process wastewater, returning reclaimed water back to Micron. The existing OWWTP has a Air Facility Registration for air emissions for the facility, which would need to be modified for the any new pollutants any new sources of air emissions.

Greenhouse Gas Emissions, Climate Change, and Climate Resiliency

There will also be an increase in greenhouse gas (GHG) emissions during construction and operation of the proposed Micron facility. GHGs include carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O) and fluorinated gases (F-GHGs). Unlike criteria pollutants and HAPs, GHGs typically do not cause local air quality effect, but rather contribute to the overall increase in GHGs throughout the planet. Fluorinated gases used in the semiconductor manufacturing are especially potent and long-lived with some remaining in the atmosphere for 1000s of years.

The Micron project will be responsible for an increase in GHGs in the construction, operation, and associated traffic from the facility. Construction GHG emissions are primarily from the combustion of petroleum fuels from non-road equipment and generators. Operation GHG emissions will result from using fluorinated GHGs, N₂O, CH₄, and CO₂ as raw materials in manufacturing processes, from oxidation of organic compounds in thermal oxidation systems and RCTOs, from the combustion of natural gas and diesel, and from leaks of HTF. In addition, the indirect GHG emissions from the use of electricity (Scope 2) emissions will be significant when the Micron facility is in operation.

Long-term mobile GHG emissions are associated with the increase in traffic for the project. According to the DEIS, the long term operational mobile sources related to the proposed project in year 2041 would increase GHG emissions within the regional study area by 2 percent.

As mentioned previously, GHG emissions is a global concern and does not affect the local air quality. GHG emissions are attributed to climate change with an increase in Statewide average temperature by 3 degree F since 1970, with increases "heat island effect", decreased groundwater table, as well as a greater number and strength of extreme weather events creating potential flooding events. These impacts are not anticipated to be

significant for the project area, but Micron has incorporated the following into the design of the facility:

- Use of Stormwater Management Practices such as wet extended detention pond, infiltration basins, and filtration bioretention controls.
- Facility and associated infrastructure will be designed to withstand climate impacts.
- Install mitigation measures to reduce GHG emissions
- Purchase 100% carbon-free electricity via:
 - Power Purchase Agreements (PPAs)
 - Renewable Energy Credits (RECs)

Although not associated with the Micron project, the Town of Clay could experience issues with Town infrastructure associated with climate change. However, as noted in the DEIS, the proposed Micron project is not anticipated to significantly affect the climate resiliency of the surrounding area.

Subject: [EXTERNAL] Micron

Hello,

I am writing you to tell you that this is a huge mistake. The environmental impact is too great. This place is going to consume more water in one year than all of Syracuse combined. They are already asking for another pipeline for water. Not to mention all the wildlife you are going to displace and KILL off. In the end Syracuse does not need this big of a facility anywhere near it.

Kylie

Importance: Normal

Sensitivity: None

I know many are anxious for you to start building and come into Clay ,NY with your new, shinny plant. but I wish you would not come here.

My family moved to Brewerton NY over 30 years ago from the city of Syracuse. It was about 40 minutes away from Syracuse and our jobs as teachers for the Syracuse City school District. But, it was a wonderful escape into the rural community. We have a home on Oneida lake and have enjoyed living with the wildlife, the open spaces, and the nearby farms. The less polluted air, the garden I grow, the small shops I frequent will be negatively affected by your coming here. The land you are going to rip apart and cover with concrete currently is absolutely beautiful. Lush with trees, native grasses, and wildlife. Once you pollute this space, it will never recover. I do not want you here. In the end

, this space will be polluted and desecrated and left to rot when you inevitably decide to move on and need/want a different physical location or a better economical deal elsewhere. My children will have to move elsewhere to escape again. Marjorie Canino

Subject: comment on Micron: against Micron moving in

To Whom It May Concern,

I am writing today because I wanted to voice my opinion that approving Micron to build an extra large complex is not a good deal for the State of New York or the local people.

In addition to displacing wildlife and severely impacting water systems in negative ways, we can look to history to understand the boom and bust cycle of companies like this coming into an area. Typically there is great excitement originally in the belief that there will be job creation, but companies like this thrive on tax breaks, money from taxpayers, special privileges, and then more money later on down the road when they decide to move their industry somewhere else and the state and local governments are desperate for them to stay. In a way, these situations are a version of a Ponzi scheme.

Great amounts of infrastructure must be built which impacts the environment and people. Already the traffic congestion and land speculation in the area is outrageous. It will get worse, and never really get better. These things swell until they burst.

We have only to look at Onondaga Lake and Allied Chemical to see the future of the wetlands and waterways in this area. Operations like this, including aspects of AI, consume water at an incredible, unfathomable rate and create continuous pollution.

We also have only to look at IBM operations of the past to also see this pattern play out. Hope for jobs, short boom period with taxpayers paying in and special dispensations on every level, the company uses up as many resources as it can access, and then they will move on and leave the area destitute.

This is not a long term, sustainable deal for Upstate New York.

Please count my voice as a voice against Micron coming in.

Sincerely,

Tracey Canino

Subject: [EXTERNAL] EIS Comments

**Micron Draft Environmental Impact Statement
Concerns of Immanuel Evangelical Lutheran Church**

Immanuel Evangelical Lutheran Church 4947 Route 31 in the hamlet of Clay is located less than 1/2 mile west of the Micron campus on Route 31. The congregation has been active in Clay for many years, having recently celebrated our 200th anniversary in 2023. Throughout that time, we have been dedicated to service in the Clay community. While we are excited to see the Micron development and the jobs and opportunities it will bring, we have some concerns regarding the impact it will have on our ministries and property.

Many of our community activities involve the use of our buildings. In addition to our regular Sunday services, we host an active Food Pantry and a monthly Free Senior Citizens lunch. We sponsor a weekly AA meeting in our Fellowship Hall and Companionate Friends, an organization dedicated to suicide prevention, holds their monthly meeting there. The Kyle Schneider Foundation that assists veterans is also based in our building. As you can see, access to our facilities is essential to carry out this work.

We are concerned about the effect and magnitude of the roadworks connected to the project, particularly with Route 31. Our church, built in 1916 is 25 feet from the edge of Route 31, and we have nearly 300 feet of frontage. According to the Draft EIS, Route 31 could change to a major four lane road. This will have a significant impact on our church and parking lot. When will a decision be made regarding the changes to Route 31? What is the proposed construction schedule for this and associated roads? Not knowing what the impact of these changes will be makes it very difficult to plan for building maintenance and updating.

We are also concerned with the environmental impact the project will have on the immediate area. Will the noise of construction interfere with our services? What is the effect of the dust and chemicals on us? I know you are actively planning and working to mitigate these effects but due to our proximity to the project we are very concerned.

We welcome any discussion on how our facilities can be of use to Micron during all phases of this project. Immanuel has a history of helping our neighbors and we welcome any ideas on how we can be an asset to Micron and all the people involved.

Michael Demeter
Immanuel Evangelical Church of Clay
Council President

Subject: [EXTERNAL] Public Comment Micron Project

To whom it may concern,

I am concerned that the proposed plant will cause a tremendous amount of irreversible and long term environmental damage. We do not know what health risk our towns neighborhoods will face with this plant. Will Clay become the next Love Canal?

With the current viaduct project, our infrastructure is already at capacity. Construction of the manufacturing facility would only add to the already at capacity roadways. In addition thousands of trucks going in and out nonstop over the next decade or so would create an unnecessary amount of air, noise, water pollution.

The area of northern Onondaga county is home to a unique and ecological wetland habitat. Much of these wetlands have been lost through urbanization and agriculture practices. Once lost these places can never be replaced to exhibit the ecological importance.

I hope our elected officials will listen and understand that the health and happiness of our ecosystem is more important than a few numbers on chart.

Thank you,

WG

The Syracuse Onondaga County NAACP is resubmitting comments to the MICRON DEIS as it was noted that the inside address identified the incorrect county in the previous submission. Our apologies for any inconvenience.

NAACP

Syracuse and Onondaga County

August 9, 2025

VIA Email to: chipsnepa@chips.gov

Onondaga County Industrial Development Agency
335 Montgomery Street
Syracuse, New York 13202

Attn: Micron Project

The National Association for the Advancement of Colored People (NAACP) has reviewed the Micron Semiconductor Manufacturing Project, Clay, NY, Draft Environmental Impact Statement (EIS). Our review focuses on the project's potential implications for environmental justice and the well-being of all communities, particularly those identified as disadvantaged, minority, or low-income.

The NAACP recognizes the project's stated purpose to revitalize the U.S. semiconductor manufacturing industry, accelerate domestic production of cutting-edge logic and memory chips, and catalyze long-term economically sustainable growth, supporting U.S. economic and national security. We also acknowledge the commitment to attracting new semiconductor manufacturing projects to New York, including through measures like the New York Green CHIPS Program, which aims to create thousands of jobs and attract billions of dollars.

Environmental Justice Analysis and Key Findings:

- The EIS includes a dedicated Environmental Justice section (Section 3.16), which assesses potential effects on Disadvantaged Communities (DACs) and minority or low-income communities, in accordance with New York State laws and policies such as the Climate Leadership and Community Protection Act (CLCPA) and NYSDEC Commissioner Policy 29 (CP-29). These policies require state agencies to consider the effects of their actions on DACs and avoid disproportionately burdening them.
- The EIS identifies DACs primarily in the City of Syracuse, Village of Baldwinsville, City of Fulton, and City of Oswego. It notes that the Town of Clay, where the majority of the Proposed Project would be located, is predominantly non-minority and non-low-income.
- The closest DAC to the Proposed Project site is identified as five miles south in North Syracuse (Census Tracts 140 and 144). Census Tract 144 is noted as having comparatively higher burdens and vulnerabilities, including housing vacancy rate and highway truck traffic.
- The EIS also identifies **two minority block groups in the Town of Clay** near Onondaga

P O Box 11081, Syracuse, NY 13218
Syracusenaacp.com 315.440.6340

Lake and notes that the **nearest low-income community is approximately one mile north in Brewerton** in the Town of Cicero. Furthermore, **five low-income communities and portions of six DACs are located within a half-mile of the Connected Actions**, primarily relating to water supply pipeline and facility upgrades.

While the EIS concludes that the Preferred Action Alternative would **not cause or increase a disproportionate pollution burden** on DACs or minority/low-income communities from construction or operation, the NAACP emphasizes the critical need for vigilant oversight and concrete commitments to ensure that potential adverse effects, even if not deemed "disproportionate," do not unduly impact these communities.

Specific Areas of Interest and Recommendations:

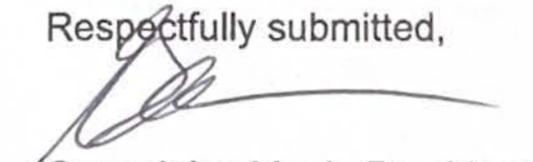

- **Housing Affordability and Indirect Displacement:** The EIS identifies a **potential short-term significant adverse effect on housing** due to induced growth, specifically the risk of **increased rents and property values** in communities within the local study area, such as the low-income community in Brewerton (CT 102 BG 4). Although the EIS states that planned housing projects and Micron's coordination with stakeholders are expected to mitigate this, the NAACP demands **concrete, measurable commitments to support and expand affordable housing initiatives** to prevent indirect displacement for existing residents. Transparent plans outlining how Micron and local agencies will ensure adequate, affordable housing options are available are essential to prevent displacement of vulnerable populations.
- **Water Resources and Indigenous Concerns:** We note the concerns raised by the Onondaga Nation regarding fish and water quality in Onondaga Lake, Lake Ontario, and the Oneida River. While the EIS states that the Preferred Action Alternative would not result in significant adverse impacts on water quality or aquatic life and proposes mitigation measures such as a Wetland Mitigation Plan and stormwater Best Management Practices (BMPs), the **unavoidable permanent loss of approximately 193.38 acres of federal jurisdictional wetlands** (and 10.5 acres of non-jurisdictional wetlands) is a significant environmental impact. We urge continuous, transparent monitoring of water quality and the effectiveness of all mitigation efforts, with active involvement of affected communities, including Indigenous Nations, in the oversight process.
- **Traffic and Noise Impacts:** The EIS predicts **significant adverse noise effects** from construction and operation of the Micron Campus, Rail Spur Site, and Childcare Site, affecting 51 sensitive receptors, including an apartment complex and a nursing home. Additionally, **significant traffic noise effects are anticipated** primarily along major roadway corridors (NYS Route 31, Caughdenoy Road, NYS Route 481, and U.S. Route 11), potentially affecting approximately 520 dwelling unit equivalents. While mitigation measures are proposed, some noise barriers are deemed infeasible due to property

access. The NAACP calls for the prioritization of effective noise and traffic mitigation measures that protect *all* residents, especially those in close proximity to the project and its transportation corridors, ensuring their quality of life is not unduly compromised.

- **Strain on Community Facilities (Fire Services):** The potential significant adverse effect on volunteer fire services due to induced growth is acknowledged, with Micron committing to pay for and support ongoing training efforts with Clay Fire and other local fire departments. Micron also proposes to work with Clay Fire to determine the future need for a full-time professional fire service through a feasibility study or similar method. We emphasize the need for these commitments to translate into **equitable and robust support for all emergency services** serving the expanded population, ensuring that public safety is not compromised in any community, including those which are low-income or minority.
- **Beneficial Effects and Community Investment Fund:** We acknowledge the project's projected beneficial effects, including thousands of new jobs and regional economic development. Of particular note is the proposed **\$500 million investment over 20 years through the Green CHIPS Community Investment Fund (CIF)** for local and regional initiatives. The NAACP advocates for **direct and equitable allocation of these funds to DACs and minority/low-income communities** to address their specific needs and vulnerabilities, ensuring that the benefits of this development are broadly shared and help to rectify existing inequities. Transparency in the allocation and impact of these funds is paramount.

Ongoing Engagement and Accountability: The NAACP stresses the critical need for **continued, meaningful engagement with all affected communities**, particularly DACs and minority/low-income communities, throughout the project's lifecycle. We urge the lead agencies, CPO and OCIDA, and Micron, to establish **transparent and accessible mechanisms for ongoing public accountability** regarding all environmental, social, and economic impacts, including adaptive management strategies for unforeseen issues. We look forward to the opportunity to provide further comments and engage in the decision-making process to ensure that the Micron Semiconductor Manufacturing Project is not only economically successful but also serves as a model for **truly equitable and environmentally just development** in New York State.

Attn: Micron Project

The National Association for the Advancement of Colored People (NAACP) has reviewed the Micron Semiconductor Manufacturing Project, Clay, NY, Draft Environmental Impact Statement (EIS). Our review focuses on the project's potential implications for environmental justice and the well-being of all communities, particularly those identified as disadvantaged, minority, or low-income.

The NAACP recognizes the project's stated purpose to revitalize the U.S. semiconductor manufacturing industry, accelerate domestic production of cutting-edge logic and memory chips, and catalyze long-term economically sustainable growth, supporting U.S. economic and national security. We also acknowledge the commitment to attracting new semiconductor manufacturing projects to New York, including through measures like the New York Green CHIPS Program, which aims to create thousands of jobs and attract billions of dollars.

Environmental Justice Analysis and Key Findings:

- The EIS includes a dedicated Environmental Justice section (Section 3.16), which assesses potential effects on Disadvantaged Communities (DACs) and minority or low-income communities, in accordance with New York State laws and policies such as the Climate Leadership and Community Protection Act (CLCPA) and NYSDEC Commissioner Policy 29 (CP-29). These policies require state agencies to consider the effects of their actions on DACs and avoid disproportionately burdening them.
- The EIS identifies DACs primarily in the City of Syracuse, Village of Baldwinsville, City of Fulton, and City of Oswego. It notes that the Town of Clay, where the majority of the Proposed Project would be located, is predominantly non-minority and non-low-income.
- The closest DAC to the Proposed Project site is identified as five miles south in North Syracuse (Census Tracts 140 and 144). Census Tract 144 is noted as having comparatively higher burdens and vulnerabilities, including housing vacancy rate and highway truck traffic.
- The EIS also identifies **two minority block groups in the Town of Clay** near Onondaga

P O Box 11081, Syracuse, NY 13218
Syracusenaacp.com 315.440.6340

Lake and notes that the **nearest low-income community is approximately one mile north in Brewerton** in the Town of Cicero. Furthermore, **five low-income communities and portions of six DACs are located within a half-mile of the Connected Actions**, primarily relating to water supply pipeline and facility upgrades.

While the EIS concludes that the Preferred Action Alternative would **not cause or increase a disproportionate pollution burden** on DACs or minority/low-income communities from construction or operation, the NAACP emphasizes the critical need for vigilant oversight and concrete commitments to ensure that potential adverse effects, even if not deemed "disproportionate," do not unduly impact these communities.

Specific Areas of Interest and Recommendations:

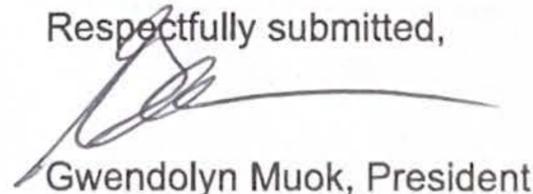

- **Housing Affordability and Indirect Displacement:** The EIS identifies a **potential short-term significant adverse effect on housing** due to induced growth, specifically the risk of **increased rents and property values** in communities within the local study area, such as the low-income community in Brewerton (CT 102 BG 4). Although the EIS states that planned housing projects and Micron's coordination with stakeholders are expected to mitigate this, the NAACP demands **concrete, measurable commitments to support and expand affordable housing initiatives** to prevent indirect displacement for existing residents. Transparent plans outlining how Micron and local agencies will ensure adequate, affordable housing options are available are essential to prevent displacement of vulnerable populations.
- **Water Resources and Indigenous Concerns:** We note the concerns raised by the Onondaga Nation regarding fish and water quality in Onondaga Lake, Lake Ontario, and the Oneida River. While the EIS states that the Preferred Action Alternative would not result in significant adverse impacts on water quality or aquatic life and proposes mitigation measures such as a Wetland Mitigation Plan and stormwater Best Management Practices (BMPs), the **unavoidable permanent loss of approximately 193.38 acres of federal jurisdictional wetlands** (and 10.5 acres of non-jurisdictional wetlands) is a significant environmental impact. We urge continuous, transparent monitoring of water quality and the effectiveness of all mitigation efforts, with active involvement of affected communities, including Indigenous Nations, in the oversight process.
- **Traffic and Noise Impacts:** The EIS predicts **significant adverse noise effects** from construction and operation of the Micron Campus, Rail Spur Site, and Childcare Site, affecting 51 sensitive receptors, including an apartment complex and a nursing home. Additionally, **significant traffic noise effects are anticipated** primarily along major roadway corridors (NYS Route 31, Caughdenoy Road, NYS Route 481, and U.S. Route 11), potentially affecting approximately 520 dwelling unit equivalents. While mitigation measures are proposed, some noise barriers are deemed infeasible due to property

access. The NAACP calls for the prioritization of effective noise and traffic mitigation measures that protect *all* residents, especially those in close proximity to the project and its transportation corridors, ensuring their quality of life is not unduly compromised.

- **Strain on Community Facilities (Fire Services):** The potential significant adverse effect on volunteer fire services due to induced growth is acknowledged, with Micron committing to pay for and support ongoing training efforts with Clay Fire and other local fire departments. Micron also proposes to work with Clay Fire to determine the future need for a full-time professional fire service through a feasibility study or similar method. We emphasize the need for these commitments to translate into **equitable and robust support for all emergency services** serving the expanded population, ensuring that public safety is not compromised in any community, including those which are low-income or minority.
- **Beneficial Effects and Community Investment Fund:** We acknowledge the project's projected beneficial effects, including thousands of new jobs and regional economic development. Of particular note is the proposed **\$500 million investment over 20 years through the Green CHIPS Community Investment Fund (CIF)** for local and regional initiatives. The NAACP advocates for **direct and equitable allocation of these funds to DACs and minority/low-income communities** to address their specific needs and vulnerabilities, ensuring that the benefits of this development are broadly shared and help to rectify existing inequities. Transparency in the allocation and impact of these funds is paramount.

Ongoing Engagement and Accountability: The NAACP stresses the critical need for **continued, meaningful engagement with all affected communities**, particularly DACs and minority/low-income communities, throughout the project's lifecycle. We urge the lead agencies, CPO and OCIDA, and Micron, to establish **transparent and accessible mechanisms for ongoing public accountability** regarding all environmental, social, and economic impacts, including adaptive management strategies for unforeseen issues. We look forward to the opportunity to provide further comments and engage in the decision-making process to ensure that the Micron Semiconductor Manufacturing Project is not only economically successful but also serves as a model for **truly equitable and environmentally just development** in New York State.

To Whom it May Concern:

Comment from the Preservation Association of Central New York (PACNY) on the Micron Draft Environmental Impact Statement

The Preservation Association of Central New York (PACNY), whose mission for the past 50 years has been to promote the preservation of the historical and cultural resources of Central New York, offers the following comments on the Draft Environmental Impact Statement (DEIS) for the Micron Semiconductor Manufacturing Project in Clay, New York.

PACNY serves the five-county region of Onondaga, Oswego, Madison, Cortland, and Cayuga Counties—matching the area of potential induced growth identified by Micron in its DEIS. This alignment presents an important opportunity to ensure that cultural resource considerations are fully integrated into the document, reflecting the significance of these resources within the area likely to experience the project’s indirect impacts.

Need for Attention to Historic Properties in Induced Growth Areas

The DEIS notes that the proposed project will result in “significant changes to land use” across the five-county region due to induced growth, which “would potentially result in upzoning existing residential and commercial districts for higher density or occur outside of districts already zoned” for development (DEIS p. 3-34). However, the document provides only limited analysis of how such widespread land use change could affect historic resources—particularly in rural, agricultural, or historically residential areas where unregulated growth may alter historic context, fabric, and community identity.

The only mention of this concern appears in the following brief statement:

Induced growth throughout the five-county region has the potential to affect historic architectural properties. Although it cannot be predicted exactly when, or to what degree, induced growth would affect historic architectural properties... (DEIS p. 3-143)

This language does not fully convey the likelihood that growth in these areas could lead to the demolition, neglect, or irreversible alteration of historic buildings, landscapes, and districts. A more detailed and proactive assessment could help identify and mitigate these potential impacts.

Housing Crisis and the Definition of “Existing Rental Units”

The DEIS states:

Housing demand in the areas of highest population growth is not expected to be met by existing rental units and for-sale homes... (DEIS p. 3-32)

However, it does not clarify whether the term “existing rental units” refers only to housing that is currently habitable and available, or also includes the many units in the City of Syracuse and nearby villages that are vacant or underutilized due to disrepair and long-term disinvestment. This distinction is important: if part of the region’s housing shortage is linked to the underuse of existing housing stock, then focusing solely on new construction on open land may inadvertently divert demand and resources away from the urban core.

Without targeted strategies to address these issues, there is a risk that the project could unintentionally contribute to further population loss in Syracuse—perpetuating the long-term impacts of mid-20th-century urban renewal and highway construction, particularly in historically marginalized communities—and reinforce patterns of sprawl, disinvestment, and economic disparity.

Growth Models and Long-Term Impact

The population growth models predicting tens of thousands of new households by 2041 (e.g., up to 23,500 in Onondaga County and 7,500 in the City of Syracuse) are presented with confidence but without sufficient explanation of methodology or contingencies. These projections should be examined closely in light of changing remote work trends, housing market volatility, and shifting migration patterns. A flawed model could result in overbuilding and unsustainable infrastructure expansion.

PACNY encourages Micron and reviewing agencies to clarify what specific measures will be taken to promote urban residency—particularly within Syracuse, where infrastructure, housing stock, and public services already exist—and to outline incentives for infill development and the rehabilitation of historic homes.

Cultural Landscape and Open Space as Heritage

Open space and agricultural land in Central New York are not simply “vacant” or “underutilized” parcels awaiting development—they are integral to the region’s cultural

landscape and rural heritage. The DEIS appears to assume these lands are available for transformation with limited attention to their historic significance or community value. If consumed by speculative subdivisions or generic corporate parks, the region risks losing elements of its distinct identity.

Equity and Community Benefit

This project raises important questions about equity and shared benefit: Will there be funding not just for new construction, but also for the stabilization of historic neighborhoods in Syracuse and other legacy cities? Will cultural organizations that anchor and enrich communities be eligible for support? Will residents at risk of housing insecurity due to rising costs or displacement have access to assistance?

Experience with GlobalFoundries in Malta, New York, shows that the workforce catchment area will extend at least 40 miles in all directions—reinforcing the importance of considering regional impacts in planning and mitigation.

Conclusion

PACNY encourages all reviewing agencies to ensure a robust and equitable approach to addressing the known indirect effects of this project. This should include:

- A comprehensive review of historic resources in areas likely to experience induced growth;
- Incentives for urban infill and historic housing rehabilitation;
- Clear justification of growth modeling assumptions; and
- Funding for emergency housing, historic preservation, and cultural organizations in affected communities.

We look forward to collaborating with state and local partners to ensure that Central New York's cultural heritage is protected and strengthened as part of this significant economic development effort.

Sincerely,

The Preservation Association of Central New York (PACNY)

Subject: [EXTERNAL] I'm Robert Peters of Jamesville, NY, and I'm commenting against Micron for several reasons. New Paragraphs

Importance: Normal

Sensitivity: None

The 2nd to 6th paragraphs from the bottom are new, the rest you might have gotten before.

I'm Robert Peters of Jamesville, NY, and I'm commenting against Micron for several reasons. One reason I'm against it, is that it will ruin an irreplaceable natural environment, for a company that will probably not keep any of their promises, in letter or in spirit, and probably leave once the tax breaks expire. Everything else that this County has given tax breaks or other benefits to, has never worked out like the people who want the tax breaks and benefits claim. DestinyUSA has to be the biggest example of this in this County that I have heard of. They promised, among other things, an aquarium and a replica of the Erie Canal. What we got instead was a rather standard mall with a mishmash of flooring, that also bounces when people walk by. Also other places have had private projects supported by the government not work out. Examples include that Foxconn factory in Mount Pleasant Wisconsin that never got used, damaged the village's credit rating, and ended up becoming a data center site, and that research facility expansion in New London, Connecticut that was canceled after a merger that led to the research facility being closed and the area looking like a slum.

Another reason that I'm against it, is that it will take 20 years to build and that is a long time in real terms, and an eternity in tech terms. For example a child born today, could be in their 2nd year of college in 20 years, if they decide to go to college. Who knows what innovations in technology there will be in 20 years, innovations that could render the plant obsolete before it's even half way finished. People didn't expect 20 years ago that the computer company that uses a logo that is a piece of fruit with piece bitten out of it, wouldn't be using the architecture that they had transitioned to at the time, 20 years later. Nor that they would radically change what we thought of a cell phone, nor that they would have developed their own CPU chips for their computers. That also applies to other businesses, as I wasn't thinking at the time that the last new brand to be introduced by a major automaker, wouldn't actually be around 20 years later.

It's entirely possible that a completely new way of making chips emerges that renders the current technology obsolete overnight. It's also possible that memory and storage starts getting put on the CPU die in 20 years, to save board space.

Also Micron also only makes commodity chips, and not anything that is really unique, so they are also easily replaced with another company's chips. Other companies actually make chips with some differentiation in functionality and performance. Micron only makes chips that have to be made to a standard, so there isn't any product differentiation between them and other makers of the same kinds of chips.

Another reason that I'm against it, is that 20 years is a long time in both political and business terms. A lot can change in both the business and political worlds in a day or two, let alone 20 years. A modern publicly traded business goes quarter-by-quarter basis, and not on a long term plan. A tech company can go from being on top to being bankrupt and out of business in a couple of years, as the competition can become better, the products in development don't end up working out, they ended up making bets that didn't work out, somebody else did

something to make their product obsolete, or a combination of things. Also tech companies tend to not be very long lived if they make hardware, as hardware is both a fickle and difficult environment to be in, as they have a lot of physical inventory and processes. The computer company that uses a logo that is a piece of fruit with piece bitten out of it, uses software to sell hardware and they actually haven't made their any of own hardware in over 20 years.

Most if not all of the successful chip makers now, actually only design the chips and off load the actually manufacturing to somebody else. One of the chip makers that actually makes the chips, the one that used to advertise with three blue colored men, is actually subcontracting out some of it's chip manufacturing to somebody who actually specializes in making chips as the one doing the contracting is having problems with their newest process. Also there is no point in building more fabs here, as most of the chips have to be exported to be used, as most of the plants that put chips into assemblies are overseas, which is more expensive and takes more time than making the chips close to where the devices that use them are assembled. The devices also aren't generally conducive to being assembled without the chips in them, so you can't ship them and install the chips here. Also the products made in factories sited because of government encouragement and subsidies, tend to be garbage quality. There's a reason why that nobody else has tried to build cars in New Brunswick, Canada or in Northern Ireland again, as the cars built there weren't all that good, quality wise. The products of Volkswagen plant in Pennsylvania were considered to be not as good as the ones from Germany. And the MBTA has had a lot of problems with subway cars assembled in the Quincy, Massachusetts plant, that was located in Massachusetts, because somebody wanted subway cars assembled in Massachusetts.

Also the political climate can change rapidly. Five people can be president over a 20 year span. That means that major changes in policy and how other countries view us, are possible. Also both the County Executive and Governor could be dead, out of power, or something in between, in 20 years. For that matter the County Executive could have a stroke that could either incapacitate or kill him tomorrow, as he has had a mini-stroke before and probably isn't in the best of health. The next person might not be supportive of the Micron project.

In 20 years the reason to build a fab here could go away for one reason or another. It's possible that in 20 years that the People's Republic of China either implodes or gets peaceably gets taken over by Taiwan, like how West Germany took over East Germany in 1990, something that would end the need for more fabs here, as the People's Republic of China is no longer a threat. Also tariffs could make using chips made here even more expensive, because they could incur tariffs in both directions, because they would be exported as chips and imported in finished devices. Also in 20 years countries might not be willing to deal with us anymore, because we still have problems with civil rights and decide to both boycott and embargo the US in a way that makes what Apartheid South Africa faced look like free trade. The US needs the rest of the world, more than the rest of the world needs the US.

I'm also against it for both military strategy and national security reasons. For one it would be a nice juicy target for aerial bombardment and long-range, missile attacks by any enemies with the capability who are at war with us, as it's planned to be big, important, and the site can be located on any Syracuse road map with Burnet Rd in Clay on it. It would be easily to take out or at least severely damage it, by simply bombing the area around where Burnet Rd is on the map, as you're bound to hit something vital at some point. Even if the situation is only a cyberwar and not a kinetic one, it's still a nice juicy target for a cyberattack, as it would be easy to cause a lot of damage to production and maybe even to the facility itself because being so big, a small network or personnel compromise could be leveraged to actually attack a lot of production equipment. A successful social engineering or cyber attack would have really big rewards for a adversary, as it would cripple a large amount of chip manufacturing capacity. Also it's being built on a wetland and an area with a high water table, which means the possibility of soil liquefaction exists, which can be induced by an explosion. Also that means that the soil is probably very soft and may not actually be able to support the weight of the fabs, which would mean that the project would be a colossally expensive mistake, as they would sink and possibly not sink level. Soft ground can't support a lot of weight, which is why heavy things sink in it. All the dirt they want to bring in, probably will end up

getting saturated and being made useless. Also where are they going to get all of that dirt from, as it's soil and not the stuff used to get leverage over someone.

Also if National Grid is going to install smart metering, somebody at National Grid could turn off the power accidentally or accidentally on purpose, which would ruin a lot of production. Somebody might turn off the power because they want to reduce the load on the grid and not realizing what they are turning off the power to, or they want to sabotage production. A hacker or cyberwarrior could also get into National Grids systems and do the same thing, possibly to a wider area as well.

I'm also against it because it will use way too much electricity and will ruin our quality of life. The governor is trying to reduce the state's carbon emissions, which this facility is going to increase if built. One of the things she is doing to achieve that goal, is by replacing fossil fuels with electricity. That is going to increase the demand for electricity by a very large amount, as a heat pump is an air conditioner that can also operate normally in reverse, to take in heat from outside. The heating elements inside of the air handler of ducted heat pump systems, also take quite a bit of power. It also take quite a bit of power to charge all of the electric vehicles in a reasonable amount of time, or at all in some cases. The average house may end up needing a 300 amp service to handle all of those loads. That size of service is not all that common even now. This means that we probably can't handle both all of those demands and Micron, because there won't be enough generation and distribution capacity. And people will revolt if only Micron and the local elites can get electricity, as they didn't sign up for an Authoritarian state. I don't see National Grid beefing up the distribution infrastructure or increasing generation capacity, as they are surprisingly encouraging energy conservation. It's probably cheaper to do that, than to actually make upgrades. Micron will probably cause electricity prices to skyrocket, as they will use a lot of electricity and not pay for any upgrades. Micron will also mean that power outages will become more frequent, as National Grid's priority will be to keep Micron supplied with power, at the expensive of everybody else. That also means that natural gas service may end up getting interrupted because at least some compressor stations are electric, and that grid-tied solar systems without battery backup won't work.

Also they probably aren't going to hire any local people even if they say they will, which means the population will skyrocket which will strain local services and infrastructure, and make the Syracuse area an awful place to live. The Syracuse area can't deal with anymore garbage that it supplies now, and they apparently don't have any contingency plans for when the incinerator breaks down. People were actually panicking when it broke down the first time, and that place is beyond it's design life anyway and apparently they don't stock more than one of any given spare part. What happens if they end up breaking something that they don't have more of, and that part has a six month lead time. We might not be able to supply enough water and sewer capacity for everybody and Micron. You might be able to kick the sewer capacity problem down the road for 4 years, depending on how many septic systems are installed and how big they are, but the water problem would be immediate.

They also say that it will create "up to" jobs and not a fixed number of jobs, which means they could hire either nobody, or only 4 security persons to watch the site after they have abandoned it, and technically keep their promise. The phrase "up to" is a scary thing in this kind of thing, as it's easy for them to weasel out of it and still keep all of the government benefits that they received. It's like when they use "up to" in the reward for the apprehension of a criminal. They only way that they are going to pay out the full reward, is if you bring them in yourself and are shrewd negotiator. They are going to try to do anything to get out of paying the reward.

Personally if I was in charge of Micron, I wouldn't build the fab as it's a very poor use of company money. It would be better to abandon the project now and take a small hit to the price of the stock, or even possibly a boost to the price of the stock, then end up tanking the stock and the quarterly report because you essentially flushed a ton of money down the drain. There are way too many unknowns for spending money on this to be a sensible thing to do. This project is going to be like playing Jenga in bed or in a moving vehicle, as you don't know what's going to bring the whole thing crashing down, or when it's going to happen.

I don't know if anybody will even read this, or any comment on this project as they don't care about what the constituents want. They only care about who is lining their pockets. Now you may think that I'm cynic for thinking that, but a cynic is what an idealist calls a realist. I've heard rumors that say that the Onondaga County Executive takes kickbacks. That is true, one way or the other. I bet if you did a through investigation of most politicians, you would find that they have unexplained income or income that they don't want to tell you where it comes from, as it would incriminate them.

It's almost like we live in an Authoritarian state already, as stuff that the people don't like gets shoved down their throats. It's not their jobs are all that important anyway. If it all hit the fan, most of them would be useless in the situation anyway, as they don't know how to do anything. The jobs of garbage people, and the people who keep the water supply and sewer systems working, have jobs that are way more important than the jobs of the politicians. When the politicians stop working correctly nothing really changes, but when garbage people go on strike, it can bring a city to it's knees, both literally and metaphorically. A non-functional water supply or sewer system can cause major problems too, as a modern city can't function well without both. As long as everything gets funded, you really don't need politicians, because things can be setup to fund operations and the repairs and replacements of infrastructure automatically. Nothing has really changed much since the 1950s or 1960s anyway, so it's not like the politicians are actually doing anything useful. It's no wonder why people vote for the Authoritarian, since democracy doesn't appear to behave any differently, if we get stuff shoved down our throats anyway. Since the County Executive is an R-Word anyway, he feels that he has carte blanche to be an Authoritarian, since the orange man in the White House is one, or at least acts like one.

Also, both the Governor and the County Executive don't realize the nature of their relationship with the constituency. They think that they are kings ruling over subjects, but in reality they are a high school principal and we are the school board, since we are the ones that hire and fire, and we can ask them to leave. The people are technically their bosses, as we determine whether they get hired or fired and if they receive any promotions. The County Executive probably has problems with realizing that somebody else is the boss, as that might be at least part of the reason why he got divorced.

Politically, it would be safer for both of them to not go through with this project, as they can't do a James Chupaila if they don't go through with it. James Chupaila was the principal of Fayetteville Manlius High School from 1987 to 2010. Though he killed his career on June 19th 2009, when he told the parent's of yours truly and a person on the Spectrum, the day of the graduation, that I couldn't go to my graduation. My parent's were understandably furious, and let other parents know about what they were told, and probably including Nick Cappoletti. I went to my graduation ceremony anyway, and among the other people that showed up to the graduation that the principal probably didn't want showing up, was somebody who arrived in a hospital bed, and Nick Cappoletti son, Mark. There was no special graduation ceremony at the district office, for people in special education classes that year, like what they had done previously, and possibly after that. The school board ended up getting wind of the resulting firestorm, resulting in him probably getting a choice between leaving and getting fired. I don't know if they decided to get rid of him, because he pulled that stunt, or that it resulted in more people that they didn't want showing up to the graduation ceremony, showing up and ruining the image that they are a perfect school. The moral of the story is, that when your actions can result in something blowing up in your face, it's safest do to nothing. If James Chupaila hadn't made that phone call and let me attend the graduation without any fuss. The special graduation ceremony at the district office would've gone on with everybody else, and his career at Fayetteville Manlius would've lasted until at least 2015. But because he made the phone call, he ended up being reduced to serving as interim principal for three different school districts, and even then those might have not happened, if they knew the reason why he left and what he done June 19th 2009.

When the people are unhappy with something that somebody in power as done, they can vote them out or demand a reversal or their resignation. And even the party could be so unhappy with what he has caused that somebody primarys him and wins, or even worse, one of the big gray residents of Syracuse could beat him, the ones with the really long and flexible nose. Even communist parties have become tired of their leaders and have

gotten rid of them. Of course there are some people that, for various reasons, will take a different and more immediate, course of action. Somebody could make the County Executive disappear because he admitted that he doesn't care about people opinion's and just does what he wants, which is how a communist behaves. There maybe are still people out there who believe that communism, communists, and fellow travelers, must be eradicated by any means necessary. I wouldn't know from experience but, it seems to be easy to get rid of a body in this County as if you throw it out in the trash, it will be gone in three days, as that is how long the trash usually "stews" for at the incinerator before they burn it. The operators of the place mentioned that fact at one time. The option of burial in or under something exists but it's not a reliable method, as there is the possibility that it might eventually be found. Important people have disappeared without a trace before in the past. Judge Crater hasn't been seen since 1930 and Jimmy Hoffa hasn't been seen since 1975. I'm not one of those people who would resort to those kinds of things, but there are people who would, either because they are unstable, have nothing to lose, feel it's the only way to stop it, or they just want the "fame" that can come from killing somebody "important". Look at all of the people who are only remembered for killing somebody "important", though McKinley's assassin maybe less known than most of the others.

I'm honestly surprised that the County Sheriff hasn't made the County Executive's life a living H-E Double hockey sticks, by having an deputy working to rule following him everywhere he goes and stopping him for every law he violates, no matter how small, because of the Jamesville Penitentiary situation. It isn't police harassment if the County Executive is actually doing something illegal. Or that worse hasn't happened to him, since at least one deputy knows how to get away with it now. I don't know if anyone would miss him, though his ex-wife may not want to see her gravy train go down the mine. Of course they Sheriff would probably rather have him alive, as a Theodore Roosevelt quote says. The gist of the quote is, is when you have them by one pair of body parts, their hearts and minds will follow. That quote is kind of true, as some people will do anything to save their bacon.

If this project goes through, it will ruin the lives of the people who live in the Syracuse area. The cons outweigh the pros, so it would be best for all involved to abandon the project before starting. It would a massive environmental disaster and a massive waste of money for no benefit, so why even bother doing it. Everybody involved in starting the project may actually be out of office or dead in 20 years, but the environmental damage and the reduced quality of life would be permanent. The environment and quality of life is a lot more important than money and jobs that probably won't actually come. When it comes to projects like this in this day and age, you can't trust corporations to hold up their end of the bargain

Subject: [EXTERNAL] I'm Robert Peters of Jamesville, NY, and I'm commenting against Micron for several reasons.

I'm Robert Peters of Jamesville, NY, and I'm commenting against Micron for several reasons. One reason I'm against it, is that it will ruin an irreplaceable natural environment, for a company that will probably not keep any of their promises, in letter or in spirit, and probably leave once the tax breaks expire. Everything else that this County has given tax breaks or other benefits to, has never worked out like the people who want the tax breaks and benefits claim. DestinyUSA has to be the biggest example of this in this County that I have heard of. They promised, among other things, an aquarium and a replica of the Erie Canal. What we got instead was a rather standard mall with a mishmash of flooring, that also bounces when people walk by. Also other places have had private projects supported by the government not work out. Examples include that Foxconn factory in Mount Pleasant Wisconsin that never got used, damaged the village's credit rating, and ended up becoming a data center site, and that research facility expansion in New London, Connecticut that was canceled after a merger that led to the research facility being closed and the area looking like a slum.

Another reason that I'm against it, is that it will take 20 years to build and that is a long time in real terms, and an eternity in tech terms. For example a child born today, could be in their 2nd year of college in 20 years, if they decide to go to college. Who knows what innovations in technology there will be in 20 years, innovations that could render the plant obsolete before it's even half way finished. People didn't expect 20 years ago that the computer company that uses a logo that is a piece of fruit with piece bitten out of it, wouldn't be using the architecture that they had transitioned to at the time, 20 years later. Nor that they would radically change what we thought of a cell phone, nor that they would have developed their own CPU chips for their computers. That also applies to other businesses, as I wasn't thinking at the time that the last new brand to be introduced by a major automaker, wouldn't actually be around 20 years later.

It's entirely possible that a completely new way of making chips emerges that renders the current technology obsolete overnight. It's also possible that memory and storage starts getting put on the CPU die in 20 years, to save board space.

Also Micron also only makes commodity chips, and not anything that is really unique, so they are also easily replaced with another company's chips. Other companies actually make chips with some differentiation in functionality and performance. Micron only makes chips that have to be made to a

standard, so there isn't any product differentiation between them and other makers of the same kinds of chips.

Another reason that I'm against it, is that 20 years is a long time in both political and business terms. A lot can change in both the business and political worlds in a day or two, let alone 20 years. A modern publicly traded business goes quarter-by-quarter basis, and not on a long term plan. A tech company can go from being on top to being bankrupt and out of business in a couple of years, as the competition can become better, the products in development don't end up working out, they ended up making bets that didn't work out, somebody else did something to make their product obsolete, or a combination of things. Also tech companies tend to not be very long lived if they make hardware, as hardware is both a fickle and difficult environment to be in, as they have a lot of physical inventory and processes. The computer company that uses a logo that is a piece of fruit with piece bitten out of it, uses software to sell hardware and they actually haven't made their any of own hardware in over 20 years.

Most if not all of the successful chip makers now, actually only design the chips and off load the actually manufacturing to somebody else. One of the chip makers that actually makes the chips, the one that used to advertise with three blue colored men, is actually subcontracting out some of it's chip manufacturing to somebody who actually specializes in making chips as the one doing the contracting is having problems with their newest process. Also there is no point in building more fabs here, as most of the chips have to be exported to be used, as most of the plants that put chips into assemblies are overseas, which is more expensive and takes more time than making the chips close to where the devices that use them are assembled. The devices also aren't generally conducive to being assembled without the chips in them, so you can't ship them and install the chips here. Also the products made in factories sited because of government encouragement and subsidies, tend to be garbage quality. There's a reason why that nobody else has tried to build cars in New Brunswick, Canada or in Northern Ireland again, as the cars built there weren't all that good, quality wise. The products of Volkswagen plant in Pennsylvania were considered to be not as good as the ones from Germany. And the MBTA has had a lot of problems with subway cars assembled in the Quincy, Massachusetts plant, that was located in Massachusetts, because somebody wanted subway cars assembled in Massachusetts.

Also the political climate can change rapidly. Five people can be president over a 20 year span. That means that major changes in policy and how other countries view us, are possible. Also both the County Executive and Governor could be dead, out of power, or something in between, in 20 years. For that matter the County Executive could have a stroke that could either incapacitate or kill him tomorrow, as he has had a mini-stroke before and probably isn't in the best of health. The next person might not be supportive of the Micron project.

In 20 years the reason to build a fab here could go away for one reason or another. It's possible that in 20 years that the People's Republic of China either implodes or gets peaceably gets taken over by Taiwan, like how West Germany took over East Germany in 1990, something that would end the need for more fabs here, as the People's Republic of China is no longer a threat. Also tariffs could make using chips made here even more expensive, because they could incur tariffs in both directions, because they would be exported as chips and imported in finished devices. Also in 20 years countries might not be willing to deal with us anymore, because we still have problems with civil rights and decide to both boycott and embargo the US in a way that makes what Apartheid South Africa faced look like free trade. The US needs the rest of the world, more than the rest of the world needs the US.

I'm also against it for both military strategy and national security reasons. For one it would be a nice juicy target for aerial bombardment and long-range, missile attacks by any enemies with the capability who are at war with us, as it's planned to be big, important, and the site can be located on any Syracuse road map with Burnet Rd in Clay on it. It would be easy to take out or at least severely damage it, by simply bombing the area around where Burnet Rd is on the map, as you're bound to hit something vital at some point. Even if the situation is only a cyberwar and not a kinetic one, it's still a nice juicy target for a cyberattack, as it would be easy to cause a lot of damage to production and maybe even to the facility itself because being so big, a small network or personnel compromise could be leveraged to actually attack a lot of production equipment. A successful social engineering or cyber attack would have really big rewards for an adversary, as it would cripple a large amount of chip manufacturing capacity. Also it's being built on a wetland and an area with a high water table, which means the possibility of soil liquefaction exists, which can be induced by an explosion. Also that means that the soil is probably very soft and may not actually be able to support the weight of the fabs, which would mean that the project would be a colossally expensive mistake, as they would sink and possibly not sink level. Soft ground can't support a lot of weight, which is why heavy things sink in it. All the dirt they want to bring in, probably will end up getting saturated and being made useless. Also where are they going to get all of that dirt from, as it's soil and not the stuff used to get leverage over someone.

Also if National Grid is going to install smart metering, somebody at National Grid could turn off the power accidentally or accidentally on purpose, which would ruin a lot of production. Somebody might turn off the power because they want to reduce the load on the grid and not realizing what they are turning off the power to, or they want to sabotage production. A hacker or cyberwarrior could also get into National Grids systems and do the same thing, possibly to a wider area as well.

I'm also against it because it will use way too much electricity and will ruin our quality of life. The governor is trying to reduce the state's carbon emissions, which this facility is going to increase if built. One of the things she is doing to achieve that goal, is by replacing fossil fuels with electricity. That is going to increase the demand for electricity by a very large amount, as a heat pump is an air conditioner that can also operate normally in reverse, to take in heat from outside. The heating elements inside of the air handler of ducted heat pump systems, also take quite a bit of power. It also take quite a bit of power to charge all of the electric vehicles in a reasonable amount of time, or at all in some cases. The average house may end up needing a 300 amp service to handle all of those loads. That size of service is not all that common even now. This means that we probably can't handle both all of those demands and Micron, because there won't be enough generation and distribution capacity. And people will revolt if only Micron and the local elites can get electricity, as they didn't sign up for an Authoritarian state. I don't see National Grid beefing up the distribution infrastructure or increasing generation capacity, as they are surprisingly encouraging energy conservation. It's probably cheaper to do that, than to actually make upgrades. Micron will probably cause electricity prices to skyrocket, as they will use a lot of electricity and not pay for any upgrades. Micron will also mean that power outages will become more frequent, as National Grid's priority will be to keep Micron supplied with power, at the expensive of everybody else. That also means that natural gas service may end up getting interrupted because at least some compressor stations are electric, and that grid-tied solar systems without battery backup won't work.

Also they probably aren't going to hire any local people even if they say they will, which means the population will skyrocket which will strain local services and infrastructure, and make the Syracuse area an awful place to live. The Syracuse area can't deal with anymore garbage that it supplies now, and they apparently don't have any contingency plans for when the incinerator breaks down. People were actually panicking when it broke down the first time, and that place is beyond it's design life anyway and

apparently they don't stock more than one of any given spare part. What happens if they end up breaking something that they don't have more of, and that part has a six month lead time. We might not be able to supply enough water and sewer capacity for everybody and Micron. You might be able to kick the sewer capacity problem down the road for 4 years, depending on how many septic systems are installed and how big they are, but the water problem would be immediate.

They also say that it will create "up to" jobs and not a fixed number of jobs, which means they could hire either nobody, or only 4 security persons to watch the site after they have abandoned it, and technically keep their promise. The phrase "up to" is a scary thing in this kind of thing, as it's easy for them to weasel out of it and still keep all of the government benefits that they received. It's like when they use "up to" in the reward for the apprehension of a criminal. The only way that they are going to pay out the full reward, is if you bring them in yourself and are shrewd negotiator. They are going to try to do anything to get out of paying the reward.

Personally if I was in charge of Micron, I wouldn't build the fab as it's a very poor use of company money. It would be better to abandon the project now and take a small hit to the price of the stock, or even possibly a boost to the price of the stock, then end up tanking the stock and the quarterly report because you essentially flushed a ton of money down the drain. There are way too many unknowns for spending money on this to be a sensible thing to do. This project is going to be like playing Jenga in bed or in a moving vehicle, as you don't know what's going to bring the whole thing crashing down, or when it's going to happen.

I don't know if anybody will even read this, or any comment on this project as they don't care about what the constituents want. They only care about who is lining their pockets. Now you may think that I'm cynic for thinking that, but a cynic is what an idealist calls a realist. I've heard rumors that say that the Onondaga County Executive takes kickbacks. That is true, one way or the other. I bet if you did a through investigation of most politicians, you would find that they have unexplained income or income that they don't want to tell you where it comes from, as it would incriminate them.

It's almost like we live in an Authoritarian state already, as stuff that the people don't like gets shoved down their throats. It's not their jobs are all that important anyway. If it all hit the fan, most of them would be useless in the situation anyway, as they don't know how to do anything. The jobs of garbage people, and the people who keep the water supply and sewer systems working, have jobs that are way more important than the jobs of the politicians. When the politicians stop working correctly nothing really changes, but when garbage people go on strike, it can bring a city to it's knees, both literally and metaphorically. A non-functional water supply or sewer system can cause major problems too, as a modern city can't function well without both. As long as everything gets funded, you really don't need politicians, because things can be setup to fund operations and the repairs and replacements of infrastructure automatically. Nothing has really changed much since the 1950s or 1960s anyway, so it's not like the politicians are actually doing anything useful. It's no wonder why people vote for the Authoritarian, since democracy doesn't appear to behave any differently, if we get stuff shoved down our throats anyway. Since the County Executive is an R-Word anyway, he feels that he has carte blanche to be an Authoritarian, since the orange man in the White House is one, or at least acts like one.

Also, both the Governor and the County Executive don't realize the nature of their relationship with the constituency. They think that they are kings ruling over subjects, but in reality they are a high school principal and we are the school board, since were are the ones that hire and fire, and we can ask them to leave. The people are technically their bosses, as we determine whether they get hired or fired and if they

receive any promotions. The County Executive probably has problems with realizing that somebody else is the boss, as that might be at least part of the reason why he got divorced.

Politically, it would be safer for both of them to not go through with this project, as they can't do a James Chupaila if they don't go through with it. James Chupaila was the principal of Fayetteville Manlius High School from 1987 to 2010. Though he killed his career on June 19th 2009, when he told the parent's of yours truly and a person on the Spectrum, the day of the graduation, that I couldn't go to my graduation. My parent's were understandably furious, and let other parents know about what they were told, and probably including Nick Cappoletti. I went to my graduation ceremony anyway, and among the other people that showed up to the graduation that the principal probably didn't want showing up, was somebody who arrived in a hospital bed, and Nick Cappoletti son, Mark. There was no special graduation ceremony at the district office, for people in special education classes that year, like what they had done previously, and possibly after that. The school board ended up getting wind of the resulting firestorm, resulting in him probably getting a choice between leaving and getting fired. I don't know if they decided to get rid of him, because he pulled that stunt, or that it resulted in more people that they didn't want showing up to the graduation ceremony, showing up and ruining the image that they are a perfect school. The moral of the story is, that when your actions can result in something blowing up in your face, it's safest do to nothing. If James Chupaila hadn't made that phone call and let me attend the graduation without any fuss. The special graduation ceremony at the district office would've gone on with everybody else, and his career at Fayetteville Manlius would've lasted until at least 2015. But because he made the phone call, he ended up being reduced to serving as interim principal for three different school districts, and even then those might have not happened, if they knew the reason why he left and what he done June 19th 2009.

When the people are unhappy with something that somebody in power as done, they can vote them out or demand a reversal or their resignation. And even the party could be so unhappy with what he has caused that somebody primaries him and wins, or even worse, one of the big gray residents of Syracuse could beat him, the ones with the really long and flexible nose. Even communist parties have become tired of their leaders and have gotten rid of them. Of course there are some people that, for various reasons, will take a different and more immediate, course of action. Somebody could make the County Executive disappear because he admitted that he doesn't care about people opinion's and just does what he wants, which is how a communist behaves. There maybe are still people out there who believe that communism, communists, and fellow travelers, must be eradicated by any means necessary. I wouldn't know from experience but, it seems to be easy to get rid of a body in this County as if you throw it out in the trash, it will be gone in three days, as that is how long the trash usually "stews" for at the incinerator before they burn it. The operators of the place mentioned that fact at one time. The option of burial in or under something exists but it's not a reliable method, as there is the possibility that it might eventually be found. Important people have disappeared without a trace before in the past. Judge Crater hasn't been seen since 1930 and Jimmy Hoffa hasn't been seen since 1975. I'm not one of those people who would resort to those kinds of things, but there are people who would, either because they are unstable, have nothing to lose, feel it's the only way to stop it, or they just want the "fame" that can come from killing somebody "important". Look at all of the people who are only remembered for killing somebody "important", though McKinley's assassin maybe less known than most of the others.

I'm honestly surprised that the County Sheriff hasn't made the County Executive's life a living H-E Double hockey sticks, by having an deputy working to rule following him everywhere he goes and stopping him for every law he violates, no matter how small, because of the Jamesville Penitentiary situation. It isn't police harassment if the County Executive is actually doing something illegal. Or that worse hasn't

Subject: [EXTERNAL] Micron DEIS public comment

To whom it may concern,

My name is Katie Purcell and I am a lifetime resident, worker, and community member of Onondaga county. I am also a graduate of Syracuse's own SUNY College of Environmental Science & Forestry (ESF). As a community member and an individual who is personally committed to human and environmental health, I am writing to comment on the Draft Environmental Impact Statement (DEIS) for Micron Technology's proposed microchip fabrication facility.

Frankly, there are numerous issues with the project as it stands dictated by the DEIS. Firstly, the proposed facility requires the decimation and/or alteration of hundreds of acres of natural wetlands that fulfill multiple valuable roles on our planet; wetlands are carbon sinks, natural filtration in our water cycle, sequester water (which mitigates flooding risk), and crucial habitat for valuable wildlife -- particularly endangered & threatened species -- just to name a few vital ecosystem services. While the DEIS proposes to restore wetlands in other areas, this proposal does not account for several pertinent issues: 1) restored wetlands are not as effective in their ecological roles (such as the benefits listed above) nor are they as biodiverse as the original, aged wetlands that will be impacted by Micron's development; 2) the production of microchips requires the use of chemicals (including but not limited to PFAs) that are known to have harmful impacts on the environment, as well as those that exist in it (plants, animals, humans, etc.). Beyond this, there is a complete lack information on how Micron intends to reduce greenhouse gas emissions.

Issues that Micron must address, on behalf of the affected community:

- Transparency and details on the types of chemicals used in the microchip production process, as well as how they intend to enforce environmental monitoring and due diligence to not contaminate nearby communities and surface waters with these harmful substances.

- Where are the proposed alternative locations for this project? It is a borderline essential for developers to provide alternative location considerations for proposed projects in their impact assessments, and the pros and cons of said location considerations. Knowing that wetland restoration in other areas is not nearly as beneficial or biodiverse as the wetlands that would be altered for this project, and the current DEIS is not sufficient in a disappointing plethora of ways, what other options have been considered?

To those at Micron or associated with the Semiconductor Manufacturing Project that currently reside in the area or intend to reside here in the future: are you satisfied with the efforts to mitigate harm to humans and the surrounding natural world that are outlined by this DEIS? Would you allow your children to play, live, and drink water in the surrounding areas of the Micron project, knowing that they have not considered any cumulative environmental impacts on communities? Do you intend to live downstream of this facility and its hazardous waste? Do you think that this project's contribution to climate change is a "global and regional issue," and therefore not a relevant local environmental justice issue to address in their DEIS? Do you feel safe knowing that most of the air pollution monitoring data for this DEIS comes from monitors more than 70 miles away from the project site?

From someone who has had to read multiple environmental impacts statements for school, I want you to know that this DEIS is heinously insufficient in addressing impacts of the environment and the surrounding community/individuals that will be subject to the effects of this project for years to come. I am not just a bleeding heart activist who does not understand the realities of the perceived benefits of domestic microchip production or economic growth of the area; I am a scientist and well-read member of this community who took the time to parse through this DEIS only to find that it does not address a multiplicity of concerns and issues surrounding the project as it stands. Moreover, to only allow 45 days for public comment on such a large document detailing one of the biggest construction projects in NYS history is deeply inconsiderate and downright disrespectful to the community that you seek to change forever through this project. If Micron is set on altering our community and cherished ecosystems, I implore them to show more dignified behavior and values moving forward.

Many thanks for your time and consideration,

Katie Purcell

Subject: [EXTERNAL] Public Comment for Micron DEIS: Urgent Need to Address Housing Locally

Dear Micron DEIS Review Team,

I am writing as a resident of Syracuse to express concern that the Draft Environmental Impact Statement does not meaningfully address housing. Saying “the state will solve it” is not enough. The local housing shortage is already serious, and without concrete commitments, this project could make it worse.

The final EIS should:

Include specific local housing mitigation measures such as funding for affordable housing, rehabilitation programs, and tenant protections.

Provide clear timelines and funding sources for any state involvement.

Commit to working with county and municipal housing agencies to ensure timely implementation.

Housing is central to community stability, economic health, and equity. It should be treated as a core part of mitigation, not left to future state action. I urge you to address it directly in the final plan.

Maurice Brown, Syracuse

From: Christy Dannible <copydiva58@gmail.com>
Sent: Sunday, August 10, 2025 9:30 PM
To: CHIPSNEPA@chips.gov
Subject: [EXTERNAL] Micron Project

My name is Christy Dannible. I reside at 5108 Old Barn Rd, Clay, NY 13041. I have lived at this address for the last 16 years.

I am writing you today why the Micron Plant should NOT be allowed in the Town of Clay.

First, it will destroy our Wetlands. Micron's proposed chipmaking plant involves the destruction of hundreds of acres of wetlands that we will never be able to replace. There are endangered species such as the Indiana bat and the Northern long-eared bat; as well as high-priority species in need of the greatest conservation needs: the Eastern Meadowlark, Brown Thrasher and the Bobolink that will continue to decline due to the loss of their habitats. There are many more listed as near-threatened due to major losses. The U.S. Fish and Wildlife Service criticized Micron for not presenting alternative site plans that would avoid some of the wetlands and highlighted the project's impact on aquatic habitats, as well.

Have we not learned from Onondaga Lake? We do not need anymore air or water pollution in this City, especially NOT in the two most-populated towns in Syracuse! We will never be able to rebuild our much-needed wetlands!

Second, the use of harmful chemicals in the middle of Suburba is just asking for more cancers and other disorders for the residents and animal life in this area. I already have acute myloed leukemia. I have been through chemo, radiation and a bone marrow transplant. I have rebuilt my home to be my forever home. Safe. Nontoxic. Now, I run the risk of living on top of smelly ponds and suffering possible other health problems due to my proximity to the plant.

Syracuse already has the highest rate of thyroid cancer due to Allied Chemical dumping in Onondaga Lake.

Semiconductor manufacturing processes rely on chemicals such as fluorinated gases (like NF3 with 17,000 times the global warming potential of CO2), wet chemicals, and PFAS ("forever chemicals"). PFAS chemicals can accumulate in the environment and are toxic, posing potential health risks. I am

extremely concerned about the discharge of unidentified or unknown toxins in unspecified quantities seeping into our groundwater supply.

I have friends that live next to the Micron Plant in Manassas, Virginia, and they say the air smells; there are people complaining of sore throats, migraines and a host of other problems. Most of the complaints have been settled out of court, but that plant has negatively impacted that area. I do not want that to happen to our beautiful town. Pollute it and this area will end up just like THE LORAX.

Lastly, a company of this magnitude does not belong in two of the most-populated towns in Syracuse. We already have a ridiculously high traffic volume due to the number of residents and the rerouting of I-81. It already takes close to an hour to run the gauntlets of Routes 31 and 11 in what used to be minutes. This area does not need a higher volume of traffic congesting the area.

There are many reasons the Micron Plant does not belong in this area. I sincerely hope some of these reasons resonate with the powers that be.

Sincerely,
Christy Dannible

Importance: Normal

Sensitivity: None

Archived: Thursday, August 14, 2025 12:35:09 PM

My public comment submission:

Micron says this project will have “no environmental justice impacts,” but they haven’t shown how they reached that conclusion. They looked at too small an area, didn’t consistently consider disadvantaged or low-income communities, and left out many connected impacts like new roads, rail lines, utilities, and all the extra development this project will bring. They have only held two small public meetings, and there’s no plan to share ongoing environmental monitoring or include community voices in decisions over the next 16 years.

Big questions remain about PFAS pollution, wetland impacts, stormwater, air quality, and climate change, all of this affects our communities completely. This also affects our wildlife, wetlands, and the natural areas many of us depend on for clean water, flood protection, and habitat.

This review needs to be expanded, made transparent, and include real community oversight before the project moves forward.

Micron falls short of including the local community in the full project and impacts. It is just another example of how big business takes advantage of a community, and leaves wreckage in its wake. The transparency is lacking for a reason and it isn’t to the benefit of its neighbors.

Subject: [EXTERNAL] comment on Micron Draft EIS

To Whom It May Concern:

Commitments made in support of the Draft Environmental Impact Statement should be reflected in enforceable conditions in subsequent permits (unless more stringent permit conditions are deemed necessary).

For example, BMPs for GHGs and Climate Change, identified in Table 3.7-14, should become enforceable permit conditions, unless more stringent conditions are deemed necessary.

HISTORY

The EPA's engagement of PFAS pollution started with the litigation of 3M corporation in 1999. By the start of the Clay Micron project the EPA had established a nation-wide comprehensive, science-based approach to understanding the diversity of pfas chemicals, their distribution, potential toxicity, and monitoring program. This served as the basis for Regulations, and treatment. The EPA had a growing Office of Research and Development. ORD did lab science, funded PFAS research at major universities, worked with States and industry, and promulgated initial drinking water standards. It also generated initial lists of PFAS chemicals to be monitored. . In response to the increasing importance of this expanding human and ecological health arena, the EPA generated the policy document: **PFAS Strategic Roadmap** (<https://www.epa.gov/pfas/pfas-strategic-roadmap-epas-commitments-action-2021-2024>).

One Roadmap goal was "cradle to grave" PFAS management. A Roadmap's key strategic guidance documents strongly encourages State agencies, which issue Federal/State water and air discharge permits, to place pfas monitoring requirements on the permits. This proactively can generate in-situ knowledge, and enhance public transparency.

Generalizing, the extensive discussion of PFAS in the DEIS, amounts to Micron stating it will conform to Federal and State regulations. This includes transit, and worker safety. In the spring of 2025 the Federal government cancelled all research university PFAS contracts. Also in the spring, EPA had a major staff reduction. A second one followed. In the new Federal budget, the EPA ORD has been eliminated. There will be no new Federal PFAS regulation or guidelines of Micron for the foreseeable future. The current DEIS covers the full 4 Fab build-out. Phases 3 and 4 may require a supplemental EIS process, probably an "Environmental Assessment". NEPA itself is undergoing major transformations. "Climate change", and "environmental justice" have been removed" as impact categories. Individual Federal EIS Lead Agencies have been ordered to rewrite their own NEPA Regulations.

As per the 10th Amendment to the Constitution, states are responsible for the public health safety and welfare. NY will need to establish strong PFAS sharing relationships with like-minded states and countries.

How is NY State Doing with this Brand New Major Responsibility?

Chip Fabs make different chip, use different PFAS, and are located in unique geo/social settings.

SEQR Regulations

Most States don't have an EIS Law. In those that do some apply only to major actions by state agencies, such as a highway. NY SEQR Regs are pretty simple because they apply to projects ranging from a small local shopping mall to Micron. There is however a unique subsection of the regulations.

6NYCRR SEQR

Sec 619.7 Preparation and Contents

(b) Contents

- (6) In addition to the analysis of significant adverse impacts required in subparagraph (b)(5)(iii) of this section, if information about reasonably foreseeable catastrophic impacts to the environment is unavailable because the cost to obtain it is exorbitant, or the means to obtain it are unknown, or there is uncertainty about its validity, and such information is essential to an agency's SEQR findings, the EIS must:

617.9 – 617.10

- (i) identify the nature and relevance of unavailable or uncertain information;
- (ii) provide a summary of existing credible scientific evidence, if available; and
- (iii) assess the likelihood of occurrence, even if the probability of occurrence is low, and the consequences of the potential impact, using theoretical approaches or research methods generally accepted in the scientific community.

This analysis would likely occur in the review of such actions as an oil supertanker port, a liquid propane gas/liquid natural gas facility, or the siting of a hazardous waste treatment facility. It does not apply in the review of such actions as shopping malls, residential subdivisions or office facilities.

All of this **except (iii)** applies to MICRON PFAS.

There are no current Federal or NYS regulations on Emissions from Chip fabs. We don't have, and may never have, enough long term human/ecological morbidity/mortality knowledge to regulate individual chip fab generated PFAS emissions.

In the last few years, NYS has substantially engaged statewide PFAS issues. It has public drinking water standards. It has banned materials ranging from clothing to airport de-icing sprays that are known toxins. SUNY ESF is monitoring statewide sewage sludge chemicals, that if applied to farms, may pollute crops and groundwater.

However, Chip Fabs are few and individually unique.

What NY State needs is a DEC and DOH required holistic approach to long term management of its new fabs. Here are some "comments" that are not addressed in the MICRON DEIS

Water and Air need to be co-monitored and co- managed as State-County -Corporate partnership for a defined dynamic PFAS Geo/Social Shed.

Monitoring requires “baselines” to analyze change. Micron PFAS will be discharged from the new sewage plant. There is and will be Biological accumulation in fish downstream. There’s nothing in the DEIS on this.

This raises related questions: what are the pre-operational Micron baselines? Some Pfas chemically change in the environment. What chemicals are in the new County water pipeline from Lake Ontario? upstream of the new County STP; is it monitored at micron input to the new STP?, are Micron specific pfas monitored in the County STP sludge, and in the river downstream?

There appears to be in the DEIS no substantive analysis in the DEIS of coordination between State and County agencies. There are no statements by DEC on monitoring requirements on water or air permits

The recently deleted EPA ORD generated short lists of which pfas chemicals to be monitored for large scale different priority contexts. They had tested the monitoring technology. There is no such list of Chip Fab pfas because they are quite unique, and some are manufacturing trade secret confidentiality. The latter need to be monitored using emerging to organized PFAS subgroups.

To flourish, the fabs continually evolve. Even Micron which which makes memory chips, not hugely complex AI chips. There will be new pfas or equivalent process chemicals, and new approaches the capture and treatment of pfas and other problematic chemicals.. It is important that Micron and the state and county have articulated, effective communications.

Subject: [EXTERNAL] Comments on Micron DEIS

Micron must build the chips plant to LEED Platinum environmental standards. Micron must run the plant on 100% renewable energy. There must be a coherent plan set in place on how to decontaminate and deconstruct the chips plant when Micron decides to leave Clay or plant becomes obsolete. Micron must consult with CENTRO to enable adequate public transit access for all workers of the chips plant. Bus passes should be provided to all workers at the chips plant as part of benefits package. Employees at the chips plant should be given Micron stock options as benefits. Please build the chip plant to the north of Route 31 to protect the beloved Meltzer Park of Clay. All Micron workers and anybody else working at the chips plant such as janitors or cafeteria servers should be given full healthcare benefits and paid a living wage. Everybody who works at the Micron plant even as janitors or food servers should be allowed to form or join unions. Micron should repay all the subsidies given to build the plant IF the plant gets shut or closes down prematurely within only a few years of operation. Micron must collaborate and give training to local cleanup crews and firefighters on how to eliminate any industrial accidents at the chips plant. Any plants or shrubs planted as landscaping at the chip plant must be indigenous to Onondaga County.

To: chipsnepa@chips.gov
Subject: [EXTERNAL] Micron DEIS must do more to protect the ecosystem of Onondaga County

Micron should both create and allow an independent citizen review board to monitor all chemical spills and water pollution. There must be an alert system in place in case of industrial accidents at the chip plant. There must also be greater collaboration with transportation department of NY State to make sure that there will be no traffic congestion from all the vehicles both during construction and from future plant workers. Improve the road between Maple drive and Route 81 to accommodate all future traffic from the plant workers and folks doing the construction work. Please improve the sewage infrastructure to handle the hazardous chemicals and increased population after the plant is finished. Meltzer Park should be protected from being demolished by the chips plant. There must be public disclosure about how many kinds of chemicals will be stored at the plant and how much of the chemicals will be stored. All residents and plant workers must be taught how to survive any potential future chemical spills and environmental accidents. Public schools must be given proper equipment to protect students during any future chemical contamination from the chips plant. There should be a preference to hire local Onondaga residents for any and all future chip plant workers. Local Onondaga residents should be given preference for hiring as construction workers. Micron must refrain from bringing in any H1B Visa holders to work at the chip plant because Onondaga County already has a high unemployment rate. Healthy food should be sold at the canteen. No unhealthy foods should be sold onsite at the chip plant. The chip plant must have a strict anti-bullying policy for employees. There should be anti-harassment training for employees and construction workers of the chip plant. Any construction workers who catcall people near the chip plant must be blacklisted from both the worksite and all other Onondaga County construction projects.

Attachments: Micron DEIS 3.2 & 3.3 Review_FoxPG Final Report.pdf

Sterling Water Stewards hereby submits our organization's comments on the Micron Draft Environmental impact Statement, ***in the form of the attached report and recommendations from our consulting professional geologist about the karstic conditions at the Micron site.***

Karstic conditions exacerbate the risk of groundwater, surface water, and /or drinking water contamination in the event of hazardous material incidents, equipment failures, or poorly managed industrial wastewater treatment.

Micron's DEIS is deficient in detail concerning the specific chemicals to be used at the site; quantities to be used; the methodology that will be used to remove harmful chemical substances from wastewater; and how discharges will be monitored.

To allow a commercial enterprise like Micron to dump unidentified or unknown toxins in unspecified quantities with unproven and underdeveloped treatment technologies into our groundwater supply is a serious abdication of governmental responsibilities.

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 4 of 21

EXECUTIVE SUMMARY

Based on currently available geologic data and information, initiation of construction activities such as the excavation and removal of soil or bedrock at the Site is not recommended at this time based on the documented occurrence of soluble bedrock with evidence of dissolution and highly variable subsurface conditions at the Site that could lead to fast, turbulent subsurface water flow and further dissolution of soluble bedrock. These surface and subsurface conditions are consistent with karst geology/features and can pose significant risks to human health, built structures, water quality, and the environment through the formation of unwanted and damaging land subsidence, flooding, slope movements, and/or contaminant migration. The Draft Environmental Impact Statement (EIS) fails to acknowledge the presence of karst-like conditions at the Site and is therefore insufficient to assess the impacts of highly variable subsurface conditions on site preparation and development. Focused areas of groundwater recharge need to be identified to help prevent contamination from sources on or adjacent to karst features and to avoid or minimize natural and human-induced geologic hazards and impacts in areas of soluble bedrock such as land subsidence, flooding, and slope movement. The review uncovered significant data and information gaps regarding the Site's geology, soils, topography, and water resources, including but not limited to recent nearby use of a productive bedrock aquifer for local water supply. Additional investigation and characterization of the Site's geology, hydrology, and local groundwater use are required to inform the public and to assist owners, operators, design professionals, plan reviewers, public works officials, and jurisdictional regulators in making informed decisions on Site development and management. Recommendations are provided in response to existing data and information gaps and to address the key findings and conclusions contained in this report.

PROJECT BACKGROUND

The United States Department of Commerce's Creating Helpful Incentives to Produce Semiconductors (CHIPS) Program Office (CPO) and the Onondaga County Industrial Development Agency (OCIDA) are joint lead agencies under the New York State Environmental Quality Review Act (SEQR) for the proposed Micron semiconductor manufacturing project. The proposed project and some of its connected actions are located in the Towns of Clay and Cicero, Onondaga County, New York (the Site). Figure 1 (Attachment A) shows the location and layout of the proposed Micron Campus and surrounding areas. Micron proposes to construct four semiconductor fabrication facilities on the proposed Micron Campus portion of the Site over a period of approximately 16 years.

SEQR requires all local, regional, and state government agencies to equally examine the environmental impacts along with the social and economic considerations for a certain project, or action, during their discretionary review (NYSDEC, 2025a). Agencies must follow the multi-step SEQR Decision Process, which requires them to assess the environmental significance of all actions they have the power to approve, fund, or directly assume. If an action consists of multiple phases, sets of activities, or if separate agencies are involved, SEQR requires agencies to jointly consider these cumulative impacts during their review. The Draft EIS for the Site dated June 2025 (CPO & OCIDA, 2025) was prepared by CPO and OCIDA to consider these cumulative impacts.

The Sterling Water Stewards requested that FoxPG review relevant portions of the Draft EIS regarding geologic conditions at the Site and provide key findings and recommendations to inform the public and to assist owners, operators, design professionals, plan reviewers, public works

Page 5 of 21

officials, and jurisdictional regulators in making informed decisions on Site development and management.

METHODS

Data and information contained in the Draft EIS (CPO & OCIDA, 2025), as well as data and information from other relevant scientific and technical sources indicated in the sections below, were reviewed by FoxPG to evaluate the Site and areal geologic and environmental conditions that may be relevant to the protection of human health, built structures, water quality, and the environment. FoxPG's review focuses on the proposed Micron Campus and Rail Spur portions of the Site, where the vast majority of chemicals and other potential contaminants will be stored and used at the Site. This is a critical area because the frequent transfer and storage of chemicals and waste in high traffic areas greatly increases the possibility of spills and uncontrolled releases to the environment.

Selected data and information from the review are summarized into various figures, tables, and attachments. Figures referenced in this report are presented in Attachment A. Tables referenced in this report are presented in Attachment B. Acronyms and abbreviations contained in this report are listed in Attachment C. Scientific, technical, or other references cited in this report are listed in Attachment D.

RESULTS

Salient results of the review are organized below by physical setting, soil/glacial deposits, bedrock, hydrology and water resources, and potential contaminants and contaminant migration.

Physical Setting

Figure 1 (Attachment A) shows the location, layout, and reported land use for parcels at the proposed Micron Campus and surrounding areas.

A review of topographic contours shown in Figure 2 (Attachment A) shows that the overall land surface in the vicinity of the proposed Micron Campus and surrounding areas slopes generally towards the intermittent streambed of Youngs Creek. Topographic contours at the proposed Rail Spur Site show that the overall land surface in that portion of the Site is relatively flat (Attachment A, Figure 3).

The 10-foot contour interval used in topographic maps presented in Section 3.2 of the Draft EIS is inadequate to identify topographic features with less than 10 feet of relief. Field experience has shown that many topographic features associated with the dissolution of soluble bedrock (i.e., karst) in central New York have less than 10 feet of topographic relief. Karst is a landscape formed by the dissolution of soluble bedrock and is characterized by a variety of distinctive features including solution-enlarged fractures, rock pinnacles, closed topographic depressions, sinking streams, and others, and also by the dominance of subsurface drainage over surface drainage (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014). The use of smaller topographic contour intervals (e.g., a 2-foot contour interval) in mapping is better suited for assessments of potential karst areas in central New York, particularly in relatively flat areas.

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 6 of 21

Figures 2 and 3 (Attachment A) also show areas of steeper slopes at the Site, which are indicated by brighter shades of red. Close examination of these two figures show numerous locations with generally circular or elliptical areas of connected (closed) steeper slopes. Some (possibly many) of these areas likely represent closed circular or elliptical topographic depressions, which are a common, distinctive landform that occurs in areas of karst geology and hydrology (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014; Kappel et al., 2020; ASTM, 2023).

Figure 4 (Attachment A) also shows topographic contours in the vicinity of the proposed Micron Campus and surrounding areas published by the New York State Department of Transportation (NYSDOT, 1989). Review of Figure 4 shows many water-filled closed topographic depressions on and near the proposed Micron Campus. Water-filled closed topographic depressions are a common landform that occurs in areas of karst geology and hydrology (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014; Kappel et al., 2020; ASTM, 2023).

Figure 5 (Attachment A) shows geological hazard areas in Onondaga County as determined by the Syracuse-Onondaga County Planning Agency and the Onondaga County Department of Emergency Management (SOCPA-OCDEM, 2019). Review of Figure 5 indicates that the proposed Micron Campus is located fully within a geological hazard area consisting of dolostone (dolomite) bedrock. Dolostone bedrock is a soluble carbonate rock that is susceptible to dissolution and the resulting formation of karst features such as solution-enlarged fractures and sinkholes, and the associated hazards of land subsidence, floods, and slope movements (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014; SOCPA-OCDEM, 2019; Kappel et al., 2020; ASTM, 2023).

Soil/ Glacial Deposits

The thickness of soil and glacial deposits in portions of the proposed Micron Campus that have been investigated to date is illustrated in Figure 6 (Attachment A). Reported thickness varies from 4.0 to 33.5 feet. Section 3.2.2.1 and Section 3.2.2.2 of the Draft EIS (CPO & OCIDA, 2025) describe soil and glacial deposits present at the Site and indicate that most of the soil types are consistent with soils typically found in an area of glacial deposition and erosion (i.e., previous ice ages). The predominant soil types are silt loams, including Niagara, Rhinebeck, and Collamer silt loams. Glacial deposits encountered at the Site are highly variable and consist predominantly of glacial till, glaciolacustrine silt and clay, and glacial sand as demonstrated by soil boring logs and other data from several phases of geotechnical investigations performed at the Site (Draft EIS Appendix E-4). Soil and glacial deposits at the Site consisting predominantly of glacial till or glaciolacustrine silt and clay are relatively impermeable (i.e., do not readily transmit water) as demonstrated by their typically wet to saturated moisture content. The Draft EIS states that many of these soil and glacial deposits (particularly the finer-grained and wetter deposits) are unsuitable for proposed Site construction activities and will therefore need to be removed and replaced with more suitable imported fill materials (e.g., coarse-grained, relatively permeable fill materials such as sand and gravel). Specifically, Section 3.2.3.2 of the Draft EIS indicates that an estimated 1.5 million cubic yards of native soil and glacial deposits at the Site will be removed during construction of the proposed Micron Campus. Therefore, Micron is proposing to remove a very large volume of relatively impermeable soil and replace it with more permeable fill materials, which will increase infiltration into the subsurface and likely exacerbate the dissolution of soluble bedrock and the formation and development of karst features. Additionally, removal of significant amounts of soil or other cover over karst features may also accelerate or trigger the development of sinkholes or other karst features through a variety of processes (see Table 1 in Gutierrez et al., 2014).

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 7 of 21

Soil and glacial deposits can obscure karst features in the landscape and thus result in a geologic condition known as “covered” or “mantled” karst (Palmer et al., 1991; Rubin, 2009; Gutierrez et al., 2014; ASTM, 2023). One form of glacial deposition of sediments typically involves the high-pressure smearing of sediments beneath the weight of overlying glacial ice into pre-existing voids and conduits in the land surface, including karst voids and conduits. Glacial processes have a high probability of generating covered or mantled karst conditions, particularly when glacial sediment is fine-grained (which occurs at the Site). Areas of covered or mantled karst often have no obvious karst features visible at the surface (Gutierrez et al., 2014). Therefore, the statement in Section 3.2.2.1 of the Draft EIS that karst topography was not noted at the Site does not eliminate the presence of karst conditions at, beneath, or near the proposed limits of disturbance at the Site. Additionally, as noted above in the section entitled “Physical Setting”, evidence of closed topographic depressions has been demonstrated at the Site (see Attachment A, Figure 5) and is also suggested in many portions of the Site by slope data presented in the Draft EIS (see Attachment A, Figures 2 and 3 of this report).

Bedrock

Bedrock beneath the proposed Micron Campus is mapped by the New York State Geological Survey (NYSGS) as the Upper Silurian Lockport Group, which in central New York consists predominantly of gray to black dolostone and limestone with lesser amounts of calcareous or dolomitic shale (Rickard and Fisher, 1970). Dolostone and limestone are carbonate rocks which are susceptible to the formation of karst features (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014; SOCPA-OCDEM, 2019; Kappel et al., 2020). Dolomitic and calcareous shales in New York State are also susceptible to the formation of karst features (Kappel et al., 2020). All of the Lockport Group bedrock formations in central New York are identified in a list of karst aquifers in New York State published by the United States Geological Survey (USGS; Kappel et al., 2020). While the Lockport Group may be less likely to develop karst features than some other karst formations in New York, development of some karst features, including sinkholes, has been documented in the Lockport Group, typically along bedding planes near the bedrock surface (Kappel et al., 2020).

Another bedrock formation that is present in the vicinity of the Site and its connected actions in Onondaga County is the Upper Silurian Vernon Formation (Ailing, 1928; Rickard, 1969; Rickard and Fisher, 1970; Treesh and Friedman, 1974; Kappel et al., 2020; Fox et al., 2022). The Vernon Formation consists predominantly of red to green dolomitic detrital mudstone with localized zones of evaporite minerals such as gypsum, anhydrite, and halite (Rickard, 1969; Fox et al., 2022) and is also prone to the development of karst features and land surface subsidence in central New York, primarily due to the dissolution of gypsum (Kappel et al., 2020). The Vernon Formation is also identified in the list of karst aquifers published by the USGS (Kappel et al., 2020).

The structural attitude of the sedimentary bedrock in central New York consists predominantly of sub-horizontal bedding that strikes generally east-west and dips gently (typically one degree or less) towards the south (Rickard, 1969; Kappel et al., 2020). Several sets of regional joints or fractures occur in area bedrock with predominant structural trends striking generally northwest (Zhao and Jacobi, 1997) and generally east-northeast (Engelder, 1982). These regional joint and fracture sets commonly act as preferential pathways for water migration and the development of solution-enlarged joints and fractures in soluble carbonate or evaporite bedrock formations, such as those that occur at and near the Site.

Several areas in Figure 6 (Attachment A) show bedrock encountered at shallow depths (light-colored circles) very close to bedrock encountered at greater depths (dark-colored circles). Variable depth to

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 8 of 21

bedrock is a common condition in areas of karst geology and may indicate a zone of epikarst. Epikarst is a concentrated area of dissolution features and enhanced porosity and permeability that typically occurs in the upper portions of carbonate or evaporite bedrock in karst areas, and the epikarst typically contains significant amounts of stored water (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014).

Among other data, Appendix E-4 of the Micron Draft EIS contains photographs and data in boring logs from 81 bedrock core runs collected at 45 boring locations by geotechnical consultants during three phases of geotechnical investigation at the Site. One core run is five feet in length. Examples of representative bedrock cores collected at the Site, including the various geologic textures, compositions, and other geological parameters, are presented in Figures 07 through 11 (Attachment A). Selected data from these bedrock cores and their associated boring logs are summarized in Table 01 and Table 02 (Attachment B). Review of available data results in the following salient observations with respect to features associated with the dissolution of soluble bedrock.

1. Numerous fractured or broken areas contain weathering that is consistent with dissolution and solution enlargement (i.e., karst features).
2. Rock quality designation (RQD) data indicates that bedrock quality at the Site ranges the full spectrum from “very poor” to “excellent” according to the ASTM International (ASTM) Standard D6032/D6032M entitled “Standard Test Method for Determining Rock Quality Designation of Rock Core” (ASTM, 2017). RQD data have been widely used as a warning indicator of low-quality rock zones that need greater scrutiny and require additional investigation (ASTM, 2017). Rock cores with “poor” to “very poor” RQD commonly correspond to intervals with a higher degree of weathering consistent with karst dissolution and solution enlargement. Therefore, geologic features consistent with karst features are present at the Site in several areas proposed for construction of fabrication facilities and associated infrastructure, including areas relevant to the potential for contamination issues such as proposed chemical or waste storage tanks and other structures.
3. A possible void with a minimum diameter of at least 1.9 feet may have been encountered at location B-129.
4. Drilling water was lost to the bedrock formation in three rock core runs from two boreholes (B-217 and B-292), indicating the localized presence of subsurface voids or conduits with the ability to transmit significant amounts of water (or other fluids) at a very rapid rate. These observations are consistent with and may represent karst voids or conduits.
5. Unconsolidated silt or clay deposits (referred to as “seams” in boring log descriptions) were reported in 15 of 81 bedrock core runs. These silt or clay seams are consistent with and may represent sediment transported by turbulent subsurface water flow within solution-enlarged bedrock conduits (i.e., karst bedrock conduits).

Please refer to Table 01 and Table 02 (Attachment B) for additional information, including the designations of other borings with evidence of one or more of the features referenced above that are consistent with the dissolution of soluble bedrock.

Hydrology and Water Resources

Onondaga County has a temperate, humid continental climate. Onondaga County averaged 39.4 inches of precipitation annually for the period from 1895 through 2024 (NOAA, 2025). Section 3.3.3.2 of the Draft EIS indicates that 98.6 percent of the streams within the proposed Micron Campus were classified as intermittent (water present only during wet portions of the year) or ephemeral (water present only immediately after a precipitation event). In a humid area with high

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 9 of 21

precipitation, the lack of persistent, permanent streams at the proposed Micron Campus demonstrates significant vertical water infiltration downwards into the subsurface (i.e., sinking or losing streams) and the dominance of subsurface drainage. In addition to the presence of distinctive features typically associated with karst, the dominance of subsurface drainage is a primary characteristic of an area with karst geology and hydrology (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014). Wetlands present at the Site may occur predominantly in areas where fine-grained soil and/or fine-grained underlying glacial deposits slow/limit infiltration of water from precipitation into the subsurface.

Section 3.3.3.4 of the Draft EIS indicates that the depth to groundwater at the Site ranges from 0.1 to 7.8 feet below the ground surface in the western portion of the proposed Micron Campus. The shallow depth to groundwater at the Site indicates it is extremely likely that there is significant interaction between surface water and groundwater at the Site. This section of the Draft EIS also indicates that a total of 42 monitoring wells were installed at the Site through January 2025. However, a map showing the location of all monitoring wells is not provided, and boring logs and monitoring well completion records for wells installed after the three rounds of geotechnical investigation also are not provided in Section 3.2, Section 3.3, Appendix F, and Appendix E of the Draft EIS. Additionally, the Draft EIS does not present groundwater contour maps, groundwater potentiometric maps, geologic cross sections, bedrock surface contour maps, or similar maps and data (for both overburden groundwater and bedrock groundwater) that are typically prepared and presented in an evaluation of groundwater flow and surface water and groundwater interaction. Therefore, surface water and groundwater interaction within the Water Resources Study Area has not been evaluated and/or has not been presented nor discussed in the Draft EIS at a level commensurate with the complex geology and hydrogeology of the Site. Figure 12 (Attachment A) presents schematic cross sections showing some typical scenarios of surface water and groundwater interaction in karst areas. Characterization of surface water and groundwater interaction is required for an understanding of potential risks and measures that may be necessary to mitigate these risks to human health, built structures, water resources, and the environment that are commonly encountered in areas of soluble bedrock (Gutierrez et al., 2014; ASTM, 2023).

As initially described above in the section of this report entitled "Bedrock", epikarst is a concentrated area of dissolution features and enhanced porosity and permeability that typically occurs in upper portions of soluble carbonate or evaporite bedrock. The epikarst typically contains significant amounts of stored water and is therefore highly relevant to the hydrology, hydrogeology, and protection of water resources in a karst area such as the Site. As stated above in the section entitled "Soil/Glacial Deposits", very large volumes of soil, glacial deposits, and bedrock are proposed for removal during construction activities at the Site (see Section 3.2.3.2 of CPO & OCIDA, 2025). Figure 13 of this report (Attachment A) shows proposed locations for bedrock removal at the proposed Micron Campus. Because the epikarst typically occurs in the upper portions of soluble bedrock, it is likely that the proposed removal of bedrock at the Site may remove all or a significant portion of the epikarst zone beneath portions of the Micron Campus. Removal of epikarst without further characterization and appropriate engineering measures to address subsurface water flow may have significant impacts on subsurface water flow at the Site and could cause or exacerbate flooding, particularly because the Lockport Group bedrock aquifer system is generally present at shallow depths in epikarst and bedding-plane structures in bedrock (Kappel et al., 2020). Bedding-plane structures in bedrock have been documented at the Site (see Attachment A, Figures 07 through 10, and Attachment B, Tables 01 and 02 of this report). Therefore, the presence and extent of epikarst at the Site should be evaluated prior to the initiation of any excavation for the removal of soil, glacial deposits, and/or bedrock at the Site in order to avoid, minimize, and/or better identify and manage potential hydrology/hydrogeology impacts such as flooding and contaminant migration.

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 10 of 21

The assessment provided in Section 3.3.3.4 of the Draft EIS references water supply wells from the NYSDEC's DECinfo Locator website. Water well information posted on this website is typically based on water well completion records submitted to NYSDEC by registered water well drillers as required in Section 15-1525 of New York State's Environmental Conservation Law. Review of the DECinfo Locator website indicates many of the water wells shown on the DECinfo Locator website as being within or near the proposed Micron Campus are actually located in Oswego County based on information provided in the corresponding well completion reports. Additionally, the assessment provided in the Draft EIS does not include private water supply wells that were installed prior to April 2000. This date is when NYSDEC began its current requirement for registered water well drillers to submit water well completion reports to NYSDEC. It is likely that many private water supply wells in this area were installed prior to April 2000 given the Town's long history of residential development dating back to 1791 (Town of Clay, 2025) and the fact that municipal water was not available in the vicinity of the Site until the late 1960s at the earliest (OCWA, 2025). Therefore, the owners of (and data from) many of the private water supply wells located within the Water Resources Study Area have not been considered and incorporated into the Draft EIS because the Draft EIS currently considers only private water supply wells that were installed during or after April 2000.

Review of a NYSDEC water well completion report presented in Figure 14 (Attachment A) indicates that a private water supply well designated as well OD2031 was installed in 2008 and produces groundwater from black limestone bedrock (NYSDEC, 2025b). This bedrock is similar to bedrock located below the proposed semiconductor fabrication facilities as demonstrated by data presented in Appendix E-4 of the Draft EIS (CPO & OCIDA, 2025). This private water supply well is located within approximately 600 feet of the eastern boundary of the proposed Micron Campus and has a high yield (stabilized discharge) of 100 gallons per minute (gpm) of groundwater that is produced from shallow bedrock (the overburden is cased off and the maximum depth of this water supply well is 39 feet below ground surface). High well yields at relatively shallow depths are typical of karst aquifers. The proposed semiconductor fabrication facilities are located directly over a productive bedrock aquifer that has been (and may still be) recently used for local water supply purposes.

A private water well survey is not presented in the Draft EIS. Therefore, the current extent of local usage of this productive bedrock aquifer for water supply in this area has not been evaluated or has not been presented in the Draft EIS.

A portion of the western boundary of the proposed Micron Campus and Rail Spur Site is located approximately 1.0 mile from a confined aquifer located in the western portion of the Water Resources Study Area. Figure F-37 designated "Groundwater Aquifers in Water Resources Study Area" and contained in Appendix F-5 of the Draft EIS, indicates that groundwater beneath portions of the Micron Campus and Rail Spur Site flows toward this aquifer. Potential hydraulic connections between soluble bedrock at the Site and this confined aquifer either have not been evaluated or have not been presented in the Draft EIS.

A portion of the western boundary of the proposed Micron Campus and Rail Spur Site is located approximately 2.9 miles from the Baldwinsville Primary Aquifer as mapped and designated by the USGS and NYSDEC (Pagano et al., 1986). Primary Aquifers are defined in NYSDEC's Division of Water (DOW) Technical and Operational Guidance Series (TOGS) Memorandum 2.1.3 as "highly productive aquifers presently utilized as sources of water supply by major municipal water supply systems" (NYSDEC, 1990). Primary Aquifers are afforded special protection by NYSDEC regulations governing the siting of potential sources of contamination. Figure F-38 from the Draft EIS indicates that groundwater beneath western portions of the Micron Campus and Rail Spur Site flows

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 11 of 21

towards this aquifer. Potential hydraulic connections between soluble bedrock at the Site and the Baldwinsville Primary Aquifer either have not been evaluated or have not been presented in the Draft EIS.

Potential Contaminants and Contaminant Migration

Potential contaminants associated with semiconductor manufacturing may include a wide variety of chemicals, compounds, or elements including but not limited to alcohols, ammonia, carbon, cyanides, glycols, halogens, metals/inorganics, nitrogen and its compounds, peroxides, per- and polyfluoroalkyl substances (PFAS), acidity/alkalinity (measured as pH), phosphorous and its compounds, silica, sulfur and its compounds, total dissolved solids (TDS), tetramethylammonium hydroxide (TMAH), total suspended solids (TSS), and toxic organic compounds including volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and possibly others (USEPA, 2022; NIST, 2024). While the Draft EIS identifies by name some specific chemicals and products that are planned for use at the Site by Micron, other chemicals and products are identified in numerous sections of the Draft EIS only by generic chemical categories, such as PFAS, metals, oxidizers, corrosives, etc.

Some of the chemicals proposed for use at the Site are widely considered by numerous authorities having jurisdiction as “emerging contaminants”, which are generally substances that are relatively new to our awareness and understanding regarding their presence in the environment, their mobility and persistence in the environment, and/or their potential impacts on human health and the environment. Such chemicals include but are not limited to PFAS, 1-4 dioxane, and TMAH. For example, TMAH, which is widely used in the semiconductor industry in silicon etching, has a high solubility in water, a high affinity to bind to solids, and is toxic and therefore inhibits biological processes relied upon for wastewater treatment and water quality protection (TRA, 2025). There is currently no laboratory analytical method approved by the United States Environmental Protection Agency (USEPA) for analysis of TMAH. Therefore, the industrial discharge of TMAH is prohibited by some wastewater treatment authorities, such as the Trinity River Authority (TRA) in Texas (TRA, 2025). Consideration of the planned use of TMAH or other emerging contaminants at the Site should enhance the ability of authorities having jurisdiction to avoid or minimize impacts to water treatment facilities and therefore facilitate protection of human health, water resources, and the environment.

Even though the discharge of treated industrial wastewater from Micron’s operations will occur under a State Pollutant Discharge Elimination System (SPDES) permit issued by NYSDEC, contaminants from Micron’s fabrication operations will be discharged into the Oneida River under the proposed approach outlined in Section 3.2.1, Section 3.2.3.2, Section 3.3.2, Section 3.3.4.2, and other sections of the Draft EIS. The proposed approach/discharge may add significant contaminant mass into the Oneida River, which would subsequently migrate downstream to surface water and sediment further downstream, including the Oswego River and Lake Ontario.

As outlined above in the sections entitled “Bedrock” and “Hydrology and Water Resources”, depth to bedrock is shallow in some areas (see Attachment A, Figure 6), and excavation into bedrock is proposed in some portions of the Site, particularly beneath the proposed semiconductor fabrication facilities (see Attachment A, Figure 13). There may be little to no soil or imported fill material in some areas between the bottom of the proposed semiconductor fabrication facilities and the top of soluble bedrock with high porosity and permeability. Fill imported to a site for building construction purposes is usually coarse-grained sand and/or gravel with relatively high porosity and permeability (e.g., the fill material is typically highly transmissive to fluid flow). This corresponds to a reduced ability for imported fill material to filter any accidental chemical releases or spills that may occur at the facilities

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 12 of 21

during Site operations relative to finer-grained soil or fill materials. In the absence of impermeable containment systems (or if such systems fail to operate as designed), releases of contaminants at the Site would likely flow directly into highly transmissive imported fill material and soon after into highly transmissive underlying soluble bedrock. As documented above, soluble karst bedrock has the potential to transport contaminants large distances (miles) over short time periods (days or weeks).

The scope and level of an environmental investigation, including a geologic or hydrogeologic investigation, should be consistent with the complexity and stability of the Site as well as pertinent technical, environmental, and safety considerations (NYSDEC, 2010). Such considerations include but are not limited to:

- the complexity of the site geology and hydrogeology;
- the nature of the contaminants;
- exposure pathways and the distance to potential receptors;
- the identification of potential receptors not previously identified or addressed; and/or
- any other conditions NYSDEC identifies which necessitate the need for additional investigation activities.

Detailed investigation is typically appropriate to facilitate enhanced protection of human health, built structures, water quality, and the environment where Site conditions include one or more of the following conditions, all of which are suspected or have been positively identified at or adjacent to the proposed Micron Campus and Rail Spur Site:

- soluble bedrock with karst features;
- rock quality deficiencies; and
- aquifers susceptible to contamination.

The NYSDEC and the New York State Department of Health (NYSDOH) are concerned about the protection of water resources in karst areas and have been collaborating with the agricultural community to increase their awareness of karst and how to manage dairy farming activities to reduce their impact on water resources, particularly in karst areas (Kappell et al., 2020). Major karst features such as large sinkholes are not required for an area of soluble bedrock to act as a rapid conduit for subsurface water and contaminant migration; in fact, some of the worst contamination events have occurred in areas where only minor karst features are present (Kappel et al., 2020). In addition to manure from agricultural activities, karst aquifers in New York State have also been contaminated by unintended spills or improper chemical handling or disposal of contaminants such as petroleum products, chlorinated solvents, or other commercial or industrial chemicals, many of which are commonly used in semiconductor manufacturing operations (NIST, 2024). Due to increasing legal conflicts between citizen groups, farm operators, and regulatory agencies, Richardson (2020) evaluated the regulation of manure management at concentrated animal feeding operations (CAFOs) in karst areas in selected midwestern states. The factors at a site that govern the transport and fate of contaminants from agricultural operations into surface water and groundwater resources (e.g., physical and chemical properties, climatic conditions, geologic and hydrogeologic conditions, etc.) are substantially similar for many commercial or industrial contaminants. While the level of regulation of karst areas varies considerably from state to state, common provisions in states that have enacted more proactive regulations to minimize the potential for contamination events (and thereby enhance the protection of human health and the environment) include:

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 13 of 21

- vertical separation requirements for distances between the bottom of storage facilities and karst bedrock (e.g., must be ≥ 10 feet in Minnesota);
- horizontal separation requirements for surface distances between karst features and storage facilities (e.g., up to 800 feet from certain karst features for certain structures in Iowa); and
- more stringent design and construction requirements intended to prevent seepage of stored materials into water resources (e.g., in Ohio, no storage may be located in a karst area without groundwater monitoring and engineered controls).

KEY FINDINGS

Physical Setting

1. The 10-foot contour interval used in the topographic maps presented in Section 3.2 of the Draft EIS is inadequate to identify topographic features with less than 10 feet of relief. Field experience has shown that many karst features in central New York have less than 10 feet of topographic relief.
2. Topographic maps presented in the Draft EIS also show areas of steeper slopes at the Site, which are indicated by brighter shades of red. Close examination of these figures show numerous locations with generally circular or elliptical areas of connected (closed) steeper slopes. Some (possibly many) of these areas may represent closed circular or elliptical topographic depressions, which are common landforms that occur in karst areas.
3. Review of topographic contours at the Site previously published by NYSDOT (1989) shows numerous water-filled closed topographic depressions on and near the proposed Micron Campus. Water-filled closed topographic depressions are common landforms that occur in karst areas.
4. The proposed Micron Campus and Rail Spur Site are located fully within a geological hazard area as determined by the Syracuse-Onondaga County Planning Agency and the Onondaga County Department of Emergency Management. The geological hazard consists of dolostone (dolomite) and limestone bedrock, which are soluble carbonate rocks that are susceptible to the formation of karst features such as solution-enlarged fractures, sinking streams, sinkholes, and others.

Soil/ Glacial Deposits

5. Soil and glacial deposits encountered at the Site are highly variable. The Draft EIS states that many of these soil and glacial deposits (particularly the finer-grained and wetter deposits) are unsuitable for proposed Site construction activities and will therefore need to be removed and replaced with more suitable imported fill materials (e.g., coarse-grained, relatively permeable fill materials such as sand and gravel). Specifically, Section 3.2.3.2 of the Draft EIS indicates that an estimated 1.5 million cubic yards of native soil and glacial deposits at the Site will be removed during construction of the proposed Micron Campus. Therefore, Micron is proposing to remove a large volume of relatively impermeable soil and replace it with more permeable fill materials, which will increase water infiltration into the subsurface. Removal of significant amounts of soil or other cover over karst features may accelerate or trigger the development of sinkholes and other karst features through a variety of processes. The velocity of water in karst is much greater than in overburden porous media (i.e., soil/glacial deposits or imported fill materials), and the replacement of fine-grained soils with sand and gravel fill materials will increase average velocity in the overburden even

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 14 of 21

more, making erosion of subsurface cavities faster and more likely regardless of the type of bedrock present.

6. Soil and glacial deposits can obscure karst features in the landscape and thus result in a geologic condition known as “covered” or “mantled” karst. Areas of covered or mantled karst often have no obvious karst features visible at the surface. The statement in Section 3.2.2.1 of the Draft EIS that karst topography was not noted at the Site does not equate to an absence of existing karst features at the Site.

Bedrock

7. Site bedrock consists predominantly of dolostone with lesser amounts of dolomitic to calcareous shale. Site bedrock is prone to the development of dissolution (karst) features and associated geologic hazards including land subsidence, flooding, and slope movements due to the dissolution of bedrock and is identified in a list of karst aquifers published by the USGS (Kappel et al., 2020).
8. The structural attitude of Site bedrock likely consists predominantly of sub-horizontal bedding that strikes generally east-west and dips gently (typically one degree or less) towards the south. Several sets of regional joints or fractures occur in area bedrock with predominant structural trends striking generally northwest and generally east-northeast. These regional joint and fracture sets commonly act as preferential pathways for water migration and the development of solution-enlarged joints and fractures in soluble carbonate or evaporite bedrock formations, such as those that occur at and near the Site.
9. Depth to bedrock is variable at the Site, which is common in areas of karst geology and may indicate a zone of epikarst. Epikarst is a concentrated area of dissolution features and enhanced porosity and permeability that typically occurs in the upper portions of carbonate or evaporite bedrock in karst areas, and the epikarst typically contains significant amounts of stored water.
10. Photographs and data in boring logs from 81 bedrock core runs collected at 45 boring locations during three phases of geotechnical investigation at the Site document features consistent with the dissolution of soluble bedrock (i.e., karst features), including:
 - numerous fractured or broken areas contain weathering that is consistent with dissolution and solution enlargement;
 - rock cores with “poor” to “very poor” RQD, which commonly correspond to intervals with a higher degree of weathering consistent with karst dissolution and solution enlargement;
 - a possible void with a minimum diameter of at least 1.9 feet may have been encountered at one location;
 - drilling water was lost to the bedrock formation in three rock core runs from two boreholes, indicating the localized presence of subsurface voids or conduits with the ability to transmit significant amounts of water (or other fluids) at a very rapid rate; and
 - unconsolidated silt or clay seams that are consistent with and may represent sediment transported by turbulent water flow within karst bedrock conduits.

Hydrology and Water Resources

11. The general lack of permanent water-filled stream channels at the Site demonstrates significant water infiltration vertically downwards into the underlying soil/glacial deposits and underlying bedrock (i.e., sinking or losing streams) and the predominance of subsurface drainage at the Site. This drainage condition is characteristic of karst environments and is typically conducive to the formation and intensification of dissolution features in soluble

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 15 of 21

- bedrock that occurs at the Site. The surface water hydrology of Youngs Creek and the proposed Micron Campus and Rail Spur Site are consistent with a karst hydrologic system.
12. Section 3.2, Section 3.3, Appendix F, and Appendix E of the Draft EIS do not present groundwater contour maps, groundwater potentiometric surface maps, geologic cross sections, bedrock surface contour maps, or other maps and data that would allow an evaluation that characterizes the impacts of site development on shallow and deep groundwater flow systems on and adjacent to the Site. Therefore, surface water and groundwater flow and interaction within the Water Resources Study Area has not been evaluated or is not presented and discussed in the Draft EIS.
 13. Many of the private water supply wells located within the Water Resources Study Area have not been considered and incorporated into the Draft EIS because the Draft EIS currently considers only private water supply wells that were installed during or after April 2000. Many of the private water supply wells in the area were likely installed prior to April 2000. While public water is available in the area, that is not a good reason to ignore data available from private water supply wells and the possibility that private water supply wells used for irrigation, farm animals, or other agricultural or residential uses can still be detrimentally affected causing significant impacts.
 14. Inspection of NYSDEC water well completion reports in the area indicate a high yield private water supply well designated OD2031 was installed in 2008 and produces groundwater from black limestone bedrock that is similar to bedrock in rock cores recently installed and described at various locations beneath and near the proposed semiconductor fabrication facilities. This private water supply well is located approximately 600 feet from the eastern boundary of the proposed Micron Campus and has a high yield (stabilized discharge) of 100 gallons per minute (gpm) of groundwater that is produced exclusively from shallow bedrock. High well yields from shallow bedrock are typical of karst aquifers. The proposed semiconductor fabrication facilities are located directly over a productive bedrock aquifer that has been (and may still be) recently used for local water supply purposes.
 15. A private water well survey is not presented in the Draft EIS. Therefore, the current extent of local usage of the productive bedrock aquifer for water supply has not been evaluated or has not been presented in the Draft EIS.
 16. A portion of the western boundary of the proposed Micron Campus and Rail Spur Site is located approximately 1.0 mile from a confined aquifer located in the western portion of the Water Resources Study Area. Figure F-37 from the Draft EIS indicates that groundwater beneath western portions of the Micron Campus and Rail Spur Site flows towards this aquifer. Potential hydraulic connections between soluble bedrock at the Site and this confined aquifer either have not been evaluated or have not been presented in the Draft EIS, and the data and discussion provided in the Draft EIS fail to rule out detrimental impacts to this confined aquifer.
 17. A portion of the western boundary of the proposed Micron Campus and Rail Spur Site is located approximately 2.9 miles from the Baldwinsville Primary Aquifer. Primary Aquifers are defined by NYSDEC as "highly productive aquifers presently utilized as sources of water supply by major municipal water supply systems". Primary Aquifers are afforded special protection by NYSDEC regulations governing the siting of potential sources of contamination. Figure F-38 from the Draft EIS indicates that groundwater beneath portions of the Micron Campus and Rail Spur Site flows towards this aquifer. Potential hydraulic connections between soluble bedrock at the Site and the Baldwinsville Primary Aquifer either have not been evaluated or have not been presented in the Draft EIS, and the data and discussion provided in the Draft EIS fail to rule out detrimental impacts to this Primary Aquifer.

Potential Contaminants and Contaminant Migration

18. Potential contaminants associated with semiconductor manufacturing may include a wide variety of chemicals, compounds, or elements including but not limited to alcohols, ammonia, carbon, cyanides, glycols, halogens, metals/inorganics, nitrogen and its compounds, peroxides, PFAS, acidity/alkalinity (measured as pH), phosphorous and its compounds, silica, sulfur and its compounds, TDS, TMAH, TSS, and toxic organic compounds including but not limited to certain VOCs and SVOCs.
19. Some of the chemicals proposed for use at the Site are widely considered by numerous authorities having jurisdiction as “emerging contaminants”, which are generally substances that are relatively new to our awareness and understanding regarding their presence in the environment, their mobility and persistence in the environment, and/or their potential impacts on human health and the environment. Such chemicals include but are not limited to PFAS, 1-4 dioxane, and TMAH. The industrial discharge of some emerging contaminants is prohibited by some wastewater treatment authorities as a means to avoid or minimize interference with water treatment facilities and therefore enhance protection of human health, water resources, and the environment.
20. Even though the discharge of treated industrial wastewater from Micron’s operations will occur under a SPDES permit issued by NYSDEC, the Draft EIS states that contaminants from Micron’s fabrication operations will be discharged into the Oneida River. The Draft EIS does not indicate the identity and concentrations of potential surface water discharges and therefore detrimental impacts cannot be ruled out. The proposed approach/discharge may add significant contaminant mass into the Oneida River. Contaminants would subsequently migrate to surface water and sediment further downstream, including the Oswego River and Lake Ontario.
21. Depth to bedrock is shallow in some areas and excavation and removal of significant volumes of bedrock is proposed in some portions of the Site, particularly beneath the proposed semiconductor fabrication facilities. As a result, there may be little to no soil or imported fill material between the bottom of the proposed semiconductor fabrication facilities and the top of soluble bedrock, which corresponds to little to no ability to filter any accidental chemical releases or spills that may occur at the facilities during Site operations. Soluble bedrock with dissolution features (i.e., karst) has the potential to transport contaminants large distances (miles) over short time periods (days or weeks).
22. The scope and level of an environmental investigation, including a hydrologic or hydrogeologic investigation, should be consistent with the complexity and stability of the Site as well as pertinent technical, environmental, and safety considerations. Detailed investigation is typically appropriate to facilitate enhanced protection of human health, built structures, water quality, and the environment where soluble bedrock features, rock quality deficiencies, and/or aquifers susceptible to contamination at or near a site are suspected or have been positively identified (which is the case at this Site).
23. While the level of regulation of karst areas varies considerably from state to state (Richardson, 2020), common provisions in states that have enacted more proactive regulations to minimize the potential for contamination events (and thereby enhance the protection of human health and the environment) include:
 - vertical separation requirements for distances between the bottom of storage facilities and karst bedrock (e.g., must be ≥ 10 feet in Minnesota);
 - horizontal separation requirements for surface distances between karst features and storage facilities (e.g., up to 800 feet from certain karst features for certain structures in Iowa); and

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

August 2025

Page 17 of 21

- more stringent design and construction requirements intended to prevent seepage of stored materials into water resources (e.g., in Ohio, no storage may be located in a karst area without groundwater monitoring and engineered controls).

SUMMARY AND CONCLUSIONS

1. Multiple lines of evidence including the Site's physical setting, geology, and hydrology indicate the proposed Micron Campus and Rail Spur Site are located directly over a productive soluble bedrock aquifer with features consistent with a karst aquifer. This aquifer is likely used by some property owners in the area for water supply. Karst aquifers are highly susceptible to contamination, and contamination can move long distances (miles) in karst aquifers quickly (days or weeks) with little attenuation (Veni, 1999; Palmer, 2007; Taylor and Greene, 2008; Gutierrez et al., 2014; Kappel et al., 2020; NRCS, 2022). Other natural and human-induced geologic hazards of karst including land subsidence, sinkholes, flooding, and slope movements are typically caused or aggravated by the redirection and concentration of water and/or the removal of soil, bedrock, or other cover over karst features during site development (Gutierrez et al., 2014). To determine the extent of the hazard, areas of focused groundwater recharge need to be identified and the probability of the hazard occurring within some time period needs to be assessed (Kappel et al., 2020). Based on the geologic formations underlying parts of Onondaga County, including the proposed Micron Campus and Rail Spur Sites, subsidence and sinkhole events may occur gradually or abruptly according to SOCPA & OCDEM (2019). If long-term subsidence or sinkhole formation is not recognized and mitigation measures are not implemented, subsidence and sinkholes could potentially cause significant property damage and/or loss of life (SOCPA & OCDEM, 2019). The presence of karst features on, beneath, and near the proposed Micron Campus and Rail Spur Sites, including closed circular depressions and solution-enlarged joints and fracture zones, requires additional consideration, characterization, evaluation, planning, and monitoring to facilitate protection of human health, built structures, water quality, and the environment.
2. The amount of local usage of the productive bedrock aquifer for water supply is currently unknown. The assessment provided in the Draft EIS apparently includes private water supply wells from Oswego County that are incorrectly mapped in this area and does not include private water supply wells that were installed prior to April 2000. It is likely that many private water supply wells in this area were installed prior to April 2000 given the Town's long history of residential development and the fact that municipal water was not available in the vicinity of the Site until the late 1960s at the earliest (OCWA, 2025). Therefore, the owners of (and data from) private water supply wells installed prior to April 2000 have not been considered and incorporated into the Draft EIS. A private water well survey should be performed to provide information on the amount of local usage of the productive bedrock aquifer and to incorporate all private water well owners and available data into the Final EIS.
3. Section 3.3.3.4 of the Draft EIS indicates that the depth to groundwater at the site ranges from 0.1 to 7.8 feet below the ground surface in the western portion of the proposed Micron Campus. The shallow depth to groundwater at the Site indicates it is extremely likely that there is significant interaction between surface water and groundwater at the Site. Surface water elevations are not provided in any portion of Section 3.2 or Section 3.3 of the Draft EIS, and apparently none of the 42 groundwater monitoring wells reportedly installed at the Site to date are installed within the productive bedrock aquifer. Therefore, the existing water

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

August 2025

Page 18 of 21

level monitoring network described in Section 3.2.2.2, Section 3.2.4, Section 3.3.3.4, Section 3.3.4.2, Section 3.3.5, and Section 3.7.4 of the Draft EIS is insufficient to evaluate site hydrology and hydrogeology in the Water Resources Study Area, particularly with regard to evaluation and identification of likely connections/interaction between surface water, shallow groundwater in overburden, and deeper groundwater in the underlying productive bedrock aquifer. A map showing the location of all monitoring wells is not provided and boring logs and monitoring well completion records for wells installed after the three rounds of geotechnical investigation also are not provided in Section 3.2, Section 3.3, Appendix F, and Appendix E of the Draft EIS. Additionally, the Draft EIS does not present groundwater contour maps, groundwater potentiometric maps, geologic cross sections, bedrock surface contour maps, or similar maps and data that are typically prepared and presented in an evaluation of groundwater flow and surface water and groundwater interaction (including both overburden groundwater and bedrock groundwater). Therefore, surface water and groundwater interaction within the Water Resources Study Area has not been evaluated and/or has not been presented nor discussed in the Draft EIS at a level commensurate with the complex geology and hydrogeology of the Site. Characterization of surface water and groundwater interaction is required for an understanding of potential risks in areas of soluble bedrock such as the Site, and the measures that may be necessary to mitigate the risks of karst to human health, built structures, water resources, and the environment (Gutierrez et al., 2014; ASTM, 2023).

4. While the Draft EIS identifies by name some specific chemicals and products that are planned for use by Micron, other chemicals and products are identified in numerous sections of the Draft EIS only by generic chemical categories, such as PFAS, metals, oxidizers, corrosives, etc. In the absence of more information on the specific chemicals to be used at the Site, all authorities having jurisdiction should consider initially requiring analysis for all potential contaminants identified in USEPA and NIST lists of chemicals commonly used in semiconductor fabrication operations (USEPA, 2022; NIST, 2024). The analytical list may be able to be reduced after an initial period of sampling and laboratory analysis demonstrates that certain analytical parameters are not detected in wastewater effluent from Micron's operations, presuming that the reduced parameters are not subsequently introduced into Micron's operations at a later date.
5. Some of the chemicals proposed for use at the Site are widely considered by numerous authorities having jurisdiction as "emerging contaminants", which are generally substances that are relatively new to our awareness or understanding regarding their presence in the environment, their mobility and persistence in the environment, and/or their potential impacts on human health and the environment. Such chemicals include but are not limited to PFAS, 1-4 dioxane, and TMAH. For example, TMAH, which is widely used in the semiconductor industry in silicon etching, has a high solubility in water, a high affinity to bind to solids, and is toxic and therefore inhibits biological processes relied upon for wastewater treatment and water quality protection (TRA, 2025). There is currently no laboratory analytical method approved by USEPA for analysis of TMAH. Therefore, the industrial discharge of TMAH is prohibited by some wastewater treatment authorities, such as the Trinity River Authority (TRA) in Texas (TRA, 2025). If it has not already done so, OCDWEP should consider consulting with TRA or other water authorities that accept wastewater from semiconductor fabrication facilities. The Onondaga County Department of Water Environment Protection (OCDWEP) may also want to consider prohibiting the discharge of TMAH and other emerging contaminants to the publicly-owned treatment works (POTW), or alternatively requiring Micron to pretreat its wastewater on the Micron Campus to levels that can be

Sterling Water Stewards

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 19 of 21

demonstrated by Micron at its expense as not harmful to the efficiency or effectiveness of Onondaga County's POTW.

6. Even though the discharge of treated industrial wastewater from Micron's operations will occur at the Oak Orchard wastewater treatment plant under a SPDES permit issued by NYSDEC, contaminants from Micron's fabrication operations will be discharged into the Oneida River under the proposed approach outlined in Section 3.2.1, Section 3.2.3.2, Section 3.3.2, Section 3.3.4.2, and other sections of the Draft EIS. The proposed approach/discharge may add significant contaminant mass into the Oneida River, which would subsequently migrate to surface water and sediment further downstream, including the Oswego River and Lake Ontario.
7. Section 3.2, Section 3.3., Appendix E, and Appendix F (Volume 1, Part 1) of the Draft EIS for this Site do not indicate that these sections were prepared under the direction of a New York State-licensed Professional Geologist with specialized training and experience in karst survey and assessment methods. Given the complex hydrology and hydrogeology of the Site, including a professional geologist in the team directing the preparation and finalization of these sections of the EIS should facilitate enhanced protection of human health, built structures, water resources, and the environment.

RECOMMENDATIONS

Based on currently available geologic data and information, initiation of construction activities such as the excavation and removal of soil or bedrock at the Site is not recommended at this time based on the documented occurrence of soluble bedrock with evidence of dissolution and highly variable subsurface conditions at the Site that could lead to fast, turbulent subsurface water flow and further dissolution of soluble bedrock. These surface and subsurface conditions are consistent with karst geology/features and can pose significant risks to human health, built structures, water quality, and the environment through the formation of unwanted and damaging land subsidence, flooding, slope movements, and/or contaminant migration. The Draft Environmental Impact Statement (EIS) fails to acknowledge the presence of karst-like conditions at the Site and is therefore insufficient to assess the impacts of highly variable subsurface conditions on site preparation and development. Focused areas of groundwater recharge need to be identified to help prevent contamination from sources on or adjacent to karst features and to avoid or minimize natural and human-induced geologic hazards and impacts in areas of soluble bedrock such as land subsidence, flooding, and slope movement. The review uncovered significant data and information gaps regarding the Site's geology, soils, topography, and water resources, including but not limited to recent nearby use of a productive bedrock aquifer for local water supply. Additional investigation and characterization of the Site's geology, hydrology, and local groundwater use are required to inform the public and to assist owners, operators, design professionals, plan reviewers, public works officials, and jurisdictional regulators in making informed decisions on Site development and management.

The following additional recommendations are provided in response to existing data and information gaps and to address the key findings and conclusions contained in this report.

1. Conduct a systematic assessment of karst within the entire Water Resources Study Area through performance of a Preliminary Karst Assessment for Site Development in conformance with the ASTM D8512-23 standard (ASTM, 2023). Personnel who do not have specialized training and experience in karst survey and assessment methods should obtain

Review of Micron Draft Environmental Impact Statement

FoxPG Project Number STE-004R1

August 2025

Page 20 of 21

assistance from qualified professionals with specialized training and experience in karst survey and assessment methods.

2. Perform a water supply well survey and prepare an inventory of all property owners within five miles of the Micron Campus to accurately determine the number and extent of private water supply wells in the area that produce (or have the ability to produce) groundwater from the productive bedrock aquifer. This survey would provide a better understanding of the extent of use of this bedrock aquifer and will ensure that all private water supply well owners and data from private water wells in the area are considered and incorporated into the Final EIS.
3. Perform additional hydrologic and hydrogeologic characterization of the Water Resources Study Area, including characterization of the productive bedrock aquifer and all other hydrogeologic units present within the Water Resources Study Area. The hydrogeologic characterization should be performed under the direction of a New York State-licensed Professional Geologist with specialized training and experienced in the assessment of karst areas. Incorporate the results of all hydrologic and hydrogeological characterization into the Final EIS. At a minimum, the additional characterization should include the following major scope of work components at appropriate locations:
 - a. Establish and survey surface water elevation measurement stations;
 - b. Perform surface fracture characterization (e.g., remote sensing, lineament and fracture trace analyses);
 - c. Perform surface geophysical investigation using one or more methods discussed in ASTM (2020) tailored for subsurface fracture detection (e.g., seismic reflection, frequency-domain electromagnetic) and void or sinkhole detection (e.g., electrical resistivity, ground penetrating radar, gravity);
 - d. Install additional monitoring wells at appropriate locations and depths, including coupled overburden and bedrock monitoring wells;
 - e. Incorporation of existing private water supply wells (particularly bedrock wells) acquired by Onondaga County from former property owners on or near the proposed Micron Campus and Rail Spur Sites into the hydrogeological investigation;
 - f. Borehole geophysical investigations;
 - g. Aquifer characterization testing and analysis, including but not necessarily limited to aquifer pumping tests and dye tracing;
 - h. Sampling and field and/or laboratory analysis of surface water and groundwater from each hydrogeologic unit present in the Water Resources Study Area to characterize water quality, including but not necessarily limited to major cations, major anions, pH, temperature, conductivity, oxidation-reduction potential, and potential contaminants;
 - i. Preparation of overburden thickness, water infiltration potential, groundwater contour, potentiometric surface, geologic cross sections, bedrock surface contours, aquifer thickness, well yield, land use, and/or other mapping and evaluation as appropriate based on the results of the hydrogeologic investigation;
 - j. Development of a comprehensive Conceptual Site Model of the hydrology and hydrogeology of the Water Resources Study Area that includes all hydrologic and hydrogeologic units identified during the investigation; and
 - k. Preparation of a report describing all characterization methods, findings, conclusions, and recommendations. The report should be made available to the public for review and comment prior to finalization and approval.
4. In the absence of Micron providing an initial list and quarterly updates of all specific chemicals to be used at its Clay semiconductor fabrication facilities, all authorities having jurisdiction should consider requiring sampling and laboratory analysis for all

August 2025

Page 21 of 21

elements/compounds/chemicals listed in Appendices C and D of the CHIPS Program Office Final Programmatic Environmental Assessment document dated 28 June 2024 (NIST, 2024). With regards to PFAS and/or other organofluorine compounds, in addition to analysis for all target PFAS analytes by USEPA Method 1633, all authorities having jurisdiction should also consider requiring analysis of total organic fluorine (TOF) and total oxidizable precursors (TOP) assay to provide an estimate of the mass of PFAS (in the form of free perfluoroalkyl acid precursors) and/or other organofluorine compounds present in discharged wastewater from Micron's operations at the Site. The TOP assay is the most widely commercially available of the qualitative PFAS analytical techniques and is typically accepted as a means of determining PFAS load on remediation (treatment) media (ITRC, 2023). This recommendation applies to all regulatory programs (e.g., SPDES monitoring, response to any environmental investigation and/or remediation required for any spills or releases from the Micron Campus and/or connected actions, etc.) and to all applicable environmental matrices (e.g., water, wastewater, soil, sediment, etc.). Required analysis lists may be able to be reduced after an initial period of sampling and laboratory analysis demonstrates that certain analytical parameters are not detected at concentrations of concern in wastewater effluent or other discharges or releases from Micron's operations, and presuming that the reduced parameters are not subsequently introduced into Micron's operations at a later date.

5. Regarding the emerging contaminant TMAH, which is widely used in the semiconductor industry in silicon etching, there is currently no USEPA-approved method for laboratory analysis of TMAH. If it has not already done so, OCDWEP should consider consulting with TRA or other water authorities that have experience accepting wastewater from semiconductor fabrication facilities regarding an effective laboratory analytical methodology for TMAH and/or to evaluate whether OCDWEP may want to consider prohibiting the discharge of TMAH into Onondaga County's POTW (or alternatively requiring Micron to pretreat its wastewater on the Micron Campus to TMAH concentrations that can be demonstrated by Micron at its expense as not harmful to the efficiency or effectiveness of Onondaga County's POTW).
6. To reduce environmental impacts, Micron should consider proactively supporting NYSDEC's Water Quality Antidegradation Policy (NYSDEC, 1998) and the findings and objectives of the Great Lakes-St. Lawrence River Basin Sustainable Water Resources Agreement of December 13th, 2005 by proactively treating their wastewater before it leaves the Micron Campus to an extent that will avoid the planned discharge of contaminant mass into the waters of the People of the State of New York and the larger, connected Great Lakes Basin.
7. At a minimum, Section 3.2, Section 3.3., Appendix E, and Appendix F (Volume 1, Part 1) of the Final EIS for this Site should be prepared and finalized under the direction of a New York State-licensed Professional Geologist with specialized training and experience in karst survey and assessment methods to facilitate enhanced protection of human health, built structures, water resources, and the environment.
8. There are controls that should be able to mitigate the concerns raised and documented in this report. If Micron chooses not to perform additional investigation and characterization of the Site's hydrology and hydrogeology, all authorities having jurisdiction should consider requiring Micron to provide specific design plans prepared under the direction of a New York State-licensed Professional Engineer that will mitigate the concerns raised and documented in this report.

Surface depression (source of focused water infiltration/ groundwater recharge)

Generalized cross section diagrams illustrating selected variations in gaining, losing, connected, and perched reaches of streams in relation to an underlying karst aquifer. GWL = groundwater level. Perched gaining reaches are typically observed when higher intensity rainfall induces perched groundwater flow due to limited capability of the epiphreatic zone to convey large volumes of water towards the underlying less karstified bedrock. Conversely, connected losing reaches are typically observed when the rainfall intensity is lower. Modified from Figure 12 in Gutierrez et al. (2014).

Subject: [EXTERNAL] Comments on DEIS for Micron Semiconductor Manufacturing Project

To whom it may concern:

I am writing to submit comments on the draft environmental impact statement for the Micron semiconductor manufacturing project proposed in Clay, NY. I am a professor of chemistry at Le Moyne College in Syracuse, NY and a resident of Syracuse. I also row on Onondaga Lake and the Seneca River. The Micron semiconductor manufacturing project presents an exciting economic opportunity. However, residents of this area are well aware of the negative environmental impacts that can result from industrial development, as evidenced by the long history of Allied Chemical and its predecessors polluting Onondaga Lake. The Micron project is enormous in scale; it is of the utmost importance that environmental and other impacts are fully and thoughtfully addressed both before the project begins and throughout the lifetime of the facility so that the project not only provides economic benefits but also minimizes environmental impacts and contributes to a healthy, sustainable future for all in this region.

While the DEIS is vast, there are a number of elements that are not adequately addressed. Those that are of most concern to me are the following:

Plans for (renewable) energy use and GHG emissions. When operational, Micron is expected to consume ~5% of all the energy in the state of New York. Greenhouse gas emissions will be ~4.7 million CO₂ equivalents, equivalent to 29.5% of New York's 2022 industrial sector emissions (Section 3.3). Under the Green CHIPS act, Micron must utilize 100% renewable energy. The DEIS indicates that Micron will "Install on-site renewable energy systems and onsite battery storage systems to supplement the Proposed Project's energy supply to the extent practicable," and otherwise "reduce its Scope 2 emissions by purchasing 100 percent carbon-free electricity utilizing power purchase agreements and renewable energy credits for the power consumption of the Micron Campus." Given the incredible energy use expected for this project, renewable energy credits do not seem sufficient. Micron has not demonstrated that these credits will be available in New York and not already committed to other users. Although there are uncertainties, the DEIS should provide more detail on the energy that will be produced on-site, and provide alternatives for GHG emission mitigation such as additional construction of renewable energy sites.

Transportation plans. The construction of the Micron facility will lead to significant traffic increases, and all of the proposed mitigation plans involve roadway improvements (3.11.3.4). In line with the goals of the CHIPS Act and the Green CHIPS Act, alternative transportation solutions and traffic mitigation measures such as buses, bicycle lanes, and incentives for carpooling should be considered. These measures could also allow the size of the parking lot to be decreased, decreasing other environmental impacts, as well as indirect CO₂ emissions.

Plans for dealing with waste and hazardous substances. The DEIS does not specify the specific fluorinated chemicals that will be used and their quantities. While monitoring of PFOA and PFOS are specified in the DEIS (3.8.3.2), many other fluorinated compounds are used in the semiconductor industry,^[1] and they are likely to have significant environmental and health impacts. Micron should commit to monitoring and limiting all fluorinated compounds in wastewater, solid waste, and gases emitted.

There are concerns about the ability of Onondaga County to deal with the waste generated due to recent failures; a new \$23 million sewage treatment building is not operational due to toxic air quality.^[2] Most of the waste will be shipped off-site by contracted waste handlers. The sites of this waste and environmental justice impacts should be addressed.

Wetland destruction and restoration plans. The DEIS reports the permanent loss of ~200 acres of wetlands. The proposed mitigation is the restoration of 422 acres of wetlands. The proposed mitigation ratio is near the minimum required (Table 3.3-13). The proposed wetlands for restoration are not contiguous. Restored wetlands take years to develop, are, on average, not as productive as original wetlands, and may not be effective in the same ecosystem services.^[3] Additionally, more than 193.4 acres of wetlands may ultimately be degraded at the original site due to the large increase in impervious surfaces nearby, as laid out in Section 3.3.4.2 of the DEIS, even if BMPs and SMPs for stormwater are implemented. Micron should preserve and restore larger and more contiguous sections of wetlands to more effectively offset those that they will destroy.

Finally, with such a huge project incurring large impacts on the environment and the economy and with significant potential impacts for human health, I hope Micron will be transparent and inclusive in developing and sharing the details of the project and of mitigation strategies. Engaging local experts and communities will help to ensure that all aspects are considered and that the benefits of the project (not just the negative impacts) are spread equitably to those already living in the area.

Thank you for your consideration,

Emily Harcourt, Ph.D.

Subject: [EXTERNAL] Micron project

I am writing to voice my concerns regarding the micron plans to build four computer chip factories at the corner of Route 31 and Caughdenoy Road. I am a life time resident of the Syracuse area and currently reside off Caughdenoy Road near the proposed factory site. I echo the concerns voiced at the public hearing at Liverpool High School regarding traffic, noise, air quality especially emissions of forever chemicals. On the environmental concerns flooding already exist and with this project it would exacerbate our current situation. We have septic systems and some residents still have well water. The disruption of natural run off will increase are flooding and cause contamination of drinking water and compromise are waste systems. Having public sewage systems in place for the current residents to secure our health and well being as well as for future home development in the area. would help resolve some of this problem. I believe that with all the new technology, co-operation and commitment of all parties involved this could be an asset to the community showing when we all work together good things can happen. Sincerely, AnnMarie Kazmirski
residing at 4781 Becker Road Brewerton NY

Subject: [EXTERNAL] Micron in Clay, NY comments, Moving People Transport Coalition
Attachments: Micron DEIS comments_Moving-People.docx

Hello CHIPS Program Office ,

I submit here, comments on the Micron Project in Clay, NY from Moving People Transport Coalition in Syracuse, NY.

Moving People is submitting these comments now, but we would like to know if revisions and further comments could be accepted tomorrow Aug.

11th.

Best regards,

Peter King for Moving People Transport Coalition, Syracuse, NY.

August 8, 2025

Onondaga County Industrial Development Agency (OCIDA)
ATTN: Micron Project
335 Montgomery Street, Floor 2M
Syracuse, NY 13202

To whom it may concern:

On behalf of the Moving People Transportation Coalition, I submit the following comments regarding the Micron Semiconductor Manufacturing Project, Clay, NY, Draft Environmental Impact Statement. Moving People Transportation Coalition advocates for a sustainable and equitable regional transportation system that prioritizes pedestrians, public transportation, and micromobility.

MPTC is particularly concerned with the environmental harms related to increased vehicle miles travelled (VMT) predicted in the DEIS. The DEIS predicts that the Micron project will increase regional VMT by 67 million miles travelled annually by 2041 (*DEIS Table 3.7-12, p.3-208*). This increase will result in additional greenhouse gas pollution including over 16,000 additional metric tons of CO₂ equivalent (CO₂e) emitted annually by 2041, and over 22,500 tons CO₂e as considering Upstream Fuel Production and Transport (*Ibid.*). Increased VMT will also impose broader costs on the region including increased flood risk due to expanded impermeable surface area, worsening congestion, and additional traffic fatalities. For these reasons, local planning efforts including the City of Syracuse's Vision Zero initiative, Syracuse Metropolitan Transportation Council's Metropolitan Transportation Plan, and Onondaga County's Comprehensive Plan all aim to reduce VMT, and in that context, the anticipated increase in regional VMT expected to be caused by the Micron project requires substantial mitigation.

The DEIS proposes no mitigation for increased VMT. The DEIS considers VMT as a potential cause of traffic congestion in the immediate area of the project site and proposes a series of road widenings to mitigate that congestion. However, the DEIS anticipates that these proposed mitigations will actually increase VMT by ~1 million miles annually by 2041 even while maintaining acceptable levels of service on the identified vehicle routes (*Comment on Table 3.7-12 Regional Mobile Source VMT, and Sec. 3.11.3.4*). The proposed mitigations, then, will worsen the other environmental harms associated with increased VMT including increased traffic fatalities and surface runoff. The DEIS touches briefly on traffic safety, but avoids mentioning potential flood risks from increasing paved surface area (*Comment on Sec.'s 3.11.3.9 Safety, 3.11.3.4 Analysis of Recommended Mitigations and 3.11.4 Summary of Impacts*).

A better measure would mitigate traffic congestion *and* other environmental harms caused by increased VMT, by addressing VMT directly. Although Micron will inevitably attract more vehicles to the area, there is ample opportunity to mitigate VMT by encouraging mode shift. The DEIS predicts that Micron will only generate 80 bus trips and 80 bicycle trips daily.

Each of these figures could be improved by implementing a Transportation Demand Management (TDM) plan after Micron begins regular operation. Such a plan would encourage people travelling to the site—both employees and visitors—to arrive by some means other than driving themselves alone.

Micron can provide incentives for people who arrive by bus, bike, or who carpool to decrease VMT by reducing the total number of cars driving to and from the site. Measures could include providing more convenient parking spaces for carpools, charging for onsite parking, reimbursing bus fare, providing vouchers for the purchase of ebikes, and coordinating with Centro to subsidize useful bus service at shift changes. (*Comment on Sec. 3.11, Transportation*).

Furthermore, Micron's TDM planning needs to include more than the limited agency stakeholders named in their proposed transportation mitigation plan, by collaborating with more local transportation and planning stakeholders. Micron broadly names New York State Dept. of Transportation (NYSDOT) and Onondaga County Dept. of Transportation (OCDOT), and the Towns of Clay and Cicero Planning Boards as "Involved agencies" (*Table 1.2-1*). However, Micron's transportation footprint will affect a wider area and more stakeholder groups than those agencies represent. Micron's TDM should include Centro, Syracuse Metropolitan Transportation Council (SMTC), and other local planning departments, agencies as applicable for TDM planning. Micron's TDM should be adaptive, based in stakeholders openly sharing data and reassessing methods for meeting TDM goals, including traffic safety and reducing VMT. (*Comment on Sec. 3.11, Transportation, 1.2.2 Participating Agencies and Entities*).

Measures such as these would fulfill the requirements identified in the NYS Green CHIPS program to "plan for supporting public transportation or alternative transportation options for employees" including "measures supporting smart growth, integrating facilities into public transportation services, and providing incentives for businesses to accommodate non-vehicular commuting, including employee-based trip reduction programs, low/no-cost transit passes for employees, micro-transit options for employees, ride-sharing programs, bike-sharing, and scooter-sharing; and cycling accommodations." (*Green CHIPS Sustainability Plan Template, from NYS Empire State Development*). (*Comment on 1.1.2 Micron Purpose and Need, Table 1.2-1 State and Local Involved and Interested Agencies*).

These measures will also reduce the need for surface parking at the site—the DEIS anticipates an unreasonable 12,000 parking spaces which will destroy wetlands and increase runoff—and it will further reduce indirect VMT increases by eliminating the need for proposed road widenings (*Comment on Sec.3.3 Water Resources, > 3.3.4.2 Preferred Action Alternative*)

There is still a need for further mitigation measures to address the regional increase in VMT predicted to result from the Micron project. Micron, the New York State Department of Transportation and Onondaga County should mitigate the growth-induced effects of increased VMT by building regionally significant bike and pedestrian infrastructure, expanding access to ebikes and other micromobility devices, and improving public transportation service across the region (*Comment on Sec. 3.11, Transportation*).

Sincerely,

/s/ Alex Lawson

This increase will result in additional greenhouse gas pollution including over 16,000 additional tons of CO₂ equivalent emitted annually by 2041. Increased VMT will also impose broader costs on the region including increased flood risk due to expanded impermeable surface area, worsening congestion, and additional traffic fatalities. For these reasons, local planning efforts including the City of Syracuse's Vision Zero initiative, Syracuse Metropolitan Transportation Council's Metropolitan Transportation Plan, and Onondaga County's Comprehensive Plan all aim to reduce VMT, and in that context, the anticipated increase in regional VMT expected to be caused by the Micron project requires substantial mitigation.

The DEIS proposes no mitigation for increased VMT. The DEIS considers VMT as a potential cause of traffic congestion in the immediate area of the project site and proposes a series of road widenings to mitigate that congestion. However, the DEIS anticipates that these proposed mitigations will actually increase VMT by 1 million miles annually by 2041 even while maintaining acceptable levels of service on the identified vehicle routes. The proposed mitigations, then, will worsen the other environmental harms associated with increased VMT including increased traffic fatalities and surface runoff.

A better measure would mitigate traffic congestion *and* other environmental harms caused by increased VMT by addressing VMT directly. Although Micron will inevitably attract more vehicles to the area, there is ample opportunity to mitigate VMT by encouraging mode shift. The DEIS predicts that Micron will only generate 80 bus trips and 80 bicycle trips daily.

Each of these figures could be improved by implementing a Transportation Demand Management (TDM) plan after Micron begins regular operation. Such a plan would encourage people travelling to the site—both employees and visitors—to arrive by some means other than driving themselves alone. Micron can provide incentives for people who arrive by bus, bike, or

who carpool to decrease VMT by reducing the total number of cars driving to and from the site. Measures could include providing more convenient parking spaces for carpools, charging for onsite parking, reimbursing bus fare, providing vouchers for the purchase of ebikes, and coordinating with Centro to subsidize useful bus service at shift changes. The TDM plan should be adaptive, by responding to ongoing data collection and reassessment by all stakeholders for meeting TDM goals, including traffic safety and reducing VMT.

Measures such as these would fulfill the requirements identified in the NYS Green CHIPS program to “plan for supporting public transportation or alternative transportation options for employees” including “measures supporting smart growth, integrating facilities into public transportation services, and providing incentives for businesses to accommodate non-vehicular commuting, including employee-based trip reduction programs, low/no-cost transit passes for employees, micro-transit options for employees, ride-sharing programs, bike-sharing, and scooter-sharing; and cycling accommodations.”

These measures will also reduce the need for surface parking at the site—the DEIS anticipates an unreasonable 12,000 parking spaces which will destroy wetlands and increase runoff—and it will further reduce indirect VMT increases by eliminating the need for proposed road widenings.

There is still a need for further mitigation measures to address the regional increase in VMT predicted to result from the Micron project. Micron, the New York State Department of Transportation and Onondaga County should mitigate the growth-induced effects of increased VMT by building regionally significant bike and pedestrian infrastructure, expanding access to ebikes and other micromobility devices, and improving public transportation service across the region.

Sincerely,

/s/ Alex Lawson

Subject: [EXTERNAL] Micron Project

Hello my name is Chris Minardi, my address is 5108 Old Barn Rd, Clay NY 13041. I am against Micron for three main reasons.

The first is the negative environmental impact, both to wildlife and people. Many species of plant life and wildlife will be displaced and/or destroyed due to the building of the plant. It may take decades or longer to fully recover from the damage. Entire Waste products including heavy metals and forever chemicals could end up in the ground and in our water supply. This risk alone is far too great to offset any economic or technological benefits.

The second is the noise pollution and extra traffic the plant will bring. This will disrupt residents including myself who have worked very hard to be a part of a community that prides itself on safety and tranquility, which will be disrupted.

The third reason is the cost of moving if the plant comes. My girlfriend whom I reside with has acute myeloid leukemia, and she cannot be around the aforementioned heavy metals and chemicals. If the plant comes, we will be forced to move, which is expensive and disruptive to the life we've build and become accustomed to.

Please consider this message when making your final decisions and say no to Micron. Thank you.

-Chris Minardi

Subject: [EXTERNAL] Micron DEIS Public Comment

August 10th, 2025

Dear US Department of Commerce and Onondaga County Industrial Development Agency,

Thank you for the opportunity to comment on the July 10, 2025 Draft Environmental Impact Assessment (DEIS) for federal financial assistance to Micron Technology under the CHIPS incentives program and state financial assistance under the Green CHIPS Act for Micron's proposed Semiconductor Manufacturing Project in Clay, New York (EISX-006-55-CPO-001).

I am an Environmental Studies Professor at SUNY College of Environmental Science and Forestry. I completed my doctorate in Earth and Environmental Science at the University of Minnesota with a focus on hydrology. I also have a Bachelor of Science in Geoscience from Penn State. I do not speak on behalf of my employer, SUNY ESF, or any other organization. My comments are my own from my own expertise.

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025.

The DEIS raises several concerns. I am writing to urge the Department of Commerce (DOC) and Onondaga County Industrial Development Agency (OCIDA) to minimize health, safety, and environmental harms; protect workers; and maximize equitable quality-of-life and socioeconomic benefits for communities impacted by Micron's development in Central New York (CNY).

Loss of Water Storage & Increased Runoff:

Micron's plans will turn 200 acres of wetlands and ~8,000 linear feet of streams into 645 acres of impervious surfaces (asphalt, concrete) and 58 acres of semi-impervious surfaces. Rainwater that was once contained on this site and recharged into aquifers will now be quickly discharged downstream as stormwater. This will be especially true during heavy rainstorms, which are predicted to increase with climate change.

Micron proposes to restore existing farm fields into wetlands. However, the proposed wetland restoration sites indicated in the DEIS are not downstream of Micron and therefore do not mitigate this loss of water storage.

While Micron's Draft Environmental Impact Statement recognizes this increase of stormwater runoff, they do not provide detailed stormwater management plans in their statement. Once complete, Micron project site will contain 66.6 acres of

stormwater management areas. Micron will implement stormwater best management practices and adaptive management informed by monitoring, all following NYS law and permitting requirements. Preliminary calculations of stormwater have been conducted for the project, but results were not included in the Draft Environment Impact Statement.

Following the Rational method, the standard yet simplified equation for estimating stormwater runoff (Thompson 2006), the Micron site will have about 1,360 cubic feet per second of runoff with rain at 2 inches per hour. For comparison, the Onieda River ranges from 2000 to 8000 cubic feet per second year just downstream of the Micron site in Euclid, New York ([USGS Stream Gauge Data](#)). Additionally, increased heavy rainstorms with climate change will further increase this stormwater runoff quantity, and has not been considered or addressed in this plan.

Stormwater quantities associated with the Rail Spur, Childcare Center, and the Wastewater Treatment Plant expansion have not been quantified. Water quality impacts of this stormwater are not addressed.

Comment: Sufficient information has not been provided to take a hard look at stormwater runoff and make a reasoned judgement justifying that the proposed 66.6 acres stormwater management and wetland restoration plans fully mitigate the water quantity and quality of increased runoff and loss of wetlands on the site.

Recommendation: Micron must provide detailed stormwater modeling and management plans as part of their Environmental Impact Statement. Independent experts should review this modeling and downstream communities should be included in the decision making process around acceptable levels of flood risk.

Sources: Thompson, D.B., 2006. The rational method, Regional regression equations, and site-specific flood-frequency relations. Austin, TX: Texas Department of Transportation Research and Technology, Report No. 0-4405-I. 78763-5080.

Increased Downstream Flood Risk:

Micron's flood analysis included looking at FEMA flood maps to see if any of their sites were in a 100- or 500-year floodplain. While they acknowledge that the extensive changes to their site will increase stormwater runoff rates and therefore lead to expanded floodplain boundaries, *their analysis does not include any such modeling or calculations*. They also acknowledge that significant growth of residential and commercial areas in the surrounding region is likely, and will lead to the loss of more wetlands and streams and an increase in impervious surfaces. This will raise risks for pollution and downstream flooding, yet they do not include this in their modeling or calculations. Additionally, they do not consider increased risks for heavy precipitation events with climate change in their flood risk analysis. Instead of fully exploring the impacts of climate change and development to flooding on their site, they conclude that their site is not within a floodplain or directly adjacent to one, and therefore there is no risk.

The Draft Environmental Impact Analysis does not include analysis of downstream flooding impacts of the proposed Micron site. They do not consider how their extensive development with increased impervious surfaces will impact flooding downstream, especially compounded with the increased residential and commercial development anticipated across the region. Additionally, the Micron facility will discharge ~40 million gallons per day of treated industrial and sewage wastewater once the facilities are fully built out. For comparison, the current wastewater treatment plant discharges about 6 million gallons per day. This water is discharged into the Onieda River which flows into the Oswego River to Lake Ontario. This discharge will increase the water flowing in Onieda and Oswego Rivers, along with the increased stormwater runoff, and could increase downstream flood risk.

While upstream [Brewerton](#) is projected to have only moderate flood risk, downstream towns of [Phoenix](#) and [Fulton](#) have severe and extreme flood risks respectively, according to First Street Map analysis. These risks will only increase with climate change and increased impervious surfaces in the watershed.

Comment: The Draft Environmental Impact Statement says the Micron development will not result in significant adverse or cumulative effects on water resources and floodplains. However, sufficient information has not been provided to take a hard look at cumulative flooding impacts and make a reasoned judgement justifying that the proposed stormwater management and wetland restoration is enough mitigation to address all of these impacts and claim not significant adverse effects.

Recommendation: Micron must provide detailed stormwater modeling and management plans that account for climate changes, increasing regional development, changes in floodplains, wastewater discharge, that mitigates downstream flooding risk.

Dewatering for construction:

The Micron Draft Environmental Impact Statement notes that groundwater was 0.1 to 4.2 feet below the surface. To construct the fabrication facilities and other infrastructure on site that extend deep underground, Micron will have to pump out water, as they mention in their Draft Environmental Impact Statement. This “dewatering” will artificially lower the water table, potentially draining nearby wetlands, streams, and wells. This water will also have to be stored and discharged somewhere. Construction is estimated to take 16 years.

Comment: The Micron Draft Environmental Impact Statement does not take a hard look at the environmental impacts of dewatering in their construction process to justify use of this process without a mitigation plan to protect the surrounding wetlands, streams, and wells.

Recommendation: Micron should disclose when, where, and how long they will dewater this site and how they will mitigate the impacts to surrounding wetlands.

Interim Wastewater Discharge during build-out:

Before the full wastewater treatment plan upgrade, Micron will begin discharging water from their construction, initial equipment testing, and possibly initial manufacturing in Fab 1. Micron will construct a temporary water treatment project to treat this water, consisting of temporary biological treatment. Fab 1 is scheduled to be complete by 2029 by which point they will be producing 8.7 MGD of industrial wastewater. Therefore, it seems this temporary water treatment plan will span at least four years and include significant amounts of wastewater.

Comment: Very few if any details of their temporary plan are included in the Draft Environmental Impact Statement. Therefore, the Micron Draft Environmental Impact Statement does not take a hard enough look at the first four years of wastewater discharge (up to 8.7 MGD) and provide an adequate plan for treating this pollution to justify the claim there will be no significant adverse effects.

Recommendation: Micron must provide such plan and justification.

Water contamination from construction:

During the 16-year construction period, large expanses of the Micron site will be cleared and excavated, exposing sediment that was previously held in place by vegetation to erosion. The Micron Environmental Impact Statement says “temporary erosion and sediment controls, stormwater management areas, and stormwater infrastructure” will be put in place. New utility lines will be buried in 420 acres of land by excavating trenches, laying pipe, and recovering trenches, or by jack and bore drilling. Hydraulic directional drilling will also be used to lay pipe underneath streams.

Comments: These methods have the potential to release drilling fluids and sediment into downstream waters. While Micron commits to using sediment controls, no specifics are detailed. This is especially concerning because the construction is proposed to last for 16 years, which is a long time to maintain temporary sediment erosion controls.

Recommendation: Micron must fully account for these impacts and mitigations plans in detail.

Industrial Pollution

The DEIS does not discuss in any detail the pollutants that are likely to be part of its industrial wastewater stream. The DEIS acknowledges process-related wastewater will likely contain PFAS substances, but there is no information on the type or amount of PFAS that will likely be present. Instead, the DEIS relies on bald assertions that the Micron facility and the planned Oak Orchard Industrial Wastewater Treatment Plant (WWTP) will use advanced treatment technologies and will comply with their respective Clean Water Act permits. Based on a promise of permit compliance, Micron asserts that its wastewater discharges will have no significant environmental impact. This is an incomplete assessment for several reasons.

First, PFAS is a common component of all semiconductor manufacturing and is likely used in and discharged from Micron's other facilities. Micron relies on its experience in Idaho and Taiwan to estimate overall waste levels (Table 3.8-4, p. 3-232). It should be able to use that same experience to provide additional information on the type and amount of PFAS substances used in production, the discharge methods that have been implemented in other facilities, and their effectiveness.

Second, PFAS is an emerging contaminant and, despite the known hazards of exposure, environmental regulations haven't caught up. Micron acknowledges that there are at least 10,000 PFAS substances known to be used in or produced by manufacturing processes (p. 3-240). Fewer than 10 PFAS substances have established federal or state drinking water standards that could be translated into permit terms. This is complicated even more by the lack of reliable detection methods. As stated in the DEIS, EPA's most up-to-date methods can detect only 40 PFAS substances. For these reasons, compliance with permit terms does not mean no significant environmental effects.

Recommendation: Micron should provide more information about the type and amount of PFAS that are used in the production processes in its other facilities and the amount and type found in those waste streams. Unless Micron can demonstrate otherwise, the DEIS should assume that all -- or a percentage based on past experience -- of this PFAS will escape detection or capture by any industrial wastewater treatment plant and assess the impacts of its discharge into the environment.

Contamination in Wastewater Sludge

The DEIS does not consider the potential contaminants in sludge generated by its on-site industrial wastewater treatment facility. As noted in the first comment and acknowledged by Micron, there are likely to be PFAS substances in the process-related wastewater. If Micron is able to remove PFAS from this wastewater stream before discharging to Oak Orchard WWTP, that PFAS will likely be contained in the sludge, which will limit its beneficial reuse.

Recommendation: Micron should provide additional detail on the PFAS treatment systems proposed for its on-site Industrial WWTP, including an assessment of where PFAS removed from the process wastewater will end up. Unless Micron can show that PFAS will fall out elsewhere in the treatment process, the sludge from the on-site industrial WWTP should be considered hazardous and not suitable for land application as fertilizer or soil enhancer.

Air Pollution:

The DEIS asserts that air pollution emissions from the construction nor operation of the Micron facility will not violate the National Ambient Air Quality Standards (NAAQS) for the study area. However, most of the monitoring data for criteria air pollutants (those with established NAAQS) on which this assessment relies comes from monitors in Rochester, NY, more than 70 miles from the project site. Only ozone and small diameter particulate matter (PM_{2.5}) are measured in the Syracuse area. Conditions in Rochester may be expected to be similar, but Micron should at least be required to demonstrate -- with actual local monitoring data -- that they are before relying on these figures to demonstrate that the facility will not have any significant environmental impacts.

In addition, in making this assessment, the DEIS does not allow for or consider the impacts of any exceedances, upsets, or violations in assessing the environmental impacts of air emissions. However, no equipment works perfectly. Again, based on its experience in chip manufacturing, Micron should have some sense of how often its facilities encounter upsets, exceedances, or unavoidable permit violations that may result in excess air emissions. If Micron doesn't have that data, it could rely on industry-wide statistics. For example, the Environmental Working Group found that, as of October 25, 2024, 10% of active semiconductor manufacturing facilities had violated federal environmental laws and regulations in the last 10 years and 27% of the facilities with individual discharge permits had violated those permits. (Environmental Working Group (2024, Oct. 25), "What the Building CHIPS America Act Could Mean for Public Health and the Environment," available on-line at <https://www.ewg.org/news-insights/news/2024/10/what-building-chips-america-act-could-mean-public-health-and-environment>).

Finally, assuming that the DEIS NAAQS compliance analysis is correct, modeled levels of both NO_x and PM_{2.5} are very close to NAAQS limits. Given the uncertainty inherent in modeling data, Micron should be required to keep a closer eye on the regional levels of these pollutants during construction and operation.

Recommendation: Micron should be required to either provide background data supporting its assumption regarding the comparability of Rochester and Syracuse air quality conditions for most of the critical air pollution evaluated OR install air quality monitors in the airshed directly affected by the Micron facility. The data from those monitors could be used to both check NAAQS compliance under regular operating conditions and to identify the environmental impacts of exceedances, upsets, or other unavoidable violations of air emission limits. Micron can then adjust its operations or its controls if the localized air monitoring shows a problem.

Data Requirements

Throughout the air, water, and solid/hazardous waste sections of the DEIS, Micron asserts that it will comply with all applicable federal and state laws, regulations, and permits and therefore its operations will have no significant environmental impacts. That is not appropriate. Both NEPA and SEQRA assume compliance with applicable laws. The goal of these environmental assessment statutes is to determine what the environmental impacts of otherwise legal actions will be. In some cases, such as the NAAQS which are based on achieving or maintaining ambient air standards designed to protect public health, this may be appropriate. (Even in NAAQS-compliant airsheds, however, there may be localized exceedances that create public health impacts. *See* Carlson, A.E. (2018). The Clean Air Act's Blind Spot: Microclimates and Hotspot Pollution, 65 U.C.L.A. Law Rev. 1036.) For other environmental standards based on best available technology or, in particular, in areas where regulations are struggling to catch up with data on environmental impacts, this assumption is not valid.

Recommendation: Rather than simply reciting the applicable legal standards and its intent to comply with those standards, Micron should be required to provide data on the pollution reduction that can be achieved via available air emission or water discharge controls and assess the environmental impacts of the resulting emissions/discharges directly.

Community Oversight

The Micron project will take more than 15 years to build, involves complex and evolving technology, and admittedly includes many uncertain environmental impacts. As noted above, the type and amount of PFAS discharges in wastewater, the level of control achievable from available PFAS control technology, the actual regional levels of most criteria air pollutants, the likely air emissions from the facility, particularly in terms of upsets and exceedances are unclear. The DEIS acknowledges other major uncertainties, such as the location and intensity of residential or commercial development sparked by the project; and the success of wetlands, bat, and grassland bird mitigation projects. Because of the inherent uncertainty surrounding other impacts, Micron has committed to adaptive management for issues such as managing groundwater and stormwater run-off on-site wetlands, and flood response.

The DEIS mentions air and water quality monitoring, but it lacks detail on how data will be shared with the public and how health outcomes will be tracked over time. Establishing a community advisory and oversight board to oversee environmental monitoring and ensure transparency should be considered. The DEIS references the idea of adaptive management as best management practice in many areas, including managing groundwater during construction, managing stormwater run-off, managing on-site wetlands, and flood response. The DEIS also discusses complying with evolving best management practices or installing new control technology to limit emissions or other environmental impacts. This means that, as new best practices come online over the course of construction or operations, the project might be amended to incorporate less environmentally harmful projects.

Recommendation: Given the inherent uncertainties and evolving nature of this enormous and long-term project, Micron should be required to create and support a community advisory and oversight committee which can help with on-going monitoring, environmental impacts assessment and response, and community engagement. This committee should be composed of both community members and local experts who can provide grounded information to and review of continuing assessment and adaptive management at the site and a direct line of communication with the affected public.

The baseline and long-term monitoring must include:

1. Air and Water: Long-term and local air quality monitoring as well as monitoring of surface waters and both shallow and bedrock groundwater quality and quantity.
2. Restored Wetlands: The wetland mitigation plan acknowledges that changes in restoration methods may be required based on restoration successes or failures in the field. Further the restored wetland sites are meant to operate in perpetuity. On-going monitoring and opportunities for citizen or community expert engagement is critical to ensure that this mitigation measure operates as designed.
3. Impact of Habitat Loss: The DEIS presumes that, between mitigation plans and available habitat near Micron campus, the loss of habitat for bats, birds, small mammals, amphibians/reptiles, and native plants will not be a significant problem. Additional baseline and post-construction impact monitoring of wetland, forest, grassland loss is necessary to demonstrate that this assumption is correct.

The Community Oversight committee would review:

1. Micron's mitigation measures sequentially for each FAB to ensure that the best available practices are adopted.
2. Micron's ongoing mitigation efforts to prevent climate change will also evolve in response to technical developments.
3. The several areas in the DEIS where impacts are uncertain, unpredictable, or based primarily on modeled data:
 1. Use of best available technology to detect and remove PFAS from wastewater and air emissions;
 2. The location and intensity of residential or commercial development sparked by the project, including the traffic impacts;
 3. Noise effects from construction and operation, including related traffic, which are based on modeled data;
 4. The success of wetlands mitigation projects; and
 5. The likely air emissions from the facility

Public engagement and communication would be promoted through an on-going community advisory and oversight committee. This Committee should have a meaningful oversight role and should be considered an enforceable condition of Micron's CHIP grant.

More Consideration of Alternatives

The DEIS considered and rejected project alternatives that involved a smaller production facility (two or three "fabs" rather than four). This assessment was based on a stated need for Micron to produce 52,000 wafers per week to meet the national need for domestic chip production. Since this assessment was completed, Micron announced plans to build a second fab at its Idaho facility and a new plant on its Virginia site. (Day, Don (Jun 12, 2025). *Micron Announces Second Fab*, BoiseDev, <https://boisedev.com/news/2025/06/12/micron-boise-second/>). Given this significant production expansion, the 52,000 wafer per week production goal may be met in other ways, allowing for Micron to consider a scaled-down version of its Clay facility. Even a slightly smaller three- fab alternative in Clay might eliminate significant environmental impacts by avoiding wetlands clustered east of Burnett Road.

Recommendation: For that reason, the DEIS should be expanded to consider a three-fab alternative.

Sincerely,

Madeline Nyblade

Subject: [EXTERNAL] Micron project feedback

Importance: Normal

Sensitivity: None

Hello-

I am writing as part of the public commentary on the Micron project. The Micron report says that the land was purchased by the Onondaga Industrial Development Agency to put some kind of industrial park on the property to begin with, so there's probably not much anyone can say about adverse effects on nature for this project or any other. Given that, I can appreciate that Micron is attempting to mitigate loss of habitat by creating alternative habitat elsewhere. However, the alternative habitat is not going to help the hundreds of thousands of plants and animals currently living in the target zone, who face death by loss of their homes, food supply, water supply, and outright suffocation by being buried alive in their burrows as acres of concrete get poured on top of them. There may also be migratory ill-effects that we are unaware of. There should be a substantive relocation effort for the myriad species already living in the target zone, who can't read a map to tell them where their new homes are.

Additionally, the use of untold quantities of water from Lake Ontario is troubling, as much of the country faces drought. The factory would pretty much be poisoning great quantities of the freshwater supply every day, which would then have to be piped and stored elsewhere. Every environmental worker knows that the pipes and storage vats eventually leak into the soil and groundwater, contaminating the food and water we need to survive. Micron's storage system is not likely that much better than anyone else's. They also use the phrase "renewable freshwater" to refer to Lake Ontario. As any fifth-grader can tell you, the water system is a closed circuit: rain falls, water moves and evaporates into the air, which moves and falls again as rain. Water is not "renewable". Once it's poisoned, it's gone. This jeopardizes freshwater availability for our survival in the not-so-far future, as well as for other communities near the lake and various other affected streams and creeks, which depend on that water for their own livelihoods, such as fishing and tourism (and eating and drinking).

The use of "billions of cubic feet of natural gas per year" also makes the project dependent on a dirty fuel supply, contributing greatly to climate change and further poisoning the air we breathe, as well as the water we drink and the soil we grow our food in. Investing in clean credits is nice, but it doesn't do much to mitigate this impact locally, as the gas still needs to be extracted from the ground, which causes its own pollution, and then burned for energy. They are also clear-cutting away hundreds of acres of trees, which will no longer be available to help clean the air, will release more carbon, and be a major habitat loss for birds and other species. With all of that construction, Micron could at least set up solar panels on the rooftops of the new buildings. (I know, this is Syracuse, mostly overcast but we still *sometimes* have pretty sunny days.). They could also invest in and use energy from some of the nearby wind farms, which are already up and functional.

Thank you for the opportunity to comment.

Subject: [EXTERNAL] Comments to Micron DEIS

As different groups are submitting comments on a list of specific DEIS items, I'll comment here just on land preservation.

The Micron project will bring huge changes to our region. The region has lost most of its manufacturing base over the past many years, and it seems the Micron project will be a big boost. Syracuse's history with our large manufacturers, however, has been fraught with environmental consequences. For example, Allied Chemical brought jobs but poisoned Onondaga Lake. Remediation moved dredged waste material to other sites to the dismay of neighbors; lake shores are still contaminated yet we build and plant on them to camouflage the white contaminants that remain. This is all to say that Micron must do better — must be required to be a regional environmental partner as it brings job opportunities to us and income to itself and shareholders.

The project is going to destroy critical wooded wetland habitat. Micron should purchase, and preserve from development, contiguous parcels of equal or better habitat quality. It should support our local land preservation not-for-profit organization, CNY Land Trust, through partnering, donation, and by establishing, in perpetuity, a stewardship endowment.

On site, instead of the usual non-native landscaping with lawns, establish native conservation plantings following the ideas of Homegrown National Park.

<https://homegrownnationalpark.org/>

Sincerely,
Barb Root

Dear Micron and OCIDA,

I request that there should be additional public hearings and that the comment period be extended six months since there is not enough time to listen to the community stakeholders. I am interested in the transportation and housing. I believe the influx of new people into our community will increase the cost of housing, especially since there will not be enough of new residential construction, Consequently, the poor will be driven from their homes and the the economic disparities in our community will get worse.

I also believe the transportation issues were not adequately addressed since there is no point of having new jobs with higher pay than normal manufacturing jobs in the Syracuse area if the people of the city of Syracuse, particularly people of color do not have meaningful access to Micron by adequate , subsidized transportation. One way to resolve the transportation problem is having Micron pay full fare for a transportation system that would guarantee that all residents of the city of Syracuse receive free transportation to and from Micron in less than 45 minutes one way. This could be handled by the metropolitan transit system and/or Micron vans. Either way, the cost of this service should be subsidized by Micron.

Since Micron is receiving so much financial assistance and since the poverty in Syracuse is so glaring, Micron must provide some assistance in providing economic assistance to people who desperately need economic assistance to get to well-paying jobs in the suburbs. Building a new facility without an upgraded transportation system would be one more fatal step in disregarding the needs of the residents of the City of Syracuse.

Sincerely,

Robert Sarason

CHIPS Program Office CHIPS Program Office,

I am very concerned that there will not be equal access to jobs at MICRON if the transportation system in Syracuse is not greatly improved. Many people in our community live in poverty, do not have cars, and confront a transportation system that does not run in all neighborhoods. Buses do not run regularly through out the day. Micron must have plans to work with the New York Dept. of transportation to increase bus stops and routes through out the city. Many of Micron's future workers will live in our city and will desire a more comprehensive bus schedule as well.

This is also an environmental issue because more appropriate transportation will also deal with the traffic congestion and car exhaust pollution which will certainly develop when your factories open.

There are so many concerns I could address. From the obvious PFAS to offsetting and displacing a flood basin that will alter the landscape and flood residences. I could also talk about the unprecedented size of the project and how fun it will be for days when hydrogen sulfide is giving a pleasant fragrance of rotten eggs to an otherwise fresh air region of once quiet and quaint suburbs. I could talk about how few people brought up the Manassas incident and what happens when chemicals go wrong... The traffic, the unneeded infrastructure / population increase, the disruption for classes of people who are already having a hard time in a sellers market. I could talk about how disgusting it is to waste the habitat of endangered species regardless of construction windows or attempting a 2:1 "reconstruction". Don't listen to ecologists or biologists. What could they know? It cannot "truly" be recreated regardless of the long term scope. Some things also just have to be stood on principle in the face of the seemingly always industrial disregard for the natural environment. We could also discuss at length people's ignorance of industrial heat island effect, the emissions (as we know this is not going to be net zero for a long time) etc. Everyone is complaining about record heat averages yet they just continue to assist in the rise. I could even talk about how this project's location is going to absolutely eat into the Adirondack territory with population and possible pollution. Another place slowly becoming less and less sacred.

This all seems immaterial to address for a people who will quite literally destroy themselves and everyone else by continually disrupting the natural environments and over-populating, over paving and needing plazas at every turn. Refusal to release reports, threats of eminent domain. Business as usual. Not a good look. Yet somehow is trying to sell a community on "growth". The community has no say. They will be placated with every lie in the book under the pressure of greed.

What else doesn't look very good? Onondaga lake, once sacred to the Haudenosaunee (aka Iroquois people) became the most polluted lake in the world. You want to say "that was then this is now"? Understandably so but also a fool's point. It's something a greedy person without foresight would say. We are just now catching up to understanding the dangers of microplastics being discovered in our bodies and all life on Earth. We don't even understand some of the long term effects of the materials / process we're using with "PFAS" chemicals. You think it's going to be good? Do you think that's a good look for the "largest chip-making facility" to be built in the region of one of the world's most polluted

lakes? Not just America. What Allied Chemical did? That was sacrilege. The building of this plant is also sacrilegious. The history and destruction of that lake's ecosystem should have served as the entire community's (and international) cautionary tale for things that happen when disrupting the natural world and taking a dump on it. As a point of principle (not just preserving the natural biomes as much as possible), things like this should never come on the desk of the wrong local politicians in this beautiful region. Syracuse was once upon a time a place of industry but guess what... The times are changing. Neither the economy nor the community needs or wants something of that magnitude. The only people who obviously want it are those who stand to turn a profit from it. Obviously. Generations of good people and families don't need the concern of a "new pollution". They don't need the concern of being out-classed and not being able to afford the region they grew up in.

I do utilize technology. I'm realistic in understanding it's a monster we've created in civilization. I also understand that no one wants certain things in "their back yard". At the same time, are there not better regions near large bodies of water? Michigan and Ohio have miles of abandoned car manufacturing plants already paved. No natural habitat destruction. It's blight. Wetlands are not "blight". It's an ecosystem. It's alive. It just feels like a small people is being taken advantage of (being dumped on) and we're being overpowered by aliens who want our water... Not dissimilar to Independence Day. Do we have a choice? Will our voices actually matter? Or will we simply be placated and bossed around. I can't emphasize enough (because I didn't hear many others bring this up) again that this location would be in the underbelly of the Adirondack territory and will also have a negative impact on that region with population growth. So please don't.

Thank you for your time if you didn't use Ai to shorten my email. Comprehend the reasons for rejecting the potential reality and consequences of this project. This is NOT what we the people of Onondaga county wish to represent or be known for. We are NO LONGER a people of industry. If it were up to us there would be a wooded trail through the wetlands so people might become more educated before they scarf up the planet. That's who we are. We respect the land. Outsiders and greed have already made the mark to make things like this unwelcome.

Also I ask this to whom it may concern... You may find this corny but I'm serious.

Go watch Fern Gully: The Last Rainforest with your kids (heres a link it's free). Then look them in the eyes and tell them what you do... Let them know you might be helping not one species of "Batty Kodas" but 2 make the soon to be extinct short list. Tell them why you have to evict them. Construction around roosting seasons will mean nothing. It will do anything but help protect wildlife.

Again, thank you for your time to understand what is sacred here that should be sacred everywhere.

**Subject:** [EXTERNAL] DEIS Comments for Micron Project, Clay, NY - Section 5.1  
**Attachments:** Micron DEIS comments PJA 2.pdf

As a long-time practicing architect and sustainable community planner in Central New York, I am submitting comments on the Draft Environmental Impact Statement (DEIS) for the proposed Micron plant in Clay, NY.

These comments are contained in the body of this email and attached as a pdf file. Should there be any reason why these comments cannot be included in the public record for this action please advise ASAP so that a remedy can be sent; otherwise I will assume that these comments are acceptable for inclusion in the public record and for appropriate response and consideration when the Final EIS is issued.

Thank you for the opportunity to submit these comments. If you have any questions, please contact me anytime.

**To: OCIDA / CHIPSNEPA**

**RE: Micron Project – Clay, NY DEIS comments**

**From: Peter J. Arsenault, FAIA, Architect**

**Date: August 11, 2025**

**Comments herein refer to  
DEIS Section 5.1 – Unavoidable Significant Adverse Impacts**

Page 682 of the Micron DEIS points out the SEQRA requirement to identify any “adverse environmental impacts that cannot be avoided or adequately mitigated if the proposed action is implemented” (6 NYCRR § 617.9 (b)(5)(iii)(b)). The document goes on to say that “A significant adverse impact is considered “unavoidable” if there are no reasonably practicable mitigation measures to eliminate the impact, or if there are no reasonable alternatives to the proposed project that would meet the purpose and need of the action, eliminate the impact, and not cause other or similar significant adverse impacts.”

The DEIS then lists 5 areas where the Preferred Action Alternative “would result in some unavoidable significant effects that cannot reasonably be avoided or mitigated below the level of significance.” These areas include Water Resources, Biological Resources, Climate Change, Transportation, and Noise.

As a practicing, licensed architect in New York State and elsewhere in the United States, I have been directly engaged in creating “sustainable” and “green” buildings and communities since 1980 – long before those terms were popular. I take exception to the acceptance of some of the “unavoidable” significant impacts identified in the DEIS. Over the past 45 years, I have witnessed changes in design approaches, technology, and construction systems that reveal many things previously thought to be unavoidable were being overcome and even fully abated. Therefore, I submit that there are many reasonable, practical, methods or alternatives to achieve mitigation or avoidance which are omitted from the DEIS and need to be addressed.

The successes of the past 40+ years have been based on several key factors. First, a recognition that “business as usual” does not need to be the norm when designing and engineering an industrial building or providing it with energy and other resources. Second, an exploration of available alternative options for building construction, energy generation, land-use planning, and building operations. Finally, a commitment by all of the stakeholders to go beyond the “status quo” and achieve something that is truly better for the people who work in and use the facility as well as for the surrounding community. Yes, this means a bit more work on the part of the professionals involved in the project, but it also means that a facility like the Micron plant can truly achieve a higher standard of sustainability and green building operations, thus avoiding significant impacts.

Based on the foregoing, I submit that the following points be reconsidered or be made a condition of any permit that is issued as a result of the EIS.

**Water Resources** The impact on the nearly 200 acres of wetlands on the site seems to be the result of the location of the buildings, roadways, and parking. The four planned buildings of 1.2 million square feet each (4.8 million square feet total) are being located and placed on a site that is 1,377 acres or 59.9 million square feet. That means the buildings only require approximately 8 percent of the entire site. The wetlands are about 8.7 million square feet or about 16 percent of the entire site. Consider the following points:

- **Building Locations:** If the buildings were located outside of the wetlands, that means approximately 75 percent of the site is still available for development. The placement of the buildings has been shown in renderings as four identical facilities lined up in a row. Have other layouts been assessed which would still allow efficient operation and flow while avoiding the wetlands? Such an approach would mean that wetland impacts would indeed be avoidable.
- **Access and Site Roadways:** The second apparent reason for the wetlands and water resource impact is the need for access and onsite roads. The DEIS refers to, but fails to provide any details on, other planning alternatives that were considered for the layout and design of the roadways and access points for the project. Alternative road layouts that avoid crossing the 16 percent of the site that has wetlands, means direct water resource impact could be avoidable. Runoff water can also be managed, filtered and controlled using readily available porous paving methods, well-designed bio-filters, and controlled water retention. In fact, the wetland areas can play a role in that if designed properly. It would be more appropriate to transfer some of the construction budget into these types of measures instead of constructing multiple smaller off-site wetlands that are likely to fail in their attempt to serve the natural environment. Hence, more impacts would be avoidable.

- **Parking:** The DEIS fails to adequately address transportation options beyond the use of automobiles. As others have commented, if public transportation were provided and planned for, the need for automobile parking would be reduced as would the need for paved parking areas. Porous pavement and controlled water runoff management could similarly mitigate water resource issues as well as “heat island” effects, making all of these avoidable.

**Biological Resources** As with the water resources impacts stated above, alternatives in planning and layout that consider avoiding critical habitat locations, or preserving them to the extent possible, could significantly reduce the impact making at least some of them avoidable.

**Climate Change** There are two areas noted in the DEIS which impact climate change:

- **Construction Activity:** For the past decade or longer, the North American design and construction community has been actively engaged in and exposed to alternative materials, products, and construction methods which directly reduce the GHG impacts of construction. This is particularly true for omnipresent materials such as concrete, aluminum, and steel which can account for the vast majority of GHG emissions. As a result, it is quite possible, today, to use low-carbon concrete which can reduce the carbon emissions of the process literally by nearly 50 percent. With an accelerated rate of development and adoption in New York State, it is entirely conceivable that very low carbon, or even no-carbon concrete may be available soon, during the construction of the first fab plant. By making low carbon concrete a required stipulation of permitting, a very significant amount of GHG emissions can be avoided. Further, the sheer quantity needed (680,000 cubic yards estimated for each fab plant) would directly impact the market offering a positive “ripple effect” for wider use of low carbon concrete in NY State, instead of producing a negative impact. The same can be said about steel, particularly structural steel and reinforcing steel. The not-for-profit organization Architecture 2030 has information on this topic - <https://www.materialspalette.org/steel/> I would propose that the use of recycled steel processed in an electric arc furnace (preferably from sustainable electricity) be a stipulated requirement of any permits. Notably, the CNY local company, Auburn Steel, has been well known for providing such steel products in the past, others are available as well.
- **Building Operations:** There is a plethora of information and knowledge about ways to design buildings, so they use less energy. Therefore, at a minimum, the buildings should be required to meet a significant level of energy use reduction as evidenced in third party certifications such as LEED® or others. Process energy is not typically included in such certifications, so if Micron is to live up to its promise of being “truly sustainable” then the sources of their immense energy requirements need to be sustainable. That either means renewable, non-polluting on-site energy generation (i.e., wind, solar, hydro, etc.) or purchasing renewable energy. The statement that Micron intends to use significant amounts of renewable electricity is a start, but based on the numbers in the DEIS, that only accounts for half of the total energy requirements. The other half is currently shown as being provided by natural gas or diesel -polluting fossil fuels. Converting those needs to

renewable electricity or to a non-polluting alternative (i.e., hydrogen, biomass, etc.) would mean that more of the Climate Change impacts would be avoidable and would reduce their significance.

**Transportation** The unavoidable impacts cited in the DEIS related to transportation are all related to automobile and truck traffic on roadways. As noted above, the use of public transportation, mass transit, or other automobile alternatives would greatly reduce the significance of this impact and make them quite avoidable. There are countless examples of successful rubber-tire based transport (i.e., buses with “stations”), light rail, or even cable-based systems that dramatically relieve the burden on traffic. In the process, they can directly reduce air pollution from gasoline or diesel-powered vehicles, particularly if electric vehicles are used. Implementing alternatives such as these, including the option of dedicated travel lanes or travel ways, not only reduces the impacts from transportation, but they can also make the travel experience more palatable and appealing for workers, visitors, and vendors accessing the Micron plant. A greater focus on alternative modes of transportation could create more positive outcomes individually and cumulatively. Therefore, directing public or other funds towards these mass transit/ public transportation options instead of only on highway improvements can yield a notable reduction in the significance of the transportation impacts.

**Noise** The DEIS presumes that noise during construction can be effectively mitigated, which is reasonable although the details of what is being proposed there are not clear. The post-construction noise concern is again with traffic. This is another case where mass transit/ public transportation can yield positive instead of negative impacts. By reducing the number of cars and other vehicles, the noise levels are directly reduced.

**Conclusion** Based on all of the foregoing, **I submit that the list of unavoidable significant adverse effects in the DEIS is flawed.** It reflects a lack of commitment to truly sustainable planning, design, and construction and allows for the “easy way out”. **It is not appropriate for the lead agencies to accept these things as “unavoidable” when there is so much evidence to the contrary** as shown in successfully constructed and operating facilities today – and with the trend to be able to do even better during the decades of construction of the Micron project. **I urge you to acknowledge this reality and make it a requirement of the project to meet all of the currently achievable levels of sustainability as described.**

Robert Petrovich  
Onondaga County Industrial Development Agency  
335 Montgomery Street, 2<sup>nd</sup> Floor  
Syracuse, NY 13202

Dear Robert Petrovich,

The New York State Department of Environmental Conservation (DEC) offers the following comments on the joint National Environmental Policy Act (NEPA), State Environmental Quality Review (SEQR) Draft Environmental Impact Statement (DEIS) for the proposed Micron New York Semiconductor Manufacturing Project (Micron Project) and the connected actions. As an involved agency, DEC provided input on the development of individual resource sections and the evaluation of the potential environmental impacts. DEC reviewed, assessed, and provided feedback on the development of the DEIS's initial evaluation of impacts to: land use; geology/soils/topography; water resources (including wetlands); biological resources; historic and cultural resources; air quality; greenhouse gas emissions, climate change, and climate resiliency; solid and hazardous waste and materials; human health and safety; utilities and supporting infrastructure; transportation and traffic; noise and vibration; visual effects and community character; community facilities, open space, and recreation; socioeconomic conditions; environmental justice; and cumulative impacts. This iterative process occurred over several months prior to publication of the DEIS and resulted in the current state of the DEIS. DEC appreciates and encourages the continued opportunity to collaboratively review the proposed project with Onondaga County, the U.S. Department of Commerce-CHIPS Program Office, various State agencies, and the Federal cooperating agencies.

In addition to the SEQR-NEPA environmental impact review detailed in the Micron DEIS, DEC is evaluating potential environmental impacts through a concurrent review of application materials submitted by the applicants for permits under the Environmental Conservation Law (ECL) which are required for construction and operation of the Micron Project and the connected actions.

Along with this continued evaluation of potential environmental impacts through the permitting process, the following comments pertain specifically to the DEIS:

## **Geology Chapter 3.2**

The DEIS states that bed rock removal may require blasting operations as a last resort to fragment bedrock, and a blasting plan was included in DEIS Appendix E, Volume 2. DEC recommends:

- permanent blasting lines are kept clear of conductive materials such as power circuits, pipes, rails, etc., and ideally maintained at least 20 feet away from power lines;
- the NYS licensed blaster must follow standard state and federal guidelines, including air blast limits and safe ground vibration levels, which shall be protective for the surrounding structures and residences; and
- all blasts are monitored by a seismograph.

## **Water Resources Chapter 3.3**

DEC notes the discussion on Micron's wetland adaptive management plan and the proposed ground and surface water monitoring plans as best management practices during construction. DEC asked Micron to evaluate surface and groundwater resources during construction to ensure that the remaining wetlands would not be impacted by changes to hydrology. DEC appreciates that this evaluation is now included in the DEIS.

### **Wetlands**

The Freshwater Wetland Act, Article 24 of the ECL, and the implementing regulations require that a project first avoid and then minimize impacts to regulated wetlands and then mitigate for all unavoidable impacts. Chapter two of the DEIS demonstrates Micron's evaluation of alternative layouts with consideration for onsite natural resource impacts. Micron and The Wetland Trust have submitted wetland mitigation plans to DEC and the US Army Corps of Engineers to mitigate the unavoidable and irreversible loss of wetlands. DEC is working collaboratively with Micron to further refine these plans, which must mitigate for the specific wetland functions, benefits, and acres lost as part of the Micron Project. DEC recommends the Final Environmental Impact Statement (FEIS) contain the final wetland mitigation plans if there are updates or site plan adjustments.

### **Stormwater**

Micron and the Rail Spur operator are required to gain coverage under the DEC Construction General Stormwater Permit, GP-0-25-001 (CGP), which requires developing a Stormwater Pollution Prevention Plan (SWPPP) that includes the implementation of practices to protect water quality and to reduce future flooding risks associated with the project. The CGP requires the evaluation of future physical risks due to both extreme storms and climate change and installation of post-construction Stormwater Management Practices to provide stream channel protection and reduce flooding risk.

DEC and the Town of Clay will be completing a joint review to ensure that the SWPPP meets DEC technical standards and the requirements of the CGP. DEC will also be completing routine site inspections to ensure permit compliance during project

construction. DEC looks forward to the completed application being reviewed by the public prior to construction. If available, DEC recommends appending the Micron and Rail Spur SWPPP to the final EIS.

### **Wastewater**

As discussed in the DEIS, to accommodate the increase in the flowrate and the associated organic/inorganic loadings to the existing Oak Orchard Waste Water Treatment Plant (OOWWTP), Onondaga County will submit an NY-2A application to DEC for modification of the current OOWWTP State Pollution Discharge Elimination System (SPDES) permit, which will include a chemical characterization of the wastewater from all existing and new sources that the expanded facility is expected to receive and treat. Additionally, the wastewater characterization will include the admixture of any emerging contaminants that are assumed to be contained within the discharge from new industrial sources. DEC, Onondaga County, and Micron continue to work closely in the development and review of the SPDES permit modification to maintain New York State's high water quality standards. DEC recommends including any updates to the OOWWTP upgrade plans to the FEIS, as necessary and if available.

### **Chapters 3.6 Air Quality and 3.7 Greenhouse Gas Emissions, Climate Change, and Climate Resiliency**

The DEIS was published prior to the publication of Micron's Climate Leadership and Community Protection Act (CLCPA) Analysis, which was publicly noticed as part of DEC's Notice of Complete Application, Notice of Public Comment Period, and Notice of Public Comment Hearing for the Freshwater Wetlands, ECL Article 24, (implemented by 6 NYCRR Part 663); Water Quality Certification (401 certification), Section 401 of the U.S. Clean Water Act; Incidental Take of Threatened or Endangered Species, ECL Article 11, (implemented by 6 NYCRR Part 182) permits.<sup>1</sup> As such, DEC notes that there is a finer level of detail included in the CLCPA Analysis than is presently in the DEIS Air Quality or Greenhouse Gas chapters. DEC therefore recommends that the FEIS incorporate the latest greenhouse gas emissions data and information available to ensure consistency amongst the permitting documents and related CLCPA Analysis.

### **Closing**

DEC appreciates the opportunity to review the DEIS and looks forward to publication of the FEIS. The scope and complexity of the potential impacts associated with the Micron Project require a thorough and comprehensive review of environmental, social, and economic factors. In addition to submitting these comments on the SEQR-NEPA review, DEC will continue to work with the applicants and the other local, state, and federal agencies as necessary to further address potential environmental impacts of construction and operation of the Micron Project throughout the permitting process.

---

**RE: Lighting best practices should be required at Micron’s proposed complex in Troy, NY, to protect biodiversity and lighten loads on the regional energy grid**

To Whom It May Concern:

I am writing on behalf of Lights Out Central New York to express concern about Micron Technology Inc.’s draft lighting plan for its proposed complex at White Pine Commerce Park in Clay. **Micron’s lighting plan needs to be significantly revised so that light pollution is minimized at the site during construction and operations.** Given the complex’s proposed location in a pristine, sensitive wetland area, the U.S. Department of Commerce and the Onondaga County Industrial Development Agency should require Micron to follow best lighting practices throughout the site.

All luminaires, lights, and lighting practices at the site should follow the highest industry standards. These are articulated in [LEED v5’s Interior Lighting](#) and [Light Pollution Reduction](#) credits. We recommend that Micron be required to follow these standards throughout the proposed complex, *whether or not Micron seeks LEED certification for any part of the site.*

Studies show that light pollution is growing at an alarming pace, with satellite and ground-based measurements revealing that North Americans experience more than **10% annual increases in artificial light** ([Kyba et al., 2023](#)). Artificial light at night poses serious threats to local fauna and flora, ecosystems, and also public health. Troy is located in the Atlantic Flyway, a migration route for over 300 bird species. Artificial nighttime lighting causes significant disorientation for migratory birds and associated mortality due to building collisions, while affected bird populations are in steep decline ([Rosenberg et al, 2019](#)).

Lighting doesn’t just affect wildlife—excessive nighttime lighting has also been linked to human health risks. A 2016 study from the American Medical Association warns that artificial light exposure at night is associated with increased risks of sleep disorders, obesity, depression, and even certain cancers ([Motta, 2024](#)).

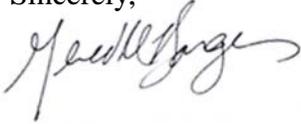

Following industry best practices, lighting should only be installed and used if absolutely necessary—no decorative or façade lighting should be allowed, particularly after 11pm. For lights deemed necessary, they must be controlled with modern technologies: automatic timers, motion sensors, and dimmers should be used that automatically turn off or dim at least 70%. All outdoor luminaires should be full-cutoff; lights should be at the lowest possible lumen level (intensity), and in warm tones (2,500K or less).

Because lighting needs can be substantial at large tech facilities, **following industry best practices would also help reduce energy demands at the complex and ease pressure on the regional grid**—and ease burdens on the local energy market affecting residential customers.

By adopting best lighting standards for both its construction and operations, Micron would avoid preventable ecological damage, help protect biodiversity, and demonstrate that it is serious about being a good neighbor that follows sustainable development best practices.

Therefore, Lights Out CNY urges the U.S. Department of Commerce and Onondaga County Industrial Development Agency to request Micron Technology, Inc. to revise the lighting plans for its proposed complex to include a comprehensive light-pollution mitigation plan, so that, if the project is approved, Micron's legacy in the area is one of environmental stewardship and conscientious lighting, not one of easily preventable harms to local biodiversity, public health, and the night sky.

Sincerely,

A handwritten signature in cursive script, appearing to read "Meredith Barges".

**Subject:** [EXTERNAL] Public Comment - MICRON Draft EIS 2025

The MICRON Draft EIS and Appendix L provide a baseline for construction-phase safety but lack critical operational-phase health, safety, and environmental details. As proposed, key risks to workers and the community remain unquantified and unmitigated, especially regarding PFAS, hazardous waste, and renewable energy sourcing. I urge OCIDA to require a more detailed, transparent, and enforceable plan before project approval.

Central New York's academic and medical institutions (SUNY Upstate, SUNY ESF, Syracuse University, Le Moyne, etc.) also offer unique opportunities for research and education in partnership with Micron. In addition to the recommendations below, I urge Micron to allocate research funding to local universities for independent monitoring of air emissions and water discharges, to identify less-hazardous material alternatives, to advance the science of PFAS mitigation and treatment, and to address other emerging needs not currently known.

### Worker Health & Safety During Operations

Appendix L of the Draft EIS addresses construction-phase safety in detail but contains minimal discussion of ongoing occupational health and safety programs once the facility is operational. The EIS defers post-construction health and safety planning to Micron's internal EHS programs, without providing specifics. No operational-phase exposure assessments, medical surveillance programs, or workplace monitoring plans are described, despite listing hazards such as solvents, acids/caustics, toxic metals, and radiation. Appendix L also details the maintenance of a comprehensive safety training facility within the project site, but defers this responsibility to 'The Contractor,' and limits application to construction activities. Most responsibilities contained in Appendix L are deferred to 'The Contractor.'

*Request:* Include an operational-phase Occupational Health & Safety Management Plan with: 1) formal, paid worker participation in health and safety committees, 2) employee and on-site contractor training on applicable Safety Data Sheets (SDS) in multiple languages and formats, 3) a detailed medical surveillance program managed by an occupational medicine physician, 4) air and water monitoring protocols for priority contaminants including PFAS, 5) a safety training facility and comprehensive training plan managed by Micron that includes ongoing operation of the facility beyond construction activities, 6) inclusion of at least one Certified Industrial Hygienist (CIH) as mandatory expertise on the Micron EHS team, and 7) annual public reporting of worker injury/illness rates (public access to OSHA 300 Logs), PFAS discharge, and air/water quality data.

### PFAS Use, Management, and Wastewater Treatment

The EIS acknowledges PFAS as “essential to the production of modern semiconductors,” but does not list specific PFAS chemicals or quantities to be used. Without disclosure of compound-specific data, risk evaluation for workers, the community, and downstream ecosystems is not possible. The structure of a PFAS molecule directly affects wastewater treatment feasibility. Without knowing the CAS-specific chemical structure, treatment design is guesswork. The DEIS references emerging treatment technologies but makes no commitment to complete removal of PFAS to below part-per-trillion (ppt) levels. Reliance on the proposed Onondaga County industrial wastewater treatment plant transfers a critical control measure and liability to a third party, funded by taxpayers.

*Request:* 1) Provide a full PFAS inventory (CAS numbers, use phase, annual quantities), 2) commit to the best-available treatment technology capable of ppt-level removal on-site, before industrial wastewater is passed to the Onondaga County treatment plant, 3) include PFAS in continuous effluent monitoring requirements and allocate funding for third-party verification, and 4) develop a detailed PFAS worker exposure prevention plan.

### Hazardous Waste & Worker Training

The EIS notes significant hazardous waste generation and outlines a Hazardous Waste Training Procedure, but this focuses on regulatory compliance rather than exposure prevention. No detail is provided on what specific waste streams workers will handle, and little detail is provided on how the Hierarchy of Controls will be applied to individual hazards. Micron’s Reuse, Recycle, and Recovery (RRR) program is mentioned, but lacks a discussion of hazards in reuse/recycling operations and the training needed to perform them safely.

*Request:* 1) Specify hazardous waste streams, their associated hazards, and controls, 2) make Micron’s hazardous waste procedures publicly available, and 3) require initial and annual refresher hazardous waste training for all affected employees and contractors.

### 4. Human-Centered Design & Ergonomics

Ergonomic risk is minimally referenced in the EIS and Appendix L, despite evidence that integrating ergonomics into initial facility design reduces injury rates and retrofit costs, while also improving employee performance and well-being.

*Request:* 1) Engage a Certified Professional Ergonomist during facility design - recommended ergonomics expertise includes physical, cognitive, and macro ergonomics, 2) integrate adjustable workstations, manual material handling aids, and human factors into equipment selection, and 3) include ergonomic training in both construction and operations phases.

### Stormwater, Green Infrastructure & Renewable Energy

The EIS lists general stormwater management measures but does not commit to green infrastructure best practices such as green roofs, bioswales, or permeable pavement when feasible. Renewable energy planning relies heavily on unbundled Renewable Energy Credits (RECs) without proof of availability in NYS. No plan is provided for on-site renewable generation or storage. LEED certifications are limited to office buildings, and do not extend to production facilities, where most of the energy, water, and chemical use will occur.

*Request:* 1) Incorporate site-scale green infrastructure to manage stormwater, enhance habitat, and reduce heat island effects, 2) provide a renewable energy procurement plan prioritizing new renewable capacity rather than existing RECs, 3) evaluate rooftop solar, solar windows, geothermal, and waste heat recovery potential, 4) utilize carbon-negative and carbon-neutral concrete and recycled steel where feasible, 5) document how LEED-inspired strategies (e.g., low-emitting materials, advanced ventilation, daylighting where feasible, renewable energy integration) will be adapted to the unique requirements of semiconductor manufacturing, and how LEED principals can be integrated into cleanroom and fab design, including measures to reduce toxic material use, improve indoor air quality, and recover/reuse process water, and 6) provide a public report on LEED-equivalent performance metrics for the production facilities, even if formal LEED certification is not sought for those areas.

Sincerely,

Michelle Beltran

Director of Continuing Education, Center for Occupational and Environmental Health, Berkeley Public Health

Property owner in Baldwinsville, NY 13027

## Caiazza Comments on the Micron Technologies Draft Environmental Impact Statement

### Introduction

I am a retired air pollution meteorologist, with extensive electric energy and environmental regulatory analysis experience as well as environmental permitting experience. I author the [Pragmatic Environmentalist of New York](#) blog where I have written over 550 articles about the Climate Leadership & Community Protection Act (CLCPA). I live less than seven miles from the White Pine Commerce Park.

Based on my background I believe that the Final Environmental Impact Statement (EIS) should include an option for an on-site Combined Cycle Gas Turbine (CCGT) powerplant that has provisions for co-generation for process heat applications. This option offers the best opportunity for a reliable, affordable generation source providing the massive amount of energy required by the facility.

### Micron Sustainability Commitments

The [July 2025 Micron Climate Leadership and Community Protection Analysis](#) (CLCPA Analysis) notes that Micron Technology is proposing to construct and operate a “leading-edge semiconductor manufacturing facility” in the Town of Clay, NY. The description of Micron’s sustainability commitments in the CCLCPA Analysis states:

Micron is an industry leader in semiconductor manufacturing and conducts its operations using both leading-edge technologies and intentional sustainability practices. As outlined in its 2023 Sustainability Report,<sup>6</sup> Micron takes a proactive approach to environmental stewardship, investing in technologies to mitigate its environmental footprint, and integrates environmental, health and safety (EHS) considerations, including energy, water and waste efficiency, Leadership in Energy and Environmental Design (LEED) criteria, and other factors into its processes, facility design, and construction. This approach is demonstrated in Micron's published goals and progress relating to emissions, energy use, water use, and waste generation worldwide.

### Energy Use

I queried [Perplexity AI for a description of energy use](#) at the facility. The following describes the massive amount of energy required:

The Micron facility represents an unprecedented energy demand for Central New York. When fully operational with all four fabrication plants (fabs) completed by around 2043, the Clay complex will consume 16 billion kilowatt-hours (16,000 GWh) of electricity annually.

The Micron facility will require 1.85 gigawatts of continuous power from the grid, operating 24 hours a day, 7 days a week. This around-the-clock operation is critical because semiconductor manufacturing cannot tolerate even brief power interruptions -

any outage would cost Micron tens or hundreds of millions of dollars in lost production and could take days or weeks to recover from.

Despite the massive energy demand, Micron and New York State have committed to meeting 100% of the facility's electricity needs through renewable energy sources. However, this commitment faces significant practical challenges:

#### Current Renewable Allocations

New York Power Authority has allocated [140 MW of hydropower](#) to Micron, representing only about 7% of the facility's total needs

Micron has signed a [178 MW onshore wind power agreement](#), providing less than 3% of total demand

Combined, these commitments leave approximately 90% of Micron's power demand still to be determined

Unfortunately, the commitment to source 100% of the facility's electricity needs through renewable energy source is more consistent with Micron's sustainability commitments than energy reality. The chip fab plant will not only require enormous amounts of electric energy but also firm capacity, stable voltage, and frequency in a narrow range. Providing electricity with those characteristics using renewable energy sources is an enormous challenge and failure risks viability of the facility.

#### **CLCPA Status**

Furthermore, New York's provisions for renewable energy are in jeopardy. The CLCPA Analysis does not acknowledge several important uncertainties associated with New York's CLCPA implementation. It is through no fault of Micron, but the reality is that there are new factors that should be considered in the plans for providing power in the final environmental impact assessment.

On July 1, 2024, Department of Public Service (DPS) Staff and the New York State Energy Research and Development Authority (NYSERDA) filed the Draft Clean Energy Standard Biennial Review (Biennial Review). The findings indicate problems with the implementation schedule that could affect the commitments for energy resources. The Biennial Review summarizes the progress made toward the renewable energy and zero emission goals set by the CLCPA since the establishment of the Clean Energy Standard. In May 2025 DPS [finalized the document](#). They found that:

### Current Progress vs. 2030 Target

New York has made measurable progress but faces a substantial gap. As of 2022, renewable energy resources supplied 25.1% of the state's electric load, totaling 38,061 GWh out of 151,836 GWh statewide load. Combined with nuclear generation, total renewable and zero-emission sources reached 46.1% of statewide load.

However, under the revised 2030 base case forecast of 164,910 GWh, the 70% renewable target requires 115,437 GWh of renewable generation. The review projects that operational and contracted renewable sources will provide only 73,292 GWh by 2030, creating a significant renewable energy deficit of 42,145 GWh.

### Timeline Implications and Delays

The biennial review concludes that achieving the 70% renewable goal by 2030 may be unavoidable to delay. Instead, the analysis suggests the target could be reached by 2033 when factoring in load growth and contributions from offshore wind and distributed generation.

To maintain trajectory toward eventual achievement, the review proposes procuring approximately 23,486 GWh through six Tier 1 solicitations between 2024 and 2029. This requires increasing annual procurement from the current 4,500 GWh per year to 5,600 GWh per year when accounting for project attrition.

The Biennial Report issued in July 2024 was based on an assessment of potential renewable energy deployments at a time when there was significant federal financial and regulatory support available from the Biden Administration. It is not currently clear at this time what, if any, support will be available from the Trump Administration, but there is no question that there will be significant change to renewable deployments. These uncertainties were not incorporated into the Order that accepted the Biennial Review. This makes the proposal to double down on renewable procurements unlikely to succeed.

There is another recent issue that results in additional unacknowledged uncertainty in Micron's plans. A [Perplexity AI response](#) notes that Governor Hochul recently acknowledged that the Biennial Review findings mean that the current schedule is untenable and that there are significant cost impacts. Proponents for clean energy are arguing that the CLCPA targets are legal mandates but there are heretofore unacknowledged legal safety valves.

Public Service Law [Section 66-P Establishment of a Renewable Energy Program](#) is the law that implements the Climate Act renewable energy mandates. It includes provisions for bounds on

implementation. PSL 66-p(2),b states “The commission may, in designing the program, modify the obligations of jurisdictional load serving entities and/or the targets upon consideration of the factors described in this subdivision.” Section 66-p (4) states: “The commission may temporarily suspend or modify the obligations under such program provided that the commission, after conducting a hearing as provided in section twenty of this chapter, makes a finding that the program impedes the provision of safe and adequate electric service; the program is likely to impair existing obligations and agreements; and/or that there is a significant increase in arrears or service disconnections that the commission determines is related to the program”.
