Since I drafted these comments a [letter](#) written by two Climate Action Council members to the Chairman of the Public Service Commission came to my attention. Their recommendations are consistent with my findings. The existence of those safety valve provisions, the acknowledged program delays, and the current changes in Federal clean energy policies suggest that Micron must consider an alternative plan for sourcing its energy requirements.

### **Recommendation**

The current energy sourcing plan is to rely on the local utility (Niagara Mohawk Power Corporation [NMPC] doing business as National Grid) as the source of energy for the facility. This recommendation is based on the [Independent Intervenor Statement in Opposition to the Joint Proposal](#) (Opposition Statement) in the NMPC rate case. In that statement we described an alternate approach for NMPC to provide electric power to Micron. The Opposition Statement projected the necessary renewable resources needed for Micron’s energy requirements in comparison to an alternative approach.

Public Service Law 66-P mandates renewable generation which would consist of a combination of onshore wind power, large scale solar, short-term energy storage and a currently unavailable Dispatchable Emissions-Free Resource (DEFER) for long duration, low renewable resource availability episodes. To provide the high-quality electricity necessary for the Micron facility, ancillary support services that provide support for things like inertial stability using synchronous condensers and flywheels will be needed. The nameplate generation capacity of these resources must be significantly greater than today’s installed reserve margin to account for the intermittency of wind and solar. The expected lifespan of these resources is significantly less than today’s electric energy resources. These factors combine to raise serious questions about the viability of the current renewable energy plans for the New York electric system.

In addition, although these renewable resources and associated components are commonly claimed to be “carbon free”, they in fact have a considerable GHG footprint associated with

their manufacture, installation, operation, and decommissioning. In the example cited, the PSL 66-P footprint exceeds 30 million metric tons. And based on available cost metrics, the [LCOE](#) will exceed \$150/MWh.

I recommend that the Final EIS include an option using a current generation Combined Cycle Gas Turbine (CCGT) powerplant. A facility with a nameplate rating of 1.25 GW will provide equivalent output to the PSL 66-P renewable energy approach with the same or better reliability, but without the need for energy storage or inertial support. The chip fab manufacturing process requires process heat. It is not as energy efficient to use electricity from the grid to generate process heat as using on-site combustion. On-site generation also eliminates transmission line loss. These efficiency benefits warrant consideration of this option.

Properly maintained, the CCGT will have a lifespan exceeding 40 years - adjusting to match the same equipment lifespan as the renewable assets described above. If the full life cycle of GHG emissions is considered, the GHG footprint associated with the manufacture, construction, routine O&M, and decommissioning is projected to be less than 5 million metric tons. Applying a similar adjustment for equivalent energy output over a 25-year lifespan, the GHG footprint of the natural gas extracted from Appalachian sources is roughly 130 million metric tons. The LCOE for the CCGT alternative is \$50/MWh based on [similar projects](#).

At first glance, the net sustainability benefit of the PSL 66-P approach is 105 million metric tons. But accounting for just the life cycle carbon footprint of the incremental difference in LCOE, the savings [drops](#) to 70 million metric tons. If the CCGT facility is co-located with an agricultural park that uses the CO<sub>2</sub> from the power plant to [boost productivity](#), the net savings plunges to 10 million metric tons - which is barely 7% of the savings claimed by the CLCPA. This natural gas alternative may be more sustainable than the renewable energy approach when properly considering all the lifecycle effects.

There is yet another advantage to the natural gas powerplant option. If new nuclear baseload generation is developed during the operational life of the CCGT powerplant, the CCGT can be converted to operate on any fuel mixture up to 100% hydrogen, capturing excess renewable production through on-site electrolyzers and providing dual-fuel redundancy for additional grid reliability. While the round-trip efficiency of hydrogen electrolyzers is lower than other options, there is a net sustainability benefit associated with the reuse of an existing generation asset and transmission infrastructure compared to new-built battery energy storage or other DEFR technologies.

The lack of boundary conditions on PSL 66-P implementation plans precludes a pragmatic solution that provides similar benefits at a lower cost. This example is emerging as a [preferred low carbon solution](#) in other areas of the U.S. and abroad. The significant tradeoffs of PSL 66-P should be included in the Final EIS because it is likely that the CLCPA schedule and ambition will be modified. Micron's commitment to meet 100% of the facility's electricity needs through renewable energy sources is laudable but indications are that it is not going to be feasible.

### **Conclusion**

There is growing evidence that the schedule and ambition of Public Service Law 66-P renewable energy program deployment cannot be achieved. The existence of safety valve provisions, the acknowledged program delays, and the current changes in Federal clean energy policies suggest that Micron must consider an alternative plan for sourcing its energy requirements. If Micron is to truly lead, then they must advocate for options that will work. Blind adherence to a flawed net-zero transition plan will affect the viability of the plant. It is time to step up and offer a pragmatic solution that will work. The CCGT approach with co-generation and agricultural park option fulfills that objective.

## **CNY CHAPTER - NYS ALLIANCE FOR RETIRED AMERICANS**

**4983 Brittonfield Parkway**

**East Syracuse, NY 13057**

August 11, 2025

ATTN: Micron Project  
Onondaga County Industrial Development Agency (OCIDA)  
335 Montgomery Street, Floor 2M  
Syracuse, NY 13202

CNY Chapter of NYSARA, representing thousands of retired educators in Central New York, welcomes Micron as a good neighbor. To ensure that relationship is a long and beneficial one to both parties, we ask that certain guidelines be established.

CNY Chapter of NYSARA, along with many other union, environmental, workforce, public health and safety organizations ask that the organizations that control Micron's development in Central New York take into consideration workplace safety; creation of good paying jobs in a union- accepting climate; no adverse impact on school funding; environmental quality and continued monitoring; good housing and transportation.

First, the health and safety from toxic chemicals used to make chips must not pollute air, soil, fish, wildlife, and drinking water. A long term, continuing monitoring of this must be in the plan with enough resources to sustain it.

Second, commit to ensuring that clean water and energy in abundance will be affordable to the area into the future. Ratepayers should not shoulder the burden. Also, generate renewable energy with a low carbon impact.

Third, safe working conditions are necessary. We know the workers will be exposed to toxic chemicals and all measures must be taken for their sake as well as their families.

In addition, we seek pay equity, and a diverse workforce that would be allowed to unionize without adverse ramifications. To further aid working families, public transportation and child care on site or near would be helpful.

Fourth, invest in housing needed for existing and new residents. Mixed income and affordable housing will be needed, and micron must be involved in a cooperative effort to bring that about.

Fifth, tax abatements to Micron must not come at the expense of schools and students.

According to a report issued by "Good Jobs First NY" schools lost a total of \$ 1.8 billion in property tax revenue due to tax abatements granted by IDAs.

We would appreciate support and actions on these guidelines. We look forward to your response.

Sincerely,

CNY Chapter of NYSARA

## MICRON SEMICONDUCTOR MANUFACTURING PROJECT, CLAY, NY, DRAFT ENVIRONMENTAL IMPACT STATEMENT (JUNE 2025)

This document provides comments on the Draft Environmental Impact Statement (DEIS) by CNY Solidarity Coalition, 226 Teall Ave, PO Box 6137, Syracuse, NY 13217, [cnysolidarity@gmail.com](mailto:cnysolidarity@gmail.com)

### 1. Wetlands

- a. Micron will destroy about 200 acres of wetlands.
- b. These wetlands have many benefits
  - i. Habitat for endangered species, including the **Indiana bat** and the **Northern Long-eared Bat**, both of which are listed as endangered species under federal and New York State law. Other bat species detected on the site include the little brown bat, big brown bat, tri-colored bat, eastern red bat, hoary bat, and silver-haired bat.
  - ii. Many species of insects and birds
- c. What is Micron proposing
  - i. Replace wetlands with a series of unconnected parcels that will develop over time into wetlands. This development could take a generation. What does that mean for the flora and the fauna whose habitat has been destroyed?
- d. The area around the plant site is prone to flooding. The wetlands provide a buffer to manage surface water during heavy rain. The existing plant will cover 1400 acres between the buildings, the parking lots and other hard surfaces. There has already been testimony at public hearings that flooding is an issue in the area around the location of the proposed Micron plant. This is in spite of the presence of the wetlands which help to reduce flooding by providing a water sink during heavy rains. However, no mention has been made in the DEIS of settling ponds to deal with water runoff or other efforts to mitigate the clearly increased potential for flooding in the area.
- e. The DEIS proposes parking lots capable of handling 12,000 vehicles. According to a calculation by the University of Tennessee ([University of Tennessee Parking Calculation](#)), one acre of land can accommodate about 150 standard sized cars. For a parking lot accommodating 12,000 vehicles, that translates to about 80 acres. However, the actual area required is likely to be at least 90 acres. We are proposing a significant role for mass transit to bring workers to the plant and hopefully reduce the parking requirements by at least 50%. This will reduce hard surfaces by at least 45 acres and subsequently reduce water runoff mitigation required. In addition, we propose using porous surface material in the parking lots and internal roadways to further reduce runoff.

### 2. PFAS and other chemical compounds

- a. PFAS refers to a family of chemicals that are highly toxic and chemically stable (thus the nomenclature “forever chemicals”) There are over 10,000 thousand of these compounds and only a few have been characterized. Only two of these compounds are currently listed as toxic by the EPA, PFOA and PFOS
  - i. There is no identified lower limit to their toxicity. A few parts per trillion is still considered toxic
- b. They will be used in the chip-making process
- c. They will be present in the wastewater that will be sent to the improved Oak Orchard Water Treatment Plant in Clay. The treated water will be discharged into public waterways which will eventually lead to the Oswego River and Lake Ontario. The discharge point in Lake Ontario is within 2 miles of the intake ports for domestic water from Lake Ontario for Onondaga County.
- d. It is unlikely that the PFAS in the water passing through that plant will be removed by the processes in the plant.
- e. PFAS will also be present in solid waste that will be removed from the site to a landfill, not yet identified. Micron must ensure that no PFAS can enter the ground and potentially contaminate the existing water table.
- f. Many other hazardous chemicals will be used in the Fabs. Some, but not all, have been identified by Micron. Many have not.
- g. Micron must use the most effective processes to destroy PFAS and other toxic chemicals before they leave the plant, regardless of their cost. No PFAS must be allowed to enter the public waterways of New York State.
- h. Micron must also plan to invest in improved PFAS destruction processes as they become available over time.

### 3. Energy

- a. Micron will use as much electricity as the states of Vermont and New Hampshire combined, or the equivalent of more than 1 million homes or the entire output of a nuclear power plant.
  - i. By itself, Micron will increase the state’s energy usage by 5%
- b. Micron is subject to the provisions of New York’s landmark CLCPA legislation, which requires zero greenhouse gas emissions from electricity generation by 2040.
- c. Micron has pledged to use 100% renewable electricity
  - i. The only way it can do this is by increasing renewable energy through solar, wind, and geothermal generation.
  - ii. Renewal energy credits do not actually increase generation and should not be allowed to meet the goal of 100% renewable energy.
- d. Micron should not use electricity from existing nuclear power plants. All that does is divert that electricity from other users and does not increase generation. Although nuclear power does not generate greenhouse gases during the electric generation process, large amounts of nuclear waste are generated and the time it will take and the cost to build the nuclear generating plant could be used to create sufficient renewable energy sources that will meet Micron’s needs without the negative effects of nuclear power.
- e. The DEIS does not ensure that Micron’s massive demand for water and electricity won’t result in increased costs for ratepayers in terms of increased water and electricity rates. The DEIS must address the potential for these increases and ensure that they do not burden New York’s residents with them.

---

# 1. Introduction

CHIPS Communities United (CCU) is a national coalition of labor, environmental justice, public health, and community organizations working to ensure that semiconductor manufacturing supports healthy, equitable communities. We advocate for policies that prevent environmental harm, protect workers, and ensure that publicly funded investments deliver meaningful benefits to the people most directly affected by this industry.

Micron's New York project represents a generational public investment, with over \$20 billion in state and federal subsidies anticipated. Given this unprecedented scale, the Draft Environmental Impact Statement (DEIS) must offer transparent and enforceable protections for worker health, environmental safety, community well-being, and public accountability. Unfortunately, the DEIS fails to meet that bar. While it includes extensive detail in some areas, it omits or defers critical information in others. It consistently avoids enforceable commitments in favor of general promises and aspirational goals.

In partnership with environmental, labor, and public health groups, CCU seeks to address this gap through the Community Vision for Strong Environmental, Resident, and Worker Protections.<sup>1</sup> This document was developed with local leaders and community organizations with expertise in public policy, environmental law, workforce development and safety, environmental and chemical science, energy technology and infrastructure, and housing and transportation equity.

Given the project's scale and the range of potential impacts, we strongly urge the U.S. Department of Commerce and the Onondaga County Industrial Development Agency to extend the comment period to October 25 2025, at a minimum. This request is further supported by a petition signed by over 1,500 residents of the region.<sup>2</sup> Despite the limited current comment period, we submit this comment to ensure that the Micron project meets its promise to Central New York—not only by creating jobs and growing the economy, but also by protecting residents from toxic exposures, displacement, and climate risks. The following sections outline our specific concerns and recommendations.

**It should be noted that this comment does not include detailed discussion of PFAS-related concerns. These issues are being addressed separately in a dedicated comment submitted on our behalf by Earthjustice and co-signed by Earthjustice, National Resources Defense Council, and the Atlantic Chapter of the Sierra Club.**

## 2. Scope and Alternatives

Micron has described this project as the largest single private investment in New York history, involving \$100 billion in capital investment over 20 years of phased construction. Yet the DEIS fails to adequately evaluate alternative project scales.

The DEIS identifies a "Preferred Alternative" involving the construction and operation of four fabs, but dismisses the Reduced Scale Alternative (two fabs) on the basis of Micron's claimed need to produce 52,000 wafers per week. However, this assumption is undermined by Micron's June 2025 announcement of new fabs in Boise, Idaho and Manassas, Virginia (see: <https://boisedev.com/news/2025/06/12/micron-boise-second/>). These projects suggest that Micron's production goals could be met through other means.

Under NY SEQRA law, the purpose of examining a range of alternatives is to identify ways to reduce environmental harms. The SEQRA Handbook explains that a reduced scale should be considered when:

1. Environmental impacts can be avoided or reduced by a smaller project size;
2. The smaller project still serves the intended function; and
3. The reduced scale may lower profits but does not make the project infeasible.

All three conditions apply here. A smaller footprint would reduce water usage, emissions, waste, and energy consumption—each of which scales with fab capacity. A two-fab complex would still meet Micron's goal of regional DRAM production and could be scaled up in later phases after demonstrating operational success.

In light of the phased buildout and evolving technological landscape, it is also critical that the environmental review process accounts for future changes. The DEIS itself acknowledges the "rapidly evolving PFAS wastewater treatment technology," and by the time the third and fourth fabs are built, there will almost certainly be advances in PFAS remediation, chip production processes, and our broader understanding of PFAS-related health and environmental risks. Given this, we ask: how will OCIDA account for new information or changed circumstances while the Project is under construction? Unless the Reduced Scale Alternative is adopted, there should be an enforceable commitment to conduct a Supplemental Environmental Impact Statement before approvals are granted for the third and fourth fabs are approved.

Therefore, we urge the agencies to revise the DEIS to fully assess a Reduced Scale Alternative consistent with SEQRA requirements. Unless the Reduced Scale Alternative is adopted, the DEIS should include a clear and enforceable mechanism to re-evaluate project impacts before approving construction of the third and fourth fabs—such as a commitment to conduct a Supplemental Environmental Impact Statement based on new information and technological developments.

### 3. Hazardous Substances and Wastewater

The DEIS's treatment of hazardous substances and wastewater is dangerously superficial given the chemical-intensive nature of semiconductor manufacturing. CCU calls for full chemical transparency, detailed characterization of waste and emissions, and use of best available technologies to minimize health and environmental harms. These protections must be enforceable and monitored by independent third parties, not left to Micron’s discretion.

#### A. Hazardous Substances and Chemical Inventory Transparency

The DEIS does not identify the specific chemicals Micron will use, store, or discharge. Table 3.8-9 offers generic chemical classes (e.g., "toxic gases," "liquid corrosives") with no specificity. The DEIS needs to list the identity and quantities of these chemicals to properly define health and safety risks for both workers and the surrounding community. Moreover, the environmental impacts of a sudden release of hazardous chemicals can only be assessed if the identity and potential quantities are given in the final Environmental Impact Statement (EIS) for which the DEIS is a draft.

The NIST Programmatic Environmental Impact Statement (PEIS) for Modernization and Expansion of Existing Semiconductor Fabrication Facilities (NIST 2024) offers a clear example of the level of detail that should be required. Appendix D of that document includes ten pages listing nearly 200 “representative” chemicals used by the semiconductor industry, all of which are subject to the Toxic Substances Control Act (TSCA). Table 3.8-1 of the NIST PEIS offers further specifics on hazardous chemical use and storage, shown here:

Table 3.8-2. Hazardous Process Chemicals Used in Semiconductor Manufacturing

| Chemical Category                            | Use(s)                                                                                                                                                                                       | Process Chemical                                                                           | Hazard Class                       |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|------------------------------------|
| Aqueous solutions (commonly acids and bases) | To wet-etch or clean the surface of the wafer; as part of the photolithography process.                                                                                                      | Hydrochloric acid, HF, sulfuric acid, nitric acid, ammonium hydroxide, potassium hydroxide | 8 Corrosive Material               |
|                                              |                                                                                                                                                                                              | Ammonium fluoride                                                                          | 6.1 Poisonous Materials            |
|                                              |                                                                                                                                                                                              | Hydrogen peroxide                                                                          | 5.1 Oxidizer                       |
| Specialty gases                              | As precursors to deliver a substance such as arsenic or tungsten onto the wafer or into the silicon lattice (used in small quantities); to dry-etch a pattern onto the surface of the wafer. | Silane                                                                                     | 2.1 Flammable Gas                  |
|                                              |                                                                                                                                                                                              | Ammonia, nitrogen trifluoride, sulfur hexafluoride                                         | 2.2 Non-Flammable Compressed Gas   |
|                                              |                                                                                                                                                                                              | Ammonia, phosphine, tungsten hexafluoride, arsine, CO, fluorine, chlorine, diborane        | 2.3 Poisonous Gas                  |
| Organic compounds (commonly solvents)        | As constituents in specialty chemicals; to clean the wafer; as part of the photolithography process.                                                                                         | Isopropanol, xylene, propylene glycol ethers, acetone                                      | 3 Flammable and Combustible Liquid |
| Metallic compounds                           | Applied to the wafer in specific locations to create transistors; to plate wafers to provide electrical connections.                                                                         | Copper sulfate                                                                             | 9 Miscellaneous Hazardous Material |

Sources: ISMI, 2006; 49 C.F.R. Part 172; EPA, 2022a.

In contrast, the Micron NY DEIS (p. 3-244) lists only eight chemicals—ammonium hydroxide, anhydrous ammonia, hydrogen, hydrogen chloride, silane, chlorine, dichlorosilane, and HF—that meet the narrow definition of “extremely hazardous substances” above applicable threshold quantities. Fewer than ten other chemicals are even mentioned (pp. 3-237, 3-239). This is completely inadequate to assess potential impacts.

For example, Table 3.8-10 (p. 3-242) indicates each fab will store 13.5 million gallons of “liquid corrosives.” But what corrosives? Sulfuric acid and ferric chloride both qualify, but pose drastically different hazards. Likewise, the DEIS says 94,600 pounds of “toxic gases” will be stored at each fab—without clarifying whether these include deadly gases such as arsine or phosphine (commonly used in the chips industry per NIST 2024, Table 3.7-1).

CCU urges Micron to publish a full chemical inventory including:

- All process and maintenance chemicals to be used or stored onsite;
- Estimated quantities by phase of construction and operation;
- Chemical-specific storage, use, and disposal plans.

This list must include extremely hazardous substances regardless of federal threshold quantities, as even small leaks can pose major risks. Transparency is necessary not only for environmental review but also to protect workers, emergency responders, and the surrounding community.

Moreover, while Micron’s 2024 Sustainability Report (Appendix K, Vol. 2, p. 395) mentions a “rigorous review and approval process” for hazardous and restricted substances, the DEIS does not disclose what this process entails. The report references tracking Micron’s “chemical use profile” and efforts to eliminate or reduce chemicals, but none of this data is shared. No decision criteria, oversight mechanisms, or lists of restricted substances are included in the DEIS. The DEIS provides no examples of what substances have been phased out or what alternatives are being considered. Without transparency, these claims cannot form the basis for public trust or regulatory compliance.

Micron also describes having a team of subject matter experts identify emerging hazardous substances and eliminate them before regulatory bans take effect. This proactive stance should be commended. But again, the underlying criteria, procedures, and outcomes remain confidential. In a rapidly evolving chemical landscape where regulators often lag behind science, this internal hazard evaluation process could be a crucial safeguard. This is important information to share with the public and with regulators. If Micron has developed its own internal review process to identify chemicals that should be restricted or eliminated, this is critical information that the public and regulators need. Without transparency, these claims cannot serve as the basis for regulatory trust or community protection.

## B. Missing Implementation Plans, Documentation Failures, and Public Access Barriers

The DEIS references several key programs—such as hazardous waste reduction plans, contingency plans, and chemical approval protocols—but offers no documentation or evidence of implementation. These omissions are especially troubling given the extensive public concern around hazardous chemicals expressed during the SEQRA comment period.

While the DEIS announces a goal of “near-zero hazardous waste-to-landfill” by 2030, it includes no implementation plan, timeline, or metrics to track progress. There is no public explanation of how “near-zero” is defined, whether PFAS-containing waste is included, or what accountability mechanisms exist. If the landfill diversion strategy primarily involves shipping hazardous materials offsite to third-party contractors like Veolia (DEIS p. 3-237), this merely relocates the environmental burden—often to communities with less political and economic power.

This displacement is unacceptable. Veolia has a documented record of environmental violations and is currently facing class action litigation related to the Flint water crisis. If these materials are ultimately incinerated, that presents new risks: incineration generates toxic air emissions and PFAS-laden ash. This is why the Department of Defense decided to move away from burning firefighting foam. Waste-to-incinerator should not be the solution to landfill reduction because it may still cause environmental harm.

The DEIS also fails to provide access to the very documents it claims will guide environmental protections. For instance:

- Appendix K references hazardous waste procedures and universal waste plans, but links require password-protected logins (Vol. 2, p. 454);
- Other links—such as for job hazard analysis information—lead to broken webpages (Vol. 2, p. 452);
- Legally required plans under NYSDEC regulations—like the “Hazardous Waste Reduction Plan,” “Hazardous Waste Contingency Plan,” and “Hazardous Waste Procedure”—will not be prepared until six months before operations begin (p. 3-238).

Public commenters and agencies requested far more disclosure. For example:

- NYSDEC Comment 23 requested an evaluation of chemicals used in manufacturing and whether alternatives could reduce hazardous waste. The DEIS response redirected to prior comments but failed to answer the core question about safer alternatives. (Appendix A-D, p. 67)
- Public Comment 4 (on Water Resources) asked for identification of chemicals in wastewater, regardless of volume. The DEIS again deflected, providing no clear list or mitigation plan. (Appendix A-D, p. 79)

This pattern of omission suggests a structural unwillingness to disclose basic information about chemical hazards at one of the largest proposed semiconductor fabs in the country. It undermines trust in the DEIS and impedes meaningful public engagement.

### C. Hazardous Waste Generation and Disposal

The DEIS projects 50,300 tons of hazardous waste annually at full buildout. Yet it provides only vague categories like “acidic waste” and “solvent waste” (DEIS p. 3-236). Table 3.8-7 gives volumes but no chemical identities or densities. A rough conversion (using water density to represent acidic waste and acetone and isopropyl alcohol density to represent solvent waste) suggests that over 9,500 tons of annual hazardous waste remains unaccounted for. This therefore begs the question: What chemical waste accounts for the missing 9,500 ton/year of hazardous wastes estimated for each fab? What are the solvents? What are the acids? What is the rest of the waste?

Table 3.8-8 lists categories such as “glues,” “lab waste,” and “resins,” but again omits quantities and chemical identities. The lack of clarity makes it impossible to evaluate risk or ensure proper treatment.

The DEIS (p. 3-239) states that some chemicals and hazardous waste will be recycled while others will be sent to kilns for fuel blending, or incinerated. Micron should be commended for reuse efforts. However, much more detail is needed about:

- Specific chemicals by type and volume;
- Which waste streams will be incinerated versus recycled;
- Destination facilities and vendors, including Veolia.

CCU is particularly concerned about the incineration of “non-recyclable” wastes with no accountability for hazardous emissions or ash disposal. Fluorinated compounds should never be incinerated due to risk of toxic byproducts. Micron should:

- Segregate PFAS-containing materials;
- Prohibit incineration of these wastes;
- Characterize incinerator byproducts and monitor for destruction efficiency.

### D. Air Emissions and Thermal Oxidizer Byproducts

The DEIS assumes thermal oxidation and RCTOs will sufficiently destroy high-global warming potential (GWP) gases. However, NIST’s 2024 Environmental Assessment for the Micron fab in Boise acknowledges that destruction and removal efficiency (DRE) for point-of-use abatement systems can be as low as 60%, depending on the gas.

These systems also emit unregulated products of incomplete combustion (PICs), including fluorinated organic compounds and hydrogen fluoride (HF)—a highly corrosive and toxic substance. This is why the Department of Defense moved away from incinerating PFAS firefighting foam.

Micron and NYSDEC must:

- Disclose estimated DREs for each fluorinated gas;
- Quantify and characterize PICs and HF emissions;
- Instead of burning fluorinated gasses, capture and dispose of them using technologies that destroy the carbon-fluorine bond without the formation of additional PFAS or other hazardous byproducts.

## E. Wastewater Sludge and Industrial Pretreatment

The DEIS proposes sending non-hazardous sludge from on-site wastewater treatment to beneficial reuse vendors (DEIS Table 3.8-5), but does not explain what contaminants will be present. Prior drafts estimated over 67,000 tons of sludge and metals annually, yet the public version omits quantity projections.

This sludge may contain PFAS, heavy metals, resins, fluorides, and microplastics. Yet there is no analysis of:

- The feasibility of actually re-using the sludge and the environmental consequences of doing so;
- Whether it will be tested for hazardous substances to determine whether it should be classified as hazardous waste;
- How reuse vendors will prevent contamination of soil, water or wildlife;
- Where the sludge will go and under what regulatory oversight.

CCU urges NYSDEC and Micron to disclose the expected quantity and composition of all sludge, require routine testing, and prohibit any reuse or land application without demonstrating it is safe. No beneficial use should proceed without prior contaminant screening.

## 4. Emergency Preparedness

Emergency planning at this scale of development cannot be vague or reactive. It must be proactive, transparent, and built in coordination with first responders and impacted communities. Without detailed emergency response and flood preparedness plans, the DEIS falls short of protecting public safety and environmental integrity.

## A. Emergency Preparedness and Risk Management

The DEIS outlines general commitments to implement a Risk Management Plan (RMP) and coordinate with the Syracuse Fire Department's hazardous materials unit. The DEIS states that Micron expects its RMP to cover eight federally regulated substances, including hydrogen fluoride (HF), chlorine, and anhydrous ammonia (DEIS p. 3-239). However, it omits other substances commonly used in fabs, such as arsine and phosphine, which may be lethal in small concentrations and are subject to more stringent thresholds under California's regulations.

Key questions remain unanswered:

- Will the RMP include all regulated substances and extremely hazardous substances regardless of federal thresholds?
- Will dispersion modeling be conducted to assess risks to nearby childcare centers, homes, or schools?
- Will local fire departments have adequate staffing, resources, and training to respond to semiconductor-specific chemical emergencies?

Micron should also clarify how it will ensure rapid notification and evacuation protocols for surrounding communities.

CCU recommends:

- Including a full chemical inventory in the RMP and emergency response planning;
- Providing financial support for staffing and equipping local hazmat responders;
- Committing to annual joint training exercises with local agencies and third-party evaluators.

## B. Flooding and Stormwater Risks

The DEIS significantly underestimates the risk that increased impervious surfaces and extreme rainfall could pose to the Micron site and surrounding communities.

The project will replace 200 acres of wetlands and approximately 8,000 feet of streams with 645 acres of impervious surface, sharply reducing local capacity to absorb stormwater. The proposed wetland mitigation sites are *not downstream* from the facility and will not reduce downstream flood risk.

The DEIS claims that a "stormwater management plan" will be developed, but provides no modeling or specific mitigation measures for increased downstream flood risk. Communities like Phoenix, Fulton, and neighborhoods near Stearns Road already experience flooding, and First Street Foundation data shows these areas face increasing flood exposure.

Moreover, the DEIS does not evaluate how climate change-induced extreme precipitation events—like those recently seen in Texas—might impact open containment systems or underground infrastructure during fab operation.

CCU recommends:

- Modeling downstream flood risk under current and post-construction conditions using climate-adjusted rainfall scenarios;
- Public release of the Stormwater Pollution Prevention Plan (SWPPP) and site grading plans;
- A commitment to upstream and downstream flood mitigation infrastructure that accounts for both Micron and regional development impacts;
- Integration of green infrastructure, permeable surfaces, and on-site water capture technologies into facility design.

Absent clear and enforceable flood mitigation measures, Micron risks exacerbating regional flooding while placing vulnerable communities in harm's way. Emergency preparedness planning must include climate-related flood risk.

## 5. Community Health, Jobs and Livability

Protecting the health and safety of workers must be central to the Micron project, yet the DEIS provides inadequate detail to assess operational risks or ensure strong safeguards. Significant gaps in transparency, monitoring, and enforceable protections leave workers—especially those most exposed—vulnerable to preventable hazards.

### A. Occupational Health and Worker Safety

#### *Absence of Job-Level Detail and Chemical Risk Transparency*

The DEIS includes high-level language about its Global Environmental Health and Safety (EHS) programs and commitment to worker health, but it fails to provide the operational detail needed to evaluate occupational safety at scale. Approximately 9,000 permanent on-site operational jobs are projected for the Micron campus at full buildout, but the DEIS only offers broad categorizations of these roles (e.g., manufacturing, IT, security, procurement, etc.) (pp 3-488-3-489). There is no breakdown of tasks by job category and no risk assessments tied to specific roles or workstations. In both the main DEIS and Appendix L, chemical-specific hazards are not identified by process stage, job title, or department. Instead, the DEIS relies on general references to OSHA standards and mentions that risk matrices will be developed internally (Appendix L, p. 8)—without sharing examples, criteria, or reporting mechanisms. This lack of detail is especially concerning for maintenance and support personnel—including contractors—who may not work full time in hazardous areas but are often the most exposed

during equipment servicing, material handling, or emergency response. While much of Micron wafer handling will be automated, maintenance and supply personnel, including contractors, will be on the frontlines of exposure. These may include people who do not routinely work in hazardous areas. Unless they are adequately trained and provided with protective equipment, the more protective chemical-specific environmental standards should be applied. Without job-specific risk assessments and targeted protective measures for these roles, key exposure risks may go unrecognized and unaddressed.

#### *Illness Rates*

Equally concerning is the absence of illness rate data. While the DEIS discusses injury rates, it does not include information about illness rates (Appendix K, Vol. 2, p. 447). This is a major omission. Many occupational exposures—especially to chemicals—manifest as illnesses, not acute injuries, and these should be captured and reported alongside injury statistics. We ask that Micron’s occupational health clinic not only provide care, but also collect and share de-identified illness data in a format compatible with public health tracking. While injury statistics are discussed, the DEIS does not include information about illness rates (Appendix K, Vol. 2, p. 447)—chronic, chemical-related or otherwise—despite the well-known potential for semiconductor workers to develop occupational diseases due to long-term exposure to toxic substances.

#### *Industrial Hygiene Monitoring*

Micron pledges to apply the most protective occupational exposure limits (OELs) across the facility (p. 3-258) and to revise standards within 90 days of new, more protective thresholds (p. 3-259). OELs vary in stringency. Micron should disclose which OELs apply for each substance. It also would be ideal if the revision occurred even faster. In addition, there is no mention of Micron publicly reporting—at minimum—summary data on its exposure sampling results (and the OELs against which the exposures are being measured), worker health monitoring trends (with patient identities removed), or any corrective actions taken. These reports should be shared regularly with NYSDOH and made accessible to the public.

#### *Safety Committees and Fear of Retaliation*

The DEIS mentions that Micron will establish Worker Safety Committees (WSCs) to promote hazard identification and resolution (3-256). However, it provides no detail on how these committees will be structured to protect worker voices. Will employees have the right to raise concerns anonymously? Will participation be voluntary and protected from retaliation? Will committee proceedings be recorded or summarized for public or third-party review?

Too many communities have learned too late that internal EHS programs, however well-intentioned, can fail to catch or correct dangerous trends when there is inadequate

transparency or worker empowerment. Micron should clarify how it will ensure these WSCs are effective, inclusive, and insulated from fear-based suppression.

#### *Construction vs. Operations: Asymmetry in Standards*

Appendix L provides over 100 pages of detailed EHS requirements for construction contractors—including risk controls, compliance inspections, and method statements with job hazard analyses (Appendix L, pp. 10-115). However, there is no equivalent document or plan presented for operational workers who will face daily exposure to hazardous chemicals and process equipment over decades.

Many of the same standards should apply across both phases: critical risk checklists, PPE documentation, emergency response kits, pre-task planning. The DEIS mentions these elements for operations on pages 3-255 to 3-261, but does not provide access to the operational equivalent of the construction EHS performance standard. Will Micron publish these procedures? Will EHS metrics for operational staff be tracked and reported, as they are for contractors? Will there be a reward and recognition program for EHS participation by operational employees? These are basic elements of a mature safety culture—and their absence from the DEIS is concerning.

#### *Risk Management Plans and Community Access*

Micron's plan to develop a Risk Management Plan (RMP) for eight regulated chemicals is a positive step (p. 3-243). The company's pledge to share the RMP with local first responders and the public is particularly encouraging. However additional detail on how the public will access this information is missing. Will the RMP be published online? Will hard copies be available through local agencies? Will updates be automatically shared or only available by request?

Micron has stated that it uses an internal chemical approval process to identify potential hazards and apply controls, even in the absence of regulatory mandates (Appendix K, Vol 2, p. 395). The DEIS also refers to internal banned and restricted chemical lists as part of Micron's best management practices provided for hazard control measure examples (p. 3-258). Consistent with a precautionary approach, Micron should include in its RMP not only any regulated substances, but also any chemicals it deems hazardous through its own internal evaluations—whether listed as restricted or banned, or simply identified as potentially hazardous—regardless of their status under current federal or state regulations.

#### *ISO 45001*

Micron's ISO 45001 certification is cited repeatedly as proof of strong health and safety practices (ex: 3-256). While ISO 45001 is a widely respected framework, the certification standard is not publicly available—it must be purchased for \$222 USD (or 177 CHF). This cost barrier prevents

workers, community members, and many researchers from understanding what the certification truly entails or what commitments are being made.

CCU recommends that:

- Conduct and disclose job-specific risk assessments.
- Report illness rates in addition to injury data.
- Publish EHS protocols for operations equivalent to construction phase standards.
- Ensure worker safety committee participation is anonymous, voluntary, and protected from retaliation.
- Conduct illness rate reporting alongside injury data for operations.
- Ensure safe working conditions, fair compensation, and transparent promotion pathways.

These measures are essential to ensuring transparency, accountability, and worker protection throughout Micron's operations. Without enforceable commitments and publicly accessible information, critical health and safety risks may remain unrecognized and unaddressed.

## **B. Socioeconomic Impacts and Jobs**

Micron's proposed project is slated to receive upwards of \$20B in public subsidies and tax credits from federal, state, and local governments. With this momentous investment, the CNY community has been promised thousands of good jobs. However, Micron has made few concrete or enforceable commitments surrounding the permanent manufacturing jobs that define what constitutes a "good job" or how equitable access for these jobs will be ensured for current local residents, especially Syracusans.

This substantial public investment must result in real, quality jobs for members of the CNY community, especially those who have been historically left out of economic opportunity. A "good job" must guarantee family-sustaining wages and comprehensive benefits, safe working conditions, equitable hiring and employment practices, and access to an inclusive workforce pipeline and training opportunities. To meet this standard, Micron must provide specific details on its hiring process, compensation structures, working conditions, and training programs - and must make those commitments enforceable.

The DEIS underscores the importance with which socioeconomic impacts must be weighed under SEQRA, noting that " Under SEQRA, the protection and enhancement of the environment should be given appropriate weight with social and economic considerations, and the factors should be considered together in reaching decisions on proposed activities; environmental factors are not the sole consideration in decision-making (6 NYCRR § 617.1(d))." (p. 3-465)

### *Worker Pay*

The DEIS projects that by 2045, Micron’s Fab Complex will create over 9,000 permanent on-site operational jobs—90% in manufacturing and 10% in supportive services such as IT, security, and procurement—plus approximately 40,000 indirect jobs statewide (p. 0-1, 3-488). Within manufacturing, 10% will be leadership roles, 44% engineering/professional, and 36% equipment/process technicians; however, only 669 jobs in the first three years will be accessible without an advanced degree (p. Q-49-50).<sup>3</sup> While Micron advertises \$100,000 average total compensation (base salary plus cash bonuses)(p. 3-489), this figure includes bonuses of unclear frequency, and base salaries vary: engineers are projected to earn \$94,800 and technicians \$68,600, meaning nearly half of operational workers will fall short of the publicized average.<sup>4</sup> Micron also has one of the highest CEO-to-worker pay gaps among CHIPS Act recipients, with CEO compensation reaching \$30 million in 2024 while half of workers earned under \$54,570 in 2023.<sup>5</sup> To ensure equity and transparency, the EIS must require disclosure of full salary ranges for each position, clearly separating base pay from bonuses.

### *Hiring*

The DEIS highlights Micron’s inclusive construction hiring initiatives, including commitments to hire 1,500 veterans via the “Helmets to Hardhats” program (p. Q-53), participation in the CHIPS Women in Construction Framework (p. Q-49), setting targets for hiring from disadvantaged populations (p. Q-49), and a Project Labor Agreement with local trades (p. Q-49). However, it lacks enforceable commitments for recruiting marginalized workers into permanent manufacturing jobs, especially from high-poverty communities. While Micron aims to match or exceed the 60–70% local hire rates achieved at other facilities—equating to 6,300 permanent local jobs—it does not commit to this target (3-489). It also does not clarify how many hires would come from the City of Syracuse, which faces a 46% child poverty rate and significantly higher overall poverty than nearby areas like Clay and Cicero. Micron must guarantee that a meaningful percentage of new hires come from marginalized local communities, particularly within the City of Syracuse. Micron must establish a workforce development process that targets census tracts with the highest concentration of poverty in the CNY region.

### *Training*

The DEIS notes Micron’s partnerships with regional universities to expand equitable access to engineering careers, particularly for underrepresented and rural students, but lacks clarity on how these groups are defined, targeted, or supported (Q-53). While this is a positive step,

August 22, 2024. <https://ips-dc.org/report-leveraging-chips-program-to-create-good-jobs>.

Micron must also commit to equitable training access for production workers in lower-skill, entry-level, and mid-skill roles, particularly technicians, who will comprise 36% of the manufacturing workforce and require lower certification barriers (Q-50). The EIS should detail the structure, content, and delivery of the Micron Apprenticeship Program and on-the-job training, including how these programs differ, eligibility for each, whether certain workers will be prioritized for enrollment, and whether either program is offered in collaboration with community-based organizations, labor unions, or registered apprenticeship sponsors (state or federal). For the Micron Apprenticeship Program, the EIS should detail whether the program will intentionally target underrepresented or marginalized workers and if so how the targeting is implemented. It should also address the absence of plans for ongoing professional development to ensure equitable promotion, retention, and advancement opportunities, creating true long-term career pathways and inclusive economic mobility in a specialized sector.

#### *Work Conditions and Opportunities for Advancement*

The DEIS does not outline plans to ensure Micron workers will have access to internal advancement opportunities, despite reports from the Institute for Policy Studies that employees at Micron’s Manassas, Virginia facility have faced barriers such as premature removal of job postings, unpaid extra hours beyond twelve hour shifts to be considered for promotion, and minimal wage increases over several years. These concerns reflect broader challenges for U.S. semiconductor workers, where low wages, limited advancement, safety risks, and demanding schedules are common.<sup>6</sup> The DEIS states Micron will operate five shifts over 24-hour day, with 11.5-hour overlapping shifts, but provides no details on mitigating fatigue or related safety risks (p. 2-15). Long hours and mandatory overtime are linked to significantly higher injury rates—one U.S. study found overtime increased injury risk by 61%, with at least 12 hours of work a day raising it by 37% and at least 60 hours per week by 23%.<sup>7</sup> These demanding work schedules, combined with a lack of clarity around advancement and training, raise serious concerns about job quality and long-term retention. The EIS should directly address these issues by outlining how Micron plans to provide safe working conditions, fair compensation, and transparent, equitable pathways for internal promotion and professional development.

#### *Workforce Reporting Information Collection*

To ensure Micron meets the goals of the CHIPS Incentives Program and Green CHIPS Act, the CHIPS Program Office (CPO) and Empire State Development (ESD) must actively monitor workforce metrics, milestones, and compliance with health and safety standards. Collecting baseline data is essential to determine if these programs deliver good, accessible manufacturing jobs. At minimum, Micron should report:

---

<sup>6</sup> Mills Rodrigo, Chris. 2024. “Leveraging the CHIPS Program to Create Good Jobs for All Semiconductor Workers.”

<sup>7</sup> A. E. Dembe, J. B. Erickson, R. G. Delbos, and S. M. Banks, “The Impact of Overtime and Long Work Hours on Occupational Injuries and Illnesses: New Evidence from the United States,” *Occupational & Environmental Medicine* 62, no. 9 (September 2005): 588–97, <https://pubmed.ncbi.nlm.nih.gov/16109814/>.

1. The number and geographic location of U.S. jobs created or supported.
2. Minimum wages and benefits for each job title (to expose pay disparities obscured by averages.)
3. Recruitment, hiring, and training plans for marginalized workers, including women, people of color, veterans, formerly incarcerated individuals, rural residents, residents of low-income census tracts, and workers transitioning from carbon-intensive industries.

Quarterly reports should be mandated and required to detail U.S. Full Time Equivalent (FTE) work performed that quarter by job type and demographics; minimum pay and benefits disaggregated by title and demographics; new hire information; and descriptions of workforce development, apprenticeship, and training initiatives. Micron should also be required to submit all federally or state-mandated administrative and national policy compliance documentation—such as firm level EEO-1 Component reports and OSHA 300 logs—and disclose violations and their overall compliance status.

CPO, NIST, and ESD must enforce compliance by applying penalties or rescinding benefits if workforce-related commitments are not met. Similar to the CHIPS Incentives Program NOFO's clawback provisions for missed construction targets, technology-sharing violations, or prohibited foreign expansion<sup>8</sup>, the Green CHIPS Program should impose penalties for failing to meet its job creation targets, reporting requirements, or equitable hiring commitments.<sup>9</sup> The federal and state CHIPS Acts present the opportunity to ensure that the hundreds of thousands of jobs created are high-quality, equitable positions, and robust reporting with strong enforcement mechanisms is essential to achieving that goal.

#### *Economic Development & Growth Inducing Effects*

Economic inequality and segregation are deeply entrenched in Central New York, especially in Syracuse, where Black and Latinx residents face significantly higher poverty rates than white residents, and disparities between the city and surrounding areas like Clay are stark. In Syracuse, 29% the population is Black, compared to just 4.5% in Clay. Despite these realities, Micron has made no clear, enforceable commitments to reducing poverty in Onondaga County. The DEIS downplays potential labor and economic impacts, asserting without documentation that Micron's hiring will not significantly affect labor costs or workforce availability for other businesses. It also claims construction-phase labor shortages—expected to last 16 years—will be “limited and short-term” (p. 3-485) without explaining the basis for that conclusion. Absent detailed evidence on labor acquisition, training, in-migration, and impacts on other employers, the public cannot meaningfully evaluate these claims. The DEIS also fails to address how an influx of low-wage spinoff jobs—especially in retail and service sectors that dominate the regional economy—may worsen poverty and inequality. Without wage distribution data, it is impossible to assess whether new jobs will lift incomes or deepen economic divides, particularly

---

<sup>8</sup> National Institute of Standards and Technology (NIST). 2023 “Notice of Funding Opportunity: Commercial Fabrication Facilities.

<sup>9</sup> Excelsior Jobs Program Regulations (updated for Green CHIPS 3/28/23). March 28, 2023. <https://esd.ny.gov/sites/default/files/ExcelsiorRegs%20-2023-GC-updated-final-050123.pdf>.

given Syracuse’s 30.1% poverty rate and highest-in-the-nation child poverty rate of 46%. Lessons from other high-tech hubs show that growth in high-wage jobs can increase regional employment growth overall but also raise housing costs and erode real wages for lower earners—risks that the DEIS does not adequately address.

The DEIS similarly minimizes likely adverse impacts on housing, affordability, infrastructure, and greenhouse gas (GHG) emissions, relying on vague assurances and aspirational planning principles rather than binding commitments. It acknowledges the region has outdated municipal plans and is unprepared to manage induced growth, yet offers no enforceable mitigation measures. Leaving induced growth, its impacts, and mitigation to “future planning policies” is unacceptable and untenable. Approvals for the fab development must be contingent on robust, binding mitigation commitments with measurable objectives to address concerns including GHG emissions, infrastructure strain, traffic congestion, housing affordability, and homelessness. A binding CBA that details a mitigation plan with measurable and achievable objectives will go far in helping to offset the adverse impacts of the induced growth. The EIS must also account for GHG emissions from induced residential and commercial (or even supply chain growth) rather than dismissing them as minor compared to fab operations. Without robust, enforceable mitigation strategies, the project risks exacerbating inequality, displacing low-income residents, and imposing long-term socioeconomic and environmental costs on the community.

### *Community Investments*

As part of the Green CHIPS investment, Micron has pledged at least \$250 million over 20 years—half of the \$500 million Community Investment Fund—toward workforce development and expansion, education, community assets and organizations, and affordable housing, as outlined in the CIF Memorandum of Understanding (MOU).<sup>10</sup> While these commitments are promising, they are made in “good faith” and are not enforceable, and the DEIS fails to provide measurable community outcomes or accountability mechanisms. The “Green CHIPS Community Plan” which is intended to formalize these commitments (referenced in the MOU), is not publicly available despite FOIL requests, leaving unclear what goals Micron will be held to, how they will be met, and what will be publicly reported. Notably, the DEIS makes no references to the “Green CHIPS Community Plan” despite several references to the Green CHIPS Investment Fund. To ensure tangible benefits, we encourage Micron to make these commitments enforceable through clear milestones, public reporting on outcomes, and structured community oversight. These measures for accountability can be provided and enforced through CBAs between impacted communities and CHIPS grantees. Like job creation commitments, community investment commitments whether included in a CBA or not, should be subject to monitoring and public reporting. Because they directly involve impacted communities in their negotiation and enforcement, we believe robust CBAs are the best way for companies to comply with 15 U.S. Code § 4652, which requires recipients of CHIPS and Science Act funding to invest in surrounding host communities. Such a CBA should establish a community monitoring committee with worker

---

<sup>10</sup> ESD. 2022. “Memorandum of Understanding for Micron Community Investment Framework in Central New York.”

and resident representatives, require regular public reporting (by Micron or a community-managed third-party expert), and make all information accessible online. Central New York's history of unfulfilled corporate promises, such as Destiny USA, underscores the urgency of enforceable commitments. With one of the highest poverty rates in the nation, Syracuse cannot afford another broken investment, and Micron—supported by local, state, and federal leaders—must guarantee that this monumental public investment delivers lasting, equitable economic benefits.

CCU recommends that:

- Define and enforce “good job” standards, including wages, benefits, safety, equity, and training access.
- Disclose salary ranges by job title and make local hire targets enforceable.
- Guarantee a meaningful share of hires from marginalized communities and remove unnecessary hiring barriers.
- Partner with unions and community organizations for workforce development.
- Make training and apprenticeship commitments enforceable, with clear eligibility, partnerships, and targeting of marginalized workers.
- Commit to ongoing professional development and clear internal advancement pathways.
- Mitigate fatigue and safety risks from long shifts through rest periods, shift rotations, and fatigue management protocols.
- Conduct comprehensive impact analyses on housing, labor shortages, earnings distribution, and low-wage spinoff job impacts.
- Implement targeted housing mitigation measures with a regional housing mitigation fund and dedicated staffing.
- Establish a community oversight board, citizens' conservation/mitigation council, and independent professional planning team.
- Detail labor acquisition strategies, workforce training plans, in-migration impacts, and effects on existing employers.
- Address inequality and displacement risks for marginalized and low-income communities.
- Assess and report GHG emissions from induced residential, commercial, and supply chain growth.
- Make project approvals contingent on a binding CBA with measurable mitigation objectives.

The DEIS also lacks detail on career advancement pathways, fatigue management for 11.5-hour shifts, and health risks tied to mandatory overtime. These omissions conflict with Micron's claims of creating "good jobs" and should be addressed through enforceable labor standards.

## 6. Climate and Renewable Energy Claims

The Micron facility will vastly increase the emission of GHGs, through direct emission (Scope 1) and electricity use (Scope 2), but the DEIS fails to identify adequate plans for limiting the burning of fossil fuels.

The company proposes to burn 9.7 billion cubic feet of natural gas annually primarily to incinerate process gases containing perfluorocarbons (PFCs). PFCs are powerful greenhouse gases, and their emissions threaten to move New York far away from the Climate Leadership and Community Protection Act goals of 70% energy from renewable sources by 2030 and 100% zero-emission energy by 2040. Once complete, the facility will use 15,674 GWh of electricity annually, equivalent to all of the power used by customers in 2023 in CNY (Load Zone C) (p. 3-269).

Micron claims it will mitigate 2.4 million metric tons of Scope 2 GHG emissions through the purchase of renewable energy credits, but offers no detail on the sourcing, quality, or impact of these purchases. The DEIS does not specify whether Micron will use power purchase agreements (PPAs) or rely solely on unbundled renewable energy certificates (RECs), which are widely recognized as low-impact and ineffective in driving new renewable energy development.

Micron's plan includes a 4 MW solar installation—mitigating only 0.02% of its projected Scope 2 emissions. The rest of its mitigation claim depends entirely on offset accounting methods that do not reflect actual fossil fuel displacement. Semiconductor fabs operate 24/7 and require steady baseload power, meaning they frequently draw on fossil sources during periods of low renewable production.

The DEIS also fails to address the broader impact Micron's electricity demand will have on the New York grid. According to the NYISO, Micron's facility is the single largest load increase in the state's 2042 forecast, and will require fossil generation to remain online longer than otherwise planned.

CCU recommends:

- Micron commit to sourcing 24/7 carbon-free electricity through PPAs with new renewable sources, combined with battery storage;
- Eliminate reliance on unbundled RECs in Scope 2 mitigation accounting;
- Include a demand flexibility strategy to reduce fossil use during peak hours;
- Disclose GHG emissions from induced grid buildout and embedded emissions from materials, construction, and induced development.

Absent these commitments, Micron's GHG mitigation plan will fall short of state climate goals and contribute to long-term fossil fuel reliance.

## 7. Monitoring, Reporting, and Public Accountability

The DEIS includes numerous plans and programs Micron "intends" to develop—but fails to ensure that these will be made public, monitored, or enforceable. Examples include:

- Occupational health and safety protocols;
- Emergency preparedness documents;
- Wastewater monitoring and chemical inventories;
- Workforce development and hiring commitments;
- Green CHIPS Community Investment Fund outcomes.

As the DEIS notes (p. 3-465), SEQRA requires balancing environmental, social, and economic factors in project decisions. But without mechanisms for tracking outcomes, the public has no way to evaluate whether Micron meets its obligations or to intervene when problems arise.

CCU recommends that the Final EIS:

- Require Micron to report quarterly on environmental, workforce, and public health metrics, including:
  - Hazardous waste quantities and destinations;
  - Air and water monitoring data;
  - Workforce demographics, wages, and local hiring rates;
  - Health and safety incidents and corrective actions.
- Require public release of the following documents:
  - Emergency response protocols;
  - Chemical inventories and exposure control plans;
  - PFAS, including fluoropolymer, use and emissions reports;
  - Community Investment Fund goals, grantees, and outcomes.
- Establish a third-party public oversight committee with representation from community, labor, and environmental organizations to monitor compliance, receive complaints, and review reports.

## 8. Conclusion and Summary of Recommendations

Micron's DEIS outlines an ambitious project—but lacks the enforceable commitments and transparent systems needed to protect workers, communities, and the climate. CCU supports investment in U.S. semiconductor manufacturing, but not at the cost of environmental degradation, community displacement, or weak labor standards.

We recommend the following actions: (see next page)

### **Scope and Alternatives**

- Fully assess a Reduced Scale Alternative that considers a two-fab buildout to reduce environmental harms, consistent with SEQRA requirements.
- Unless the Reduced Scale Alternative is adopted, the DEIS should include a clear and enforceable mechanism to re-evaluate project impacts before approving construction of the third and fourth fabs—such as a commitment to conduct a Supplemental Environmental Impact Statement based on new information and technological developments.

### **Hazardous Substances and Wastewater**

- Publish a full chemical inventory, including identities, quantities, and use/storage plans.
- Apply transparency to internal chemical review processes and disclose restricted substances and reduction strategies.
- Disclose specific air pollutants and destruction/removal efficiency (DRE) values for thermal oxidizers.
- Consider safer alternatives to incineration, such as capturing gases, condensing them and treating them with supercritical water oxidation (SCWO).

### **Hazardous Waste Generation and Disposal**

- Identify chemicals by type and volume for all waste categories.
- Prohibit incineration of fluorinated compounds and characterize byproducts if incineration occurs.
- Disclose disposal vendors and ensure accountability for downstream impacts.

### **Wastewater Sludge and Industrial Pretreatment**

- Provide sludge volume projections and testing protocols.
- Prohibit reuse or land application of sludge without contaminant screening.
- Disclose contaminants expected in sludge and regulatory oversight plans.

### **Emergency Preparedness**

- Publish the full Risk Management Plan (RMP), including all hazardous substances regardless of threshold.
- Provide public access to emergency response protocols and conduct offsite consequence modeling.
- Support hazmat responder staffing, training, and annual exercises.
- Model flood risk and integrate climate-adaptive stormwater and green infrastructure strategies.

### **Occupational Health and Worker Safety**

- Conduct and disclose job-specific risk assessments.
- Report illness rates in addition to injury data.
- Disclose occupational exposure limits (OELs) for each hazardous substance and publicly report exposure monitoring results, trends, and corrective actions.
- Publish EHS protocols for operations equivalent to construction phase standards.
- Ensure worker safety committee participation is anonymous, voluntary, and protected from retaliation.

- Conduct illness rate reporting alongside injury data for operations.
- Ensure safe working conditions, fair compensation, and transparent promotion pathways.

### **Socioeconomic Impacts and Jobs**

- Define and enforce “good job” standards, including wages, benefits, safety, equity, and training access.
- Disclose salary ranges by job title and make local hire targets enforceable.
- Guarantee a meaningful share of hires from marginalized communities and remove unnecessary hiring barriers.
- Partner with unions and community organizations for workforce development.
- Make training and apprenticeship commitments enforceable, with clear eligibility, partnerships, and targeting of marginalized workers.
- Commit to ongoing professional development and clear internal advancement pathways.
- Mitigate fatigue and safety risks from long shifts through rest periods, shift rotations, and fatigue management protocols.

### **Growth-Inducing Impacts and Housing**

- Conduct comprehensive impact analyses on housing, labor shortages, earnings distribution, and low-wage spinoff job impacts.
- Implement targeted housing mitigation measures with a regional housing mitigation fund and dedicated staffing.
- Establish a community oversight board, citizens’ conservation/mitigation council, and independent professional planning team.
- Detail labor acquisition strategies, workforce training plans, in-migration impacts, and effects on existing employers.
- Address inequality and displacement risks for marginalized and low-income communities.
- Assess and report GHG emissions from induced residential, commercial, and supply chain growth.
- Make project approvals contingent on a binding CBA with measurable mitigation objectives.

### **Climate and Renewable Energy Claims**

- Eliminate reliance on unbundled RECs for GHG mitigation.
- Source 24/7 carbon-free electricity via power purchase agreements with new renewable energy projects.
- Disclose emissions from grid expansion and facility construction.
- Commit to demand flexibility strategies to reduce fossil fuel dependence during peak hours.

### **Monitoring, Reporting, and Public Accountability**

- Require quarterly public reporting on environmental, workforce, and health metrics.
- Release key documents: RMP, chemical inventories, PFAS emissions reports, emergency plans, and investment outcomes.
- Establish a third-party oversight committee with representatives from labor, environmental, and community organizations.

---

Good afternoon,

Please find the Cortland County IDA 's letter in support of the MICRON project attached.

Thank you,

**Ashley B Riehlman**

Cortland County BDC/IDA  
Community Relations Specialist  
40 Main St, Suite A, Cortland, NY 13045

August 11, 2025

To Whom It May Concern:

The Cortland County Industrial Development Agency is pleased to offer its strong support for the MICRON project. This transformative investment represents a historic opportunity for our region and state, and we are proud to stand behind an initiative that will drive economic growth, create quality jobs, and strengthen the advanced manufacturing ecosystem throughout Central and Upstate New York.

The MICRON project is poised to generate tens of thousands of direct and indirect jobs, including a significant number of high-paying positions in semiconductor manufacturing. The ripple effects of this investment will reach far beyond the Onondaga county, offering surrounding communities like Cortland the opportunity to contribute to, and benefit from, the project's long-term success.

As the regional economy prepares to meet the needs of such a large-scale project, the Cortland County IDA is actively engaged in supporting workforce development with two higher education institutions and a growing network of vocational training programs, Cortland County is well-positioned to supply talent in construction, electrical work, HVAC, precision machining, and other trades critical to the project's development phases.

In addition, the MICRON project is expected to create a wide range of indirect job opportunities, most notably in construction, logistics, materials supply, and engineering services. Cortland County businesses and contractors stand ready to support this growth, and the IDA is committed to facilitating connections between local businesses and the MICRON supply chain.

We recognize the MICRON project as a once-in-a-generation economic catalyst for Upstate New York. The Cortland County IDA is enthusiastic about the possibilities it presents for regional collaboration, sustainable development, and inclusive workforce growth. We look forward to being a partner in its success.

Sincerely,

*Melanie Vilardi*

ATTN: Micron Project; Draft Environmental Impact Statement for Micron Semiconductor Manufacturing Project, Clay, NY

RE: Draft Environmental Assessment EISX-006-55-CPO-001

From: Paul Crovella, PE, PhD

Date: August 11, 2025

Comments herein refer to GHG emissions from production of construction materials for four Micron fabs in Clay, NY

Dear Members of the CPO and OCIDA,

Thank you for your review and consideration of these comments on the Micron Project located in Clay, NY. Since the moment that this project was announced, there has been a palpable sense of excitement in the community. I, too, share excitement over the potential for how this project can provide in leadership, both technological and environmental, for Central New York, New York State, and the United States.

Some of the earliest activities on site, activities planned to last for decades, will be those of the construction operations. The scale of these activities is unlike any single project that this community has seen in the past two centuries. In carrying out these activities, I believe there lies an untapped opportunity for this project to be an exemplar of how significant environmental impacts from these construction activities can be mitigated. I believe that the DEIS must not be accepted until the appropriate steps are taken to reduce these significant impacts for the Community, the State, and the Nation.

In Section 3.7.3.2 of the DEIS, the document states “GHG emissions associated with construction upstream inputs and resulting lifecycle emissions for the entire value chain are not reasonably foreseeable at this time due to variability and uncertainty. As a result, these estimates have not been developed as they would not provide reliable information for decision-making.”<sup>1</sup> However, from the industry reports and statements by Micron officials themselves, these GHG emissions are reasonably foreseeable, can be accurately predicted, and action can be taken to significantly reduce their impacts.

Based on values in a presentation, **Creating Sustainable Wafer Fabs for the Future**, delivered by Herbert Blaschitz at the November 2019 International Trade Partners Conference<sup>2</sup>, the amount of concrete required to build the four semiconductor wafer fabs will exceed 2,500,000 cubic yards. Based on the current industry average for concrete production in the Great Lakes

---

<sup>1</sup> <https://cdxapps.epa.gov/cdx-enepa-ii/public/action/eis/details?eisId=520451>

<sup>2</sup> Creating Sustainable Wafer Fabs for the Future – International Trade Partners Conference presentation in 2019 by Herbert Blaschitz (available upon request)

Region from the Carbon Leadership Forum<sup>3</sup>, the GHG emissions from this concrete production will exceed 600,000 metric tons over the construction lifetime of the project. These impacts are significant, and a plan to mitigate these impacts must be implemented.

Fortunately, these emissions can be reduced significantly. Approximately 88-90% of the GHG emissions from concrete production come from the use of Portland Cement in the mixture. The production of Portland Cement is a GHG emissions-intense operation. However, there are methods of production of Portland Cement and other products that can be substituted for Portland Cement, both of which can significantly reduce the GHG impacts from concrete production with no impact on structural performance. Cement production from companies like Brimstone<sup>4</sup> and supplementary cementitious materials such as fly ash from coal combustion, ground granulated blast furnace slag from steel production, and glass pozzolans from glass returned for recycling can all be used in concrete to replace traditional Portland Cement. The use of such techniques can reduce the carbon impact from cement by 40%<sup>5</sup> or more.

The use of steel in the construction of the fabs provides a similar opportunity to mitigate a significant environmental impact using currently available industrial technologies. Both the primary and secondary productions have a range of carbon intensities in the current industry offerings. Requiring Micron to engage with the Sustainable Steel Buyers Platform<sup>6</sup>, and to reduce the GHG emissions from primary and secondary steel production by 25% based on the industry's Responsible Steel Performance Levels will ensure that these significant impacts are responsibly mitigated.

Given that the production of concrete and steel are responsible for approximately 15% of the anthropogenic GHG emissions since the industrial revolution, and given that reports from June 2024 statements by a Micron executive tallied the concrete needs as six times greater than used to build the Pentagon, and the steel needs as four times greater than those of the Golden Gate Bridge<sup>7</sup>, ***the DEIS should not be accepted until the document includes an analysis of the GHG emissions from construction activities, and concrete and steel procurement are revised to include a commitment to reduce the concrete GHG levels to 50% below the Northeast concrete batch plant average values for 2024 as reported by the National Ready Mix Concrete Association and steel procurement for primary and secondary processes are both 25% below the industry values reported in the Responsible Steel Performance Levels.***

Thank you for your attention and dedication to this DEIS review.

**John Paul Doody's Comments on  
MICRON SEMICONDUCTOR MANUFACTURING PROJECT, CLAY, NY, DRAFT  
ENVIRONMENTAL IMPACT STATEMENT (JUNE 2025)**

This document provides comments on the Draft Environmental Impact Statement (DEIS) by John Paul Doody, P.E., residing at 3308 Misty Cove Circle, Baldwinsville, NY (email [pauldoody1978@gmail.com](mailto:pauldoody1978@gmail.com)). It should be noted that if there are any discrepancies between comments I provided on July 24, 2025 at the morning session of the public meeting and the comments herein, the comments herein shall supersede prior comments. I have organized my comments as General Comments up front followed by Specific Comments (listed by page number).

**General Comments**

1. While there are approximately 20,000 pages in the DEIS there is inadequate detail with which to truly assess the potential for significant adverse environmental effects. Most sections provide reasonable descriptions of the methodology employed but lack sufficient detail to do an independent assessment, or be able to understand the detailed basis of the report's conclusions. As an example, I could not find anywhere in the EIS a listing of all the chemicals and quantities planned to be used at the facility. As such, I cannot independently assess whether conclusions about wastewater and air discharges as well as waste management and Health and Safety (H&S) are reasonable. Also, the public deserves to know what chemicals will be transported along our roadways, increasing risks to the community. The list of all chemicals currently contemplated to be used at the facility, along with the quantities of each chemical to be delivered, stored, consumed and disposed should be included in the Final EIS. Specific comments point out areas where additional details are warranted.
2. There is only a very superficial discussion about spills, chemical releases, system upsets and equipment malfunctions that can result in contamination of building materials, soil, groundwater, surface water and the atmosphere. The report only provides very brief simplistic statements that there will be secondary containment, SPCC plans, spills will be quickly cleaned up and spill kits will be available. One area of particular concern I have is related to a release that could enter the Oneida River eventually discharging to Lake Ontario. The Oswego River mouth is not too far from OCWA's water intake potentially resulting in contamination of our multi-county water supply. More discussion and recognition of this potential risk is critical, therefore I am recommending a thorough vulnerability assessment/risk

management approach to more fully assess the risk of spills, their consequence and appropriate mitigation measures, such as additional potable water treatment or expansion of the Otisco Lake and Skaneateles Lake capacity as backup, for example. This should be supported by fate and transport modeling to inform the vulnerability assessment. I recommend that the public actively participate in such an assessment as we will be accepting a lot of the risks. I would point out that the DEIS does include some more detailed discussion of spills in Section 4 (under Groundwater), where it describes potential cumulative effects on groundwater, covering a list of known development projects not necessarily related to Micron. The text in Section 4 states *“It can be assumed that planned residential, industrial, and transportation development, along with the implementation of the Proposed Action and Connected Actions could reasonably result in the increased storage, handling, and use of potential groundwater contaminants, ultimately leading to the increased risk of groundwater exposure to pollutants from spills or leaks, or from contaminated stormwater runoff. Based on the characteristics of relevant aquifers, increases in groundwater contamination due to urbanization could lead to local and regional cumulative impacts, as surficial aquifers are highly permeable and could become contaminated from overlying spills, leaks, or infiltration, and carbonate aquifers can transport groundwater long distances through solution openings, potentially transporting contamination on a regional scale. Ultimately, depending on the severity of potential groundwater exposure to contaminants, impacts could be significant and widespread. However, preventative measures taken by those entities storing or handling potential groundwater contaminants would reduce risks of exposure to groundwater. These may include standardized chemical storage and handling practices, the use of spill prevention and countermeasure plans and practices, and the use of BMPs that can trap or prevent the infiltration of contaminated stormwater.”* This type of discussion needs to be included in Section 3 (and additional Section 4 subsections) under Surface Water, Groundwater, Air, Solid/Hazardous Waste, and Health and Safety sections. The public deserves to know the true risks of contamination associated with Micron’s operations.

3. I would like to emphasize and support the geologic analysis completed by Jon Fox, P.G. on behalf of and submitted as comments on the DEIS by Sterling Water Stewards. The Executive Summary of the report is: *“Based on currently available geologic data and information, initiation of construction activities such as the excavation and removal of soil or bedrock at the Site is not recommended at this time based on the documented occurrence of soluble bedrock with evidence of dissolution and highly variable subsurface conditions at the Site that could lead to fast, turbulent subsurface water flow and further dissolution of soluble bedrock. These surface and subsurface conditions are consistent with karst geology/features and can pose significant risks to human health, built structures, water quality, and the environment through the formation of*

*unwanted and damaging land subsidence, flooding, slope movements, and/or contaminant migration. The Draft Environmental Impact Statement (EIS) fails to acknowledge the presence of karst-like conditions at the Site and is therefore insufficient to assess the impacts of highly variable subsurface conditions on site preparation and development. Focused areas of groundwater recharge need to be identified to help prevent contamination from sources on or adjacent to karst features and to avoid or minimize natural and human-induced geologic hazards and impacts in areas of soluble bedrock such as land subsidence, flooding, and slope movement. The review uncovered significant data and information gaps regarding the Site's geology, soils, topography, and water resources, including but not limited to recent nearby use of a productive bedrock aquifer for local water supply. Additional investigation and characterization of the Site's geology, hydrology, and local groundwater use are required to inform the public and to assist owners, operators, design professionals, plan reviewers, public works officials, and jurisdictional regulators in making informed decisions on Site development and management. Recommendations are provided in response to existing data and information gaps and to address the key findings and conclusions contained in this report.” It is critical that the issue of geologic conditions be reconciled given the additional risks associated with karst conditions.*

4. I would recommend that a community oversight council be developed that has equal authority and a seat at the table with other oversight agencies to review the project on an ongoing basis. It is likely that many things will change over the nearly 20-year period of construction and 15 years of operation, such as semiconductor manufacturing processes, environmental technological advancements and lessons learned. We are inevitably going to learn more and technologies will be developed warranting ongoing review and adjustments. As such, an adaptive management program with active public involvement should be implemented.
5. It appears the traffic analysis did not consider the traffic delays during construction of the proposed traffic improvements. The summary charts show traffic impacts in 2027 and 2031, and the text states that the planned traffic improvements will begin after 2027 and be completed by 2031. Therefore, the conclusions about delays to traffic ignore the inevitable traffic headaches during the construction of those improvements. I think we all realize there will be major traffic headaches with all of this construction and it is important that the report assess the combined effects of Micron's construction and operations along with the traffic improvement construction. The Final EIS must recognize this important aspect to traffic inconveniences and reflect the combined effects of facility construction, facility operations and construction of traffic improvements.
6. There is reasonable recognition of the state of knowledge on PFAS, referred to as “forever chemicals”, however no detail is provided in the DEIS regarding how much

PFAS and what specific formulations will be delivered, stored, used and discharged. I commend Micron for committing to install treatment on their wastewater to remove PFAS but it is not possible to assess the viability of treatment effectiveness absent details on PFAS quantities and concentrations in waste streams. I also didn't see any discussion about PFAS air emissions nor any treatment of PFAS air discharges. Additional details regarding PFAS, as noted in this comment, must be included in the Final EIS.

7. I'm also concerned with the impact this project will have on housing affordability. While many homeowners expect to see home values rise, the increase in housing and rental prices will make housing even more unaffordable than it is today for many people in the region. The report refers to a NYS initiative but I question whether that will be enough. This is an issue someone other than Micron needs to take ownership of, and not just kick it to the state of NY.
8. The Final EIS should address the massive construction and availability of resources. More specifically the Final EIS should evaluate whether there are there an adequate number of qualified contractors and rail-accessible aggregate availability to be able to handle all this construction under the schedules presented.

### **Specific Comments**

1. Page 0-5, Section 0.3: In the subsection addressing elimination of Rt. 11 Access, I agree that having multiple access points is good for mitigating traffic impacts to the community. In addition, it would provide additional means for egress in emergencies and additional access for emergency vehicles. I believe the employees will like the increased convenience as well.
2. Page 0-8, Section 0.4: In the subsection on Biological Resources describe any relocation efforts planned for plants and animal species, especially threatened and endangered species, to minimize losses.
3. Page 0-8, Section 0.4: Subsection on Historic and Cultural Resources, please describe what the public review process is for the ongoing study. In addition, please add any new findings from those studies in the Final EIS. Also, describe the most current schedule for completion of these studies as they could affect the start of construction. See additional detail in the Specific Comment for Section 3.5.3
4. Page 0-9, Section 0.4: Subsection on Air Quality, I would expect there will be significant dust issues during construction and to gloss over this is irresponsible. The public deserves a transparent assessment about dust during construction, even when Micron does everything it can to mitigate. Also, during operation there will be significantly more toxic releases than exist today, not including releases during

upset conditions. Additional specific comments are provided regarding air quality under Section 3.

5. Page 0-9, Section 0.4: GHG Emissions, Climate Change and Climate Resiliency, the statement that the facility construction and operation will have a significant impact on climate change seems to be quite important. If this single facility can have that much impact on global climate change then it must be seriously considered whether it should be built and operated anywhere. The wording in this section should be carefully reviewed to be consistent with the GHG discussion in Section 3.
6. Page 0-10, Section 0.4: Solid Waste, Hazardous Waste and Hazardous Materials, this subsection needs to indicate the risks associated with spills, and other inadvertent releases. As noted in specific comments for Section 3, the issue of spills and other inadvertent releases also needs to be included in sections describing surface water, groundwater, soils, and air emissions.
7. Page 0-10, Section 0.4: Human Health and Safety, when discussing the possibility of accidents please clarify if this includes traffic accidents during construction of the facility. Also, I'm glad the EIS recognizes the importance of communicating, training and coordinating with first responders, however I recommend that similar education be provided for all regional hospitals and Urgent Care facilities so they are aware of any unique health care needs due to exposure to the myriad chemicals transported, transferred, stored, used and discharged/disposed.
8. Page 0-11, Section 0.4: Utilities and Infrastructure, in the top paragraph please better describe why the significant effects of the Micron facility on the electricity demand are not adverse. Simply suggesting the planning process will alleviate problems seems unreasonable and seems to be kicking the can to another entity. In the first full paragraph, if there is a reduction in gas supply for some reason (e.g., upset conditions or other shortage) to the area describe the implications on gas service such as who gets preference for the supply, Micron or the public? It seems like under such a situation there could be a significant adverse effect that should be recognized. It would be nice to know if Micron plans to have their own water tank/tower for fire demand and equalization of usage to minimize impacts to other water users.
9. Page 0-12, Section 0.4: Transportation and Traffic, this section should note where in the document wetland impacts associated with traffic improvements are assessed. I'm thinking about the proposed new 481 interchange at the CSX crossing as I don't see how wetland impacts can be avoided and should be added to the overall project impacts.

10. Page 0-13, Section 0.4: Visual Effects and Community Character, depending on hours of operation for construction the noise effects could be significant for local residents, particularly backup alarms on construction vehicles, as they don't typically show up as unacceptable when modelling noise. The project should consider use of "quacker" alarms or strobes for after hours construction. Also, in the last paragraph of this subsection the EIS needs to include its conclusion about whether there are significant adverse effects.
11. Page 0-14, Section 0.4: Community Facilities, Open Space and Recreation, in the second to last paragraph, please clarify if the local Fire/EMT will need to be expanded to adequately service this facility and whether Micron will have its own emergency service staffing on site. Also, in the final paragraph of this subsection indicate whether the snowmobile trail will be relocated as part of this project, to avoid closure of an important community resource.
12. Page 0-15, Section 0.4: Environmental Justice, it is not clear why the adverse effect on home and rent prices would be temporary. I see the pricing increase to be permanent, so it will make housing in the region less affordable permanently, the text needs to clarify this point, or refer the reader to the more detailed section of the report to support the conclusion that the effect is temporary.
13. Page 0-17, Section 0.6: The Final EIS needs to add construction dust, and spills during construction and operation as well. There will be mitigation and protective measures employed but these adverse effects should still be expected.
14. Page 2-7, Section 2.1.1.1: In the paragraph below Table 2.1-2 consider qualifying the 4Q 2025 date for construction start, as I don't see any way Micron will even start foundation work let alone a shell this year.
15. Page 2-9, Footnote 14: It is a big assumption that the Town's construction time restriction will be approved, it is a very important item for anyone in proximity to the site as they will have to deal with 16 years of noise, dust, traffic headaches, etc. for many years. The public needs to be made aware of this change, and specifically the intended hours of operation. This is yet another big reason we need more public engagement, this DEIS cannot be relied on as the sole communication vehicle for the project.
16. Page 2-10, Section 2.1.4: In the second to last paragraph in this section, some clarification on the math related to numbers of acreage is needed. It appears that 16 acres are missing from the total acreage (997 acres).
17. Page 2-14, Table 2.1-3: Describe any emergency holding lagoons/tanks to divert and contain spills or other inadvertent releases before discharge to stormwater outfalls.

Similarly, describe any emergency holding lagoons/tanks planned for wastewater in the event of spills or upset conditions.

18. Page 2-18, Section 2.1.2.3: It would help to explain why the possibility of using the Rail Spur Site for transport of hazardous substances to be used at the facility is not being considered. It would seem to be a safer transportation mode and likely preferable to the large number of tanker trucks running along our roadways which are susceptible to accidents and chemical spills.
19. Page 2-20, Table 2.1-4: Describe in more detail the spill protection (e.g., secondary containment) that will be provided for the locomotive shed sump that is intended to collect waste fluids.
20. Page 2-24, Table 2.1-5: For the pedestrian walkway and bridge consider providing some walking paths, Micron could also connect trails to some wetlands with interpretive signage. Consider including walking/jogging trails at the main plant site for employees use during breaks. It would be a nice way to connect with nature and could include interpretive signage near or within wetlands or any historic sites.
21. Page 3-3, Footnote 23: the footnote refers to industrial-zoned properties but revise to include commercially-zoned properties if they would also be acceptable for a warehouse.
22. Page 3-13, Figure 3.1-4: There is a symbol for Industrial wastewater conveyance (brown line type), but I could not find any such linework in the figure. Please review and adjust if needed. This same comment applies to Figure 3.1-7 on page 3-16.
23. Page 3-23, Section 3.1.3.2: In Construction Effects subsection, it is unclear whether converting prime agricultural land requires mitigation, like land grants to maintain agricultural property in perpetuity. Also, this analysis ignores the fact that this campus will spur additional commercial and industrial development, which should be addressed.
24. Page 3-26: Land Use Changes subsection, there is reference to two remaining properties that Micron does not have access to, and that OCIDA may need to go through eminent domain to obtain access. Given the time and effort associated with the eminent domain process, the EIS should note this (along with all the other approvals needed) as potential schedule impacts so the public is aware.
25. Page 3-36, Table 3.2-1: Under New York State Material Management Program, clarify whether NYS Beneficial Use (BUD) program would apply here, for reuse of fill material excavated from the site.
26. Page 3-38, Figure 3.2-1: There are no borings east of Burnett Road so any observations and conclusions regarding site geology and geotechnical competence of bedrock should be qualified to note that portions of the site were not

- characterized. The DEIS should indicate that borings in uncharacterized development areas will be collected at a later date.
27. Page 3-39, Section 3.2.2.1: In the second paragraph there is reference to glacial till being up to 164 feet thick yet Figure 3.2-1 indicates bedrock is shallow, only as deep as 33.5 feet. This discrepancy should be explained.
  28. Page 3-48, Section 3.2.3.2: Specify what utilities will be installed underground at the facility, and whether shallow groundwater will be an issue with construction. Also, some discussion on rail-served quarries and whether there is sufficient quantity of rail-available aggregate (the DEIS indicates the project will require 9 million cy) needs to be included as it can have a significant impact on the overall project schedule (this comment applies to page 3-51 as well). It is not clear whether bedrock removal is based on elevation of bedrock or bedrock competency for foundational support. Please clarify the basis for bedrock removal in the Final EIS.
  29. Page 3-50, Section 3.2.3.2: In the discussion regarding blasting please describe mitigation efforts to monitor and/or protect nearby buildings and structures, as well as planned communications with residents in the vicinity.
  30. Page 3-51, Section 3.2.3.2: The final paragraph references SPDES permitting for stormwater management during construction. In this section, and perhaps more importantly the sections on air emissions and water resources there needs to be a recognition that fugitive dust emissions may exceed the allowable particulate levels off the property (as well as complaints about dust impacting residents' properties, even if they are below the allowable thresholds), and releases of turbid waters that escape the SWPPP-prescribed protective measures should be expected. While they may be short-lived and corrected in a prompt manner the public should be made aware of the likelihood that such releases exists. A complaint hotline should be established for the project along with a management system to track complaints and document resolution.
  31. Page 3-53, Section 3.2.3.2: Connected Actions subsection, please make sure to include the two 15 million gallon storage tanks planned at OCWA's facility on Rt 31.
  32. Page 3-53, Section 3.2.3.2: Operational Effects subsection, it would be prudent to include the possibility that groundwater pumping to contain contamination from spills could be possible in the future, which would have an effect on groundwater elevations and quality.
  33. Page 3-54, Table 3.2-5: The listing of groundwater monitoring using 17 wells during construction comes out of the blue, and should be described earlier in the text. I may have had comments on the proposed monitoring but no details were provided.

34. Page 3-60, Table 3.2-6: There is reference to SPDES Individual discharge permit, but no mention of a pretreatment permit for the Micron Facility with Onondaga County, please add reference for such in the table.
35. Page 3-72, Section 3.3.4.2: In the subsection on wetlands construction effects there does not appear to be any discussion regarding the effects that the development and construction over 1000 acres (permanently destroying about 200 acres) will effect the remaining wetlands. I find it hard to fathom that such massive construction won't have a negative effect on remaining wetlands, including under unforeseen upset conditions. This needs to be recognized and assessed in the Final EIS.
36. Page 3-78, subsection on Stormwater, the first sentence indicates that construction of the facility will result in temporary alteration of land type and soil type, but it will permanently change the land type and soil type as all overburden soils are being replaced with aggregate, and the land type will be industrial rather than vacant. Please revise this subsection accordingly.
37. Page 3-79, Groundwater subsection, the text implies that groundwater is not used for potable water, but there is no discussion about a thorough well survey in the project vicinity, just a public records search which would not pick up wells installed prior to NYS requirement for well construction to be reported. Spills at the facility could contaminate the groundwater at the facility and potentially migrate off site; this needs to be addressed as contaminating private drinking wells would be a significant adverse effect. Also dewatering to facilitate excavation and installation of foundations could impact wetlands through drawdown of the water table and this needs to be evaluated to assess potential impacts on wetlands as well as off-site private wells (if any) in the vicinity. Finally, I could find very little discussion about the 42 monitoring wells installed at the facility. It would be very helpful to include results from monitoring to date (both potentiometric data as well as any conventional parameters or hazardous substances sampling) in the Final EIS.
38. Page 3-82, Wetlands Operational effects, The BMPs during operations will be different than those used during construction (which are inherently temporary). Also, the first sentence of the second full paragraph says the construction general permit (CGP) would apply to operations but I would expect an individual SPDES permit for the operational phase stormwater discharges. This needs to be reconciled.
39. Page 3-83, Surface Water subsection, I appreciate Micron committing to installing treatment for removal of emerging contaminants, such as PFAS, from the wastewater stream even if not required under their SPDES permit. However, I'm

interested in better understanding the anticipated concentration of individual PFAS substances in the wastewater and the target removal efficiencies, so the Final EIS should provide such detail. Also please describe what other emerging contaminants are being contemplated for treatment.

40. Page 3-84, Surface Water subsection, there is no discussion regarding the impacts that spills, upset conditions or other accidental releases will have on wastewater discharges, so this section needs to be revised to indicate the possibility and potential consequences (see General Comment on this topic).
41. Page 3-85, Table 3.3-11: I would encourage Micron to continue to explore creative methods for managing stormwater at the facility, to further minimize adverse effects from stormwater discharges. There are some good suggestions in the table but more creativity is warranted for such a large impervious surface. I did not see any indication of containment systems (e.g., gates on catch basins, emergency impermeable holding basins, tanks etc.) to enable containment and capture of spills and other inadvertent releases at the facility that reach the stormwater conveyance systems. In the paragraph under the table there is mention of the 42 monitoring wells again. It would help to provide what the goals of the monitoring are, what parameters will be monitored and criteria the results will be compared to.
42. Page 3-86, Groundwater subsection, as noted in previous sections adverse effects from spills and other inadvertent releases needs to be described in better detail. Simply saying the facility will have a SWPPP, SPCC Plan and clean up spills immediately is good but it is very superficial and completely ignores the adverse effects if releases escape the containment systems. The text should indicate that spills and accidental releases are inevitable, and describe the specific design measures in the system to prevent spills from reaching soils and groundwater. Also, what soils and groundwater sampling will be performed following spills to ensure they were adequately cleaned up. Finally, the conclusion that there will not be a significant adverse effect needs to be qualified with an assumption that spills are adequately contained, cleaned up and verified but that a significant adverse effect could result if spills/releases unacceptably contaminate groundwater, surface water or atmosphere.
43. Page 3-88, Summary of Effects subsection, there is a very weak assessment of wastewater discharges to the Oneida River, there is no mention of potential spills, other releases or treatment equipment malfunctions causing releases into the Oneida River, Oswego River and Lake Ontario. As mentioned in the general comments the OCWA water intake is in vicinity of the Oswego River discharge so if

there was a significant spill contaminating the rivers it could contaminate the County's water supply.

44. Page 3-88, Section 3.3.5, Table 3.3-12: The benefits description under the water recycling BMP should not include GHG emissions and solid waste generation, they should be described in their respective sections. Also, the benefits of groundwater monitoring should more accurately say they "document" conditions. They don't necessarily verify things are acceptable as the monitoring may show otherwise. Claiming the benefit side of the monitoring ignores the possibility of showing problems, and therefore is misleading. The table should be revised to more accurately reflect what the monitoring will accomplish, which is documenting actual conditions.
45. Page 3-89, Table 3.3.-12: In the bullet list there is an auto shutoff valve mentioned, but this will require real-time monitoring which is not possible for all discharge parameters, so the bullet should be qualified as such. The bullet list mentions an Accidental Spill Prevention Plan but it was not mentioned when spills were discussed previously, please describe this plan as it relates to the SPCC Plan. Spill response should also be included in the table.
46. Page 3-92, Table 3.3-13: The proposed wetlands mitigation ratio of 2:1 is quite inadequate for the high-quality wetlands (the EIS previously indicated that these are high quality wetlands) that will be permanently destroyed. Using multiple smaller areas in a disjointed fashion would also justify a higher overall mitigation ratio.
47. Page 3-105, Table 3.4-3: Please label the units (acres) more prominently on the Table.
48. Page 3-114, Table 3.4-6: Please label the units (acres) more prominently on the Table.
49. Page 3-124, Subsection on Bats: I would encourage Micron and the agencies to develop some more creative mitigation efforts, like building structures for bat roosting in safe, but nearby locations. In addition, please mention whether bats can be captured and relocated. I see Table 3.4-12 has some roosting boxes which is a good start but I would encourage additional creativity to truly minimize the adverse effects on bats.
50. Page 3-125, last sentence in Bats subsection: The last sentence references ongoing coordination and consultation. The Final EIS needs to discuss whether this will be completed prior to the intended start date for construction, or whether construction will be delayed until completion of coordination and consultation.
51. Page 3-127, subsection on Lake Sturgeon: The text indicates that the IWWTP will not involve any construction in the Oneida River, yet the treatment plant is being

expanded to allow discharge of an additional 33.5 MGD, which would intuitively appear to require an increase in the outfall capacity or installation of an additional outfall. Please verify the existing outfall does not require any modification to accommodate the additional flow.

52. Page 3-128, subsection on Operational Effects: This is not necessarily specific to this subsection, but the Final EIS should explore some stormwater retention features to provide beneficial habitat for some species. There are likely other opportunities for designing in habitat improvements to attract wildlife and mitigate impacts associated with the significant loss of habitat. This same comment applies to Table 3.4-11 on pages 3-133 and 3-134 under landscape management.
53. Page 3-145, Section 3.5.3: The text on page 3-144 indicates the Phase 1B investigations are ongoing. The text on page 3-145 indicates these investigations will be completed as well as all consultations completed prior to any intrusive construction in 2025. This seems like an important critical path item for the schedule. The Final EIS should provide a realistic schedule for these efforts so the public is aware of any construction schedule delays.
54. Page 3-160, subsection on Construction Effects: The text on stationary sources indicates generators will run 12 hours/day, but Footnote 54 indicates 16 hours/day. Please reconcile the discrepancy or explain the difference. Also see prior comment on Town approval that is needed to increase allowable construction hours.
55. Page 3-163, Table 3.6-7: Please reference where these emissions estimates are derived. Footnote 55 indicates estimates can be found in air permit application packages for Fabs 1 and 2, these should be provided in an appendix for ease of review. Appendix I-1 indicates the estimates are for the 4 Fab scenario so the appendix and text need to be better synchronized and referenced accordingly.
56. Page 3-164, subsection on Connected Actions Operations Effects: The list of wastewater treatment components needs to include the PFAS treatment processes described on page 3-83.
57. Page 3-167, subsection on Air Dispersion Modeling: The text in the second full paragraph, along with the referenced footnote 58, asserts that emissions from IWWTP are not significant and not included, but would be if needed at a later date. The Final EIS needs to provide more technical basis for excluding the emissions, simply asserting they are not significant is not appropriate without some backup.
58. Page 3-170, subsection on Effects Determination: The conclusion at the top of the page stating no significant adverse effects ignores emissions during upset conditions and air pollution control equipment malfunctions. Similar to my comments regarding the lack of adequate consideration of spills, the air quality

section needs to add in discussions regarding the adverse effects of upset conditions and other inadvertent releases to the atmosphere. While it may not change the overall conclusion about significant adverse effects it is imperative the public be made aware of these situations. Also, it appears that the different sources are assessed separately, yet there will be both construction and operations emissions between 2029 and 2041 so the cumulative effects of both construction and operations need to be considered for the coincident time periods and presented in the Final EIS.

59. Page 3-171, Table 3.6-13: The last paragraph makes reference to construction emissions listed in Table 3.6-13 being less than 1% of the total NYS emissions, except for sulfur dioxide. I fail to see the relevance of comparing the emissions to the entirety of NY state, please explain why this is relevant, just because it is 1% of the state's total emissions doesn't mean it isn't significant to the local community in Clay and Cicero.
60. Page 3-183, Section 3.7.2.1: The second to last sentence in the first paragraph does not make sense. I have read it multiple times and still don't understand the point being made, so please revise to reduce confusion in the Final EIS. The Scope 1: Direct GHG Emissions subsection references on-site fossil fuel power generation. If this is in reference to emergency generators the text should be clarified, as written it could be construed that the Micron facility will have full-time fossil fuel generators running. Also, it's not clear how the emissions from emergency generators are handled in the GHG estimates (i.e., the assumptions about how often they are used, does the analysis only include the routine exercising of generators, or some assumed usage during power outages?). I could not locate relevant assumptions in Appendix J-1.
61. Page 3-210, Section 3.7.4: In the paragraph regarding extreme weather events the text should describe the how the basis of design for stormwater management will account for more extreme rainfall events. Traditional design uses historic data to define various storm event frequency/probability (e.g., 25 year 24 hour storm) that the system components will be designed for. The text needs to describe how extreme events will be accounted for to minimize the potential for flooding at the site, or cause flooding of neighboring properties. The text on page 3-211 regarding stormwater management provides some basis of design information, but does not explain how future increases in storm intensity will be accounted for. A sensitivity analysis would be a useful tool during design to help optimize the protectiveness of the stormwater management system. Also, this paragraph emphasizes the need for good spill response management as infiltration basins will facilitate transport of any

spills that reach the stormwater system into the groundwater, further supporting my concerns regarding spills.

62. Page 3-215: The sentence directly below Table 3.7-14 indicates Micron commits to purchasing 100% carbon-free electricity. However, I recall there being a prior commitment by Micron to utilize 100% renewable energy. This section should be revised to explain why Micron has changed the important commitment to utilize 100% renewable electricity.
63. Page 3-217, Section 3.8.1: The last paragraph indicates there are no local regulations or laws regarding hazardous waste or hazardous substances, which may be true but Table 3.8-1 does include local laws and regulations for solid waste. The text should be revised to note the local requirements listed in the table, or delete the sentence regarding local regulations in the paragraph.
64. Page 3-218, Table 3.8-1: The description for TRI under EPCRA should more clearly note the reporting requirements so the public understands that there will be periodic reporting about toxic releases that they will have access to. The latter part of the description implies the reporting but some additional clarity is warranted.
65. Page 3-220, Table 3.8-2: The table only references obtaining an ID number but there should be much more required for the facility under RCRA so please revise the table accordingly.
66. Page 3-221, Section 3.8.2: It would help to list the 5 counties referenced in the first paragraph. In Section 3.8.2.1 regarding Phase 1 Assessments, it would help to indicate that the scope included a site walk of the properties examined. Also, it appears there were no Phase 2 activities completed on the properties but I would recommend Micron complete some baseline sampling of soils, groundwater, surface water, noise and air at the site (and surrounding areas for air and noise) so they know what conditions existed when taking ownership of the property. It could help in the future if extraordinary conditions arise, to establish whether conditions changed and to what extent.
67. Page 3-222, Section 3.8.2.2: It would help to note if any hazardous substances (e.g., asbestos, lead paint, PCBs) were removed when homes were demolished. In the paragraph regarding National Grid's substation it should be noted whether any herbicides were used that could have contaminated groundwater (note arsenic based herbicides were commonly used at substations), are/were there any PCB containing transformers or capacitors, and whether an SPCC Plan exists to cover the bulk petroleum tank. The same comment applies relative to an SPCC Plan at the LOWTP and OWWTP.

68. Page 3-224, Section 3.8.2.3: It would help to note the available permitted capacity remaining at Seneca Meadows and High Acres landfills and any planned expansions that need to be permitted.
69. Page 3-226, Table 3.8-3: In the first entry assess whether uncontaminated excavated soil ineligible for beneficial use could be used as landfill cover at solid waste facilities. It would be another form of beneficial use. Relative to footnote 72, I recommend the backup for the estimated quantities be provided in an appendix and referenced as such in the footnote.
70. Page 3-228: In the final paragraph it would help the reader to provide a preliminary estimate of the amount of soil to be reused on site. In addition, please assess whether some of the excavated wetland soils could be used in wetland restoration at the proposed mitigation sites. It may be optimistic to assume all remaining soils would be recyclable, which is inconsistent with Table 3.8-3 that indicates some soils may need to be disposed in commercial landfills.
71. Page 3-229: As noted previously please assess whether some of the soils described in the first paragraph could be used as daily cover at the landfills.
72. Page 3-233: This comment applies more generally but I recommend that the backup for all the estimates provided in this EIS be clearly documented in appendices. I believe it is imperative that the public understand, and be able to ground truth, the basis and derivation of all estimates. In the second to last paragraph describing industrial wastes, I would expect to see water and wastewater treatment sludges, spent filters, used PPE and other solid wastes, not just spent chemicals.
73. Page 3-235, Table 3.8-5: Describe the basis for determining that the non-hazardous sludge from wastewater treatment can be beneficially used. This could be accomplished using a footnote explaining the basis for concluding it can be beneficially used.
74. Page 3-236, Table 3.8-6: Describe which category wastes containing PFAS will fall under (i.e., RR, non-hazardous or hazardous). I could not find anywhere in the report or Appendix K where the estimated disposal volumes are derived. I had expected to see a table summarizing all the listed and characteristic wastes (by individual waste number) that make up the summary numbers shown in the text. Indicating they are based on data from other Fab sites is reasonable but additional backup detail is warranted.
75. Page 3-238: In the second paragraph where emergency response is discussed with notifications to first responders, there should be some discussion (or reference to another section where it's discussed) about training that will be provided to all first responders as well as hospital/urgent care facilities regarding the unique hazards,

risks, and appropriate medical response to the myriad of chemicals that will be used at the facility. With respect to hazardous waste management I would like to see more detail regarding the design of chemical/waste loading/unloading facilities, storage facilities (tanks, drums, ISO tanks, gas canisters, etc.), and conveyance systems. Somewhere secondary containment is mentioned and details on what that consists of would also be helpful to understand. This comment also applies to page 3-244.

76. Page 3-241: In the discussion regarding PFAS I would like to better understand what suite of PFAS compounds is proposed to be used along with a material balance showing the supply and disposition of the individual PFAS components. This could be included in one of the appendices. It sounds like there is uncertainty with identifying a disposal option, therefore if Micron cannot find an acceptable disposal facility, PFAS wastes will need to be stored at the facility for prolonged period of time, or properly stored somewhere and this needs to be discussed in the Final EIS. I would recommend that Micron verify with each disposal facility whether the disposal facility will accept wastes that contain PFAS. My experience has been that some solid waste disposal facilities will not accept wastes containing PFAS (regulated or not), so some additional due diligence to verify acceptability for disposal of wastes containing PFAS is appropriate. The text should explicitly mention that the TRI listed PFAS compounds represent a very small fraction of all PFAS compounds, and specifically what fraction of PFAS compounds used at the facility will be subject to TRI reporting.
77. Page 3-241: Hazardous Materials subsection: In the list of example hazardous materials at the bottom of the page please add arsine if it will be used at the facility given its highly toxic characteristics.
78. Page 3-242, Table 3.8-10: This table highlights the significant quantities of hazardous materials that will be stored on site, which includes a total of 55,780,000 gallons of bulk chemicals, and about 15,000 55-gallon drums. These quantities are broken down in general chemical types, but as noted in the general comments the DEIS, it does not list the specific chemicals delivered, stored and used at the facility. The Final EIS needs to include a complete list of chemicals used at the facility along with the quantities (by chemical) delivered, stored, used and disposed. The details can be provided in an appendix with Table 3.8-10 summarizing the total quantities by category. The Table should also clarify whether the quantities represent raw chemicals for use, or whether it includes both raw chemicals as well as wastes. Finally, somewhere in this section the EIS needs to indicate which waste type PFAS compounds will fall under.

79. Page 3-243: In the third paragraph there is mention about shippers having spill procedures in place but protocols for spills at the Micron facility during chemical delivery unloading and loading for disposal or recycling needs to be described.
80. Page 3-250, Table 3.8-13: The entries describing spills are very superficial and, as noted in previous comments, spills and other inadvertent releases deserve much more discussion in this EIS. They have the potential to contaminate building materials, soil, groundwater and surface water as well as potentially result in unacceptable employee exposure.
81. Page 3-254, Footnote 88: It seems acceptable to say that connected actions will have similar H&S protocols for construction, but I don't see how that would apply to operations. There are substantially different operations at connected actions compared to the Micron facility, where there is significantly more chemical usage and very unique workplace hazards.
82. Page 3-257, Table 3.9-2: In the risk management measures for toxic and sensitizing hazards describe whether the exhaust from gas operations will be treated prior to discharge. The same comment applies to Table 3.9-3.
83. Page 3-271, Figure 3.10-3: The text explaining the figure should provide the rationale for why only limited buildings would have solar panels installed. This is a lost opportunity for renewable energy and more energy independence for the facility, and warrants more rationale.
84. Page 3-274, Figure 3.10-4: It is unclear what pretreatment will occur at the Micron facility compared to the treatment by Onondaga County at Oak Orchard. Some clarification in the text and on Figure 3.10-4 would help.
85. Page 3-295: In the bus and rail sections it seems like a great opportunity to identify ways to improve mass transit to support the Micron facility, which would help alleviate passenger vehicle traffic problems and also potentially reduce the GHG footprint for the project. This should be explored by the county in more detail so we don't miss out on a great opportunity to improve our mass transportation infrastructure.
86. Page 3-297: In the third bullet describing traffic accident risks please add increased risk of chemical spills from trucks delivering and transporting wastes, particularly during the years when Fabs 1 and 2 are operating but Fabs 3 and 4 are under construction.
87. Page 3-298: The proposed schedule for traffic improvements seems very optimistic, and they are critical to minimizing impacts to community. As noted in the general comments, describe whether there are an adequate number of qualified

contractors to complete all the traffic improvements along with all the development at Micron.

88. Page 3-339, Section 3.11.3.6: Similar to the comment regarding mass transit, it appears we could improve the bike and pedestrian access to the area to encourage more alternatives to accessing the facility. With all the roadway improvements it wouldn't be too much more effort to improve bicycle and pedestrian access, perhaps with auxiliary parking at strategic locations.
89. Page 3-361: In the first full paragraph describe how noise and dust during the construction of traffic improvements (between 2027 and 2031) is addressed.
90. Page 3-397: In the first bullet mention that less audible backup alarms, such as quackers and strobes (nighttime only) will be considered as well. Backup alarms are notorious for resulting in complaints, even if average noise levels are acceptable.
91. Page 3-399: In the final paragraph it would help to estimate the fraction of EVs expected, which would tend to reduce the vehicle noise and GHG emissions.
92. Section 3.14: Incorporate previous comment regarding training of first responders and hospital staff on unique potential hazards at the Micron Facility.
93. Page 4-17, Groundwater subsection: The language in this subsection regarding adverse effects on groundwater should be included (in a contextually modified form) in Section 3 as noted in previous comments. This language is more reflective of the risks posed by spills and other inadvertent releases. In addition, there is mention of karst geology here, yet the section describing the Micron facility indicates no karst features. Similar language about the adverse effects of spills should be provided for adverse effects on surface water, soils and air as well.
94. Page 4-33, Section 4.3.15.2: subsection on Housing, please verify Great Northern Mall is still planning on developing housing at the site. I recall recent reporting that they are reconsidering development of a shopping area.

david.frenkel@chips.gov

Dear David Frenkel:

This responds to the request for comments by the US Department of Commerce (Commerce) and Onondaga County Industrial Development Authority (IDA) on the Draft Environmental Impact Statement (DEIS) Report dated June, 2025 which evaluates the proposed Micron Semiconductor Manufacturing Project to be located in the Town of Clay, Onondaga County, New York.

Thank you for providing the U.S. Fish and Wildlife Service (Service), as an interested agency, the opportunity for this review pursuant to the National Environmental Policy Act (NEPA) and the New York State Environmental Quality Review Act (SEQRA). The Service previously provided comments on Pre-Draft versions of the document, and we consider this to be our final set of comments on outstanding issues.

Commerce is the lead federal agency for the project and in addition to NEPA, has responsibilities under Section 7 of the Endangered Species Act (ESA) (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*) to consult with the Service regarding projects that may affect federally listed species or designated critical habitat, and confer with the Service regarding projects that are likely to jeopardize federally proposed species and/or adversely modify proposed critical habitat. Section 7 consultation is ongoing, and we anticipate it will be completed in the near future.

Attached to this letter is a table with our latest comments on the DEIS. In summary, we found that there are discrepancies with the acreages within sections of the document and also between the DEIS and the Biological Assessment. We also suggest some text changes to the document to expand upon or make clearer the text describing the biological resources and project effects. We understand that this is an enormous project with many components, and it is difficult to maintain consistency with so much information.

Thank you for your coordination and consideration of these comments. If you require additional information, please contact Tim Sullivan at 607-753-9334 or [tim\\_r\\_sullivan@fws.gov](mailto:tim_r_sullivan@fws.gov). Future correspondence with us on this project should reference project file 2024-0005791.

Sincerely,

Ian Drew  
Field Supervisor

Attachment: U.S. Fish and Wildlife Service Comments on June 2025 Micron Semiconductor Manufacturing Project, Clay, NY Draft Environmental Impact Statement, June 2025.

| DEIS Section                                                             | Text (page numbers from pdf document)                                                                                                                                                                           | FWS Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>3.3 Water Resources, Wetlands, Section 3.3.3.1</b>                    | Text describing existing wetland resources and Table 3.3-5. “Ramboll classified the 408.61 acres of delineated Federal jurisdictional wetland identified within the proposed Micron Campus as a mixture of ...” | There seems to be a discrepancy between the text and Table 3.3-5 (pg. 3-65), which says there are 422.20 federal wetlands on Campus. The ** footnote does not seem to clarify this.                                                                                                                                                                                                                                                                                               |
| <b>Section 3.4.4 Environmental Consequences (Ecological Communities)</b> | Table 3.4-8 (pg. 3.117)                                                                                                                                                                                         | Text in the table describes the effects and mitigation of fragmentation. We recommend a project commitment be added here that forested areas that will remain undisturbed are properly; reference to construction monitor who would monitor invasive plant establishment, if this will be part of the monitor’s scope of work; and under altered composition: consider changing “where feasible” to the “maximum extent practicable.” Native plants should be the default choice. |
|                                                                          | Effects on mammals and birds, pg. 3-118, 3-120                                                                                                                                                                  | Please consider the carrying capacity of the adjacent or nearby habitat these animals might relocate to and give context as to how much habitat is available.                                                                                                                                                                                                                                                                                                                     |
|                                                                          | Special Status Species (Table 3.4-9)                                                                                                                                                                            | We acknowledge that the No Effect determination for the tricolored bat will be revised in the Biological Assessment (BA).                                                                                                                                                                                                                                                                                                                                                         |
|                                                                          | Tree clearing commitment, pg. 3-123                                                                                                                                                                             | Text states, “all tree clearing...would only occur within the winter hibernation window from November 1 through March 31.” Please revise to include the “shall occur” commitment language.                                                                                                                                                                                                                                                                                        |
|                                                                          | Loss of 335 acres of roosting habitat for the Micron Campus and rail Spur Site, pg. 3-123; loss of 82 acres for all connected actions, pg. 124                                                                  | This does not agree with the BA, which says a total of 727 acres would be lost (which includes all actions; 467 acres for the campus and rail spur site). These acreages should be consistent across all documents. Discuss the remaining 307 acres of forested habitat. A table similar to Table 11 in the BA would be useful in discussing roosting habitat loss (and remaining habitat)                                                                                        |
| Operational effects on bats                                              | Table 3.4-10, pg. 3-132                                                                                                                                                                                         | It appears this table quantifies habitat loss due to cumulative growth through 2041, but it is unclear what these table entries mean (what do the numbers not in parentheses mean). It appears to be inconsistent with the forested (roosting habitat) loss in Table 14 of the BA.                                                                                                                                                                                                |
|                                                                          | Table 3.4-11 BMP, pg. 133                                                                                                                                                                                       | Please update this table with the correct acreages. 307 acres of forested habitat will remain; landscape management: use of native species should be the default choice; please update this table to reflect the project commitments of the Biological Opinion (BO).                                                                                                                                                                                                              |
|                                                                          | Section 3.4.5.2 Mitigation Measures                                                                                                                                                                             | BO will also include Conservation Measures, that include the mitigation plan; please update Table 3.4-12 to be consistent with the BA                                                                                                                                                                                                                                                                                                                                             |
| <b>Cumulative Impacts</b>                                                | Section 4.4.4 Water Resources – Wetlands, pg. 4-14-4-15                                                                                                                                                         | Please acknowledge that, on a regional basis, cumulative impacts to wetlands from the projects listed in Table 4.2-1 are likely to be substantial on                                                                                                                                                                                                                                                                                                                              |

| <b>DEIS Section</b> | <b>Text (page numbers from pdf document)</b> | <b>FWS Comment</b>                                                                                                                                                                                                                                                                 |
|---------------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     |                                              | downgradient functions and services, despite BMPs and mitigation measures.                                                                                                                                                                                                         |
|                     | Section 4.3.4 Biological Resources           | Besides the loss of forested habitat, which is discussed, please consider the increased human activity, noise and light expected from these projects on a regional basis. Cumulatively, these effects would decrease suitable habitat for listed bat species and wildlife overall. |

---

**To:** chipsnepa@chips.gov  
**Subject:** [EXTERNAL] MICRON

I am writing with concerns about the MICRON Project. Too many questions have been left unanswered. Some of the main ones regard environmental impacts. Hundreds of acres of wetlands stand to be destroyed with no apparent mitigation plan available. Chip disposal has not been addressed adequately, given that wastewater measures are not in place. Page 18 of the report, regarding low-GHG alternatives, is entirely speculative, given that the company already knows that low-GHG alternatives really don't exist at this point in time. The same is true for HTFs. As for wastewater, committing to the hope that by 2030 they might reuse or recycle 75% of the water does not address the huge amount of potable water (aka drinking water) that will be used for the first five years. Chip manufacture requires potable water, not non-potable water. This potable water use will impact the water table and aquifer.

Greenhouse gas emissions. As you might know, nitrogen trifluoride is one of the top greenhouse gases of concern. Throughout the report, Micron notes that "technically viable alternatives have not been found" to either the use of NF<sub>3</sub>, or its derivatives that are generated by the manufacturing processes. Repeated mention is made of these gases being "emitted" but no mention that I see of what will be done about the emissions, which can impact families living in the area, as well as the overall health of the environment.

The idea of 50,000 jobs but actually only 9,000 "high-paying jobs" means that the bulk of the jobs will be low-paying, or temporary during the construction phase. The entire "jobs" package looks severely inflated.

I urge you to reconsider, or at least defer, bringing such a large manufacturing facility with so many either unknown or unaddressed potential impacts to the area.

Regards,

Paula Durbin

**Subject:** [EXTERNAL] Comments on proposed Micron plant

As a 70 year resident of NYS, living in both Onondaga and now Oswego county, the changes that are about to happen surrounding the construction of these 4 Micron fabs in Clay, offer benefits to those who are focused on job creation in the Upstate NY area to offset the loss of so many jobs and large manufacturing facilities that are gone.

Yet at the same time, this progress for many also represents major inconveniences and ongoing hardships to residents who live in close proximity to where this plant would potentially be located. It is unfortunate that people in power chose to put a plant of this magnitude in an already congested area that will decimate the areas around it in ways too numerous to count. One issue that is not getting the coverage it should, relates to potential odor/smell/foul air that could be emanating from this plant.

Perhaps this foul odor issue is why a Micron executive who is relocating to this area has made it a condition for the local real estate company assisting in the purchase of their home in this area, that they will look at no houses within a 5 mile radius of this plant, referencing the potential foul odor/smell as their main concern.

As a point of reference towards the potential foul odor from this plant in Clay being a real issue: information about the foul odor issues at the Micron plant in Manassas, Virginia is available online. It appears to be an ongoing, unresolved issue for those residents near this plant, which Micron acquired in 2002. That's 23 years and they appear to be still dealing with the foul odor problem. What could that history mean for this area?

Many at the 3 public hearings on July 24<sup>th</sup> referenced the environmental challenges surrounding the plant with wildlife and water referenced much of the time. Not much was mentioned about the air quality potentially being affected. So aside from those important environmental issues, what assurance do CNY residents living within 5 miles of this plant in Clay have, that the issues with foul odor will not happen here?

The Micron executive coming into this area clearly has concerns of their own regarding potential foul odors emanating from the plant, and clearly possesses information we are not privileged to know regarding this issue. Lots of "trust us to do the right thing" kind of comments have been made about many issues of environmental concern, but who will guarantee we will not have the same issues with foul odors specifically as the people in Virginia? Those residents who live in Cicero to the east of the plant beyond the 5 mile radius, might be concerned about what they may be smelling at some point too, since the prevailing winds blow mostly in that direction.

There are many of us living within this 5 miles radius surrounding the proposed plant who have lived in NYS for many years, paid state, local and real estate taxes, raised families and supported local businesses. Many of us planned to live here through retirement years, and will be directly affected by what will be happening with the plant construction and manufacturing. While property values will more than likely be increased by local assessors as more and more people move into this area, there are those residents who have no plans or interest in selling, so increases in their property value will only result in increases in real estate taxes for them.

When the extreme inconvenience this plant in Clay will cause residents in that 5 mile radius from increased traffic to grocery shopping, buying gasoline, dining out, retail shopping and medical care -- and the potential foul odor issue, which unfortunately will not be evident until the plant is long established unless steps are taken now to guarantee this will not happen -- perhaps Onondaga and Oswego counties could offer those residents within that 5 mile radius of this plant a small gesture to recognize the contribution they have made to their communities for many years, and the upcoming inconveniences many of us will be dealing with for years to come if this plant is built -- and who are gaining basically nothing positive from the plant's construction.

The gesture? Once shovels go into the ground, and the project actually begins, the assessments on all properties within that 5 mile radius will be capped at the current level as of that date, with NO increases made by the assessors in these areas until the property at some future date is sold, and the property could then be re-assessed. This does not seem an insurmountable task or cost to the 2 counties for assessors to determine what residents fall within this 5 mile radius, and offer a simple, written agreement to these residents that their assessments will not be raised until the house would be sold to a new owner at some future date.

It appears Micron is moving full speed ahead because of the powerful forces at play who want it to happen. If this plant does materialize, the small gesture of no raise in assessments for residents in that 5 mile radius will make those of us who have made upstate NY our home for years with no plans to leave, help us feel we, too, are valued instead of invisible and unimportant.

And, if the foul odor/smell issue materializes here as well, we will at least be given something for what will end up being a major inconvenience and degradation to our way of life in our own homes, as well as a potential devaluation of our home's value as an unpleasant side effect of compromised foul air quality we can then do nothing about.

The requests in this letter are twofold:

1. Ensure that there is independent, reliable, ongoing and fact-based evaluation, and determination of the impact the Micron plant will have related to foul odor issues within the 5 mile radius, with solutions identified, implemented and closely monitored, designed to prevent these issues from ever happening.
2. Keep the assessments of those within the 5 mile radius of this plant at the exact amount they are on the date the first shovel goes into the ground.

And finally, to those who are in favor of this project, and do not live anywhere near where the plant will be, ask yourselves this one question: What would you make sure happened with this potential odor/foul air/smell issue -- aside from all of the other environmental and other related negative issues surrounding the plant's construction and operation -- if any of YOU were one of the residents living within that 5 mile radius, as that Micron executive made sure was avoided for their own family.

Thank you.

Chris Egan, 109 Barton Road, Pennellville, NY

**To:** chipsnepa@chips.gov  
**Subject:** [EXTERNAL] Micron DEIS Public Comments

---

Hello,

Please find a list of my concerns and recommendations:

### **1. Regional Growth and Infrastructure**

**Recommendation:** Proactively coordinate with local government and regional planning authorities to ensure infrastructure (transportation, housing, healthcare, schools) scales responsively with workforce growth.

**Rationale:** Unplanned rapid growth can strain public services, degrade quality of life, and increase traffic congestion and pollution.

### **2. Water Quality and PFAS Management**

**Recommendation:** Explicitly commit to deploying state-of-the-art PFAS treatment technologies such as UV-photochemical degradation or similarly effective advanced oxidation processes capable of >99.99% PFAS destruction.

Implement comprehensive water monitoring programs for PFAS and other emerging contaminants in groundwater, surface water, and treated effluent with transparent public reporting.

If environmental laws are weakened in the future, pledge to maintain no less than the laws in place at the beginning of this study, and exceed these standards.

**Rationale:** PFAS contamination poses severe long-term health risks including cancer and endocrine disruption; early adoption of the best available treatment ensures regional water safety.

### **3. Greenhouse Gas Emissions & Carbon Management**

#### **Recommendation:**

Set clear, quantitative short-term and long-term GHG reduction targets aligned with regional climate goals (e.g., net-zero by 2050).

Incorporate embodied carbon accounting into project decision-making with binding reduction goals using low-carbon materials and circular economy principles.

Prioritize on-site renewable energy generation and explore opportunities for carbon offset projects within the region (e.g., reforestation).

Energy demand will increase costs regionally.

**Rationale:** Transparent carbon targets enable accountability; embodied carbon often represents a significant share of total project emissions.

#### **4. Sustainable Architecture and Regenerative Design**

**Recommendation:** Mandate third-party green building certifications (e.g., LEED Platinum or equivalent) for all new construction phases.

Design the building to Passive House standards.

Integrate regenerative landscaping that supports biodiversity, improves stormwater management through natural filtration, and enhances urban heat island mitigation via extensive tree canopy coverage.

Design buildings for adaptability, allowing future retrofits that reduce energy demand or accommodate alternative uses.

Limit exterior lighting/use only dark-sky compliant lights.

**Rationale:** Sustainable design improves occupant health, reduces operational costs, and enhances ecological resilience.

#### **5. Air Quality**

**Recommendation:** Institute rigorous air quality monitoring during construction and operation phases focusing on particulate matter (PM), volatile organic compounds (VOCs), nitrogen oxides (NOx), and other pollutants linked to semiconductor manufacturing.

Adopt best available control technologies (BACT) for emissions abatement including scrubbers or filters as necessary.

**Rationale:** Semiconductor manufacturing can emit hazardous air pollutants; protecting air quality safeguards respiratory health of workers and nearby communities.

#### **6. Community Health & Environmental Justice**

**Recommendation:**

Engage local communities continuously through transparent communication channels to address concerns related to noise, traffic, pollution, and employment opportunities.

Conduct cumulative impact assessments focusing on vulnerable populations disproportionately affected by industrial development.

**Rationale:** Inclusive engagement fosters social license to operate; environmental justice considerations prevent exacerbation of existing disparities.

## **7. Waste Management**

**Recommendation:** Implement comprehensive waste minimization protocols emphasizing hazardous waste reduction, recycling programs, and safe disposal practices for semiconductor-specific chemicals including solvents and acids.

**Rationale:** Proper waste handling reduces contamination risk to soil, water, and public health

## **8. Biodiversity Impact Assessment**

### **Recommendation:**

Conduct comprehensive, up-to-date biological surveys covering all seasons to identify sensitive habitats and presence of endangered, threatened, or candidate species within the project footprint and adjacent areas.

Include aquatic as well as terrestrial ecosystems in assessments.

## **9. Habitat Loss and Fragmentation**

### **Concerns:**

Land development can lead to habitat destruction and fragmentation, adversely affecting wildlife movement corridors and ecosystem connectivity. This reduces biodiversity resilience and can isolate populations of sensitive species.

### **Recommendation:**

Minimize the project's spatial footprint through compact site design and clustering of facilities. Minimize parking lots.

Preserve existing natural habitats, especially mature woodlands, wetlands, and riparian zones. Implement buffer zones around sensitive habitats to reduce edge effects.

## **10. Protection of Endangered and Sensitive Species**

### **Concerns:**

Potential disturbance or displacement of listed endangered or threatened species during construction or operation phases could occur without adequate mitigation.

### **Recommendation:**

Develop and implement species-specific avoidance and minimization plans in consultation with state wildlife agencies and U.S. Fish & Wildlife Service.

Schedule disruptive activities outside critical breeding or migration periods where feasible.

Use exclusion fencing or wildlife crossings where infrastructure intersects known animal pathways.

## **11. Habitat Restoration and Enhancement**

### **Opportunity:**

The project offers potential for regenerative design approaches that support local biodiversity recovery post-construction.

**Recommendation:**

Commit to restoring disturbed lands using native plant communities adapted to local ecological conditions.

Enhance onsite green spaces with pollinator-friendly plants and habitat features such as bird boxes or amphibian ponds.

Incorporate stormwater management systems that mimic natural hydrology (e.g., bioswales, constructed wetlands), which support aquatic organisms.

**12. Monitoring & Adaptive Management**

**Recommendation:**

Establish long-term biodiversity monitoring programs to track effectiveness of mitigation measures, detect unforeseen impacts early, and adapt strategies accordingly.

**To:** CHIPSNEPA@chips.gov  
**Subject:** [EXTERNAL] Micron Project, Clay NY

To Whom it may Concern:

With the very unfortunate loss of ~400 acres of woodland/forest to make way for this project, please attend to the following:

1. Allow time and pathways for wildlife species to exit the area as removal progresses. Assist smaller species (including amphibians, reptiles). Begin after migratory birds including songbirds have exited the area. Please do not work at night creating light pollution.
2. Professionally log the area first to recoup the highest value possible from wood and consider reinvesting these funds in habitat restoration and reforestation.
3. Replace trees exceeding carbon capture value for carbon capture value. Not simply the numeric number of trees. The environmental value of a tree is related to its maturity and it takes many young trees to replace the value of a mature tree.
4. Do even better on wetlands offsets/replacement.
5. Be the best and most forward looking environmentally conscious company you can be: make us all proud in this region, be a leader. You can never go wrong with that and it will in fact pay even profit dividends to your company for doing so.

Thank you for your serious consideration.

Sincerely,

Christina M. Fadden

**ATTN: Micron Project; Draft Environmental Impact Statement for Micron Semiconductor Manufacturing Project, Clay, NY**  
**RE: Draft Environmental Assessment EISX-006-55-CPO-001**

Dear Members of the CPO and OCIDA,

Thank you for your consideration of the Sierra Club Atlantic Chapter's comments on the Micron Project located in Clay, NY. We are a volunteer-led environmental organization with over 600,000 members nationwide, including over 40,000 members in New York state, all dedicated to protecting New York's air, water and remaining wild places.

We recognize that the semiconductor industry supports critical facets of modern life: these are the microchips and semiconductors that are going to be in our electric cars, our smart grids, and will help us achieve our 21st century solutions, in the post-fossil fuel consuming society we are trying to build towards.

For these reasons, we have the opportunity to make sure that we lead by example at this facility. This is the perfect opportunity for the semiconductor industry and Micron to focus on the idea of a circular economy - for the businesses to take into account the full lifecycle of these products - from idea conception to disposal. To demonstrate to the larger

semiconductor industry that there is indeed room for good actors and that the environmental community, labor, etc can all work together with industry to create a model for 21st century solutions. We are hoping that with our comments on the DEIS, we can help in addressing concerns now, and are not dealing with mass clean ups and mitigating contamination 10- 20 years in the future.

While we are grateful for the Federal and State DEIS processes that have allowed the opportunity for public comment and feedback on this massive project, we do not feel that the 46-day comment period afforded for public comment is in any way sufficient. The proposed project, as described in the 20,000-page DEIS, will affect nearly every aspect of life in central New York and, for some aspects like greenhouse gas (GHG) emissions, across the planet. The Sierra Club supported the effort to extend the comment period to at least 120 days, and are disappointed that this extension was not granted. This project is massive and the impacts to the community (and beyond) will be vast. We hope the lead agencies will take this all into consideration while reviewing comments, and recognize that the comment period was inadequate to capture the breadth of stakeholders and citizens with serious concerns.

There are several areas where the Sierra Club believes the DEIS did not provide enough information on the subject matter discussed. Additionally, the DEIS is lacking in areas where the mitigation measures are not strong enough to address the impacts to the environment in which they will be disruptive. Further, it is well within the province of NEPA and SEQR to consider foreseeable direct and indirect impacts as well as cumulative impacts. This has long been understood as part of the obligation of review.<sup>1</sup>

For these reasons, our comments address the following areas:

- I. Scope of Alternatives Identified in the EIS
- II. Energy and Energy-Related Climate Impacts
- III. Failure to Identify Chemicals & Quantities
- IV. Catastrophic Impact Due to Spill, Leak, or Equipment Failure
- V. Per- and polyfluorinated Alkyl Substances (PFAS)
  - A. Types of PFAS used in semiconductor industry
  - B. Treatment of PFAS in wastewater
- VI. Commercial Solid waste
- VII. Wastewater sludge
- VIII. Hazardous waste
- IX. Effects of chemical waste and other transport on traffic volumes
- X. Air pollution
  - A. NAAQS and Hazardous Air Pollutants
  - B. Incineration of perfluorinated compounds (PFCs) and related gases

---

<sup>1</sup> See [Ctr. for Biological Diversity v. Salazar, 695 F.3d 893, 916-17 \(9th Cir. 2012\)](#); [Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 350 \(1989\)](#).

- XI. Addressing the Wetland Concerns at the Site
- XII. Climate and Pollution Impacts Embodied in Construction Materials

Again, we thank you for the opportunity to comment on this project.

### **I. Scope of Alternatives Identified in the DEIS**

The DEIS defines the Preferred Action as the construction of four fabrication facilities (“fabs”). However, the CHIPS funding for the project actually only pertains to the construction and outfitting of two fabs. Moreover, the Scoping Document for this project considered two “build” alternatives:

- 1) Full construction and operation of four fabs over an approximately 20-year period
- 2) Reduced Scale: construction and operation of two fabs over a shorter period.

The Reduced Scale alternative is not considered in the DEIS, based on a stated need for Micron to produce 52,000 wafers per week. However, just prior to the release of this DEIS for public comment, Micron announced plans to build a second fab at its Idaho facility and a new plant on its Manassas, Virginia site. (Jun 12, 2025). *Micron Announces Second Fab*, BoiseDev, <https://boisedev.com/news/2025/06/12/micron-boise-second/>). Given this significant production expansion by Micron, the 52,000 wafer per week production goal may be met in other ways, allowing for Micron to consider a scaled-down version of its Clay facility. Many of the environmental impacts—water pollution, air emissions, generation of solid waste, consumption of energy—are proportional to the size of the facility. Thus, alternative projects of two or three- fab can and must be considered in the DEIS.

The [SEQR Handbook](#) (NYSDEC, 2020) offers the following answer to the question: When is it appropriate to include a discussion of alternative scales or magnitudes of action in an EIS?

Consideration of alternative scales or magnitudes may be reasonable under the following circumstances:

1. Some or all potential impacts of the action can be avoided or reduced by a change in project size,
2. The change in project size does not reduce the project to the point where it will no longer serve its intended function; for example, a communication tower may require a minimum height for effective operation; or
3. The reduction in project size may decrease potential profit but does not make the project infeasible.

Items (1), (2) and (3) are all true for this project: a smaller project will reduce environmental impacts; a facility with fewer fabs will be able to produce tens of thousands of wafers per week; and a smaller project may reduce profits but does not make the project infeasible.

## II. Energy and Energy-Related Climate Impacts:

### 1. The Energy Commitments in the DEIS Are Inconsistent with Those in Micron’s Term Sheet Agreement

There is a significant inconsistency between the commitments made by Micron as reflected in the Term Sheet and the discussion in the DEIS. In September 2022, Micron signed a Term Sheet agreement with Empire State Development, Onondaga County, and OCIDA. According to the Term Sheet, among other agreements, Micron committed to negotiating a Clean Energy and Sustainability Action Plan that will “at minimum” “require Micron to [u]tilize 100% renewable energy for electricity by 2025 in its New York Fab Complex operations, which may include but not necessarily be limited to the use of renewable energy credits, and maintain that renewable energy for electricity supply for the duration of the Term.”<sup>2</sup> The DEIS, by contrast, explains that “Micron would commit to purchasing 100% carbon-free electricity utilizing power purchase agreements and renewable energy credits (RECs).”<sup>3</sup>

The distinction between “renewable” and “carbon-free” is material. Resources that qualify as “renewable” under New York’s Climate Leadership and Community Protection Act are zero emissions.<sup>4</sup> By contrast, resources that are “carbon-free” are not necessarily renewable. Most significantly, while nuclear energy results in no emissions at the point of electric generation, it is neither renewable nor environmentally benign.

If Micron is seeking to modify the Term Sheet to allow supply of electricity from nuclear, the EIS for the project must consider the additional environmental impacts that would entail. Environmental impacts from nuclear energy are laid out in a Red Paper by the Onondaga Nation, Haudenosaunee Environmental Task Force, and American Indian Law Alliance<sup>5</sup> and in comments submitted by the Sierra Club regarding NYSERDA’s Draft Blueprint for Consideration of Advanced Nuclear Technologies.<sup>6</sup> These include the adverse human health and environmental impacts of uranium mining and processing, water consumption, and waste disposal, as well as a range of safety risks. As detailed in the Red Paper, *in-situ* leach mining of uranium has resulted in spills and leaks of contaminated fluids and full clean-up and remediation has proven impossible.<sup>7</sup> Cooling has multiple adverse environmental impacts including massive water withdrawals — an estimated 13.3 million gallons of water per year from Lake Ontario for Nine Mile Point units 1 & 2 and

<sup>7</sup> Red Paper at 16-17.

Fitzpatrick<sup>8</sup>—as well as impinging and entraining hundreds of millions of organisms,<sup>9</sup> and discharging heated water into cold water ecosystems, disrupting the ecological balance.<sup>10</sup>

Additionally, if Micron is contemplating nuclear energy to power its chip fabrication facility, it must consider the time frame for nuclear development and interim power needs. The timeline for the only recently completed nuclear reactor in the United States—Plant Vogtle—was 15 years, and NuScale recently terminated its Small Modular Reactor (SMR) project in Utah after nine years despite hundreds of millions in Department of Energy subsidies.<sup>11</sup> Given these protracted development timelines, the EIS must address the interim power supply and the environmental impacts of those generation resources.

## **2. The DEIS Fails to Consider the Project’s Impact on New York’s Attainment of Its Statutory Renewable Energy Mandates, Which Is Not Advanced by Micron’s Proposed Purchase of RECs**

Under the CLCPA, by 2030, a minimum of 70% of the statewide electric generation secured by jurisdictional load serving entities to meet the electrical requirements of end-use customers in New York state “shall be generated by renewable energy systems,”<sup>12</sup> en route to achieving statewide greenhouse gas emission reductions of at least 85% below 1990 levels by 2050.<sup>13</sup> As discussed in the New York Public Service Commission’s order on the Biennial Review of the state’s Clean Energy Standard, New York has a considerable distance to go in achieving the 70% renewable energy by 2030 mandate. As of 2022, renewable and zero emission electric generation comprised only 46.1% of statewide load.<sup>14</sup> The state’s ability to reach 70% renewables has been challenged by a number of factors including global interest rates, inflation, and supply chain pressures, transmission system inadequacies, interconnection delays, changes to capacity accreditation at the New York Independent System Operator, changes in federal incentives, siting complexities, and growing statewide electric load.<sup>15</sup>

Micron represents a massive new electricity demand in New York State and will further impede the state’s efforts to achieve 70% renewable energy by 2030. Total retail electricity sales in 2023 were 139,422 GWh,<sup>16</sup> meaning that Micron’s 15,673 GWh represents 11.2% of New York’s total electricity consumption. Adding a new single electricity

<sup>16</sup> EIA, New York Electricity Profile 2023, <https://www.eia.gov/electricity/state/newyork/>

load that will increase New York electricity consumption by over 11% has significant implications for the achievement of New York's attainment of its climate and clean energy legal mandates that must be considered. Indeed, the state would need to contract for an additional 10,971 GWh of renewable energy—70% of Micron's anticipated 15,673 GWh of demand—to comply with the state's renewable energy mandates. Yet the DEIS fails to discuss or address the environmental impacts of this additional energy development burden.

Micron's proposed use of unbundled RECs to mitigate greenhouse gas emissions from the facility's operations<sup>17</sup> fails to address or ameliorate the facility's adverse impacts on achievement of New York's renewable energy mandates. A Renewable Energy Credit, or REC, is a "market-based instrument that represents the property rights to the environmental, social, and other non-power attributes of renewable electricity generation."<sup>18</sup> Each REC corresponds to the attributes associated with one megawatt-hour (MWh) of electricity that is generated and delivered to the electricity grid from a renewable energy resource.<sup>19</sup> Micron's purchase of RECs, without the accompanying clean energy, does not contribute to New York's achievement of the 70% renewable energy mandate, as it fails to increase statewide electric generation secured by jurisdictional load serving entities.<sup>20</sup> Indeed, based on its commitment, Micron could purchase RECs from out-of-state facilities that have no ability to serve New York load.

But as discussed above, even if Micron purchased bundled RECs from renewable energy resources delivering to New York, to the extent those RECs and energy were from existing renewable energy resources that New York was already counting toward attainment of the 70% renewable energy mandate, the Micron facility would still be exacerbating the state's clean energy challenges, compelling New York to develop yet more renewable energy resources to serve the state's existing load.

### 3. The DEIS Impermissibly Understates Scope 2 Emissions

To calculate Scope 2 (indirect) GHG emissions, the DEIS states that Micron utilized the facility's estimated electricity consumption (15,673.83 GWh) and the applied GHG emission factors to this energy use "based on New York State electrical emission rate factors obtained from USEPA's Emissions and Generation Resource Integrated Database (eGRID)."<sup>21</sup> This approach is flawed. Calculating Scope 2 emissions for a new massive source of load based on eGRID emission rates—which represent the average emissions intensity of the local grid—misstates the emissions impact of adding the Micron facility. Instead, marginal emission rates must be utilized, and produce results that are multiple times higher than Micron estimates.

---

<sup>17</sup> DEIS at 0-9.

<sup>18</sup> U.S. EPA, Renewable Energy Certificates (RECs), <https://www.epa.gov/green-power-markets/renewable-energy-certificates-recs>.

<sup>19</sup> *Id.*

<sup>20</sup> See P.S.L. § 66-p(2)(a).

<sup>21</sup> DEIS at 3-203.

As EPA explains on the eGRID Power Profiler, the eGRID emission rates represent “average” emission rates for a subregion<sup>22</sup>—i.e., an emission rate that averages all sources of generation in the subregion that operate at any time. But the Micron facility will not be drawing *average* power from the grid. It is a massive *new* load and therefore will be drawing incremental (marginal) power. Consequently, the emission factor associated with serving the new electric load is that of the *marginal* unit, not that of the average unit, as the New York Public Service Commission recently affirmed.<sup>23</sup>

This distinction is critically important because the Upstate New York (NYUP) subregion has large amounts of hydropower (32.9% of fuel mix) and nuclear energy (32.3% of fuel mix),<sup>24</sup> which dramatically lowers the subregion’s average emissions intensity. But nuclear and hydropower typically operate as baseload resources, dispatching before fossil (gas) units. Gas is routinely the marginal fuel in New York,<sup>25</sup> including when the marginal unit is located in Central New York (Zones B, C, and E), where the Micron facility would be located.<sup>26</sup>

DEIS Table 3.7-11 shows emissions from electricity usage of 2,273,587 metric tons of CO<sub>2</sub>e using a 100-year global warming potential (GWP).<sup>27</sup> Assuming this figure is based on electricity consumption of 15,673.73 GWh, the emissions correspond to an assumed emission rate of 290.1 lb/MWh.<sup>28</sup> Scope 2 GHG emissions based on marginal rather than average emission rates would be multiple times higher than the Micron’s estimates. According to EPA’s 2023 eGRID data, the “nonbaseload” (marginal) CO<sub>2</sub>e emission rate for the Upstate New York region (NYUP) is 911.8 lb/MWh.<sup>29</sup> Replacing Micron’s 290.1 lb/MWh with the eGRID marginal emission rate increases projected CO<sub>2</sub>e Scope 2 emissions from 2,273,587 metric tons per year to 6,484,300 metric tons per year<sup>30</sup>—more than 4 million metric tons per year higher and nearly 3 times greater than Micron estimates.

It bears note these massive Scope 2 emissions are not offset in any material way by the 4 MW of solar panels Micron proposes to install. While Sierra Club is supportive of efforts by Micron to develop solar and other renewable resources to mitigate impacts from the facility, Micron calculates that its 4 MW would offset 503 metric tons/year of CO<sub>2</sub>e,<sup>31</sup>

<sup>31</sup> DEIS at 3-205 (using 100-year GWP).

which represents 0.0078% of the facility's Scope 2 emissions. As discussed above, while Micron has committed to source its electricity from carbon-free resources, it proposes to allow this to be achieved through the purchase of RECs. But use of unbundled RECs does not ensure that the generation is new or incremental. Consequently, use of marginal emissions is appropriate.

### **III. Failure to Identify Chemicals & Quantities.**

The DEIS needs to include far more details about what chemicals are being used by Micron. New York State has issued regulations specifying the content of an adequate EIS. NYCRR 617.9 (b)(1) states " An EIS must assemble relevant and material facts upon which an agency's decision is to be made. It must analyze the significant adverse impacts and evaluate all reasonable alternatives." The DEIS fails to meet this standard.

The CHIPS and Science Act and the New York GREEN CHIPS Law, at best, should be public-purpose industrial policies that serve a clear public good rather than simply subsidize multinational corporations. To that end, the CHIPS and Science Act includes numerous research, development, and demonstration programs meant to boost public health and reduce environmental impacts in chips manufacturing communities like Onondaga County.

Among these federally-funded research programs are the Perfluoroalkyl and Polyfluoroalkyl Substances Reduction and Innovation in Semiconductor Manufacturing program, administered by the National Semiconductor Technology Center, and the CHIPS AI/AE for Rapid, Industry-informed Sustainable Semiconductor Materials and Processes funding opportunity, which is administered by NIST. These two federally funded programs are meant to track and monitor harmful chemicals across the chips manufacturing process and to identify less harmful chemical substitutes that can be readily adopted by industry to protect communities, workers, and the environment.

By failing to disclose the numerous chemicals—especially the many types of PFAS compounds that will likely be used at the Clay facility, Micron and the overall community will be unable to avail themselves of innovative findings emerging from federal research programs. The federal research programs exist to correct deficiencies in the present chipmaking process. Those deficiencies will persist if Micron and the final EIS fail to acknowledge shortcomings.

Table 3.8-9 lists various hazardous chemicals: flammable gases, pyrophoric gases, corrosives, toxic gases, oxidizers, asphyxiants, flammable liquids, and water reactive substances.<sup>32</sup> (Pyrophoric chemicals spontaneously catch fire when exposed to air.) The DEIS needs to list the identity and quantities of these chemicals to properly define health and safety risks for both workers and the surrounding community. Moreover, the environmental impacts of a sudden release of hazardous chemicals can only be assessed if the identity and quantities of chemicals transported to and stored at the facility are given in the EIS.

---

<sup>32</sup> DEIS at 3-242.

The Programmatic Environmental Impact Statement for Modernization and Expansion of Existing Semiconductor Fabrication Facilities offers an example of the level of detail needed in an EIS for a semiconductor fab, whether new or existing.<sup>33</sup> Appendix D of that document includes ten pages listing approximately 200 “representative” chemicals used by the semiconductor industry. All of these are listed under the Toxic Substances Control Act (TSCA). NIST also offers specific information regarding hazardous chemicals used by the chips industry in Table 3.8-2, shown on the next page.<sup>34</sup>

In contrast, the DEIS lists *only* eight chemicals (ammonium hydroxide, anhydrous ammonia, hydrogen, hydrogen chloride, silane, chlorine, dichlorosilane, and HF) which meet the narrow definition of “extremely hazardous substances” above applicable threshold quantities given in 40 C.F.R. § 68.130.<sup>35</sup> Fewer than ten other chemicals are mentioned on pages 3-237 and 3-239. This is completely inadequate for the agencies to analyze the significant adverse impacts. All of the chemicals used by Micron in its manufacturing process must be identified and approximate quantities provided.

Table 3.8-10 illustrates the inadequacy of the chemical information in the DEIS. This table, titled Hazardous Materials, reveals that 13.5 million gallons of “Liquid corrosives” will be stored at each fab.<sup>36</sup> What type of corrosives? Sulfuric acid is a liquid corrosive. So is a solution of ferric chloride. These pose completely different types of risk and environmental impacts. Again, all chemicals used must be identified so that adequate storage and mitigation risks can be identified.

We have the same question for all other categories of chemicals, especially the 94,600 pounds of toxic gases stored at each fab. How toxic are these “toxic gases”? It is well established that the chips industry uses deadly gases like arsine, phosphine and nitrogen trifluoride (see e.g. NIST 2024, Table 3.7-1). The DEIS needs to specify how much of these gases will be stored on site, and how they will be handled, to meet the requirements of NYCRR 617.9 (b)(1).

| Chemical Category                            | Use(s)                                                                                                                                                                                       | Process Chemical                                                                           | Hazard Class                       |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|------------------------------------|
| Aqueous solutions (commonly acids and bases) | To wet-etch or clean the surface of the wafer; as part of the photolithography process.                                                                                                      | Hydrochloric acid, HF, sulfuric acid, nitric acid, ammonium hydroxide, potassium hydroxide | 8 Corrosive Material               |
|                                              |                                                                                                                                                                                              | Ammonium fluoride                                                                          | 6.1 Poisonous Materials            |
|                                              |                                                                                                                                                                                              | Hydrogen peroxide                                                                          | 5.1 Oxidizer                       |
| Specialty gases                              | As precursors to deliver a substance such as arsenic or tungsten onto the wafer or into the silicon lattice (used in small quantities); to dry-etch a pattern onto the surface of the wafer. | Silane                                                                                     | 2.1 Flammable Gas                  |
|                                              |                                                                                                                                                                                              | Ammonia, nitrogen trifluoride, sulfur hexafluoride                                         | 2.2 Non-Flammable Compressed Gas   |
|                                              |                                                                                                                                                                                              | Ammonia, phosphine, tungsten hexafluoride, arsine, CO, fluorine, chlorine, diborane        | 2.3 Poisonous Gas                  |
| Organic compounds (commonly solvents)        | As constituents in specialty chemicals; to clean the wafer; as part of the photolithography process.                                                                                         | Isopropanol, xylene, propylene glycol ethers, acetone                                      | 3 Flammable and Combustible Liquid |
| Metallic compounds                           | Applied to the wafer in specific locations to create transistors; to plate wafers to provide electrical connections.                                                                         | Copper sulfate                                                                             | 9 Miscellaneous Hazardous Material |

Sources: ISMI, 2006; 49 C.F.R. Part 172; EPA, 2022a.

#### **IV. Catastrophic impacts due to spill, leak, or equipment failure.**

There is very superficial discussion about spills, accidental releases and system upsets that can result in contamination of building interior spaces, the underlying soil, the groundwater and surface water. It is clear even from the limited information about stored chemicals given in Table 3.8-10 that large quantities of chemicals will be stored at the site. The table lists these categories of hazardous liquids (rounded to nearest 1000 gallons):

- Acidic Solutions: 172,900 gallons/fab x 4 fabs = 692,000 gal
- Caustic Solutions: 82,300 gallons/fab x 4 fabs = 329,000 gal
- Liquid Corrosives: 13.5 million gal/fab x 4 fabs = 52 million gal
- Flammable liquids: 121,900 gallons/fab x 4 fabs = 488,000 gal
- Peroxide: 124,000 gallons/fab x 4 fabs = 496,000 gal

In addition, the DEIS states that the “Micron Campus would have an aggregate aboveground oil or petroleum product storage capacity of approximately 1.55 million gallons, which would store diesel, gasoline, lubricating oil, hydraulic fluid, ...” and several minor types of oils.<sup>37</sup>

Altogether, over 55 million gallons of hazardous liquid chemicals and petroleum products would be stored on site once the four fabs are completed and operational. Of course these chemicals are not simply stored. They must be transported to the site, transferred into storage tanks, or loaded into drum storage space; distributed to manufacturing areas; and dispensed as needed. Wastes need to be collected, containerized, and properly recycled, treated, and/or shipped off-site for disposal.

The DEIS states that groundwater contamination is not an issue during construction, asserting the “Micron would implement a SWPPP and SPCC/SPR [Spill Prevention Control and Countermeasure Plan and Spill Prevention Report] to reduce the risk of accidental releases, leaks, or spills of materials such as concrete, oil, fuel, lubricants, or hydraulic fluids during construction and provide for immediate containment and cleanup of any release.”<sup>38</sup> The same language is applied to operations at the facility: “Micron also would be required to implement SWPPP and SPCC/SPR Plan measures to reduce the risk of accidental releases, leaks, or spills during facility operations and provide for immediate containment and cleanup of any release.”<sup>39</sup> But accidents and spills do not necessarily go according to plan and containment is never “immediate.” The DEIS needs to assess the actual risks of spills, especially given the fact that large quantities of chemicals are being transported to the facility, and large quantities of waste chemicals are being transported away from the facility.

While the quantity of chemicals used is not given in the DEIS, it is possible to estimate it using literature values. Kim *et al.* researched two factories in Korea which produce memory chips (NAND and DRAM), the same product that Micron will make in its Clay facility. They calculated chemical usage rates of 4.26 and 8.3 ton/year per employee. Micron aims to employ approximately 9000 workers when all four fabs are operating. Applying the published factors, we estimate between 38,000 and 75,000 tons of chemicals will be delivered to the Micron facility per year, once the four-fab complex is fully operational in 2041. This means that, roughly, 100 - 200 tons of chemicals are delivered to the facility every day, 365 days/year.<sup>40</sup>

The DEIS indicates that “Chemicals would be delivered to the Micron Campus by truck ... using a variety of packaging and containment methods, including tanks, drums, and pallets... Micron would contract with carriers and shippers of hazardous materials that maintain 24/7 emergency response support in the event of hazardous materials spills...”<sup>41</sup> Trucks will be travelling on highways, competing with construction vehicles, employee vehicles, delivery vehicles, and vehicles of Clay and Cicero residents. The risk of accidents on

---

<sup>37</sup> Id., 242, 244.

<sup>38</sup> Id., 3-80.

<sup>39</sup> Id., 3-86.

<sup>40</sup> Kim, J. C. Yoon, S. Ham *et al.* (2018) “Chemical use in the semiconductor manufacturing industry” *INT’L J. OF OCCUPATIONAL AND ENVIRONMENTAL HEALTH*. VOL. 24, NOS. 3-4, 109-118

<sup>41</sup> Id., 3-243

these congested roadways is relatively high. We raise serious concerns about the response time for a chemical spill. How long would it take for a national chemical carrier to respond to an accident involving a spill? What kinds of spills are they equipped to handle? These concerns, which are central to the evaluation of environmental risks, do not appear to be addressed in the DEIS.

Micron can substantially reduce risks to human health and the environment by shipping the bulk of its chemical supplies by rail. It does not appear that this mitigation of spill risk has been considered, even though the DEIS recognizes the superior safety of rail transport: “Freight rail accidents occur at a much lower rate than truck accidents (3.6 versus 11 fatalities per 10 billion ton-miles), freight rail-related non-fatal accidents are one-fifth that of truck accidents, and rail accidents that cause property damage are 62 times less frequent compared to truck accidents (OneRail, 2016).”<sup>42</sup>

The DEIS recognizes the susceptibility of the local groundwater to contamination in Section 4. CUMULATIVE EFFECTS. On p. 4-16 it states: “It can be assumed that planned residential, industrial, and transportation development, along with the implementation of the Proposed Action and Connected Actions could reasonably ...[lead to] the increased risk of groundwater exposure to pollutants from spills or leaks, or from contaminated stormwater runoff.” The DEIS notes further that “surficial aquifers are *highly permeable* and could become contaminated from overlying *spills, leaks, or infiltration*, and *carbonate aquifers can transport groundwater long distances through solution openings, potentially transporting contamination on a regional scale*. Ultimately, depending on the severity of potential groundwater exposure to contaminants, *impacts could be significant and widespread.*” (emphasis added)

But the DEIS does not address, in any substantive way, the potential for spills, leaks and infiltration from the operations at the Micron facility to contaminate the local groundwater, and for that groundwater to transport contaminants long distances. Fox Professional Geology PLLC (2025) asserts in comments submitted regarding this Proposed Action that “The Micron Campus is located directly over a highly productive karst bedrock aquifer.” Fox observes that “The presence of karst features on, beneath, and near the Micron Campus, including closed circular depressions and solution-enlarged joints and fracture zones, requires careful and thorough consideration, evaluation, planning, and monitoring to facilitate protection of human health, built structures, water quality, and the environment.” We agree with Jon Fox that this level of analysis has been regrettably omitted from the DEIS, and that it needs to be incorporated.

## **V. Per- and polyfluorinated Alkyl Substances (PFASs)**

### **A) Types of PFAS Used in the Semiconductor Industry**

Per- and polyfluoroalkyl substances (PFAS) constitute a large class of over 15,000 fluorinated chemicals that have gained notoriety due to their persistence, their ability to accumulate in the bodies of human beings and wildlife, and their toxicity. The DEIS language

---

<sup>42</sup> DEIS at p. 3-255

on PFAS “forever chemicals” is vague and general, providing no information about the types of PFAS to be used and/or discharged from the facility. In contrast the CHIPS Program Office in its 2024 *Final Programmatic Environmental Assessment for the Modernization and Expansion of Existing Semiconductor Fabrication Facilities* contains considerable detail about the use of PFAS in wafer fabrication. Appendix C of that document includes a 10-page table listing the numerous types of PFAS used by the semiconductor industry.<sup>43</sup> The DEIS must be revised to include far greater detail about the types and quantities of PFAS used in the Micron fabs.

Regulation of PFAS has not kept pace nor caught up to the reality that hundreds of types of PFAS are employed in modern chips manufacturing. Most regulations are focused on just two types of PFAS: perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS). The state of New York and USEPA have issued drinking water standards only for these two types of PFAS.<sup>44</sup> NY state has also issued drinking water quality guidelines for only PFOA and PFOS.<sup>45</sup>

However, these types of PFAS are no longer used by the chips industry. As noted in the CHIPS PEA (2024; p. C-15), “Long-chain PFAS compounds, such as PFOS, have been replaced by short-chain PFAS. Another long-chain PFAS, PFOA, was phased out in the United States by 2015 and is projected to be eliminated globally by 2025 (EPA, 2022; WSC, 2023).”

The DEIS (p. 3-240) says Micron will request “detailed chemical constituent documentation from its chemical vendors, including PFAS content, which often requires the use of non-disclosure agreements to obtain such information.” Non-disclosure is not acceptable - and we would argue is even unlawful. The public has a right to know the identity of hazardous substances used and released in their communities. The DEIS needs to specify how much of these highly toxic chemicals will be stored on site, and how they will be handled, to meet the requirements of NYCRR 617.9 (b)(1).

## B) Measurement and Treatment of PFAS in Wastewater

Wastewater generated at Micron’s facility will be treated in a pre-treatment system on the Micron campus, and portions thereof sent to a specialized facility owned and operated by Onondaga County: “Industrial wastewater generated on the Micron Campus that is not treated at the campus for reuse would be sent as secondary residual wastewater via the wastewater conveyance to the Industrial Waste Water Treatment Plant (IWWTP) at the Oak Orchard Site. For compliance with ECL Article 17 (6 NYCRR Part 750), the IWWTP would be required to obtain an individual SPDES permit issued by NYSDEC to permit

<sup>45</sup> NYS Dept of Environ. Conservation (2023):  
[https://extapps.dec.ny.gov/docs/water\\_pdf/togs111addendum2023.pdf](https://extapps.dec.ny.gov/docs/water_pdf/togs111addendum2023.pdf)

discharge of treated industrial wastewater into surface waters associated with the Oneida River.”<sup>46</sup>

The DEIS acknowledges that the wastewater sent to the IWWTP will contain PFAS, since the “IWWTP also would include technologies specifically designed to remove emerging contaminants, such as per- and polyfluoroalkyl substances (PFAS), including reverse osmosis and nanofiltration ...granular activated carbon ..., ion exchange resins ... and advanced oxidation processes.... To comply with its SPDES permit for the IWWTP, OCDWEP would be required to perform regular analytical testing of surface water and effluent samples collected using NYSDEC-approved methods and would be subject to ongoing sampling, monitoring, and reporting requirements.”<sup>47</sup>

The DEIS claims that “Based on these measures, industrial wastewater discharges from operation of the IWWTP would not be anticipated to result in significant adverse effects on water resources outside the mixing zone.”

This claim is false for several reasons. First, NYSDEC-approved analytical methods, namely USEPA draft Method 1633, only measures 40 types of PFAS. Research conducted at Cornell University and elsewhere demonstrates that wastewater created by semiconductor manufacturing will contain hundreds of different types of PFAS. Of these, a fraction can be identified using sophisticated analytical techniques such as homologous series detection and the total oxidizable precursor (TOP) assay. The remainder are “dark” or “non-target” PFAS which can constitute a significant fraction of the total mass of PFAS in the wastewater.<sup>48</sup>

Dr. Helbling explained the significance of the “non-target” PFAS in a presentation given at the Healthy Water Solutions conference on May 16, 2024 (Helbling 2024).<sup>49</sup> His research group analyzed wastewater from three full-scale operating semiconductor manufacturers across the U.S. using standard analytical methods, supplemented with techniques to estimate non-targeted PFAS concentration. In the slide, shown below, a large fraction of the total PFAS concentration in the wastewater could not be accounted for using standard methods. In the facility identified as “fab1,” 42% of total PFAS in the effluent (“fab1\_down”) was identifiable. In fab3, 17% of total PFAS in the effluent (“fab2\_down”) was identifiable. In fab2, only 0.5% of the total PFAS (78,700 ng/L) in the wastewater effluent could be identified. As explained in the research paper, fab1 discharges wastewater to a stream and fab2 and fab3 discharge wastewater to publicly owned treatment works. This

<sup>49</sup> Helbling, Damian (2024) “Target and non-target analysis of per- and poly-fluoroalkyl substances (PFASs) in industrial wastewater.” Presented at the New York Center of Excellence in Healthy Water Solutions Annual Conference, SUNY-ESF, Syracuse, NY. May 16, 2024

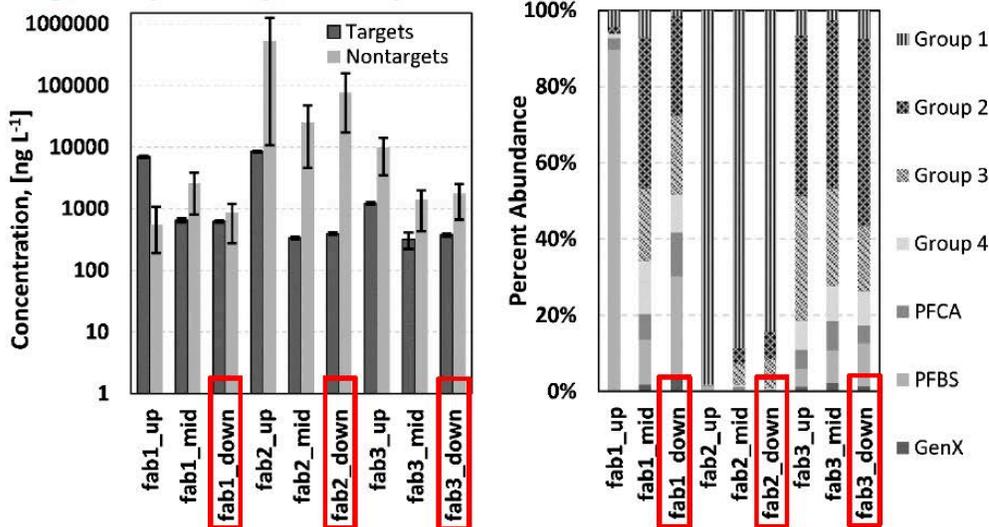

illustrates the inability of conventional analysis, using available chemical standards, to quantify the amount of PFAS in the wastewater discharged from the chips industry.

Given the lack of adequate monitoring of PFAS compounds for Micron’s manufacturing processes, the DEIS must be modified to acknowledge that the environmental impact of PFAS discharges from the facility could very well be significant. As a mitigation measure, we recommend that Micron test its wastewater using a combination of analytical methods which include the whole range of PFAS. Such methods could include TOPS and total adsorbable fluorine and/or total fluorine.

Second, the claim that, by treating the wastewater, that there will be no “significant

### Sum concentrations of nontarget PFAS at point-of-discharge are higher (as expected)

|                      |                  |                   |                  |
|----------------------|------------------|-------------------|------------------|

adverse effects on water resources outside the mixing zone” is based on the false assumption that dilution of PFAS will eliminate their ill effects. Nothing could be further from the truth. PFAS are called “forever chemicals” because they do not break down in the environment. PFAS are known to bioaccumulate in humans, animals, and in some cases, plants.<sup>50</sup> The

<sup>50</sup> ITRC Per- and Polyfluoroalkyl Substances Team (Dec. 2023) notes that “Biomonitoring studies across a variety of organisms, habitats, and geographies show that certain PFAS can accumulate in wildlife and that exposures are occurring on a global scale.”

CHIPS PEA states that “Wastewater discharge from semiconductor fabrication facilities presents a substantial risk for PFAS contamination of the environment.”<sup>51</sup>

The treated wastewater will be discharged to the Oneida River, which merges with the Seneca River to become the Oswego River, which discharges into Lake Ontario. The Onondaga County Water Authority, along with many other water suppliers around this great lake, draws its water supply from Lake Ontario. PFAS which is discharged in Micron’s treated wastewater will eventually contaminate Lake Ontario and potentially the OCWA drinking water supply.

The CHIPS PEA explains that “most facilities send 100 percent of TARC [Top Anti-Reflective Coating] waste to industrial wastewater drains, unless segregated in a separate drain and collection system for disposal.”<sup>52</sup> TARCs currently account for over 50 percent of total PFAS used in photolithographic processes worldwide and thus contribute a large portion of the PFAS found in wastewater discharges.

Micron’s approach to PFAS treatment is also discussed on DEIS page 3-241: “Early evaluations suggest that the most effective wastewater treatment solution for the Proposed Project will involve installation of PFAS segregation technology targeted to the relevant process wastewater streams. Micron’s final design will include wastewater treatment for regulated PFAS-containing wastewater that meets current regulatory requirements under New York and Federal law prior to discharge to the IWWTP.”

We concur with Micron’s plan to segregate their process wastewater streams which contain PFAS. However, to mitigate the serious environmental harms created by discharges of PFAS via wastewater, Micron needs to do more than “meet current regulatory requirements.” As explained above, current regulatory requirements are **not protective of the environment** because they do not address the hundreds of persistent and toxic PFAS found in the semiconductor industry’s wastewater. Micron needs to install at its pre-treatment plant or have installed at the Onondaga County industrial WW treatment plant, state-of-the art treatment technology which completely eliminates the entire range of PFAS compounds. An example of such technology is reverse osmosis, followed by treatment of the concentrated reject stream using advanced oxidation or surface plasma treatment. Removal and destruction of PFAS must be confirmed using sophisticated analytical techniques which are capable of detecting the wide range of PFAS compounds which may be present.

The DEIS states “Micron would dispose of or otherwise manage waste known to contain regulated PFAS in accordance with applicable regulations and as appropriate given its content and characteristics.”<sup>53</sup> Again, current regulatory requirements are **not protective of the environment because:**

---

<sup>51</sup> “Final programmatic environmental assessment for modernization and expansion of existing semiconductor fabrication facilities under the CHIPS Incentives Program,” p. C-15, United States Department of Commerce, National Institute of Standards and Technology CHIPS Program Office, Washington, D.C., 28 June 2024.

<sup>52</sup> Id.

<sup>53</sup> DEIS at p. 3-241.

- There are no categorical limits for PFASs in wastewater discharged by the semiconductor industry
- NYSDEC water quality standards exist only for PFOA and PFOS, ignoring the hundreds of other PFAS compounds commonly found in semiconductor wastewater
- The USEPA has not set water quality standards for any type of PFAS.
- Analytical methods which has been adopted by USEPA, NYSDOH, and NYSDEC fail to quantify the majority of PFAS compounds found in **semiconductor wastewater**

## VI. Commercial Solid Wastes

It is anticipated that the Micron facility would generate substantial amounts of Commercial Solid Waste and wastes that could be potentially recycled. The waste quantities are summarized in Table 3.9-4, shown below:

| Material                                      | Disposal Method <sup>82</sup>                                            | Fab 1  | Fabs 1-2 | Fabs 1-3 | Fabs 1-4 |
|-----------------------------------------------|--------------------------------------------------------------------------|--------|----------|----------|----------|
| <b>Solid Waste</b>                            |                                                                          |        |          |          |          |
| Industrial waste (tpy)                        | Private hauler transport to private industrial waste disposal facilities | 800    | 1,300    | 1,800    | 2,300    |
| Commercial MSW (tpy)                          | Private hauler transport to municipally owned waste disposal facilities  | 15,800 | 25,000   | 34,300   | 43,500   |
| General MSW (tpy)                             | Private hauler transport to municipally owned waste disposal facilities  | N/A    | N/A      | N/A      | N/A      |
| RMW (30-gallon bins per year) <sup>83</sup>   | Private hauler transport to RMW disposal facilities                      | 11     | 22       | 34       | 45       |
| <b>Reusable or Recyclable Material</b>        |                                                                          |        |          |          |          |
| Micron RRR or other recyclable material (tpy) | (See Table 3.8-5 below)                                                  | 32,200 | 51,100   | 70,000   | 88,800   |

The Commercial Solid Waste is characterized as “metals, drums and cylinders, E-waste, batteries, plastic, foam, cardboard, scrap wood, office supplies, etc.” The DEIS goes on to say that: “The non-RRR portions of this commercial MSW would be collected via licensed commercial haulers for transport to municipally owned waste disposal facilities within the OCRRA service area ... The commercial MSW would be transported first to the

WTE Facility, capacity permitting, to maximize energy recovery. Overflow amounts would be sent to the RCR Transfer Station, which could receive up to 800 tons per day.”<sup>54</sup>

According to Table 3.8-5 Metals, drums and cylinders, E-waste, batteries, scrap wood, office supplies, plastic, foam are all designated for recycling. However, the ability to recycle plastics and foam—especially when contaminated—is limited. The Onondaga County Resource Recovery Agency currently accepts a limited selection of solid plastic items for recycling and does not accept foam or film plastics.<sup>55</sup>

**The DEIS needs to define more fully what is in the non-recyclable commercial waste.** This is a critical question because a large portion of the commercial SW is to be burned at OCRRA’s WTE plant. The semiconductor industry is highly reliant on PFTE, PFA and other fluoropolymers. (The CEO of chemical manufacturer Chemours claimed “We estimate that in a modern-day fab, there’s a half-kilo of PFA in every square foot. So in a 400,000- to 600,000-square-foot fab, that’s 200 to 300 metric tons of this stuff.”)<sup>56</sup> Fluorinated materials such as PFTE (Teflon™) and PFA will not fully break down when burned, leading to emission of hazardous products of incomplete combustion, as well as hydrofluoric acid (HF), an extremely corrosive and toxic substance.

**To mitigate air pollution impacts, Micron should segregate all waste materials made with fluoropolymers and not allow them to be incinerated. It would be best to find a way to recycle this material.**

## **VII. Wastewater sludge**

A significant environmental impact of the Micron project stems from the creation of various wastewater treatment solid by-products, commonly called “sludge.” Sludge is a type of solid waste which must be considered per NYCRR 317 (b)(3)(5) item f. “impacts of the proposed action on solid waste management and its consistency with the state or locally adopted solid waste management plan.” The DEIS fails to adequately address the management of wastewater sludge created at the Micron facility and, as a related effect, at Onondaga County’s Oak Orchard treatment facility.

There are three sources of wastewater sludge as shown in the diagram below:

---

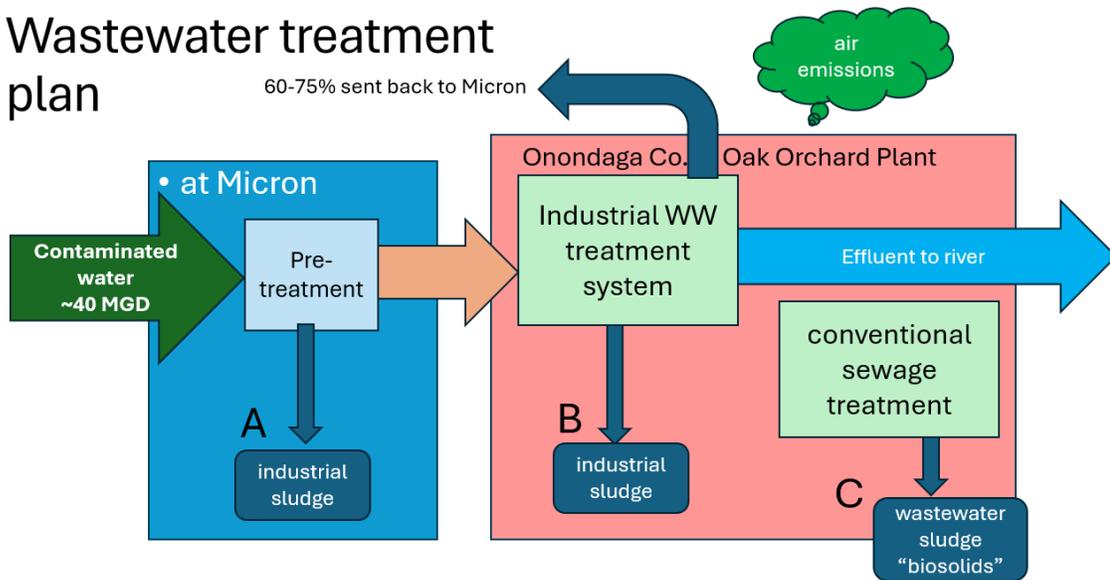

<sup>54</sup> DEIS at p. 3-233.

<sup>55</sup> see current guidelines at [https://ocrra.org/wp-content/uploads/2024/03/Recycling\\_101\\_Web.pdf](https://ocrra.org/wp-content/uploads/2024/03/Recycling_101_Web.pdf)

<sup>56</sup> Feldman, Amy (2023) *More Domestic Chip-Making Means More ‘Forever Chemicals.’* Forbes magazine. Oct 05, 2023.

[www.forbes.com/sites/amyfeldman/2023/10/05/more-domestic-chip-making-means-more-forever-chemicals/?sh=2d10b08c7821](https://www.forbes.com/sites/amyfeldman/2023/10/05/more-domestic-chip-making-means-more-forever-chemicals/?sh=2d10b08c7821).

## Wastewater treatment plan

The EIS needs to address the three sources of sludge labeled in the diagram: A, B and C. For each sludge source, the EIS should:

- Estimate the quantity generated
- Provide a description of the anticipated characteristics of the sludge, such as water content, organic content, and anticipated concentrations of contaminants
- Identify how the sludge will be disposed of, or, if not known at the time, likely options.

Sludges A and B are entirely due to Micron’s operations, while the volume of sludge C will be increased due to induced growth. We offer these comments on Sludges A and B.

### Sludge A.

**What quantity of sludge is estimated to be generated? How much water will it contain? The environmental impacts of sludge disposal or beneficial use depend greatly on the quantity of sludge generated.** A previous draft of the DEIS (from March 2025) stated that, upon full buildout, the facility would generate “88,800 tons of RRR materials annually. Approximately 24 percent of this RRR volume would consist of recyclables (21,100 tons per year). The majority of the remaining RRR volume is anticipated to consist of [wastewater pre-treatment] sludge and metals.” Based on that, over 67,000 tons of sludge and metals would be generated per year.

These important details were removed from the draft released for public comment. They should be re-inserted.

Table 3.8-5 Industrial and Commercial Materials for Micron RRR Program shows that “Non-hazardous sludge from on-site wastewater treatment” will be disposed of by “Send[ing] to [a] beneficial use vendor or recycle.” Is this sludge being generated from the four Biological Wastewater Treatment Facility described in DEIS Table 2.1-3 (DEIS, p. 2-13)? **What substances are anticipated to be in this sludge?** Wastewater from the semiconductor manufacturing process is likely to be contaminated with a wide variety of substances, including:

- heavy metals
- fluorides
- PFAS
- Resins and specialty organics
- microplastics, and
- polycyclic aromatic hydrocarbons.

No explanation is given as to how this sludge could be beneficially re-used or recycled. What is the feasibility of actually re-using this sludge? Where would it go? What are the environmental consequences? Will it be tested for hazardous substances to determine whether or not it should be classified as hazardous waste? If PFAS compounds are present, how will the sludge be managed so that it does not contaminate soils, surface water, plants, wildlife and groundwater with PFAS?

Appendix K-12 provides an example recycling program from the Micron facility in Boise, Idaho. That does not describe or even list a sludge re-use/recycling program.

### **Sludge B.**

We were unable to find any estimate of the quantity of sludge to be generated from the IWWTP in the DEIS released for public comment. However, the March version of the DEIS (Section 3) stated “operation of the IWWTP would generate an industrial waste stream from [sic] zero liquid discharge solids of approximately 109,500 wet tons/year.” Again, an estimate of sludge volume should be provided in the Final EIS. Without this it is not possible to meaningfully assess its environmental impact. Likewise, the EIS needs to assess disposal options for this material, based on likely composition and levels of contaminants. It seems likely that this material would be contaminated with PFAS, heavy metals, and potentially other recalcitrant substances associated with semiconductor manufacturing. Disposal options should be described.

## **VIII. Hazardous Waste**

It is reported in **Table 3.8-6** that the Micron facility would initially generate 18,300 ton/yr of hazardous waste (Fab 1 in operation), ranging up to 50,300 ton/year with four fabs in operation. The sentence at the bottom of p. 2-236 states that “As shown in Table 3.8-7,

hazardous waste would consist mainly of acidic and solvent waste volumes.” Table 3.8-7 shows volumes of unspecified “acidic waste” and unspecified “solvent waste” generated per fab. To convert these volumes to tonnages requires the densities of the waste. We assumed a density of water (1.00 g/ml) for the acidic waste and a density of 0.785 g/ml, which is representative of acetone and isopropyl alcohol, for the solvent waste. Applying these numbers, the total amount of acidic and solvent waste generated = 8,750 tons per year per fab. This accounts for less than half of the 18,300 ton/yr total waste estimated per fab in **Table 3.8-6**.

**Table 3.8-8** provides a bit more detail about types of waste generated, but no quantities or specific identities are reported.

**The types and quantities of hazardous waste should be specified. What specific solvents are in the solvent waste? What acids are in the acidic waste? What chemical waste accounts for the missing 9,500 tons/year of hazardous wastes estimated for each fab?**

**Hazardous wastes, by their nature, pose a threat to the health and safety of workers and the surrounding community. Unintentional releases of chemical wastes can have devastating effects on the environment as well. For example the derailment of train cars carrying vinyl chloride, phosgene, and other chemicals in Palestine, Ohio on February 3, 2023 forced the evacuation of thousands of residents and contaminated air, water and soils.**

On p.3-239 the DEIS says: “Micron plans to explore the distillation of isopropyl alcohol and ammonia solutions to reduce waste and to increase potential for valuable reuse off-site. Other material streams such as bulk solvent, drummed solvent, and contaminated debris would be reused or recovered through fuel blending or energy recovery at approved permitted cement kilns that allow kilns to run on waste-derived fuel.”

Certain waste streams such as lab waste, cylinders, expired materials, glues, resins, a subset of solvents, and certain acids would likely need to be incinerated at permitted off-site disposal facilities in other states.

**Micron is to be commended for maximizing the reuse and recycling of IPA, and ammonia. The final EIS should provide greater detail about the quantities of the various waste streams slated to be incinerated by Veolia.**

## **IX. Effects of chemical waste and other transport on traffic volumes**

As noted in the preceding sections, a substantial quantity of chemicals will be delivered to the facility by truck, and substantial quantities of wastes destined for landfills,

recycling, and incineration will be hauled away from the facility. Presumably these will also be transported by truck. While we were admittedly limited by the tight timeframe given to review the 20,000-page DEIS, we have not found any accounting of the traffic volume created by these delivery vehicles. The traffic caused by trucks is described in DEIS, Appendix M, Vol. Transportation and Traffic. A total of 64 trucks entering and leaving the facility each day is projected throughout the construction phase: 2027–2041. An additional 5 - 20 trucks/day leaving and entering is anticipated as operations ramp up from 2031–2044.<sup>57</sup>

As discussed in the preceding comments, trucks are being utilized to transport:

- 1) between 100 and 200 tons of chemicals per day. A wide variety of chemicals need to be delivered, ranging from small gas cylinders to large bulk tankers.
- 2) Approximately 170 ton/day of municipal solid waste, 5 day/week
- 3) Approximately 80 ton/day of various recyclable materials, 5 day/week
- 4) Approximately 260 ton/day of wastewater sludge , 5 day/week
- 5) Approximately 195 ton/day of hazardous wastes , 5 day/week

Considering all of the above, it appears that the DEIS has substantially underestimated the traffic caused by truck deliveries related to operations of the Micron fabs.

## **X. Air pollution**

### **A) NAAQS and Hazardous Air Pollutants**

The DEIS asserts that air pollution emissions from the construction and the operation of the Micron facility will not violate the National Ambient Air Quality Standards (NAAQS) for the study area. However, most of the monitoring data for criteria air pollutants (those with established NAAQS) on which this assessment relies comes from monitors in Rochester, NY, more than 70 miles from the project site. Only ozone and small diameter particulate matter (PM<sub>2.5</sub>) are measured in the Syracuse area. Conditions in Rochester may be expected to be similar, but Micron should at least be required to demonstrate—with actual local monitoring data—that they are before relying on these figures to demonstrate that the facility will not have any significant environmental impacts.

In addition, in making this assessment, the DEIS does not allow for or consider the impacts of any exceedances, upsets, or violations in assessing the environmental impacts of air emissions. However, no equipment works perfectly. Again, based on its experience in chip manufacturing, Micron should have some sense of how often its facilities encounter upsets, exceedances, or unavoidable permit violations that may result in excess air emissions. If Micron doesn't have that data, it could rely on industry-wide statistics. For example, the Environmental Working Group found that, as of October 25, 2024, 10% of active semiconductor manufacturing facilities had violated federal environmental laws and

---

<sup>57</sup> DEIS Appendix M at 2-10, 2-11.

regulations in the last 10 years and 27% of the facilities with individual discharge permits had violated those permits.<sup>58</sup>

Finally, assuming that the DEIS NAAQS compliance analysis is correct, modeled levels of both NO<sub>x</sub> and PM<sub>2.5</sub> are very close to NAAQS limits (see Table 3.6-10 NAAQS Results).<sup>59</sup> Modeled results for the hazardous pollutants HF, NF<sub>3</sub>, and total fluorides, shown in Table 3.6-11) are very close to annual guideline concentrations (AGC) established in NYSDEC Division of Air Resources guidance DAR-1.<sup>60</sup> Given the uncertainty inherent in modeling data, and the lack of local background monitoring data, **Micron should be required to install air quality monitors for NAAQS pollutants and selected hazardous air pollutants (including HF, NF<sub>3</sub>, and total fluorides) in the airshed directly affected by the Micron facility. The data from those monitors could be used to both check NAAQS compliance under regular operating conditions and to identify the environmental impacts of exceedances, upsets, or other unavoidable violations of air emission limits.** Micron can then modify its operations or improve emission controls if the localized air monitoring shows exceedances.

#### B) Incineration of perfluorinated compounds (PFCs) and related gases

In the section on Greenhouse Gas emissions, the DEIS notes that “Semiconductor manufacturers use a variety of high GWP [global warming potential] gases to create circuitry patterns on silicon wafers along with chillers for certain process tools to prevent overheating. Examples of widely used high GWP fluorinated compounds (F-gases) including PFCs (e.g., CF<sub>4</sub>, C<sub>2</sub>F<sub>6</sub>, C<sub>3</sub>F<sub>8</sub>, and c-C<sub>4</sub>F<sub>8</sub>), HFCs (CHF<sub>3</sub>, CH<sub>3</sub>F and CH<sub>2</sub>F<sub>2</sub>), NF<sub>3</sub>, and SF<sub>6</sub>. Semiconductor manufacturing processes also use fluorinated heat transfer fluids and N<sub>2</sub>O.”<sup>61</sup>

Micron plans to incinerate its process gases: “GHGs from the Proposed Project would be emitted as a result of using fluorinated GHGs, N<sub>2</sub>O, CH<sub>4</sub>, and CO<sub>2</sub> as raw materials in manufacturing processes, from oxidation of organic compounds in thermal oxidation systems and RCTOs (Rotary Concentrator Thermal Oxidizers), from the combustion of natural gas and diesel, and from leaks of HTF (Heat Transfer Fluid).” “Thermal oxidation systems and RCTOs would combust natural gas, and byproducts of combustion would exhaust alongside other unreacted process GHG emissions.”<sup>62</sup> The DEIS projects that Micron will release 2.48 tons/year of “fluorides” emissions from fabs 1 and 2 alone.<sup>63</sup> The source of fluorides is not described, but is likely from the incineration of F-gases.

<sup>61</sup> Id., 3-188.

<sup>62</sup> Id.

<sup>63</sup> Id., 3-165, 3-183.

The problem with incineration is two-fold: it is not 100% effective; some compounds are only reduced about 60%. According the Environmental Assessment for the Micron fab in Boise, ID: “Micron Boise currently estimates that its POU [Point of Use] abatement systems achieve DRE [Destruction and Removal Efficiency] factors between 60 and 98 percent based on the individual chemical and the ability of the POU abatement system to control each species of process gas.”<sup>64</sup> Thus, a significant fraction of some gases escape into the atmosphere despite passing through thermal oxidation and wet scrubbing.

The other problem is that incineration produces toxic products of incomplete combustion, and hydrogen fluoride (HF), which is highly toxic and highly corrosive. This is discussed at length by Weitz et al (2024).<sup>65</sup> The authors conclude that “ Few studies have been conducted at full-scale operating facilities, and none to date have attempted to characterize possible fluorinated organic products of incomplete combustion (PICs). Further, the ability of existing air pollution control (APC) systems, designed primarily for particulate and acid gas control, to reduce PFAS air emissions has not been determined.”

They recommend “Further research is needed to examine the formation and measurement of PICs in full-scale treatment facilities.”. The emission of products of incomplete combustion, which are themselves types of PFAS, is completely overlooked in the DEIS. These hazardous chemicals are not being monitored, and are not regulated under the Clean Air Act or through NYS regulations. Micron must commit to either stop using fluorinated gases—replace them with nontoxic degradable compounds—or use a superior technology to isolate and destroy them.

This is why the Department of Defense moved away from incinerating PFAS firefighting foam. The PICs are not regulated. They are not even monitored. So we have the situation where toxic gases of unknown composition are being emitted into our community. What are the health effects?

Shields *et al* researched the incineration of PFAS in firefighting foams. They concluded that “many PFAS can be converted to other PFAS at low temperatures resulting in high DEs without full mineralization and the potential release of the remaining fluorocarbon portions [smaller molecules] to the environment. Many of these products of incomplete combustion

<sup>64</sup> Draft Environmental Assessment for Micron ID1, Boise, Idaho. NIST-CPO/EA-004, CHIPS Program Office, National Institute of Standards and Technology, U.S. Department of Commerce, July 10, 2024.

<sup>65</sup> Weitz, K. et al (2024) Review of per- and poly-fluoroalkyl treatment in combustion-based thermal waste systems in the United States, *Science of the Total Environment* 932 (2024) 172658: <https://www.sciencedirect.com/science/article/abs/pii/S0048969724028055#:~:text=Available%20results%20suggest%20the%20temperature,concentrations%20in%20facility%20air%20emissions.>

(PICs) are greenhouse gases, most have unknown toxicity, and some can react to create new perfluorocarboxylic acids.”

SEQR, 6 NYCRR 617.9 (b)(6), makes a special requirement where serious but undefined effects are likely:

**“if information about reasonably foreseeable catastrophic impacts to the environment is unavailable because the cost to obtain it is exorbitant, or the means to obtain it are unknown, or there is uncertainty about its validity, and such information is essential to an agency's SEQR findings, the EIS must:**

- (i) identify the nature and relevance of unavailable or uncertain information;
- (ii) provide a summary of existing credible scientific evidence, if available; and
- (iii) assess the likelihood of occurrence, even if the probability of occurrence is low, and the consequences of the potential impact, using theoretical approaches or research methods generally accepted in the scientific community.

If Micron is unable or unwilling to eliminate the incineration of F-gases from its process, then the EIS must fulfil the requirements of 617.9 (b)(6) with respect to the potentially catastrophic effects of releasing toxic F-gases and related products of incomplete combustion into the atmosphere.

We recommend that Micron explore an alternative approach to controlling F-gases: low-temperature condensation of the gases, followed by destruction using advanced technology such as super critical wet oxidation.<sup>66</sup>

## **XI. Addressing the Wetland Concerns at the Site**

**Micron is obligated to adhere to the new NYS Freshwater Wetlands regulations.** Micron’s current determination of impacted New York State jurisdictional wetlands and the company’s obligation to comply with the new state freshwater regulations remains unclear. Starting In 2021, Micron employed Ramboll Americas Engineering Solutions, Inc. (Ramboll) to further identify wetlands types and acreages that should be included under the ACOE and New York state’s permitting authority. The results of this research are found in a series of tables, charts, and maps in the DEIS that largely reflect information from old DEC jurisdictional paper maps confirmed by surveys. (Based on determinations issued by NYSDEC under ECL Article 24, approved Jurisdictional Determinations issued by USACE

---

<sup>66</sup> See USEPA report at [https://cfpub.epa.gov/si/si\\_public\\_record\\_Report.cfm?dirEntryId=357639&Lab=CESER](https://cfpub.epa.gov/si/si_public_record_Report.cfm?dirEntryId=357639&Lab=CESER)

under the Clean Water Act, and what Ramboll describes as non-jurisdictional wetlands ‘definitively excluded from Federal and State jurisdiction’)

The DEIS does not, however, indicate the criteria for how Ramboll decided what wetlands would not receive permitting protection. The DEIS acknowledges the wetlands permitting reforms passed by the NYS Legislature in 2022 and the subsequent regulations for freshwater wetlands that went into effect January 1, 2025.<sup>67</sup> But it remains unclear whether Micron is operating under the old rules or the new rules when both the applicant and DEC decide which wetlands deserve permitting protection.

Under the old rules, State Jurisdictional wetlands were wetlands found on approved maps that are 12.4 acres or larger. If a wetland never made it on a map, its destruction did not require a state permit. The new law and regulations require a permit for any wetland, regardless of whether it is on an approved State map or if it is larger than 12.4 acres (7.4 acres after 2028) or is a wetland of any size that possesses local importance from a specific list of criteria (wetlands that attenuate significant flooding, filter drinking water, provide habitat for rare species, are located in an urban area).

According to the DEIS, the Micron Campus was field evaluated for the potential presence of wetlands regulated by the Federal government and the State of New York by Ramboll biologists in the fall of 2021, summer of 2022, and the spring, summer, and fall of 2023. Site visits were also conducted in the spring, summer, and fall of 2023 and the spring of 2024 with USACE Buffalo District and NYSDEC Region 7 personnel to observe, verify, and supplement the delineations conducted by Ramboll.<sup>68</sup> But if some of the delineation happened before the Freshwater wetlands legislative reforms were enacted in 2022 and all of the delineations and site advisories happened before the language of the final regulations and the revised wetlands classification system was made public in December of 2024, it is unclear how such data collection and analysis could reflect the demands of the new law. The DEIS makes no mention of capturing smaller wetlands of ‘unusual importance’ in the field surveys or the attempt to identify vernal pools, two central considerations of wetland delineation under the new rules. The DEIS cites the Department of Environmental Conservation staff signing off on certain Micron jurisdictional determinations in February 2024, while others are still pending in 2025. It would be wholly inappropriate to create a wetlands protection / mitigation plan for the entire Micron complex with some of the impacted landscape shielded from protection by the weaknesses of the old law, while other habitat areas (though at this point the minority of the acreage) held to the standards of the more protective laws.

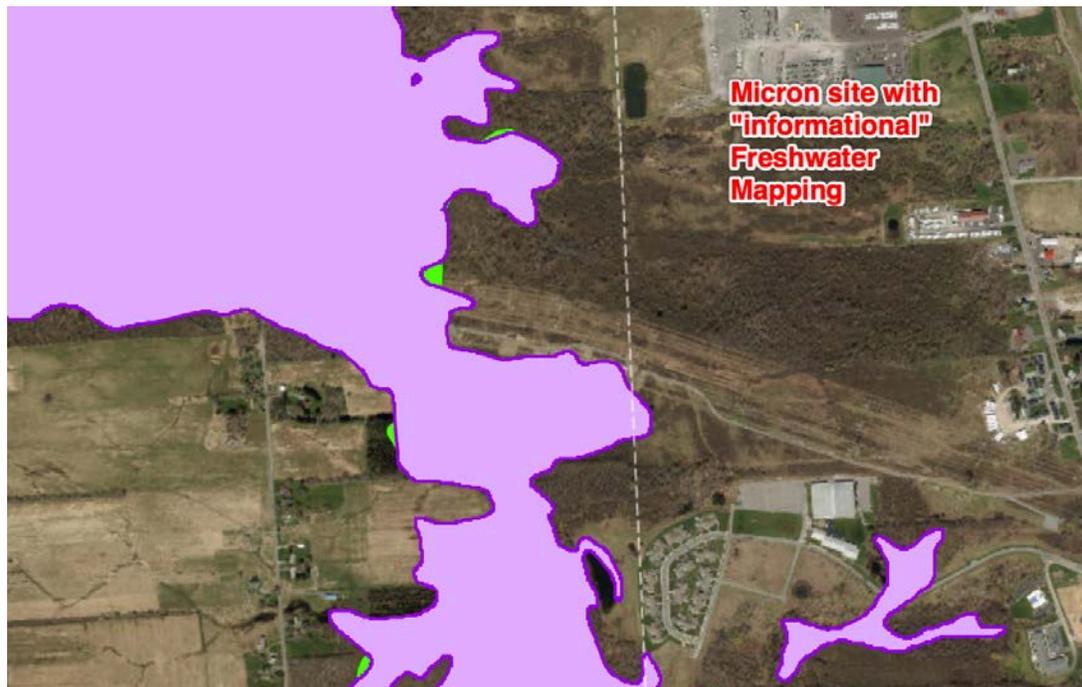

---

<sup>67</sup> DEIS Appendix F at F-8.

<sup>68</sup> DEIS Appendix F Vol. 1 Part 1.

The DEIS suggests that State Jurisdictional determinations were based upon the adherence to historic wetlands delineations as depicted in green. (source: DEC Environmental tracker)

The wetlands in purple depict “informational wetlands” where DEC predictive mapping identifies potential locations for jurisdictional wetlands, beyond what was originally mapped.

Ramboll, however, did compile in the DEIS tables, lists and maps of wetlands deemed “non jurisdictional” presumably because these habitats were not on official maps or did not

meet the ACOE test of having a significant nexus to the 'Waters of the United States'. But again, without understanding the rules by which Ramboll conducted its assessment, it is unclear whether it captured every wetland within the development zone under the 2025 regulations or if its count was constrained by outdated standards. In sum, the entire Micron project will allegedly result in the permanent loss of approximately 193.38 acres of federal jurisdictional wetlands, which overlap with approximately 174.77 acres of State jurisdictional wetlands.

The applicant acknowledges approximately 10.5 acres of impacted non-jurisdictional wetlands and will compensate for their loss in consideration of mitigation, which equates to a sum total of approximately 210 wetlands acres. But with State jurisdictional wetlands come protective 100 ft buffers and it is unclear whether these collective 35 acres (not considered NY state jurisdictional wetlands) will be treated with the more protective buffers or suffer the standards of the outdated rules.

The publicly subsidized Micron proposal has projected that it will be a beacon of modernity that will uplift New Yorkers as much as it will advance a new age of technological innovation. But Micron cannot fulfill its obligation to the public good if it gives short-shrift to the environmental review process by shielding its wetlands obligations from the new law.

Micron and DEC must make clear through the EIS process that this project does not qualify for exemptions from the new freshwater regulations that went into effect January 1, 2025.

#### **Wetlands mitigation measures**

The DEIS notes that the construction of the facility will require excavating over 1.6 million cubic yards (2.70 to 3.67 million total tons) of soil and muck from the existing wetlands and fields at the WPCP. This material is designated for "beneficial reuse."<sup>69</sup>

**Micron should coordinate with the Wetlands Trust and other experts in wetlands to see whether this material which is rich in wetland plant seeds, spores, and microorganisms could be utilized to create new wetlands as part of the wetlands mitigation plan. This would minimize long-distance transport of this huge amount of material, and could accelerate the establishment of new wetlands.**

**A revised plan for wetlands protection must include:**

- a declaratory statement that the Micron project will comply with the NYS wetlands regulations that went into effect January 1st, 2025.

---

<sup>69</sup> DEIS at 3-223 et seq.

- a comprehensive analysis of all wetlands on the project site, regardless of size. For a publicly subsidized and forward-thinking project like Micron that will be engaged in construction well past 2028, all wetlands larger than 7.4 acres should be considered state jurisdictional and come with the commensurate buffers, protections and mitigations associated with their permitting.
- a review of Wetlands smaller than 7.4 acres to determine if they meet the criteria for ‘Local Importance’ and deserving of permitting protections. In consideration of the potential for endangered species on the Micron property, it is conceivable that many of the smaller wetlands would qualify as state jurisdictional wetlands.
- a revised wetlands mitigation plan that truly addresses the indirect and cumulative impacts of the project by increasing the wetland replacement ratio from about 2:1 to ~10-15:1, as was done for the Seneca Meadows wetlands restoration project (see <https://res.us/projects/seneca-meadows-wetland-restoration-design-build-mitigation-for-landfill-impacts-to-wetlands/>).
- a better integration of mitigation land acquisition to accommodate the more than 600 acres of endangered species habitat with acreage acquired to mitigate wetlands loss.

## **XII. Climate and Pollution Impacts Embodied in Construction Materials**

### **1. The DEIS Inadequately Reviews the Project’s Scope 3 Emissions and Embedded Pollution Impacts**

The proposed construction project will significantly increase GHG emissions, yet the DEIS incorrectly states that these impacts are not “reasonably foreseeable” and insufficiently discloses GHG emissions and air pollutants from construction materials, known as Scope 3 greenhouse gas emissions.<sup>70</sup> This makes it impossible to adequately assess the risks the project poses to the climate and to upstream industrial communities. By failing to address embodied emissions of construction materials, the DEIS excludes the impact of GHG emissions and air pollutants from the complete lifecycle of the project.

The emissions associated with construction of the fabrication facilities and the overall campus will be significant, as cement and steel manufacturing alone remain among the highest emitting industries in the world, contributing about 16% of anthropogenic climate-warming emissions.<sup>71</sup> Information on the magnitude and product categories of the fabrication facilities’ steel, cement, and asphalt needs are largely absent from the DEIS, as is information on how Micron and its contractors plan to source and procure these materials. Failing to disclose the GHG emissions associated with construction of the facility, including the embodied emissions of carbon-intensive materials, significantly impairs the ability of the

---

<sup>70</sup> DEIS at 3-200.

<sup>71</sup> Columbia Energy Exchange, “Decarbonizing Steel and Cement,” Columbia University Center on Global Energy Policy, Aug. 8 2023, [www.energypolicy.columbia.edu/decarbonizing-steel-and-cement/](http://www.energypolicy.columbia.edu/decarbonizing-steel-and-cement/).

lead, involved, participating, and cooperating agencies with stakes in the project, the well-being of affected regions, and carrying out NEPA and SEQRA from determining if this project is in the public interest, let alone if it is adequately mitigating impacts.

*Coming Clean on Industrial Emissions*, a report commissioned by Sierra Club and developed by Synapse Energy Economics in Cambridge, Massachusetts, identifies a wide range of emissions and toxic pollutants released by domestic producers of steel and cement, which have serious implications for the upstream impacts of this project. For example, integrated mills producing steel products have Scope 1 and 2 emissions intensities ranging from 0.39 to 2.35 metric tons of carbon dioxide equivalent per metric ton of steel produced. Despite more clustering in the cement sector, the gap between the best and worst performing facilities is equally stark: the best performing cement facility emits 0.21 metric tons of CO<sub>2</sub>e per metric ton of cement produced, while the greatest laggard emits 1.45 metric tons of CO<sub>2</sub>e per metric ton of cement produced. Secondary steel made in electric arc furnaces has a similar noteworthy gap between best and worst performers with the most carbon-intensive minimill emitting 1.38 metric tons of CO<sub>2</sub>e per metric ton produced and the least intensive emitting 0.22 metric tons of CO<sub>2</sub>e per metric ton produced.<sup>72</sup> Due to the significant emissions-intensity disparities in the incumbent market, disclosure of sourcing information and product specifications are critical to understand this project's upstream impacts.

The environmental and public health impacts of steel and cement operations are immense and heterogenous. For example, the domestic iron and steel industry releases 39 chemicals on land, 51 into water, and 77 into the air. The domestic cement industry releases 26 chemicals on land, 17 into water, and 139 into the air.<sup>73</sup> And, while *Coming Clean* uses a variety of methods to capture the climate emissions and fence-line pollution of these facilities, additional pollutants created by electric-generating units powering them is not depicted. Without additional information on sourcing, product specifications and cleanliness verification, the array of impacts, including on New York manufacturing communities, will remain unknown.

The absolute volume of cement and steel necessary to complete the 1,377-acre site is staggering. The DEIS assesses that the five million square feet of factory space for fabrication facilities alone involves millions of tons of steel and other construction materials.<sup>74</sup> Reporting from June 2024 tallied the concrete needs as six times greater than used to build the Pentagon. The steel needs were said to be four times more than those of

---

<sup>72</sup> Synapse Energy Economics, "Coming Clean on Industrial Emissions" Report Database, Prepared for the Sierra Club, Sep. 12, 2023, [https://docs.google.com/spreadsheets/d/1oVevRe4KdmO6iK83R\\_-jE-JpAnoZEOAE/edit?gid=1490092082#gid=1490092082](https://docs.google.com/spreadsheets/d/1oVevRe4KdmO6iK83R_-jE-JpAnoZEOAE/edit?gid=1490092082#gid=1490092082).

<sup>74</sup> DEIS at 0-18.

the Golden Gate Bridge, per a Micron Executive Vice President's comment to then-President Joe Biden on the undertaking's scale.<sup>75</sup> According to a 2019 presentation by Exyte, a builder of fabs tapped by Micron to be the construction manager of its Boise, Idaho expansion, material needs of a generic fab are 520,000 cubic meters of concrete and 73,000 metric tons of steel rebar. Across four fabs, as is Micron's intention for its New York project, this figures to two million cubic meters of concrete and 300,000 metric tons of steel rebar.<sup>76</sup> The DEIS should provide estimates for the quantities of the carbon-intensive materials to be used to further underpin its analysis. Failure to disclose this information is a serious omission. The knowledge gap inappropriately forces agencies with legal obligations to assess and report on impacts to rely on news articles, corporate-officer soundbites, and possibly outdated estimates that are not specific to the project in question. However, failure to include this non-specific information in the DEIS suggests that involved agencies did not carry out even a haphazard appraisal of these impacts.

## **2. The DEIS Does not Discuss the Nexus between Scope 3 Emissions and State Laws, Executive Orders, Regulations, and Project Terms**

In the discussion of state and local laws pertinent to the DEIS, the Agencies should incorporate requirements for green building materials covered under the New York Green CHIPS Law and Executive Order 22.<sup>77</sup> The New York Green CHIPS Law and the term sheet between the New York State Urban Development Corporation, Onondaga County, and Micron requires Micron to "encourage contractors to...incorporate low-carbon building materials (green steel, green cement, etc) into construction."<sup>78</sup> Micron's Green Chips Sustainability Plan, hitherto not made public, further would require discussion of "incorporating regional low-carbon building materials (green steel, green cement, mass timber, etc.) into construction."<sup>79</sup> Executive Order 22 requires the accounting and reduction of embodied carbon in construction materials, verified through the submission of environmental product declarations, across affected agencies including New York State Urban Development Corporation.<sup>80</sup> Doing business as Empire State Development, the Urban Development Corporation leads the Green CHIPS Program, has committed \$5.5 billion in incentives to Micron, and has signed the aforementioned term sheet. For Micron to receive

<sup>80</sup> New York State Executive Order No. 22, "Leading by Example: Directing State Agencies To Adopt a Sustainability and Decarbonization Program," Governor Kathy Hochul, Sep. 20, 2022.

its substantial state subsidy and proceed in partnership with Empire State Development and the County, it must complete the Sustainability Plan, which Empire State Development must then approve. The plan must be submitted such that there is “...sufficient time to review sustainability options under consideration during various aspects of the project from design, construction, and operation, but before final decisions are made on such options.”<sup>81</sup> The DEIS should disclose Micron’s plans to comply with the state and local policies, as well as how it may harness existing state capacity, benchmarks, and industry standards to guide its procurement of materials and their embodied emissions.<sup>82</sup>

Whatever steel and cement facilities Micron and its contractors choose, there will be impacts. Clear preferences for low-emissions steel and cement or a requirement for materials below a certain emissions threshold, if communicated to contractors and signaled to producers, could mitigate environmental and public health burdens and create a large market to sustain new low-carbon cement and steel production.

With the cement and steel industries using low-carbon labeling and environmental product declarations, and New York Executive Order 22 paving the way for this work, it is reasonable and within the nexus of the project impacts and the law’s remit for Micron to transparently report effects, mitigation plans, and opportunities.<sup>83</sup> Further, as stated earlier, it is well within the province of NEPA and SEQRA to consider foreseeable direct and indirect impacts as well as cumulative impacts. This has long been understood as part of the obligation of review.<sup>84</sup> Transparency and review is critical in this instance due to the scale and duration of the project and because the effects are not necessarily indirect and distant.

Production to outfit the Micron construction has clear emissions, pollution, and jobs impacts. For example, the Nucor Steel Auburn facility is several miles from the project site, and is known for producing steel with a lower carbon footprint relative to several competitors. A preference for lower emissions steel may drive demand to the facility over dirtier competitors elsewhere in the country, or incentivize the facility to reduce emissions further through investments like new clean electricity or further partnerships with

innovators in New York.<sup>85</sup> Holcim’s Ravena cement plant south of Albany, a significant regional polluter, may pollute more if outfitting the Micron campus. However, if induced by Micron’s purchasing preferences, Holcim may choose to introduce pollution controls and novel technologies, such as Sublime Systems’ zero-carbon process, to transform the facility and reduce cumulative burdens across the Capital Region depending on Micron’s commitment or lack thereof to material cleanliness. Holcim is a Sublime Systems investor, and Holcim has also launched carbon capture projects to continue conventional production but reduce burdens.<sup>86</sup> The Micron project is of such a scale and decadal timeline that it is not unreasonable that new and shuttered material producers alike may stay open and reopen, respectively, to service its needs. This may include the closed Lehigh Cement Company facility in Glen Falls, NY, which was, until recently, a significant polluter north of Saratoga Springs.<sup>87</sup> Producing these materials includes additional upstream impacts, such as mining and transporting limestone, and midstream impacts, such as using heavy duty vehicles to transport materials to the project site. Adequate review must consider not only direct impacts but also the project’s indirect and cumulative impacts.

Given the scale of the proposed facility, Micron’s demand for these products will likely increase greenhouse gas emissions and toxic air and water releases harmful to populations in proximity to steel and cement production. However, by requiring that materials used represent at least half the embodied emission-intensity of existing regional averages upon the start of the project, by preferencing near-zero-emissions materials through the life of the project, and by joining sustainable materials buying platforms to verify its intention to use clean materials brought to market, Micron can mitigate impacts, encourage building material manufacturers to make capital investments and process changes that lower emissions, reduce pollution, benefit public health, and magnify economic benefits of the Micron project both in and beyond Onondaga County.<sup>88</sup>

### 3. The DEIS Does not Establish Mitigatory Scope 3 Emission Reductions

The goal of reducing emissions by half is readily achievable now with existing technologies and projections within the industry indicate significantly greater reductions during the coming decade as the Micron plant is being built. The construction of the first two fabs should require at least a 50% reduction in scope 3 emissions associated with concrete. The construction of the first two fabs should require at least a 25% reduction in scope 3 emissions associated with primary and secondary steel, reflecting an increment of performance improvement across the primary and secondary sectors.<sup>89</sup>

Micron is geographically well-positioned to make, and benefit from, a near-zero-emissions preference for its building materials for the first and second fab today, which should ratchet up to a zero-emissions requirement upon the start of construction of the third and fourth fabs. The nation's leading near-zero-carbon cement and steel operations are in the region. Sublime Systems' Holyoke, Massachusetts commercial plant will be one of only two open cement facilities in the Syracuse area. It is already buoyed by a major order from Microsoft. The Holyoke site is well-placed to outfit the Micron fabs, and Sublime Systems is looking to build larger scale facilities, which may include the Syracuse region if Micron were to commit to purchase or, at least preference, zero-carbon products.<sup>90</sup> Likewise, Boston Metal's Woburn, Massachusetts zero-emission steel demonstration plant will be deployed in 2026.<sup>91</sup> Micron's preferencing of low- or zero-carbon steel would validate its commercial production. However, in addition to not expressing the carbon-intensity of materials to be used, the DEIS fails to evaluate the robustness of the secondary steel market and if primary steel will be needed to contend with possible scrap shortages, particularly as international trade vicissitudes influence market conditions each day. This oversight makes it impossible to assess if needs will be met by recyclers or if primary steelmakers will fill the gap. The different emissions and toxic-pollution profiles of the ironmaking and recycled steel pathways would vastly alter the scale of the project's cumulative upstream impacts. Clearly signaling a low- or zero-carbon steel preference to each industry, along with the possible size of the ultimate purchase, could greatly reduce these impacts. Without transparency and without an embodied-emissions use or procurement target, it is impossible to evaluate impacts and there is little reason to presume that steelmakers or recyclers would have reason to adopt mitigations or invest in transformative innovations.

<sup>90</sup> Violet George, "Microsoft and Sublime Sign Deal to Scale Clean Cement, Carbon Herald, May 26, 2025, <https://carbonherald.com/microsoft-and-sublime-systems-sign-deal-to-scale-clean-cement/>.

<sup>91</sup> Press Release: "Boston Metal plans first demonstration plant in 2026 in Woburn, Massachusetts, with molten oxide electrolysis industrial cell technology; company aims to offer an efficient and scalable approach for zero-emission, clean steelmaking," Globe Newswire at Industry Intelligence Inc., Mar. 14, 2025, [www.industryintel.com/news/boston-metal-plans-first-demonstration-plant-in-2026-in-woburn-massachusetts-with-molten-oxide-electrolysis-industrial-cell-technology-company-aims-to-offer-an-efficient-and-scalable-approach-for-zero-emission-clean-steelmaking-169086533784](http://www.industryintel.com/news/boston-metal-plans-first-demonstration-plant-in-2026-in-woburn-massachusetts-with-molten-oxide-electrolysis-industrial-cell-technology-company-aims-to-offer-an-efficient-and-scalable-approach-for-zero-emission-clean-steelmaking-169086533784).

Despite the DEIS's failure to adequately report on construction material needs, the pollution-profiles of materials that will be procured, and what facilities may be able to service the demand, Appendix J does acknowledge that pollution controls adopted by incumbent steel and cement producers can be employed to reduce emissions. For example, carbon capture and storage options used at steel and cement facilities are acknowledged as an option to mitigate emissions from those plants. While the technology is largely deemed infeasible to mitigate Micron's vast scope 1 emissions, no discussion is extended to the preferencing of low-carbon materials to lower the facilities' scope 3 emissions. Pollution controls incorporated at steel, cement, and additional facilities to promote the efficiency of gas boilers are considered elsewhere in Appendix J, too.<sup>92</sup> Yet again, the DEIS does not consider whether Micron's construction needs would incentivize producers making use of sound pollution controls or where pollution may increase or have reason to decrease, on an absolute or emissions-intensity basis, as facilities compete to outfit the Micron campus.

There is ample opportunity for Micron to demand low-carbon and low-pollution construction materials. There is law and regulation either promoting or requiring use of low-carbon materials and disclosure and verification of carbon-intensities. Unfortunately, across thousands of pages, the DEIS sheds no light on this subject. Without information on its steel and cement needs and sourcing plans, environmental and public health burdens in steel and cement manufacturing communities in New York and across the region are sure to increase. As it stands, the DEIS provides insufficient disclosure and analysis to determine the impact on the climate, the environment, public health, and jobs from the construction materials involved in the building process.

Additional analysis is paramount to fulfill legal obligations, to mitigate impacts, and to evidence economic, environmental, public health, and jobs impacts and benefits across the region. This analysis must assess the impacts of the project if using construction materials of national and regional average emissions- and pollution-intensities, the impacts of the project if using low-pollution and low-emissions materials already on the market, and the impacts of— and prospects for—the project if it were to commit to preferencing the use of near-zero pollution and emissions materials, including those being demonstrated in the region.

### **Conclusion:**

As stated earlier, we are grateful for the Federal and State DEIS processes that have allowed the opportunity for public comment and feedback on this massive project. **However, with only 46 days to provide public comment on this vast DEIS, our submitted comments - while extensive - hit on only a fraction of the many issues surrounding the severity and scale of the Micron project.**

**We reiterate that there are several areas where the Sierra Club believes the DEIS did not provide enough information on the subject matter discussed. Additionally, the DEIS**

---

<sup>92</sup> DEIS Appendix J, 75-79.

is lacking in areas where the mitigation measures are not strong enough to address the impacts to the environment in which they will be disruptive. And we will state again, it is well within the province of NEPA and SEQR to consider foreseeable direct and indirect impacts as well as cumulative impacts: all parts of the obligation of review.

For all of the reasons outlined above, we urge CPO and OCIDA to lead by example at this facility and to demonstrate to the larger semiconductor industry that there is room to create a model for 21st century solutions. We are hoping that with our comments on the DEIS, we can help in addressing concerns now, and are not dealing with mass clean ups and mitigating contamination 10- 20 years in the future.

Thank you for the opportunity to provide comment on the Micron DEIS.

Sincerely,

**Subject:** [EXTERNAL] Town of Cicero Draft Micron EIS comments

On behalf of the Town of Cicero, we offer the following comments relative to Appendix M, Vol. 4.

Sheet No. 6

The improvements to Lakeshore Road and the Lakeshore Road Spur do not indicate a Shared Use Path or sidewalk. Though there are currently no sidewalks on Lakeshore Road for this proposed improvement to connect into, it is common for pedestrians to walk along the road shoulder. A sidewalk off of the road surface up to the Rt-31 intersection would be a prudent and appreciated feature. Adding safe pedestrian connections is very important to the community.

Sheet No. 6b

The connection to the new I-81 interchange from Route 11 and Sneller Road, does not indicate any Shared Use Paths or sidewalks. Adding pedestrian connections is very important to the community.

Thank you for your serious consideration.

Re: Draft Environmental Impact Statement for Micron Semiconductor Manufacturing Project, Clay, NY

Dear Mr. Petrovich and Ms. McKay:

On behalf of Clean Air Action Network of Glens Falls (CAAN), I am submitting these comments on the Draft Environmental Impact Statement (“DEIS”) for the Micron Semiconductor Manufacturing Project in Clay, New York (the “Project”). CAAN is a regional citizens organization focussed on preventing air pollution and protecting public health and the environment from harmful pollution. CAAN is a member of the PFAS-Free NY campaign committed to fighting for upstream solutions and downstream protections from a dangerous class of toxic chemicals called per and polyfluoroalkyl substances (“PFAS”). These substances are often referred to as “forever chemicals” because of their extreme persistence and ubiquity in the environment. It is estimated PFAS contaminate up to 45% of the nation’s tap water and are found in the blood of nearly the entire U.S. population.

PFAS contamination has spread across the world, harming countless people and species. The health risks associated with PFAS are well established and broadly recognized by international scientific organizations, federal and state regulatory agencies, and other leading scientific bodies. Many PFAS are associated with “significant and diverse” adverse health effects that include cancer, liver disease, decreased fertility, high cholesterol, reduced vaccine response, and more.

New York is not immune to the impacts from PFAS. Millions of New Yorkers are living with the legacy of unregulated PFAS releases. Almost half of New York’s public drinking water systems are contaminated by PFAS, and more than two-thirds of the inactive landfills in the state have unsafe levels of PFOA, PFOS, or both in their groundwater impacting private well owners. In addition, PFAS already contaminates multiple sites in the vicinity of the Project, increasing the potential for cumulative exposures. There is known PFAS contamination at the Hancock Field Air National Guard Base in Syracuse. There is suspected PFAS contamination at the Oak Orchard Wastewater Treatment Plant site, where

Micron intends to build the Project's new industrial wastewater treatment facility. And there are multiple facilities in the area that are suspected of using or having used PFAS, including two airfields immediately south of the Project site.

With PFAS already costing the state up to \$4.4 billion in annual health care costs and millions in drinking water treatment and site remediation, New Yorkers cannot afford for this Project to worsen the New York's PFAS crisis. Instead, the Project should be a model of sustainable semiconductor production, and a demonstration that domestic microchip production need not come at the expense of our health and the environment.

A necessary first step towards responsible semiconductor manufacturing is a comprehensive analysis of the environmental and social impacts of proposed manufacturing projects. Unfortunately, the Project's DEIS does not provide enough detail on Micron's use, disposal, and release of PFAS for the public to understand the Project's environmental and human health impacts. Because the scope and severity of the anticipated impacts are not disclosed, the mitigation needed to ensure health protective control of PFAS at the proposed facility remains unclear.

#### ***DEIS must rely on the science-based definition of the PFAS class***

A threshold point for the DEIS, it must rely on a science-based class definition of PFAS. As acknowledged in the DEIS, the assessment and regulation of PFAS "depend[s]" in large part "on the definition of PFAS applied." The New York Legislature, United States Congress, more than 100 leading scientists, and 16 state attorneys general have all defined PFAS as a class of chemicals containing "at least one fully fluorinated carbon [atom]." This definition has broad scientific support, since it is the presence of a fully fluorinated carbon that gives PFAS their common trait of persistence. We urge the project proponents to rely on this science-based PFAS definition, which is already enshrined in multiple provisions of New York State law.

While EPA claims to define the PFAS class on a "case-by-case basis," as opposed to relying on a single consistent definition, prior EPA definitions have excluded thousands of PFAS recognized by the Organisation for Economic Co-operation and Development ("OECD"), New York State, and others. These exclusions have no scientific basis, and if applied to semiconductor manufacturing many PFAS would be excluded that are used or formed during production. For instance, EPA's prior definitions did not include polyvinylidene fluoride ("PVDF"), a PFAS used in semiconductor manufacturing, or trifluoroacetic acid ("TFA"), which forms when the fluorinated gasses used to make semiconductors break down in the environment. To fully assess the Project's PFAS impacts, the DEIS must use a definition that encompasses the full PFAS class.

#### ***DEIS must discuss Micron's use and discharge of PFAS chemicals***

PFAS are widely used during the production of semiconductors, and while PFOA has predominately been phased out, semiconductor plants continue to use "short-chain" PFAS, which are often associated with the same types of health effects as the long-chain PFAS they are used to replace. PFAS in wastewater discharges has been detected at other facilities producing semiconductors. Based on information obtained from Global Foundries semiconductor manufacturing facility in Essex Junction, Vermont, at least 17 different PFAS have been detected in the wastewater discharged. Up to 78,000 parts-per-trillion of PFAS were detected in another domestic semiconductor plant's wastewater.

The DEIS does not identify which PFAS Micron will use or specify how Micron plans to treat and dispose of its PFAS-containing waste. It only offers noncommittal assurances that PFAS concerns will be handled in future permitting processes, deferring the evaluation and mitigation of significant adverse impacts without any certainty that such permits would even address PFAS releases. This is an unacceptable level of detail given the serious risks PFAS pose and the knowledge that PFAS will be used at the proposed facility. This approach is problematic and not protective, because New York does not sufficiently regulate PFAS as a class in permitting industrial facilities (DEC only regulates PFOA and PFOS). This regulatory gap gives no assurances that PFAS will not be permitted into the environment.

The environmental analysis must identify the specific PFAS to be used at the facility; how those PFAS will be used; and all anticipated releases via air emissions and surface and wastewater discharges, including discharges from the Project's industrial wastewater treatment plant ("IWWTP"). The Final EIS must incorporate mitigation measures to require safer, non-PFAS alternatives wherever available and specify permitting conditions that prohibit the release of PFAS used at the Micron facility.

#### ***DEIS must discuss Micron's PFAS Air Emissions***

The DEIS acknowledges that Micron will use and release fluorinated gasses ("F-gasses"), with almost 2.5 tons of projected "fluorides" emissions from fabs 1 and 2 alone. But the DEIS overlooks the fact that many F-gasses are themselves PFAS or PFAS-precursors, the adverse impacts of which extend far beyond their contribution to climate change.

F-gasses comprise more than 60 percent of the world's annual PFAS emissions. In the environment, most F-gasses degrade into trifluoroacetic acid ("TFA"), one of the most prevalent PFAS. In addition to its high persistence, TFA is associated with developmental toxicity and liver and thyroid harm. TFA is ubiquitous in the environment and extremely difficult to control, since "methods to remove TFA from water are expensive and often inefficient due to TFA's persistence and mobility." Here, not only does the DEIS fail to mention TFA, but the County "never considered the potential impacts of the Project's [F-gas] emissions at all." "

The DEIS fails to discuss the limitations of thermal treatment options for PFAS, which resist thermal degradation, despite industry's claims of high PFAS destruction rates, recent air sampling around a Chemours thermal oxidizer in North Carolina detected high levels of PFAS. Air permits for existing Micron facilities do not address PFAS air emissions, and the DEIS contains "no 'reasoned elaboration' as to why . . . the issuance of a state facility permit . . . would result in no significant adverse environmental impact from the project's air emissions." The final EIS must consider the Project's PFAS air emissions and impose specific mitigation measures to address PFAS air emissions in subsequent state permits.

#### ***DEIS must discuss Micron's disposal of PFAS chemicals***

Their unique chemical structure also makes PFAS difficult to treat and dangerous to dispose of. Conventional wastewater treatment processes will remove some, but not all PFAS, especially the short-chain PFAS that are most widely used in semiconductor manufacturing. Even the successful removal of PFAS from wastewater creates waste products – such as spent carbon filters or reverse osmosis concentrate – with high PFAS concentrations. The disposal of these treatment residuals presents further problems, since traditional means of waste disposal do not effectively contain or destroy PFAS.

The incineration of PFAS waste presents similar concerns. PFAS are widely used in firefighting foam precisely because they do not break down when burned. Those same properties make PFAS extremely difficult to incinerate, and EPA has acknowledged that "the effectiveness of incineration to destroy PFAS compounds . . . is not well understood." The incomplete combustion of PFAS "can result in the formation of smaller

PFAS,” as well as other toxic chemicals like hydrogen fluoride. These products of incomplete combustion are then released with any residual PFAS via the incinerator’s air emissions, “spread[ing] them into surrounding areas.” The final EIS must consider the Project’s PFAS disposal and impose specific mitigation measures to ensure disposed.

### ***Micron Fails to Commit to Any Concrete PFAS Mitigation Measures***

The DEIS must identify practicable PFAS mitigation measures. As described above, there are significant gaps in the DEIS analysis in respect to PFAS air or water releases, and wastes, and the DEIS commits only to compliance with future administrative processes and regulations.

Below are a non-exhaustive list of mitigation measures that are needed to “minimize or avoid” the significant adverse effects associated with PFAS. These mitigation measures should be enshrined as conditions to facility permits (e.g., SPDES, Title V).

- **Monitoring:** Significant monitoring protocols should be employed to monitor the Project’s impacts and identify potential PFAS releases using EPA-approved methods that cover the greatest range of detectable PFAS. This monitoring should include monitoring of water discharges (surface and wastewater, before and after pretreatment), air emissions. Micron should fund the quarterly monitoring of PFAS in the influent, effluent and biosolids from the Industrial Wastewater Treatment Plant at the Oak Orchard Site (“IWWTP”).
- **Minimization:** Micron should be required to conduct a PFAS Alternatives Assessment to evaluate the specific PFAS that are known, intended, or reasonably foreseen to be used on site; the respective functions of such PFAS; and whether such PFAS can be reduced or eliminated. The PFAS Alternatives Assessment shall be made public on a dedicated, easy-to-find webpage. Micron should also be required to use less hazardous, non-PFAS alternatives wherever practicable, and prepare an annual report on its actions taken to reduce or eliminate PFAS use.
- **Pretreatment:** The Onondaga County Department of Water Environment Protection (“OCDWEP”) should be required to implement a Pretreatment Program for discharges to the Project’s IWWTP, in accord with Clean Water Act regulations. Such a pretreatment program shall prohibit the discharge to surface or groundwater of any wastewater containing any detectable PFAS to the IWWTP.

Micron must be required to install a pre-treatment plant or have one installed at the Onondaga County industrial WW treatment plant. It should use state-of-the art treatment technology which completely eliminates the entire range of PFAS compounds. An example of such technology is reverse osmosis, followed by treatment of the concentrated reject stream using advanced oxidation or surface plasma treatment. Removal and destruction of PFAS must be confirmed using sophisticated analytical techniques which are capable of detecting the wide range of PFAS compounds which may be present.

- **Other measures:** The SPDES permits issued to Micron and the IWWTP shall include effluent limitations and/or new source performance standards for all PFAS that Micron knows or foresees will be discharged from the facility, including degradation byproducts that are PFAS. Consistent with New York and federal law, if neither EPA nor New York has developed effluent limitations, standards, or guidance values for a PFAS that Micron foresees discharging, DEC should develop the effluent limitations and/or standards based on the best available technologies economically achievable using its best professional judgment. The SPDES permit issued to the IWWTP shall prohibit the land application of biosolids.

### **Conclusion**

We urge Project Proponent and other involved agencies to fully evaluate the Project’s PFAS impacts, to consider feasible alternatives and mitigation measures, and to require mitigation that eliminates significant adverse impacts by preventing PFAS releases and exposures.

The current DEIS inappropriately defers PFAS impacts and lacks sufficient assurances to protect the community and New York’s environment. The Project should be a model of sustainable semiconductor production, and a demonstration that domestic microchip production need not worsen the nation’s PFAS contamination crisis. The final EIS should require mitigation that eliminates significant adverse impacts by preventing PFAS releases and exposures.

Respectfully submitted,

Tracy Frisch, MS

**Subject:** [EXTERNAL] Questions

---

Why didn't you want to hold more public hearings on environmental impacts?  
Why are you not extending the deadline as requested?

That doesn't seem like a good partnership to me.

Ever see the movie Erin Brockovich? That's what the plant and lack of planning for true and very real environmental concerns reminds me of. Your plant and jobs are not wanted here if you can not transparently disclose everything you are doing about every question below. Our area is beautiful and you're about to screw it all up if you don't take this seriously. Go somewhere else if you can't figure all of this out with careful planning and full disclosure of those detailed plans BEFORE you take any further actions or touch our pristine area. Most of us do not want this so the lack of proper planning and disclosures just makes it even worse.

## 1. Water usage and quality

- **Clarification on wastewater discharge:** Micron initially projected discharging 4 million gallons of wastewater per day, which was later revised to 8-20 million gallons/day. What factors contributed to this significant increase, and what further details can be provided on the anticipated volume and composition of the discharge?
- **Wastewater treatment effectiveness:** While Micron plans to build an on-site pretreatment plant and utilize the county's expanded wastewater treatment facility, details on the specific technologies and expected effectiveness in removing all pollutants, especially "forever chemicals" (PFAS), remain unclear. How will Micron ensure the complete and safe removal of all hazardous substances before discharge into the Oneida River, and will regular, independent monitoring be conducted to verify treatment effectiveness?
- **Contingency plans for spills and leaks:** Given the significant volume of chemicals stored and used on-site (up to 56 million gallons of corrosives), what are the comprehensive contingency plans and emergency response procedures in place to prevent and manage potential spills or leaks, particularly into water sources like Lake Ontario and surrounding wetlands?
- **Transparency on chemical usage:** Public concern exists regarding the lack of transparency about the specific chemicals Micron will use in its production process. What steps will Micron

take to disclose this information, recognizing the potential impact on public health and the environment?

## 2. Air quality and greenhouse gas emissions

- **Greenhouse gas emission mitigation:** The DEIS estimates Micron's annual direct and indirect CO<sub>2</sub> emissions at nearly 5 million tons, potentially threatening New York State's climate goals. While Micron pledges to purchase carbon-free electricity, concerns exist regarding the feasibility and impact of acquiring such a large amount of renewable energy credits and power purchasing agreements in New York State. What concrete steps will Micron take to ensure its operations align with the state's climate goals, and are they actively exploring on-site renewable energy generation beyond the proposed rooftop solar panels?
- **Air emission monitoring and control:** What specific technologies and protocols will be implemented to monitor and control air emissions, especially hazardous air pollutants, from the manufacturing process and supporting facilities (e.g., bulk gas yards)? How will Micron ensure these measures are consistently effective in protecting local air quality?

## 3. Land use and habitat impact

- **Wetlands mitigation effectiveness:** Micron plans to destroy over 200 acres of wetlands and create/restore hundreds of acres elsewhere as mitigation. What measures will be in place to ensure the created/restored wetlands adequately replace the ecological functions and biodiversity of the destroyed wetlands?
- **Habitat preservation and management:** Given the presence of endangered and threatened species like the Indiana Bat on the project site, what long-term measures will be implemented to protect remaining habitat areas, ensure the effectiveness of conservation easements, and minimize disruptions during construction and operation?
- **Forest and grassland loss mitigation:** The DEIS projects the loss of over 10,000 acres of forests and grasslands due to Micron and associated development. What strategies will Micron implement to reduce or offset this loss, particularly considering the role these ecosystems play in carbon sequestration and biodiversity?

## 4. Community impacts and sustainability

- **Affordability of energy and water:** Micron's significant energy and water demands raise concerns about their impact on the affordability and availability of these resources for the wider community. How will Micron ensure their operations do not disproportionately burden residents through increased utility costs or resource scarcity?
- **Local infrastructure and emergency services:** The massive scale of the project will strain existing infrastructure, including roads, utilities, and emergency services. While plans for infrastructure improvements are mentioned, details are lacking on Micron's contributions to these costs and how impacts on services like emergency response will be managed, particularly during a potential chemical incident. We deserve to see the full plan, what is your plan?
- **Sustainable development goals and metrics:** Micron has committed to sustainable development goals within the Green CHIPS incentive program, such as reducing greenhouse gas emissions and expanding water restoration efforts. What specific, measurable metrics will be used to track progress towards these goals, and how will Micron ensure regular public reporting on these metrics?

Onondaga County Industrial Development Agency (OCIDA)  
ATTN: Micron Project  
335 Montgomery Street, Floor 2M  
Syracuse, New York 13202

To whom it may concern:

CenterState CEO is pleased to submit comments for the Micron project Draft Environmental Impact Statement, along with more than 110 business and community leaders.

After decades of disinvestment, manufacturing losses and economic stagnation, Central New York is at a moment of unprecedented investment, growth and opportunity. A moment of growing optimism and hope for the future, one where competitive industries can thrive, attract new residents, and where our kids don't have to look elsewhere to find opportunity.

That moment was sparked when Micron Technology announced in October 2022 it would invest \$100 billion to construct four fabs in the Town of Clay. The company's decision was made possible because leaders in Onondaga County realized they had something special in Clay's White Pine Commerce Park. It offered a unique set of infrastructure assets, with requisite power, water and geology. Combined with strategic property acquisition over the past few years, it is one of a handful of sites in the nation large enough to attract such a semiconductor megaproject, an increasingly important industry for consumers, businesses and U.S. national security. Micron, one of the world's leading computer chip manufacturers, was attracted by the site's amenities, and saw promise in the region's workforce and commitment to further building a skilled talent pipeline.

After more than two years of expert review and significant public input, including several open houses and public hearings, our community's extensive planning was validated by one of the most exhaustive environmental analyses ever considered for a project in New York, the project's Draft Environmental Impact Study.

**When viewed in its totality, the DEIS shows that Central New York is one of, if not *the*, best places in the world for critical, leading-edge semiconductor manufacturing.**

Through this project, Micron is setting new standards for megaprojects in wildlife conservation and habitat protection, wetlands restoration and water recycling systems, to name a few. Perhaps most importantly, Micron's project in Clay will avoid approximately 77% of potential greenhouse gas emissions by adhering to New York's climate protection laws. In

**Creating a region where business thrives and all people prosper.**

115 W. Fayette Street | Syracuse, NY 13202 | 315.470.1800 | centerstateceo.com

addition, more than 86% of the electricity used at the site will be generated from carbon-free energy sources.

At the same time, Central New York will benefit from sorely needed investments in regional infrastructure including water and wastewater systems, the electric grid and much-needed road and highway investments in Onondaga County's northern suburbs. We are already seeing commitments to expand and improve our civic infrastructure with needed investments in child care and health care across the region. Building permits for new housing are up by more than 50%, which will help address both current and future housing needs. These investments are in addition to the \$500 million Community Investment Fund established as part of Micron's commitment to New York State through the Green CHIPS Excelsior Jobs program.

These benefits precede the project's 4,200 construction jobs, 9,000 permanent jobs and up to 40,000 follow-on jobs expected to drive meaningful population growth to the Syracuse area for the first time in generations, delivering \$16.7 billion in annual real economic output in New York.

In 2041, when its fourth fab is complete, Micron employees in Clay, along with other fabs in the Northeast, will produce one in every four chips made in America. The DEIS notes that the scale of production at all four fabs is crucial to the financial viability of this project and U.S. economic and national security needs.

The Micron Project DEIS confirms what we have long believed—that Central New York is the best region in the nation for semiconductor development—environmentally, socially and economically. We look forward to our continued close partnership with Micron as it builds the most environmentally sustainable chip facility in the world.

Sincerely,

ATTN: Micron Project  
Onondaga County Industrial Development Agency (OCIDA)  
335 Montgomery Street, Floor 2M  
Syracuse, New York 13202

Dear Sir or Madam:

Citizen Action of New York (Citizen Action) welcomes this opportunity to comment on the Micron Technology (Micron) draft environmental impact statement (DEIS) for the Clay, New York project. Citizen Action is a grassroots membership organization that advocates for social, racial, economic, and environmental justice with chapters or affiliates in eight regions of New York State. Among our policy concerns are climate justice, housing, health care, criminal justice, state and federal budget policies, fair elections, and consumer rights.

**I. Need for an Extension of the Comment Period and Expanded Hearing Process**

Citizen Action joins Central New York (CNY) environmental, workforce, and numerous community organizations in calling for the Onondaga County Industrial Development Agency (OCIDA) to ensure that the massive Micron project benefits neighboring communities and does not inflict harm to the health of Central New Yorkers or the environment. With such a massive project, often touted as the largest private investment in state history, a 45-day comment period is utterly insufficient for a 20,000-page DEIS. Given just 45 days, an individual would have to read over 440 pages a day to get through the DEIS front to back. Additionally, hosting only one day of in-person hearings in one location is simply not enough. The public is entitled to a fair and transparent process in the face of a project with such vast impacts. For these reasons, we urge OCIDA to extend the comment period and host multiple hearings across different days and different times in various locations across CNY.

**II. Compliance With the New York Climate Law and Opposition to Use of Nuclear Power**

Driven by climate change, Central New Yorkers are facing increased instances of extreme weather events, such as heatwaves, flooding, and even tornadoes. The nation and the

world are similarly experiencing horrible loss of life and property from these ever-increasing extreme weather events, most recently seen with deadly flooding in Texas. In response to the climate crisis, New York passed its landmark 2019 climate law, the Climate Leadership and Community Protection Act (CLCPA). This law requires the state to drastically reduce its greenhouse gas emissions and to transition to a renewable energy economy.

By expanding its operations into New York State with the massive Clay project, Micron must adhere to the CLCPA. In order to do so, Micron must commit to generating and investing in a significant amount of renewable energy while greatly reducing its impact on our climate by mitigating any greenhouse gas emissions from its factories. To abide by the 100% renewable energy commitment between Micron and New York State, Micron must commit to investing in proven and safe renewable energy such as wind, solar, geothermal, and battery storage. This must be done without purchasing renewable energy credits.

In addition, Micron must not substitute new nuclear power, otherwise referred to as advanced nuclear power, for the proven and safe renewable energy sources previously mentioned. Pursuing new nuclear facilities in New York will lead to an unfair cost burden on New Yorkers, as proven by the massive bailouts already provided to nuclear facilities in Oswego County. Not only that, more nuclear power will result in additional dangerous nuclear waste being stored and transported in Central New York, threatening the health and safety of its residents.

### **III. Micron Cannot Endanger the Health or Environment of Central New York**

Hundreds of chemicals are used to create microchips, a number of them toxic. It is imperative that Micron does not endanger the health of Central New Yorkers and the environment through exposure to these chemicals, including but not limited to PFAS, often referred to as forever chemicals. Numerous communities across New York State, including Hoosick Falls in Rensselaer County, have suffered massive harms from PFAS exposure. We cannot risk any such exposure in Clay and surrounding communities. Therefore, Micron must limit its use of toxic chemicals to the greatest extent possible and must commit to protecting the surrounding soil, water, and air from contamination.

### **IV. Additional Concerns**

The massive Micron project impacts many facets of CNY beyond its climate, environmental, energy usage, and chemical issues. Citizen Action of New York shares the concerns raised by Jobs to Move America (JMA) regarding Micron's impacts on wetlands, native species, and ecological communities, job access, workforce development, equitable and safe workplaces, housing and transportation justice and equity.

Once again, thank you for the opportunity to comment on the Micron DEIS. If you have any

questions, I may be reached via the telephone number or email below.

Very truly yours,

A handwritten signature in black ink, appearing to read "Bob Cohen". The signature is fluid and cursive, with the first name "Bob" and last name "Cohen" clearly distinguishable.

Bob Cohen, Esq., Research and Policy Director

**Subject:** [EXTERNAL] Comments on Micron Draft Environmental Impact Statement

To Whom it May Concern,

I have many concerns about Micron Fab plant development, and many of these were not fully addressed in the DEIS. It has been said repeatedly that this is an “Erie Canal Moment” for Central New York. As an historian, I am acutely aware that while the Erie Canal brought significant changes and advancement to many settled in Central New York, it also tremendously and adversely affected the Indigenous population that was already there and made unalterable changes in the ecology and economy of the region. Micron may make equally big changes.

We need to support the changes that we deem beneficial and work hard to document and mitigate the most harmful impacts.

For me – and many others who have followed the development of this project and the roll-out of the DEIS - these fall into three main categories.

1. Excessive water consumption and the likelihood of regular and unintentional water contamination of local lakes, rivers, streams, and wells. Does the massive projected outflow of Lake Ontario water to Micron violate the Great Lakes Compact?
2. Excessive energy consumption that cannot now be met with renewable sources without forced more use down the line of fossil fuels (as well as higher electric prices for smaller residential and commercial consumers). Micron is going to exponentially INCREASE energy use in New York State. How realistic is it that this increase can be met with renewables. Isn't it more realistic that for many years we will see an increase in fossil fuel use (especially gas) in New York State due to Micron energy needs?
3. The excessive use of PFAS (“forever”) chemicals without proper consideration and oversight of what these chemicals are, what their effects are individually and collectively, and how they will be stored and disposed of. PFAS chemicals (forever chemicals) are often highly toxic and are always persistent in the environment. Like most chemicals introduced for industrial and other use there is little or no advance testing for health and safety impacts, and there is no testing of chemical combinations.

I have some faith that the regulators, engineers, and government agencies will work with Micron to manage water and energy use. The problems need to be recognized, and Micron and other technology leaders should

commit to not just supporting chip manufacturing, but to support and develop technological development that will reduce water and electrical use.

Based on my past work as an historian fo the plastics industry, I am much more worried about the third item – chemicals. Here one cannot see the danger, but we know from experience that the dangers of chemical pollution can be very serious, and importantly long-lasting. The harm done often is not even measurable until the damage is done (and sometimes even the polluting factory has closed).

In the case of Micron – we do not even know the names and numbers of the actual chemicals used in their chip process – so NONE of the chemicals can be evaluated. This problem is not unique to Micron, but in this case since so many taxpayer dollars are spent to develop this project, we need much more transparency and oversight, and absolute dedication by Miron to continuously monitor and improve the use and disposal of PFAS and other toxins. PFAS don't break down, they accumulate in the soil and the water and in wildlife – and can in humans, too. We know in Update New York the perils of unmonitored and untested industrial pollution. We are still cleaning up the mess of the 19<sup>th</sup> and 20<sup>th</sup> centuries, and thousands and paid the price in health problems over the decades. We need to go into the Micron era with eyes wide open, and with a commitment to public health and environmental quality. Micron should provide a detailed list of chemicals for the mixing zone in the Oneida River and then dispersed in Lake How does the disbursement take place, who monitors, and how often? How will unintentional chemical spills be dealt with, and how many chemicals will be stored on site, and under what control?

Lists of chemicals released into the air should also be provided and studied and well as a detailed list of industrial waste going into local landfills.

Like everyone else in the region I am also concerned about traffic, local jobs, rising housing prices ...but I think all these things can be reasonably addressed. But we still need better answers about Water, energy and chemical.

Thank you,

Samuel D. Gruber, Ph.D.

Onondaga County Industrial Development Agency (OCIDA)  
ATTN: Micron Project  
335 Montgomery Street, Floor 2M  
Syracuse, New York 13202  
Submitted to: chipsnepa@chips.gov

**Re: MICRON PROPOSAL DEIS COMMENTS RE: WATER USE AND THE GREAT LAKES COMPACT**

Dear Onondaga County Industrial Development Agency,

Thank you for the opportunity to provide feedback on the Draft Environmental Impact Statement (DEIS) for the planned Micron semiconductor manufacturing facility in Clay, New York. Freshwater Future is a Great Lakes-based, binational 501(c)(3) and is a catalyst for community action that strengthens policies designed to safeguard the waters of the Great Lakes region. Our organization submits this comment to specifically address the project's estimated water use and the requirements of the Great Lakes Compact ("the Compact"). Freshwater Future was an active contributor to the creation of the Compact and has significant concerns that current water withdrawal permits underestimate the scale of the proposed project's water use.

The Great Lakes Compact seeks to protect the water in the Great Lakes Basin from diversions or large-scale withdrawals out of the Basin, in order to keep water in the ecosystem. Depleting water would harm the ecosystem that millions of people depend upon for not only drinking water, but also for the quality of life and culture created by living in the Basin.

The Compact recognizes "consumptive use" and makes certain allowances. For example, water used in the manufacturing process that leaves the basin as part of a product is a consumptive use and is not considered a diversion under the Compact. However, the Micron Proposal DEIS triggers a concern related to the Compact due to the **scale** of water use and the potential consumptive use from this manufacturing operation.

New York state law was updated to incorporate the obligations required by the Compact. The state requires a permit for any type of water withdrawal system having the maximum capacity to withdraw 100,000 gallons per day (gpd) or more of surface water or groundwater. The DEIS notes that the 48 MGD (million gallons per day) that would be required for the full build-out of the Proposed Project would be sourced from Lake Ontario through the Lake Ontario Water Treatment Plant, which currently has a practical sustained output of approximately 54 MGD, a maximum capacity of 60 MGD, and a permitted water withdrawal limit of up to 62.5 MGD.

Also, according to the DEIS, Onondaga County Water Authority's (OCWA) existing infrastructure could accommodate the freshwater demand exclusively from Fabrication Buildings (Fabs) 1 and 2 with minor upgrades. However, to accommodate the freshwater demand beyond Fabs 1 and 2 and induced growth, OCWA would need to obtain a modification to its withdrawal permit. OCWA may pursue a permit modification earlier as part of its long-range capacity planning efforts.

**A review of the existing water withdrawal permits should be required now.** The DEIS notes that Table 3.10-3 shows the Proposed Project's estimated 2041 water usage, when added to current user demand, would exceed OCWA's base case water capacity by approximately nine percent. Micron asserts that uncertainty factors could dispute some concerns and that is reason enough to put off predictions of needed water use. We believe every effort should be made now to predict and request permissions related to water withdrawals, before the project is fully underway.

Also, the Proposal DEIS notes the following:

*The Proposed Project would rely primarily on water withdrawn, and ultimately returned to Lake Ontario, which is one of the largest freshwater bodies in North America (see Chapter 3.10, Utilities and Infrastructure). While there are projections for increased variability in lake levels under future climate scenarios, including potential for extreme highs and lows, the expectation is that water levels in the lake are anticipated to increase slightly in a future affected by climate change, which further indicates that the Proposed Project is unlikely to have any significant adverse impact on freshwater supply.<sup>1</sup>*

**No mention is made of the loss of water to consumptive use – potentially millions of gallons. Again, the existing permit should be reviewed now.**

---

<sup>1</sup> MICRON SEMICONDUCTOR MANUFACTURING PROJECT, CLAY, NY, DRAFT ENVIRONMENTAL IMPACT STATEMENT, Section 3.7.4 Climate Change and Resiliency, page 3-212

The State Environmental Quality Review Act requires agencies to identify any “adverse environmental impacts that cannot be avoided or adequately mitigated if the proposed action is implemented.”<sup>2</sup> The DEIS notes that significant adverse impact is considered “unavoidable” if there are no reasonably practicable mitigation measures to eliminate the impact, or if there are no reasonable alternatives to the proposed project that would meet the purpose and need of the action, eliminate the impact, and not cause other or similar significant adverse impacts.

In chapter 5 of the DEIS, the following is noted:

*The Preferred Action Alternative also would have significant effects on localized surface water and stream resources despite the implementation of mitigation measures. See Chapter 3.3 (Water Resources). As a result of the construction of the Proposed Project, most of the existing stream channels currently located in what would become the Micron Campus Site and Rail Spur Site would be lost. Loss of these surface water and stream resources is considered an unavoidable significant impact of the Preferred Action Alternative.*<sup>3</sup>

We urge DEC to review the water withdrawal permits to ensure that the spirit of the Great Lakes Compact is upheld for the development of this important proposal.

Sincerely,

Jill M. Ryan  
Executive Director

CHIPS Program Office  
U.S. Department of Commerce  
100 Bureau Drive  
Gaithersburg, Maryland 20899

Onondaga County Industrial Development Agency  
335 Montgomery Street, Floor 2M  
Syracuse, New York 13202

To Whom it May Concern:

On behalf of Syracuse University, I write in support of the Draft Environmental Impact Statement (DEIS) released by Onondaga County, the U.S. Department of Commerce, and Micron.

Syracuse University is a private research university that advances knowledge across disciplines to drive breakthrough discoveries and breakout leadership. Our collection of 13 schools and colleges with over 200 customizable majors close the gap between education and action, so students can take on the world.

The DEIS marks a major milestone in transforming Micron's historic investment in Central New York from promise to reality. This once-in-a-generation opportunity will reshape our region, drive innovation and advance economic prosperity for all. Syracuse University stands proudly in support of this ambitious endeavor.

The DEIS outlines the scope of the project and reflects a careful approach to managing the potential impacts of a development of this scale. Syracuse University's deep commitment to a sustainable future is evidenced by the aggressive goals outlined in our Climate Action Plan and is part of our ethos. That is why we are encouraged by the substantial investment and thoughtful mitigation strategies proposed to protect public health, local ecosystems and the overall quality of life in our region.

Since 2022, when Micron and elected leaders first gathered on our campus to announce the company's plans, Syracuse University has worked closely with regional partners to help lay the foundation for long-term success.

Through our leadership in the Future-Ready Workforce Innovation Consortium, together with our area partners, we are developing a cutting-edge talent pipeline for New York State and beyond. This effort includes academic programs, skills training and forward-thinking partnerships to build a strong, sustainable workforce pipeline.

Syracuse University's D'Aniello Institute for Veterans and Military Families (IVMF) has partnered with Micron to create the nation's first semiconductor training hub focused specifically on veterans and military-connected individuals. The inaugural cohort has already completed training, a testament to the speed and seriousness with which we are approaching this opportunity.

We are also collaborating with Onondaga County on the Syracuse University Center for Advanced Semiconductor Manufacturing, which remains on track to open later this year. And as a founding member of the Northeast University Semiconductor Network, our University is helping to build the academic and training infrastructure that the semiconductor industry in Central New York will need to thrive.

On campus, we are fostering a culture of awareness and engagement. Our first annual Micron Day in early 2025 introduced students, faculty, and staff to Micron leaders and provided insights into the groundbreaking work ahead. Micron Day reflects our belief that real opportunity starts with deep understanding.

Syracuse University is also expanding the impact and contributions of its College of Engineering and Computer Science to help Micron meet its demand for highly skilled engineers and scientists. And through the Micron Student Internship Program, we are preparing tomorrow's professionals to move directly from campus to careers in semiconductors.

Why does this matter? Because Micron's investment goes far beyond jobs and buildings. It's about our community and our people's futures.

For our region: economic revitalization, population growth, and a renewed position at the forefront of American innovation. For students: new internships, career paths, and hands-on learning. For faculty and staff: new collaboration opportunities, research expansion, and professional growth and development.

Much like the Erie Canal once opened New York to the world and transformed its economic future, Micron's presence in our community has the potential to redefine what's possible for this region and for the nation.

A project of this magnitude will come with challenges, change and growing pains. But more than anything, it brings unprecedented opportunity - to transform lives, strengthen our communities and shape the future of Central New York. This is not the moment to pause. This is the moment to lead.

Syracuse University stands ready to meet that moment - not just for our campus, but for our region and our country. The path ahead demands bold action, shared commitment, and unwavering resolve. Micron's success is Central New York's success.

Thank you for your consideration of these comments.

Sincerely,

J. Michael Haynie, Ph.D.  
Vice Chancellor, Strategic Initiatives & Innovation  
Executive Dean, Whitman School of Management

**Subject:** [EXTERNAL] Watershed contamination

**Importance:** Normal

**Sensitivity:** None

---

Dear OCIDA,

The current moment and future of central New York is nicely summarized by the following song lyric:

*"Forget about tomorrow, why ask why?  
We'll all drink money when the well runs dry"*

I am extremely concerned with the expedited process surrounding the Micron Draft EIS.

The issue of PFAS/PFOA/per-and polyfluoroalkyl chemical contamination must be thoroughly, exhaustively addressed among dozens of other quality of life issues surrounding Micron.

We know why Micron is here. The water, the land, and a compliant local, state, and national government. There is money to be made here.

Central New York water is our most precious resource and contamination by forever chemicals is unacceptable. The depletion of our water supply for industrialization of Lake Ontario water and throughout the watershed is unacceptable. The public should not trade jobs for long term illness, environmental degradation, and litigation that will cost the taxpayers across generations. Water must be sacrosanct. PFAS/PFOA/per-and polyfluoroalkyl chemicals in our neighbors water is unacceptable. Turning Lake Ontario and our watershed into a toxic reservoir for industrial profit is unacceptable. We drink this water. We swim in this water. This water is our heritage. Will we protect it or turn it over to private industry?

We know the consequences. We know what has happened in Parkersburg, WV, Wilmington, NC, Hoosick Falls NY and the list goes on and on when public water becomes industrialized. The people of Syracuse and Oswego know all about these toxic legacies, let's not repeat that history listening to the music of Micron's siren song. Will we be fooled again? So far, it looks that way.

We know the strategies used by industry to hide the identity of toxins used in the manufacture of their PFAS/PFOA/per-and polyfluoroalkyl compound dependent products. The volumes of water potentially polluted by these unidentified chemicals is staggering.

We know how regulations are avoided by not disclosing the names of chemicals deemed "proprietary."

We know how industry pollutes based on regulations that are written in their favor so that compounds not specifically named in regulations don't have to be monitored or controlled.

We know that the precautionary principle is routinely ignored in favor of innovation and expediency and national security. We know these chemicals are not adequately monitored right now, let alone in a Micron world.

We know the games and deceits that allow our water to become toxic. Choices to look the other way kill people... see

the communities listed above. Does Central New York want to be a “sacrifice zone?”

We know how industry and a complicit government will want to fast track and ignore public concerns in the name of jobs, national security or national defense. They’ll scare us with threats that address everything but our health or a healthy environment.

We know about legal definitions and plausible deniability. Just because the tragically dismantled, toothless EPA says something isn’t a pollutant doesn’t make it right to pollute. We know the game. Define the problem out of existence and then claim plausible deniability.

We know how the “merchants of doubt” operate. We know how vandals of public trust operate.

Will a new standard be set in Central New York?

Will Micron, Onondaga County, the State of New York, and federal representatives do right by the people of this region? Or will our government betray the people for private profit margins? Should we trade employment for personal illness and tragedy?

As our government tries not to think about the pollution and water extraction issues (among dozens of others surrounding Micron), here are some basic pollution concerns.

1. How will Micron prevent ALL of the thousands of PFAS/PFOA/per-and polyfluoroalkyl chemicals from entering our drinking water supply?
2. Specifically, what filtration systems will be used to monitor PFAS/PFOA/per-and polyfluoroalkyl in our watershed and drinking water. What are the systems, how will they work, how often will they be replaced, and who will pay?
3. Who will pay for pollution remediation in our drinking water system when loopholes are used and contamination is inevitably discovered that is caused by previously undocumented PFAS/PFOA/per-and polyfluoroalkyl chemicals? We know the legal games ahead. Can we set the ground rules ahead of the pollution or will we be naive? Who will protect the family with polluted water?

All of us need to remember that Micron needs us. They need our water, our land, or business friendly environment. They are using public resources. However, their duty is to their shareholders, not the public of central New York. Their obligation is to profits for their shareholders.

The people and natural resources of central New York are simply a means to maximize profit margins. When we hold them accountable, I doubt they will be so friendly (see the polluters and their communities above). Same story, different location.

We, the public, expect the highest standards from Micron and all governmental representatives at all levels. Rest assured, a portion of the public is watching and we know the game. We won't be fooled. We follow facts and evidence, not platitudes and wishful thinking.

Thank you for your attention to this important matter.

Our health, families, and environment depends on your decisions.

Eric Hellquist  
Oswego, NY

Onondaga County Industrial Development Agency  
335 Montgomery Street, Floor 2M  
Syracuse, New York 13202

To Whom it May Concern:

On behalf of Syracuse University, I write in support of the Draft Environmental Impact Statement (DEIS) released by Onondaga County, the U.S. Department of Commerce, and Micron.

Syracuse University is a private research university that advances knowledge across disciplines to drive breakthrough discoveries and breakout leadership. Our collection of 13 schools and colleges with over 200 customizable majors close the gap between education and action, so students can take on the world.

The DEIS marks a major milestone in transforming Micron's historic investment in Central New York from promise to reality. This once-in-a-generation opportunity will reshape our region, drive innovation and advance economic prosperity for all. Syracuse University stands proudly in support of this ambitious endeavor.

The DEIS outlines the scope of the project and reflects a careful approach to managing the potential impacts of a development of this scale. Syracuse University's deep commitment to a sustainable future is evidenced by the aggressive goals outlined in our Climate Action Plan and is part of our ethos. That is why we are encouraged by the substantial investment and thoughtful mitigation strategies proposed to protect public health, local ecosystems and the overall quality of life in our region.

Since 2022, when Micron and elected leaders first gathered on our campus to announce the company's plans, Syracuse University has worked closely with regional partners to help lay the foundation for long-term success.

Through our leadership in the Future-Ready Workforce Innovation Consortium, together with our area partners, we are developing a cutting-edge talent pipeline for New York State and beyond. This effort includes academic programs, skills training and forward-thinking partnerships to build a strong, sustainable workforce pipeline.

Syracuse University's D'Aniello Institute for Veterans and Military Families (IVMF) has partnered with Micron to create the nation's first semiconductor training hub focused specifically on veterans and military-connected individuals. The inaugural cohort has already completed training, a testament to the speed and seriousness with which we are approaching this opportunity.

We are also collaborating with Onondaga County on the Syracuse University Center for Advanced Semiconductor Manufacturing, which remains on track to open later this year. And as a founding member of the Northeast University Semiconductor Network, our University is helping to build the academic and training infrastructure that the semiconductor industry in Central New York will need to thrive.

On campus, we are fostering a culture of awareness and engagement. Our first annual Micron Day in early 2025 introduced students, faculty, and staff to Micron leaders and provided insights into the groundbreaking work ahead. Micron Day reflects our belief that real opportunity starts with deep understanding.

Syracuse University is also expanding the impact and contributions of its College of Engineering and Computer Science to help Micron meet its demand for highly skilled engineers and scientists. And through the Micron Student Internship Program, we are preparing tomorrow's professionals to move directly from campus to careers in semiconductors.

Why does this matter? Because Micron's investment goes far beyond jobs and buildings. It's about our community and our people's futures.

For our region: economic revitalization, population growth, and a renewed position at the forefront of American innovation. For students: new internships, career paths, and hands-on learning. For faculty and staff: new collaboration opportunities, research expansion, and professional growth and development.

Much like the Erie Canal once opened New York to the world and transformed its economic future, Micron's presence in our community has the potential to redefine what's possible for this region and for the nation.

A project of this magnitude will come with challenges, change and growing pains. But more than anything, it brings unprecedented opportunity - to transform lives, strengthen our communities and shape the future of Central New York. This is not the moment to pause. This is the moment to lead.

Syracuse University stands ready to meet that moment - not just for our campus, but for our region and our country. The path ahead demands bold action, shared commitment, and unwavering resolve. Micron's success is Central New York's success.

Thank you for your consideration of these comments.

Sincerely,

J. Michael Haynie, Ph.D.

ATTN: Micron Project  
Onondaga County Industrial Development Agency (OCIDA)  
335 Montgomery Street, Floor 2M  
Syracuse, New York 13202

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York.

Communications Workers of America, AFL-CIO, (CWA) is a union of hundreds of thousands of public and private sector workers in communities across the United States—including Puerto Rico, the U.S. Virgin Islands, and other U.S. Territories—and Canada. In New York, we represent 65,000 workers. Our members work in telecommunications and tech, the airline industry, manufacturing, news media, broadcast and cable television, education, health care, public service, and other fields. For years, CWA members have fought for domestic manufacturing, fair trade policies, and strong workplace and environmental standards for workers globally.

IUE-CWA is the industrial division of CWA. IUE-CWA members work in a wide range of manufacturing sectors, including power generation, aerospace, automotive, semiconductors, and other critical industries.

Despite the submission of the following comments, please consider that the 45-day comment period does not give the public enough time to read and fully understand the 20,000-page report. We are asking for an extension of the comment period to October 25, 2025, at a minimum, and note that there has been no public response to a petition signed by over 1,500 residents of the region asking the same. Based on our current understanding of the DEIS, we still wish to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

### **Protection of Air, Water, and Workers**

The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. As noted in previous comments we have submitted, semiconductor manufacturing is highly dependent on the use of thousands of hazardous chemicals, posing a serious risk to worker and community safety. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

### **Affordable and Abundant Water and Energy**

The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

### **Job Access, Housing & Transportation**

The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed-income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

### **Greenhouse Gases**

The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar – without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

### **Water and Ecological Resources**

The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

Sincerely,

Carl Kennebrew  
President, IUE-CWA

Re: Draft Environmental Impact Statement for Micron Semiconductor Manufacturing  
Project, Clay, NY

Dear Mr. Petrovich and Ms. McKay:

Chips Communities United (“CCU”), along with Earthjustice, Natural Resources Defense Council, and Sierra Club Atlantic Chapter, submit these comments on the Draft Environmental Impact Statement (“DEIS”) for the Micron Semiconductor Manufacturing Project in Clay, New York (the “Project”). CCU is a national coalition of labor, environmental, social justice, civil rights, and community organizations dedicated to the socially and environmentally responsible development of the semiconductor industry. With \$280 billion in taxpayer dollars supporting domestic semiconductor manufacturing, including more than \$6 billion for the Project itself, CCU works to ensure that substantial public investment benefits workers, strengthens communities, and protects the environment. A necessary first step towards responsible semiconductor manufacturing is a comprehensive analysis of the environmental and social impacts of proposed manufacturing projects.

The National Environmental Policy Act (“NEPA”) and State Environmental Quality Review Act (“SEQRA”) require precisely that analysis. Those laws “require[] . . . agencies to take into account all environmental consequences of their projects before they decide to undertake them . . . as well as all possible and feasible mitigation measures.”<sup>1</sup> The “heart” of NEPA and SEQRA review is an environmental impact statement (“EIS”), a detailed assessment that “alert[s] responsible public officials to environmental changes before they have reached ecological points of no return.”<sup>2</sup>

The Project’s DEIS fails to meet those statutory requirements. These comments focus on one core shortcoming of the DEIS: the failure to take a hard look at the Project’s use, release, and

---

<sup>1</sup> *Town of Henrietta v. N.Y. Dep’t of Env’t Conservation*, 76 A.D.2d 215, 221 (4th Dep’t 1980).

<sup>2</sup> *Id* at 220.

disposal of per- and polyfluoroalkyl substances (“PFAS”), as well as alternatives and mitigation measures that would prevent the significant adverse effects associated with PFAS.<sup>3</sup>

PFAS are a class of over 15,000 synthetic, long-lasting, and highly toxic chemicals. Often referred to as “forever chemicals” because of their extreme persistence in the environment, PFAS contaminate up to 45% of the nation’s tap water and the blood of nearly the entire U.S. population.<sup>4</sup> Many PFAS are linked to cancer, immunotoxicity, reproductive and developmental harm, and other serious health effects at even extremely low exposure levels. Despite these serious risks, PFAS remain widely used in the production of semiconductors, and the DEIS acknowledges that Micron would use and release PFAS.

However, the DEIS does not identify which PFAS Micron will use or specify how Micron plans to treat and dispose of its PFAS-containing waste. That information and other details about Micron’s PFAS releases are needed for the government to take a hard look at the Project’s environmental impacts and for the public to understand the extent and severity of the Project’s risk to human health and the environment. The DEIS also fails to consider alternatives that would minimize Micron’s PFAS use or mitigation measures that would prevent PFAS releases. Instead, it offers only noncommittal assurances that PFAS concerns will be handled in future permitting processes, deferring the evaluation and mitigation of significant adverse impacts without any certainty that such permits would even address PFAS releases. SEQRA and NEPA require more than the cursory acknowledgment of serious environmental concerns and wishful thinking about unspecified mitigation.

When the Project was announced in 2022, the State of New York, Onondaga County, and Micron pledged to make it “one of the most sustainable chip fabs in the world.”<sup>5</sup> We support that commitment, and the EIS should provide the roadmap for achieving it. With respect to PFAS, the Onondaga County Industrial Development Agency (“OCIDA”) and CHIPS Program Office of the Department of Commerce must identify all the ways the Project may use or release PFAS; require the use of safer, non-PFAS alternatives wherever available; and prohibit the environmental release of any PFAS that cannot be fully eliminated, including PFAS releases

---

<sup>3</sup> Some of the signatories to these comments are submitting additional comments addressing other deficiencies in the DEIS. While these comments focus solely on PFAS, the Project will also use and release many other toxic chemicals, and the DEIS must fully evaluate and mitigate the unreasonable adverse effects from those releases as well.

<sup>4</sup> U.S. Geological Surv., *Tap Water Study Detected PFAS ‘Forever Chemicals’ Across the U.S.* (July 5, 2023), <https://www.usgs.gov/news/national-news-release/tap-water-study-detects-pfas-forever-chemicals-across-us>; Julianne Cook Botelho et al., *Per- and Polyfluoroalkyl Substances (PFAS) Exposure in the U.S. Population: NHANES 1999–March 2020*, 270 *Env’t Rsch. <sup>5</sup> Resolution of New York Governor Kathy Hochul, U.S. Senate Majority Leader Charles E. Schumer, Onondaga County Executive Ryan McMahan, and Micron President & CEO Sanjay Mehrotra re: Oct. 4, 2022 announcement of Micron’s transformative \$100 billion investment to bring Micron semiconductor manufacturing to New York (Oct. 2022), [https://www.scribd.com/document/598753901/Micron-Resolution#from\\_embed](https://www.scribd.com/document/598753901/Micron-Resolution#from_embed).

from the Project’s industrial wastewater treatment plant (“IWWTP”). In these comments, we identify specific measures that would mitigate the significant, adverse impacts associated with the Project’s use, release, and disposal of PFAS. We urge OCIDA and other agencies to require those mitigation measures, among others, as conditions in their respective SEQRA Findings Statements.

## **I. The Release of PFAS from Semiconductor Manufacturing Presents Significant Adverse Effects on Human Health and the Environment**

### **A. PFAS Cause Significant Adverse Effects on Human Health**

“For far too long, communities across the United States have been suffering from exposure to PFAS.”<sup>6</sup> PFAS do not occur naturally, and less than a century ago they did not exist.<sup>7</sup> Over the course of roughly one human lifespan, PFAS contamination has spread across the world, harming countless people and species.<sup>8</sup> In the United States, PFAS are estimated to contaminate the drinking water supplies for up to 200 million people,<sup>9</sup> and they are frequently detected in human blood, breast milk, and umbilical cord blood, contaminating fetuses in the womb.<sup>10</sup>

All PFAS share common characteristics that make them particularly dangerous to people and the environment. First, PFAS have one or more carbon-fluorine bonds, which is the strongest single bond in organic chemistry.<sup>11</sup> This “common structural feature . . . makes [PFAS] highly problematic,”<sup>12</sup> since once they are released to the environment PFAS can persist for

decades or longer, increasing the risk of human or environmental exposures.<sup>13</sup> While PFAS vary in size, structure, and chemical composition, “all PFAS either are extremely persistent in the environment and biota or partially transform into extremely persistent PFAS.”<sup>14</sup>

Second, many PFAS bioaccumulate, or build up, in people and animals, meaning even low-level releases can result in significant long-term exposures and harm.<sup>15</sup> Because PFAS accumulate in living organisms faster than they can be eliminated, their concentrations often increase as they move up the food chain, with people exposed to high levels of PFAS from the consumption of contaminated fish or livestock.<sup>16</sup>

Third, PFAS are highly toxic. The health risks associated with PFAS are well established and broadly recognized by international scientific organizations,<sup>17</sup> federal and state regulatory agencies,<sup>18</sup> and other leading scientific bodies.<sup>19</sup> Many PFAS are associated with “significant and

diverse” adverse health effects that include cancer, liver disease, decreased fertility, high cholesterol, reduced vaccine response, and more.<sup>20</sup> These risks can arise from extremely low levels of PFAS exposure, at times below the levels at which PFAS can be detected in the environment.<sup>21</sup>

Studies have found that workers and communities who are exposed to PFOA—a PFAS previously used in semiconductor manufacturing, among other industries<sup>22</sup>—experience higher rates of thyroid disorders, decreased vaccine response, pregnancy-induced hypertension and preeclampsia, and multiple types of cancer.<sup>23</sup> Despite phasing out PFOA, semiconductor plants continue to use “short-chain” PFAS,<sup>24</sup> which are often associated with the same types of health effects as the long-chain PFAS they are used to replace.<sup>25</sup> In fact, some short-chain PFAS, including GenX, are considered more potent than many long-chain PFAS and are capable of causing harm at even lower levels of exposure.<sup>26</sup>

Because many PFAS have common health effects, people who are exposed to multiple PFAS may face greater risks of harm from these co-exposures. As EPA has explained, “PFAS have dose additive impacts.”<sup>27</sup> Indeed, studies have shown that exposure to PFAS mixtures alters critical biological processes in children and young adults that are associated with an increased

<sup>27</sup> 88 Fed. Reg. at 18,649–50.

risk of developmental disorders, cardiovascular disease, and many types of cancer.<sup>28</sup> Recent human birth cohort studies also report associations between exposures to multiple PFAS during pregnancy and adverse health outcomes, with co-exposures to multiple PFAS associated with even greater risks of gestational diabetes and altered glucose levels during pregnancy, altered levels of thyroid hormones in pregnant people and in newborns, and liver injury in children.<sup>29</sup>

PFAS already contaminate multiple sites in the vicinity of the Project, increasing the potential for cumulative exposures. There is known PFAS contamination at the Hancock Field Air National Guard Base in Syracuse.<sup>30</sup> There is also suspected PFAS contamination at the Oak Orchard Wastewater Treatment Plant site, where Micron intends to build the Project's new industrial wastewater treatment facility.<sup>31</sup> And there are multiple facilities in the area that are suspected of using or having used PFAS, including two airfields immediately south of the Project site.<sup>32</sup>

## B. PFAS Cause Significant Adverse Effects on the Environment

In addition to their health risks, PFAS releases threaten widespread environmental harm, including to protected species in the vicinity of the Micron site. PFAS have been detected in more than 600 different animal species,<sup>33</sup> and “myriad . . . studies have found harm to wildlife from PFAS contamination.”<sup>34</sup> Long-term PFAS exposures are linked to the disruption of metabolic, immune, and endocrine function and to reduced reproduction across a broad range of species, “pos[ing] an additional risk to species already negatively impacted by . . . climate change, harvesting[,] habitat degradation,” and other stressors.<sup>35</sup> High levels of PFAS have been detected in bat guano,<sup>36</sup> suggesting potential impacts to three threatened or endangered bat species in the vicinity of the Micron site.<sup>37</sup> PFAS were also found in the nestlings of bald eagles collected from the Great Lakes region,<sup>38</sup> another endangered species that has been “documented nesting in the vicinity of the Oak Orchard Site” where Micron’s wastewater will be treated.<sup>39</sup>

PFAS also harm livestock and dairy production, threatening the “predominant agricultural land use in [Onondaga County].”<sup>40</sup> The impacts of PFAS first came to light when a West Virginia farmer sued DuPont after PFOA releases from a Parkersburg, West Virginia chemical plant killed hundreds of his cows.<sup>41</sup> High levels of PFAS have also been detected in the bodies and milk of

cattle that graze in PFAS-contaminated fields, forcing the closure of several family farms.<sup>42</sup>

### C. PFAS Are Hard to Remove, and Often Impossible to Fully Destroy, Using Traditional Treatment and Disposal Methods

Their unique chemical structure also makes PFAS difficult to treat and dangerous to dispose of. PFAS often pass through conventional wastewater treatment systems, resulting in additional discharges to the environment.<sup>43</sup> Studies have found concentrations of PFAS in wastewater treatment plant effluent that is “similar to those in [influent] samples,” indicating “minimal PFAS removal during [wastewater treatment plant] treatments.”<sup>44</sup> In many circumstances, PFAS concentrations “increased rather than decreased . . . during treatment,” as PFAS precursors transform into new PFAS during the treatment process.<sup>45</sup> Conventional water and wastewater treatment technologies, such as biological oxidation, coagulation/flocculation, chemical oxidation, and ultraviolet radiation “are inadequate for removing PFAS.”<sup>46</sup> Other treatment technologies—such as the use of granular activate carbon—are less effective at removing the short-chain PFAS that are most widely used in semiconductor manufacturing.<sup>47</sup> As a result, PFAS are widely detected in wastewater effluent and surface water downstream from

<sup>47</sup> EPA, *Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS) Technologies for Reducing PFAS in Drinking Water*, Sci. in Action at 1 (2019), [https://www.epa.gov/sites/default/files/2019-10/documents/pfas\\_drinking\\_water\\_treatment\\_technology\\_options\\_fact\\_sheet\\_04182019.pdf](https://www.epa.gov/sites/default/files/2019-10/documents/pfas_drinking_water_treatment_technology_options_fact_sheet_04182019.pdf) (“[S]horter chain PFAS like perfluorobutanesulfonic acid (PFBS) and perfluorobutyrate (PFBA) do not adsorb as well [to GAC filters] resulting in earlier breakthrough.”).

wastewater treatment plants.<sup>48</sup>

Even the successful removal of PFAS from wastewater creates waste products—such as spent carbon filters or reverse osmosis concentrate—with high PFAS concentrations.<sup>49</sup> Biosolids from wastewater treatment plants also contain high levels of PFAS.<sup>50</sup> The disposal of these treatment residuals presents further problems. Biosolids are often applied to agricultural land as fertilizer, contaminating an estimated 20 million acres of farmland across the country.<sup>51</sup>

Traditional means of waste disposal do not effectively contain or destroy PFAS. Because of their extreme persistence, PFAS do not break down in landfills, making them likely to leach into the soil and groundwater or to volatilize and enter the air.<sup>52</sup> EPA scientists have estimated that municipal solid waste landfills alone release more than 130 kilograms of PFAS into the environment each year, a dangerously high amount for chemicals that can cause harm in the parts-per-trillion or parts-per-quadrillion range.<sup>53</sup> PFAS were also detected at 96% of inactive landfills in New York State, many of which have impacted local drinking water sources or private wells.<sup>54</sup>

The incineration of PFAS waste presents similar concerns. PFAS have been widely used in firefighting foam precisely because they do not break down when burned. Those same

properties make PFAS extremely difficult to incinerate, and EPA has acknowledged that “the effectiveness of incineration to destroy PFAS compounds . . . is not well understood.”<sup>55</sup> The incomplete combustion of PFAS “can result in the formation of smaller PFAS,” as well as other toxic chemicals like hydrogen fluoride. These products of incomplete combustion are then released with any residual PFAS via the incinerator’s air emissions, “spread[ing] them into surrounding areas.”<sup>56</sup>

#### **D. PFAS Are Widely Used and Released During Semiconductor Manufacturing**

PFAS are widely used and frequently released during the production of semiconductors.<sup>57</sup> “The primary use of PFAS in semiconductor manufacturing is in photolithography,” a process in which ultraviolet light is filtered through photoacid generators to imprint circuit patterns onto a semiconductor wafer.<sup>58</sup> PFAS are widely used as photoacid generators, and during this process less than 1% of PFAS used remain on the chip, with the majority either disposed of in wastewater or incinerated.<sup>59</sup>

PFAS gases are also used in the etching step of semiconductor production, during which excess material is removed from the semiconductor wafer to create the desired structure.<sup>60</sup> During deposition, additional PFAS are used to apply additional layers of material to the wafer.<sup>61</sup> The European Semiconductor Industry Association estimated nearly 12,900 kg of gaseous PFAS releases from European semiconductor facilities in a single year.<sup>62</sup>

It is therefore unsurprising that the DEIS found that “PFAS may be present in [Micron’s] process-related wastewater.”<sup>63</sup> The DEIS does not disclose which PFAS may be present in

<sup>63</sup> DEIS at 3-239.

Micron’s wastewater nor the likely concentration of total PFAS. However, based on information from other semiconductor manufacturing sites and found in the CHIPS facilities’ programmatic EA,<sup>64</sup> it is likely that many PFAS will be used at the Micron site and, absent strict restrictions, released into the environment. For example, at least 17 different PFAS have been detected in the wastewater discharged by the Global Foundries semiconductor manufacturing facility in Essex Junction, Vermont.<sup>65</sup> Up to 78,000 parts-per-trillion of PFAS were detected in another study of another domestic semiconductor plant’s wastewater, more than 20,000 times higher than New York State’s water quality guidance value for PFOS.<sup>66</sup>

#### **E. The DEIS Must Use a Broad, Science-Based Definition of the PFAS Class**

As acknowledged in the DEIS, the assessment and regulation of PFAS “depend[s]” in large part “on the definition of PFAS applied.”<sup>67</sup> The New York Legislature,<sup>68</sup> United States Congress,<sup>69</sup> more than 100 leading scientists,<sup>70</sup> and 16 state attorneys general<sup>71</sup> have all defined

<sup>70</sup> Safer States, *Scientists’ Statement on Defining PFAS* at \*1 (May 7, 2024), <https://www.saferstates.org/wp-content/uploads/Scientists-Statement-on-Defining-PFAS.pdf> (“Scientists’ Statement on Defining PFAS”). The Scientists’ Statement also expresses support for the OECD’s similar definition of the PFAS class, discussed below.

<sup>71</sup> State Att’y’s General of N.J. et al., *Comments on TSCA Section 8(a)(7) Reporting and*

PFAS as a class of chemicals containing “at least one fully fluorinated carbon [atom].” This definition has broad scientific support, since it is the presence of a fully fluorinated carbon that gives PFAS their common trait of persistence. We encourage OCIDA to adopt that science-based PFAS definition, which is already enshrined in multiple provisions of New York State law.

The DEIS references another PFAS definition from the Organisation for Economic Co-operation and Development (“OECD”).<sup>72</sup> The OECD defines PFAS as “fluorinated substances that contain at least one fully fluorinated methyl or methylene carbon atom (without any H/Cl/Br/I atom attached to it).”<sup>73</sup> While slightly narrower than the definition referenced above, the OECD definition covers most substances with at least one fully fluorinated carbon atom.<sup>74</sup>

Both of those definitions are preferable to the narrower and scientifically unsupported PFAS definitions that the United States Environmental Protection Agency has adopted in the past.<sup>75</sup> While EPA claims to define the PFAS class on a “case-by-case basis,” as opposed to relying on a single consistent definition, prior EPA definitions have excluded thousands of PFAS recognized by the OECD, New York State, and others.<sup>76</sup> These exclusions have no scientific basis, and they could exclude many PFAS that are used or formed in semiconductor manufacturing. For instance, EPA’s prior definitions did not include polyvinylidene fluoride (“PVDF”), a PFAS used in semiconductor manufacturing,<sup>77</sup> or trifluoroacetic acid (“TFA”), which has been detected in semiconductor wastewater.<sup>78</sup> To fully assess the Project’s PFAS impacts, the DEIS must use a definition that encompasses the full PFAS class.

## **II. NEPA and SEQRA Require the Government to Take a Hard Look at The Project’s Environmental Impacts and Potential Alternatives and Mitigation Measures**

The National Environmental Policy Act (“NEPA”) and the State Environmental Quality Review Act (“SEQRA”) operate at the federal and state level, respectively, to ensure that agencies closely examine, disclose, and mitigate the environmental consequences of significant

projects. NEPA “promotes [a] sweeping commitment to ‘prevent or eliminate damage to the environment and biosphere’ by focusing Government and public attention on the environmental effects of” the proposed facility.<sup>79</sup>

SEQRA, which applies to New York state and local agencies, “is modeled upon” NEPA.<sup>80</sup> But “unlike its Federal counterpart . . . SEQRA is not merely a disclosure statute; it imposes far more action-forcing or substantive requirements on state and local decisionmakers than NEPA imposes on their federal counterparts.”<sup>81</sup> Passed in 1975, the New York State Environmental Quality Review Act “makes environmental protection a concern of every agency.”<sup>82</sup> The NY legislature’s purpose in enacting SEQRA was to “encourage productive and enjoyable harmony between man and his environment; to promote efforts which will prevent or eliminate damage to the environment and enhance human and community resources; and to enrich the understanding of the ecological systems, natural, human and community resources important to the people of the state.”<sup>83</sup> Further, all agencies were to “conduct their affairs with awareness that they are stewards of the air, water, land, and living resources,” and with awareness “that they have an obligation to protect the environment for the use and enjoyment of this and all future generations.”<sup>84</sup> As part of this duty, the “activities of . . . corporations” are to be regulated such that “due consideration is given to preventing environmental damage.”<sup>85</sup>

SEQRA requires the preparation of an environmental impact statement (“EIS”) for “any action which may have significant effect on the environment.”<sup>86</sup> Providing the “[o]ppportunity for public participation and engagement is an essential and mandatory part of the SEQRA process.”<sup>87</sup> Through this process “SEQRA insures that agency decision-makers—enlightened by public comment where appropriate—will identify and focus attention on any environmental impact of proposed action,” “balance those consequences against other relevant social and economic considerations,” “articulate the bases for their choices,” and “minimize adverse environmental effects to the maximum extent practicable.”<sup>88</sup>

Additionally, following the enactment of the Green Amendment, which took effect on January 1, 2022, New York residents are each constitutionally entitled “to clean air and water, and a healthful environment.”<sup>89</sup> Though legal interpretations of the provision’s meaning are nascent, courts have begun exploring the necessity of “more demanding” standards of review for

SEQRA actions.<sup>90</sup> The Amendment “exists to challenge laws, activities, or proposed actions that pose significant threats to the environment” by “provid[ing] an independent cause of action that may be applicable to the government’s failures to protect New Yorkers from contaminated drinking water, polluted air, pollutants, extreme weather and climate change events.”<sup>91</sup>

### A. Contents of an Environmental Impact Statement

An EIS under SEQRA must include, among other topics, “a description of the proposed action, its environmental impact[,] and mitigation measures proposed to minimize the environmental impact.”<sup>92</sup> “SEQRA requires an EIS to set forth ‘any adverse environmental effects which cannot be avoided should the proposal be implemented.’”<sup>93</sup>

Under both SEQRA and NEPA, an EIS is required to provide substantive discussion of a range of reasonable project alternatives and their comparative environmental impacts.<sup>94</sup> SEQRA ultimately requires agencies to “choose alternatives which, consistent with social, economic[,] and other essential considerations . . . minimize or avoid adverse environmental effects” to “the maximum extent practicable.”<sup>95</sup> As a result, the DEIS must “go beyond mere assertions and provide sufficient data and reasoning to enable a reader to evaluate the analysis and conclusions.”<sup>96</sup>

<sup>96</sup> *Nat. Res. Def. Council, Inc. v. Callaway*, 524 F.2d 79, 93 (2d Cir. 1975) (internal citations omitted).

Similarly, the mitigation measures adopted by the lead agency in response to the DEIS must address environmental harms caused by the project to the “maximum extent practicable.”<sup>97</sup> “SEQRA requires an approving agency to act affirmatively upon the adverse environmental impacts revealed in an EIS,” so that the EIS is “not a mere disclosure statement but rather . . . an aid in an agency’s decision-making process to evaluate and balance the competing factors.”<sup>98</sup> In so doing, “[l]ead agencies have the authority under [SEQRA] to impose mitigation measures on actions . . . that are otherwise outside its jurisdiction, or the jurisdiction of any other agency.”<sup>99</sup>

## **B. The “Hard Look” Standard**

A lead agency is required to take a “hard look” at the environmental consequences of a proposed project under both NEPA and SEQRA.<sup>100</sup> To do so “the lead agency must ‘thoroughly analyze the identified relevant areas of environmental concern to determine if the action may have a significant adverse impact on the environment.’”<sup>101</sup> Under SEQRA, “the requirement of environmental consideration to the fullest extent possible sets a high standard . . . enforced by the reviewing courts.”<sup>102</sup>

Ultimately, the “extent of detail required” in any given EIS “must necessarily be related to the complexity of the environmental problems created by the project.”<sup>103</sup> The DEIS must evaluate “the potential significant adverse environmental impacts *at a level of detail that reflects the severity of the impacts and the reasonable likelihood of their occurrence.*”<sup>104</sup> While an EIS need not, and cannot, realistically belabor every potential impact no matter how remote, areas of complex or extreme environmental concern must receive detailed treatment in an EIS.<sup>105</sup> A DEIS cannot rely on “general assurances” future actions will “adequately mitigate” recognized risks.<sup>106</sup>

## **C. Agencies May Not Defer NEPA or SEQRA Review to Subsequent Permitting Processes or Administrative Proceedings**

---

<sup>97</sup> 6 N.Y.C.R.R. § 617.11(d)(5) (requiring agencies to certify that “adverse environmental impacts will be avoided or minimized to the maximum extent practicable by incorporating as conditions to the decision those mitigative measures that were identified as practicable.”).

<sup>101</sup> *Clean Air Action Network of Glens Falls, Inc. v. Town of Moreau Plan. Bd.*, 235 A.D.3d 1124, 1127 (3rd Dept. 2025) (quoting 6 N.Y. C.C. R.R. § 617.7(b)(3)).

<sup>102</sup> *Town of Henrietta*, 76 A.D.2d at 223 (internal quotes omitted).

<sup>103</sup> *Id.* at 215, 224.

<sup>104</sup> 6 N.Y.C.C.R.R. § 617.9 (emphasis added).

<sup>105</sup> *Id.*

<sup>106</sup> *See H.O.M.E.S. v. New York State Urban Dev. Corp.*, 69 A.D.2d 222, 232 (4th Dept. 1979).

Logically, under SEQRA and NEPA, projects significant enough to trigger the preparation of an EIS often necessitate the issuance of environmental permits as well. NEPA and SEQRA generally require the environmental review process to be completed prior to the final issuance of such permits.<sup>107</sup> An agency is not free to simply defer an EIS’s site-specific disclosure of recognized environmental risks and mitigation needs to these future permitting or administrative proceedings. “Postponement of review of environmental impacts or reliance on tentative plans for future mitigation . . . is in violation of SEQRA.”<sup>108</sup> A “lead agency improperly defers its duties when it abdicates its SEQRA responsibilities to another agency or insulates itself from environmental decision[-]making,” and one of the ways it does so is by excluding detailed disclosure of known environmental impacts and mitigation plans from the EIS.<sup>109</sup>

Even where courts “recognize that the [facility] in question will be subject to ‘state and federal air permitting processes,’” and are willing to “assume that . . . emissions will be subject to” changing regulations at some future point, “the existence of permit requirements overseen by another federal agency or state permitting authority cannot substitute for a proper NEPA analysis.”<sup>110</sup> Similarly, under SEQRA specifically, even if elements of a site-specific EIS’s hazard management plans and permitting will be managed in future administrative proceedings, those permit applications or plans must be “subject to review as part of the SEQRA process,” in “some form” detailed enough to permit meaningful scrutiny, understanding, and mitigation determinations.<sup>111</sup>

For example, in *Boise v. City of Plattsburgh* the DEIS contemplated the use of a future, site-specific, health and safety plan to address the recognized risks posed by contaminated soil beneath the proposed project’s parking area.<sup>112</sup> Although the draft EIS “contemplated the implementation of” this future safety plan “to address risk” the plan was not actually “created and subject to review as part of the SEQRA process” in any form detailed enough to permit a “hard look” at its sufficiency or public “scrutiny” of the processes’ alleged mitigation of risks.<sup>113</sup> Ultimately, this vague description of future administrative processes the DEIS would allegedly rely on to mitigate a known environmental risk “demonstrates noncompliance with SEQRA” in both its failure to take a hard look at the problem and the failure of the lead agency to secure mitigation measures.<sup>114</sup> As the court in *Matter of Clean Air Action Network* similarly summarizes, there is no compliance with SEQRA where there is no “reasoned elaboration as to

Auth.*, 86 A.D.3d 401, 402–03 (1st Dept. 2011) (“Respondents contend that . . . it could appropriately defer consideration of long-term monitoring measures until the completion of remediation . . . under SEQRA it was impermissible . . . to omit a known remediation issue from the EIS with the idea of taking up that issue at a later date.”)

<sup>110</sup> *Sierra Club v. FERC*, 867 F.3d 1357, 1375 (D.C. Cir. 2017)); *Clean Air Action Network of Glens Falls*, 235 A.D.3d at 1228 (applying the same principle under SEQRA).

<sup>111</sup> *Boise*, 219 A.D.3d at 1058; see *Bronx Comm. for Toxic Free Sch.*, 86 A.D.3d at 402–03.

<sup>112</sup> *Boise*, 219 A.D.3d at 1058.

<sup>113</sup> *Id.* at 1058–59.

<sup>114</sup> *Id.* at 1060.

why the issuance of a state facility permit negates the potential adverse impacts” or results in “no significant adverse environmental impact” from the proposed facility’s hazardous emissions.<sup>115</sup>

In sum, site-specific EISs must go beyond general assurances and provide information on permits and plans, particularly where the EIS relies on these processes as an answer to a project’s known environmental threats. One of the many purposes of taking a “hard look” in the EIS is “ensur[ing] that the agency will not act on incomplete information, only to regret its decision after it is too late.”<sup>116</sup> Deferring review of a project’s hazardous pollutant exposure risks and control plans until after the SEQRA process is concluded may result in an agency’s failure to secure feasible mitigation measures for recognized environmental harms in contravention of SEQRA.<sup>117</sup> And if an agency is free to defer analysis of key impacts and mitigation until the permitting stage, after they have already committed resources to the project and in some instances started construction, it will often be too late to truly inform the agency’s selection among alternatives and mitigation options. To that end, “deferring resolution of . . . hazardous waste remediation issue[s]” to subsequent administrative proceedings is inappropriate and can result in “fail[ure] to take the requisite hard look at” areas of “recognized environmental concern” under SEQRA.<sup>118</sup>

### **III. The DEIS Fails to Take a Hard Look at the Effects of Micron’s PFAS Releases**

The Project’s DEIS does not provide enough detail on Micron’s use, disposal, and release of PFAS for the public to understand the Project’s environmental and human health impacts. Because the scope and severity of the anticipated impacts are not disclosed, the mitigation needed to ensure health protective control of PFAS at the proposed facility remains unclear. These gaps exist across the DEIS’s analysis of: (1) PFAS in wastewater, (2) PFAS in air

Giuliani*, 280 A.D.2d 13, 22 (1st Dept. 2001) (finding legal “error” where the Department of City Planning “defer[ed] its analysis” of zoning amendments, since “the mere fact that environmental review may be required at the time an applicant seeks a special permit does not, by itself, obviate the CPC’s obligation to consider possible environmental impact.”); *H. O. M. E. S.*, 69 A.D.2d at 232 (review “failed to take a ‘hard look’ at the problems and adverse potential effects of the project . . . where it vaguely recognized their existence and relied upon general assurances” the problem would be adequately mitigated “by some unspecified appropriate action.”); *Bronx Comm. for Toxic Free Sch.*, 86 A.D.3d at 402–03; *Town of Huntington*, 859 F.2d at 1143 (explaining NEPA EIS discussion of site designation is not distinct from permitting and it is “improper to defer [EIS] analysis of the type, quantities and cumulative effects of waste” involved in proposed project.).

emissions, (3) disposal of PFAS contaminated media, (4) PFAS in drinking water, and 5) PFAS impacts on local ecosystems and species of concern.

## **A. The DEIS Fails to Take a Hard Look at the Impacts of PFAS in Wastewater**

### **1. PFAS Content of Wastewater**

Regarding the specific PFAS compounds the facility will use, the DEIS states only that Micron will 1) independently request such information at a later date, subject to nondisclosure agreements and 2) comply with federal reporting requirements for PFAS listed on the Toxics Release Inventory (“TRI”).<sup>119</sup> A wide array of PFAS compounds are routinely found in semiconductor wastewater influent or effluent,<sup>120</sup> and the DEIS confirms “PFAS may be present in process-related wastewater” at the proposed facility.<sup>121</sup> The Programmatic Environmental Assessment for CHIPS semiconductor facilities correctly concludes that “[w]astewater discharge from semiconductor fabrication facilities presents a substantial risk for PFAS contamination of the environment.<sup>122</sup> The DEIS notes Micron is evaluating non-PFAS alternatives, but nevertheless affirms PFAS use at the proposed facility remains “essential” and that there are no known substitutes for “many PFAS uses” at its proposed facility.<sup>123</sup>

At base, the DEIS does not tell the public which PFAS compounds the facility will release or the anticipated concentrations of such PFAS in the facility’s wastewater. Neither a definitive list nor a reasonable attempt at an estimate based on similar Micron operations is provided.<sup>124</sup> This is not a tolerable level of detail given the seriousness of the risk PFAS pose and

---

<sup>119</sup> DEIS at 3-239–41 (Micron would report the manufacture, process, or other use of individual TRI-listed PFAS that exceed reporting thresholds. This would include the 196 TRI-listed PFAS compounds.) Given only 196 of the more than 1,400 PFAS in commerce (using EPA’s narrow definition) are listed on the TRI, it is very possible that TRI reporting requirements will not cover any of the PFAS used at the Micron site, potentially rendering this commitment of little or no value. EPA, *Addition of Certain PFAS to the TRI by the National Defense Authorization Act*, <https://www.epa.gov/toxics-release-inventory-tri-program/addition-certain-pfas-tri-national-defense-authorization-act#> (last updated Jan. 17, 2025).

<sup>120</sup> Paige Jacob et al., *Target and Nontarget Analysis of Per- and Polyfluoralkyl Substances in Wastewater from Electronics Fabrication Facilities*, 55 *Env’t Sci. & Tech.* 2346 (2021), <https://pubs.acs.org/doi/10.1021/acs.est.0c06690>.

<sup>121</sup> DEIS at 3-239.

<sup>122</sup> Programmatic EA at C-15.

<sup>123</sup> DEIS at 3-239.

<sup>124</sup> For example, the DEIS could provide an estimate of PFAS in wastewater drawn from Micron’s Boise semiconductor facility, comparable domestic semiconductor facilities, or recent research of semiconductor wastewater content from industry groups of which Micron is a part, such as the Semiconductor Industry Association. See Semiconductor Indus. Ass’n, *Semiconductor PFAS Consortium*, <https://www.semiconductors.org/pfas/#:~:text=AND%20SEMICONDUCTOR%20PROCESSING%20%3E-,Technical%20Papers,-These%20publications%20were> (last accessed July 31, 2025).

the complete certainty that PFAS will be used at the proposed facility.<sup>125</sup> Even the Programmatic Environmental Assessment for CHIPS facilities was able to identify at least some of the specific PFAS used during semiconductor manufacturing.<sup>126</sup> It is feasible for Micron to provide more detail than is currently contained in the DEIS. Without knowing which PFAS are in use, it becomes far more difficult for regulators and the public to identify which test methods to use to monitor the Project's PFAS or to accurately evaluate the effectiveness of potential mitigation measures. Disclosure of the compounds themselves as well as estimation of their concentrations and release locations form the basis of informed monitoring, pollution control, and determination of health risks and practicable mitigation needs. Further information is needed on this subject to meet the mandates of SEQRA.

## 2. PFAS in Wastewater Permits

The DEIS relies on assurances of legal compliance with future permits and plans for an IWWTP to conclude the Project's PFAS impacts will be minimal. However, the DEIS describes the wastewater permits Micron intends to obtain and the pollution control technologies it will use in very general terms.<sup>127</sup> No commitments to any treatment technology are made. It is noncommittally suggested that reverse osmosis, nanofiltration, granular activated carbon, or potentially ion exchange resins may be candidates for PFAS removal at the proposed IWWTP, but the relative effectiveness and limitations of these technologies are not discussed.<sup>128</sup> Ultimately, the DEIS concludes that Micron is still assessing "emerging technologies" at the time of the DEIS and will select "appropriate solutions" at an unspecified later date.<sup>129</sup> This cursory and generalized disclosure regarding controls for PFAS in wastewater, a known and serious environmental risk, is so lacking in detail as to be unlawful under SEQRA.<sup>130</sup>

Additionally, the DEIS does not explain how anticipated permits will address, or if Micron commits to address, the PFAS in semiconductor wastewater that are not currently regulated and controlled under New York and federal Law. The DEIS does not provide any pending or anticipated permit applications or control plans as sources of information or otherwise include details about anticipated plan and permit terms. The DEIS instead relies heavily on general assertions that future plans and permits will be environmentally sufficient and that the Project will comply "with limits set forth" in those permits.<sup>131</sup> Generalized assurances a company will comply with the law, or vague gestures to future controls, do not satisfy the hard look standard, particularly given the severity of the Project's potential PFAS impacts.<sup>132</sup> This is

---

<sup>125</sup> DEIS at 3-239; *see supra* II.A–C.

<sup>126</sup> Programmatic EA at C-14–25.

<sup>127</sup> DEIS at 3-240–41.

<sup>128</sup> DEIS 3-83.

<sup>129</sup> DEIS at 3-240–41.

<sup>130</sup> N.Y. Comp. Codes R. & Regs. tit. 6, § 617.9 (2018); *Town of Henrietta*, 76 A.D.2d at 224; *Brander*, 847 N.Y.S.2d at 457; *Boise*, 219 A.D.3d at 1058; *Penfield Panorama Area Cmty.*, 253 A.D.2d 342, 349–50; *Clean Air Action Network of Glens Falls, Inc.*, 235 A.D.3d at 1124; *H.O.M.E.S.*, 69 A.D.2d at 232.

<sup>131</sup> DEIS at 3-129; 3-240–41.

<sup>132</sup> *Id.*

especially so because the DEIS suggests that the permit for the wastewater treatment plant would include limits only for two specific PFAS.<sup>133</sup> While we do not believe that such a permit would be lawful, if Micron believes that its wastewater discharge permit would not have limits for each PFAS it expects to release, it is all the more critical that the DEIS include specific information about how Micron will prevent significant adverse environmental and public health impacts from the discharge of its wastewater.

Further, the current set of terms between Micron, NY State, and Onondaga County places financial responsibility for wastewater treatment at the IWWTP on Onondaga County.<sup>134</sup> Given the absence of detail in the current DEIS as well as the absence of financial assurances for the potential cost of the IWWTP, there are reasonable grounds for concern that the county may ultimately determine it cannot incorporate rigorous PFAS controls into the IWWTP due to cost constraints.

### 3. PFAS in Wastewater Discharges to Surface Water

The DEIS also does not discuss the environmental impacts of PFAS-contaminated discharges to local surface water. The DEIS concludes that any impact of its Industrial Wastewater Treatment Plant's effluent releases to the Oneida River will be limited to the plant outfall's mixing zone, a zone to be determined in future permit proceedings but to be "no greater than approximately 1,000 ft downstream."<sup>135</sup> It is not clear if—and is in fact extremely unlikely that—a mixing zone will ameliorate PFAS contamination from the IWWTP. A mixing zone is "an allocated impact zone where water quality criteria can be exceeded as long as acutely toxic conditions are prevented."<sup>136</sup> There are no water quality criteria or permissible acute toxicity values for the majority of the PFAS that Micron would be discharging into the Oneida River. Given there aren't water quality standards for the suite of PFAS at issue, it is far more likely that the mixing zone would address conventional pollutants and ignore PFAS, and it is unclear how NYSDEC or OCIDA will assure a mixing zone addresses the IWWTP's PFAS releases. In sum, the absence of discussion regarding PFAS-contaminated effluent's potential impacts on the Oneida River is unacceptable under SEQRA.

Further, as previously raised, the DEIS does not disclose which PFAS it anticipates releasing, which PFAS it anticipates monitoring for in its influent and effluent, or what PFAS removing technologies it commits to using.<sup>137</sup> Despite claiming no significant impacts beyond the mixing zone, the DEIS notes, correctly, that "effects of the IWWTP may vary depending on

final design of the treatment plant,” which will be decided as “appropriate,” later.<sup>138</sup> Unsurprisingly, as a result, unacceptable information gaps remain as to whether the DEIS’s conclusions about the negligible impact of effluent beyond the mixing zone are factually sound.

The ubiquity of PFAS contamination in U.S. surface waters is due, in part, to PFAS’ mobility and persistence. Persistent and mobile chemicals, such as PFAS, can easily migrate beyond the mixing zones of wastewater treatment plant outfalls.<sup>139</sup> PFAS pass through wastewater treatment plants, such that PFAS contamination of a given body of water increases in tandem with the increased presence of wastewater treatment plant outfalls into that body of water and those it is hydrologically connected to.<sup>140</sup> Acknowledgement of the aforementioned risks and a “hard look” discussion of the IWWTP’s potential impacts is not included in the DEIS.

### **B. The DEIS Fails to Take a Hard Look at the Impacts of PFAS Air Emissions**

The DEIS acknowledges that Micron will use and release fluorinated gases (“F-gases”), with almost 2.5 tons of projected “fluoride” emissions from fabs 1 and 2 alone.<sup>141</sup> EPA calculates the greenhouse gas emissions associated with those releases, “which have the ability to trap thousands of times as much heat as CO<sup>2</sup> on a pound-for-pound basis.”<sup>142</sup> But the DEIS overlooks the fact that many F-gases are themselves PFAS or PFAS precursors, the impacts of which extend far beyond their contribution to climate change.

F-gases comprise more than 60 percent of the world’s annual PFAS emissions.<sup>143</sup> In the environment, most F-gases degrade into trifluoroacetic acid (“TFA”), one of the most prevalent PFAS.<sup>144</sup> In addition to its high persistence, TFA is associated with developmental toxicity<sup>145</sup>

and liver and thyroid harm.<sup>146</sup> TFA is ubiquitous in the environment and extremely difficult to control, since “methods to remove TFA from water are expensive and often inefficient due to TFA’s persistence and mobility.”<sup>147</sup> Here, not only does the DEIS fail to mention TFA, but it “never considered the potential impacts of the project’s [F-gas] emissions at all.”<sup>148</sup>

The DEIS states that “thermal oxidation” will be used to control F-gas emissions.<sup>149</sup> But OCIDA fails to discuss the limitations of thermal treatment options for PFAS, which resist thermal degradation. Last year, EPA concluded that “the data are insufficient to allow conclusions on the overall efficiency of thermal oxidizers in PFAS destruction.”<sup>150</sup> Moreover, despite industry’s claims of high PFAS destruction rates, recent air sampling around a Chemours thermal oxidizer in North Carolina detected high levels of PFAS.<sup>151</sup> “Because there is no evidence in the record before us that [OCIDA] even considered the impact” of the Project’s PFAS air emissions, the DEIS violates SEQRA’s requirement to take a “hard look” at those impacts.<sup>152</sup>

### C. The DEIS Fails to Take a Hard Look at the Impacts of PFAS Waste Disposal

The DEIS also fails to discuss the generation of PFAS-contaminated solid waste or to evaluate the impacts of handling and disposing of such waste. OCIDA asserts that the Project’s IWWTP “would include technologies specifically designed to remove . . . PFAS,” such as “reverse osmosis and nanofiltration (membranes used to filter out PFAS . . . )” or “granular activated carbon (an effective method for removing PFAS through adsorption).”<sup>153</sup> Those treatment methods, however, generate PFAS-contaminated filters or membranes that must ultimately be disposed of, and the DEIS does not consider the impacts of that PFAS disposal.

[where] the record confirms that the planning board never considered the potential impacts of the project’s HAP emissions at all.”).

<sup>153</sup> DEIS at 3-83.

The DEIS states “non-hazardous solid waste generated at the IWWTP would either be disposed of at the [Onondaga County Waste-to-Energy] Facility for energy recovery or, depending on the waste type, collected via private hauler for transport to landfills.”<sup>154</sup> Both of those options have the potential to further spread PFAS contamination, as opposed to destroying it. In addition to the broader concerns about PFAS incineration discussed above,<sup>155</sup> waste-to-energy plants routinely operate below combustion temperatures that are associated with PFAS destruction. The Onondaga County Waste-to-Energy Facility is required to maintain a combustion temperature of 1,800 degrees Fahrenheit,<sup>156</sup> or roughly 980 degrees Celsius. However, a recent study by EPA scientists found incomplete PFAS destruction and the formation of new PFAS byproducts at incineration temperatures below 1,000 degrees Celsius.<sup>157</sup>

As described above, the disposal of concentrated PFAS waste in landfills is equally problematic. EPA evaluated discharge data from over 200 landfills nationwide and detected PFAS in the leachate at more than 95 percent of them.<sup>158</sup> The DEIS does not indicate how such leachate would be managed, and EPA has warned that “improper management of landfill leachate would result in PFAS releases.”<sup>159</sup> Many PFAS can also volatilize in landfills and reenter the environment as landfill gas.<sup>160</sup> However, less than half of the municipal solid waste landfills in the United States have gas collection systems in place,<sup>161</sup> and even when landfill gas is captured, it is often flared at temperatures that are too low to destroy gaseous PFAS.<sup>162</sup>

Here, too, the record contains “no evidence . . . that [OCIDA] even considered” the risks associated with the disposal of the Project’s PFAS-containing solid waste, in violation of SEQRA’s “hard look” standard.<sup>163</sup>

<sup>163</sup> *Wellsville Citizens*, 140 A.D.3d at 1770.

Micron’s use of PFAS also threatens the health of workers who handle or are otherwise exposed to those chemicals. The DEIS, however, contains no information about anticipated occupational exposure levels or the effects of those exposures.

The DEIS states that exposure to toxic chemicals “would not result in significant adverse effects on [worker] health and safety” because “Micron would apply the most protective occupational exposure limit, based on published industry standards, for each individual chemical or hazardous substance that would be used in the facility manufacturing process.”<sup>164</sup> But the DEIS does not identify a single applicable Occupation Exposure Limit for total PFAS or for the specific PFAS that Micron plans to use. There are no Occupational Safety & Health Administration permissible exposure limits or National Institute for Occupational Safety and Health (“NIOSH”) recommended exposure limits for PFAS, and the American Conference for Governmental Industrial Hygienists has established Threshold Limit Values (“TLVs”) for only three PFAS.<sup>165</sup> It is therefore unclear what limit, if any, Micron intends to apply to protect its workers from PFAS exposures.

#### **E. The DEIS Fails to Take a Hard Look at PFAS Drinking Water Impacts**

Regarding groundwater, the DEIS acknowledges: (1) the existence of private, domestic wells used for drinking water or agriculture within a mile of the project area and (2) that its IWWTP and wastewater conveyance will overlay two unconsolidated aquifers that feed private, domestic water wells.<sup>166</sup> The DEIS correctly observes that unconsolidated aquifers are particularly “susceptible to contamination from the land surface above the aquifer.”<sup>167</sup> In several locations the DEIS describes an existing groundwater monitoring well system of approximately 42 wells.<sup>168</sup> It notes in high level terms that the monitoring wells will be used to “inform adaptive management” measures and “avoid and minimize” impacts on groundwater.<sup>169</sup>

While monitoring is a commendable step, the DEIS does not say whether this groundwater system monitors for PFAS, and if so, which PFAS and which wells. Relatedly, the DEIS does not provide details regarding whether or to what extent PFAS releases from the facility’s general operations or its wastewater conveyance and IWWTP threaten private residents’ drinking water supplies.

Regarding surface water, the DEIS notes that “all public water supply sources for the municipalities in which the proposed project and connected actions would be constructed . . .

<sup>167</sup> DEIS App. F Vol. 1 Pt.1 at F-25.

<sup>168</sup> DEIS at 3-79.

<sup>169</sup> DEIS at 3-86.

originate from surface water” sourced from Lake Ontario or Otisco Lake.<sup>170</sup> Importantly “any treated effluent from the IWWTP that is not recycled and returned to the Micron Campus would be discharged into the Oneida River. The treated effluent would ultimately drain back into Lake Ontario.”<sup>171</sup> Additionally, the Connected Actions as a whole are “located within the broader Lake Ontario watershed.”<sup>172</sup>

Nevertheless, the DEIS claims all significant impacts of its wastewater discharges to surface waters are limited to the Oneida River mixing zone of no greater than 1,000 ft. The DEIS once again provides the general assurance that such releases are subject to “[State Pollutant Discharge Elimination System] permit terms and conditions.”<sup>173</sup> The overarching result is that the DEIS simply does not actually provide meaningful analysis of the risk that PFAS released from its IWWTP could impact public drinking water and whether mitigation under SEQRA is needed.<sup>174</sup> Drinking water is a primary pathway for human PFAS exposure.<sup>175</sup> A true hard look at this issue is necessary.

#### **F. The DEIS Fails to Consider the Project’s Cumulative PFAS Impacts**

“An agency making a SEQRA determination is required to consider the cumulative impact of its action” and other “related” actions.<sup>176</sup> Actions are “related,” and therefore trigger the requirement for a cumulative impact assessment, if they are: (1) “included in any long-range plan of which the action under consideration is a part,” (2) “likely to be undertaken as a result” of the action under consideration, or (3) “dependent” on the action under consideration.<sup>177</sup> Here, despite acknowledging that the Project would spur residential and commercial development in the surrounding area, the DEIS never evaluated the cumulative PFAS impacts from this Project and other development that is “likely to be undertaken” as a result of the Project.<sup>178</sup> This omission violates SEQRA.

<sup>177</sup> 6 N.Y.C.R.R. § 617.7(c)(2); *Long Island Pine Barrens Soc., Inc. v. Plan. Bd. of Town of Brookhaven*, 80 N.Y.2d 500, 512 (1992).

<sup>178</sup> DEIS at 4-1 to 4-11; 6 N.Y.C.R.R. § 617.7(c)(2).

According to the DEIS, there are nearly 50 “ongoing and reasonably foreseeable actions that potentially have cumulative effects in the immediate vicinity of the [ ] Project.”<sup>179</sup> These related actions include more than 4,000 new apartment units and homes; more than a million square feet of new commercial, retail, and office space development; and the “development of an industrial park on a 105-acre site owned by OCIDA to accommodate companies involved in innovating the semiconductor production supply chain.”<sup>180</sup> That induced and related development is likely to result in additional PFAS releases, exacerbating the Project’s environmental impacts. Residential development will result in increases in domestic wastewater and sewage, which contain PFAS.<sup>181</sup> The industrial park is likely to use and release PFAS as well, since many parts of the semiconductor supply chain—from hex nuts and washers to ion exchange membranes and refrigerants—contain PFAS.<sup>182</sup> The wastewater from that related development will presumably be discharged to the Oak Orchard Wastewater Treatment Plant, which discharges its effluent to the same receiving waters as the Project’s Industrial Wastewater Treatment Plant. SEQRA therefore requires OCIDA to evaluate the cumulative effects of those PFAS releases.

In its cumulative impact assessment, however, the DEIS never mentions PFAS. The DEIS acknowledges that “the reasonably foreseeable projects and potential induced growth could result in noticeable cumulative effects on hazardous waste and hazardous materials,” but claims those effects “would not be considered a significant adverse impact because hazardous waste and materials handling and storage, and hazardous waste disposal would comply with all applicable laws and regulations.”<sup>183</sup> As explained above, however, the assertion that the Project will comply with other laws—many of which do not directly address the PFAS that Micron is likely to use—does not excuse OCIDA’s failure to take a hard look at the Project’s cumulative PFAS impacts.<sup>184</sup> The DEIS also states that “none of the ongoing or future projects with effects that are cumulative with the Preferred Action Alternative would meaningfully alter or amplify the effects of the [Project]” because the Project is “the most significant driver[] of the environmental effects identified in this EIS.”<sup>185</sup> That argument is a red herring; nothing in SEQRA permits an agency to ignore cumulative effects merely because the impacts from related projects are less than the project undergoing review. Instead, the statute requires agencies to look at the combined effects of the Project and other related developments, and here OCIDA failed to do so.

<sup>184</sup> *See supra* II.C.

<sup>185</sup> DEIS at 0-15.

### **G. The DEIS Fails to Take a Hard Look at PFAS Impacts on Local Species and Ecosystems**

The DEIS and its internal draft Biological Assessment discuss potential negative impacts to species afforded an “additional level of protection by law, regulation, or policy,” including those listed or proposed to be listed as threatened or endangered under State or Federal Endangered Species Acts or “otherwise granted special status.”<sup>186</sup> These special status species and their potential habitat areas are enumerated and the measures intended to mitigate unavoidable impacts to local species and ecosystems are listed.<sup>187</sup> The DEIS ultimately concludes there will be significant adverse ecological impacts resulting from construction but no significant impacts associated with operation of the proposed project.<sup>188</sup> At no point in this analysis, however, does the DEIS discuss the potential impacts of the Project’s PFAS releases on protected species.

In a number of locations, the DEIS defers analysis of impacts potentially relevant to ecological issues to future permitting and planning processes. For example, the DEIS concludes suitable habitat for Lake Sturgeon and Bald Eagle, two special status species, exist in the vicinity of the IWWTP operations and the plant outfall itself.<sup>189</sup> Instead of evaluating the potential impacts on those species, however, the DEIS simply asserts that future permits will examine and resolve any environmental impact.<sup>190</sup> Regarding impacts to Lake Sturgeon, the DEIS states in general terms that “OCDWEP would be responsible for operating the IWWTP in compliance with SDPES industrial wastewater permit conditions, including conditions to protect water quality.”<sup>191</sup> Similar conclusions are made for Bald Eagle.<sup>192</sup>

There is no detailed discussion of potential PFAS release impacts on local species. Gaps remain across the DEIS’s discussion of whether PFAS released to surface waters or ambient air will impact local ecosystems in any way. The DEIS forgoes discussion of how the IWWTP’s releases into Lake Oneida and hydrologically connected waters may impact local aquatic ecosystems and species, likely because the DEIS assumed the proposed facility’s effluent will have no impact beyond a 1,000-foot mixing zone.<sup>193</sup> The DEIS similarly does not provide details as to the impact of PFAS releases into air on locally documented species of concern.

### **H. The DEIS Improperly Defers Analysis of Salient Environmental Issues to Subsequent Permitting Processes**

As demonstrated in the previous discussion of information gaps, the DEIS improperly defers critical information about the proposed facility’s environmental impacts to subsequent administrative processes outside of SEQRA. This systemic lack of detail on aspects of the

---

<sup>186</sup> DEIS at 3-105.

<sup>190</sup> DEIS at 3-126 to 3-127, 3-130–31.

<sup>191</sup> DEIS 3-131.

<sup>192</sup> DEIS 3-131

<sup>193</sup> DEIS at 3-83–84.

proposed facility that may be managed in future permits or plans makes it impossible to reasonably understand the scope of the project’s PFAS impacts or to evaluate alternatives and mitigation measures. In so doing, the DEIS shields aspects of the proposed facility’s environmental impacts from disclosure and public scrutiny.

This deferral of environmental analysis is improper because (1) the DEIS’s current analysis of future permit terms and associated plans is too vague and (2) OCIDA’s assumption that future permits will mitigate significant PFAS impacts is “without sound basis in reason or regard to the facts,” and thus arbitrary and capricious.<sup>194</sup>

## **I. Micron Cannot Assume That Future Environmental Permits Will Adequately Address Micron’s PFAS Impacts**

### **1. SPDES Permits**

First, the discussion of SPDES permits in the DEIS is impermissibly vague. Neither the permit applications nor the plans on which Micron intends to rely have been finalized or their draft terms otherwise provided in the DEIS. The absence of such information prevents the public from understanding the impacts of the Project’s PFAS releases or determining whether additional mitigation is needed under SEQRA.

Second, using a promise of compliance with unspecified SPDES permit terms to defer detailed discussion of PFAS impacts is unlawful. To date, SPDES permit requirements have not prevented the widespread release of PFAS from wastewater treatment plants and other industrial facilities.<sup>195</sup> And unlike conventional pollutants, existing regulations focus on a significantly smaller subset of PFAS than what is typically present in semiconductor wastewater. New York has not established water quality standards for any PFAS, and NYSDEC has only set SPDES Guidance Values (which require monitoring, not mitigation) for two PFAS (PFOA and PFOS).<sup>196</sup> Similarly, New York State drinking water standards address only PFOA and PFOS,<sup>197</sup> and federal drinking water standards address six PFAS, with all but PFOA and PFOS currently

---

<sup>194</sup> *Clean Air Action Network of Glens Falls*, 235 A.D.3d at 1126 (“An action is arbitrary and capricious when it is taken without sound basis in reason or regard to the fact.”).

<sup>195</sup> Letter to Administrator Lee Zeldin, from Alaska Cmty. Action on Toxics, Re: Maintaining and Defending EPA’s Hazardous Substance Designations and Drinking Water Standards for Per- and Polyfluoroalkyl Substances at 2 (Apr. 23, 2025), <https://www.ogeecheeriverkeeper.org/wp-content/uploads/2025/04/2025.04.23-Letter-Supporting-EPA-PFAS-Regulations.pdf>.

<sup>196</sup> Div. of Water, *2023 Addendum to June 1998 Division of Water Technical and Operational Guidance Series (TOGS) No. 1.1.1* (Feb. 2023), [https://extapps.dec.ny.gov/docs/water\\_pdf/togs111addendum2023.pdf](https://extapps.dec.ny.gov/docs/water_pdf/togs111addendum2023.pdf); see NYDEC, *Emerging Contaminants in NY’s Waters*, <https://dec.ny.gov/environmental-protection/water/emerging-contaminants> (last accessed July 30, 2025).

<sup>197</sup> N.Y. State Dep’t of Health, *Public Water Systems and Drinking Water Standards for PFAS and Other Emerging Contaminants* (Apr. 2024), [https://www.health.ny.gov/environmental/water/drinking/emerging\\_pfas\\_publicwater.htm](https://www.health.ny.gov/environmental/water/drinking/emerging_pfas_publicwater.htm).

under reconsideration for rollback.<sup>198</sup> In other words, the majority of public treatment works and drinking water systems in New York are not regularly monitoring for PFAS apart from PFOA and PFOS. The subset of PFAS subject to new or recently renewed permits in priority areas contain action levels only for PFOA and PFOS, two PFAS that have been largely or wholly phased out of microchip production.<sup>199</sup>

While the Clean Water Act can and should be utilized to control a broader suite of PFAS,<sup>200</sup> in the current regulatory landscape, taking a hard look at anticipated environmental impacts from PFAS requires more than a general promise the facility will comply with the law. In fact, in New York, the bar for OCIDA is much higher given the enshrinement of the state's constitutional environmental right, requiring OCIDA to consider the environmental impacts resulting from inadequate state regulatory frameworks.<sup>201</sup>

Micron's general references to future SPDES permits<sup>202</sup> are also not a salve for the local community's concern about PFAS exposure or a proper basis for the exclusion of detailed discussion of PFAS potential wastewater impacts from the DEIS. In the current regulatory landscape, taking a hard look at anticipated environmental impacts from PFAS requires more than a general promise the facility will comply with the law.

## 2. Clean Air Act Permits

The DEIS notes that Micron “must apply for and receive an air permit from the NYSDEC prior to construction, modification, or operation.”<sup>203</sup> This permit would regulate criteria air pollutants, such as nitrogen oxides and particulate matter, pursuant to the Clean Air Act's New Source Review and Prevention of Significant Deterioration requirements.<sup>204</sup> The facility would also be subject to the Semiconductor Manufacturing National Emission Standards for Hazardous

---

<sup>198</sup> 89 Fed. Reg. at 32,532; EPA, *Final PFAS National Primary Drinking Water Regulation*, <https://www.epa.gov/sdwa/and-polyfluoroalkyl-substances-pfas> (last updated May 21, 2025).

<sup>199</sup> See Semiconductor Indus. Ass'n, *PFOS and PFOA Conversion to Short-Chain PFAS-Containing Materials Used in Semiconductor Manufacturing* (June 5, 2023), <https://www.semiconductors.org/pfos-and-pfoa-conversion-to-short-chain-pfas-containing-materials-used-in-semiconductor-manufacturing/>.

<sup>200</sup> The Clean Water Act contains prohibitions on pass-through and other related provisions that control PFAS compounds beyond the limited subset explicitly targeted under current regulations. See, e.g., 40 C.F.R. § 403.5(a)(1) (“A User may not introduce into a [publicly owned treatment works] any pollutant(s) which cause Pass Through or Interference.”).

<sup>201</sup> See N.Y. Const. art. I, § 19. A major impetus for the Green Amendment was the PFAS water contamination crisis in Hoosick Falls, NY, where the village was poisoned by PFAS chemicals that were not regulated at the time.

<sup>202</sup> See, e.g., DEIS at 3-241 (“Micron's final design will include wastewater treatment for regulated PFAS-containing wastewater that meets current regulatory requirements under New York and Federal law prior to discharge to the IWWTP.”).

<sup>203</sup> DEIS at 3-151.

<sup>204</sup> *Id.* at 3-147, 3-148, 3-151.

Air Pollutants (“NESHAP”), which regulates hazardous air pollutants like xylene and hydrogen fluoride.<sup>205</sup>

But PFAS, however, are not regulated as criteria pollutants, and no PFAS are currently designated as hazardous air pollutants under the Clean Air Act. Rather, “despite the serious health and environmental threats posed by airborne emissions of PFAS, EPA has taken little to no action [to control such emissions] under the Clean Air Act.”<sup>206</sup> Air permits for existing Micron facilities do not address PFAS air emissions,<sup>207</sup> and the DEIS contains “no ‘reasoned elaboration’ as to why . . . the issuance of a state facility permit . . . would result in no significant adverse environmental impact from the project’s air emissions.”<sup>208</sup> Therefore, to prevent significant adverse impacts, OCIDA and NYSDEC (as an involved agency under SEQRA) must impose specific mitigation measures to address PFAS air emissions in their respective SEQRA findings statements.

#### **IV. The DEIS Fails to Mitigate the Harms from Micron’s PFAS Releases to the Maximum Extent Practicable**

##### **A. Micron Fails to Commit to Any Concrete PFAS Mitigation Measures**

“The purpose of SEQRA is to mitigate as much as is feasible the impact on the environment caused by development projects or other actions approved by state or local agencies.”<sup>209</sup> Therefore, “a discussion of feasible mitigation measures that could address specific identified impacts is a fundamental component of every EIS.”<sup>210</sup> In addition to requiring the identification and analysis of mitigation measures, SEQRA requires agencies to adopt measures that “minimize or avoid adverse environmental effects” to the “maximum extent practicable.”<sup>211</sup>

Here, the DEIS does not identify—much less commit to—practicable PFAS mitigation measures. With respect to solid waste, hazardous waste, and hazardous materials, the DEIS states

---

<sup>205</sup> *Id.* at 3-149.

Rev.* 369, 369 (2024), [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=4574426](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4574426).

<sup>207</sup> *See, e.g.*, Idaho Dept. of Env’t Quality, *Micron Tier II Operating Permit* (June 20, 2025) <https://www2.deq.idaho.gov/admin/LEIA/api/document/download/9609>.

<sup>208</sup> *Clean Air Action Network of Glens Falls, Inc.*, 235 A.D.3d at 1128.

<sup>209</sup> *Allied Princess Bay Co. No. 2 v. Atochem N. Am., Inc.*, 855 F. Supp. 595, 601 (E.D.N.Y. 1993).

<sup>210</sup> NYDEC SEQRA Handbook at 121; *see also* N.Y. ECL § 8-0109(2)(f) (McKinney 2024); 6 N.Y.C.R.R. § 617.11(d)(5).

<sup>211</sup> N.Y. ECL § 8-0109(1),(8); *see also* 6 N.Y.C.R.R. § 617.11(d)(5) (requiring a SEQRA findings statement to “certify that consistent with social, economic and other essential considerations from among the reasonable alternatives available . . . adverse environmental impacts will be avoided or minimized to the maximum extent practicable by incorporating as conditions to the decision those mitigative measures that were identified as practicable.”).

that “significant adverse effects are not anticipated, and no mitigation measures are required.”<sup>212</sup> However, as described above, there are major gaps in the DEIS analysis of PFAS-containing waste. With respect to PFAS air or water releases, the DEIS defers the mitigation analysis and commits only to compliance with future administrative processes and regulations. But participation in “regulatory permitting conditions and normal administrative procedures” is not a substitute for SEQRA mitigation.<sup>213</sup>

To comply with SEQRA’s mitigation requirements, OCIDA and other involved agencies must specify mitigation measures that address the significant adverse effects from the Project’s use and release of PFAS. Such mitigation must minimize PFAS use, require closed systems wherever feasible, and prohibit the environmental release of any PFAS, including through the disposal of PFAS-containing waste. Moreover, those commitments must be memorialized as binding conditions of project approval, either in the Project’s SEQRA Findings Statements or in subsequent permits. Below, we provide a non-exhaustive list of mitigation measures that are needed to “minimize or avoid” the significant adverse effects associated with PFAS, as required by SEQRA.

### **Monitoring**

1. To establish baseline environmental conditions, prior to the start of construction, Micron shall conduct monitoring for PFAS: (a) in groundwater upgradient, on-site, and downgradient from the Project site, (b) in surface water upstream and downstream from the outfall at the Oak Orchard Wastewater Treatment Plant, and (c) in aquatic species in the Oneida River. Such monitoring shall utilize EPA-approved methods that cover the greatest range of detectable PFAS, including all PFAS detectable using Methods 1633 or 1633A, as well as Adsorbable Organic Fluorine (EPA Method 1621) and Total Organic Fluorine. The results of such sampling shall be made publicly available online on a dedicated, easy-to-find webpage promptly after the lab results are complete.<sup>214</sup>

---

<sup>212</sup> DEIS at 0-10.

<sup>213</sup> See NYDEC SEQR Handbook at 78; *Boise*, 219 A.D.3d at 1058.

<sup>214</sup> EPA’s Method 1633A, which measures the presence of forty PFAS analytes, and Method 1621, which quantifies the total load of organic fluorine as a surrogate for the load of PFAS compounds, currently represent the best available science for measuring a broad set of PFAS compounds in aqueous matrices. They should therefore be used by Micron and any governmental entity sampling aqueous matrices for PFAS in the vicinity of the Micron site. These methods have been subjected to rigorous review and multi-laboratory validation studies, with opportunities for public comment in their draft and final stages. The delay in federal codification of these methods is not a basis for declining to rely on them, as Micron suggests. DEIS at 3-240. Indeed, EPA recommends use of Method 1633 or 1633A “as the best analytical methods currently available for monitoring of effluent for PFAS.” EPA, *Using PFAS Methods in NPDES Permits in Frequent Questions about PFAS Methods for NPDES Permits*, <https://www.epa.gov/cwa-methods/frequent-questions-about-pfas-methods-npdes-permits> (last updated July 3, 2025).

2. To monitor the Project's impacts and identify potential PFAS releases, Micron shall repeat the monitoring required in paragraph (1) at least once every six months during the construction and operation of the Project, and shall post the results of such sampling on a dedicated, easy-to-find website promptly after the lab results are complete.
3. Micron shall offer to conduct annual PFAS monitoring at all private drinking water wells located within a 3-mile radius of the Project site, including an offer to conduct baseline monitoring of drinking wells before the Micron facility commences operation. Such monitoring shall utilize EPA-approved methods that cover the greatest range of detectable PFAS, including Methods 533 and 537.1, and the results of monitoring shall be made available to the property owner and occupants or tenants.
4. Micron shall monitor PFAS in its wastewater, before and after pretreatment. Such monitoring shall utilize EPA-approved methods that cover the greatest range of detectable PFAS, including all PFAS detectable using Methods 1633 or 1633A, as well as Adsorbable Organic Fluorine and Total Organic Fluorine. Such sampling shall be required as a condition of the Micron's facility's SPDES permit, and the results of such sampling shall be made publicly available online on a dedicated, easy-to-find webpage promptly after the lab results are complete.
5. Micron shall monitor PFAS in its air emissions, including but not limited to emissions from thermal oxidation systems. Such monitoring shall utilize EPA-approved methods that cover the greatest range of detectable PFAS, including all PFAS detectable using Methods OTM-45 and OTM-50, as well as Total Organic Fluorine. Such sampling shall be required as a condition of the Micron's Title V permit, and the results of such sampling shall be made publicly available online on a dedicated, easy-to-find webpage promptly after the lab results are complete.
6. Micron shall fund the quarterly monitoring of PFAS in the influent, effluent, and biosolids from IWWTP at the Oak Orchard Site. Such monitoring shall utilize EPA-approved methods that cover the greatest range of detectable PFAS, including all PFAS detectable using Methods 1633 or 1633A, as well as Adsorbable Organic Fluorine and Total Organic Fluorine. Such sampling shall be required as a condition of the IWWTP's SPDES permit, and the results of such sampling shall be made publicly available online on a dedicated, easy-to-find webpage promptly after the lab results are complete.
7. Recognizing that the methods for measuring PFAS in water, air, and solid matrices will evolve and improve, including by expanding the set of PFAS compounds that can be reliably identified, Micron shall commit to tracking the development of new test methods for all of the monitoring required above and shall use the most advanced monitoring methods recognized by EPA or an agency of any state.

### **Minimization of PFAS**

8. Prior to commencing operations, and at least once every five years thereafter, Micron shall conduct an evaluation of the specific PFAS that are known, intended, or reasonably foreseen to be used on site; the respective functions of such PFAS; and whether such PFAS can be reduced or eliminated (the “PFAS Alternatives Assessment”). The PFAS Alternatives Assessment shall include, but not be limited to: (1) the potential use of polyoxyethylene or alkyl polyglucoside surfactants as alternatives to PFAS in the etching process,<sup>215</sup> (2) the potential use of non-fluorinated photoacid generators as alternatives to PFAS in photolithography,<sup>216</sup> and (3) the potential use of PFAS-free membranes throughout the semiconductor production process.<sup>217</sup> The PFAS Alternatives Assessment shall be made public on a dedicated, easy-to-find webpage.
9. Micron shall use less hazardous, non-PFAS alternatives wherever practicable, and shall prepare an annual report on its actions taken to reduce or eliminate PFAS use. Such report shall include an explanation for Micron’s continued use of any PFAS with an identified alternative.
10. Micron shall establish a \$100,000,000.00 PFAS research fund, which shall be used to fund: (1) the development of safer alternatives to the PFAS used by Micron, (2) the development of test methods that can detect the PFAS used by Micron in relevant environmental media and matrices, to the extent such methods do not currently exist, and (3) the development of safer disposal methods for PFAS-containing waste.

### **Worker Protection**

11. Micron’s Hazard Communication Program, prepared pursuant to Occupational Safety & Health Administration (“OSHA”) regulations, shall include an inventory of all PFAS used at the facility and a Safety Data Sheet for each PFAS.<sup>218</sup>
12. Micron shall conduct personal breathing zone air sampling for all detectable PFAS used at the facility. The results of such sampling shall be made available to all facility workers.

<sup>216</sup> See Danilo De Simone & Emily Gallagher, *Patterning Performance of Perfluoroalkyl Substances (PFAS) Free EUV Chemically Amplified Resists: A Step Towards Environmentally Friendly Lithographic Chemicals*, 13428 SPIE (2025), <https://doi.org/10.1117/12.3052050>; Emily Gallagher & Danilo De Simone, *Removing PFAS from Semiconductor Manufacturing, from Resists to Rinses*, EE Times (April 3, 2025), <https://www.eetimes.eu/removing-pfas-from-semiconductor-manufacturing-from-resists-to-rinses/>.

<sup>217</sup> See Fraunhofer-Gesellschaft, *PFAS-Free Polymer Membranes for Semiconductor Processing*, (June 3, 2024) <https://www.fraunhofer.de/en/press/research-news/2024/june-2024/pfas-free-polymer-membranes-for-semiconductor-processing.html>.

<sup>218</sup> DEIS at 3-259; 29 C.F.R. § 1910.1200.

13. Micron shall adopt an Exposure Control Plan to prevent or minimize workplace exposures to PFAS in a manner consistent with the occupational hierarchy of controls.<sup>219</sup>

#### **Pretreatment and Disposal Requirements**

14. The Onondaga County Department of Water Environment Protection (“OCDWEP”) shall implement a Pretreatment Program for discharges to the Project’s IWWTP, in accord with Clean Water Act regulations.<sup>220</sup>
15. The OCDWEP Pretreatment Program shall prohibit the discharge to surface or groundwater of any wastewater containing any detectable levels of any PFAS to the IWWTP. Clean Water Act regulations prohibit an industrial facility from sending wastewater to a wastewater treatment facility if the wastewater contains pollutants that will “pass through” the facility.<sup>221</sup> It is well-documented that PFAS pass through wastewater treatment facilities.<sup>222</sup> Micron shall prioritize the use of wastewater pretreatment methods that destroy, rather than remove, PFAS. Such methods may include, but are not limited to supercritical water oxidation.<sup>223</sup>
16. OCIDA and OCDWEP shall impose a condition that the Micron plant cannot commence operations until (1) the IWWTP is fully operational, and (2) the IWWTP has demonstrated its ability to treat PFAS-containing waste without any “pass through.”<sup>224</sup>

---

<sup>219</sup> CDC, *Hierarchy of Controls* (Apr. 10, 2024), <https://www.cdc.gov/niosh/hierarchy-of-controls/about/index.html>.

<sup>220</sup> The Clean Water Act EPA requires POTWs with a total design flow of greater than 5 million gallons per day that receive pollutants from industrial uses that pass through the treatment plant to establish a pretreatment program and authorize pretreatment plants for POTWs with lower design flows where, as here, “the nature or volume of the industrial influent, treatment process upsets, violations of POTW effluent limitations, contamination of municipal sludge, or other circumstances warrant in order to prevent Interference with the POTW or Pass Through.” 40 C.F.R. § 403.8(a).

<sup>221</sup> 40 C.F.R. § 403.5(a).

<sup>222</sup> Bridger J. Ruyle et al., *High Organofluorine Concentrations in Municipal Wastewater Affect Downstream Drinking Water Supplies for Millions of Americans*. 122 Procs. Nat’l Acad. Scis. U.S. Art. No. e2417156122, 1. <https://doi.org/10.1073/pnas.2417156122> (finding that even with advanced treatment technologies, maximum PFAS removal efficiency at 8 large wastewater treatment facilities was only about 25%); Wash. DOE, *PFAS in Wastewater* (“Nearly all municipal wastewater treatment plants have measurable levels of PFAS in their discharge . . . Available treatment technologies do not destroy PFAS. Some PFAS compounds can undergo transformation within the treatment plant, complicating the measurement of influent and effluent levels. And PFAS compounds will move around between the liquids and solids produced in current treatment processes.”).

<sup>223</sup> Christopher G. Scheitlin et al., *Application of Supercritical Water Oxidation to Effectively Destroy Per- and Polyfluoroalkyl Substances in Aqueous Matrices*, 3 ACS EST Water 2053 (2023), <https://pubs.acs.org/doi/10.1021/acsestwater.2c00548>.

<sup>224</sup> 40 C.F.R. § 403.5(a).

17. PFAS-containing waste generated by the Project, including wastewater treatment residuals or concentrate, shall not be incinerated, and shall be disposed of in a manner that minimizes the risk of PFAS releases to the environment.

### **Permit Conditions**

18. The SPDES permits issued to Micron and the IWWTP shall include effluent limitations and/or new source performance standards for all PFAS<sup>225</sup> that Micron knows or foresees will be discharged from the facility, including degradation byproducts that are PFAS. Consistent with New York and federal law, if neither EPA nor New York has developed effluent limitations, standards, or guidance values for a PFAS that Micron foresees discharging, NYSDEC should develop the effluent limitations and/or standards based on the best available technologies economically achievable using its best professional judgment.<sup>226</sup> The SPDES permits shall ensure that there is no degradation of the water quality as a result of discharges from the Micron facility or the IWWTP.
19. The SPDES permit issued to Micron shall require the use of Best Management Practices to control or abate the discharge of pollutants, including, but not limited, to “product

---

<sup>225</sup> In this context, PFAS must be defined as any chemical in the class of chemicals containing “at least one fully fluorinated carbon [atom],” as New York State consistently defines this term. E.g., N.Y. ECL §§ 37-0203(6), 37-0101(7), 27-3301(8); N.Y. Gen. Bus. Law § 391-u(1)(f).

<sup>226</sup> 40 C.F.R. § 125.3(a)(2)(ii)-(v) (all non-POTW permits must, at a minimum, contain BAT effluent limitations based on best professional judgment); 40 C.F.R. § 122.44(a)(1) (all NPDES permits must include technology based effluent limitations and standards, including “case-by-case effluent limitations” when others are not available); 33 U.S.C. § 1342(a)(1)(B) (a discharge permit should include “such conditions as the Administrator determines are necessary to carry out the provisions of this chapter); *see also* EPA, *Technology-based Effluent Limits Flue Gas Desulfurization (FGD) Wastewater at Steam Electric Facilities*, attach. A in *National Pollutant Discharge Elimination System (NPDES) Permitting of Wastewater Discharges from Flue Gas Desulfurization (FGD) and Coal Combustion Residuals (CCR) Impoundments at Steam Electric Power Plants* at 2 (June 7, 2010), <https://www3.epa.gov/region1/npdes/merrimackstation/pdfs/ar/AR-1564.pdf> ) (“an authorized state must include technology-based effluent limitations in its permits for pollutants not addressed by the effluent guidelines for that industry. [citations omitted] In the absence of an effluent guideline for those pollutants, the CWA requires permitting authorities to conduct the ‘BPJ’ analysis discussed above on a case-by-case basis for those pollutants in each permit.”). As a state designated to implement the NPDES program, New York must adhere to these authorities (40 C.F.R. § 123.25) and does so. *See* N.Y. ECL § 17-0811 (McKinney 2024) (SPDES permits must include, where applicable, effluent limitations, standards of performance for new sources, and any further limitations to comply with water quality standards); 6 N.Y.C.R.R. §§ 750-1.11(a)(1–3). *See also* 6 N.Y.C.R.R. § 750-1.2 (“*Best professional judgement (BPJ)* means effluent limits authorized under the [Clean Water] Act . . . BPJ is the method used by permit writers to develop BAT or BCT limits or requirements on a case-by-case basis for pollutants and wastewaters not addressed by 40 CFR 405 to 471.”).

elimination or substitution when a reasonable alternative to using PFAS is available in the industrial process.”<sup>227</sup>

20. The SPDES permit issued to the IWWTP shall prohibit the land application of biosolids.
21. All renewals of environmental permits for the Project, including for the IWWTP, shall be based on a full technical and legal review of the permit terms and conditions, as opposed to administrative renewal.

## Conclusion

Across the state, millions of New Yorkers are living with the legacy of unregulated PFAS releases. In Hoosick Falls, PFAS released by Saint Gobain and other industrial polluters contaminated the air and water, resulting in an “increased risk [of] . . . developmental effects and . . . liver and immune toxicity.”<sup>228</sup> In Newburgh, PFAS exposures from a military base are linked to high blood pressure and high cholesterol.<sup>229</sup> Almost half of New York’s public drinking water systems are contaminated by PFAS,<sup>230</sup> and more than two-thirds of the inactive landfills in the state have unsafe levels of PFOA, PFOS, or both in their groundwater.<sup>231</sup>

With PFAS already costing the state up to \$4.4 billion in annual health care costs and millions in drinking water treatment and site remediation, we cannot afford for the Project to worsen New York’s PFAS crisis.<sup>232</sup> Instead, the Project should be a model of sustainable semiconductor production, and a demonstration that domestic microchip production need not come at the expense of our health and the environment.

---

<sup>227</sup> Memorandum from Radhika Fox, Assistant Adm’r, EPA to Regional Water Div. Dirs., Regions 1-10, EPA Re: Addressing PFAS Discharges in NPDES Permits and Through the Pretreatment Program and Monitoring Programs (Dec. 5, 2022), [https://www.epa.gov/system/files/documents/2022-12/NPDES\\_PFAS\\_State%20Memo\\_December\\_2022.pdf](https://www.epa.gov/system/files/documents/2022-12/NPDES_PFAS_State%20Memo_December_2022.pdf); 40 CFR § 122.44(k)(4).

Dear OCIDA and CHIPS Program Office Micron Project DEIS Reviewers,

This letter is submitted on behalf of the City of Syracuse (the "City") to provide comments regarding the Draft Environmental Impact Statement (the "DEIS") for the Micron Semiconductor Manufacturing Project, prepared by the U.S. Department of Commerce, CHIPS Program Office (CPO), and Onondaga County Industrial Development Agency (OCIDA).

The City has and continues to be a strong and supportive partner of the Micron Project. The DEIS presents a thorough assessment of the proposed project and the connected project actions. Specifically, the DEIS report analyzes the reasonably foreseeable effects of the proposed project on various resource areas, analyzes the reasonably foreseeable cumulative effects of the proposed project, and discusses the unavoidable significant adverse effects and the irreversible or irretrievable commitments of environmental resources. Importantly, it also evaluates a range of alternatives and recommends appropriate mitigation measures for the project's impact on our region. We appreciate the opportunity to comment on this extensive report and have focused our comments on a few specific chapters of the report.

## **Economic Development**

As stated in the EIS, the socioeconomic effects of the Preferred Action Alternative would be significant and beneficial. The Proposed Project would generate substantial new economic activity in the local and regional study areas. It is projected that operations of a 4-fab facility would generate over \$10 billion in real GDP impacts within the regional study area, generate additional tax revenues for the local and regional study areas, invest \$500 million in local and regional initiatives that advance identified community needs, generate over 4,000 on-site construction jobs over the approximately 16-year construction period, and generate over 9,000 permanent on-site operational jobs.

Fax 315-448-8036  
[syr.gov/NBD](http://syr.gov/NBD)

**GROWTH. DIVERSITY. OPPORTUNITY FOR ALL.**

In addition to on-site benefits, the Proposed Project's construction and operational activities would generate off-site economic activity and additional jobs and labor income within industries supporting Micron's construction, and within governments and businesses supporting workers' day-to-day spending. It is anticipated that the Proposed Project would generate over \$2 billion in induced disposable personal income in the five-county region by 2035 and over \$3.3 billion by 2041. By 2045, the Proposed Project would generate demand for nearly 9,500 jobs at regional supply chain businesses and approximately 23,500 jobs at regional governments, institutions, and businesses supporting the growth in regional household spending (approximately 33,000 off-site jobs in total by 2045).

These would be direct benefits to the region, and the City. Syracuse could benefit from these new employment opportunities. New Micron related jobs will attract young professionals to the area. If 5% to 10% of those young professionals choose to live in the City, that would conservatively translate to 2,000 to 4,000 new households in the City, over the next two decades from this project alone.

During the past seven years, the City of Syracuse has led regional collaboration on workforce development and career training programs in industries essential to a success semiconductor industry: building and construction trades and technology and advanced manufacturing. Syracuse Build is the established and successful construction careers program, and Syracuse Surge, the city's strategy for inclusive growth in the New Economy, the high performing tech and advanced manufacturing program. We look forward to continuing to be a partner in these efforts to ensure they create opportunities for city and county residents.

This increase in households in the City and career opportunities would directly increase economic investment and neighborhood stability, a primary goal of the current administration and the City's recently completed Housing Strategy. We support the DEIS's conclusion that, "the Preferred Action Alternative would not result in any significant adverse effects with respect to zoning or public policies, and it would likely result in beneficial effects by fulfilling economic development policy goals."

### **Transportation**

The Preferred Action Alternative would result in significant adverse effects on transportation and traffic in the surrounding areas during certain periods of construction and operation. Many of these effects, however, would be addressed through mitigation measures developed with input from agencies with jurisdiction to implement such measures.

The DEIS indicates that transportation impacts are generally limited to the project study area, which would not directly affect the City, but we are supportive of the

recommended mitigations identified in the DEIS to mitigate the adverse traffic impacts. We also urge the project team to work in close coordination with Centro to provide robust public transportation service from the City of Syracuse directly to the project site. This service should be aligned with the anticipated Bus Rapid Transit system to make it possible for City residents to easily get to project related jobs with minimal harmful impact to transportation.

### **Environmental Impact**

Under Section 404 of the Clean Water Act and Article 24 of the Environmental Conservation Law, mitigation would be required to address the anticipated permanent losses of federal and State jurisdictional wetlands and surface water features. Under a proposed mitigation plan, Micron would enhance, establish, or restore a total of 422.14 acres of wetlands and 14,030 LF of stream features across six mitigation sites located within a nine-mile distance to the northwest of the WPCP, an approximately 2:1 mitigation ratio. Overall, approximately 1,341 acres of land within the Oneida River watershed would be protected in perpetuity under the mitigation plan. Additionally, Micron would purchase nine in-lieu fee program credits.

While the displacement of the wetlands in the proposed project area is not beneficial to the regional environment, the proposed replacement and restoration of new wetlands at a 2:1 ratio is valuable. We encourage the project team to meet or preferably exceed this ratio and provide these critical wetlands to support ecosystems affected by the proposed development.

Additionally, Micron's commitment to purchase 100% carbon-free electricity utilizing power purchase agreements and renewable energy credits (RECs) is worth noting. The report acknowledges the project's potentially significant impact on climate change, but it also identifies a variety of ways to decrease that impact and support renewable energy locally, something the City is supporting through the *Sustainable Syracuse Initiative*.

### **Water Usage and Capacity**

According to the DEIS, the Proposed Project would have no significant adverse effect on water usage and capacity, as necessary system upgrades, permitting, and infrastructure development led by Onondaga County Water Authority (OCWA) and local water authorities are expected to maintain adequate capacity. Wastewater treatment needs, including both sanitary and industrial wastewater, would be accommodated by existing and planned infrastructure, including construction of the Industrial Wastewater Treatment Plant (IWWTP), avoiding any significant adverse effects on wastewater treatment capacity.

There will be a significant water impacts in the region, but proposed system upgrades are planned by Onondaga County Water Authority. OCWA is designing its planned

infrastructure improvements with redundancy measures, including redundant parallel pipelines, and these features enhance infrastructure resilience, minimizing risks to service reliability during maintenance or emergencies. Further, under the preferred action alternative, the developer would commit to achieve up to a 75 percent water conservation rate by 2030 through on-site and off-site water reclamation, recycling, and reuse. Micron also is working with Onondaga County Department of Water Environment Protection to develop additional methods for off-site water reuse, including evaluating two sources of recycled water to further reduce the Proposed Project's anticipated demand for freshwater supply from OCWA.

### **Conclusion**

The City is encouraged by much of the DEIS report, specifically the expected economic growth, investment in the region, and positive impacts on jobs. These economic benefits are anticipated to help many communities work toward greater fiscal sustainability, including the City. We strongly encourage the project team, permitting agencies, and other project stakeholders to continue their efforts to reduce any and all potential adverse project impacts and work toward creative mitigation solutions to achieve this.

We thank the CPO and OCIDA for the opportunity to provide these general comments on the DEIS report. We appreciate the effort they continue to make in order to ensure the Micron Semiconductor Manufacturing Project benefits the entire Onondaga County region, and their focus on minimizing any and all potential impacts of the project. This project will launch the region into exponential growth in a variety of areas, and it will create a historic economic boost that will extend throughout Central New York.

Thank you for your work on this generational project for the City of Syracuse and the entire Onondaga County region.

Sincerely,

A handwritten signature in black ink, appearing to read "O. Kerney", with a stylized flourish at the end.

Owen Kerney  
Deputy Commissioner, City Planning & Sustainability

RE: Draft Environmental Assessment EISX-006-55-CPO-001

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

In particular I am concerned about: How, SPECIFICALLY, MICRON  
WILL ADDRESS WATER USAGE & WASTE WATER  
TREATMENT. DUE TO OUR KARST TOPOGRAPHY  
HOW CAN WE PROTECT ONEIDA LAKE, RIVERS +  
LAKE ONTARIO & FINGERLAKES? (SPECIFIC TO  
OUR REGION NOT BOISE IDAHO OR  
MANASSAS, VA)  
EMISSIONS (AIR) MITIGATION,  
SPECIFIC TO OUR REGION DEALING WITH  
AIR POLLUTION & HAZARDOUS AIR POLLUTION  
HOW WILL THEY DEAL WITH CARBON  
STORAGE & TEMPERATURE CONTROL, DUE TO THE BASIC  
15-20 ACRES NEEDED JUST FOR PARKING

I also urge consideration and response to the following issues and concerns:

1. **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
2. **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
3. **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
4. **Affordable and abundant water and energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.
5. **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge

INCREASE IN POPULATION (HOUSING, TEMPORARY: OTHERWISE),  
THUS ALL UTILITIES, WATER USE, LAND USE (DANGEROUS  
OR NOT)

★ HOW, SPECIFICALLY, WILL MICRON ADDRESS ANY  
BECOMING A LOAD POCKET INSTEAD OF SUPPLIER?  
WHERE WILL OUR ENERGY COME FROM AND A WHAT  
COST PER HOUSEHOLD?

RE: Draft Environmental Assessment EISX-006-55-CPO-001

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

In particular I am concerned about: The timelines to create new ecosystems  
not being sufficient to rehome displaced wildlife before  
their homes are destroyed.  
Housing stock in NYS is generally old. Would Micron or  
NYS agree to Retrofit homes and buildings  
to decrease energy use from homes and  
Buildings? What will be done to eliminate  
Acid Runoff Reaching Limestone and causing  
degradation of the stone.

I also urge consideration and response to the following issues and concerns:

1. **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
2. **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
3. **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
4. **Affordable and abundant water and energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.
5. **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge

lack of transparency around what specific chemicals will be used in their processes and how they will be disposed of. As well as a lack of research on its effect on surrounding low income communities.

They are not committing to ensuring that the employees that interact with these chemicals being paid the 100k/yr jobs they are promising

3. **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
4. **Affordable and abundant water and energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.
5. **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge

RE: Draft Environmental Assessment EISX-006-55-CPO-001

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

In particular I am concerned about: Micron's carbon footprint.

In particular their use of energy; with all the roof acreage they should be installing solar panels on the roofs to have on-site electricity production to ease their useage of electricity from the grid.

Why can't they use more solar? what is/are the basis for not using solar?

George Lorefice

I also urge consideration and response to the following issues and concerns:

1. **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
2. **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
3. **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.
4. **Affordable and abundant water and energy:** The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.
5. **Job Access, Housing & Transportation.** The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. Hello CPO,

Sending here my comment on Micron 2025 Project in Clay, NY

Best regards,

Peter King, Syracuse NY

August 11, 2025

National Institute of Standards and Technology, Creating Helpful Incentives to Produce Semiconductors (CHIPS) Program Office (CHIPSNEPA@chips.gov)

Onondaga County Industrial Development Agency (OCIDA)

ATTN: Micron Project

Hello CPO and OCIDA,

I am here commenting on the following paragraph in the DEIS (Under Sec. 3.2.2.1 Geology)

"(...) No sinkholes were identified on the WPCP.

Bedrock was core-sampled at 13 test boring locations and verified to be sedimentary interbedded shale and dolostone, which is nonreactive to only slightly reactive to dilute hydrochloric acid (HCl). Karst topography (known for higher incidences of sinkholes) was not noted at the site. Steep slope and soil conditions at greater risk of landslides also were not identified at the WPCP. According to the 2019 Onondaga County Multi-Jurisdictional Hazard Mitigation Plan Update, the Towns of Clay and Cicero are located in areas with moderate susceptibility to landsliding but a low incidence of occurrence; only one small area in the center of the southern portion of Onondaga County has a moderate incidence of landslide occurrence.

The geologic conditions at the proposed Rail Spur and Childcare Sites and existing utility properties are substantially similar to those at the WPCP. Therefore, the existing seismic, sinkhole, and landslide risks at those locations is also low. "

The above analysis dismisses the potential for karst deformation here, by a) relying on site-specific core-sampling, and b) not finding 'karst topography'. Also, this section c) depreciates the Tully Mudslides of 1993 as a "moderate incidence of landslide occurrence".

The above analysis focuses mostly on landslides, while also reporting no sinkholes on the combined Micron-related sites.

However, the 1993 Tully Mudslides were far from moderate at the time. No human life was lost, but could easily have been, had the persons involved not exited their buildings (Croyle, 2016). I do completely agree, Clay and Cicero are low-lying areas, with little or no landslide risks.

However, in a New York Statewide Assessment of Karst, Kappel, Reddy and Root categorize most of northern Onondaga County as potentially evaporite karst (gypsum and halite), specifically 'Camillus Shale - gypsum' (Kappel et al 2020 > "Figure 1. Major geologic units in which karst may be developed in New York State", pg. 12 of 86). Kappel et al note how karst can develop more suddenly and unexpectedly in the partially and predominantly evaporite areas such as may include the Micron site, than in carbonate areas like limestone drumlins in Syracuse and further southward.

"Evaporite deposits of gypsum and halite associated with some shales are the most soluble of the common rock types... ..making the rocks relatively insoluble in relation to evaporite deposits. A major difference between carbonate- and evaporite-rock karst is the time it takes for karst features to develop. Karst in carbonate rock develops over years, decades, or centuries, but karst in evaporite rock can develop over days, weeks, or years (Johnson, 2007). "(pg.13 of 86.)

The DEIS identifies Lockport Group, (Guelph) Dolostone as bedrock around the White Pine (Micron) site. This could be 100% correct.

Kappel et al do observe,

"the Lockport Group is less likely to develop karst features. Some karst development in the form of sinkholes and springs has been documented in the Lockport Group but typically along bedding planes near the bedrock surface (Yager and Kappel, 1987). Regionally, the Lockport aquifer system is generally confined to these bedding-plane structures and the weathered bedrock surface."

However, the Camillus Shale layer is also nearby, where...

"The Camillus Shale has a thin bed of gypsum (3 to 5 ft thick) which has been mined north of the Onondaga Escarpment. It has been reported that small solutional conduits drained into these mines and some land-surface subsidence (bulk or sinkhole subsidence features) has also occurred as the mine openings collapse."

At least one study observed, gypsum mining occurred close by, just across I-81 towards Cicero (Chamberlain, et al, 2014).

Also, Kappel et al are clear, a landscape absent from overtly identifiable karst features, does not mean free from karst concerns.

"Although the extent of karst development is important for understanding the surface water-groundwater interaction in a karst terrain, "the number of karst features has little to do with the problems of groundwater flow and contamination in karst. In fact, sparse karst can give a false security. Some of the worst cases of groundwater contamination are in carbonates with only minor karst features" (Art Palmer, professor emeritus, State University of New York at Oneonta, written commun., 2016)." (Kappel et al 2020, pg.18 of 86.)

Given the above Karst concerns, I urge Micron to conduct the most thorough preventative planning contra flooding, water contamination, and other similar concerns. This planning should include stakeholders, especially those at risk from these events.

Micron has incorporated an adaptive management plan for addressing concerns about

Wetland changes and removal, as influencing Stormwater, Groundwater and Floodplains issues

during construction and regular operation, as described under Table 3.2-5 'Best Management Practices', and detailed under 3.3.4.2 Preferred Action Alternative (pp 3-78, 3-79). Adaptive management is probably the best way to address these concerns, but should also involve more stakeholders than

Micron, National Grid, OCWA, and OCDWEP. Given the karst risks described above, these stakeholders should also include nearby municipalities, especially those downstream from the Micron site, for example along the nearby Oneida River, Three Rivers area, and so on.

The incidence of strong storms is well documented in the area, in recent decades starting with St. Agnes Hurricane in the 1972 (Syracuse-Onondaga Planning Agency 1997). Given our current trends, only increases in precipitation are projected further on this century. Heavy precipitation is increasing in this area, as well as periods of near-drought, such as this summer 2025. These extreme swing conditions can provoke karst development, and dry out areas which would be more resilient to flooding if more constantly wet.

Thank you,

Peter King, Syracuse

To whom it may concern:

On behalf of the Moving People Transportation Coalition, I submit the following comments regarding the Micron Semiconductor Manufacturing Project, Clay, NY, Draft Environmental Impact Statement. Moving People Transportation Coalition advocates for a sustainable and equitable regional transportation system that prioritizes pedestrians, public transportation, and micromobility.

MPTC is particularly concerned with the environmental harms related to increased vehicle miles travelled (VMT) predicted in the DEIS. The DEIS predicts that the Micron project will increase regional VMT by 67 million miles travelled annually by 2041 (*DEIS Table 3.7-12, p.3-208*). This increase will result in additional greenhouse gas pollution including over 16,000 additional metric tons of CO<sub>2</sub> equivalent emitted annually by 2041. Increased VMT will also impose broader costs on the region including increased flood risk due to expanded impermeable surface area, worsening congestion, and additional traffic fatalities. For these reasons, local planning efforts including the City of Syracuse's Vision Zero initiative, Syracuse Metropolitan Transportation Council's Metropolitan Transportation Plan, and Onondaga County's Comprehensive Plan all aim to reduce VMT, and in that context, the anticipated increase in regional VMT expected to be caused by the Micron project requires substantial mitigation.

The DEIS proposes no mitigation for increased VMT. The DEIS considers VMT as a potential cause of traffic congestion in the immediate area of the project site and proposes a series of road widenings to mitigate that congestion. However, the DEIS anticipates that these proposed mitigations will actually increase VMT by 1 million miles annually by 2041 even while maintaining acceptable levels of service on the identified vehicle routes (*Table 3.7-12 and Sec. 3.11.3.4*). The proposed mitigations will also worsen the other environmental harms associated with increased VMT, including increased traffic fatalities and surface runoff. The DEIS disregards potential flood risks from increasing paved surface area (*Comment on > 3.11.3.4 Analysis of...Mitigations, 3.11.4 Summary of Impacts*).

A better measure would mitigate traffic congestion *and* other environmental harms caused by increased VMT by addressing VMT directly. Although Micron will inevitably attract more vehicles to the area, there is ample opportunity to mitigate VMT by encouraging mode shift. The DEIS predicts that Micron will only generate 80 bus trips and 80 bicycle trips daily.

Each of these figures could be improved by implementing a Transportation Demand Management (TDM) plan after Micron begins regular operation. Such a plan would encourage people travelling to the site—both employees and visitors—to arrive by some means other than driving themselves

alone. Micron can provide incentives for people who arrive by bus, bike, or who carpool to decrease VMT by reducing the total number of cars driving to and from the site. Measures could include providing more convenient parking spaces for carpools, charging for onsite parking, reimbursing bus fare, providing vouchers for the purchase of ebikes, and coordinating with Centro to subsidize useful bus service at shift changes. The TDM plan should be adaptive, by responding to ongoing data collection and reassessment by all stakeholders for meeting TDM goals, including traffic safety and reducing VMT. (*Comment*> *Sec. 3.11, Transportation*).

Micron currently names few transport-related agencies as “Involved agencies” (*Table 1.2-1*). However, Micron’s transportation footprint will affect more concerns than those agencies represent. Micron’s TDM should include Centro, Syracuse Metropolitan Transportation Council (SMTC), and other agencies as applicable. A more adaptive TDM enables more ongoing flexibility, including reducing VMT. (*Comment*> *Sec. 3.11, Transportation, 1.2.2 Participating Agencies and Entities*).

Measures such as these would fulfill the requirements identified in the NYS Green CHIPS program to “plan for supporting public transportation or alternative transportation options for employees” including “measures supporting smart growth, integrating facilities into public transportation services, and providing incentives for businesses to accommodate non-vehicular commuting, including employee-based trip reduction programs, low/no-cost transit passes for employees, micro-transit options for employees, ride-sharing programs, bike-sharing, and scooter-sharing; and cycling accommodations.” (*Green CHIPS Sustainability Plan, NYS Empire State Development*). (*Comment*> *1.1.2 Micron Purpose and Need, Table 1.2-1 State and Local Involved and Interested Agencies*).

These measures will also reduce the need for surface parking at the site—the DEIS anticipates an unreasonable 12,000 parking spaces which will destroy wetlands and increase runoff—and it will further reduce indirect VMT increases by eliminating the need for proposed road widenings. (*Comment*> *Sec.3.3 Water Resources, > 3.3.4.2 Preferred Action Alternative*).

There is still a need for further mitigation measures to address the regional increase in VMT predicted to result from the Micron project. Micron, the New York State Department of Transportation and Onondaga County should mitigate the growth-induced effects of increased VMT by building regionally significant bike and pedestrian infrastructure, expanding access to ebikes and other micromobility devices, and improving public transportation service across the region. (*Comment on Sec. 3.11, Transportation*).

Sincerely,

**/s/ Alex Lawson**

alone. Micron can provide incentives for people who arrive by bus, bike, or who carpool to decrease VMT by reducing the total number of cars driving to and from the site. Measures could include providing more convenient parking spaces for carpools, charging for onsite parking, reimbursing bus fare, providing vouchers for the purchase of ebikes, and coordinating with Centro to subsidize useful bus service at shift changes. The TDM plan should be adaptive, by responding to ongoing data collection and reassessment by all stakeholders for meeting TDM goals, including traffic safety and reducing VMT. (*Comment*> *Sec. 3.11, Transportation*).

Micron currently names few transport-related agencies as “Involved agencies” (*Table 1.2-1*). However, Micron’s transportation footprint will affect more concerns than those agencies represent. Micron’s TDM should include Centro, Syracuse Metropolitan Transportation Council (SMTC), and other agencies as applicable. A more adaptive TDM enables more ongoing flexibility, including reducing VMT. (*Comment*> *Sec. 3.11, Transportation, 1.2.2 Participating Agencies and Entities*).

Measures such as these would fulfill the requirements identified in the NYS Green CHIPS program to “plan for supporting public transportation or alternative transportation options for employees” including “measures supporting smart growth, integrating facilities into public transportation services, and providing incentives for businesses to accommodate non-vehicular commuting, including employee-based trip reduction programs, low/no-cost transit passes for employees, micro-transit options for employees, ride-sharing programs, bike-sharing, and scooter-sharing; and cycling accommodations.” (*Green CHIPS Sustainability Plan, NYS Empire State Development*). (*Comment*> *1.1.2 Micron Purpose and Need, Table 1.2-1 State and Local Involved and Interested Agencies*).

These measures will also reduce the need for surface parking at the site—the DEIS anticipates an unreasonable 12,000 parking spaces which will destroy wetlands and increase runoff—and it will further reduce indirect VMT increases by eliminating the need for proposed road widenings. (*Comment*> *Sec.3.3 Water Resources, > 3.3.4.2 Preferred Action Alternative*).

There is still a need for further mitigation measures to address the regional increase in VMT predicted to result from the Micron project. Micron, the New York State Department of Transportation and Onondaga County should mitigate the growth-induced effects of increased VMT by building regionally significant bike and pedestrian infrastructure, expanding access to ebikes and other micromobility devices, and improving public transportation service across the region. (*Comment on Sec. 3.11, Transportation*).

Sincerely,

**/s/ Alex Lawson**

## MICRON SEMICONDUCTOR MANUFACTURING PROJECT, CLAY, NY, DRAFT ENVIRONMENTAL IMPACT STATEMENT (JUNE 2025)

This document provides comments on the Draft Environmental Impact Statement (DEIS) by Urban Jobs Task Force of Syracuse, 224 Harrison St, Suite 210, Syracuse, NY 13202, [urbanjobstaskforcesyr@gmail.com](mailto:urbanjobstaskforcesyr@gmail.com)

### 1. Wetlands

- a. Micron will destroy about 200 acres of wetlands.
- b. These wetlands have many benefits
  - i. Habitat for endangered species, including the **Indiana bat** and the **Northern Long-eared Bat**, both of which are listed as endangered species under federal and New York State law. Other bat species detected on the site include the little brown bat, big brown bat, tri-colored bat, eastern red bat, hoary bat, and silver-haired bat.
  - ii. Many species of insects and birds
- c. What is Micron proposing
  - i. Replace wetlands with a series of unconnected parcels that will develop over time into wetlands. This development could take a generation. What does that mean for the flora and the fauna whose habitat has been destroyed?
- d. The area around the plant site is prone to flooding. The wetlands provide a buffer to manage surface water during heavy rain. The existing plant will cover 1400 acres between the buildings, the parking lots and other hard surfaces. There has already been testimony at public hearings that flooding is an issue in the area around the location of the proposed Micron plant. This is in spite of the presence of the wetlands which help to reduce flooding by providing a water sink during heavy rains. However, no mention has been made in the DEIS of settling ponds to deal with water runoff or other efforts to mitigate the clearly increased potential for flooding in the area.
- e. The DEIS proposes parking lots capable of handling 12,000 vehicles. According to a calculation by the University of Tennessee ([University of Tennessee Parking Calculation](#)), one acre of land can accommodate about 150 standard sized cars. For a parking lot accommodating 12,000 vehicles, that translates to about 80 acres. However, the actual area required is likely to be at least 90 acres. We are proposing a significant role for mass transit to bring workers to the plant and hopefully reduce the parking requirements by at least 50%. This will reduce hard surfaces by at least 45 acres and subsequently reduce water runoff mitigation required. In addition, we propose using porous surface material in the parking lots and internal roadways to further reduce runoff.

## 2. PFAS and other chemical compounds

- a. PFAS refers to a family of chemicals that are highly toxic and chemically stable (thus the nomenclature “forever chemicals”) There are over 10,000 thousand of these compounds and only a few have been characterized. Only two of these compounds are currently listed as toxic by the EPA, PFOA and PFOS
  - i. There is no identified lower limit to their toxicity. A few parts per trillion is still considered toxic
- b. They will be used in the chip-making process
- c. They will be present in the wastewater that will be sent to the improved Oak Orchard Water Treatment Plant in Clay. The treated water will be discharged into public waterways which will eventually lead to the Oswego River and Lake Ontario. The discharge point in Lake Ontario is within 2 miles of the intake ports for domestic water from Lake Ontario for Onondaga County.
- d. It is unlikely that the PFAS in the water passing through that plant will be removed by the processes in the plant.
- e. PFAS will also be present in solid waste that will be removed from the site to a landfill, not yet identified. Micron must ensure that no PFAS can enter the ground and potentially contaminate the existing water table.
- f. Many other hazardous chemicals will be used in the Fabs. Some, but not all, have been identified by Micron. Many have not.
- g. Micron must use the most effective processes to destroy PFAS and other toxic chemicals before they leave the plant, regardless of their cost. No PFAS must be allowed to enter the public waterways of New York State.
- h. Micron must also plan to invest in improved PFAS destruction processes as they become available over time.

## 3. Energy

- a. Micron will use as much electricity as the states of Vermont and New Hampshire combined, or the equivalent of more than 1 million homes or the entire output of a nuclear power plant.
  - i. By itself, Micron will increase the state’s energy usage by 5%
- b. Micron is subject to the provisions of New York’s landmark CLCPA legislation, which requires zero greenhouse gas emissions from electricity generation by 2040.
- c. Micron has pledged to use 100% renewable electricity
  - i. The only way it can do this is by increasing renewable energy through solar, wind, and geothermal generation.
  - ii. Renewal energy credits do not actually increase generation and should not be allowed to meet the goal of 100% renewable energy.
- d. Micron should not use electricity from existing nuclear power plants. All that does is divert that electricity from other users and does not increase generation. Although nuclear power does not generate greenhouse gases during the electric generation process, large amounts of nuclear waste are generated and the time it will take and the cost to build the nuclear generating plant could be used to create sufficient renewable energy sources that will meet Micron’s needs without the negative effects of nuclear power.

- e. The DEIS does not ensure that Micron's massive demand for water and electricity won't result in increased costs for ratepayers in terms of increased water and electricity rates. The DEIS must address the potential for these increases and ensure that they do not burden New York's residents with them.

---

**Attachments:** Micron DEIS Comments.pdf

## Comments on Micron DEIS submitted by Jan Kublick

1. Climate Change Action and Awareness (CCAA) is the largest local group focusing on all aspects of Climate Change. While I am a member and a committee chair of CCAA, these comments are mine alone, and in the case of those on energy and climate, are in support of, and a supplement to, CCAA's comments.

2. I have practiced environmental, land use, real estate, and municipal law in Syracuse for 46 years. I have had the privilege to be a member of the Executive Committee of the Environmental and Energy Law Section of the NYS Bar since the Section was started in the early 80s. I have been involved with SEQR since its earliest regulations for the last 50 years, and am very familiar with its goals, requirements and case law. I currently serve as its Adirondacks and Natural Resources Co-Chair, and am a Board member of the College and University Alumni for a Sustainable Planet (CUSP) and a founding member of Dartmouth Alumni for Climate Leadership. Nevertheless, these comments are mine alone and do not reflect those of any of the mentioned groups.

3. The Project offers undeniable economic and social benefits for the region. It also brings with it substantial adverse environmental impacts which under SEQR must be avoided or minimized to the maximum extent practicable. In my opinion the Micron project is both highly desirable from a social and economic perspective and not nearly good enough from an environmental perspective to be approved as presented without extensive findings and clear and substantive conditions to identify and mitigate adverse environmental impacts over the 16 year buildout of the Project and its operation for generations to come.

4. My focus will be on two important issues, climate and energy, and air and water emissions of fluorinated chemicals, which is both a climate issue, and a major issue for public health due to growing scientific and regulatory scrutiny of, and widespread concern for, the human health effects of such chemicals. There are many other issues of concern and many other comments on the DEIS from individuals and groups including those of CCAA, and other Involved Agencies which must be addressed in the SEQR process with many embodied in conditions to the approvals needed for the Project to proceed.

## CLIMATE AND ENERGY

5. The Project will demand an enormous and growing share of the State's renewable energy capacity, and it will produce prodigious amounts of GHGe by its combustion of natural gas, challenging the attainment of the State's GHGe reduction goals. These are hugely important issues, for the reasons acknowledged in the DEIS itself. GHGe emissions are already altering the world's climate systems, with catastrophic consequences already seen both in New York and throughout the world. As the DEIS acknowledges, New York is one of the few states taking meaningful steps to lessen GHGe emissions and foster a transition to a modern fossil free economy. Micron must take all available steps now and over the years of design, construction and long term operation of the Project to help the State achieve the goals of the CLCPA.

6. SEQR allows for the approval of the Project despite significant adverse impacts, but it also clearly requires all Lead and Involved Agencies to make findings and impose conditions that avoid or mitigate those adverse environmental impacts to the maximum extent practicable. SEQR does not require that a project with significant adverse impacts be denied, but it empowers all Lead and Involved Agencies to require mitigation of those impacts as conditions of approval. (617.11(d)(5)). This is SEQRA's substantive dimension, long recognized in New York. Moreover, recent amendments to the SEQR regulations require specific findings and hence, specific conditions, concerning energy and climate. (617.9 (b)(5) (iii) (e) and (i) respectively).

7. The first phase of the Project will take five years to come on line, and throughout the entire DEIS there are promises by Micron to work to improve the Project, to employ Best Management Practices, including from an energy and climate point of view. Those commitments need to become conditions of approval, and there need to be measurable action forcing mechanisms by which opportunities for improvement are openly discussed with the Lead and Involved Agencies on a scheduled and public basis. As well there should be requirements that there be a means for local groups, communities and citizens to bring ongoing, or unanticipated, concerns to both the Involved and Lead Agencies, and to Micron.

8. The SEQR process contemplates that new information, new opportunities for improvements and new environmental issues will develop even before the first phase is built. Moreover, the duration of the construction of the overall project is 16 years. Fab 3 and 4 will be constructed many years in the future. It should be a condition of approval that a Supplemental EIS be drafted and reviewed when the Fab 3 and 4 project is under design. It is inevitable that changes in the industry, the communities affected, climate and environmental needs, impacts, and opportunities will have changed over that time. SEQR requires a new hard look at the Project when the new phase is under review. The SEQR review that is embodied in this DEIS is not and may not legally be a 'one and done' process. In fact, while avoidance of segmentation requires the full build out be considered now, the impacts of the second phase of the project are in the nature of a Generic EIS, as they are speculative and uncertain. Even more importantly, environmental concerns, requirements and opportunities will certainly change and evolve in the next decade, all of which necessitates a Supplemental DEIS. (617.9 (a) (7)).

9. The Project requires a huge quantity of energy, both fossil, in the form of natural gas, and electricity. The statement by Micron that it is using renewable energy is true. That renewable energy is already available and now largely exported out of the Zone C area to other parts of the State to offset fossil energy with renewable energy. In the short run, there appears to be no alternative to this, but it does impede the State in attaining its CLCPA emissions goals. In essence it provides an important economic development project for this region, while challenging the State's larger climate goals. The DEIS simply mentions that Micron will in part fulfill its requirement to use renewable energy by acquiring Renewable Energy Credits, but does not discuss the climate effectiveness of doing so, nor the current or future state of the market for purchasing them. This is an important omission and should be corrected. In Micron's CLCPA

Compliance Analysis, Micron is admitting that its enormous fossil and renewable energy demands will require waivers from the Climate Act's requirements. Those waivers must come with conditions for Micron to sharply reduce its GHGe emissions over the next 16 years in order to assist the State meet its climate and energy goals. During that time the State will be attempting to meet both GHGe emissions reduction and related renewable electrification goals, while balancing the need for ever more energy from data centers, high tech manufacturing, personal consumption for cars and for increasing climate-driven air conditioning. Micron is such a significant source of GHGe emissions that it must be required to be a partner in the State's crucial transition to renewable energy and lower GHGe emissions.

10. Approval decisions must attempt to mitigate the Project's increased emissions from burning fossil fuel and acquiring electricity, some of which will be generated by fossil fuel sources. To begin with, the Project is not proposing to construct any meaningful amount of renewable energy generation. Each proposed Fab will have 600,000 square feet of roof. Each Fab therefore has nearly 14 acres of rooftop. Some of that acreage could be used to install rooftop solar. Micron has done this in other Fabs, notably in Singapore. It is therefore a practicable mitigation by definition. The buildings can be designed to do so. The production on site of electricity for onsite use is a practicable mitigation of some of the Project's electrical use. The Campus is also more than large enough to provide space for co-located solar, wind or advanced geothermal renewable energy production. Certainly the Campus could be designed to provide room for and capacity for future onsite generation, and for extensive battery storage, even if not presently in the plans. Moreover there is no commitment by Micron to seek out and purchase local renewable energy from projects not yet proposed. Such agreements from local renewable sources would lower Micron's need to use electricity from public utility sources, and would stimulate further economic development, and the growth of renewable energy in the State. Any approval decisions must condition approval on efforts now and in the future to generate on site electricity and to explore all avenues to lessen reliance on the combustion of fossil fuel on site and off. Another condition could require Micron to provide electric vehicle charging capacity scalable to service the entire workforce, and to provide on site generated electricity free of charge to encourage employee transition to EVs, an important goal of the CLCPA and the State's Energy Policy. Another condition could be to provide electric vans to pick up workers at designated areas to lessen miles driven by them, an approach adopted by tech companies elsewhere.

11. Reducing GHGe emissions and transitioning to renewable energy is one of the State's, and the world's, most important priorities. SEQR requires a specific finding on this issue. The decision to approve the Project must require Micron to improve its present proposal, to work diligently to further reduce its GHGe footprint and to generate renewable energy and provide storage capacity for it. In addition, before proposing the second phase of the project, Micron must be required to address the issue with a Supplemental EIS, reflecting both the significance of the issue and the dynamic changes that are certain to take place in the next five to ten years. Climate impacts are going to increase at an accelerating rate. Energy demand will increase dramatically as well. New technologies in chip production, renewable energy production, and battery storage will all accelerate. Renewable energy generation is already the cheapest way to

generate electricity and that will continue to improve, with the co-benefit of slowing climate change and its catastrophic impacts. As noted above, all approval decisions must require more of Micron on this issue, now and in the future development of the Project, and to the maximum extent practicable the Project should be designed to be better in the future, including providing for current and future production and storage of renewable energy.

#### POLY AND PER FLUORINATED CHEMICALS (PFCs)

12. Approval decisions should impose a requirement for rigorous establishment of baseline conditions in the local air, water and soil for all chemicals that foreseeably will be introduced to the environment by the Project. The collection and public availability of the baseline data must be assured. This is especially true of data for air emissions of PFCs that also pose a climate risk due to their tremendous heat capturing potential in the atmosphere.

13. Scientific studies strongly suggest many health risks are caused by PFCs as well. Any PFCs that are not removed by Micron from the waste water stream will have to be thoroughly removed at the downstream County treatment plant, likely by very expensive reverse osmosis. The DEIS admits that Micron does not know the details of the County's plans for its new treatment plant. That seems a major omission in the overall water treatment plan analysis and will certainly require the County to prepare its own DEIS soon. It appears from the DEIS that Micron is promising to lessen the release of such chemicals to the environment. An approval decision on the Project must mandate that those efforts occur and be shared and reviewed by the relevant Involved Agencies including OCIDA and the County. There should be regular mandated comparisons of current levels to baseline levels of these chemicals. Provisions for Micron to pay the cost of review of these efforts, and the public availability of this data will be critical to the public's confidence in it and likely work to lessen the cost to the taxpayers

14. PFCs are known or suspected of serious adverse health effects. The chip fabrication process, according to Micron, has few alternatives to PFCs for current chip manufacturing. To the greatest extent practicable, Micron must be required, as a condition of approval, to avoid the release of PFCs to the environment. This is especially true of the water waste stream, as released PFCs will then become the responsibility of the County to remove, at taxpayer expense, without the possibility of landspreading the biosolids that result. PFCs in biosolids have already badly polluted farming operations in other states, most notably Maine. Onondaga County has a legacy of environmental contamination by industry, much of it before the harm was fully understood. All Involved Agencies, but especially the County have the opportunity, and the duty, to avoid a repeat of this history.

15. The issue of PFCs is a particularly difficult one. Micron's process already involves the use of a wide range of PFCs. Some PFCs are already known to be harmful, and there is active scientific research, much of which points toward all PFCs posing human health risks. At the very least it is true that releasing PFCs to the air, water and onto the soil is an area of great concern and major scientific uncertainty, including about chemicals created and released by incinerating them, as Micron is proposing. SEQR specifically provides special requirements when this

condition is met. It requires that the uncertainty be acknowledged and the state of scientific knowledge be summarized (617.9(b)(6)). A recently published book entitled *Poisoning the Water: How Forever Chemicals Contaminated America* by Sharon Udasin and Rachel Frazier, 2025, contains an extensive bibliography and footnotes that provide current citations to this quickly evolving scientific field. Also, the nationwide group Beyond Plastics maintains a list of current articles at this link: (<https://www.beyondplastics.org/reports-studies>). 1112 of the Public Health Law already addresses 1-4 Dioxin and EPA and DEC have a very low allowance for several PFCs. The State has already restricted the use of PFAS in apparel and other products and the Legislature unanimously banned PFAS and other toxins from menstrual products (S1548/A1502) (the bill is waiting for the Governor's signature) and the Legislature is proposing to address 23 different PFCs in the Packaging Reduction and Recycling Infrastructure Act (S1464/A1749). That PFCs are chemicals of great concern and potential catastrophic impacts on the environment, and not yet fully understood, cannot be denied, ignored or avoided.

#### SUMMARY:

16. This is a Project that will be approved. But it should be approved with express and enforceable conditions that avoid or mitigate adverse environmental impacts, and require ongoing consultation and improvements consistent with Micron's promises to do exactly that. SEQRA in 617.9 b( 5)( e), and(i) specifically address the requirements for Lead and Involved Agency findings and decisions regarding both energy and climate change. Those sections require the agencies to make decisions with conditions to assure mitigation to the maximum extent practicable on these issues.

17. Such conditions should include establishing baseline pre-project levels of the presence of all chemicals to be used by Micron, and an ongoing verified and public monitoring system of the presence of those chemicals in the environment. This includes both criteria chemicals required for permits, but also levels of chemicals which are not currently permitted. This is especially true of PFCs of all types used or to be used by Micron. Conditions should include requiring Micron to capture all air and water releases of PFCs, whether currently required by permit or not. It is possible and practicable to remove all of the PFCs from water effluent. Micron should be required to do so.

18. A condition should be imposed requiring that Best Management Practices aimed at reducing and eventually eliminating Scope 1, 2 and 3 GHGe emissions, and requiring periodic collaboration between the Lead and Involved Agencies and Micron in a manner that assures all opportunities are explored. This should include the right of local communities and the public to participate, and to provide input on both new opportunities and new impacts over the entire life of the Project, and especially during the design and approval of the second phase of the Project.

19. Conditions of approval should clearly require a Supplemental DEIS under 617.9 (a)(6) at the time of review and approval of Fabs 3 and 4. As noted above, detailed information about the second phase of the Project, and information about the outcome of construction and operations

at Fabs 1 and 2, the regulatory landscape, the state of renewable energy technology and storage, manufacturing technology and innovations and the State's progress on climate change, including the inevitably worsening effects of climate change are presently unknown and unknowable. SEQR requires an updated look at all issues before the second phase is permitted.

20. In conjunction with local approvals subject to SEQR, all Involved Agencies must also make findings and render decisions on the environmental issues raised, including the Economic Development Council which, under the Green Chips Act, must find that the Project will mitigate its greenhouse gas emissions over its lifetime. That Plan must account for mitigating both the Scope 1 emissions from burning natural gas, but also the Scope 2 emissions from the fossil fuel component of its electrical demand. Mitigation should mean to mitigate to help meet the State's GHGe targets and the State's renewable electric targets of 70% renewable by 2030 and 100 by 2040. To do so would be to require Micron to reduce and eventually phase out fossil fuel use as quickly as practicable and to produce or acquire its electric supply from renewable sources as soon as possible.

21. CCAA looks forward to reviewing responses to the substantive comments raised, and to permit decisions that respond to the wide range of issues raised by the public and involved agencies. CCAA, and all of the groups and individuals who provided comments will remain interested and involved in the ongoing design, construction, permitting and operations of Micron. Conditions of approval should, at every turn, make that interest and continued involvement easier. Data should be made easily available. Reports should be provided regularly, so that the public is given a means of informed participation.

22. The benefits of the Project are great, for the State, the region, and especially for the County. Nevertheless, Micron's environmental impacts will burden the County and its communities for generations. As a condition of approval, the County and the benefitted local communities should commit to concrete steps to reduce GHGe emissions across the County and the Region, which also is greatly benefitted by the Project. Those GHGe emissions are produced directly and indirectly by the County, by local governments, and by individuals. Renewable energy projects should be sited and approved to help offset Micron's GHGe Scope 1, 2, and 3 emissions. Perhaps most importantly, the County and the communities benefitted should provide information and encourage public understanding of climate change, and the importance of reducing GHGe emissions, not just for the world, but for the State and the County as well.

**Subject:** [EXTERNAL]

Email to Micron (today is the last day) before they f up our beautiful CNY water with their lackluster poor planning. Email questions to: [CHIPSNEPA@chips.gov](mailto:CHIPSNEPA@chips.gov)

Mine:

Why didn't you want to hold more public hearings on environmental impacts?

Why are you not extending the deadline as requested?

That doesn't seem like a good partnership to me.

Ever see the movie Erin Brockovich? That's what the plant and lack of planning for true and very real environmental concerns reminds me of. Your plant and jobs are not wanted here if you can not transparently disclose everything you are doing about every question below. Our area is beautiful and you're about to screw it all up if you don't take this seriously. Go somewhere else if you can't figure all of this out with careful planning and full disclosure of those detailed plans BEFORE you take any further actions or touch our pristine area. Most of us do not want this so the lack of proper planning and disclosures just makes it even worse.

#### 1. Water usage and quality

Clarification on wastewater discharge: Micron initially projected discharging 4 million gallons of wastewater per day, which was later revised to 8-20 million gallons/day. What factors contributed to this significant increase, and what further details can be provided on the anticipated volume and composition of the discharge?

Wastewater treatment effectiveness: While Micron plans to build an on-site pretreatment plant and utilize the county's expanded wastewater treatment facility, details on the specific technologies and expected effectiveness in removing all pollutants, especially "forever chemicals" (PFAS), remain unclear. How will Micron ensure the complete and safe removal of all hazardous substances before discharge into the Oneida River, and will regular, independent monitoring be conducted to verify treatment effectiveness?

Contingency plans for spills and leaks: Given the significant volume of chemicals stored and used on-site (up to 56 million gallons of corrosives), what are the comprehensive contingency plans and emergency response procedures in place to prevent and manage potential spills or leaks, particularly

into water sources like Lake Ontario and surrounding wetlands?

Transparency on chemical usage: Public concern exists regarding the lack of transparency about the specific chemicals Micron will use in its production process. What steps will Micron take to disclose this information, recognizing the potential impact on public health and the environment?

## 2. Air quality and greenhouse gas emissions

Greenhouse gas emission mitigation: The DEIS estimates Micron's annual direct and indirect CO<sub>2</sub> emissions at nearly 5 million tons, potentially threatening New York State's climate goals. While Micron pledges to purchase carbon-free electricity, concerns exist regarding the feasibility and impact of acquiring such a large amount of renewable energy credits and power purchasing agreements in New York State. What concrete steps will Micron take to ensure its operations align with the state's climate goals, and are they actively exploring on-site renewable energy generation beyond the proposed rooftop solar panels?

Air emission monitoring and control: What specific technologies and protocols will be implemented to monitor and control air emissions, especially hazardous air pollutants, from the manufacturing process and supporting facilities (e.g., bulk gas yards)? How will Micron ensure these measures are consistently effective in protecting local air quality?

## 3. Land use and habitat impact

Wetlands mitigation effectiveness: Micron plans to destroy over 200 acres of wetlands and create/restore hundreds of acres elsewhere as mitigation. What measures will be in place to ensure the created/restored wetlands adequately replace the ecological functions and biodiversity of the destroyed wetlands?

Habitat preservation and management: Given the presence of endangered and threatened species like the Indiana Bat on the project site, what long-term measures will be implemented to protect remaining habitat areas, ensure the effectiveness of conservation easements, and minimize disruptions during construction and operation?

Forest and grassland loss mitigation: The DEIS projects the loss of over 10,000 acres of forests and grasslands due to Micron and associated development. What strategies will Micron implement to reduce or offset this loss, particularly considering the role these ecosystems play in carbon sequestration and biodiversity?

## 4. Community impacts and sustainability

Affordability of energy and water: Micron's significant energy and water demands raise concerns about their impact on the affordability and availability of these resources for the wider community. How will Micron ensure their operations do not disproportionately burden residents through increased utility costs or resource scarcity?

Local infrastructure and emergency services: The massive scale of the project will strain existing infrastructure, including roads, utilities, and emergency services. While plans for infrastructure improvements are mentioned, details are lacking on Micron's contributions to these costs and how impacts on services like emergency response will be managed, particularly during a potential chemical incident. We deserve to see the full plan, what is your plan?

Sustainable development goals and metrics: Micron has committed to sustainable development goals within the Green CHIPS incentive program, such as reducing greenhouse gas emissions and expanding water restoration efforts. What specific, measurable metrics will be used to track progress towards these goals, and how will Micron ensure regular public reporting on these metrics?

---

**To:** chipsnepa  
**Subject:** [EXTERNAL] Forever chemical concerns

Hi, I am a citizen of DeWitt New York, near Syracuse. In the Micron Draft Environmental Impact Statement (<https://ongoved.com/microndeis2025/>) for the Clay New York proposed facility, it seems that the plan is not to fully filter the water of per- and polyfluoroalkyl substances (e.g., see page 3-83 of the draft statement). In fact, in some cases perhaps they are just “monitored” and not ever really filtered by Micron. In general, it also seems that a lot of the treatment of wastewater will be done by public facilities, which seems like a tax and infrastructure burden to local citizens. There is a very long history of industry driven environmental damage in Central New York State, and I think Micron could choose to be a continuing part of the legacy or be a force of positive change. Please invest more into fully filtering the water waste from the facility. Dumping lots of forever chemicals into the Oswego River watershed and therefore Lake Ontario, seems like a horrible environmental catastrophe that will have negative impacts for many centuries on the people that live in the region. Please be a good company and citizen in this new location you seek to move to.

Jamie Lamit  
DeWitt, NY

**Subject:** [EXTERNAL] Micro mitigation ration is too low

---

Hi,  
I am a citizen of DeWitt New York, near Syracuse. In the Micron Draft Environmental Impact Statement (<https://ongoved.com/microndeis2025/>) for the Clay New York proposed facility, the wetland mitigation ratio is only 2:1 (see page (3-92 and 3-93 of the impact statement). Wetland mitigation ratios are typically at least 3:1 or higher because the wetlands created offer far lower quality habitat and ecosystem services than the natural ones that were destroyed. Given the massive tax incentives and other perks that Micron has received for the project, why is the mitigation ratio not higher? Micron stands to gain an enormous amount of profit from this facility and it seems like small potatoes to raise that ratio above 2:1. There is a very long history of industry driven environmental damage in Central New York State, and I think Micron could choose to be a continuing part of the legacy or be a force of positive change. In the long-term, the loss of wetland area has a vast cost compared to keeping it unmodified, which will be a burden to the people of the region and beyond. Please increase your mitigation ratio.

Jamie Lamit

**Subject:** [EXTERNAL] Forever chemical concerns

Hi, I am a citizen of DeWitt New York, near Syracuse. In the Micron Draft Environmental Impact Statement (<https://ongoved.com/microndeis2025/>) for the Clay New York proposed facility, it seems that the plan is not to fully filter the water of per- and polyfluoroalkyl substances (e.g., see page 3-83 of the draft statement). In fact, in some cases perhaps they are just “monitored” and not ever really filtered by Micron. In general, it also seems that a lot of the treatment of wastewater will be done by public facilities, which seems like a tax and infrastructure burden to local citizens. There is a very long history of industry driven environmental damage in Central New York State, and I think Micron could choose to be a continuing part of the legacy or be a force of positive change. Please invest more into fully filtering the water waste from the facility. Dumping lots of forever chemicals into the Oswego River watershed and therefore Lake Ontario, seems like a horrible environmental catastrophe that will have negative impacts for many centuries on the people that live in the region. Please be a good company and citizen in this new location you seek to move to.

Jamie Lamit  
DeWitt, NY

Re: Public Comment on the Draft Environmental Impact Statement for the Micron Semiconductor Manufacturing Project (EISX-006-55-CPO-001)

Dear NEPA and SEQRA Lead Agencies:

We submit these comments as concerned citizens of Syracuse and Onondaga County regarding the Draft Environmental Impact Statement (Draft EIS) for the proposed Micron Semiconductor Manufacturing Project in Clay, New York. After reviewing the Draft EIS, we am deeply troubled by the profound and permanent adverse environmental impacts identified, many of which stand in direct tension with both New York State and federal statutory commitments to environmental protection, climate action, and natural resource stewardship.

*1. Permanent destruction of wetlands and violation of Clean Water Act objectives*

The Draft EIS makes clear that this project will result in the irretrievable loss of approximately 193 acres of federal jurisdictional wetlands and associated stream systems. This level of permanent wetland destruction - even with proposed compensatory mitigation - conflicts with the foundational purposes of the Clean Water Act (33 U.S.C. 1251 et seq.), which aims to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters."

Moreover, the project would fundamentally compromise local ecosystem services, including natural flood control, water filtration, and wildlife habitat, directly undermining the goals set forth in New York's Environmental Conservation Law Article 24 (Freshwater Wetlands Act). It is particularly concerning that the Draft EIS acknowledges these impacts as unavoidable significant adverse effects yet moves forward on a finding of necessity primarily based on economic grounds.

*2. Irreversible habitat loss threatening compliance with federal and state endangered species protections*

The Draft EIS details significant adverse impacts to multiple federally and state-listed threatened and endangered species. Under the Endangered Species Act (16 U.S.C. 1531 et seq.), federal agencies are obligated to ensure that actions they fund, authorize, or carry out

do not jeopardize the continued existence of listed species or destroy or adversely modify critical habitat.

Similarly, New York's Environmental Conservation Law Article 11 (Fish and Wildlife Law) reinforces the imperative to protect listed species and their habitats. The acknowledged permanent loss of significant habitat areas - despite the proposed use of Best Management Practices and some off-site mitigation - appears to fall short of fully preventing such jeopardy.

### *3. Incompatibility with New York's Climate Leadership and Community Protection Act (CLCPA)*

The project is expected to cause a large, unavoidable, and long-term increase in greenhouse gas (GHG) emissions, driven by massive energy consumption (including natural gas) and the inherently energy-intensive nature of semiconductor manufacturing. These emissions growth projections fundamentally conflict with the legally mandated requirements of New York's Climate Leadership and Community Protection Act (CLCPA, Chapter 106 of the Laws of 2019), which requires an 85% reduction in statewide GHG emissions by 2050 from 1990 levels, with interim targets.

Even with proposed solar installations and efficiency measures, the project represents a huge new stationary and indirect GHG source. Proceeding with such a large fossil-dependent project without clear enforceable commitments to align operations with the CLCPA's emissions reduction mandates would undermine the statute's objectives and erode statewide climate progress.

### *4. Irretrievable commitments of natural resources and circumvention of long-term sustainable land use planning*

The Draft EIS explicitly acknowledges that the project would result in irreversible or irretrievable commitments of environmental resources, including permanent conversion of roughly 1,000 acres of existing land to impervious surfaces, consumption of millions of tons of construction materials, and massive long-term use of nonrenewable resources such as natural gas. This effectively forecloses future land uses aligned with sustainable development or regenerative ecological restoration. Such long-term commitments are at odds with New York State Smart Growth Public Infrastructure Policy Act (Environmental Conservation Law 6-0101 et seq.).

### *5. Serious cumulative effects and disproportionate burdens on disadvantaged communities*

The Draft EIS identifies cumulative effects related to induced growth, traffic congestion, increased noise, and additional strain on local infrastructure and housing. Particularly concerning is the intersection with New York State's Environmental Justice Policy (Commissioner Policy 29) and the federal Executive Order 12898 on Environmental Justice, which require fair treatment and meaningful involvement of all communities. The proximity of impacted areas to designated disadvantaged communities (DACs) raises serious equity concerns that have not been fully resolved.

### *6. Unavoidable traffic congestion and air quality degradation*

The project's induced travel demand is projected to cause unavoidable significant adverse impacts to five intersections even after implementing recommended mitigation measures. This will further degrade air quality and increase noise in surrounding communities, compounding health burdens and undermining local quality of life.

In summary, this Draft EIS demonstrates that the proposed Micron project will have profound and permanent environmental consequences, many of which directly contradict the protective purposes of the Clean Water Act, the Endangered Species Act, New York's Freshwater Wetlands Act, and especially the mandates of the Climate Leadership and Community Protection Act. These weaknesses underscore the urgent need for:

- *A full reconsideration of scale, with a credible analysis of reduced-scale alternatives that could materially reduce environmental harms;*
- *Legally enforceable operational requirements that align with CLCPA emissions targets;*
- *Stronger wetland and habitat protection measures that avoid rather than merely compensate for destruction; and*
- *A thorough reassessment of cumulative impacts on environmental justice communities.*

Proceeding as currently planned, without stronger avoidance or enforceable mitigation, risks violating the intent or requirements of the ESA and CLCPA or leading to noncompliance once final agency findings are made. This is why the EIS process exists — to determine if the project must be redesigned, scaled down, or conditioned with strict mitigation to be legally approvable.

We urge your offices to reconsider advancing this project in its current form and to require a substantially more protective alternative that is consistent with both New York State and federal environmental law and policy. Thank you for considering our comments.

Sincerely,  
Ann and Scott Landes

## **Comment on Micron Draft Environmental Impact Statement** Aug 7, 2025

Submitted by Catherine Landis, MS, PhD Ecology

**First**, we need to extend the comment period. 45 days is not sufficient time to evaluate a 20,000 page document full of highly technical information including charts, maps, appendices, etc.. *The comment period needs to be extended to 120 days* to give the public a fair chance to carefully review and submit accurate comment.

**Second**, I will discuss various aspects of the DEIS, beginning with **Wetlands**.

Total delineated Federal wetlands on site: **~409 acres (p3-63)**

### **From the DEIS:**

“Construction of the Proposed Project would result in the permanent loss of approximately 193.38 acres of wetlands being treated as Federal jurisdictional wetlands, or approximately 174.77 acres of wetlands being treated as State jurisdictional, (p. 3-72),

“78.86 acres of wetlands will be lost during the proposed connected actions.” (Page 3-66, section 3.3).

“Construction of the Proposed Project would result in the direct loss of wetlands and their functions and services from site development. In addition, wetland buffers (typically 100 feet from the edge of a wetland in the New York State) would be lost. Increased impervious surfaces could lead to indirect effects from increased stormwater runoff and decreased groundwater recharge.”

“11,600 parking spaces, four bus stops, and seven access roads would be constructed on the campus, including four 500-space surface parking lots. (Table 2.1-3, p. 2-13.)”

### *From the scientific literature:*

If the percent catchment impervious surface cover (ISC) increases to 10-20%, runoff increases twofold; 35-50% ISC increases runoff threefold; and 75-100% ISC increases surface runoff more than fivefold over forested catchments.

Imperviousness has become an accurate predictor of urbanization and urban impacts on streams, **and many thresholds of degradation in streams are associated with an ISC of 10-20%** (Meyer and Paul 2001).

**Comment:** In addition to direct destruction and filling of wetlands, nearby wetlands are sure to be degraded by these indirect effects. Many of the wetlands on site are good quality, including red maple swamps, hemlock-hardwood swamps, floodplain forests, and dogwood and willow shrub swamps. These wetlands contain a high proportion of native species that benefit insect production and that serves as the basis of food webs. Construction and operation of Micron will decimate these food

web connections and result in large-scale mortality of plants and animals, many of whom lack the mobility to escape. Wildlife who can move quickly (such as birds) will be driven off by noise, lights, and increased human traffic. Road salt and other runoff will degrade remaining wetlands into monocultures of Phragmites or invasive cattails, which support minimal animal and plant diversity.

Wetlands are essential to our health and environment. They support more than 1/3 of the country's threatened and endangered species, filter pollutants, and buffer communities from floods. They also store vast amounts of carbon, making them powerful tools in the fight against climate change. In fact, 300 acres of freshwater wetlands store ~305,000 metric tons of carbon dioxide, roughly equal to the yearly emissions of 66,000 cars. Destroying these wetlands will release this CO<sub>2</sub> into the atmosphere and remove future carbon storage, further contributing to climate change. This release of CO<sub>2</sub> is not accounted for in Micron's Draft Environmental Impact Statement (Nahlik & Fennessy, 2016; Watson et al. 2000).

According to the EPA and peer-reviewed literature (e.g., Bridgham et al., 2006), drained freshwater wetlands in temperate regions can release approximately 3-10 metric tons of CH<sub>4</sub> (methane, a potent greenhouse gas) per hectare over the short term following destruction (via oxidation and disturbance). This will contribute to climate change during a time when NYS is supposed to be a leader in reducing greenhouse gases and moving towards Carbon neutrality.

In addition, removing water to lower the water table on the site over the 15 year construction period will impact surrounding streamflow and aquatic ecosystems, leading to elimination of small streams and wetlands from the landscape. Such developments typically bring a cascading sequence of negative landscape impacts that the Plan aims to reduce and mitigate, but fails to do enough.

Further, we can expect these impacts to be multiplied in subsidiary development in the Clay, Cicero, and greater Onondaga and Oswego County areas, with the increase in impervious surfaces associated with thousands of new housing units, office and business spaces. These impacts just continue the trend of decades of wetland draining and filling in the northern part of Onondaga County.

### ***Recommendation***

**The best and preferred strategy to reduce these impacts, is to move the Micron facility to a more appropriate site**, one already degraded by industrial or commercial intrusions.

Barring that, and because of direct, indirect, and cumulative impacts (subsidiary development predicted to occur in the watershed, for example) **we strongly urge regulators to increase the wetland replacement ratio from ~2:1 to ~10-15:1, as was done for the Seneca Meadows wetlands restoration project** (see

<https://res.us/projects/seneca-meadows-wetland-restoration-design-build-mitigation-for-landfill-impacts-to-wetlands/>).

Note Indirect effects on adjacent wetlands and ones connected hydrologically, all the way out to Oneida River floodplain.

## **Wetland Mitigation Work Plan, Appendix G.**

### Section 4.1 Selection and Design Criteria

**“Work areas contain few, if any, existing wetlands,** which allows for focus on reestablishment and are near or adjacent to existing DEC wetlands. Delineated wetlands will be subsumed into the work area and will be either registered as rehabilitation if the area is marginal, which is usually the case, or will otherwise be subtracted from the total acreage built and corresponding credits generated. The agencies decide which option is selected.”

**“2. Sites are in active soybean production.** The sites will stay in active agriculture until construction commences, which helps prevent invasive species and incompatible land uses.”

**Comment:** The wetland mitigation sites are currently in soybean production, for the most part. That’s a major problem since it means there will be a gap of decades before the wetlands (especially the forested ones, 70 acres direct loss) can provide the similar ecological services that the current ones provide (though studies have shown they never reach the same functional capacity as original wetlands - see Moreno-Mateos et al. (2012) - summary below). The sites are also smaller and closer to disturbance (roads, farms, homes).

A meta-analysis by Moreno-Mateos et al. (2012) of 621 restored or created wetlands worldwide found that, even up to 100 years after restoration, biological structure (primarily plant communities) remained about 26% lower and biogeochemical function (driven by soil carbon storage) about 23% lower than in undisturbed reference wetlands. The authors conclude that current restoration practices are often unable to fully recover the original ecosystem functions.

To address these issues, we strongly urge regulators to require Micron to purchase large acreage of existing wetlands (especially forest and shrublands) such as any remaining floodplain forest along the Oneida River. These areas should be protected in perpetuity and held by TWT or the CNY Land Trust.

The mitigation sites are also smaller, isolated fragments, not the integrated whole of the Micron site (with its matrix of forest, grassland, and wetland intertwining– See Fig.F-3, for example).

Wetland mitigation sites should be monitored in perpetuity to ensure they meet restoration targets over the long term.

### **Wetlands and Connected Actions**

Page 3-66, section 3.3:

“A total of 78.86 acres of wetlands have been mapped or delineated within the Connected Action LODs, including the Clay Substation expansion area and the natural gas, water supply, and wastewater improvement LODs, and are being treated as jurisdictional. However, jurisdictional determinations have not yet been issued for these features, with the exception of the Clay Substation (USACE only). For additional information on these wetlands, see Appendix F-3.1.”

#### F-3.1.4

**Connected Actions** The presence and extent of wetlands within each Connected Action LOD were delineated in the field and evaluated in the same manner as those conducted for the proposed Micron Campus, except for wetlands within the proposed water supply improvement LODs, because those improvements are currently scheduled too far in the future for wetland delineations conducted at this time to be valid by the time construction begins.”

“Further, the total amount of non-jurisdictional wetlands present within the LODs cannot be determined at this time because not all of the LODs have been delineated. Except as described below for the proposed Clay Substation expansion area, functional analyses of wetlands within the remaining Connected Action LODs also have not yet been conducted, for various reasons, including because field delineations have not yet been performed, wetlands have yet to be assessed by USACE or NYSDEC, or losses of jurisdictional wetlands within the remaining LODs are anticipated to be negligible.”

#### F-3.2.2

**Connected Actions** The presence and extent of rivers and streams within each Connected Action LOD were delineated in the field and evaluated in the same manner as those conducted for the Proposed Project components, except for rivers and streams within the proposed water supply improvement LOD, because those improvements are currently scheduled too far in the future for delineations conducted at this time to remain valid by the time construction begins.”

**Comment:** 78.86 acres of wetlands and surrounding rivers and streams that will be impacted by future connected actions have not been evaluated yet - these need to be evaluated before any construction begins so that impacts of development can be tracked over time. Also, we need an understanding of total impact (over the entire period of construction) on wetland function, wildlife and plant communities.

**Table 3.3.5 in DEIS.**

**Comment:** Note primary function of wetlands as wildlife and Endangered species habitat. See comment on bats by Dr Vanessa Rojas for limitations of the mitigation plan for bat species.

The Table is missing both the Carbon storage and thermal moderation services of wetlands, two functions very important in a rapidly warming world. These services should be added.

**Wetlands: New York State Law** (new regulations went into effect Jan 2025)

Micron is obligated to adhere to the new NYS Freshwater Wetlands regulations. Micron's current determination of impacted New York State jurisdictional wetlands and the company's obligation to comply with the new state freshwater regulations remains unclear. Starting In 2021, Micron employed Ramboll Americas Engineering Solutions, Inc. (Ramboll) to further identify wetlands types and acreages that should be included under the ACOE and New York state's permitting authority. The results of this research are found in a series of tables, charts and maps in the DEIS that *largely reflect information from old DEC jurisdictional paper maps confirmed on surveys*. (based on determinations issued by NYSDEC under ECL Article 24), approved Jurisdictional Determinations issued by USACE (under the CWA) and what Ramboll describes as non-jurisdictional wetlands 'definitively excluded from Federal and State jurisdiction'.

**Comment:** *The DEIS does not indicate the criteria for how Ramboll decided what wetlands would not receive permitting protection. The DEIS acknowledges the wetlands permitting reforms passed by the NYS Legislature in 2022 and the subsequent regulations for freshwater wetlands that went into effect January 1, 2025. (DEIS appendix F-2.2) But it remains unclear whether Micron is operating under the old rules or the new rules when they decide which wetlands deserve permitting protection.*

Micron and DEC must make clear through the EIS process that this project does not qualify for exemptions from the new freshwater regulations that went into effect January 1, 2025.

**A revised plan for wetlands protection must include:**

- A declaratory statement that the Micron project will comply with the NYS wetlands regulations that went into effect January 1st, 2025.
- *A comprehensive analysis of all wetlands on the project site, regardless of size.* For a publicly subsidized and forward-thinking project like Micron that will be engaged in construction well past 2028, *all wetlands larger than 7.4 acres should be considered state jurisdictional* and come with the commensurate buffers, protections and mitigations associated with their permitting.
- A review of Wetlands smaller than 7.4 acres to determine if they meet the criteria for ‘Local Importance’ and deserving of permitting protections. In consideration of the potential for endangered species on the Micron property, it is conceivable that many of the smaller wetlands would qualify as state jurisdictional wetlands.

## **Wildlife: Reptiles and Amphibians**

### **From the DEIS:**

#### Effects on Reptiles and Amphibians (3-118)

“Mass mortality of reptiles and amphibians, including salamanders, frogs, turtles, and snakes, would be expected to occur during construction as a result of site clearing, grubbing, and grading, as these taxa are not mobile enough to avoid the paths of most site clearing and earthmoving activities. Noise and lighting disturbances also would potentially affect reptiles and amphibians in immediately adjacent areas. In addition, construction could indirectly affect amphibians and aquatic reptiles by altering the water balance and water quality of the Youngs Creek basin. However, as described in Section 3.3 (Water Resources), Micron would implement stormwater BMPs and would be required to undertake SMPs that would be documented in a SWPPP as part of its SPDES CGP. Micron also would implement the ESCP described above. Together, these measures would help minimize adverse effects on reptiles and amphibians. Construction effects on special status species are described under Special Status Species below.”

### **Comment**

--What are the specific stormwater BMP plans, and how would they benefit reptiles and amphibians? Are these creatures’ needs included in the design, or just hoped-for users? If the latter, *we can expect large-scale failure in “minimizing adverse effects”* on reptiles and amphibians, along with mass mortality of these vulnerable animals.

--What is the evidence from past projects, and from the scientific literature, that most species of reptiles and amphibians will use these stormwater areas?

--What are the projected water quality parameters for stormwater runoff, and is the chemistry in the tolerance range of reptiles and amphibians? My professional guess is that turbidity, dissolved salts from deicing agents, heavy metals from brake linings and other chemicals in runoff from impervious surfaces will create conditions intolerable to most aquatic and amphibious life.

--What will Micron do to prevent this anticipated “mass mortality” of reptiles and amphibians? Is there a re-location plan for displaced fauna? **Again, the best relocation plan would be to relocate Micron to a site already damaged** by industrial and commercial impacts, and leave this site to the many species of wildlife that call it home.

--At the very least, Micron should prepare a relocation plan and provide funding for animal road crossings to allow migration and movement of displaced animals.

#### **DEIS 3.4.3.2 Special Status Species: Bats**

Indiana, northern long-eared, tri-colored bats all detected on the Micron site. The first two species are Federally listed as Endangered, while the tri-colored bat is proposed for listing. These bats are in serious trouble due to disease and especially to habitat loss, which the Micron factory perpetuates in a major way given the scale of the project.

*The acoustic survey ... documented Indiana bat and northern long-eared bat activity at levels indicating that **maternity roosts** for one or both of those species may be present on the Micron Campus site.*

#### **Comment:**

- Endangered Bats experiencing freefalls, accelerating towards 100% decline;
- Need evidence from the scientific literature, based on the species in question (and not more generalist bats such as the little brown bat) that proposed mitigation sites will be used;
- Noise, lights, disturbance could drive these bats away; again, evidence that bats may tolerate such intrusions comes from studies on generalist species and not the Endangered ones;
- Need more evidence specific to the Endangered bats to support and revise the current mitigation plan;
- For bats, moving Micron to another site is the best solution.

#### **Birds**

Bird populations are in steep decline across North America (Rosenberg et al. 2019). The recent 'State of the Birds' report (Audubon 2025) suggests that “more than one-third of U.S. bird species are of high or moderate conservation concern.” Even common bird species are experiencing population declines in habitats where they are known to be abundant (Johnston et al. 2025). Leading causes of these declines include habitat loss and habitat fragmentation due to development. Large developments like the Micron project pose a serious threat to all bird populations and species diversity.

The Micron DEIS emphasizes the conservation of grassland birds (which is extremely important); however, **since all species are experiencing population declines, mitigation strategies should be developed and implemented for all bird species.**

#### **From the DEIS:**

##### **3-136:**

“To achieve a net conservation benefit for northern harriers and short-eared owls, NYSDEC would require Micron to achieve a 3:1 ratio of new and improved quality grassland bird habitat to grassland habitat lost due to Proposed Project and Connected Action construction. This mitigation would be carried out within 5-year cycles.”

“These 650 acres would be located across seven properties, with all restored fields to exceed at least 25 contiguous acres each. These properties are located in Oswego, Chenango, Yates, Cortland, Broome, Tompkins, and Tioga Counties at distances of approximately 10-60 miles from the Micron Campus site”

#### **Comment**

--A minimum threshold of 25 contiguous acres is indeed in line with the NYSDEC's *Strategy for Grassland Bird Habitat Management and Conservation 2022-27*; however, it is the absolute minimum requirement and is insufficient to ensure the future success of grassland bird populations. *We think this should be bumped up to a minimum size of 75 acres.*

--While the Grasshopper Sparrow has not been detected on the Micron property, they could possibly occur in the area (Table G-4). Ultimately, Grasshopper Sparrows need more habitat across New York State. Given that they are most successful in at least 75 acres of habitat, they could represent an umbrella species for grassland habitat mitigation. Mitigating habitat suitable for Grasshopper Sparrows would ultimately result in suitable habitat for most other grassland bird species that are less area sensitive.

--Incidentally, the Grasshopper Sparrow is possibly the best grassland bird indicator species primarily due to their sensitivity to habitat change (Elliot and Johnson 2018). No Grasshopper Sparrows present at the Micron site indicate that the existing habitat is perhaps of marginal quality and/or

size. Mitigation could be an opportunity to offer improved grassland habitat for this declining species.

--For Short-eared Owls—which have been observed on the site multiple times, and whose numbers are plummeting in NYS—mitigation needs to include much larger habitat blocks, at least 200 acres (Wiggins et al. 2020).

--Mitigation should be done in such a way so as to reduce habitat fragmentation; e.g., provide a smaller number of large contiguous tracts of habitat rather than several small ones.

--What does it mean that the mitigation will be carried out in 5-year cycles? Explain.

--What will be the management regime for these 7 sites? NYSDEC will maintain long-term management - does this mean in perpetuity?

i.e., these fields will need some type of disturbance (occasional late-fall mowing and/or late-winter fire) to maintain them as early successional open spaces. These fields should \*never\* be mowed between March-October (the earliest mowing events should take place early November)

### **Bird migration:**

A significant research gap is that bird surveys appear to have excluded migration stopover use (i.e., migratory birds stopping and resting on the property to refuel before moving along their migration route). Central New York is along the Atlantic flyway, an important migration path for multiple avian species, from the tiniest warblers to sizable raptors. Whether a short-distance migrant (e.g., sparrows migrating to Florida) or a long-distance migrant (e.g., neotropical migrants), stopover habitat is CRUCIAL for the conservation success of such populations and communities. This should not be overlooked. I think both fall and spring migration surveys should have been done in addition to the breeding and wintering surveys.

The migration of huge numbers of birds occurs at night, and artificial light can disorient and/or attract birds away from their route. During construction of the Micron project, *lights should be off from 11 pm to 6 am during peak spring and fall migration seasons (<https://www.lightsoutcny.org/>)*.

As discussed, the DEIS *needs to provide escape options (mitigation) for all birds, not just grassland species*. What about the great blue herons, who have a rookery on site? Or the little green heron observed in the wetlands, or

the hundreds of neotropical migratory songbirds that use the site? Micron is receiving billions of dollars in public funding, so they should provide financial support for the following practices that could benefit ALL birds, not just grassland ones:

- Acquisition of nearby large, quality habitat blocks (that could go to CNY Land Trust or The Wetlands Trust) to help displaced fauna relocate;
- As discussed, increase wetland replacement ratio to somewhere between 7-10 to 1 (acres replaced to acres lost);
- Addition of conservation practices and design to any subsidiary development, along with retrofits to existing development. For example:
  - Require developers to maintain natural features of the areas they destroy as much as possible.
  - Landscaping of new homes and offices should use native plants and designs that help recreate the habitats lost (conservation housing).
- Development of native plant nurseries and landscaping services;
- Use dark sky lighting (see <https://darksky.org/>) for any new construction, whether industrial, commercial, or residential.
- Fund research and monitoring to assess the success of all of these efforts.

Finally, I emphasize that serious consideration needs to be given for moving Micron to a site more fitting for the kind of large-scale habitat destruction planned to occur there. Wetlands, Endangered bats, Reptiles and Amphibians, Plants, Insects, Birds would all benefit immensely from that wise decision.

Thank you for this opportunity to comment.

Sincerely,

Catherine Landis

"The most important place on earth is the sea!" - Sir David Attenborough, 99

Earth's oceans contain 322,000,000 cubic miles of graded saltwaters.

Locally, ancient Ice Age's "Lake Iroquois" imprinted the flow pattern hydrology ~10,500 years ago/Initiating the Great Lakes Reality, also of which the Oneida-Seneca-Oswego waterworld is tributary. Discharges of the St. Lawrence River mix in its Gulf and merge with the Labrador Current of the N-West Atlantic, thence bathing the eastern seacoast.

A nominal respect for the indigenous ecosystem will require a willingness of Onondaga County and the other systemic regulatory to update the wastewater permits to constrain negative environmental impacts evident by clinically pointed field assays, analysis and formal findings. This is merely facing "the truth" of real chemistry, labwork, bioaccumulation study, etc. and taking a responsible position.

Micron's chemical loads after its pre-treatment will challenge the Oak Orchard processing to "up" its performance to protect our waters which will thereafter enter Lake Ontario merely 20,000 feet from the OCWA intake.

Our commons are upstream and down to our ocean. The current care mindset is well-framed in Future Sea by D. ROWAN-WRIGHT  
Signed, 1<sup>27</sup> pm Aug. 11, 2025 Tom LAW

**Subject:** [EXTERNAL] Questions / request for clarification

- 
1. OCWA will upgrade the water system to supply the micron campus. How much will this cost, and how is this work being funded? Please include how much of the work will be funded by Micron and how much will be funded by the county. How does the county plan to obtain the funds? Is an additional tax levy anticipated, and if so, what is the detailed plan for how this will take place?
  2. OCDWEP is responsible for the upgrades and new infrastructure of the wastewater treatment system. How much will this cost, and how is this work being funded? Please include how much of the work will be funded by Micron and how much will be funded by the county. How does the county plan to obtain the funds? Is an additional tax levy anticipated, and if so, what is the detailed plan for how this will take place?
  3. What other "Connected Actions" will result in costs to Onondaga County? Please include direct and indirect costs. For instance, if the telecommunications needs will be handled by existing infrastructure, how will that infrastructure be replaced, and who is responsible for the cost of it?
  4. The project claims that it will create an excess of 9000 permanent operational jobs. If that claim is not met, will there be an adjustment in the amount of government subsidy? As an example, if AI advances to the point that only 4500 permanent operational jobs are needed, will the subsidies be reduced? Will the pilot be halved?
  5. AI has significant energy needs. Is there a restriction on the energy made available to the micron facility? Is there a priority list in the event of a shortage/brownout?
  6. What will be the impact of PFAS and other "Forever Chemicals" on the fish in the watershed? How will it affect the fishing industry in the area, and what is the expected impact on the people who eat the fish from NY's streams and lakes?
  7. How will Micron and Onondaga County control PFAS and other "Forever Chemicals" that are currently not regulated by the county, state, or federal government?
  8. How will these chemicals be monitored?
  9. Will Micron do internal monitoring of the wastewater? If so, what will be monitored, and at what frequency? How will this information be communicated to the County?
  10. Is there a set of circumstances where the system will be shut down due to the effluent containing dangerously high levels of pollutants?
  11. What is the reporting / oversight method? What will Micron report to the county, and how frequently?
  12. How will emission changes be addressed? As an example, if raw materials change or if product line changes result in different emissions, how will this information be communicated to the county? How will the county respond?
  13. Will the county develop and impose limits on chemicals that are not regulated by the state or federal government?
  14. Will there be any additional monitoring of municipal water supplies to be kept abreast of problems that might occur from emissions?
  15. Will there be any help for individual homeowners who want their wells monitored? For example, will the county look for contamination on a yearly basis or after a high level release?

16. Are there tests for all the chemicals in use and created in situ that might be part of the emissions? Is the county wastewater treatment program equipped to test for them?
17. Have the government or regulators on any level given exemption from liability to Micron for damage related to the emissions? PFAS and related compounds can cause fertility and other health issues. If so, what are the details of this exemption?
18. What is the impact on international waters? If we pollute Lake Ontario, we may have an international liability. What are the laws / rules regarding this?

## **Birds:**

Bird populations are in steep decline across North America (Rosenberg et al. 2019). The recent 'State of the Birds' report (Audubon 2025) suggests that "more than one-third of U.S. bird species are of high or moderate conservation concern." Even common bird species are experiencing population declines in habitats where they are known to be abundant (Johnston et al. 2025). Leading causes of these declines include habitat loss and habitat fragmentation due to development. Large developments like the Micron project pose a serious threat to all bird populations and species diversity. This EIS emphasizes the conservation of grassland birds (which is extremely important); however, since all species are experiencing population declines, mitigation strategies should be developed and implemented for all bird species. This could include habitat creation and restoration near the Micron property, and providing financial support to local organizations such as the CNY Land Trust, Onondaga Audubon, and other environmental groups, including those that promote the use of native plants..

Open habitats are disappearing across New York State, so grassland songbirds are experiencing population- and community-level declines. This is happening all over North America. New York State is incentivizing solar farm development which is contributing to increased grassland habitat loss. According to the NYSDEC **Strategy for Grassland Bird Habitat Management and Conservation 2022-27**: "Current grassland habitat on State land is limited and insufficient to meet

the needs of grassland birds.” These early successional habitats require regular natural or anthropogenic disturbances (e.g., fire, wind, haying, grazing). Two species of conservation concern in New York State include the Northern Harrier and the Short-eared Owl. These species require large contiguous tracts of grassland habitat for both breeding and overwintering. Many grassland songbird species are also area-sensitive, so it is important that mitigation measures mindfully incorporate minimum area thresholds that are suitable for conserving as many species as possible.

Below are comments on specific components of the DEIS:

### **3-136:**

“To achieve a net conservation benefit for northern harriers and short-eared owls, NYSDEC would require Micron to achieve a 3:1 ratio of new and improved quality grassland bird habitat to grassland habitat lost due to Proposed Project and Connected Action construction. This mitigation would be carried out within 5-year cycles.”

“These 650 acres would be located across seven properties, with all restored fields to exceed at least 25 contiguous acres each. These properties are located in Oswego, Chenango, Yates, Cortland, Broome, Tompkins, and Tioga Counties at distances of approximately 10-60 miles from the Micron Campus site”

- A minimum threshold of 25 contiguous acres is indeed in line with the NYSDEC’s **Strategy for Grassland Bird Habitat Management and Conservation 2022-27**, however, it is the absolute minimum requirement and is insufficient to ensure the future success of grassland bird populations. We think this should be bumped up to a minimum size of 75 acres.
  - While the Grasshopper Sparrow has not been detected on the Micron property, they could possibly occur in the area (Table G-4). Ultimately, Grasshopper Sparrows need more habitat across New York State. Given that they are most successful in at least 75 acres of habitat, they could represent an umbrella species for grassland habitat mitigation. Mitigating habitat suitable for Grasshopper Sparrows would ultimately result in suitable habitat for most other grassland bird species that are less area sensitive.
  - Incidentally, the Grasshopper Sparrow is possibly the best grassland bird indicator species primarily due to their sensitivity to habitat change (Elliot and Johnson 2018). No Grasshopper Sparrows present at the Micron site indicate that the existing habitat is perhaps of marginal quality and/or size. Mitigation could be an opportunity to offer improved grassland habitat for this declining species.
- Mitigation should be done in such a way so as to reduce habitat fragmentation; e.g., provide a smaller number of large contiguous tracts of habitat rather than several small ones.
- What does it mean that the mitigation will be carried out in 5-year cycles? Explain.
- What will be the management regime for these 7 sites? NYSDEC will maintain long-term management - does this mean in perpetuity?
  - i.e., these fields will need some type of disturbance (occasional late-fall mowing and/or late-winter fire) to maintain them as early successional open spaces. These fields should *\*never\** be mowed between March-October (the earliest mowing events should take place early November)

### **Bird migration:**

A significant research gap is that bird surveys appear to have excluded migration stopover use (i.e., migratory birds stopping and resting on the property to refuel before moving along their migration route). Central New York is along the Atlantic flyway, an important migration path for multiple avian

species, from the tiniest warblers to sizable raptors. Whether a short-distance migrant (e.g., sparrows migrating to Florida) or a long-distance migrant (e.g., neotropical migrants), stopover habitat is CRUCIAL for the conservation success of such populations and communities. This should not be overlooked. I think both fall and spring migration surveys should have been done in addition to the breeding and wintering surveys.

The migration of huge numbers of birds occurs at night, and artificial light can disorient and/or attract birds away from their route. During construction of the Micron project, lights should be off from 11 pm to 6 am during peak spring and fall migration seasons (<https://www.lightsoutcny.org/>).

**G-45:**

We're confused by this statement:

"55 bird species have the potential to occur at the Micron Campus site and 40 species have the potential to occur at the Rail Spur Site, and 26 of those species were observed during the site investigations and surveys, indicating that those species are year-round residents at those sites."

This sentence is not clear to me. Does this mean that the same 26 species were detected during the breeding season \*and\* during the winter surveys? This is not clear (and seems unlikely).

Northern Harriers and Short-eared Owls are both considered "species of greatest conservation need" in New York State. The following observations support the premise that the area to be developed for Micron is breeding habitat for the Northern Harrier:

**Appendix G-5 Executive Summary on page i:** "However, a report of a northern harrier egg in the Project Study Area in late April, prior to the start of the survey, indicates some usage of the site as breeding habitat by this species."

**Appendix G-5, page 9:** "Ramboll staff also observed a harrier egg on the ground, which was not in a nest and appeared to be unviable and abandoned."

There is evidence that Short-eared Owls have used the Micron Campus site as a winter roost:

**G-3.5.5, page G-67:** "As stated above, a short-eared owl was documented at the Micron Campus site by NYSDEC and members of the public on eBird during the winter of 2022-2023."

- This suggests that only one bird was documented during that time. This is not true. At least three (3) individuals were detected there (personal observation from 7 February 2023 at 17:40). More than one individual foraging together - this indicates a potential communal roost. No evidence (of which I'm aware) that these birds returned for the 23-24 or 24-25 winters (which the authors of the EIS indicate).
- "The primary threat to SEOW is loss or fragmentation of habitat due to human development, reforestation, wetland loss, and changes in farming practices (Post 2004, Morgan and Burger 2008, Corwin 2012, Wiggins et al. 2020). SEOW require large, intact, contiguous grassland areas for both breeding and wintering populations, which makes them particularly vulnerable since grasslands are one of the most endangered habitats in North America – with a current loss of 97% of the United States's native grasslands (Wiggins et al. 2020, Samson et al. 2004, North American Bird Conservation Initiative 2011). Successful habitat management and restoration projects must aim to conserve or restore large blocks of

grassland habitat (>247 acres) that provide a suitable prey population of small mammals (Wiggins et al. 2020)” (as cited in Audubon 2023)

According to the Grassland Bird Trust, once, wintering flocks of 40 – 50 Short-eared Owls could easily be observed in the large grassland areas that occurred across the state. Now, fewer than 100 birds remain in the wild, and Short-eared Owls are listed as endangered in New York State. Mitigation for any habitat with potential for use as a wintering site by Short-eared Owls should be implemented. Because Northern Harriers and Short-eared Owls have similar habitat requirements and are often observed in the same area, providing and managing large blocks of grasslands for mitigation will benefit both species.

Due to the extreme amount of habitat loss that will result from the development of the Micron site and from the consequential loss of open space as land is developed to meet the needs of the Micron project, the amount of land to be purchased for mitigation should exceed a 3:1 ratio in order to provide a net conservation benefit. In addition to the 1400 acres to be developed at the site, more than a hundred acres of empty land along Route 31 have been purchased for supply chain industries for Micron and additional parcels of undeveloped land near the Micron site (about 130 acres) just came up for sale. Even more land will be used for road widening, additional power lines, solar and wind projects to supply energy to Micron, and water pipe pathways to bring millions of gallons of clean water in and to take treated wastewater away. Additional land will be taken for housing developments and the related services needed for the growing population - shopping centers, entertainment, schools, and medical services. Millions of dollars are going to be invested in new hotels, lakeside apartments, and townhouses. In a nutshell, every inch that can be developed probably will be.

In light of the cumulative habitat loss that will occur over the next sixteen years, it is quite reasonable to request a habitat replacement ratio of 5:1 to help compensate for this. Just as there is an expectation that thousands of jobs will be created due to Micron, habitat loss should also be recognized as a direct result of the construction of the Micron project in Clay and mitigation must adequately compensate for this loss.

## **Central New York Land Trust's Comments Regarding Proposed Micron Project**

The Central New York Land Trust (CNYLT) is a 501(c)3 nonprofit organization supported by members around the region since 1973. Our Land Trust currently owns and operates 56 nature preserves across Central New York. We serve communities in Onondaga County, Oswego County, and several adjacent counties. Our work is funded by more than 630 active supporters, most of them living or working in our service area. Our service area includes the proposed Micron Project, as well as many—if not all—of the communities that will be impacted.

CNYLT's nature preserves provide critical habitat for a variety of species, including rare wetland plants, endangered species, and other species that have experienced steep declines over the last few centuries. While progress has been made to protect the remaining remnant forests that exist, and protect or restore wetlands that were once drained for farming, development proposals like the Micron Project threaten to undermine that progress without appropriate mitigation measures.

As the region continues to change, any conversation about a major development proposal should be done in parallel with the longer conversation about what it means to be part of Central New York. Without adequate conservation measures and increased commitments to work with partner conservation groups, the Micron Project may cost the region more than it provides.

### **Land Conservation in Central New York**

Conservation organizations like the Central New York Land Trust play an important role in our communities. Working together, we safeguard vital habitats, enhance water quality, and restore ecosystems to ensure future generations can enjoy the wonder of our local wildlife. Three recent restoration properties CNYLT owns and manages include:

- CNYLT's Black Creek Preserve in Onondaga County, which protects more than 280 acres of habitat that were restored by our partners at Ducks Unlimited and Wetlands

America Trust through several restoration measures, including tree and shrub planting, hydrology restoration, and invasive species control;

- CNYLT’s Gardenier Road Preserve in Oswego County, which protects 71 acres that were restored from former crop field into a thriving wetland, again thanks to Ducks Unlimited and partners at the Wetlands America Trust; and
- CNYLT’s O’Neill Family Farm Field Preserve in Onondaga County, which preserves 144 acres of farmland to protect the primary drinking water source for the City of Syracuse. The preserve is home to our largest native tree restoration date undertaken to date, with 1,500 native trees planted in 2025 and 3,500 native trees scheduled in 2026. Support for this project comes from state agencies, nonprofit partners like The Nature Conservancy and Skaneateles Chamber of Commerce, and more than 80 volunteers.

Creating and maintaining a nature preserve is a community-wide effort. Each preserve comes with its own tailored management plan, which we draft with input from experts, neighbors, and other stakeholders. Oftentimes, we also consult with partner organizations that share our mission and lend additional expertise. As a nationally-accredited Land Trust, we also comply with requirements to ensure our preserves can be protected in perpetuity. Those requirements include annual monitoring activities, maintaining a legal fund to address encroachment issues, financial management and auditing rules, and following best practices for ecosystem management.

Some preserves are designed to be kept forever wild. Others include public trail access for walking dogs, watching birds, and other opportunities for Central New Yorkers to get out and enjoy nature. Our non-public preserves also provide indirect services to residents, both by protecting habitats that provide critical ecosystem services like flood management and by creating spaces for researchers to study the ways our region has changed over the centuries. Altogether, the more than 4,400 acres we have protected since 1973 provide services to more than a half million people in Central New York.

### **Concerns about the Micron Project**

Many of our members are concerned about the impact the Micron Project will have on wetlands and endangered species. Additional concerns include the amount of landfill that will be transported to the site to fill in the wetlands, and the water-intensive use of the project. Our comments today focus on the loss of wetlands and streambanks, and the ecosystem services those wetlands provide. We also offer recommendations for mitigating the most severe impacts. When considering additional mitigation actions, the Central New York Land Trust and our partners are available to assist in managing, maintaining and preserving critical wetland areas.

The DEIS acknowledges several losses for Central New York as the Micron Project is built. The project will result in destroying 194 acres of federal jurisdictional “high quality wetlands” that “would eliminate their principal and suitable wetland functions and services,” as well as the

“permanent loss of a minimum of 315 acres of wetland buffer areas” (DEIS 3-74) and 6,283 linear feet of delineated stream channels (DEIS 3-118). These wetlands and riparian habitats are home to thousands of birds, trees, shrubs, wildflowers, frogs, turtles, butterflies, moths and mammals. The DEIS concludes the impact on these species includes “significant adverse effects on Federal and State listed threatened and endangered species, including the Indiana bat, northern long-eared bat, tricolored bat, northern harrier, and short-eared owl” (DEIS 0-7). Destroying these wetlands will also impact the ecosystem services they provide to our communities, including increased stormwater runoff, decreased groundwater recharge, water quality degradation, and other impacts (DEIS 3-74, Table 3.3-8).

### **Recommendations: Commit to Communities through Conservation**

To ensure Micron’s net benefit to Central New York is positive, and not negative, Micron should adopt several measures to offset the displacement it will cause, and to account for the failure to accurately determine the overall impact. Some of these recommendations come directly from the actions Micron is committing to implement at their project sites, such as its commitment to “incorporate landscaped areas using native species where feasible around the new site buildings, parking lots, pollinator gardens, and stormwater management areas” at the Childcare Site (DEIS 3-120). The Central New York Land Trust’s recommendations include:

1. Increase the required wetland replacement ratio based on best practices for mitigation banking. The current 2:1 ratio is insufficient, given the issues mentioned above about site fidelity and associated risks. In fact, when factoring in the estimated minimum permanent loss of wetland buffer areas, the ratio drops to less than 1:1 (minimum 509 acres lost, to 406 acres mitigated). A higher ratio (in the range of 10:1 or more) would more adequately incorporate risks and estimated loss of buffer areas, and build in assurances that Central New York will benefit more than it will lose.

There are examples of how to do it right, including one right up the river. In 2007, the Seneca Meadows landfill mitigated 70 acres of forested wetlands by protecting 1,100 acres of adjacent wetlands, protecting more than 15 acres for each acre filled in a watershed that eventually drains into the Oneida River through the Erie Canal System. Real commitments to Central New York that go beyond the minimum regulatory requirements could bring a net benefit for wetland conservation, rather than a net loss.

2. Support and fund local municipalities and nonprofit organizations to build training programs and offer incentives for residents, developers and local businesses to engage in the following mitigation measures:
  - a. Training programs and incentives for residents to establish pollinator habitats on their yards and neighborhoods to plant new conservation housing;

- b. Training programs, incentives, and revised local regulations to require natural features be maintained for proposed housing development sites associated with the Micron Project;
  - c. Zoning regulations and incentives for housing projects to utilize landscaping techniques that incorporate “conservation housing” (native plants that provide habitat for pollinators, bats, and other displaced species);
  - d. Incentives for plant nurseries and landscaping services that offer native plant options to assist residents and developers in creating conservation housing, building pollinator gardens, and adopting other net-benefit measures;
3. Establish a fund for future acquisitions of conservation lands as the actual impacts of the Micron Project are better understood, instead of relying on the estimated impacts in the DEIS. Large development projects like this one come with a large number of uncertainties. If the funds were not ultimately used for future acquisitions, the funds could still support communities in the region by being reallocated to support efforts by local municipalities and nonprofits to incentivize the collective actions described above; and
  4. Increase funding for research and monitoring to assess the success of these additional efforts, in partnership with regional public universities like SUNY-ESF and SUNY-Oswego and nonprofit conservation organizations.

At the end of the day, the measure of Micron’s success will be whether its impact is a net positive for the region, both in terms of conservation goals and economic development. One way to do that is to partner with municipal and conservation partners to think creatively about ways to work together beyond the direct impact site. We can accomplish quite a lot as a region, but only if we agree to do more than the bare minimum.

Sincerely,

Patrick J. Lynch, JD, MPA

**To:** 'CHIPSNEPA@chips.gov'  
**Cc:** Robert M. Petrovich (robertpetrovich@ongov.net)  
**Subject:** [EXTERNAL] Micron

I am writing to express my enthusiastic support for the Draft Environmental Impact Statement (DEIS) for the proposed Micron New York Semiconductor Manufacturing Project in the Town of Clay, New York.

While this project will bring changes to our community in more ways than one, the overall impacts to the region will be overwhelmingly positive. After decades of stagnation, population decline, and job losses, the opportunities for our future generations to be created by Micron's investment cannot be overstated.

Unfortunately, critics of this project have overstated the ecological impacts. Indeed, those impacts have been exaggerated. Those same critics have also understated Micron's commitments to mitigation and conservation.

From my reading of the DEIS, the document reflects a thorough and compliant approach to evaluating the environmental impacts of this development. What more can we ask?

I am particularly encouraged by the proposed mitigation efforts and environmental enhancements outlined in the DEIS. For example:

- **Restoration and enhancement of local waterways**, including Buxton Creek, Fish Creek, and the Caughdenoy and Oneida River systems,

through compensatory mitigation plans that will improve aquatic habitats and water quality;

- **Implementation of green infrastructure** for stormwater management, such as bioswales and permeable surfaces, to reduce runoff and protect local water bodies;
- **Preservation and restoration of wetlands and grassland habitats**, which will support biodiversity and protect native species, including those identified in the Grassland Breeding Bird Survey; to this point, I read with interest Catherine Landis's critique which recently ran in Syracuse.com; Ms. Landis' letter focuses on, among other matters, the loss of wetlands and insufficient compensation for such losses; yes, there will be impacts to approximately 200 acres of wetlands and 6400 linear feet of stream, but what she conveniently neglects to mention is that Micron will provide for compensation to the tune of nearly 500 acres of wetland restoration and more than 14,000 linear feet of stream mitigation; she also conveniently leaves out of her opinion letter the fact that the existing wetland community is already fragmented, while complaining about the fragmented nature of the compensation areas; she also fails to mention that the wetland compensation areas will be permanently protected and managed, benefits not currently enjoyed by the Micron site; lastly, Ms. Landis makes it sound as if these wetland are unique; by any definition, they are not special; in fact, they are typical for the area;
- **Invasive species management and native landscaping**, which will enhance ecological resilience and promote long-term environmental health;
- **Energy-efficient building design and sustainable construction practices**, including recycling of construction materials and reduction of greenhouse gas emissions.

These efforts go beyond mitigation; they represent a proactive investment in the environmental stewardship and enhancement the likes of which I have never witnessed in the area. Micron's approach demonstrates a clear

commitment to sustainability, ecological restoration, and responsible growth. If I have any complaints, it's that Micron has set the mitigation bar too high for other development projects in the future.

I fully support the DEIS and the strategies it proposes, and I urge the OCIDA and CHIPS Program Office to move forward with the project's approval.

Thank you for your leadership and for the opportunity to provide input on this critical initiative.

Sincerely,

**Marco Marzocchi**

August 11, 2025

Onondaga County Industrial Development Agency (OCIDA)  
ATTN: Micron Project  
335 Montgomery Street, Floor 2M  
Syracuse, New York 13202

**RE: National Audubon Society Comments on Micron Draft Environmental Impact Statement**

To Whom It May Concern,

On behalf of the National Audubon Society's New York State office, with a membership of 90,000 New Yorkers, we thank you for the opportunity to comment on the Draft Environmental Impact Statement put forward by the Onondaga County Industrial Development Agency and CHIPS America. We respectfully submit the following comments concerning the potential impacts to the project site and the birds that rely on it for your consideration.

**Impacts to Short-eared Owl and Northern Harrier in New York State**

The Short-eared Owl (SEOW) and Northern Harrier (NOHA) have consistently struggled in New York State, and if they are present in a particular area, it will be difficult to achieve successful mitigation that provides a net conservation benefit in other locations. Compensatory mitigation is intended to compensate for the loss of known, occupied habitat by protecting or enhancing potential habitat elsewhere to replace or offset the specific habitat and species impacted. However, there is no guarantee that the proposed mitigation will be successful and replace the lost habitat and impacted species. Because of this, compensatory mitigation ratios should be at least 1:1, absent the use of successional life cycles, to address the uncertainty of success and to achieve a net conservation benefit. For example, if 100 acres of occupied habitat are taken, 100 acres of habitat should be either conserved or restored and maintained for the life of the project.

The DEIS states that the Micron Project is expected to result in “significant adverse impacts” to NOHA and SEOW due to loss of breeding and winter habitat as well as displacement from the project site. In order to mitigate these impacts, Micron has proposed to purchase 650 acres of high-quality habitat across seven properties, which will be given permanent protection and also be managed to provide habitat for grassland birds for 15 years. The DEIS states that the restored fields on these properties will exceed 25 contiguous acres each, and that a final grassland protection plan will be developed in coordination with the NYS Department of Environmental Conservation (“NYS DEC”) in order to ensure the achievement of a net conservation benefit for the impacted species.

Without additional details on the actual locations of the mitigation parcels and the specific acreages of each restored field, it is not possible for us to determine whether this mitigation will be adequate at this time. We look forward to reviewing the draft Part 182 Incidental Take Permit and providing more detailed comments on the proposed Net Conservation Benefit Plan through additional public comments to the NYS DEC. However, we believe that the DEIS should note the following habitat needs for SEOW and NOHA:

- Both species need large acreages of contiguous habitat for wintering and breeding that are at least 100 acres in size. If 650 acres of mitigation is to be spread across seven locations, the restored fields must be adjacent to additional potential habitat in order to provide a sufficient amount of habitat to support each species and their essential behaviors.
- There should be additional potential habitat in the vicinity of the proposed mitigation parcel. This contributes to the likelihood that the mitigation parcel will be occupied by the targeted species (Winter et al. 2006) and affects the productivity of the targeted species (Gates and Gysel 1978).
- SEOW and NOHA need large, unfragmented, open complexes comprised mostly of grasslands and wetlands that lack visual and structural disturbances, which may deter area-sensitive grasslands birds from selecting certain habitats (Winter et al. 2006; Gates and Gysel 1978, Ribic et al. 2009). NOHA, in particular, is quite sensitive to human disturbance and will leave wintering or breeding sites if there is too much human activity in the vicinity of its habitat (Hager 2009, Serrentino 1992, Bildsteon 1987a). Quality habitat for area-sensitive species also contains abundant interior space available, i.e. not long and linear in shape but round or square to maximize interior habitat availability and distance to the grassland edge.

**Tree Clearing and Construction Windows.** The DEIS states that tree clearing would not occur between April and July to accommodate the primary breeding season and protect woodland birds. We would suggest extending that period until August to accommodate late breeders, such as the Cedar Waxwing and American Goldfinch, or species that may produce multiple broods, which includes several grassland bird species. Additionally, the DEIS states that construction in open fields would be limited to late summer and early fall to avoid the breeding season and complete construction

prior to the wintering period. We would recommend limiting construction in open fields to the period between August 15 and November 1 for the same reasons noted above.

**Use of Impervious Surfaces.** According to Section 3.3 of the DEIS, the campus would create approximately 645 acres of impervious surface coverage, with the undeveloped areas covered mainly by manicured lawns, landscaped areas, and stormwater management areas. We appreciate that the applicant has mentioned using green infrastructure such as bioswales with native plantings, rain gardens, and permeable pavement, and advise that they be prioritized when designing the site's stormwater management plan and that the use of manicured lawns be minimized as much as possible.

**Native Plants.** The applicant has committed to using native plant species where practicable to “provide habitat value, support pollinators, and reduce need for irrigation and chemical treatments.” Native plantings should be prioritized in landscape planning wherever possible to help offset the habitat loss generated by the construction of the Micron Project.

\*\*\*

Thank you again for considering these comments. If you have any questions regarding these comments, please contact Erin McGrath, Policy Director, at [erin.mcgrath@audubon.org](mailto:erin.mcgrath@audubon.org).

Sincerely,

**Erin McGrath**  
Policy Director  
National Audubon Society

August 11, 2025

Dear CHIPS Program Office:

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. The comment period must be extended to October 25, 2025, at a minimum, especially given there has been no public response to a petition signed by over 1,500 residents of the region asking the same.

Despite the short turnaround to review the lengthy DEIS, I am submitting my comments based on my expertise as an environmental social scientist, Assistant Professor at the SUNY College of Environmental Science & Forestry and resident of Syracuse. I will focus on just a couple of the key social issues that are insufficiently addressed in the DEIS. While I also have significant environmental concerns, I trust those are being addressed by other concerned residents.

Micron says in the DEIS that there are no environmental justice impacts from this project, nor does Micron provide a methodology for their study of environmental justice impacts that allowed them to arrive at this conclusion. Micron looks at the communities only within 5 miles of its main campus and a 1/2 mile from their rail spur, childcare center, and wastewater treatment plant expansion. They do not provide consistent analysis of both "Disadvantaged Communities" and low-income communities. Micron does not consider cumulative environmental impacts on communities. Micron does not consider the

environmental justice impact of connected actions which are numerous involving rail spur, highway interchanges, new water, electric and fossil fuel lines and transportation related to installation and operation of these connected actions.

In addition, Micron gives insufficient attention to the process of soliciting community feedback during the proposal. Of note, Micron only lists two meetings with a total of 45 people. Micron mentions a consulting Community Engagement Committee, but this consultation only related to Micron's financial commitments not environmental or community impacts.

Finally, the environmental justice impacts of the growth inducing impacts of Micron are only evaluated qualitatively and generally. They do not look at the income and EJ status of the communities receiving their wastewater and stormwater downstream, or their hazardous waste. Micron claims its contribution to climate change is a global and regional issue, and therefore not a local environmental justice issue. This is not acceptable – climate impacts are inherently local and must be duly considered in the final statement. Floods, the urban heat island effect and the associated heat waves, storms, **and** the effects these and other climate impacts will have on surrounding communities – both human and non-human – must be analyzed thoroughly and made public.

In order for the Micron project to move forward, the following must be required of Micron:

Micron should provide more details on how their Environmental Justice outreach process was determined and justification for this process and provide more detail and justification for how they choose the study area for their Environmental Justice review.

Micron must make the DEP 24-1 form submitted to the NYSDEC public.

Micron should be required to increase the area they evaluate for Environmental Justice impacts to include downstream communities, the Town of Clay, Liverpool, and parts of Syracuse, as well as communities within 5 (not .5) miles of their rail spur, childcare center, and water treatment plant expansion, and around planned roadway changes.

Overall, Micron should expand their study area given that this is the largest private development project in NYS history.

Micron must be required to provide more evidence that they engaged in robust public outreach, either during or beyond their two listed meetings with a total of 45 people.

Micron should be required to engage in enhanced public participation because their project will have environmental justice impacts. This public participation should consider that many residents in EJ communities may face barriers to participation, including digital access, transportation, and language. Micron could engage in proactive outreach, including door-to-door engagement, community liaisons, and partnerships with trusted local organizations.

Micron should quantitatively and specifically evaluate the long-term impacts of growth inducing effects on environmental justice.

Micron must evaluate how their contributions to global warming will have adverse local effects and evaluate how these effects impact environmental justice.

Micron should be required report on where waste from the project site will be transported to and evaluate the environmental justice impacts on these locations.

Lastly, for the DEIS to be approved, Micron must be required to develop a community-expert advisory and oversight committee that can assist with ongoing and meaningful community engagement.

Sincerely,

Michael Mikulewicz, PhD

## REGION 2 ADMINISTRATOR

NEW YORK, N.Y. 10007

**August 11, 2025**

### **SENT VIA ELECTRONIC MAIL**

Mr. David Frenkel  
Environmental Division Director  
CHIPS for America Program  
National Institute for Standards and Technology  
E-mail: [Frenkel.David@CHIPS.gov](mailto:Frenkel.David@CHIPS.gov)

RE: Micron Semiconductor Fabrication Facility in Clay, New York – Draft Environmental Impact Statement Review

Dear Mr. Frenkel,

The United States Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statement (EIS) prepared by the Department of Commerce (DOC) for the Micron Semiconductor Manufacturing Project (Project) in Clay, New York pursuant to the National Environmental Policy Act (NEPA) and our NEPA review authority under Section 309 of the Clean Air Act (CAA), 42 U.S.C. § 7609. The CAA Section 309 role is unique to the EPA. It requires the EPA to review and comment on the environmental impact of any proposed federal action subject to NEPA's environmental impact statement requirements and to make its comments public.

The EPA is serving as a Cooperating Agency during the development of the EIS. We provided comments on the Notice of Intent (April 4, 2024), Preliminary Draft EIS (April 7, 2025), and on a rolling basis throughout the EIS development. We thank the DOC Creating Helpful Incentives to Produce Semiconductors (CHIPS) for America Program for addressing many of the comments we provided following our review of the earlier versions of the EIS and appreciate the opportunity to review and comment on the Draft EIS.

The Draft EIS analyzes the impacts of CHIPS awarding funding to Micron New York Semiconductor Manufacturing LLC (Applicant) for the purpose of constructing commercial semiconductor fabrication facilities in Clay, New York (the Project or Proposed Action). The Project would primarily consist of the following components:

1. Construction of the Micron Campus, including the four fabrication units (fabs), ancillary support facilities, ingress and egress roads, driveways, and parking, within a site totaling approximately 1,377 acres;
2. Construction of a rail spur and material conveyance facility on approximately 38 acres west

- of 8625 Caughdenoy Road in Clay, NY 13041 (the Rail Spur Site);
3. Construction of a childcare center, healthcare center, and recreational center on an approximately 31-acre parcel located at 9100 Caughdenoy Road, Brewerton, NY 13029 (the Childcare Site); and,
  4. Leasing of 360,000-500,000 square feet (sq. ft.) of existing warehouse space in an industrially zoned area at a location to be determined within 20 miles of the Micron Campus (the Warehouse Site).

In addition, several utility and infrastructure improvements are required to meet the Project's electricity, natural gas, water supply, wastewater, and telecommunications needs.

The Draft EIS evaluates the No Action Alternative, and the Preferred Action Alternative (construction of the Project and the associated connected actions). Upon completion, the Project would be the largest domestic producer of dynamic random-access memory (DRAM) chips, which have crucial applications in military equipment, cybersecurity technology, the aerospace industry, artificial intelligence (AI), and other cutting-edge uses, as well as more common areas of the domestic consumer economy. The EPA recognizes the importance of the Project in supporting the national goal of strengthening domestic supply chains for semiconductors necessary for the national security, manufacturing, critical infrastructure, and technology leadership of the U.S. We are providing the enclosed comments for your consideration, with a focus on air and water resources consistent with our Clean Water Act (CWA) and CAA authorities.

We look forward to continuing the ongoing constructive participation in the NEPA process. If you have any questions, please contact me at (212) 637-5000, or EPA Region 2 Strategic Programs and Community Based Funding Branch Manager, Dave Kluesner at [kluesner.dave@epa.gov](mailto:kluesner.dave@epa.gov) or 212-637-3653.

Sincerely,

**MICHAEL  
MARTUCCI**

Regional Administrator

### **General Comments**

#### **Statutory Authorities and Regulations: 42 U.S.C. § 7609; 42 U.S.C. § 4321 et seq.**

We offer the following recommendations to improve the clarity and completeness of the Draft EIS:

#### *Executive Summary*

- The Executive Summary should clearly state the purpose and need for the Project, as that information is critical in describing the validity of alternatives.

#### *Introduction*

- The criteria by which the commercial viability of the Project is evaluated should be defined in this section of the EIS. Such information would better support the Project's purpose and need, as the economic feasibility is an essential component in funding projects to meet DOC's objectives under the CHIPS act.
- The Draft EIS discusses additional regulatory requirements including permits and environmental reviews that will be required for the Project and connected actions. EPA suggests that the Final EIS identify the anticipated timeline for these processes.

#### *Alternatives*

- The alternatives section of the Draft EIS states that the discussion of alternatives required weighing effects of one resource area against another resource. Please briefly discuss the criteria for how this weighting was incorporated into impact determinations for the resource areas. Please provide clear definitions for impact level classifications or criteria used to assess significance of potential impacts for each resource area in the Final EIS.

#### *Mitigation Measures*

- EPA recommends creating a section that lists all mitigation measures considered in the Final EIS.

### **Air Quality**

#### **Statutory Authorities and Regulations: 42 U.S.C § 7609; 42 U.S.C. § 4321 et seq.; 40 C.F.R. Part 51 and § 52.21; 40 C.F.R. §§ 93.107 and 93.109**

EPA has reviewed the Draft EIS Preferred Action Alternative with respect to the assessment of air quality impacts and has identified several areas where the analysis and discussion of impacts could be strengthened including defining clear criteria for air quality impacts.

#### **EPA's recommendations for the Final EIS:**

##### *Construction/Stationary Sources:*

- Please modify the information in Table 3.6-1 to reflect a revised annual sulfur dioxide (SO<sub>2</sub>) NAAQS standard of 10 ppb.<sup>1</sup>

##### *Mobile Sources:*

- Please incorporate a more explicit explanation of the intersections that fail hot spot analyses and what that signifies in Appendix I-3.
- EPA suggests the best management practices (BMPs)/mitigation measures for construction equipment include best available control technology as feasible into contract specifications to reduce emissions during construction.

---

<sup>1</sup> See <https://www.epa.gov/so2-pollution/timeline-sulfur-dioxide-national-ambient-air-quality-standards-naaqs>

### **Wetlands and Water Resources**

**Statutory Authorities and Regulations: 42 U.S.C § 7609; 33 U.S.C. § 1341; 33 U.S.C. § 1342; 33 U.S.C. § 1344; 42 U.S.C. § 4321 et seq.; 40 C.F.R. Part 230**

The EPA has been coordinating with the U.S. Army Corps of Engineers, as the CWA Section 404 permitting authority, DOC, as the lead agency for the Project, and Micron (the Applicant), on various aspects of the CWA permit and the associated mitigation plans under CWA Section 404 and the 404 (b)(1) Guidelines. Please refer to the comments provided directly from EPA Region 2 Water Division on these aspects of the Project. In addition, we recommend the following:

- EPA recommends including a map of surface hydrology connecting on-site aquatic resources to downstream traditionally navigable waters.

**RG**  
NYSUT **NYSUT Retiree Council 7**  
4983 Brittonfield Parkway, P. O. Box 247, East Syracuse, NY 13057

---

August 11, 2025

ATTN: Micron Project  
Onondaga County Industrial Development Agency (OCIDA)  
335 Montgomery Street, Floor 2M  
Syracuse, NY 13202

NYSUT Retiree Council 7, representing thousands of retired educators in Central New York, welcomes Micron as a good neighbor. To ensure that relationship is a long and beneficial one to both parties, we ask that certain guidelines be established.

NYSUT Retiree Council 7, along with many other union, environmental, workforce, public health and safety organizations ask that the organizations that control Micron's development in Central New York take into consideration workplace safety; creation of good paying jobs in a union- accepting climate; no adverse impact on school funding; environmental quality and continued monitoring; good housing and transportation.

First, the health and safety from toxic chemicals used to make chips must not pollute air, soil, fish, wildlife, and drinking water. A long term, continuing monitoring of this must be in the plan with enough resources to sustain it.

Second, commit to ensuring that clean water and energy in abundance will be affordable to the area into the future. Ratepayers should not shoulder the burden. Also, generate renewable energy with a low carbon impact.

Third, safe working conditions are necessary. We know the workers will be exposed to toxic chemicals and all measures must be taken for their sake as well as their families.

In addition, we seek pay equity, and a diverse workforce that would be allowed to unionize without adverse ramifications. To further aid working families, public transportation and child care on site or near would be helpful.

Fourth, invest in housing needed for existing and new residents. Mixed income and affordable housing will be needed, and micron must be involved in a cooperative effort to bring that about.

Fifth, tax abatements to Micron must not come at the expense of schools and students.

According to a report issued by "Good Jobs First NY" schools lost a total of \$ 1.8 billion in property tax revenue due to tax abatements granted by IDAs.

We would appreciate support and actions on these guidelines. We look forward to your response.

Sincerely,

NYSUT Retiree Council 7

**Re: Onondaga Nation Comments on the Micron DEIS**

Dear OCIDA and CHIPS Staff:

On behalf of the Onondaga Nation, I am submitting the following comments on the Draft Environmental Impact Statement (DEIS) issued on DATE for the Micron semiconductor chip fabrication facility ("Micron project"). Because the Onondaga Nation recognized the significance of the Micron project and its potential environmental and social impacts, the Nation acted as a participating entity in the development of the DEIS. Some of the Nation's concerns were addressed in that process, but many were not. The comments submitted today focus on those unaddressed concerns and on additional issues that have become apparent based on the publicly released DEIS.

The Onondaga Nation has a special role to play in environmental matters in this region. The Onondaga Nation is the central fire of the Haudenosaunee Confederacy, which also includes the Seneca, Tuscarora, Cayuga, Oneida, and Mohawk Nations. The traditional territory of the Nation covers 2.5 million acres centered on Onondaga Lake near Syracuse, but extending north to the Great Lakes and south into Pennsylvania. The "affected area" for the Micron project, as it is defined in the DEIS, falls entirely within the Nation's traditional territory. The Nation's unique relationship with this land was recognized under the 1794 Treaty of Canandaigua, in which the United States recognized this connection and guaranteed the Nation's "free use and enjoyment" of its original territories.

Based on their unique spiritual and historic relationship with the land as embodied in the Gayanashagowa or the Great Law of Peace, the Nation has acted as stewards and caretaker of the lands within its traditional territories for centuries. The Nation's relationship to the land, water, plants, animals, and fish is governed by a bond of thanksgiving and care. Just as the natural world has provided for the people of the Onondaga Nation, the Onondaga Nation is bound to care for the natural world. The Nation has not abandoned these ties or this duty of care over the two centuries since this Treaty was signed. Despite disruptions caused by the influx of settlers, illegal takings of land by New York, and widespread privatization and industrialization, generations of Nation citizens have lived and continue to live in deep connection to the land and water within this traditional territory. The Nation submits these comments from that perspective and with an intent to fulfill that duty of care for the natural world.

In addition, the area directly affected by the proposed Micron project and its connected actions is of particular cultural and historical significance to the Onondaga Nation. Many recognized historic Onondaga fishing sites fall within the affected area, including sites at the Oneida Lake outlet to the Oneida River, sites just north and south of the point where the Oneida and Seneca join to form the Oswego River (the "Three Rivers Area"), sites at the northern and southern most bends in the Oneida River, and sites further west. Bradley, J. (2020), *Onondaga and Empire: An Iroquoian People in an Imperial Era*, New York State Museum Bulletin No. 514, p. 38. Onondaga built "enormous stone weirs" at these locations, which were routinely for "hundreds, if not thousands, of years." Bradley, 2020, pp. 38-39. The area was host to semipermanent fishing camps and long-term fishing villages as well. Bradley, p. 38. The Three Rivers Area just west and south of the proposed Micron project and a stone's throw from the connected actions at Oak Orchard Wastewater Treatment Plant, was an historic meeting place for Onondaga Nation citizens scattered across the Nation's traditional territory and for meetings of the larger Confederacy. For all of these reasons, the Nation holds this area to be sacred. Any development that might disturb historic sites or cause damage to the natural world here is of particular concern.

The Onondaga Nation recognizes that the semiconductor industry is a necessity in the modern world and that the Micron project will have benefits for the region in terms of job creation and income generation. However, these stated benefits come with significant environmental and public health risks. The reviewing agencies must acknowledge these inherent dangers, conduct an in-depth and detailed review of the project that does not simply rely on other federal laws to limit harm, demand transparency with respect to the hazardous materials and wastes used in or produced by the manufacturing process, and insist on regular monitoring and public reporting where those details are not yet known. In addition, the reviewing agencies must hold Micron accountable for avoiding or mitigating potential harms to the extent permitted by law. This requires consideration of avoidance or mitigation strategies that go above and beyond the minimum requirements of applicable federal or state law.

The DEIS is an attempt to meet these obligations and it provides a lengthy discussion of the project, its impacts on a range of issues, and the applicable laws and regulations. Despite the voluminous nature of the DEIS, the Nation is concerned that, for many issues, the analysis is too limited and reasonably foreseeable significant and adverse environmental impacts have gone unreviewed or been addressed in overly broad strokes, not the detailed, “hard look” required by both federal and state law. 42 U.S.C. § 4332(C); NY ECL §§ 8-0105(7), 8-0109. *See also Matter of St Elizabeth Garden, Inc. v. City of New York*, 42 N.Y.3d 992, 997 (2024); *Wilderness Society v. Salazar*, 603 F.Supp.2d 52 (D.C. Cir. 2009); *Neighbors of Cuddy Mountain v. United States Forest Service*, 137 F.3d 1372 (9<sup>th</sup> Cir. 1998).

Specifically, the Nation views the DEIS as falling short for the following reasons. The alternatives analysis is too limited. The DEIS provides insufficient information on the use and potential impacts of hazardous materials, such as PFAS, or the handling of hazardous wastes. The analysis of wetlands and wildlife impacts is too narrow and fails to properly consider harm related to loss of habitat connectivity or the potential impacts of off-site project-related effects, such as increased traffic or open-space development for new commercial spaces or housing. The DEIS also fails to consider reasonably foreseeable impacts from its substantial energy needs, including expanded reliance on nuclear power within New York State, or to properly grapple with the climate impacts of the project. The air quality impact analysis does not properly justify its reliance on distant monitoring data. More generally, the DEIS frequently relies on legal compliance to find that environmental impacts are not significant. Finally, additional mitigation measures should be considered to limit anticipated adverse impacts and to provide greater public awareness of and input on the additional impacts that will inevitably emerge over the project’s 16-year construction timeline and decades-long operations.

**I. The DEIS does not consider a sufficient range of alternatives.**

The DEIS considers only two alternatives – the no-build option and the preferred option. Other possible alternatives, including relocating the plant entirely or building a smaller facility, were deemed not possible or not able to meet the “purpose and need” for the project. This decision is unjustified for at least two reasons. First, the overarching purpose and need for the project was translated into an extremely narrow production goal, which was never properly explained or justified. Second, the DEIS fails to consider recent changes in the domestic chip production landscape that may affect the way that the overall project purpose and need is translated into an on-the-ground production goal.

This DEIS was designed to serve the purposes of both the National Environmental Policy Act (NEPA) and the New York State Environmental Quality Review Act (SEQRA). Both NEPA and SEQRA require consideration of “reasonable” alternatives to the preferred or proposed action. *Vermont Yankee Nuclear Power Co. v. Natural Resources Defense Council*, 435 U.S. 519 (1978); *Jackson v. New York State*

*Urban Development Corporation*, 67 N.Y.2d 400, 414-415 (1986). In this case, the blanket rejection of any alternative except the no-action and preferred alternatives, particularly alternatives centered on smaller facilities, is not well justified and appears to be unreasonable.

The DEIS mentions, but quickly discards, two- or three-fab alternatives, insisting that only the preferred four-fab alternative meets Micron's goal of financial viability and the governments' goals of increasing domestic chip production. However, the justification for this limitation is insufficient and not terribly compelling.

First, the DEIS asserts that, to be competitive and take advantage of economies of scale, Micron must build a four-fab alternative. In support, the DEIS provides data on the size of similar facilities in the United States and around the world operated by Micron and two of its competitors. According to this data, one competitor has a single facility larger than the proposed Micron project (more than 2,500,000 square feet of cleanroom) and the other has a facility comparable to the proposed Micron project (approximately 2,100,000 square feet of cleanroom). DEIS, p. 1-10, Fig. 1-1.2. The other five competitor-owned facilities shown in this figure are at or below 2,000,000 square feet of cleanroom space. Most of the facilities listed are well below this scale. While the DEIS notes proposals for additional large-scale production facilities in South Korea, no information about the stage of the proposal or the likelihood of approval is provided. DEIS, p. 1-7, fn 7.

The DEIS also argues that the per wafer production costs in smaller two- or three-fab facilities would be much higher, making a smaller project economically infeasible for Micron. This analysis is based on a capital asset utilization (CAU) rate as calculated for various cleanroom space represented in Appendix A, Figure A-2. Micron asserts that the CAU rate for a two-fab alternative would be 6.7% lower than for a four-fab alternative and that it would have to invest \$3.3 billion more in equipment costs to achieve the same production levels as the proposed four-fab alternative. DEIS, App. A, p. A-6. Setting aside the important fact that this assessment cannot be independently verified based on the figure provided,<sup>1</sup> this argument rests on an assumption that the Micron project in Clay must independently meet the DRAM production goals set by the U.S. Department of Commerce "necessary to offset potential disruptions to the U.S. economic and national security." DEIS, p. 1-8. This is problematic for two reasons. First, the DEIS does not properly justify the stated production goal, meaning that the public

---

<sup>1</sup> The graph provided as Figure A-2 plots CAU against square feet of clean room space. However, neither axis has numeric markers, meaning that there is no way to determine the CAU for any particular amount of clean room space or whether a two-fab or four-fab alternative is even represented on the graph as included. In addition, the graph appears to be a flattening parabola, meaning that the incremental CAU per additional square foot of cleanroom space will approach zero at some point. Without numeric markers on either axis, it's impossible to determine at what point that might happen. It is completely impossible to evaluate the asserted 6.7 reduction in CAU rates for a two- versus four-fab alternative.

simply has to trust that the Commerce's assessment is reasonable. Second, even if we assume that this overall domestic production goal is appropriate, recently announced expansions at other Micron facilities may affect production goals for the Clay facility.

The DEIS sets a domestic DRAM wafer production goal of 12% of global DRAM manufacturing capacity, which translates into a weekly production rate of 13,000 DRAM wafers by 2028 and 52,000 by 2045. DEIS, p. 1-8. However, the only data cited that ties DRAM wafer use to critical economic and national security interests is a single estimate by the Boston Consulting Group, which the DEIS characterizes as asserting that 11% of the global memory chip output is used by "applications that are critical to U.S. economic and national security" interests. DEIS, App. A, p. A-4. This characterization does not appear to be supported by the cited report.<sup>2</sup> Assuming that this characterization is correct, however, the production goal of 11% of the current global memory chip output should be close to 48,000 DRAM wafers per week by 2050.

Further, for either goal, the production is described as Micron's nation-wide goal.<sup>3</sup> Micron has recently announced plans to build a second fab at its Idaho facility and a new plant on its Virginia site. (Day, Don (Jun 12, 2025). *Micron Announces Second Fab*, BoiseDev, <https://boisedev.com/news/2025/06/12/micron-boise-second/>). Given this significant expansion of Micron's domestic chip production, the 52,000 wafer per week production goal may be met in other ways, allowing for Micron to consider a scaled-down version of its Clay facility.

Because the DEIS rejected smaller scale facilities as infeasible, the DEIS provides no analysis of the benefits of a smaller facility, which could be weighed against increased production costs or other lost benefits. These benefits may be significant. For example, a three-fab facility could avoid significant wetland destruction. As currently designed, the first three fabs fall mostly west of Burnett Road. Elimination of Fab 4 might open space for construction of BIO fields and WWTPs within the southern footprint of the facility, avoiding the intact wetlands east of Burnett Road. Three fabs

---

<sup>2</sup> In reviewing the cited report, the reported 11% figure is not apparent. The report includes an exhibit labeled "Example: How the US could establish a minimum viable capacity to address its critical strategic risk in advanced logic manufacturing," which asserts that 9% of US semiconductor consumption in 2019 was consumed by "critical infrastructure." (Varas et al, 2021, p. 48, Exh. 22.) This critical infrastructure is defined to include defense and aerospace; telecom networks; energy, security and medical equipment; and data centers of government and essential sectors. (*Id.*) Our review did not find any obvious economic or defense uses of microchips that should be added to the 9% figure or any discussion of critical strategic needs at the DEIS-reported 11% level.

<sup>3</sup> "To meet CHIPS Incentives Program objectives, Micron Technology proposed to increase its U.S.-based DRAM production by a factor of 12 (i.e., to approximately 12 percent of global DRAM output) over the next two decades . . . . As part of its merits review of Micron's application, the Department of Commerce determined that Micron's proposal would achieve domestic memory production at the scale necessary to offset potential disruptions to U.S. economic and national security . . . ." DEIS, pp. 1-7, 1-8.

could also require fewer utility upgrades that are being constructed at taxpayer expense, reduce the facility's climate impacts, result in fewer traffic disruptions, and reduce construction impacts.

Other alternatives focused on changes to the proposed project design could also be considered. For example, Micron is proposing to build an 11,600-space parking lot. The proposed workforce will be approximately 9,000 employees working over multiple shifts. Assuming that no more than two-thirds of these employees are on site at any given time, Micron is proposing to build almost twice as many parking spaces as employees on site. Eliminating even 1,600 spaces could reduce the impermeable surfaces on site by 9 to 15 acres, which could have important benefits for wetlands and habitat preservation.

For all these reasons, the DEIS should be expanded to include additional alternatives. At minimum, it should specifically review the potential for a three-fab alternative and a facility with fewer parking spaces. In addition, in light of Micron's proposed expansions in Idaho and Virginia, the DEIS should reevaluate the viability of a two-fab alternative in the Clay location.

## **II. The DEIS repeatedly and improperly relies on legal compliance to find that environmental impacts are not significant.**

At multiple points in the sections on air, water, and hazardous waste impacts, the DEIS asserts that Micron will comply with applicable federal and state laws, regulations, and permits and therefore its operations will have no significant environmental impacts. This assertion is simply not appropriate and certainly does not fulfill agency obligations to take a "hard look" at the environmental impacts of its actions.

The characterization of legal compliance as a primary basis for the conclusion that the project will have no significant adverse impacts occurs throughout the DEIS. In Section 3.3, the DEIS asserts that the Micron project will have no significant adverse impacts on surface or ground water, essentially because the facility will comply with Stormwater Pollution Prevention Plans (SWPPPs) and will discharge industrial wastewaters to a new Industrial Wastewater Treatment Plant (IWWTP) at Oak Orchard, which the DEIS presumes will comply with discharge permits issued under the Clean Water Act (CWA), DEIS, pp. 3-83 to 3-86. In Section 3.6, the DEIS concludes that the Micron project will have no significant adverse impact on air quality, because it is projected to comply with National Ambient Air Quality Standards (NAAQS) for criteria air pollutants and with the established air emission standards for other pollutants. DEIS, p. 3-169. In Section 3.8 on solid and hazardous waste and hazardous materials management, the DEIS again leans on legal compliance to support its finding of no significant adverse impact. DEIS, p. 3-248 ("Micron would be required to manage all hazardous waste in compliance with applicable Federal and State laws and regulations

[in addition to engaging in waste minimization under an internal plan]. . . . Therefore, the Preferred Action Alternative would not result in significant adverse effects relating to the generation of solid or hazardous waste or the management of hazardous materials.”).

If all that is required to demonstrate the absence of significant adverse impacts is compliance with federal or state law, NEPA and SEQRA reviews would be very short and almost entirely useless. Every project proponent will undoubtedly express its intent to follow applicable law and comply with permits, meaning that any impacts subject to regulation could be assumed to be insignificant. Despite this fact, both NEPA and SEQRA mandate environmental review for major federal or state actions, including those impacts that are regulated by state or federal law. The goal of NEPA and SEQRA, therefore, must include a meaning review of the environmental impacts of otherwise legal actions. Federal courts considering this issue have agreed. *Environmental Defense Center v. Bureau of Ocean Management*, 36 F.4<sup>th</sup> 850, 874-875 (9<sup>th</sup> Cir. 2022).

There are circumstances, such as compliance with NAAQS which are based on achieving or maintaining ambient air standards designed to protect public health, the assumption that legal compliance means no significant adverse impact is somewhat reasonable. However, even this assumption is limited, since localized exceedances that create public health impacts are possible even in NAAQS-compliant airsheds. See Carlson, A.E. (2018), *The Clean Air Act’s Blind Spot: Microclimates and Hotspot Pollution*, 65 U.C.L.A. Law Rev. 1036.

For most other impacts, the assumption that legal compliance equates to insignificant impacts is not justified. For example, under the Clean Water Act, discharge limits are often based on best available technology, which may or may not result in compliance with applicable water quality standards. Water quality standards may not be designed to prevent any and all significant adverse impacts. They may, for example, be designed to protect fish propagation, not fish consumption or direct water contact. Most water quality standards are inadequate to protect subsistence fish consumption, which may be practiced by Native Nations, refugee populations, or low-income communities.

Further, some contaminants simply don’t have proper regulations established for them. PFAS, for example, is recognized as an emerging contaminant with the potential to cause significant harm to human health and the environment at very low levels of exposure. However, this emerging contaminant is not well understood or properly regulated. The DEIS discusses the evolving legal standards for PFAS at both the state and federal level but fails to plainly state that the vast majority of PFAS compounds are unregulated. Federal and New York State drinking water standards have been developed for a handful of PFAS substances. There are no federal or state standards for PFAS in air emission. Although there are federal reporting requirements for approximately 200 PFAS compounds, only two PFAS have been formally designated as

hazardous wastes and those compounds are no longer actively used by industry. EPA, Key EPA Actions to Address PFAS, available on-line at <https://www.epa.gov/pfas/key-epa-actions-address-pfas>. Meanwhile, hundreds of PFAS compounds are routinely used in routine use. EPA, Per- and Polyfluoroalkyl Substances (PFAS), available on-line at <https://www.epa.gov/pfas>. Studies from Cornell University indicate that wastewater from electronic manufacturing facilities routinely contain more than 40 PFAS “families” and more than 100 individual PFAS compounds. Jacob, P., Barzen-Hanson, K.A., and Helbling, D.E. (2021), Target and Nontarget Analysis of Per- and Polyfluoroalkyl Substances in Wastewater from Electronics Fabrication Facilities, Environmental Science and Technology, 55(4). Complying with applicable laws and permits says absolutely nothing about the impacts of discharges or emissions of such unregulated contaminants.

For these reasons, the DEIS should be amended to eliminate all bald claims that legal compliance translates into an absence of significant adverse impacts. Rather, the DEIS should incorporate quantitative or qualitative estimates of the contaminants that may be discharged into air or water or that may be released from solid and hazardous wastes or hazardous materials. The DEIS should then discuss the likely environmental and public health impacts of exposure to those contaminant levels. This assessment should include contaminants for which final discharge, emission, or exposure standards have not yet been set and should consider the potential for localized impacts.

**III. The air quality analysis fails to justify reliance on distant air monitoring data to assess compliance with applicable air quality standards or to consider the impacts of violations, exceedances, or upsets.**

The DEIS relies on modeling to assert that the Micron project will have no significant adverse impacts on air quality. This assessment is based on an assumption that the project will not result in a violation of NAAQS and will comply with other permit terms that set Annual and Short-Term Guideline Concentrations for other air pollutants. Although NAAQS compliance may be a reasonable basis for finding no significant adverse environmental impacts on a regional scale, there are shortfalls in the overall assessment of air quality impacts.

First, the analysis of NAAQS compliance relies on local monitoring data only for ozone and small particulate matter (PM<sub>2.5</sub>). For other criteria pollutants, the DEIS presumes that the affected environment’s air quality is likely better than or comparable to air quality measured in Rochester, New York more than 70 miles away. DEIS, Appendix I, p. I-4. This presumption is based on the more urban nature of the Rochester area. This may be a reasonable assumption, but it should be verified with some local monitoring data. While long-term data will not be available, targeted data gathered using mobile monitoring devices would be important in confirming the assumption that the Rochester monitoring data provides “conservatively high background concentrations.”

DEIS, App. I, p. I-4. In addition, there should be some consideration of on-going, localized air monitoring to reassure the public that the air quality monitoring was accurate.

Second, other than an assessment of combined stationary and mobile source impacts on particulate matter, the air quality assessment does not seem to consider the potential for localized air quality impacts from facility operations alone or from the combination of facility and traffic emissions. DEIS, App. I. The Stationary Air Quality Study Area, depicted in Figure 3.6-1 on p. 3-154, is an approximately 60 mile by 60 mile square. While the air quality analysis describes relying on a “receptor grid” that includes multiple monitors at various points extending up to 50 kilometers from the site boundary, the modeled “impacts” for NAAQS pollutants were reported as a single value. DEIS, App. I-1, pp. I-7, I-10. It is not clear how the more local monitoring data was used; whether the reported value for each of the NAAQS pollutants is an average or a maximum figure; or what the degree of variability likely to be found within the Air Quality Study Area. Even the more localized Regional (Mobile) Air Quality Study area is fairly large, including Syracuse to the south, Central Square to the north, and almost reaching Fulton to the west. Discussion of mobile source air impacts within this region as a whole similarly does not provide truly localized data. At minimum, this data should be better explained.

A detailed and localized analysis of air impacts may be particularly important for the contaminants (NO<sub>2</sub>, PM<sub>2.5</sub>, fluorine, and total fluoride) that are modeled to be quite close to the regulatory limits within the Stationary Air Quality Study Area on either a short-term or annual basis. DEIS, App. I, Table I-2, p. I-11. Assuming that the projected NAAQS levels are averages and not maximums, small variations in these contaminant levels might represent unhealthy or environmentally damaging exposures on a local scale. The analysis does not seem to include all contaminants that might be of concern for this facility – specifically, there is no mention of air modeling for PFAS or contaminants specifically identified as PFAS byproducts. And, as mentioned above, the only modeling data that appears to consider the combined effects of facility operations and mobile sources relates to particulate matter. DEIS, pp. 3-175 to 3-179. There are other contaminants of concern that are associated with both facility operations and mobile sources and should be the focus of a combined analysis – for example, NO<sub>x</sub>, CO, and SO<sub>2</sub>.

Third, the DEIS does not consider the risk of upset, exceedance, or other violations of air emission permits. However, no equipment works perfectly. Exceedances of permit terms are fairly common during start-up, shutdown, or maintenance procedures. In fact, such violations are so common that the Environmental Protection Agency (EPA), in the past, adopted and enforced regulations to address them

specifically.<sup>4</sup> As an experienced semiconductor manufacturer, Micron must have some idea regarding the frequency of upset conditions or exceedances related to operational changes. That information should be provided and assessed in the DEIS.

Other types of permit violations are also possible. According to the Environmental Working Group, as of October 25, 2024, of the 1,191 U.S. manufacturing facilities actively involved in semiconductor production, 10% had violated federal environmental laws and regulations in the last 10 years and 27% of the facilities that had individual discharge permits had violated those permits. (Environmental Working Group (2024, Oct. 25), “What the Building CHIPS America Act Could Mean for Public Health and the Environment,” available on-line at <https://www.ewg.org/news-insights/news/2024/10/what-building-chips-america-act-could-mean-public-health-and-environment>). Given the frequency of permit violations, some consideration should be given to this possibility.

For the reasons listed above, the DEIS should be revised to provide a more comprehensive and better justified assessment of air quality impacts. To properly justify the use of distant monitoring data, there should be some consideration of local air data – even if that data is from short-term monitoring conducted for the EIS specifically. The analysis should consider the potential for violations and exceedances and should consider localized impacts for air emissions other than mobile source pollution. Finally, the Nation urges OCIDA and the Department of Commerce to mandate on-going, local air monitoring to provide confirmation that the Micron project is not creating regional or local air quality impacts.

#### **IV. The DEIS provides insufficient information on the use and potential impacts of hazardous materials, including PFAS.**

The DEIS provides very limited information on the specific types and quantity of hazardous materials that may be used within the Micron project, the types and quantity of hazardous wastes that are likely to be generated, or the final fate of these wastes. For the most part, the DEIS discusses hazardous materials and wastes in generalities and does not provide the specifics necessary for the public to fully understand the risks presented by the use of hazardous materials or the generation and disposal of hazardous wastes from the project.

Rather than providing a complete list of the specific hazardous materials that might be used on site, the DEIS provides a short list of “extremely hazardous

---

<sup>4</sup> in the past, both federal and state law provided for excusing such exceedances from enforcement actions if the regulatory agency deemed the violation to be unavoidable. See 40 C.F.R. 70.6(g) (2023); 6 N.Y.C.R.R. § 201-1.4(e) (2022). However, over the past few years, the EPA has begun to remove these “emergency defense” provisions from various regulations issued under the Clean Air Act (CAA) pursuant to *Natural Resources Defense Council v. EPA*, 749 F.3d 1055 (2014), which held that a similar provision in a hazardous air pollution regulation was beyond EPA’s authority.

substances” that would be regulated under a Risk Management Plan (ammonium hydroxide, anhydrous ammonia, hydrogen, hydrogen chloride, silane, chlorine, dichlorosilane, and HF), DEIS, p. 3-243 to 3-244, and otherwise lists categories of hazardous materials (acidic or caustic solutions; flammable or corrosive liquids; flammable, toxic, or pyrophoric gases; asphyxiants; toxics; oxidizers; or water reactive substances), DEIS, Tables 3.8-9 and 3.8-10, pp. 3-242 to 3-243. Hazardous wastes are similarly discussed in categorical terms, as drummed acids, drummed solvent, acids, solvent and arsenic waste, miscellaneous maintenance waste, and mercury waste. DEIS, Table 3.8-8.

These broad descriptions, and even the more specific list of extremely hazardous compounds, presented without any suggestion as to the quantity of such materials that would be routinely used or generated on the site does not provide the information needed to understand the risk posed. Given that full operation of this project is at least 16 years in the future, Micron may not be able to project the full list of materials or the specific quantities of each to be used in this project. However, data on the typical materials used and wastes generated by similar chip manufacturing facilities – either from industry-wide reporting or from prior Micron experience in the field – must be available. At minimum, that data should be provided and analyzed in this section.

The DEIS provides a slightly more specific analysis of PFAS use and disposal than of other hazardous production materials. Specifically, the DEIS acknowledges that its production processes will rely on PFAS compounds, that air emissions will have to be treated to control PFAS emissions, and that process-related wastewater will likely contain PFAS substances. However, even for this compound, there is no information on the exact types or amounts of PFAS compounds that will likely be present at the facility, used in production processes, or likely to be released via air emissions or wastewater discharges. Instead, as noted in Section II, *supra*, the DEIS asserts that PFAS wastes will cause no significant adverse effects on public health or the environment, because both Micron and the Oak Orchard Treatment Plant will comply with applicable environmental law. This is an inadequate assessment for several reasons.

PFAS is a common component of all semiconductor manufacturing and is likely used in and discharged from Micron’s other facilities. Micron relies on its experience in Idaho and Taiwan to estimate overall waste levels (Table 3.8-4, p. 3-232). It should be able to use that same experience to provide additional information on the type and amount of PFAS substances used in production, the discharge methods that have been implemented in other facilities, and their effectiveness.

Because PFAS is an “emerging contaminant,” despite its known health and environmental risks, environmental regulations haven’t caught up. Micron acknowledges that there are at least 10,000 PFAS substances known to be used in or produced by manufacturing processes. DEIS, p. 3-240. However, fewer than 10 PFAS substances have established federal or state drinking water standards that could be translated into

permit terms and, as noted above, there are no federal or New York state standards for PFAS in air emissions. This limited regulatory stance is further complicated by the lack of reliable detection methods. As stated in the DEIS, EPA's most up-to-date methods can detect only 40 PFAS substances. DEIS, p. 3-240. For these reasons, compliance with permit terms does not mean that all significant environmental effects are avoided. Rather, to determine likely environmental impacts, the DEIS must review specific data on the likely types and quantities of PFAS compounds that will be used and discharged or disposed of by the Micron project

Unfortunately, the description of PFAS wastes, discharges, and emissions – critical information to understanding the environmental impacts of the Micron project – is extremely limited, especially for PFAS discharged in the plant's wastewater. There is no effort to quantify or trace the PFAS that might be discharged in wastewater or to assess the effectiveness of available control technologies. Similarly, the DEIS does not properly analyze the potential contaminants in sludge generated by its on-site industrial wastewater treatment facility.

As discussed in the DEIS, industrial wastewater will be treated initially at an on-site industrial wastewater treatment plant (IWWTP). See DEIS, pp. 3-240 to 3-241, 3-277. The DEIS states that process-related wastewater “may” contain PFAS – a fact which, given the heavy reliance on PFAS compounds in semi-conductor fabrication, seems unavoidable not just possible. DEIS, pp. 3-239. The DEIS does not discuss on-site wastewater treatment in detail, simply noting that it will comply with its indirect discharge permit for industrial wastewater. DEIS, p. 3-241. Assuming that Micron will be required to remove some PFAS from wastewater under that indirect discharge permit, that contaminant is likely to end up in the on-site IWWTP sludge. This would limit the sludge's “beneficial reuse,” DEIS, Table 3.8-5, p. 3-235, and, in practical if not legal terms, may mean it should be treated as a hazardous waste. However, the DEIS never discusses the potential for PFAS in its on-site IWWTP sludge or acknowledges that IWWTP sludge may require special handling. This should be addressed.

The DEIS discusses the treatment of PFAS-containing wastewater at the Oak Orchard IWWTP in Section 3.3, noting that this proposed facility will include control technologies specifically designed for emerging contaminants, such as PFAS. DEIS, p. 3-83. In addition, the Oak Orchard IWWTP would be expected to monitor its discharges and comply with discharge standards contained in its CWA permit. DEIS, p. 3-83. However, this ignores the fact, recognized later in the DEIS, that current detection methods can only identify a small portion of PFAS compounds routinely used in industry, DEIS, p. 3.240, or that PFAS is largely unregulated, which makes the promise of monitoring and permit compliance less meaningful. A more detailed analysis of likely removal rates, possible PFAS discharges, and related environmental impacts must be added to the DEIS.

In addition to the incomplete assessment of PFAS in process-related wastewater streams, the DEIS does not appear to acknowledge the volume of waste that might be generated by its pre-process water purification process. According to the World Economic Forum, chip manufacturing facilities require “ultra pure” water with pollutants, minerals, and other impurities removed. Typically, 1,400 to 1,600 gallons of municipal water is required to generate 1,000 gallons of “ultra pure” water and the process can create significant volumes of wastewater contaminated with concentrated heavy metals and other pollutants. Kristen James (2024, July 19). The water challenge for semiconductor manufacturing: What needs to be done? World Economic Forum, available on-line at <https://www.weforum.org/stories/2024/07/the-water-challenge-for-semiconductor-manufacturing-and-big-tech-what-needs-to-be-done/>. See also CERES (April 2022). *Global Assessment of Private Sector Impacts on Water*, pp. 44-45, 59-60. The DEIS should provide some assessment of the contaminants expected to be removed in this pre-use purification process and the way that they will be handled.

For all the reasons discussed above, the DEIS should be revised to provide more detailed information on the type and quantity of hazardous materials to be used in the Micron project, the amount and type of hazardous or dangerous wastes that will be produced at the facility, and the specifics of its waste management plan. Particular attention should be paid to PFAS and to the management of PFAS in the wastewater stream and the sludge generated in Micron’s on-site IWWTP. Finally, the DEIS should consider the wastes likely to be produced by its pre-production water purification process and the management of those wastes.

**V. The DEIS improperly dismisses the potential impacts of industrial pollution on groundwater and connected surface water, particularly given the potential for karst structures in the area.**

The DEIS discusses the potential for ground or surface water contamination from spills, uncontrolled discharges, or stormwater runoff on the project site in a fairly superficial way. This assessment improperly minimizes the potential for broad groundwater contamination from plant operations.

First, as discussed in comments submitted by Sterling Water Stewards and adopted by reference herein, the project area is very likely to contain karst features in subsurface areas. Karst refers to “a landscape formed from the dissolution of soluble rock or rocks that contain minerals that are easily dissolved from the rock.” Kappel, W.M., Reddy, J.E., and Root, J.C. (2020), *Statewide Assessment of Karst Aquifers in New York with an Inventory of Closed-Depression and Focused-Recharge Features*, UGSG/Scientific Investigations Report 2020-5030, p. 3. The highly permeable bedrock aquifers in areas where karst has developed are at significant risk of contamination. Surface water run-off that contains contaminants can quickly enter the aquifer via the

sinkholes, enhanced bedrock fractures, and similar features, and then disperse throughout the aquifer. Kappel et al., p. 3. Even small areas of “karstification” can lead to significant contamination. Kappel et al., p. 8. New York State has been particularly concerned about the contamination of karst aquifers because of this potential for groundwater contaminants to move further and faster in karst than in other types of geologic structures.

The DEIS does not address the potential presence of karst features in the project area or the potential for “karstification” over time. This is concerning given that the geologic data suggests that the project area is susceptible to karstification. The DEIS should be revised to address this concern.

Second and more generally, the DEIS largely dismisses the potential for water pollution impacts from the project on the basis that it will have and will comply with stormwater management permits, spill response plans, and discharge permits for its industrial wastewater. As noted above, compliance with permits should not be used as a substitute for an actual impact assessment, particularly where a project uses and discharges unregulated contaminants like PFAS. Further, the assumption that Micron will never violate those standards – through improperly contained spills, failure to fully execute a stormwater management plan, or exceedances or upsets from permitted discharge points – is unwarranted generally and is certainly unwarranted without data demonstrating that such an assumption is reasonable. Data on spills, violations, upsets, and exceedances within the domestic semiconductor industry as a whole or within Micron facilities generally should be reviewed to create a more grounded and fact-based assessment of water pollution risks.

For the reasons discussed above, the DEIS should be amended to provide a more robust discussion of the potential for and likely impact of groundwater or surface water contamination from the Micron project. The revision should specifically consider the potential impacts of karst/karstification on groundwater contamination as well as the potential for ground or surface water contamination from spills, permit violations, or permissible upsets or exceedances.

## **VI. Analysis of wetlands and wildlife impacts are too narrowly construed.**

The DEIS provides detailed information on the wetlands, the threatened or endangered species, and the other plants and wildlife present on the project site. It considers project impacts on these elements of the natural world due to the conversion of undeveloped or agricultural land to a manufacturing complex. The analysis also provides a general overview of the mitigation measures proposed to reduce harms to these communities. However, the DEIS fails to provide specific mitigation plans or to properly consider harm related to loss of habitat connectivity or the potential impacts of

off-site project-related effects, such as increased traffic or open-space development for new commercial spaces or housing.

The Micron project as proposed will destroy 193.38 acres of jurisdictional wetlands. Micron proposes to mitigate these losses by enhancing, restoring, or establishing 422.14 acres of wetlands directly and purchasing in-lieu fee credits for an additional 9 acres. DEIS, Table 3.3-13, p. 3-92. This results in a 2:1 mitigation ratio. However, the adequacy of this mitigation proposal is not addressed beyond the implied standard that more is better. Several issues should be more explicitly addressed.

The wetlands that will be lost are part of a contiguous or connected parcel of wetlands. Almost half of the wetlands currently on site will be destroyed by this project. The replacement wetlands being created or enhanced as mitigation will be scattered across at least six sites. The DEIS lists fragmentation as a potential adverse impact, but does not attempt to quantify, in any way, the ecological value of these scattered wetlands compared to the value of the former large contiguous parcel. The lost area include many acres of mature forested wetlands. The replacement wetlands are largely agricultural areas where forests will have to be established over many years. According to the DEIS, 45% of the forested wetlands, including 88% of the red maple hardwood swamps, 97% of the hemlock-hardwood swamps, and 19% of floodplain forests, will be destroyed by the Micron project. DEIS, Table 3.307, p. 3073. Red maple trees don't reach mature height (approximately 20') for 10 – 20 years. Eastern hemlocks are even slower growing. The DEIS makes no effort to quantify the ecological value of these developing wetlands over time, compare them to the value of an established wetland forest, or determine when the ecological value of the developing wetlands will reach the value of the existing wetlands.

The DEIS also pays limited attention to how the remaining wetlands on the Micron project site will be affected by the overall project. The loss of buffer areas and adjacent wetlands is an issue, as acknowledged but not meaningfully addressed by the DEIS. The Micron project will not only remove half the wetlands on site, it will eliminate 6,283 linear feet of stream channels and create 645 acres of additional impervious surfaces on the project site. DEIS, pp. 3-75, 3-76. Stormwater runoff will be carefully managed to limit surface and groundwater contamination from construction and plant operations. Further, the DEIS suggests that Micron may need to dewater the active construction area, meaning that groundwater will be entirely removed from or moved to other parts of the groundwater system continuously for the next 16 years. DEIS, p. 3-79. These disruptions to ground and surface water flow on the Micron project site will almost certainly affect groundwater recharge to the remaining wetlands on site and even to adjacent wetlands. The DEIS fails to consider this issue at all.

The DEIS also gives short shrift to the analysis of the flood-related or other impacts of wetland loss, increase in impervious surfaces, artificial stormwater flow under a stormwater management plan, and other related surface and groundwater flow

changes on adjacent properties. The dramatic changes from a forested site with waterways and no impervious surfaces to a primarily built and paved environment may alter flooding patterns, stormwater flow, or even groundwater recharge to adjacent properties. This should be discussed in more detail.

Birds, bats, and other wildlife will be affected by the construction of the Micron project and the loss of forests, wetlands, and grasslands on the site. Disturbance-intolerant species, to the extent that they are mobile, will be driven from the site, but the DEIS assumes that they will move to the remaining wetland areas on-site or to nearby locations with suitable habitat. DEIS, p. 3-118. However, the DEIS does not assess the availability of suitable habitat within the migratory range of affected mammals or birds. In addition, the DEIS fails to consider the effects of other changes in the area on wildlife. Traffic and construction noise, for example, is analyzed for its effects on sensitive human receptors in the vicinity of the project. DEIS, p. 3-396. Other than the statement that disturbance-intolerant species will abandon areas of construction, the DEIS does not consider the impacts of project-related noise, particularly on-going traffic noise, on wildlife. The DEIS examines changes in traffic patterns in great detail but does not consider the potential for increased traffic in the broader area to harm wildlife, either by cutting off migration routes or by increasing the number of traffic-related wildlife fatalities.

The DEIS pays particular attention to certain endangered bats (the Indiana bat, the northern long-eared bat, and the tricolored bat) and grassland birds considered to be threatened or “of special concern” (northern harrier, osprey, vesper sparrow, sharp-skinned hawk, and golden warbler). In both instances, Micron proposes to protect alternative habitats as mitigation for the endangered/threatened bat and bird habitat lost due to project construction DEIS, App. G-4, p. 8-104 to 8-110; App. G-4, App. A, Att. 4; and App. G-5, p. i. However, the DEIS provides limited details about the proposed mitigation. The bat habitat discussion includes some details on sponsored research and gives very general information about locations (dots on a map), size, and current status of mitigation area. DEIS, pp. 3-135 to 3-136; App. G-4, p. 8-104 to 8-110; App. G-4, App. A, Att. 4. The grassland bird mitigation plan “description” appears to be limited to an assertion that Micron will protect three times the amount of “high quality” habitat elsewhere than was lost on the project site. DEIS, p. 3-136, App. G-5, p. i. The DEIS also promises that Micron will develop a “mitigation masterplan” sometime in the future. DEIS, App. G-4, p. 8-107. These mitigation measures are held out as sufficient to reduce “unavoidable significant adverse effects” on bats and bird, but the information provided is not adequate to assess the likely effectiveness of any of the mitigation proposals.

There is no discussion, for example, about what is required for “high quality” habitat for grassland birds or any information about the quality of habitat on the sites proposed as mitigation. The DEIS does not discuss the potential for endangered bats

currently using the Micron site as a maternity roost to find or use the mitigation habitats, some of which are more than 10 miles away, or for these mitigation habitats to draw other populations of endangered bats. There is no discussion of the likely impacts of roost fidelity – that is, the tendency for bats to return to the same roost trees year after year – on bat populations. Additional details on the mitigation proposals and an analysis of their likely effectiveness is necessary to support the assertion that the proposals will sufficiently reduce unavoidable significant and adverse impacts of the Micron project.

For all of these reasons, the DEIS should be revised to provide more detailed analysis of project impacts on groundwater, surface water, and wetlands the site and the birds, bats, mammals, and other wildlife that rely on those spaces. At minimum, the DEIS should provide a more detailed accounting of the value lost by wetlands destruction and the value provide by the replacement wetlands; the impacts of wetlands loss and groundwater/surface water disruptions on the wetlands remaining on campus; and the effects of noise, vibrations, increased traffic, and other project-related impacts both on- and off-site on wildlife.

**VII. The DEIS fails to consider reasonably foreseeable impacts from its substantial energy and water needs, including significant adverse effects on greenhouse gas production and expanded reliance on nuclear power within New York State.**

The Micron project will put an enormous burden on the energy, water, and wastewater processing infrastructure in the region. At full build-out, the facility will draw 48 million gallons of water and produce 2.6 million gallons of wastewater daily. DEIS, pp. 3-273, 3-275. It will also require almost 16,000 GWh of electricity annually. DEIS, p. 3-269. This is as much electricity as the states of Vermont and New Hampshire combined and more than the available electricity currently produced in this area. Unfortunately, the DEIS does not provide an in-depth assessment of environmental impacts that its water use or the massive electricity draw, in particular, may create.

While the DEIS provides quite a bit of detail on the amount of fresh water needed for the project and the infrastructure expansion required to meet that need, there is more limited discussion of the potential impact of this significantly higher water withdrawal on Lake Ontario or on the near-shore ecosystem from which the water will be drawn. The DEIS also recognizes that project-induced growth is likely to increase water demand in Onondaga County by an additional 6.6 to 9.4 MGD (p. 3-274) but does not consider these increased demands in the context of demand trends in the area absent the Micron project or the overall water demands on Lake Ontario. These gaps should be addressed.

The discussion of electricity demands is more problematic. The DEIS asserts that there is “spare” electricity produced in NYSEERDA Zone C, which includes the project

site. Approximately 50% of the current annual Zone C production of 29,776 GWh is not used within the region. While this statement may be true, it does not provide a full picture of the issue. New York as a whole produces less energy than it uses. U.S. Energy Information Administration (US EIA) (2025), New York: State Profile and Energy Estimates, available on-line at <https://www.eia.gov/state/analysis.php?sid=NY#16>. The excess energy produced in Zone C “currently flows to other load zones and demand areas, including downstate zones that are net consumers of electricity.” DEIS, p. 3-264. Further, electricity demands within the state are expected to increase by “roughly 50 to 90 percent over the next 20 years,” essentially the same time period as Micron’s proposed construction. DEIS, p. 3-264. In combination, this means that the heavy electricity demand created by the Micron facility will displace existing users and consume all of the “excess” electricity that might be needed to accommodate increased power demands within Zone C over the next 20 years.

By 2045, electricity demand from current users in Zone C can be expected to increase to between 22,039.5 GWh and 27,916.7 GWh. Assuming stable production, that will leave only 1,859.3 GWh to 7,737.5 GWh annually for Micron, resulting in an electricity deficit for the project of between 27% and 46% of its projected needs at full build. This deficit is much greater than the 591 GWh or -2% deficit reported in the DEIS. DEIS, Table 3.10-1, pp. 3-269 to 3-270. Further, the Micron-specific deficit must be considered in the context of a projected 10% deficit in electricity generation across New York by 2040. James E. Hanly (2023, Aug 21), “Micron v. New York Energy Policy,” Empire Center for Public Policy, available at <https://www.empirecenter.org/publications/micron-vs-new-york-energy-policy/#:~:text=Micron%20will%20need%20to%20draw,be%20supplied%20by%20renewable%20energy.>) In addition, Micron’s laudable promise to use only renewable electricity in its facility is likely to create a significant burden on the supply of renewable power and of Renewable Energy Credits (RECs) throughout the state.

Rather than discussing the potential impacts of displacing the existing users of the Zone C electricity surplus, the projected regional and state-wide deficits, the overall increase in electricity demands related to project-induced growth, or the potential shortfall in renewable electricity and RECs, the DEIS simply states that uncertain future demand makes it impossible to assess any impact and that, if there are power deficits in future, NYSERDA will address them by permitting additional power generation projects. However, data gaps do not entirely excuse analysis of reasonably foreseeable impacts. *Robertson v. Methow Valley Citizens’ Council*, 490 U.S. 332, 354 (1989). In this case, there is sufficient data to provide a more detailed analysis of the potential impacts of Micron’s direct power demands, even if the broader impacts of induced growth are not ascertainable.

At minimum, the DEIS should be expanded to consider the impact of the significant shortfall in regional electricity production, based on projected growth in power

demand and to consider the effects of a more limited electricity supply beyond Zone C as Micron takes up regionally generated power. In addition, because Micron has committed to using 100% renewable or carbon-free electricity, the DEIS should consider the deficit in renewable power or renewable energy credits (RECs) specifically.

Finally, the DEIS should consider impacts related to the potential expansion of nuclear power within New York State in either the Utilities and Infrastructure or the Cumulative Impacts section. While the Micron project does not explicitly include an expansion of nuclear energy facilities, this expansion is a reasonably foreseeable impact of the project, as that term is understood under both NEPA and SEQRA.

New York State began publicly contemplating expanding its nuclear facilities in September 2024 and, by the end of June, had announced a definite plan for a new nuclear facility in the State. The State's turn toward increased nuclear power has been directly tied to the enormous demand for electricity that will be generated by the Micron project. In fact, NYSERDA specifically cited "[n]ew economic development opportunities in the state in high tech manufacturing" like Micron as one of the drivers for seeking "new technologies that can supplement renewable energy." Tim Knauss (2024, Nov 15), "NY seeks input from advanced nuclear companies, another sign of interest in new nukes," Syracuse.com, available on-line at [www.syracuse.com/news/2024/11/ny-seeks-input-from-advanced-nuclear-companies-another-sign-of-interest-in-new-nukes.html](http://www.syracuse.com/news/2024/11/ny-seeks-input-from-advanced-nuclear-companies-another-sign-of-interest-in-new-nukes.html).

Micron has also acknowledged that the availability of "reliable" nuclear power was one of the reasons that it chose to locate this proposed facility in upstate New York. Andrew Donovan (2024, May 24), "Even a blip of power outage could cost Micron's fabs thousands of dollars in ruined chips," LocalSyr.com, available on-line at <https://www.localsyr.com/news/local-news/even-a-blip-of-power-outage-could-cost-microns-fabs-thousands-of-dollars-in-ruined-chips/>. Tellingly, Micron has changed its sustainability commitment from using "100% renewable electricity" for the Micron project by 2025, Onondaga County Industrial Development Authority (OCIDA)/Micron, Key Terms and Conditions for the Development of the Micron Green Manufacturing Memory Chip Fab Campus in Clay, NY, p. 7, to using "100% carbon free electricity," DEIS, p. 0-9. Because electricity generated by nuclear facilities can be defined as carbon-free, but not as "renewable," this language change strongly suggests that Micron plans to rely on nuclear energy to meet the massive power demands of its facility.

The proposed expansion of nuclear energy and the failure to include this issue in the DEIS is of particular concern to the Onondaga Nation for many reasons. Two of the three nuclear power plants currently operating in New York (the Nine Mile Point and the James A. Fitzpatrick nuclear power plants) are located within the Onondaga Nation's traditional territory. Nuclear waste from these and other nuclear facilities are regularly transported through the Nation's currently recognized territory along Interstate Highway 81 (I-81). Further, the nuclear industry has had devastating impacts on Indigenous communities at every point in the production process from the deadly legacy created on

Navajo lands from uranium mining, to the contamination of Native lands from nuclear processing facilities, to the transportation of nuclear materials and waste through Native lands, to the proposed long-term storage at Yucca Mountain, a sacred space within the recognized territory of the Western Shoshone Nation. Any expansion of nuclear power in New York State would add to these impacts and to the environmental injustice that they create. The DEIS should incorporate assessment of impacts from the Micron-related proposal to expand nuclear energy production in the State.

For all these reasons, the DEIS must expand the assessment of Micron's energy and water demands. Specifically, the DEIS should be revised and expanded to consider the state-wide impacts of Micron's massive electricity demands, the actual shortfall in power likely in future given increasing electricity demands and limited increases in electricity supply in the region and state-wide, and the potential expansion of nuclear power generation in upstate New York to meet the power demands of the Micron project.

**VIII. Additional mitigation measures should be considered to limit the significant adverse impacts that can be anticipated from the construction and operation of this project**

Based on our review of the DEIS, the Nation believes that additional mitigation measures should be incorporated and made enforceable through this process. Our proposed mitigation include greater transparency of process, additional data gathering, greater protection for on-site wildlife from construction processes, additional mitigation for acknowledged GHG impacts, and on-going public engagement in the "adaptive management" of environmental impacts from the project.

First, the DEIS fails to provide concrete data on the types and amount of hazardous materials being used by the Micron project, the quantities and types of hazardous waste generated, and the sites for hazardous waste disposal. In part, the DEIS asserts that this information is not known at this time. This may be an accurate statement, but it does negate the public's right to know what hazardous materials are being used or generated on this site and the risks that those materials pose. This inherent right to know extends beyond the reporting required under the Toxic Release Inventory. The DEIS should require Micron to make detailed information about the hazardous or potentially hazardous materials used on or generated by the site for the life of the project.

Second, Micron should be required to conduct routine and on-going monitoring of the environmental impacts of this project to ensure that the assumptions about impact significance or insignificance can be verified over time. This monitoring should, at minimum, include localized air monitoring, monitoring of waste streams for potential contaminants including the full range of potential PFAS contaminants, monitoring of the

health of the wetlands remaining on site, and on-going monitoring of the threatened or endangered wildlife populations displaced by this site. The DEIS relies heavily on modeling and on assumptions about the effectiveness of pollution controls. Micron should be required to conduct the necessary monitoring to check those assumptions.

Third, the DEIS states that project construction will result in the mass mortality of reptiles, amphibians, and small mammals with limited mobility. DEIS, pp. 3-118 to 3-119. There is no consideration of mitigation methods to limit or avoid this damage. Micron should be required to develop a construction mitigation plan focused on options such as fencing, appropriately timed construction, and even relocation efforts to reduce these wildlife impacts.

Fourth, given that the availability of renewably generated electricity is critical to Micron's GHG-related mitigation proposals and that New York State is struggling to meet its renewable energy goals, Micron should be required to take steps to increase the amount of renewable power available. This could take the form of building additional on- or off-campus renewable energy generation projects or subsidizing off-campus renewable energy projects. At minimum, Micron should be required to generate or subsidize the generation of sufficient renewable energy to offset its power demands.

Last, the Micron project will take more than 15 years to build and will involve complex and evolving technology. The project admittedly includes many uncertain environmental impacts. As noted above and in the DEIS, the type and amount of PFAS discharges in wastewater; the level of control achievable from available PFAS control technology; the actual regional levels of most criteria air pollutants; the likely air emissions from the facility, particularly in terms of upsets and exceedances; the success of wetlands, bat, and bird mitigation projects; and the induced growth effects are all discussed in generalities because the specifics are unclear. Because of the inherent uncertainty surrounding these and other impacts, Micron has committed to adaptive management for issues such as managing groundwater and stormwater run-off on-site wetlands, and flood response.

Given the inherent uncertainties and evolving nature of this enormous and long-term project, Micron should be required to create and support a community advisory and oversight committee which can help with on-going monitoring, environmental impacts assessment and response, and community engagement. This committee should be composed of both community members and local experts who can provide grounded information for use in and review of any continuing assessment and adaptive management at the site as well as a direct line of communication with the affected public. If the DEIS cannot be made more specific now, the community should have a formal role and be directly involved in the review of the specific data on environmental impacts as it is developed over time.

**Conclusion:**

The Onondaga Nation takes seriously its obligations to act as steward for the natural world within its traditional territory and beyond. For all the reasons described above, the Nation believes that the proposed Micron project will have significant impacts beyond those described in the DEIS and that this analysis should be expanded to provide a more careful and detailed assessment of these impacts. In addition, Micron should be required to undertake additional mitigation to better track and potentially reduce its environmental impacts and to engage the community on an on-going basis.

Sincerely,

A handwritten signature in black ink, appearing to read "Alma L. Lowry". The signature is fluid and cursive, with a long horizontal stroke at the end.

Alma L. Lowry, Of Counsel

Dear Mr. Petrovich,

Please see attached Alliance for a Green Economy and Nuclear Information Resource Service's comments on the June 27, 2025 Draft Environmental Impact Statement (DEIS) for the Micron Semiconductor Manufacturing Project ("Micron Plant") to be constructed in Clay, NY (EISX-006-55-CPO-001).

We appreciate this opportunity to offer our feedback; please don't hesitate to reach out with questions or need for clarification.

Respectfully,  
Avni Pravin-Buck

Re: EISX-006-55-CPO-001

*[Submitted electronically to chipsnepa@chips.gov]*

---

Alliance for a Green Economy and Nuclear Information and Resource Service appreciate the opportunity to comment on the June 27, 2025 Draft Environmental Impact Statement (DEIS) for the Micron Semiconductor Manufacturing Project (“Micron Plant”) to be constructed in Clay, NY (EISX-006-55-CPO-001).

Alliance for a Green Economy (AGREE) is a non-profit headquartered in Syracuse, New York, founded 12 years ago for the purpose of transitioning New York to 100% healthy, safe, and clean renewable energy, based on the principles of economic, social, and ecological justice.

Nuclear Information and Resource Service (NIRS) is a nonprofit organization founded in 1978 to be a national information and education center for impacted communities and the public concerned about nuclear power, radioactive waste, radioactivity, and sustainable energy issues. We provide policy analysis and informational resources on energy and radioactive waste, and monitor policy developments and industrial trends on the national and state levels.

This comment focuses on the environmental impacts of the proposed Micron Plant’s energy consumption and the energy infrastructure that it will require. AGREE and NIRS also share the concerns of other parties that have commented on numerous other environmental, social, and economic impacts that the Micron Plant would have, and which are inadequately addressed in the DEIS. We endorse and incorporate by reference the comments filed by the following parties:

- the Onondaga Nation, American Indian Law Alliance, and Haudenosaunee Environmental Task Force;
- Climate Change Awareness and Action, Inc.;
- Greening USA;
- Jobs to Move America;
- Sierra Club;
- Urban Jobs Task Force.

According to the DEIS, the Micron Plant would add 15,674 gigawatt-hours (GWh) of electricity consumption to the New York Independent System Operator (NYISO) transmission system, more than 10% of statewide electricity consumption in 2024 (151,556 GWh).<sup>1</sup> The DEIS also indicates that the Micron Plant will consume 9.7 billion cubic feet (bcf) of natural gas (hereafter, fossil gas) each year, approximately 0.7% of statewide fossil gas consumption in 2022.<sup>2</sup> Due to the phased construction of the Micron Plant’s four fabrication facilities (fabs), the DEIS indicates that energy consumption will increase incrementally with the operation of each fab:

| <b>Increment (year operational)</b> | <b>Total Electricity (GWh/year)</b> | <b>Incremental Electricity (GWh/year)</b> | <b>Generation Capacity Required (MW)</b> | <b>Fossil Gas Combustion (billion cubic feet/year)</b> | <b>Incremental Fossil Gas (bcf/year)</b> |
|-------------------------------------|-------------------------------------|-------------------------------------------|------------------------------------------|--------------------------------------------------------|------------------------------------------|
| Fab 1 (2029)                        | 3,261                               | 3,261                                     | 480                                      | 2.17                                                   | 2.17                                     |
| Fab 2 (2030)                        | 6,925                               | 3,664                                     | 576                                      | 4.34                                                   | 2.17                                     |

The scale of the Micron facility’s impacts would affect the entire NYISO grid. This one facility would add electricity loads amounting to more than 10% of current statewide consumption. NYISO transmission Zone C, in which the Micron facility would be located, is currently and historically the largest net generator of electricity, supplying the NYISO grid with more than 16.8 million MWh of electricity in 2024. Typically, electricity demand in Zone C is the third- or fourth-greatest in NYISO, but the addition of the Micron facility could easily elevate it to the second-largest.

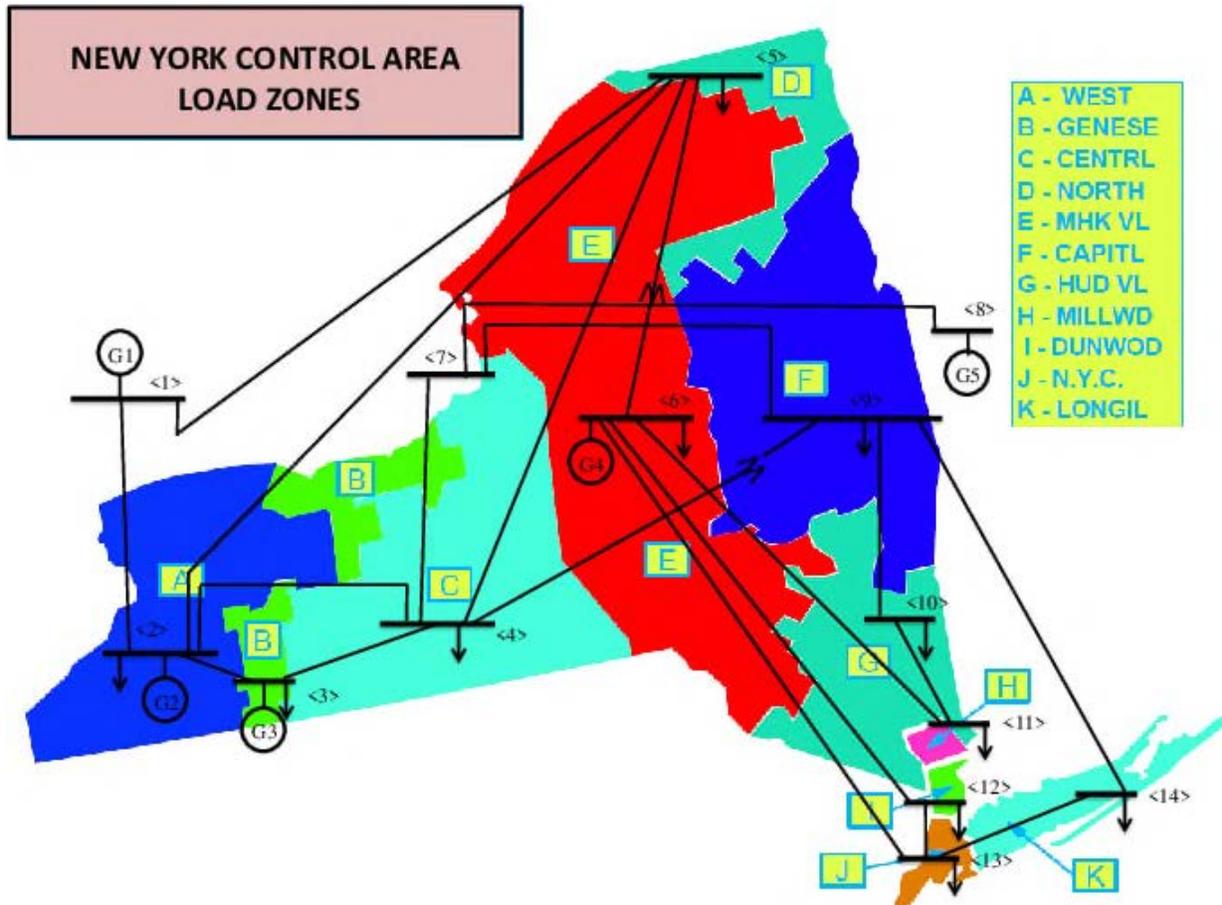

The DEIS correctly identifies that the Micron Plant’s loads could exceed the current amount of net electricity generation in the region of the New York State electricity transmission and delivery system (referred to as the New York Control Area (NYCA), hereafter, the NY Grid) in which the plant is to be built. The Micron Plant’s operations would, in effect, turn NYISO Load Zone C from the largest net exporting region of the NY Grid to a net-importing zone; at the very least, net generation in Load Zone C would be dramatically reduced, affecting statewide

<sup>2</sup> Ibid.

electricity transmission. In eight of the last nine years, Load Zone C has been the largest net exporting zone; and since the Indian Point Nuclear Power Plant was phased out in 2020-2021, Load Zone C has become the only zone with sufficient net generation to support the large needs for imported power in the Downstate region.

The DEIS also goes on to state that there could be other significant sources of new electricity demand that result from the Micron Plant’s operations, which would accelerate and exacerbate net electricity reductions in NYISO Load Zone C:

“Induced growth throughout the five-county region would be anticipated to increase electricity demand in addition to the increased electricity demand associated with the Preferred Action Alternative. This would include additional demand generated from potential supply chain operations that may be located in close proximity to the Proposed Project as well as increased residential development. Although it cannot be predicted exactly when, or to what degree, the increased electricity demand from induced growth would occur, it is anticipated that the additional demand would expedite the time in which Load Zone C’s current generation capacity is exhausted.”<sup>3</sup>

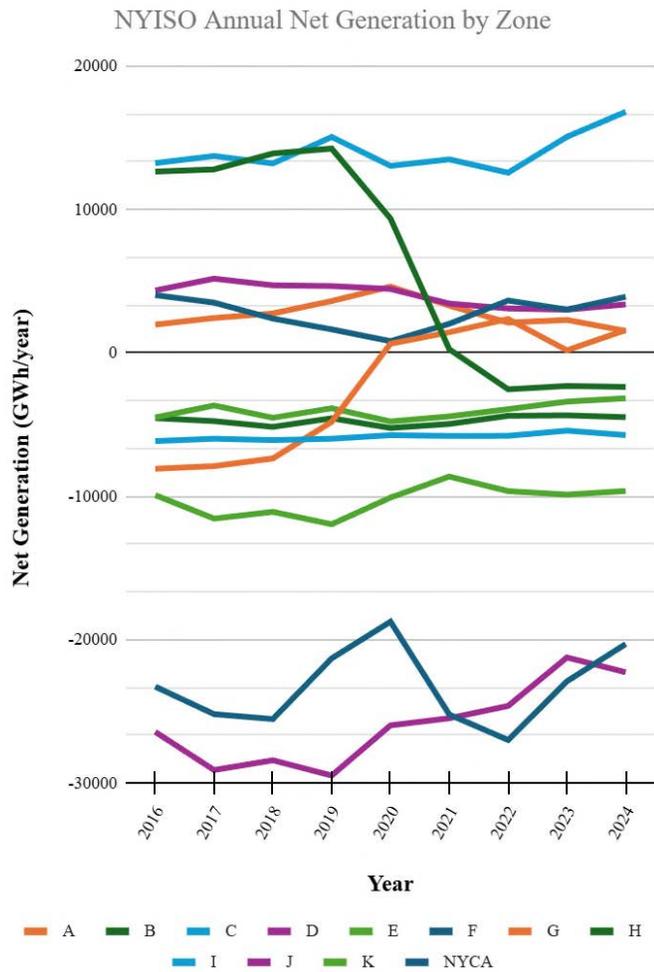

<sup>3</sup> DEIS at 3-270 (p. 384 of 719).

As discussed in greater detail below, the addition of the Micron Plant’s load would fundamentally change Load Zone C, the role it plays within the NY Grid, and the way the flows of electricity will have to be managed statewide. This has significant implications for electricity costs, service quality, and infrastructure not only in Load Zone C and the Syracuse metropolitan area, but statewide. However, the DEIS fails to even scratch the surface of those impacts, and inappropriately dismisses the potential for adverse consequences by placing responsibility on conventional energy system planning procedures:

“However, this effect would be adverse only if the NYISO and National Grid planning processes fail to ensure that additional generation capacity is adequate to support total electricity demand projected in Load Zone C and the remainder of the State when needed, whether in 2041 or earlier. The comprehensive State and utility planning processes would be anticipated to adequately prepare for the future electricity demands associated with the Proposed Project, along with the future electricity demands in the State. Based on this long-term planning capacity, the Preferred Action Alternative would result in significant, but not adverse, effects on electricity demand and transmission resources.”<sup>4</sup>

That assertion is a fundamental misrepresentation of the NY Grid and the impacts that the Micron Plant would have upon it. It appears to rest upon a viewpoint that Micron is entitled to exhaust all of the net generation capacity from Load Zone C that is currently supporting electricity reliability statewide for the operations of the Micron Plant, and it assumes that doing so would only impose an impact on the grid once the Micron Plant’s electricity consumption exceeds net generation in the zone.

<sup>4</sup> DEIS at 3-271 (p.385 of 719), emphasis added.

Highly concentrated electricity demand in regions of the grid with insufficient local generation supply and constrained transmission capacity are known as “load pockets.” New York City (NYISO Load Zone J) and Long Island (Load Zone K) have long been categorized as load pockets in the NY Grid: as illustrated in the chart above, each is characterized by significant net generation deficits, with high concentrations of demand, insufficient local generation supply, and limited transmission interconnection capacity for imported power. In order to maintain reliability of the electricity system, load pockets require significant investment in infrastructure and generation capacity. Market prices for electricity, capacity, and other grid reliability services also tend to be significantly higher in load pockets, due to large demand and constrained supply, placing cost burdens upon consumers and local economies, and potential inequities, depending on how costs are allocated across ratepayer classes.

Even regions near load pockets can suffer high electricity rates due to higher commodity and system charges. For instance, in 2014, NYISO instituted a new Lower Hudson Valley capacity market zone (incorporating Load Zones G, H, and I with Zone J) to incentivize increases in generation and transmission capacity in the Lower Hudson Valley region north of NYC.<sup>5</sup> The NYC and Long Island load pockets (Zones J and K) already had their own capacity market zones, and Zones F-I together produced net-positive generation supply at the time. Due to persistent transmission system constraints between Zones A-E (“upstate”) and Zones F-J (“downstate”), NYISO found that it was necessary to incentivize additional investments in transmission and generation capacity in the Lower Hudson region, south of the upstate-downstate transmission constraint and closest to NYC.<sup>6</sup> Creation of the LHV capacity zone had the effect of increasing capacity market charges to consumers in Zones G-I due to their proximity to the Zone J load pocket.

By information and belief, there is, in fact, no precedent for a single facility consuming as much electricity on the NY Grid as the Micron Plant: occupying less than two square miles of land, the plant would consume as much electricity as the states of New Hampshire and Vermont combined (18,856 square miles and over 2 million residents); or nearly one-third of the electricity consumed by New York City (472 square miles and 8.5 million residents). The addition of the Micron Plant’s loads would create the conditions for a load pocket by virtue of its size and concentration, notwithstanding its location in proximity to a large electricity substation with direct connection to large generation sources. The substantial enlargement of the substation

<sup>5</sup> Power Management, “NYISO Announces New Capacity Zone,” May 7, 2014, see <https://www.powermgt.com/nyiso-announces-new-capacity-zone/>, accessed August 9, 2025.

<sup>6</sup> Troutman Pepper Locke, “Second Circuit Upholds FERC’s NYISO Capacity Zone Order,” April 14, 2015, see <https://www.troutmanenergyreport.com/2015/04/second-circuit-upholds-fercs-nyiso-capacity-zone-order/>, accessed August 9, 2025.

which National Grid and Micron are now planning is evidence that existing transmission infrastructure is insufficient to accommodate the plant's loads.

The need for substantial increases in generation capacity throughout the region and statewide does require comprehensive planning. As we have seen with NYISO's institution of the Lower Hudson Valley capacity zone over a decade ago, planning processes do not mean the economic and social impacts will be fully mitigated. In fact, residents living in the Hudson Valley capacity zone saw both increased electricity prices and the siting of polluting electricity generating facilities in their communities as a result of the new load zone.

The Syracuse Metropolitan Area could become a new load pocket, due to both the load growth auxiliary to the Micron Plant described in the DEIS and already anticipated increases in electricity demand necessitated by the electrification of buildings, transportation, and industrial facilities. However, even if the region does not end up meeting the conditions of a load pocket, NYISO may decide to institute new capacity zones or other market mechanisms in an effort to drive investment in transmission and generation capacity into the area. System planning to supply and integrate enormous, geographically concentrated demands for electricity in the Syracuse region—of which the Micron Plant will constitute by far the largest share and the single greatest driver—will be necessary, and it will have foreseeable impacts on electricity rates and related environmental impacts.

Other parts of the state could be similarly impacted. If Zone C stops exporting as much electricity to downstate NY, additional capacity zones or other mechanisms may be necessary in other zones, which could drive up electricity prices there and/or incentivize additional polluting energy generation.

There are also reasonably foreseeable factors that could exacerbate all of these impacts, such as unplanned retirements of existing generation sources in Zone C, which are ignored in the DEIS but must be evaluated. The analysis provided in the DEIS assumes that existing generation levels in Load Zone C remain in place, effectively decades into the future. This is a non-conservative assumption. The vast majority of generation in Zone C is provided by three large nuclear reactors in Oswego County: Nine Mile Point unit 1 (621 MW), Nine Mile Point unit 2 (1,311 MW), and James A. FitzPatrick (838 MW). Nine Mile Point unit 1 (NMP1) is already the oldest operating reactor in the U.S., and the second-oldest in the world. Its current operating license expires in 2029. Constellation plans to seek a second 20-year extension of the operating license in 2026. Similarly, FitzPatrick's current license extension expires in 2035, when Fab 3 of the Micron Plant is projected to begin operation, and it would have to be extended under the modeling upon which the DEIS relies.

Even so, a license extension is no guarantee that a nuclear reactor will continue operating. Since 2013, a total of ten reactors which had received license extensions have retired, all of them long before a 20-year extension would have expired. For instance, the Vermont Yankee reactor entered the period of a 20-year license extension in 2012, but its owner retired the plant in 2014; and the Kewaunee reactor was retired in May 2013, even before entering the period of its 20-year extended license. Together, NMP1 and FitzPatrick generate around 12,000 GWh of electricity per year at their current performance levels—about as much as Fabs 1-3 would require in 2035. The retirement of either or both reactors could accelerate and exacerbate the loss of net generation in Load Zone C well beyond the status quo scenario relied upon in the DEIS. While existing generation sources are expected to be retired and replaced in NYS in the coming decades, the Micron Plant’s operations could greatly exacerbate the conditions in Load Zone C for many years into the future.

For instance, the New York Department of Public Service (DPS) recently submitted a proposal to extend a subsidy program that has economically propped up the otherwise uneconomical nuclear power plants in Load Zones B and C since 2017.<sup>7</sup> Under the DPS proposal, the Tier 3 Zero-Emissions Credit (ZEC) program would be extended a full twenty years, from 2029 to 2049, to accommodate license extensions of NMP1 and the Ginna reactor in Zone B. Under the base prices of ZECs proposed by DPS, the cost of the ZEC program would be up to \$33 billion over 20 years,<sup>8</sup> raising electricity rates across all of New York. If deemed necessary to assure generation supply for the enormous load growth in Zone C, the cost of the extension would be at least partially attributable to the Micron Plant. DPS notes that the prices of ZECs may be mitigated by increases in market electricity prices: “Based on Staff’s current forecasts of energy and capacity revenues, the actual ZEC prices could be less than half of the maximum ZEC prices over the full period.” But this lower ZEC cost only comes about if electricity prices in NYISO Zone A (Western New York) rise higher than \$39/MWh, which DPS correlates to a baseline market price of \$33/MWh in Zone C. That would mean DPS forecasts energy and capacity prices \$18-\$41/MWh higher than the modeled Zone C baseline. If DPS’s market forecasts are due to the Micron Plant’s contributions to load growth and loss of net generation in Zone C, the effect will be the same: increased electricity costs in Western New York and possibly throughout the Syracuse Metro Area, Zone C, the wider region, and statewide. The DEIS must address the socioeconomic impacts of electricity price increases which the Micron Plant may induce.

Electric bill hikes can have a number of negative impacts on households, including but not limited to: inability to purchase groceries or necessary medicine; inability to heat or cool home to

---

<sup>7</sup> New York Department of Public Service, “Department of Public Service Staff Zero Emissions Credit Extension Proposal,” July 31, 2025, see <https://documents.dps.ny.gov/public/Common/ViewDoc.aspx?DocRefId={20FE6198-0000-CF2B-A36D-8B6869CF6E5E}>, accessed August 10, 2025.

<sup>8</sup> *Ibid.* See page 30. Calculated by multiplying the Maximum ZEC Price values in Table 3 and the ZEC cap of 27,618,000 MWh per year (“the overall MWh cap that represents the verifiable historic contributions of the facilities”), over the 20-year period of the proposal.

a liveable, comfortable temperature, inducing thermal stress; health impacts resulting from thermal stress such as exacerbated impacts from asthma, COPD, and other respiratory disorders; inability or reluctance to use necessary medical devices that require electricity; and possible death during extreme weather events. The impact of increasing electric rates is especially felt in low-income households, who spend a disproportionately higher share of their income on utilities due to residing in older housing stock that is often less energy efficient and in need of more insulation, maintenance or repairs.

New York State is already facing a bill arrears crisis. As of June 2025, over 1.1 million households are currently in debt to their utility, and more than 421,287 are at risk of shut offs. Shutoffs themselves carry a number of harmful impacts to households, a disruption to medical treatments, the ability to attend school or work, and ultimately employment stability. A lack of home stability also impacts local employers who rely on their workers, leading to loss of business from inadequate staffing. This is not the only economic ripple effect from high electricity bills for residential households. The reduction in disposable income impacts local spending and disproportionately affects small businesses. The DEIS must consider both the direct impacts on households from increased electric bills, as well as the indirect impacts on the wider Central New York economy from greater financial stress on residents in order to fully mitigate harms caused by the Micron facility.

The DEIS describes the distribution system infrastructure necessary for the plant to access electricity from the NY Grid, namely: the expansion of a substation nearby the the Micron Plant site and the installation of eight 345 kV power lines to connect the fabs to the substation, the subject of a Joint Proposal before New York Public Service Commission (PSC).<sup>9</sup> As NIRS, AGREE, and others have commented on the Joint Proposal, its limited scope provides woefully little detail as to how the Micron Plant’s new loads will be addressed and the essential questions they raise:

- What generation sources will supply the 100% renewable energy referred to in the joint proposal?
- Where will those generation sources be located?
- How will that generation be delivered to National Grid’s Caughdenoy Road substation, and will additional transmission capacity and other infrastructure be required to do so?
- What will be the environmental and electricity rate impacts of those generation sources and grid infrastructure?

The DEIS equally fails to provide clarity on how the immense energy needs of the Micron Plant will be addressed, the full scope of environmental and socioeconomic impacts they will have, and how those impacts could be mitigated.

## **New York Energy Requirements**

The DEIS recognizes that New York State laws and regulations establish legally binding statewide targets for emissions reductions, electricity generation sources, and passenger vehicles. However, it misrepresents the specifics of those requirements and fails to evaluate their full implications for the Micron Plant and its environmental and socioeconomic impacts. There are three operative laws and regulations that apply to the Micron Plant's energy requirements:

- the Climate Leadership and Community Protection Act (CLCPA), which establishes statewide targets for electricity supply, greenhouse gas emissions, energy efficiency, passenger vehicles, and other policy measures for achieving statewide emissions reductions;
- the Clean Energy Standard (CES), the PSC program through which the CLCPA's statewide electricity supply targets are being implemented;
- the New York Green CHIPS Act, which establishes binding eligibility requirements for semiconductor manufacturing facilities that seek state financial incentives, including an approved sustainability plan that must include procurement of renewable energy for 100% of facilities' electricity demand and, if needed, hydrogen produced through electrolysis powered by renewable energy.

The CLCPA and CES contain a degree of flexibility regarding the sourcing of electricity generation. They establish a target of 70% renewable energy by 2030 and a target of 100% zero-emissions electricity by 2040. The latter target allows for use of electricity from non-renewable sources that meet the state's standard for zero-emissions generation, such as nuclear energy. However, the Green CHIPS program does not, specifying that projects must procure 100% *renewable* energy and provide detailed descriptions of how that will be achieved. The Green CHIPS Sustainability Plan Template contains the following instructions and guidance:

### **“1. Electricity**

Green CHIPS participants will be required to utilize 100% energy generated from renewable energy systems, as defined in section 66-p of the New York Public Service Law, for electricity in their operations and maintain the 100% level of renewable energy for electricity supply for the duration of the project.

“Renewable energy systems” are defined as systems that generate electricity or thermal energy through use of the following technologies: solar thermal, photovoltaics, on land and offshore wind, hydroelectric, geothermal electric, geothermal ground source heat, tidal energy, wave energy, ocean thermal, and fuel cells which do not utilize a fossil fuel resource in the process of generating electricity.

a) Discuss how your project will meet these requirements? Specific actions may include, but need not be limited to, direct renewable energy project investments, renewable project offtake or power purchase agreements, procurement of renewable energy credits, and onsite renewable energy installations – all with appropriate claims of ownership of environmental attributes.

b) If applicable, discuss any additional measures beyond these requirements that you plan to undertake. ESD encourages applicants to include additional commitments such as, but not limited to, plans to prioritize in-state sources of renewable energy, the installation of on-site renewable energy systems and on-site battery storage systems, support for community solar or similar local clean energy projects, and 24/7 or other time matching-based renewable purchase commitments.<sup>10</sup> (emphasis added)

The DEIS refers to the Green CHIPS program as imposing sustainability requirements, but only in generalities:

“... New York’s Green CHIPS Excelsior Jobs Tax Credit Program provides certain semiconductor manufacturer tax incentives .... To receive benefits from this tax credit program, a project must ... include sustainability measures to mitigate the project’s greenhouse gas emissions over its lifetime. ...”<sup>11</sup>

“The State and local land use and economic development policies relevant to activities in the land use study area include ... the New York State Green CHIPS Program. Appendix D-3 includes detailed summaries of these policies.<sup>12</sup>

“The Proposed Project would be consistent with the Onondaga County Comprehensive Plan, the SMTC 2050 Long Range Transportation Plan 2020 Update, the Town of Clay Northern Land Use Study, the draft Town of Cicero Comprehensive Plan, and the New York Green CHIPS Program, fulfilling several of their goals relating to economic development and industrial use of the WPCP.”<sup>13</sup>

“The Proposed Project would be consistent with the Onondaga County Comprehensive Plan, the SMTC 2050 Long Range Transportation Plan 2020 Update, the Town of Clay Northern Land Use Study, the draft Town of Cicero Comprehensive Plan, and the New

<sup>11</sup> DEIS at pp. 1-1 to 1-2 (pp. 48-49 of 719).

<sup>12</sup> Ibid at p. 3-22 (p. 136 of 719).

<sup>13</sup> Ibid at p. 3-520 (p. 634 of 719).

York Green CHIPS Program, fulfilling several of their goals relating to economic development and industrial use of the WPCP.”<sup>14</sup>

“Projects also must adopt sustainability measures to mitigate greenhouse gas emissions ... To be eligible to receive Green CHIPS Program incentives, Micron must meet the statutory requirements of creating at least 500 new jobs, adopting sustainability measures to reduce GHG emissions (see Section 3.7, Greenhouse Gas Emissions, Climate Change, and Climate Resiliency), paying construction workers the Federal prevailing wage, and committing to worker and community investments. In furtherance of the Green CHIPS Program and New York’s policy of incentivizing semiconductor manufacturing in New York, in September 2022, Micron, ESD, Onondaga County and OCIDA entered into a “Key Terms and Conditions for Development of the Micron Green Manufacturing Memory Chip Fab Campus in Clay, New York” (“Term Sheet”) to incentivize Micron to locate a semiconductor facility at the WPCP.

The Term Sheet outlines Micron’s commitments to creating more than 9,000 new jobs and paying the Federal prevailing wage to construction workers, and further outlines preliminary sustainability commitments designed to reduce GHG emissions. The Term Sheet further illustrates Micron’s commitments to worker and community investments, including a Community Investment Fund (CIF) of \$500 million for CNY communities, which will be used to develop the local workforce, invest in education throughout CNY, promote affordable housing, and provide additional benefits to CNY communities. Micron also committed to installing on-site renewable energy systems and implementing water conservation and efficiency measures.”<sup>15</sup>

The DEIS omits the specifics commitments Micron has made to ESD and OCIDA under the New York Green CHIPS program, which include procurement of 100% renewable energy by 2025 and throughout the duration of the project:

“Section 14 SUSTAINABILITY REQUIREMENTS

33. The Parties agree that leading-edge sustainability commitments designed to mitigate greenhouse gas ("GHG") emissions and other environmental impacts are vital to the success of the Fab Complex and will negotiate a Clean Energy and Sustainability Action Plan ("CESAP"), subject to the requirements of Excelsior Jobs Program Green CHIPS incentives and approval by ESD, that will strive for the highest standards practicable and that, at a minimum, shall require Micron to:

- a. Utilize 100% renewable energy for electricity by 2025 in its New York Fab Complex operations, which may include but not necessarily be limited to the use

<sup>14</sup> Ibid at p. 3-520 (p. 634 of 719).

<sup>15</sup> DEIS, Appendix D at pp. D-16 to D-17 (pp. 195-196 of 205).

of renewable energy credits, and maintain that 100% renewable energy for electricity supply for the duration of the Term. In fulfilling this commitment, Micron shall prioritize in-state sources of renewable energy to the extent they are available, cost-effective, compatible with Micron's corporate renewable energy definition and in alignment with New York State's Clean Energy Standard. ...

f. Where feasible and cost effective (i) utilize green hydrogen (hydrogen formed through electrolysis powered by renewable electricity, without greenhouse gas emissions) to displace/replace natural gas and gray hydrogen consumption; (ii) support /participate in New York's federal Hydrogen Hub proposal; and (iii) pursue other clean measures such as geothermal heat pumps for space heating and cooling loads;

g. Adopt other mitigation measures for GHG process emissions where practicable;

h. Commit to infrastructure for charging/fueling clean vehicles for employee, contractor, and Micron fleet use.”<sup>16</sup> (emphasis added)

In short, under the New York Green CHIPS program, Micron has committed to: procure 100% renewable electricity for the Micron Plant’s operations by 2025 and for the 20-year duration of the agreement; to prioritize renewable energy sources located in New York State; to utilize “green hydrogen” to the extent feasible; to pursue use of other clean technologies for space heating and cooling; and to incorporate clean vehicle charging/fueling infrastructure for employees, contractors, and Micron vehicles.

However, the DEIS’s description of Micron’s commitments to the energy supply for the plant’s operations does not reflect the specificity of the legal and contractual requirements of the project as detailed in the Term Sheet which it cites:

“Although Micron has committed to controlling direct GHG emissions to the maximum extent practicable, the Preferred Action Alternative would result in significant adverse effects on climate change. Micron would commit to purchasing 100% carbon-free electricity utilizing power purchase agreements and renewable energy credits (RECs). NYSDEC will be reviewing Micron’s Climate Leadership and Community Protection Act (CLCPA) analysis for consistency with New York State’s ability to meet its statewide GHG emission limits. NYSDEC may require additional climate-related mitigation measures under the CLCPA.” p. 0-9 (p. 38 of 719)

---

<sup>16</sup> Empire State Development, “Key Terms And Conditions For Development Of The Micron Green Manufacturing Memory Chip Fab Campus In Clay, New York (‘Term Sheet’),” September 22, 2022, <https://esd.ny.gov/sites/default/files/Micron-Term-Sheet-Fully-Executed.pdf>, accessed August 9, 2025.

Furthermore, the DEIS cites Micron’s plan to procure a substantial amount of fossil fuel generation through the New York Power Authority’s (NYPA) ReCharge New York and High Load Factor Power programs:

“Further, the NYPA has awarded Micron a power allocation through the ReCharge NY program to meet the Proposed Project’s short-term electricity requirements. The ReCharge NY program provides qualified companies with seven-year contracts for NYPA power in exchange for certain job and economic commitments in New York State. Micron’s initial ReCharge NY allocation consists of 140,000 kW (or 1,226 GWh), 50 percent of which is NYPA hydropower. In addition to the ReCharge NY allocation, Micron also has been approved for a 404,000 kW (or 3,539 GWh) High Load Factor (HLF) allocation for ten years. The ReCharge NY and HLF allocations would likely come from sources outside of Load Zone C. The HLF allocation is provided to energy-intensive industries and is sourced from the market. Based on the current spare capacity in Load Zone C and these additional allocations, even without new generation, existing grid capacity would be estimated to adequately supply the Proposed Project’s needs through 2030, during construction and interconnection of Fabs 1 and 2.” p. 3-270 (p. 384 of 719)

Neither of these NYPA power programs provides 100% renewable energy:

- ReCharge NY provides 50% hydropower and 50% market power, which is predominantly gas-fired generation.<sup>17</sup>
- The High Load Factor program consists of 100% market power.<sup>18</sup>

Of these NYPA power allocations, only 613 GWh is verifiably comprised of renewable energy, as defined in NYS law and regulations – less than 10% of Micron’s projected Phase 1 annual electricity consumption.

Further, the allocation of 613 GWh of hydropower from NYPA’s existing generation facilities does not mitigate Micron’s addition of 613 GWh of load to the NY Grid. NYPA’s hydropower generation is currently serving existing NY Grid loads. Therefore, regardless of Micron’s contractual relationship with NYPA to pay for an allocation of its existing renewable generation, the addition of Micron’s load to the grid will require additions of generation from other sources to supply the grid statewide. Unless the sources of that generation are new renewable energy sources and/or energy efficiency/conservation measures that verifiably reduce existing loads (e.g., residential and commercial building energy efficiency programs), then incremental

---

<sup>17</sup> New York Power Authority, “ReCharge NY,” 2025, see <https://www.nypa.gov/services/incentives-and-grants/recharge-ny>, accessed August 10, 2025.

<sup>18</sup> NYPA, “2024 Report to the Governor and Legislative Leaders on Power Programs for Economic Development,” April 2025, see <https://www.nypa.gov/-/media/nypa/documents/document-library/governance/2024-report-to-governor-and-legislative-leaders-on-power-programs-for-economic-development.pdf>, accessed August 10, 2025.

generation is likely to be provided by existing fossil fuel generation sources operating at higher capacity factors. Merely purchasing power from existing renewable energy sources, or purchasing renewable energy credits (RECs) from existing or new sources whose power is being procured by other consumers separately from the associated RECs, does not mitigate the emissions impact of new large loads like those of the Micron Plant.

### **DEIS Emissions Impacts of Energy**

The DEIS conservatively estimates the emissions impacts of energy to power the Micron Plant's operations by assuming it will be provided from fossil fuel generation sources:

“While the specific breakdown of Micron's electricity consumption is provided in Chapter 3.10, Utilities and Infrastructure, it is assumed for this analysis that all electricity is fueled by offsite fossil fuel generated power as a worst-case scenario.”

However, the projected emissions from power generation appear to be vastly underestimated. The DEIS projects two values for the Micron Plant's greenhouse gas emissions, based on two methodologies for projecting the climate impacts of those emissions:

- 2,393,850 metric tons per year, based on the 20-year global warming potential (GWP20) of the projected emissions.
- 2,274,089 metric tons per year, based on the 100-year global warming potential (GWP100).

These estimates appear to vastly underestimate the emissions impacts of the Micron Plant's electricity consumption. At 15,673.83 GWh/year, the emissions projections in the DEIS equate to rates of 152.7 metric tons/GWh (GWP20) and 145.1 metric tons/GWh (GWP100). This is far lower than the rates used by the U.S. Energy Information Administration (EIA) to compute the average CO<sub>2</sub> emissions of fossil fuel generation sources. EIA utilizes a rate of 437 metric tons of CO<sub>2</sub> per GWh for fossil gas generation.<sup>19</sup> At that emissions rate, greenhouse gas emissions from electricity generation to supply the Micron Plant's annual power use (15,673.83 GWh) would be at least 6,855,976 metric tons, approximately three times the amount reported in the DEIS. Furthermore, the DEIS does not appear to include other known sources of GHG emissions from power generation, such as fugitive methane emissions from gas and oil extraction, pipeline leakage, and incomplete combustion.

In order to fully mitigate GHG emissions from the Micron Plant's operations, a large amount of new renewable generation capacity would have to be added to the NY Grid. A representative mix of 50% land-based wind generation and 50% utility-scale solar photovoltaic (PV) generation

---

<sup>19</sup> U.S. Energy Information Administration. “Frequently Asked Questions (FAQs): How much carbon dioxide is produced per kilowatt-hour of U.S. electricity generation?,” Last updated: December 11, 2024, see <https://www.eia.gov/tools/faqs/faq.php?id=74&t=11>, accessed August 10, 2025. Per the 2023 data reported: 1,806,063 million kWh of gas generation = 1,806,063 GWh. Emissions of 790 million metric tons (MMT) from that generation yields an average rate of 437.42 metric tons per GWh. At that rate, 15,673.82 GWh of generation would emit 6,855,976 metric tons of CO<sub>2</sub>.

would require at least 7,000 MW of capacity. In addition to the 4 MW of solar PV capacity the DEIS estimates will be installed on-site at the Micron Plant:

- 2,555 MW of land-based wind<sup>20</sup>
- 4,472 MW of utility-scale solar PV<sup>21</sup>

This is substantially more land-based wind and utility-scale solar capacity than is currently installed in New York. NYISO reports there was 2,454 MW of land-based wind generation and 573 MW of utility-scale solar PV on the NY Grid in 2024. Interconnection, transmission, and integration of those generation sources will require substantial infrastructure development, from siting transmission lines and substations to various types of electricity storage systems. Development of such infrastructure would have a range of positive and negative environmental and socioeconomic impacts, from pollution reduction and climate change mitigation to siting and development of land and acquisition of land for transmission right-of-ways (ROWS); from changes to community character and electricity cost allocations to increased employment, property tax revenues, and stronger local economies. However, the DEIS fails to even consider that such impacts may arise from the Micron Plant's operations.

It is possible that the impacts of infrastructure development needed for the Micron Plant could be mitigated by, and benefit from, broader system planning of the kinds referred to in the DEIS. If done deliberately and with due consideration for ratepayer impacts, a proceeding to plan for the expansion of the grid to integrate the Micron facility and loads from electrification of transportation, buildings, and other industrial and commercial uses in the Syracuse metropolitan area and Zone C could identify synergies. For instance, integration of electrical vehicles through bi-directional charging infrastructure could enhance reliability and resilience of electricity supply to Micron and the regional grid. Unfortunately, the DEIS fails to identify the full scope of impacts that the Micron Plant's energy use would entail.

**Attachments:** Micron Clay NY DEIS overview and general comments by\_greeningUSA.pdf

On behalf of GreeningUSA, Inc., the Syracuse, NY based not-for-profit organization, and its board of directors, I am submitting the attached pdf with comments on the Micron Clay, NY DEIS. Should there be any reason why you are unable to include these comments in the public record for this action please advise ASAP so that a remedy can be sent; otherwise I will assume that the attached is acceptable for inclusion in the public record for appropriate response and consideration as the Final EIS is issued. Thank you for the opportunity to submit these comments. If you have any questions, please contact me.

*...Advocating for sustainable communities  
to the benefit of local economies and environments.*

**These comments are submitted on behalf of the board of directors for GreeningUSA Inc., a Syracuse, NY membership not-for-profit organization which has advocated for sustainable communities to benefit local economies and the environment over 21 years.** The sustainability principles for which our organization stands are defined in our “Twelve Traits of a Sustainable Community” which can be found at [www.GreeningUSA.org](http://www.GreeningUSA.org). Through the lens of these traits, the proposed Micron development, as described in the DEIS, is fraught with constructs contrary to the principles which our organization promotes. At a time when our environment is afflicted with a growing climate crisis, the quality and quantity of our water and air are being degraded, and economic and social inequities divide the people of our region, a commitment to sustainable development is critical. In our view, development that is sustainable links economic development to environmental protection, and human wellbeing to the cross-generational responsibility to protect and sustain resources for future generations. A somewhat similar notion of the responsibility that nations have was previously set forth in principles enumerated in the 1972, ‘Declaration of the United Nations Conference on the Human Environment’ which asserted that “man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well-being, and he bears a solemn responsibility to protect and improve the environment for present as well as future generations.” Simply put, sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. Even with a limited time for review of the recently issued DEIS, GreeningUSA has concluded that many aspects of the Micron development project promoted by our Federal, State and County governments are contrary to sound sustainability principles and potentially endanger the health and well-being of the region.

The 719 page DEIS and its 19,000 pages of appendices are not possible for us, or anyone, to review all aspects of the project in the 48 days allowed. Previous requests submitted by others, including GreeningUSA members, for an extension of the public input have not been responded to. While 48 days exceeds the minimum requirement for SEQRA and NEPA, this limited time frame for a complex project is contrary to the spirit of NY’s SEQRA which places high importance on public participation. The DEC’s SEQRA handbook says that ample opportunities for public involvement “allow the public and other agencies to provide input into the planning or review process, resulting in a review with a broader perspective. It also increases the likelihood that the project will be consistent with community values.” ( DEC SEQRA Handbook 4<sup>th</sup> Edition 2020, p.4)

**Two of perhaps the most important traits of a sustainable community are governmental leadership and citizen engagement.** In light of the fact that the proponents of this project, including the County of Onondaga, have spent very little effort to engage citizens in dialog over

this project, cutting the review process short disregards the public's right and responsibility to give informed input on something that will affect our future, and the future of generations to come. Creating obstacles to citizen engagement is contrary to the principles of sustainability.

Major components of the project each deserve public scrutiny of 30 to 45 days. These multi-components, lumped together with this project's overlapping multiple phases, make this DEIS difficult for anyone, including the most intelligent and experienced planning and development expert, to review, understand and respond within 48 days. Please extend the public comment period to at least 120 days, until October 23 to give the public and GreeningUSA a better opportunity to comment and a chance to review additional sections we have been unable to get to.

Based on the environmental impacts found in the DEIS, it is our opinion that this project does not adhere to many principles of sustainability and therefore must not go forward without major changes. We have come to this conclusion after consideration of the following.

**The project will destroy a critical ecological resource by filling and destroying the White Pine wetlands** that serve many useful purposes, which are not thoroughly assessed in the DEIS. An insufficient mitigation plan is proposed. The existing well developed wetland cannot be adequately replaced with the mitigation plan as proposed. Experts we have consulted advise that perhaps even a 7 to 1 replacement strategy may be necessary but that may also be insufficient. We are in the era of climate chaos, with heat disrupting people's lives in profound ways. This site is a sink to not only keep carbon out of the atmosphere, but serves as an air conditioner to cool the surrounding environment and a bathtub to keep flooding in check.

Adding a huge concrete factory and surrounding pavements only adds to the heat island effect exacerbating the adverse impact of having destroyed the wetland and forested site in the first place. Replacement wetlands proposed will not replace the valuable functions of the WPCP wetlands, including heat island mitigating effects, without additional study of heat island effects and inclusion of additional mitigating measures. After assessment of heat island effects using state of the art measurement techniques, heat island mitigation practices must be established, and a program for long term monitoring and adjustment procedures must be established.

**This proposed factory will pollute the air with carbon and other GHG including hazardous chemicals.** Water will also be at risk of being polluted with hazardous, forever chemicals which are unregulated. A GHG mitigation strategy that may need to reach

beyond Micron's campus footprint must be established so that this campus and its induced growth will not make the statewide goals of the NY CLCPA unachievable.

Lacking from the DEIS is an analysis of the social cost of the factory's GHG footprint. Including such an analysis, using methodology such as social cost estimations generated by EPA's peered review interagency modeling (see [EPA Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances](#)), would put into context incremental external costs to the nation which this singular project will contribute. Such an analysis would provide a reference value to consider in a reevaluation of the costs and benefits of the Clay, NY Micron chip fabs, and would be useful for reconsidering the conclusion that 4 four fabs are necessary to provide necessary ROI and the rationale for the preferred alternative proposed.

**The EIS should fully disclose in a comprehensive, easily understood manner all municipal costs to be incurred for expanded municipal services**, external environmental costs which can be anticipated and estimated, and revenue expected to be generated in the form of taxes, fees or other payments. Relatedly we do not see a comprehensive cost benefit analysis for the preferred alternative in the DEIS beyond the results presented in Appendix C prepared by REMI. This analysis fails to account for the environmental costs, including such things as the social cost of GHG emissions. The DEIS also fails to disclose in a comprehensive and easily understood manner the costs which will be incurred by local and state governments in support of this development, including costs of the connected water and wastewater systems or other municipal services, such as police and fire, which are necessary to serve the development, and the induced growth; nor are the revenues to be achieved over time by the taxing and service jurisdictions in the region listed in a manner the public can readily understand.

**Construction activity will impose adverse impacts on the surrounding area for years to come** with noise and traffic, which could make the area an intolerable location in which to live. A local citizens' advisory board must be established to allow local residents to be kept advised of construction activity impacts and allow for input to minimize disruptions impacting local residents. Micron should also develop ways to minimize these impacts including the possibility of reducing the number of fabs to shorten the construction period and lessen related impacts. Micron's refusal to consider a smaller project without transparent justification and analysis of the mitigating effects of a reduced footprint, or shorter construction period is a non-starter. Sustainability requires balance, and this project, with 4 fabs, may be unbalanced for the site selected and the impacts it presents.

If the project's economic development objectives can be achieved with a smaller environmental footprint this project may be more sustainable.

**Once operational the 12,000 car parking lot will impact residents in the surrounding area by attracting increased automobile traffic to the area.** Reducing the footprint for parking and creation of a transportation management plan (TMP) with reliance of mass transit, incentives for workers to utilize transit, and even financial support to create an effective multi-modal transportation system to serve its campus and the regional needs of its workers, would serve to make this project more sustainable than its current configuration and reliance of personal vehicles. A TMP with fewer parking spaces available can have multiple benefits including reduction of paved surfaces and stormwater quantity, improvements to water quality, lower GHG emissions, and less wetland destruction.

**One objective of the development is to solve the region's long standing poverty,** yet there is no assurance that local workers and local residents will reap the benefits purported to be an objective of the project. The DEIS must include clear estimates, if not commitments, of the types of jobs and wages that will be available to local residents. Micron needs to make commitments to a labor peace agreement to allow workers freedom to choose to unionize or not, and a community benefits agreement with firm commitments for local workers, worker health and safety, and programs to assist local and regional residents with rising housing costs that will be induced by the project.

**The projection that workers will immigrate to the region, increasing the population by over 64,000 and 27,000 new households,** flies in the face of the promise of good paying jobs to lift the local residents out of poverty. Micron must strike the correct balance of local and non-local hiring in order to achieve a sustainable project that will actually raise the wealth level of the local residents and reduce the impact of rising housing costs.

**There is no assessment of, nor assurance that rising housing costs will not adversely impact** the city of Syracuse (or other) renters who currently are cost burdened or on fixed incomes; or impact those wishing to build or buy a home only to find home prices and construction costs make that impossible. Gentrification, with attendant displacement and increased homelessness, is a potentially adverse impact which is not sufficiently addressed in the DEIS, and it should be. A public participation effort that places high regard for transparency and public engagement should be established to help manage the risks of gentrification and maximize the utilization of local workers.

The impact of developing an estimated 27,000 new household units is ill assessed in this DEIS. To rely on the hope that future planning and development policies will match the vision of the Onondaga County comprehensive plan for smart growth isn't sufficient. Real planning and commitments are necessary, and I see little of that detailed in this DEIS.

**The carbon footprint of the induced residential and commercial development isn't estimated** in the DEIS; nor any mitigation specified or required. They should be. Relying on existing or unknown future policies isn't acceptable, nor is rushing to get this project going without clear understanding, policies, and plans about how the environmental and economic impacts of the induced growth will serve the community's needs in a sustainable manner.

**A rebalancing of the size of the project and the magnitude of the impacts with a "build, operate and assess" adaptive management** approach may be a way to move forward with caution. Micron claims that the only alternative is to build 4 fabs; that fewer than 4 is uneconomical, robbing them of the needed ROI to make the Clay, NY project viable. This assertion isn't sufficiently supported by evidence particularly when fab projects elsewhere have fewer fabs at one location.

If four fabs are required for WPCP, the approval process should be contingent on an adaptive management incremental phasing sequence to ensure that commitments made are kept, and environmental impacts/costs are manageable in a sustainable manner, before continuing to build out additional fabs.

**The infrastructure expansion of the induced residential and commercial growth isn't estimated** in the DEIS. How many miles of new roads, water lines and sewers will be needed to serve 27,000 new households? How much land is needed to be developed? None of these are presented in the DEIS. We believe they should be, at least at some planning or schematic level of estimation.

**Micron must fund mitigating measures deemed necessary to protect the region from the adverse impacts.** It is unclear that PILOT payments, wages paid, or rising real estate values will offset adverse impacts. Offsets against added municipal services, incentives to assure sufficient affordable housing is available, and payments to offset environmental degradation should all be Micron's and its shareholders' responsibility, not current residents. The DEIS must do a better job of displaying and conveying the facts about the costs and benefits which municipalities and their residents will

experience in a clear concise manner. Using tables to summarize the effects, costs and revenues should help to convey this sort of information in an easily understandable fashion.

**With its many phases and components this project makes the DEIS complex and difficult to comprehend.** NY's SEQRA requires the public to be informed about environmental, economic and social impacts. This DEIS has limitations which need to be corrected in a way the general public can understand. Asking the public to digest 20,000 pages in 48 days isn't a sustainable practice either.

**The Micron project as currently envisioned and described in this DEIS is not an example of sustainable development.** Let's not delude ourselves. While Micron touts itself as a company that values sustainable practices, the Clay, New York project falls short of what is necessary to be a truly sustainable development. Unless the White Pine Commerce Park development is dramatically reimagined, the project on balance cannot be supported by GreeningUSA for reasons mentioned here. We urge that permits not be issued for this project until unsustainable components and practices are sufficiently mitigated.

GreeningUSA.org

## **Appendix D Land use, Zoning and Public Policy**

### **Appendix D3.1 2050 Long Range Transportation Plan 2020 Update**

Section D 3.1 reviews the 2050 long range transportation plan 2020 update of the Syracuse Metropolitan Transportation Council as amended in 2022. My question is: did the 2022 amendment utilize the latest Micron population and household projections that were developed by Remi and Micron's consultant? It is unclear whether such projections were included when SMTC amended its plan to reflect progress on the interstate 81 viaduct project. (See page 190 of the PDF or page D 11.) If the population and household growth projections in the DEIS and the SMTC plan are inconsistent then a revision of the EIS or acknowledgement of such inconsistency should be included in the final EIS.

### **Appendix D3.2 Onondaga County Comprehensive Plan**

Appendix D3.2 discusses Onondaga County's comprehensive plan policy implications. Said plan was adopted in 2023. And the plan calls for a focus on transit oriented development near identified centers and transit corridors; and enhancement of the bus rapid transit system to support the land use vision of the county. However section 3.2.1 states that the proposed Micron project would not directly advance some of the comprehensive plan's goals relating to the development of this key employment center, and that the proposed project would not include improvements to public transit, such as expansion of the bus rapid transit services. The DEIS asserts those actions are intended to be undertaken by the county. Which means there is no commitment that the County land use plan vision will come to fruition. It is my contention that the DEIS and the final environmental impact statement must include more than intentions but include commitments that transit services will support, organize and service the growth which the Micron project will induce, and the trip generation for workers travelling to and from the fabs. Assuming that transit and smart growth will be utilized without commitments, the environmental impact of the proposed project may be understated. The impacts of this project must be described: will there be transit service available to the visitors and employees of the Micron campus? Will parking at the plant be minimized, incentives issued, and service levels enhanced to spur the use of transit and deter personal vehicle travel to and from the factory? And, will the induced growth, both residential and commercial, be accommodated in a transit oriented manner or not?

Section 3.3 further states that the NLUS asserts that New York State Route 31 is currently operating at full capacity and recommends that any proposed future development that would increase the intensity of uses in northern Clay provide "adequate traffic impact." Something seems to be missing in this statement. Perhaps adequate mitigation of traffic impacts should be

written here instead? Of course mitigation measures should be inclusive of the need to incentive alternate means of travel such as transit and bicycle. Separation of bicycles from automobiles and trucks needs to be accomplished by more than just paint: a separate bicycle path must include to enhance safety of cyclists. Safe pedestrian travel must also be designed into improvements of Route 31 and related roadways.

### **Appendix D 3.3 Town of Clay Northern Land Use Study (see D-13 and D-14)**

Section D 3.3.1 establishes the fact that the construction of the Micron campus would not support the NLUS goal to preserve the rural character of the area; that it would be consistent with the studies' (NLUS) goal to concentrate large scale development around the white pine park, while the town undertakes efforts to relieve development pressure on other rural areas further away from the I 81/4 and public infrastructure. This is a bit confusing and should be clarified. The final EIS should also include specific references to the NLUS report (page numbers, etc.) and even provide copies of relevant exhibits pages from that report to establish the veracity of the conclusion provided in this analysis section on page D 14.

The town of Clay's NLUS includes recommendations to maintain the rural character of the area by focusing growth to suitable locations. These recommendations, according to section D 3.3 of appendix D, include permitting higher density large lot residential uses with a minimum lot size of 100,000 ft.<sup>2</sup> and encouraging cluster development with minimum lot sizes of 40,000 ft.<sup>2</sup> where suitable. This is also confusing, and these lot sizes seem contradictory to the need for housing to serve the expanded population and workers which the Micron project in a transit oriented manner. In the final EIS this should be clarified whether or not Clay's NLUS is consistent with the smart growth principles or not; exhibits should be included to demonstrate where and how induced household and commercial growth is intended to occur in the town of Clay. (This can be found on page D 14.)

The induced growth estimates included in Table C-4 (page C-10) indicate Clay may experience a 10% to 15% growth in households by 2024. Is this growth consistent with the NLUS and can it happen in a manner that is consistent with the Onondaga County Comprehensive Plan described in D-3.2 with lot sizes as mentioned on page D-14?

### **Section D3.5 NY Green CHIPS Program**

Appendix D, Section D 3.5 describes briefly the green chips program, and the incentives provided Micron by the State of New York for locating a chip project in Clay, NY. Analysis section D 3.5.1 states that the term sheet outlines Micron's **commitments** yet the term sheet commitments are largely not requirements, but only good faith efforts to meet the listed so called 'requirements'. It is my conjecture that the section in the Final EIS must list clearly

describe those requirements and establish definite assurances with specificity what and which of the term sheet requirements will be met and how each will be met. Without commitments which are measurable, and specifically required to be met, those **commitments** are worthless. The final EIS must clearly establish which of those requirements will be met, and to what degree.

GreeningUSA.org

## **Growth Inducing Effects**

### **3.1 LAND USE, ZONING, AND PUBLIC POLICY**

The **growth inducing effects** of the preferred alternative are described beginning on page 145 of the PDF, which is page 3–31 of the section. After the effects are summarized **section 3.1.4** titled **BMP's and mitigation measures** states that no mitigation measures are required because all the changes would continue to be subject to local discretionary approvals and planning policies, including applicable measures to avoid or minimize adverse development effects. Essentially kicking the can down the road for growth induced development without any strategy for minimizing or eliminating adverse environmental impacts of the growth which is estimated to be a minimum of 60,000 population increase and upwards of 27,000 new households regionwide. This DEIS insufficiently substantiates, on a town by town basis, the current state of development policies, plans, zoning and other relevant information that support or inhibit towns' ability to accommodate the projected population growth. Revise the EIS to include such documentation.

### **3.7 GREENHOUSE GAS EMISSIONS, CLIMATE CHANGE, AND CLIMATE RESILIENCY**

Similarly, under the **greenhouse gas emissions and climate change section 3.7.5** it is acknowledged that the project may stress the resiliency of the region to climate impacts; but that any future development would be conducted under applicable, applicable, state and local policies and programs, including smart growth public infrastructure policy act, CCLCPA, CRRRA, which leads to the DEIS conclusion that induced growth associated with the proposed project would not significantly negatively affect the current climate resiliency of the region. That is preposterous.

The EIS must estimate the climate impactful effects of growth as well as the related impactful effects of induced vehicle miles of travel. Failing to consider the GHG emissions associated with household growth and travel induced underestimates the climate and resiliency effects of the preferred alternative. Revise the EIS to include estimates of these effects. Furthermore, there is an opportunity to mitigate some of the adverse greenhouse gas/climate resiliency effects of the factories by assuring that harmful GHG and resiliency effects of induced households, commercial establishments and related vehicular travel are minimized utilizing creative solutions which may need to exceed requirements of existing policies in order to mitigate the effects of operating the chip fabs. Enhanced code requirements, transit oriented developments and travel services, and even cool roof technology could all be employed and financially supported by the applicant as mitigation of climate related stressors resulting from chip fabrication.

GreeningUSA.org

### **3.7.4 Climate Change and Resiliency**

The following from, 3-209:

“Increases in surface temperatures in the areas where the Proposed Project and Connected Actions would be located may further exacerbate already existing adverse effects of extreme heat. Impervious surfaces such as concrete and pavement can reach temperatures 40°F or more above grass temperatures under the same conditions (Knox, 2022). Increased pavement temperatures during or immediately after precipitation events can heat stormwater runoff that drains into sewers, further raising water temperatures when released into bodies of water, negatively affecting aquatic ecosystem productivity.”

The following from p 3-210:

“Increases in heat index (which pairs temperature with relative humidity), are expected to affect temperatures at the Proposed Project and Connected Action locations. High heat and moisture can cause structural weakening, corrosion of metal parts, shortening of roof lifespans, and wood damage through swelling and rotting. Air temperature and changes in humidity can impact building materials such as drywall, brick, and electrical systems. The Proposed Project will be engineered to withstand these temperature increases, and there is no reason to believe that the public utilities responsible for constructing and operating the Connected Actions would fail to engineer the structures to withstand anticipated changes in climate, including heat index. Micron’s Business Continuity process ensures that infrastructure is constructed with resiliency for natural disasters, climate change, and other factors in mind. In addition, the buildings will primarily be steel and concrete structures, not wood and drywall.”

The foregoing paragraphs assert that the preferred project will increase surface temperatures and heat index; yet in the following regarding surrounding area climate resiliency from p 3-212:

“The Proposed Project is not anticipated to significantly affect the climate resiliency of the surrounding area. The Proposed Project would not directly contribute to the demand for groundwater (see Chapter 3.10, Utilities and Supporting Infrastructure), increase the likelihood or severity of local flooding (see SMP discussion above, Chapter 3.3, Water Resources), and Chapter 3.11, Transportation), or affect the ability of the surrounding area to respond to future increases in temperature, storm activity, or precipitation. The Proposed Project would rely primarily on water withdrawn, and ultimately returned to Lake Ontario, which is one of the largest freshwater bodies in North America (see Chapter 3.10, Utilities and Infrastructure). While there are projections for increased

variability in lake levels under future climate scenarios, including potential for extreme highs and lows, the expectation is that water levels in the lake are anticipated to increase slightly in a future affected by climate change, which further indicates that the Proposed Project is unlikely to have any significant adverse impact on freshwater supply.”

It is difficult to see how this conclusion about heat island effects in the surrounding area can be reached after the foregoing paragraphs acknowledge the project’s effect will be to exacerbate heat island effects as wetlands are destroyed and buildings and pavements are added. There is no evidence of any measuring of existing surrounding area heat gradients nor projections of future surrounding area heat gradients. Heat island effects can have severe health and cost implications for the surrounding area which this DEIS fails to recognize and fails to suggest mitigating measures which are many such as choice of building materials (including cool roofing materials), and utilizing roof top solar to shade roofs—though these may not mitigate surrounding areas which may require direct intervention at the individual domicile level with retrofits, insulation, cool roofing materials and even payments to compensate area residents for increased electricity costs needed to cool their homes. It would seem Micron and this project’s proponents need to be held responsible and compensate the surrounding residents for these effects. Not only will Micron’s project indirectly adversely effect the climate by its generation of GHG emissions, but Micron will potentially and directly adversely impact residents of the surrounding area with direct heat island effects.

Relatedly, a **comment regarding the GHG projections of section 3.7** is necessary here. From pp3-205 & 206,

“For context, on a GWP100 basis, Proposed Project total GHG emissions would be approximately 2.42 percent of New York State’s 2022 statewide GHG emissions and 29.5 percent of New York State’s 2022 industrial sector emissions, which represent a significant increase in GHG emissions State- and industry-wide. Scope 1 and Scope 2 GHG emissions are roughly equivalent to the average annual GHG emissions of approximately 487,322 and 530,443 passenger cars per year, respectively (USEPA, 2024j).<sup>69</sup>

Based on the significant increase in GHG emissions, the Proposed Project would represent a significant adverse effect on GHG emissions.”

While it is laudable that this DEIS acknowledges the significant adverse emissions of GHG and even that a comparison to passenger cars per year is offered for visualization of the magnitude of the preferred project’s effects. However, these comparisons do not communicate adequately

to the average consumer of this document the damage which this level of GHG emissions will cause to our environment. I think this EIS document must do more to make it clear exactly to what extent Micron's projected emissions in Clay, NY will contribute to the toll of climate effects resulting from GHG emissions. While it may not be a perfect tool for a project such as this, EPA's methodology on the social cost of GHG may be useful to put in context the tradeoff with respect to climate damages being made in the selecting of the preferred option. For more about this method, see, [EPA Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances](#). By my calculation, and using this methodology with the social cost of the harmful effects of climate change attributed to GHG emissions at \$200 per metric ton of CO<sub>2e</sub>, Micron's annual contribution to the climate related damage affecting the nation from climate induced impacts of the GHG from the proposed Clay, NY fabs alone could amount to \$0.98 billion each year of its operation. How such a calculation could be useful in assessing the environmental, economic, and social impacts of the preferred alternative is perhaps debatable. However potentially the tradeoff might be whether the benefits of the preferred option are such that they offset the cost. Are they? Could Micron be expected to offset/mitigate this social cost by reducing GHG emissions elsewhere in the region? If not Micron, who be the bearers of this cost? Such an arrangement would move this preferred alternative from unsustainable to possibly a sustainable category.

According to a recent article published in The Atlantic Monthly,

“Last month, the world’s highest court issued a long-awaited opinion on how international law should regard climate harm. The International Court of Justice concluded, unanimously, that states have binding legal obligations to act to protect the climate system, and failure to do so—by continuing to produce, consume, and subsidize fossil fuels—may “constitute an internationally wrongful act.” In other words, curbing greenhouse-gas emissions is not merely voluntary in the eyes of the court; failure to do so is illegal.” (See: [America Is Living in a Climate-Denial Fantasy - The Atlantic](#); accessed 8/11/2025.)

Micron's failure, with assistance by US DoC, NYS and Onondaga County, to protect the climate system is potentially an internationally wrongful action which could result in the eventual award of damage compensation from legal actions initiated around the world. This EIS must acknowledge the responsibility to avoid actions which may cause climate damage in the interest of protecting U.S. and NYS residents not only from the effects of climate change, but from legally justified damage assessments awarded. Micron, NYS, Onondaga County and Department of Commerce should do the right thing and mitigate this potential before the project is permitted.

### **3.14 COMMUNITY FACILITIES, OPEN SPACE, AND RECREATION**

Section 3.14 describes impacts on community authorities, including such things as police fire medical services and schools.

#### **Growth Inducing Effects**

##### **Police, Fire, and EMS**

For the most part, the conclusions here are that impacts (on community services) can easily be adjusted over the 16 year period of construction and growth of the facility and the regional population. However, those conjectures aren't supported by any clear disclosure relevant projections, municipal official confirmations or other factual information. The basis for this assertion should be disclosed in the DEIS: Which jurisdictions will see rising services demands, to what extent and cost, and where will funding come from to meet those needs. No such details are found to support the claim made that rising municipal revenue will offset service needs. A table describing these impacts would be helpful in order to justify statements that there will be minimal impacts on communities as growth occur. Clearly showing the potential for increases in said services (e.g., expected needs) and expected tax revenues in a table form would be helpful for the public to clearly understand what is being said about municipal services.

It is welcome that Micron proposes to support the training of fire officials and suggests that a feasibility study of methods to meet other apparent service needs that could be done with Micron assistance. This must be a requirement of Micron as a mitigation measure as there is no commitment on the part of Micron to undertake actions to assist with such services.

Page 3–460, page 574 of the PDF, states that in general because police services are funded by taxes, the increased tax base associated with induced population growth **'would likely help'** to fund the needs of police services to expand overtime to keep pace with the growth. Indeed, but where are the facts to back this up? And if the rising municipal revenues would likely **'only help'**, where will the other revenue come from to support these needs? It is very likely that the in migration of workers beginning with the construction phase will cause a rise in incidents and other criminal activity requiring police response that will tax the police and security services available and local policing agencies must prepare for the inflow of not only Micron workers, but other elements who will look for ways to capitalize, legitimately as well as criminally, from the money which will come into their communities.

Relatedly there is no detailed analytical disclosure of the cost to professionalize fire services or of needed upgrades to fire services in the town of Clay and or in Cicero. And what is the impact on the one hazmat unit existing for the region which resides with the city of Syracuse? Will it be necessary to expand hazmat services over and above the existing service provided by the city of Syracuse? And who will fund such improvements?

## Comments of John Przepiora on Micron DEIS: Growth Induced Effects on Community Services

Presumably municipal officials and managers were consulted before the conclusions or conjectures reported here were made. Is that true? And if so, letters or other correspondence substantiating said claims should be included in an appendix.

*...Advocating for sustainable communities  
to the benefit of local economies and environments.*

The household growth anticipated from Micron's worker populations at a community level is estimated to be of a scale the DEIS says may be 'readily noticeable' in terms of increased population densities, as well as increased commercial and residential activity.

The estimated population growth is 64,000 and 27,000 new households need to be developed in the 5 county study area; 85% of this is estimated to be in Onondaga County and 32% of that in the city of Syracuse. "Large enough to alter local and regional housing markets." Says the DEIS of the in-migration and growth induced.

Section 3.15.3.2 has this which is puzzling: "The in-migration of workers and families for construction of the Proposed Project in the local and regional study areas would not create direct or indirect effects to real property and housing within the local and regional study areas." (p3-482)

Though further down in Growth inducing effects it is said, "The Proposed Project's induced population would be large enough to alter local and regional housing markets. . . the Project's induced growth would generate housing demand at a scale not experienced since the 1970s." (p3-493)

Also, "The in-migrating labor force would increase the demand for housing and exceed available vacant supplies in the local study area.<sup>140</sup> Because Micron construction would begin as soon as practicable after all applicable regulatory approvals are secured, the local study area would likely not be able to provide new housing stock necessary to accommodate a substantial number of Phase 1 construction workers and their families." (p3-493)

Also, is this, ". . . there would be rent pressures attributable to the Proposed Project's induced growth in markets beyond the local study area . . ." (p3-494) and,

"The Preferred Action Alternative's induced housing demand may lead to rent increases and the potential to indirectly displace residents who cannot afford rent increases." (p3-502)

The way all of this is presented in the DEIS is very confusing, and should be clarified: there will be adverse effects on such things as housing costs, and housing affordability and that should be made clear. The magnitude of these impacts however is not estimated so I wonder: How it is possible to say, as the DEIS claims, that these effects will be short-term, perhaps four years as the market is expected to adjust in that time frame?

There is little or no detail in the DEIS to describe or estimate magnitudes of the short or long term impacts will be of such as: costs, rents, greenhouse gas emissions, potential for displacement or even homelessness.

For displacements, the DEIS estimates it is only in the local study area that the potential exists for displacement of residents resulting from rising housing costs; not suggesting that displacements in the Syracuse area are a potential impact resulting from rising housing costs. I question that conclusion: what studies is this conclusion based on?

The DEIS praises raising housing costs as a mechanism to get improvements to housing stock that has been allowed to deteriorate due to low housing values. While this may be true and perhaps positive, it still begs the question: will residents in places like Syracuse (as well as other neighborhoods) be able to continue to live where they have for years or will they be displaced as neighborhoods are 'gentrified' and rents rise to meet the rising demands for housing?

According to the recent Syracuse housing study, "***Syracuse*** [where 40% of households are renters] ***is disproportionately home to households with low incomes that struggle to cover housing costs. Onondaga County is highly segregated by income, with lower-income households concentrated in the city and higher-income households outside the city. Syracuse has 30% of the county's households but only 20% of all the county households with incomes of \$50,000 or more. Meanwhile, Syracuse has about 47% of county households with incomes of less***

*than \$50,000, and the poverty rate inside Syracuse is four times the poverty rate in the rest of the county.”*  
(Syracuse Housing Strategy, September 2024 Prepared for the City of Syracuse by czbLLC. P. 19)

Further, the Syracuse housing strategy says, **“7,605 households in Syracuse received some form of assistance in 2021 to alleviate cost burdens. Existing levels of housing cost assistance would have to triple to meet the needs of the 15,258 cost-burdened renters while continuing to assist these 7,605 households.”** (Syracuse Housing Strategy, September 2024 Prepared for the City of Syracuse by czb LLC. P. 17) And that isn’t even accounting for the rising housing cost Micron’s project will induce.

The DEIS presents no details on projected price increases or how much prices will change over time as Micron’s population growth increases. Were projections made to estimate how much prices will rise? And if not, how can you make statements about this impact only being ‘short term’ without such projections? Will there be an increasing number of homeless residents as a result of rising housing costs? And if so, what mitigation measures will be established to avoid this adverse impact? What will the impact be for those, such as seniors, on fixed incomes?

If such an assessment is available, the details should be included in the EIS. If such assessments are not available, I believe these impacts must be estimated utilizing appropriate and best available methods and professional judgement, and disclosed as part of the EIS.

\*\*\*\*

Relatedly, section 4, Cumulative Impacts, includes **Table 4.2-1 Present and Reasonably Foreseeable Actions** which lists amongst other things housing developments currently planned and in some stage of development. From my tally there are 5,852 housing units included, far short of the 27,546 estimated to be required by Micron’s in migration. Further, none of the listed units have been designated as ‘affordable’.

The **Growth Inducing Effects** section poorly explains how the growth induced impacts of the community will be met; it praises, in the abstract, the benefits that are estimated or intended resulting from fab development and from rising home values, but minimizes the adverse impacts which will likely arise without adequate preparation, infusion of funding and citizen oversight and engagement, which has been grossly lacking with this project to date.

The DEIS implies (i.e., many municipalities and counties have only outdated comprehensive plans) that the region is ill prepared for meeting the challenges which Micron’s induced in migration will create and that only by adopting future policies can growth be managed in a smart way. On page 3-33 (Section 3.1 Land use, Zoning and Public Policy) the following is stated:

*Although other counties and municipalities in the five-county study area have enacted comprehensive plans, there are few recent plans. The City of Syracuse Comprehensive Plan was enacted in 2012, the Oswego County Comprehensive Plan was enacted in 2008, and the Cortland County Consolidated Plan was enacted in 2002. Over time, other counties and municipalities could enact updated policies similar to the Onondaga County, Clay, and Cicero plans described above to include measures to mitigate adverse growth inducing effects from the Proposed Project, while harnessing smart growth principles, such as the goals outlined in the Onondaga County Comprehensive Plan, to realize positive benefits from induced growth in the region. In particular, future planning policies could direct development to appropriate locations with the fewest adverse effects to farmland.*

Has there been an analysis of existing comprehensive plans and zoning to assess the feasibility of developing the additional housing units needed to reach the projected 27,000 estimated to be needed? The DEIS on page 3-33

asserts that the Onondaga County Comprehensive plan will guide this (for Onondaga County at least) though this isn't enforceable on the county's towns. It would be useful to have a table summarizing where development will or can occur to substantiate the ability for the region to accommodate in-migration.

A table listing towns, status of plans, and estimated number of units reasonably expected to be accommodated (given existing plans and zoning, etc.), and changes in plans, policies or zoning needed to meet expectations would be useful so we can clearly see the basis for the statement that the housing market will adjust to meet the demand.

I would like to know, and permitting agencies should know, whether the Micron in-migration can be accommodated before permits are issued for this project. Have Towns expressed support for or against these residential growth projections? And if so, please include this evidence to document each town's concurrence or disfavor. Further, how many new miles of roads, and other infrastructure, will be needed to accommodate such growth?

Page 3-33 also contains this:

*Under the Comprehensive Plan, municipalities in Onondaga County would be expected to conform future discretionary land use and zoning actions to facilitate new housing and business development in appropriate locations with the fewest adverse effects (e.g., adverse effects on infrastructure capacity or farmland).*

What does 'expected to conform' mean here? As far as I know, towns are free to adopt town plans and can't be required to adopt policies imposed by Onondaga County. Is the Onondaga County Plan a mandatory proscription imposed on Town governments? Please clarify this in the EIS.

Page 3-503 in the **mitigation measures** (section 3.15.4 page 3-503) contains the claim that Micron does not control the housing market and cannot specifically mitigate such impacts, only that Micron will "continue to **work with** agencies and stakeholders to identify specific actionable measures to avoid or minimize the potential for short term significant adverse effects" on the local housing market. I think the public needs more than '**work with**'. The public needs assurances that housing disruptions will be mitigated. We need more than '**work with**'. What does that mean anyway? The DEIS has a local study area and a regional study area. How is the 'local housing market' defined for purposes of the DEIS? Is this pledge to '**work with**' applicable to the entire regional study area? What about affected areas outside of the regional study area? Again, what is work with? We need specific and measurable objectives to which Micron must be held accountable.

**Additional Comments:**

**Section 3.15 Environmental Analysis: Socioeconomic Conditions and Section 3.7.5, Economic Development, Labor, and Employment and Mitigation Measures**

**1. The intersection of household growth and GHG emissions** is something that deserves additional scrutiny and additional analysis in the EIS. Although admitting that “induced growth from the Proposed Project may stress the resiliency of the region to climate impacts”, it either dismisses the GHG impacts of induced growth as minor compared to the fabs themselves so no need to further assessment, since “any future development would be conducted under applicable State and local policies and programs, including the Smart Growth Public Infrastructure Policy Act, CLCPA, and CRRA”, there is no need for further assessment or mitigation at this time. I don’t agree.

Regardless of the relative magnitude of GHG emissions from each sector, the GHG emissions from induced residential and commercial growth (or even supply chain industries) should be accounted for and reported in the EIS. Minimizing the carbon footprint of the induced household growth should be required as an offset against the carbon footprint of Micron’s Clay, NY fabs which Micron should be required to fund.

Financial mitigation measures should be imposed on Micron to offset fab GHG emissions at the fabs which they claim are not possible to eliminate by the funding the elimination of the GHG emissions associated with residential and commercial growth induced. This could be direct funding of the added cost of renewable energy projects, offsetting the cost of higher standard energy codes for new development, incentivizing transit oriented and walkable communities, incentivizing commuting via transit, incentivizing construction of affordable and green housing, etc.

The cost to eliminate the GHG/climate related costs should be allocated to Micron and not placed on the shoulders of our residents.

**2. Economic Development, Labor, and Employment**

In the subsection, **3.15 section on economic development, labor, and employment**, which begins on 3–488, the impacts of operational activities on economic development, labor, and employment are said to be not a significant adverse effect. However, it seems preposterous that Micron’s employment would not have adverse impact on the cost of labor for other businesses and manufacturers in the central New York area. The DEIS implies these employers will not see an adverse impact on their abilities to retain or pay workers. The EIS must substantiate this claim with data. Have other regional electronics manufacturers or other employers been consulted to assess projected impacts once Micron begins hiring production workers?

On page 3-485 describing labor shortages during construction—expected to last 16 years—the statement is made that shortages of labor are expected to be limited and short-term, but I find no documentation about how this broad conclusion was reached. Where are the facts? Please include a detailed analysis of the facts that lead to this statement. On page 3-486 a statement is made about ‘working with local partners to identify the potential to source approximately 76 percent of the labor necessary for the construction of Fab 1 from workers living within a 90-mile radius of the Micron Campus. . .etc.’: Is this claim substantiated in the DEIS? Where and if not, please include a listing of those local partners and details of what this ‘working with’ has discovered to substantiate this claim.

Labor shortages relating to both construction and operational phases are important topics and important impacts which are not completely recognized in the DEIS. While it may be true that training programs will increase the labor supply and mitigate upward pressure on labor costs, the DEIS seems not clear about this, and details supporting

claims are lacking. The DEIS should be amended to clearly describe projections and actions related to labor acquisitions, training, in-migration and impacts on existing employers; provide details, not just abstract conjecture. The way it is presented here makes it difficult to understand or to see the validity of the claims.

Micron will likely affect the overall job market, in both short and long term, and other businesses in the central New York area will be affected. The EIS should provide a clear, fair, unbiased, and detailed assessment of this impact.

### **3. Mitigation**

Section **3.15.4 Mitigation Measures is totally inadequate**. The growth inducing effects of in-migration is estimated to include 64,000 region wide population increase and 27,000 households needing to be constructed. The effects and costs such as the need for new roads and other infrastructure have not been estimated or described in the DEIS. The rising housing cost is generically suggested but details are lacking. There is no estimation of the adverse impacts of rising housing costs on current residents and no consideration of the potential for homelessness to increase, or any suggestion for how housing can be developed in a sustainable manner except to say that future policies can be adopted to control how and where smart growth can occur.

**Mitigating measures relating to growth inducing impacts** such as the following must be imposed:

Creation of a citizens conservation management and environmental mitigation and sustainability council to oversee all actions relating to the environmental impacts of the fabs as well as the induced growth and mitigation of its effects.

Creation of an independent professional planning team (perhaps within the Regional Planning and Development Board) dedicated to growth issues in the 5 county study area made up of professional, certified planners to oversee, review, and manage growth related mitigation measures.

Adequate public (or Micron provided) funding for staffing of the planning team and the citizens' council, as well as funding for incentives or subsidies needed to mitigate problems related to housing shortages, affordability, and avoidance of homelessness.

The funding of these initiatives could be similar or related to the green chips community benefits fund, Micron's contribution to the existing community benefits fund of \$250 million is a drop in the bucket when one considers the needs, as well as Micron's ability to pay. Shareholders get regular dividends, and they should pay necessary costs to mitigate the impact on this community.

Perhaps the PILOT payments are sufficient to meet all the needs of the community to eliminate adverse socioeconomic impacts, municipal services, offsets to prevent adverse housing affordability impacts or even to reduce greenhouse gas emissions of induced growth. If so, the EIS should make it clear that such is the case. I see little evidence of that in the DEIS except for glib statements that expanded services needed by municipalities for things like police and fire services will be offset by PILOT payments. The EIS should explain and describe community costs and assess whether PILOT payments will be sufficient to meet community needs and mitigation costs.

**Growth Induced GHG emissions must be mitigated**. Minimizing the carbon footprint of the induced household growth should be required as an offset against the carbon footprint of Micron's Clay, NY fabs which Micron should be required to fund.

As a consequence for approving the fab development project, binding mitigation measures, e.g. a binding mitigation plan with measurable and achievable objectives, which will offset the adverse impacts of the induced growth must be established and include, in addition to those previously stated structural components, the following smart growth conditions:

All residential and commercial development must be in accordance with smart growth principles which minimize GHG emissions, create walkable and transit oriented (and serviced) communities.

All residential and commercial developments should be powered solely by renewable, non-fossil fuel energy.

Housing developments must include a variety of types, uses and affordability options.

Anti-gentrification and anti-displacement provisions must be established as high priority goals; and procedures, plans and controls established to prevent neighborhood gentrification, and resident and local business displacement.

The principles and methods to meet the intent of this mitigation plan shall be subject to further development, review and recommendation by a citizens conservation management, sustainability and mitigation council.

Funding commitments established to incentivize smart growth developments to be provided by Micron or from state and local revenues derived as a result of the fab and other chip developments.

Micron shouldn't be allowed to locate here and create diverse environmental impacts and not pay for the destruction and disruption. It isn't enough to say that since Micron pays wages and makes PILOT payments, housing prices are rising, and that the project meets all of the community's policy objectives that all impacts are balanced out against the economic benefits. No. Micron must be made to offset damages they are allowed to induce with financial contributions over and beyond wages, PILOT payments, the one time contribution to the community benefit fund and rising real estate values. The costs of these adverse impacts should be paid by Micron and not placed on the shoulders of our residents. A community cost and benefits agreement should be negotiated as a mitigating measure; and until such an agreement between the community and Micron is created, with the input and approval of key regional community groups, the project must not be permitted.

**The Green Chips CEC and the "Community Priorities Document"** includes input from central New Yorkers but much of what the CEC has reported as priorities has not been included as important project components or mitigating measures to assure that appropriate community benefits accrue to residents and that adverse impacts avoided.

There is recognition in the CEC report of the need for good public transportation to serve the area, though Micron will have 12,000 parking spaces and the DEIS fails to suggest the need for a robust transportation management program which utilizes transit, minimizes space requirements for parking surfaces and reduces related stormwater and vehicle-trip related GHG emissions. Also, the CEC document gives a high priority to affordable housing, but the DEIS fails to evaluate how in-migration and rising housing prices will impact existing residents, nor does it include plans to minimize the housing impacts except to say that the housing market will adjust in 4 years' time or that existing policies or future ones will take care of this. This isn't sufficient. The Federal government, the state of NY and the County of Onondaga want to bring a mega chip fab to CNY but have yet to do the planning and community development necessary to avoid harmful impacts on our CNY community. We need more than one 46 page CEC report to prepare and avoid Micron's harmful impacts.

I find it ironic that the CEC report states, “The Community Engagement Committee emphasizes the importance of ongoing public engagement to ensure the community’s evolving priorities are accurately represented.” I don’t know of anyone who has participated in the process or who is currently participating, or even if this CEC still exists. I don’t want to impinge the sincerity of the CEC, or the people who participated in their engagement process, but it seems like their credible effort in community engagement and priority setting is being wasted if these priorities aren’t included in the project and used only to greenwash the project. The facts that OCIDA and Department of Commerce have refused to extend the comment period for this DEIS process, or that there has been little public engagement by Micron, the County or DoC about this project and its impacts, demonstrates there is a lack of ongoing public involvement which the CEC emphasized as important. I understand that CEC’s Green Chips process was narrowly focused and limited to priorities for allocating the community benefits fund and not intended to serve the full range of this project’s sustainability needs (as the report says, “Moreover, the Community Engagement Committee operates independently of processes involving environmental assessments, sustainability studies, or governmental incentives.”). However, it is time for this to change, and a robust community involvement structure as suggested above, along with a broad community benefits agreement, must be established should this project move forward.

#### **4.0 CUMULATIVE EFFECTS**

Chapter 4, cumulative effects, is very confusing. It is unclear whether the entire growth induced effects of population increases are being considered as an accumulative impact in the analysis of cumulative effects. It is unclear whether the entire growth induced effects of population increases are being considered as cumulative in this analysis. In some places it appears that only those projects that are listed in a table 4.2 – 1 are considered as contributing to cumulative effects, but certainly there will be cumulative effects of the entire growth induced housing.

The expanded population with related needs for transportation and commercial purposes are growth induced effects as well as cumulative. My suggestion is that this section be clarified to be more specific as to whether or not the population growth induced is included in the considerations about cumulative effects.

One important part of cumulative effects are greenhouse gases. And it should be made clear whether or not the cumulative impacts of greenhouse gas emissions from the induced households have been included in the section. One specific area of confusion is in section 4.3.7.2 mobile source greenhouse gas emissions; here the statement is made that mobile source greenhouse gas emissions for the preferred action alternative which includes induced growth will result and higher mobile source greenhouse gas emissions compared to the no action alternative. But it is unclear if those greenhouse gases only include transportation related impacts, or do they include stationary impacts of housing for the growing population.

**Subject:** [EXTERNAL] Micron Clay, NY Draft EIS 2025 Comment 7 of John Przepiora  
**Attachments:** DEIS and household induced growth LTE by jprzepiora.pdf

The attached pdf document contains a comment, in the form of a letter addressed to the editor of our local newspaper plus related documentation, on the DEIS issued for the NEPA and NY SEQRA reviews of the proposed Clay, NY Micron Chip Fab project. I am submitting this for inclusion in the public comments record for the NEPA and SEQRA reviews. The subject areas included in this include: Household induced growth with references to information found in sections 3.15 and 4.0.

Should there be any reason why you are unable to include these comments in the public record for this action, please advise ASAP so that a remedy can be sent; otherwise I will assume that the attached will be accepted and included in the record for appropriate response and consideration as the Final EIS is issued.

John Przepiora

GreeningUSA.org

To the editor:

There needs to be more reporting on the housing issues relating to Micron, particularly local residents' ability to pay rising housing costs which will be supercharged by Micron's development and its spinoffs. The DEIS fails to assess the magnitude of rising housing costs which will fall disproportionately on low income households, such as in Syracuse, where many residents are already rent burdened. Will there be an increase in homelessness? How many will be forced to relocate due to rising rents?

The DEIS lists just 15 residential developments with 5,852 units (none affordable) currently planned. This represents 21% of the 27,000 claimed to be needed. Onondaga County's recent comprehensive plan provides a vision for smart, town centered growth, but outdated town plans and zoning regulations need to be revised to allow it.

We taxpayers already foot the bill for federal, state and county subsidies for Micron and we shouldn't have to pay more for housing because Micron makes chips here. Existing overburdened residents should not have to pay more for their housing, nor be displaced by unaffordable housing costs.

Though rising property values may spur redevelopment of severely dilapidated Syracuse housing, the DEIS says little about how cost increases will be mitigated beyond that Micron will "continue to work with agencies and stakeholders to identify specific actionable measures to avoid or minimize the potential for short term significant adverse effect." I'd like to know what 'work with' means, and what Micron will spend to mitigate the housing crisis the fab development will supercharge.

Micron's DEIS Housing related facts and statements\*:

27,546 new households are required to accommodate 64,000 migrants. (p3-491-492)

85%, or 23,000 households, will be added in Onondaga County with approximately 32% of those within the city of Syracuse. (see Table 3.15-5, p3-492)

The "induced population would be large enough to alter local and regional housing markets" and household growth would "be of a scale that may be readily noticeable." (p3-493)

The "in-migrating labor force would increase the demand for housing and exceed available vacant supplies in the local study area." (p3-493)

". . . there would be rent pressures attributable to the induced growth. . ." (p3-494)

". . . rent increases [have] the potential to indirectly displace residents . . ." (p3-502)

15 residential developments with 5,852 units (none affordable) currently planned representing 21% of the 27,546 claimed to be needed. (Personal computations based on Table 4.2-1. Present and Reasonably Foreseeable Actions, p4-6)

\*These statements and facts compiled by John Przepiora and are based on statements included in: **Micron Semiconductor Manufacturing Project, Clay, NY Draft Environmental Impact Statement** EISX-006-55-CPO-001 | June, 2025 published by U.S. Department of Commerce, CHIPS Program Office, Onondaga County Industrial Development Agency, U.S. Army Corps of Engineers, & U.S. Environmental Protection Agency.

To: David Frenkel,

This email is for the purpose of confirmation that earlier today (August 11, 2025), from this email address I submitted seven email messages transmitting seven pdf files with various comments in response to the request for public comments on the Micron, Clay NY DEIS. Additionally, from the address [John@GreeningUSA.org](mailto:John@GreeningUSA.org) I transmitted an additional pdf file with comments on behalf of GreeningUSA, Inc. If there was any difficulty with the receipt of any of those files I would appreciate being informed ASAP in order to correct the matter. Thank you for the opportunity to comment on this very important project.

to the benefit of local economies and environments.*

**These comments are submitted on behalf of the board of directors for GreeningUSA Inc., a Syracuse, NY membership not-for-profit organization which has advocated for sustainable communities to benefit local economies and the environment over 21 years.** The sustainability principles for which our organization stands are defined in our “Twelve Traits of a Sustainable Community” which can be found at [www.GreeningUSA.org](http://www.GreeningUSA.org). Through the lens of these traits, the proposed Micron development, as described in the DEIS, is fraught with constructs contrary to the principles which our organization promotes. At a time when our environment is afflicted with a growing climate crisis, the quality and quantity of our water and air are being degraded, and economic and social inequities divide the people of our region, a commitment to sustainable development is critical. In our view, development that is sustainable links economic development to environmental protection, and human wellbeing to the cross-generational responsibility to protect and sustain resources for future generations. A somewhat similar notion of the responsibility that nations have was previously set forth in principles enumerated in the 1972, ‘Declaration of the United Nations Conference on the Human Environment’ which asserted that “man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well-being, and he bears a solemn responsibility to protect and improve the environment for present as well as future generations.” Simply put, sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. Even with a limited time for review of the recently issued DEIS, GreeningUSA has concluded that many aspects of the Micron development project promoted by our Federal, State and County governments are contrary to sound sustainability principles and potentially endanger the health and well-being of the region.

The 719 page DEIS and its 19,000 pages of appendices are not possible for us, or anyone, to review all aspects of the project in the 48 days allowed. Previous requests submitted by others, including GreeningUSA members, for an extension of the public input have not been responded to. While 48 days exceeds the minimum requirement for SEQRA and NEPA, this limited time frame for a complex project is contrary to the spirit of NY’s SEQRA which places high importance on public participation. The DEC’s SEQRA handbook says that ample opportunities for public involvement “allow the public and other agencies to provide input into the planning or review process, resulting in a review with a broader perspective. It also increases the likelihood that the project will be consistent with community values.” ( DEC SEQRA Handbook 4<sup>th</sup> Edition 2020, p.4)

**Two of perhaps the most important traits of a sustainable community are governmental leadership and citizen engagement.** In light of the fact that the proponents of this project, including the County of Onondaga, have spent very little effort to engage citizens in dialog over

this project, cutting the review process short disregards the public's right and responsibility to give informed input on something that will affect our future, and the future of generations to come. Creating obstacles to citizen engagement is contrary to the principles of sustainability.

Major components of the project each deserve public scrutiny of 30 to 45 days. These multi-components, lumped together with this project's overlapping multiple phases, make this DEIS difficult for anyone, including the most intelligent and experienced planning and development expert, to review, understand and respond within 48 days. Please extend the public comment period to at least 120 days, until October 23 to give the public and GreeningUSA a better opportunity to comment and a chance to review additional sections we have been unable to get to.

Based on the environmental impacts found in the DEIS, it is our opinion that this project does not adhere to many principles of sustainability and therefore must not go forward without major changes. We have come to this conclusion after consideration of the following.

**The project will destroy a critical ecological resource by filling and destroying the White Pine wetlands** that serve many useful purposes, which are not thoroughly assessed in the DEIS. An insufficient mitigation plan is proposed. The existing well developed wetland cannot be adequately replaced with the mitigation plan as proposed. Experts we have consulted advise that perhaps even a 7 to 1 replacement strategy may be necessary but that may also be insufficient. We are in the era of climate chaos, with heat disrupting people's lives in profound ways. This site is a sink to not only keep carbon out of the atmosphere, but serves as an air conditioner to cool the surrounding environment and a bathtub to keep flooding in check.

Adding a huge concrete factory and surrounding pavements only adds to the heat island effect exacerbating the adverse impact of having destroyed the wetland and forested site in the first place. Replacement wetlands proposed will not replace the valuable functions of the WPCP wetlands, including heat island mitigating effects, without additional study of heat island effects and inclusion of additional mitigating measures. After assessment of heat island effects using state of the art measurement techniques, heat island mitigation practices must be established, and a program for long term monitoring and adjustment procedures must be established.

**This proposed factory will pollute the air with carbon and other GHG including hazardous chemicals.** Water will also be at risk of being polluted with hazardous, forever chemicals which are unregulated. A GHG mitigation strategy that may need to reach

beyond Micron's campus footprint must be established so that this campus and its induced growth will not make the statewide goals of the NY CLCPA unachievable.

Lacking from the DEIS is an analysis of the social cost of the factory's GHG footprint. Including such an analysis, using methodology such as social cost estimations generated by EPA's peered review interagency modeling (see [EPA Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances](#)), would put into context incremental external costs to the nation which this singular project will contribute. Such an analysis would provide a reference value to consider in a reevaluation of the costs and benefits of the Clay, NY Micron chip fabs, and would be useful for reconsidering the conclusion that 4 four fabs are necessary to provide necessary ROI and the rationale for the preferred alternative proposed.

**The EIS should fully disclose in a comprehensive, easily understood manner all municipal costs to be incurred for expanded municipal services**, external environmental costs which can be anticipated and estimated, and revenue expected to be generated in the form of taxes, fees or other payments. Relatedly we do not see a comprehensive cost benefit analysis for the preferred alternative in the DEIS beyond the results presented in Appendix C prepared by REMI. This analysis fails to account for the environmental costs, including such things as the social cost of GHG emissions. The DEIS also fails to disclose in a comprehensive and easily understood manner the costs which will be incurred by local and state governments in support of this development, including costs of the connected water and wastewater systems or other municipal services, such as police and fire, which are necessary to serve the development, and the induced growth; nor are the revenues to be achieved over time by the taxing and service jurisdictions in the region listed in a manner the public can readily understand.

**Construction activity will impose adverse impacts on the surrounding area for years to come** with noise and traffic, which could make the area an intolerable location in which to live. A local citizens' advisory board must be established to allow local residents to be kept advised of construction activity impacts and allow for input to minimize disruptions impacting local residents. Micron should also develop ways to minimize these impacts including the possibility of reducing the number of fabs to shorten the construction period and lessen related impacts. Micron's refusal to consider a smaller project without transparent justification and analysis of the mitigating effects of a reduced footprint, or shorter construction period is a non-starter. Sustainability requires balance, and this project, with 4 fabs, may be unbalanced for the site selected and the impacts it presents.

If the project's economic development objectives can be achieved with a smaller environmental footprint this project may be more sustainable.

**Once operational the 12,000 car parking lot will impact residents in the surrounding area by attracting increased automobile traffic to the area.** Reducing the footprint for parking and creation of a transportation management plan (TMP) with reliance of mass transit, incentives for workers to utilize transit, and even financial support to create an effective multi-modal transportation system to serve its campus and the regional needs of its workers, would serve to make this project more sustainable than its current configuration and reliance of personal vehicles. A TMP with fewer parking spaces available can have multiple benefits including reduction of paved surfaces and stormwater quantity, improvements to water quality, lower GHG emissions, and less wetland destruction.

**One objective of the development is to solve the region's long standing poverty,** yet there is no assurance that local workers and local residents will reap the benefits purported to be an objective of the project. The DEIS must include clear estimates, if not commitments, of the types of jobs and wages that will be available to local residents. Micron needs to make commitments to a labor peace agreement to allow workers freedom to choose to unionize or not, and a community benefits agreement with firm commitments for local workers, worker health and safety, and programs to assist local and regional residents with rising housing costs that will be induced by the project.

**The projection that workers will immigrate to the region, increasing the population by over 64,000 and 27,000 new households,** flies in the face of the promise of good paying jobs to lift the local residents out of poverty. Micron must strike the correct balance of local and non-local hiring in order to achieve a sustainable project that will actually raise the wealth level of the local residents and reduce the impact of rising housing costs.

**There is no assessment of, nor assurance that rising housing costs will not adversely impact** the city of Syracuse (or other) renters who currently are cost burdened or on fixed incomes; or impact those wishing to build or buy a home only to find home prices and construction costs make that impossible. Gentrification, with attendant displacement and increased homelessness, is a potentially adverse impact which is not sufficiently addressed in the DEIS, and it should be. A public participation effort that places high regard for transparency and public engagement should be established to help manage the risks of gentrification and maximize the utilization of local workers.

The impact of developing an estimated 27,000 new household units is ill assessed in this DEIS. To rely on the hope that future planning and development policies will match the vision of the Onondaga County comprehensive plan for smart growth isn't sufficient. Real planning and commitments are necessary, and I see little of that detailed in this DEIS.

**The carbon footprint of the induced residential and commercial development isn't estimated** in the DEIS; nor any mitigation specified or required. They should be. Relying on existing or unknown future policies isn't acceptable, nor is rushing to get this project going without clear understanding, policies, and plans about how the environmental and economic impacts of the induced growth will serve the community's needs in a sustainable manner.

**A rebalancing of the size of the project and the magnitude of the impacts with a "build, operate and assess" adaptive management** approach may be a way to move forward with caution. Micron claims that the only alternative is to build 4 fabs; that fewer than 4 is uneconomical, robbing them of the needed ROI to make the Clay, NY project viable. This assertion isn't sufficiently supported by evidence particularly when fab projects elsewhere have fewer fabs at one location.

If four fabs are required for WPCP, the approval process should be contingent on an adaptive management incremental phasing sequence to ensure that commitments made are kept, and environmental impacts/costs are manageable in a sustainable manner, before continuing to build out additional fabs.

**The infrastructure expansion of the induced residential and commercial growth isn't estimated** in the DEIS. How many miles of new roads, water lines and sewers will be needed to serve 27,000 new households? How much land is needed to be developed? None of these are presented in the DEIS. We believe they should be, at least at some planning or schematic level of estimation.

**Micron must fund mitigating measures deemed necessary to protect the region from the adverse impacts.** It is unclear that PILOT payments, wages paid, or rising real estate values will offset adverse impacts. Offsets against added municipal services, incentives to assure sufficient affordable housing is available, and payments to offset environmental degradation should all be Micron's and its shareholders' responsibility, not current residents. The DEIS must do a better job of displaying and conveying the facts about the costs and benefits which municipalities and their residents will

experience in a clear concise manner. Using tables to summarize the effects, costs and revenues should help to convey this sort of information in an easily understandable fashion.

**With its many phases and components this project makes the DEIS complex and difficult to comprehend.** NY's SEQRA requires the public to be informed about environmental, economic and social impacts. This DEIS has limitations which need to be corrected in a way the general public can understand. Asking the public to digest 20,000 pages in 48 days isn't a sustainable practice either.

**The Micron project as currently envisioned and described in this DEIS is not an example of sustainable development.** Let's not delude ourselves. While Micron touts itself as a company that values sustainable practices, the Clay, New York project falls short of what is necessary to be a truly sustainable development. Unless the White Pine Commerce Park development is dramatically reimaged, the project on balance cannot be supported by GreeningUSA for reasons mentioned here. We urge that permits not be issued for this project until unsustainable components and practices are sufficiently mitigated.

---

To whom it may concern,

My permanent address is in Radisson, an HOA community very close to where Micron is planning on constructing their huge and dangerous complex for their business. Of course, as soon as I had heard about this I have been alarmed at the environmental impact on our region. It was evident to me that Upstate New York and our region was prime for this massive busienss development mainly due to our rich and pristine supply to our waterways, rivers and beautiful lakes.

Where this is being purposed is already overcrowded with little space for such an operation. The interstructure isn't there and route 31 and other roads are already over used making just getting through from Radisson to say Camillus can be very difficult due to the present traffic that is forced to use this way to and from many connecting areas.

But most of all a long time paying member to several associations to protect our environment, I firmly oppose going forward as planned. It is being forced down our throats with not enough care in realizing the future devastation that this endeavor will put on our region.

I say it must NOT happen.

Feel free to contact me for my further commentary on this. I have not responded sooner as I've been dealing with some personal issues that took me away from expressing my thoughts and my complete disdain for this massive project.

**Subject:** [EXTERNAL] Draft Environmental Assessment EISX-006-55-CPO-001

As a long-time Syracuse resident, I have serious concerns about Micron's proposed semiconductor manufacturing plant in Clay and its impact on the environment and the quality of life in Central New York (CNY). I, like much of the CNY population, live here because of its beauty and its affordability. Both of these appear to be threatened by this project.

Bottom line, Micron's goal in bringing a chip plant to CNY is to make a profit. Millions of taxpayer dollars have already been committed to the project and we need to ensure that, in return, Micron operates in our best interests and addresses all potential environmental threats in both its construction and its ongoing operation. With our current knowledge about the long-lasting environmental and human damage that industrial development projects can bring, we can't repeat mistakes like those made in the past in service to the profit motive.

Based on my current understanding of the DEIS, I'm submitting the following comments that speak to some of my concerns about:

- the impacts of this project on CNY land, water and air
- the impacts on human and other species currently living on the land or surrounding areas
- the energy and water requirements of the project, and
- the inadequate plans for mitigation provided in the document.

Toxic chemicals – The DEIS does not identify all of the chemicals that will be used in the chip production process or adequately address plans for preventing release of these chemicals into the environment. Micron must provide a list of these chemicals and detailed plans for how all chemicals (including PFAS and other toxic chemicals) discharged during production will be processed in a way that will not pollute our air, land or water. The final DEIS should address how toxic waste captured during this process will be handled and stored. It should also address how toxic chemicals will be stored and handled pre-production to ensure the safety of Micron employees and the environment. And it should identify a plan for oversight and how compliance will be monitored. Micron must ensure that no toxic chemicals will be brought on site before all processes and

equipment needed to prevent toxic chemicals from entering the environment are in place, including all county-operated wastewater treatment facilities.

Land use – Construction of the Micron plant will result in major changes to the landscape and significant habitat loss. The project site is home to not only endangered bat species and threatened and near-threatened bird species, but a rich variety of other species that add to the richness of this area of CNY. With loss of habitat, many of these species will be displaced and some will die. The wetlands that are lost are simply not replaceable by the smaller scattered parcels of land that are planned to compensate for the current habitat. In addition, the proposed replacement wetland sites are yet to be developed and the displaced creatures will need to find someplace to “hotel” while this development occurs; many will not survive. In the final DEIS, Micron should significantly increase the ratio of replacement wetlands to lost wetlands and put a plan in place for incremental destruction of wetlands and aggressive development of replacement environments.

Another land use concern is related to increased flooding risks across the US resulting from climate change. Loss of wetlands and construction of acres of hard surfaces at the Micron site will increase flooding and runoff into the Oneida River and ultimately into Lake Ontario. In light of this, the DEIS should include an assessment of increased flooding risks to downstream communities and address how these risks will be mitigated.

Energy use – Operating the Micron plant will require enormous energy inputs. The DEIS doesn’t address how Micron will meet these needs and also meet its 100% renewable energy commitment. The final DEIS should provide a plan for generation or purchase of solar and wind power that will not rely on power already on the grid and being used by other customers and will not increase the cost of energy to households and other energy users. The final DEIS must also address the cost of any infrastructure changes needed to support its energy use in a way that ensures these costs will not fall to utility ratepayers or to New York State or Onondaga County taxpayers.

Water use – Operating the Micron plant will require enormous amount of water pulled from Lake Ontario. The final DEIS must address how these needs will be met and monitored while ensuring water availability and affordability to current users. The final DEIS must also address the cost of any infrastructure changes needed to support its water consumption in a way that ensures these costs will not fall to current customers or taxpayers.

Additionally, the DEIS does not adequately address: increased housing needs and costs (including the impact on current CNY residents), increased traffic and the investment needed in public transportation or increased public service demands.

If Micron is truly committed to CNY, it will ensure that all steps are taken to preserve the integrity of our environment and our community and will seek community engagement in all future decisions that impact our environment and community.

Thank you for the opportunity to comment.

Email: [jeshinn@esf.edu](mailto:jeshinn@esf.edu)  
Phone: 315-565-3022

August 8, 2025

Dear CHIPS Program Office:

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. The comment period must be extended to October 25, 2025, at a minimum, especially given there has been no public response to a petition signed by over 1500 residents of the region asking the same.

Despite the short turnaround to review the lengthy DEIS, I am submitting my comments based on my **expertise as an environmental social scientist, Associate Professor (with tenure) at the SUNY College of Environmental Science & Forestry, resident of Syracuse, and mother of a young child.** I will focus on just a couple of the key social issues that are insufficiently addressed in the DEIS. While I also have significant environmental concerns, I trust those are being addressed by other concerned residents.

Micron says in the DEIS that there are no environmental justice impacts from this project, nor does Micron provide a methodology for their study of environmental justice impacts that allowed them to arrive at this conclusion. Micron looks at the communities only within 5 miles of its main campus and a 1/2 mile from their rail spur, childcare center, and wastewater treatment plant expansion. They do not provide consistent analysis of both "Disadvantaged Communities" and low-income communities. Micron does not consider cumulative environmental impacts on communities. Micron does not consider environmental justice impact of connected actions which are numerous involving rail spur, highway interchanges, new water, electric and fossil fuel lines and transportation related to installation and operation of these connected actions.

In addition, Micron gives insufficient attention to the process of soliciting community feedback during the proposal. Of note, Micron only lists two meetings with a total of 45 people. Micron mentions a consulting Community Engagement Committee, but this consultation only related to Micron's financial commitments not environmental or community impacts.

Finally, the environmental justice impacts of the growth inducing impacts of Micron are only evaluated qualitatively and generally. They do not look at the income and EJ status of the communities receiving their wastewater and stormwater downstream, or their hazardous waste. Micron claims its contribution to climate change is a global and regional issue, and therefore not a local environmental justice issue.

In order for the Micron project to move forward, the following must be required of Micron:

- Micron should provide more details on how their Environmental Justice outreach process was determined and justification for this process and provide more detail and justification for how they choose the study area for their Environmental Justice review.
- Micron should be required to increase the area they evaluate for Environmental Justice impacts to include downstream communities, the Town of Clay, Liverpool, and parts of Syracuse, as well as communities within 5 (not .5) miles of their rail spur, childcare center, and water treatment plant expansion, and around planned roadway changes. Overall, Micron should expand their study area given that this is one of the largest development projects in NYS history.
- Micron must be required to provide more evidence that they engaged in robust public outreach, either during or beyond their two listed meetings with a total of 45 people. Micron should be required to engage in enhanced public participation because their project will have environmental justice impacts. This public participation should consider that many residents in EJ communities may face barriers to participation, including digital access, transportation, and language. Micron could engage in proactive outreach, including door-to-door engagement, community liaisons, and partnerships with trusted local organizations.
- Micron should quantitatively and specifically evaluate the long-term impacts of growth inducing effects on environmental justice.
- Micron must evaluate how their contributions to global warming will have adverse local effects and evaluate how these effects impact environmental justice.
- Micron should be required report on where waste from the project site will be transported to and evaluate the environmental justice impacts on these locations.
- Lastly, for the DEIS to be approved, Micron must be required to develop a community-expert advisory and oversight committee that can assist with ongoing and meaningful community engagement.

Thank you for your consideration of my comments.

Sincerely,

A handwritten signature in cursive script that reads "Jamie Shinn".

Do not gloss over the environmental impacts of the Micron project.

1. Wetlands - what is proposed may be inadequate. I'm hearing 5:1 - preservation to destruction.
2. Water- the chemicals that will be used, some undisclosed, include at least some "forever" chemicals. The sheer volume of water that will be consumed is mind-boggling. I urge you to look deep ensure that every step is taken to prevent long-term damage to our CNY water supply. The Great Lakes are a regional resource that was tampered with once (think Lake Erie). Industry practically killed Onondaga Lake, and has cost millions to remedy. Let's learn from our mistakes.
3. The electricity that will be used by Micron is also mind-boggling. Is the infrastructure there? How can renewables be used and most effectively brought on-line? No smoke and mirrors please.
4. Housing and transportation. Ensure that the environmental costs of new housing and roads are factored in. Ensure that affordable housing is included in the projects that are developed. Ensure a plan for effective mass transport.

Micron is an opportunity. With opportunity comes risk. Please ensure that risks are mitigated. Pull in the best minds you can find to keep this project sustainable and not something that our children and grandchildren will look back upon, thinking it was a big mistake, and caused irreparable harm. We need jobs. We need development. But not at all costs.

Yours truly,  
Jane Slabowski

## INTRODUCTION

Thank you for the opportunity to comment on the July 10, 2024 Draft Environmental Impact Assessment (DEIS) for the Semiconductor Manufacturing Project in Clay, New York proposed by Micron New York Semiconductor Manufacturing LLC (Micron) (a wholly owned subsidiary of Micron Technology, Inc.) (EISX-006-55-CPO-001) (Proposed Project).<sup>1</sup>

Jobs to Move America (JMA) is a strategic policy center that advocates for climate policies that center worker and community voice. Public investments in green technologies and critical climate infrastructure can create millions of good jobs, particularly for workers historically excluded from quality manufacturing jobs. At JMA, we believe public dollars should fuel a clean economy centered on good jobs. The DEIS raises several concerns. Jobs to Move America calls on the Department of Commerce (DOC) and Onondaga County Industrial Development Agency (OCIDA) to minimize health, safety, and environmental harms; protect workers; and maximize equitable quality-of-life and socioeconomic benefits for communities impacted by Micron's development in Central New York (CNY).

Micron has promised investments and thousands of good jobs for CNY in its efforts to obtain a \$20 billion subsidy, but to date has made no enforceable commitments to workers or communities to ensure the permanent jobs created are the quality jobs promised. In partnership with environmental, labor, and public health groups, JMA seeks to address this gap through the *Community Vision for Strong Environmental, Resident, and Worker Protections*.<sup>2</sup> This document was developed with local leaders and community organizations with expertise in public policy, environmental law, workforce development and safety, environmental and chemical science, energy technology and infrastructure, and housing and transportation equity.

Given the Proposed Project's scale and the range of potential impacts, we strongly urge the U.S. Department of Commerce and the Onondaga County Industrial Development Agency to extend the comment period to at least October 25, 2025, at a minimum. This request is further supported by a petition signed by over 1,500 residents of the region.<sup>3</sup> Despite the limited current comment period, we submit the following key environmental, social, and economic concerns, as well as mitigation recommendations, many of which are insufficiently addressed in the DEIS.

## CONTRIBUTORS

This comment was drafted with legal review and input from the law firm of Rupp Pfalzgraf, LLC (Albany Practice Group) as well as technical review and input from the following experts representing local

**EXECUTIVE SUMMARY**

This comment letter is submitted in relation to the Draft Environmental Impact Statement (DEIS) for the proposed Micron New York Semiconductor Manufacturing Project. Because this is a joint Federal and State DEIS, we understand that all comments submitted will be considered by both OCIDA and CPO.

---

<sup>4</sup> See Appendix A for information on the experts' backgrounds.

Micron New York Semiconductor Manufacturing LLC (Micron) is a wholly owned subsidiary of Micron Technology, Inc. This comment letter analyzes the environmental impacts and risks of the Micron project and provides a technical assessment of environmental concerns. Specifically, as set forth in greater detail in the following sections, JMA and its experts outline the following issues with the DEIS and recommendations for a Final EIS.

## **DEIS Issues**

### **1. Wetlands, Wildlife, and Flooding**

#### **Wetlands Loss and Mitigation**

- **Extent of Loss** - 193.38 acres of wetlands will be permanently lost on-site, plus 78.86 acres from connected actions (rail spur, childcare center, wastewater expansion).
- **Ecological Value** - Wetlands filter pollutants, store carbon, buffer floods, and host threatened species. Loss releases stored carbon and methane, contributing to climate change—yet GHG effects from wetland destruction are omitted and should be assessed.
- **Mitigation Flaws** - Proposed mitigation sites are mainly farm fields, fragmented, and decades from full ecological function. Replacement ratios (~2:1) are inadequate; 10–15:1 is recommended (as done at Seneca Meadows).
- **Regulatory Compliance Concerns**  
It is unclear whether wetland delineations follow the new NYSDEC freshwater wetland regulations. Smaller wetlands and those of “local importance” may be undercounted. The wetland inventory should be updated to reflect the latest regulations.

#### **Wildlife Impacts**

- **Endangered Bats** - Indiana bat and Northern Long-eared bat populations are already near collapse due to white-nose syndrome. Habitat loss will impact roosting/maternity colonies; off-site mitigation is unlikely to replace lost habitat.
- **Other Species** - Threatened reptiles, amphibians, and grassland birds (Northern Harrier, Short-eared Owl) face habitat loss and fragmentation. Current mitigation (3:1 grassland replacement) is insufficient; 5:1 ratio and minimum mitigation parcel of 75 acres are recommended.
- **Aquatic Life** - Wetland/stream loss alters sediment, nutrient, and organic matter flow; may harm cold-water fish and macroinvertebrates.

#### **Flooding and Water Management**

- **Runoff Increases** - Project will replace permeable wetlands with ~645 acres of impervious surfaces, increasing stormwater runoff and downstream flood risk. Rail spur, childcare center, and wastewater plant runoff not fully quantified.

- **Dewatering** - Long-term groundwater lowering during construction could drain nearby wetlands/streams.
- **Wastewater Discharge** - Full buildout will discharge ~40 MGD treated water vs. current 6 MGD, increasing downstream flooding risks.

## 2. Utilities, Energy, and GHG Emissions

- **Massive Resource Demands** – Micron will consume ~15,674 GWh/year (≈11% of NY’s total 2023 electricity use) and 48 million gallons of water/day. New natural gas line construction and the massive increase in greenhouse gas emissions from electricity generation, induced development, and on-site emissions raise serious CLCPA compliance concerns.
- **Cost Burden Risks** – Upgrades to power, water, and wastewater systems could shift costs to ratepayers; cost responsibility remains unclear.
- **GHG Emissions** – Projected to release 881,699 metric tons CO<sub>2</sub>e/year from process gases, plus fugitive heat transfer fluids onsite. Induced development will release considerably more offsite. Purchase of Renewable Energy Credits (RECs) is not effective mitigation for GHGs resulting from all these emissions sources, including the electricity generation necessary to supply the plant’s electricity demand and . Instead, Micron must bring new renewable energy generation online.
- **Grid & Climate Goals Impact** – Load increase will slow or reverse NY’s progress toward 70% renewable energy by 2030 and 100% zero-emissions by 2040. Without effective mitigation that includes construction of new renewable energy generation this load increase will cause prolonged fossil fuel dependence and could impact reliable electricity supply for the region.
- **Recommendations** – Require 24/7 matched renewable power from new generation; eliminate unbundled RECs; implement load flexibility; fully disclose cost allocations; expand local renewable generation.

## 3. Solid Waste, Hazardous Waste, and Hazardous Materials

- **Chemical Identification Gaps** - The DEIS lacks a comprehensive list and quantities of hazardous chemicals used by Micron. Without this, public agencies cannot assess health, safety, or environmental risks. Industry norms (e.g., NIST, CHIPS PEA) provide far more chemical detail.
- **PFAS (“Forever Chemicals”)** - Micron’s PFAS disclosures are incomplete, omitting most of the hundreds of PFAS types used in semiconductor manufacturing. Current regulations only cover PFOA and PFOS, which the industry no longer uses. PFAS in wastewater, even after treatment, can bioaccumulate and persist in Lake Ontario, potentially impacting drinking water.
- **Wastewater Treatment Risks** - The proposed treatment methods (reverse osmosis, nanofiltration, activated carbon, ion exchange) filter but do not destroy PFAS. Testing methods only detect ~40 PFAS types, while hundreds may be present. Non-target PFAS may exceed

known ones in concentration. Micron should use advanced treatment methods that actually destroy PFAS.

- **Off-Site Disposal Issues** - Off-site incineration risks creating toxic byproducts and often occurs in EJ (environmental justice) communities. Micron has not guaranteed destruction of PFAS and other hazardous compounds.
- **Extremely Hazardous Substances** - The DEIS names only eight regulated chemicals, omitting others like arsine and phosphine. Local emergency response capacity for these hazards is unclear. Dispersion modeling needs to be done to ensure childcare and other facilities are sufficient distances from chemical storage areas in the event of an accidental release.
- **Storage, Spill, and Transport Risks** - Over 55 million gallons of hazardous liquids and petroleum could be stored on site. Truck transport increases spill risk; rail transport should be considered.
- **Cumulative Impacts** - The DEIS does not assess combined PFAS, GHG, and hazardous substance releases from Micron and other anticipated regional industrial growth.
- **Recommendations** - Identify all hazardous substances and PFAS types/quantities; require zero PFAS discharge, using destruction technologies; increase transparency on waste destinations and treatment; include dispersion modeling for toxic gas releases; evaluate regional cumulative impacts and update the EIS periodically.

#### 4. Human Health & Safety

- **Chemical Transparency Gaps** – No full chemical inventory; PFAS use acknowledged but not comprehensively addressed; lack of enforceable hazardous waste procedures before operations start.
- **Worker Protection Shortfalls** – No job-specific risk assessments, reproductive/developmental hazard protections, or public illness data. Disparity between detailed construction contractor EHS plans and minimal operational worker protections. Not clear if temporary workers will get the same protections.
- **Community Risk** – Limited public access to safety plans; no community hazard notification system; hazardous waste handling plans delayed and lacking public oversight.
- **Recommendations** – Require public disclosure of all chemicals and PFAS; adopt zero-PFAS release goal; produce detailed operational EHS plans; publish safety plans; provide ongoing, disaggregated exposure and health reporting.

#### 5. Transportation & Traffic

- **Public Transit Gaps** – No current bus routes connect Syracuse’s low-income neighborhoods to the Micron site; nearest Centro stop is ~4 miles away. Potential Bus Rapid Transit (BRT) expansion is described only as “potential,” with no timelines or funding commitments.

- **Equity Impact** – Without reliable, affordable transit, many disadvantaged residents cannot access jobs. No modeling of commute times from low- and moderate-income neighborhoods.
- **County Plan Misalignment** – Onondaga County’s comprehensive plan calls for transit-oriented development, but Micron offers no commitment to public transit expansion.
- **Recommendations** – Fund robust BRT and shuttle networks; coordinate with Centro; ensure 24/7 service for all shifts; align with county and regional sustainability goals; assess impacts of new highway interchanges.

## 6. Workforce & Socioeconomic Impacts

- **Job Quality Concerns** – Publicized \$100k average pay obscures disparities (technicians ≈\$68k; many roles below \$100k); high CEO-to-worker pay ratio; limited jobs opportunity for those without advanced degrees.
- **Local Hiring Equity** – Vague commitments for permanent jobs; unclear if there is prioritization of Syracuse residents who face the highest poverty rates.
- **Training Gaps** – Apprenticeship and on-the-job training programs lack detail, targets, and enforceable inclusion for underrepresented groups. No clear advancement pathways or ongoing upskilling commitments.
- **Work Conditions** – Demanding 11.5-hour shifts with minimal fatigue management details; concerns over promotion barriers and low wage growth in comparable facilities.
- **Economic Risks** – Risk of creating many low-wage spinoff jobs in retail/hospitality; potential to exacerbate inequality.
- **Recommendations** – Enforceable local hire targets; transparent pay ranges; targeted recruitment in high-poverty census tracts; detailed training/advancement plans; quarterly workforce reporting; penalties for non-compliance; binding Community Benefits Agreement (CBA) with community oversight.

## 7. Housing Impacts

- **Severe Market Strain** – Micron’s projected in-migration (64,000 people; 27,000+ new housing units needed) will significantly stress an already overheated housing market in Syracuse and Onondaga County. Median rents are already 40% above what typical renters can afford; home prices rose 85% from 2012–2023.
- **Underestimated & Contradictory DEIS Claims** – The DEIS claims no significant housing impact while also admitting major pressures including rent hikes, possible displacement, and market changes not seen since the 1970s.
- **Inadequate Mitigation Plans** – Current housing developments (≈5,800 units) fall far short of projected needs, with little affordable housing included. Syracuse—the highest-need area—is largely left out of development plans.

- **Equity & Infrastructure Concerns** – High poverty rates, racial segregation, and poor housing quality (lead, code violations) will worsen without targeted interventions.
- **Recommendations** – Require enforceable plans for affordable, mixed-income, climate-friendly housing; use “smart growth” principles; detail specific funding/subsidy programs; tie housing expansion to GHG reduction measures.

## 8. Environmental Justice

### Geographic Scope and Impact Analysis

- **Flawed Study Area** - The DEIS limits Environmental Justice (EJ)/Disadvantaged Communities (DAC) analysis to a 5-mile radius, improperly excluding Syracuse neighborhoods within 10 miles that may face air, water, and economic impacts.
- **Cumulative Impact Gaps** - Does not integrate hazardous materials, PFAS, GHG emissions, or induced industrial growth effects on disadvantaged communities.

### Human Health & Safety

- **Water Quality Risks** - PFAS and hazardous waste could contaminate drinking water sources affecting DACs, especially those with existing lead pipe issues.
- **Waste Disposal Risks** - Off-site disposal may shift pollution burdens to EJ communities.

### Air Quality

- **Flawed Baseline** - Relies on monitoring from Rochester (70+ miles away). No plan to assess local air pollutant impacts on DACs or during upset conditions.

### Inadequate Community Engagement

- **Flawed Outreach** - Minimal public meetings (two, 45 attendees total) and lack of substantive EJ-specific outreach. Engagement tied mostly to financial commitments, not environmental impacts.

### Housing & Growth-Induced Effects

- **DACs Impact Omitted** - Worker in-migration may raise rents and housing costs, disproportionately impacting DACs. Mitigation relies on speculative future housing stock without guarantees of affordability.

### On-Site Childcare

- **Danger from Accidental Releases** - While beneficial, its proximity to industrial hazards could pose disproportionate risks to low-income children. No modeling provided for gas release or flood-related contamination risks.

**Recommendations:** Expand EJ analysis radius to at least 10 miles. Require transparent environmental monitoring overseen by community boards. Develop enforceable Community Benefits Agreement including environmental and housing protections. Disclose and regulate waste destinations to avoid burdening other EJ communities.

## 9. Cross-Cutting Themes

- **Environmental Justice** – Low-income and marginalized communities face disproportionate risks from housing displacement, job inaccessibility, pollution, and infrastructure cost burdens.
- **GHG Impacts** – The Micron facility will generate GHGs on site and off site from many different sources, including on site combustion, on site release of organic chemicals, off-site electricity generation, wetland destruction, transportation, and induced growth. These emissions must be assessed together and mitigated so that New York’s mandatory climate goals are not violated.
- **Transparency & Accountability** – Across all areas, the DEIS lacks enforceable commitments, specific timelines, and public oversight mechanisms.
- **Community Benefits Agreement** – Advocated as a central tool to make commitments binding, create measurable objectives, and ensure ongoing community and worker participation in oversight.
- **Toxic chemicals** – The release of toxic chemicals, including PFAS, could have a detrimental impact on human health, wildlife and the environment. Greater clarity must be provided on how Micron proposes to manage this issue.

## Additional Legal Issues

The expert commenters have pointed to many deficiencies in the DEIS that must be addressed before it can be finalized. There are several additional issues that warrant attention.

### *Alternatives*

The analysis of alternatives is flawed. OCIDA previously assessed the anticipated significant adverse impacts associated with use of the Project site for a similar but smaller development footprint, accepting a Final Supplemental Generic Environmental Impact Statement on July 16, 2021 (FGEIS) and the issuance of a SEQRA Findings Statement on July 27, 2021. The current DEIS did not consider alternative sites, relying instead upon the prior analysis. It also dismissed a two fab alternative, claiming that a four fab facility is economically essential for Micron.<sup>5</sup> This contention is undercut by Micron’s approach in Boise, Idaho where it is building a two fab factory to produce advanced memory chips.<sup>6</sup> If a two fab facility is economic in Idaho, it should also be economic in New York. This means the analysis of alternatives is fundamentally flawed. Two two-fab facilities would create very similar economic benefits for New York

---

<sup>5</sup> DEIS at 2-46. <https://ongoved.com/wp-content/uploads/2025/06/Micron-Draft-EIS.pdf>

<sup>6</sup> Micron Press release dated June 12, 2025 available at

<https://investors.micron.com/news-releases/news-release-details/micron-and-trump-administration-announce-expand-us-investments>.

but would lower the risk of overwhelming the local housing and labor markets. A two-site approach would also be likely to have less impact on wetlands.

Micron is applying for a Section 404 wetlands permit. 218 acres of the 408 acres on the site are to be filled. All parties have acknowledged that the chip plant is not a water dependent use. Therefore, a 404 permit can only be issued if there are no alternatives and mitigation is provided. The flaw in the analysis of alternatives means that a showing of no alternatives cannot be made at this time.

### ***Climate Leadership and Community Protection Act***

This proposal also raises significant concerns about compliance with the Climate Leadership and Community Protection Act (“CLCPA”), and the Green Amendment to New York’s constitution. Section 7(2) of the CLCPA requires New York State agencies to consider whether administrative decisions, such as permitting actions, are inconsistent with or interfere with the statewide greenhouse gas emission limits set by the law. If an agency's decision is inconsistent with the statewide greenhouse gas emission limits under the CLCPA, a detailed justification is required. If a justification is available, the agency must identify alternatives or greenhouse gas mitigation measures. Furthermore, section 7(3) of the CLCPA requires that decisions made by State agencies do not disproportionately burden Disadvantaged Communities (“DACs”). So far, the DEIS has placed unjustifiable reliance on purchasing Renewable Energy Credits (“RECS”) but has failed to provide a valid justification of why New York should make its effort to comply with an already challenging CLPA almost impossible.

### ***Green Amendment***

Finally, the concerns regarding PFAS and hazardous chemicals may give rise to a claim under the Green Amendment as part of the SEQRA process if the lead agency does not pursue proper assessment of this issue, in which the DEIS analysis is inadequate. On November 2, 2021, New Yorkers voted in favor of an amendment to the New York State Constitution under Article 1 Section 19 “Environmental rights” (the “Green Amendment”). N.Y. Const., Art 1, §19; LON Compl. ¶¶ 129-142. Taking effect in January 2022, the State Constitution was revised to include a right to a clean and healthy environment through what has been called New York’s Green Amendment. *Id.* The Green Amendment guarantees, as of January 1, 2022, that “[e]ach person shall have a right to clean air and water, and a healthful environment.” *Id.* New York’s Green Amendment is an affirmative right, because it is included in the State’s Bill of Rights.<sup>7</sup>

The Green Amendment received overwhelming support by New York State voters. By passing the Green Amendment, the people of New York mandated the State government provide a clean and healthy environment to all New Yorkers and made plain that the State must go beyond existing environmental laws to vindicate the new right. *Fresh Air for the Eastside, Inc. v. The State of NY, et al.*, NY Slip Op 34429(U) (Index No. E2022000699) (Sup. Ct. Cnty. of Monroe, Dec. 7, 2022). In effect, the right can be regarded as gap filling. It ensures that government entities are obliged to provide the clean and healthy environment guaranteed by the Constitution even when existing environmental laws fail to do so. Where necessary, New Yorkers can now turn to the Green Amendment to obtain such an environment.

---

<sup>7</sup> Stacy Halliday et. al., 2021. “New York Becomes the Third State to Adopt a Constitutional Green Amendment,” *Bridge & Diamond*, December. 10.  
<https://www.bdlaw.com/publications/new-york-becomes-the-third-state-to-adopt-a-constitutional-green-amendment/>

As a recently enacted Constitutional provision, the Green Amendment poses some novel legal issues, but New York Courts have already made some helpful interpretations. For example, the Green Amendment has been found to be self-executing. *Id. See also, People v. Carroll*, 3 N.Y.2d 686 (1958) (finding that “[t]he general rule is that constitutional provisions are presumptively self-executing.”). In addition, the State has a nondiscretionary obligation to comply with the New York Constitution and, thus, the State must ensure that its citizens have the right to clean air and a healthful environment. *See Fresh Air for the Eastside* (finding that “[c]omplying with the Constitution is not optional for a state agency and is thus nondiscretionary and ministerial,” that the “State must ensure that its citizens have the right to clean air and a healthful environment” and that courts are “fully entitled to compel the State to comply with the Constitution”). This finding is consistent with prior opinions finding that a government agency must comply with the Constitution as a mandatory, nondiscretionary duty. *See, D.J.C.V. v. United States*, 2022 WL 1912254, at 16 (S.D.N.Y., June 3, 2022); *Finn’s Liquor Shop v. State Liquor Authority*, 24 N.Y.2d 647, 655 (1969).

Subsequently, in a separate case, a court noted that the Green Amendment has changed the standard of review for permitting decisions. *Marte v. City of New York*, 2023 N.Y. Slip Op 31198 (Sup. Ct. 2023). Not only must such decisions be rational, they must also comply with the requirements of the Green Amendment. *See id.* The vagueness of the current commitments regarding PFAS would raise a colorable claim under the Green Amendment.

## **WETLANDS & WILDLIFE**

The Micron site contains 409 acres of wetlands according to federal delineation. These wetlands include high-quality red maple swamps, hemlock–hardwood swamps, floodplain forests, and dogwood and willow shrub swamps. They host abundant native species that support insects and the interconnected food web. Construction of Micron’s megafab will result in the permanent loss of 193.38 acres of wetlands on the project site. An additional 78.86 acres will be lost due to the construction of the rail spur, childcare center, and wastewater treatment plant expansion.

The proposed campus poses significant ecological risks due to the permanent destruction of wetland habitat. Wetlands provide habitat for more than one-third of the country’s threatened and endangered species, filter pollutants, and buffer communities from flooding. They also store large amounts of carbon, making them powerful tools in combating climate change. According to the DEIS, “Construction of the Proposed Project would result in the direct loss of wetlands and their functions and services from site development. In addition, wetland buffers (typically 100 feet from the edge of a wetland in New York State) would be lost.” (p. 3-72).

To offset these adverse impacts, Micron has proposed restoring some wetlands through a mitigation plan managed by The Wetland Trust (TWT). However, there are outstanding concerns that the DEIS does not adequately address regarding potential impacts:

- Importance of the lost wetlands to the local environment;
- Potential impacts on flooding and surface flow through adjacent roadways and residential areas;
- Compliance with New York State Freshwater Regulations;

- Impacts on endangered animal populations native to White Pine Commerce Park (WPCP); and
- The need for a mitigation plan that restores degraded wetlands or creates new wetlands at a much higher ratio to compensate for all the wetland benefits lost.

Wetlands are essential to human health and the environment. They provide habitat for a significant number of threatened and endangered species, filter pollutants, and protect communities from floods. They also store large amounts of carbon—300 acres of freshwater wetlands can store approximately 305,000 metric tons of carbon dioxide, equivalent to the annual emissions of about 66,000 cars.<sup>8</sup>

In addition to direct wetland destruction, the proposed campus will increase impervious surfaces, which could indirectly harm wetlands and other habitats through increased stormwater runoff and reduced groundwater recharge. For example, the DEIS states that “11,600 parking spaces, four bus stops, and seven access roads would be constructed on the campus, including four 500-space surface parking lots.” (Table 2.1-3, p. 2-13.).

Micron has not accounted for the loss of carbon sequestration from wetland destruction in its greenhouse gas emissions evaluation. Destroying these wetlands will release stored carbon dioxide into the atmosphere and remove future storage, further contributing to climate change.<sup>9, 10</sup> This release of CO<sub>2</sub> is not accounted for in Micron’s DEIS. According to the EPA and peer-reviewed literature, drained freshwater wetlands in temperate regions can release approximately 3–10 metric tons of methane (a potent greenhouse gas) per hectare over the short term following destruction (via oxidation and disturbance).<sup>11</sup> The destruction of wetlands by the proposed project will further exacerbate climate change. The final EIS must include an analysis of how wetland loss will impact GHG emissions.

### **Wetland Mitigation Work Plan**

In its mitigation plan, Section 4.1 (Selection and Design Criteria) of the DEIS, Micron claims that “Work areas contain few, if any, existing wetlands, which allows for focus on reestablishment and are near or adjacent to existing Department of Environmental Conservation (DEC) wetlands. Delineated wetlands will be subsumed into the work area and will be either registered as rehabilitation if the area is marginal, which is usually the case, or will otherwise be subtracted from the total acreage built and corresponding credits generated. The agencies decide which option is selected.”

The Wetland Trust’s (TWT) Mitigation Project Overview notes that wetland mitigation sites are “in active soybean production. The sites will stay in active agriculture until construction commences, which helps prevent invasive species and incompatible land uses.”<sup>12</sup> The fact that a majority of the proposed wetland mitigation sites are currently active soybean fields means it could take decades for created wetlands in these fields to provide similar ecological services to the present wetlands. Even then, studies show that

<sup>12</sup> “Micron Central New York Semiconductor Manufacturing Complex: Overview of Stream/Wetland Mitigation Plan,” The Wetland Trust, Inc., (2025): [https://ongoved.com/wp-content/uploads/2025/06/Micron-Draft-EIS-Appendix\\_F\\_Vol\\_3.pdf](https://ongoved.com/wp-content/uploads/2025/06/Micron-Draft-EIS-Appendix_F_Vol_3.pdf).

restored wetlands rarely reach the full functional capacity of original wetlands.<sup>13</sup> The mitigation sites are also located closer to sources of disturbance (roads, farms, and homes) than the existing wetlands.

The mitigation sites are smaller and more isolated compared to the integrated network of forests, grasslands, and wetlands at the Micron site (Fig. F-3). The DEIS fails to account for the loss of intact wetlands that will be replaced with fragmented areas that are currently severely degraded or in agricultural use.

A large-scale meta-analysis by Moreno-Mateos et al. of 621 restored or created wetlands worldwide found that, even up to 100 years after restoration, biological structure (primarily plant communities) remained about 26% lower and biogeochemical function (driven by soil carbon storage) about 23% lower than undisturbed reference wetlands. The authors conclude that current restoration practices are often unable to fully recover the original ecosystem functions, even after a century.<sup>14</sup> To address these concerns, regulators should require Micron to purchase large tracts of existing wetlands (especially forest and shrublands), particularly floodplain forest along the Oneida River. These areas should be permanently protected by TWT or the CNY Land Trust.

The DEIS also notes that 78.86 acres of wetlands and surrounding rivers and streams will be impacted by future connected actions (p. 3-66). However, jurisdictional determinations have not yet been issued for most of these features, with the exception of the Clay Substation (USACE only)” (p. 3-67). The DEIS claims that “non-jurisdictional wetlands present within the LODs cannot be determined at this time because not all of the LODs have been delineated. Except as described below for the proposed Clay Substation expansion area, functional analyses of wetlands within the remaining Connected Action LODs also have not yet been conducted, for various reasons, including because field delineations have not yet been performed, wetlands have yet to be assessed by USACE or NYSDEC, or losses of jurisdictional wetlands within the remaining LODs are anticipated to be negligible.” ( p. F-18). All sites must be evaluated before construction begins so that impacts can be monitored over time. The final EIS should include a comprehensive analysis of the total impact on wetland function, wildlife, and plant communities over the entire construction period.

Given the direct, indirect, and cumulative impacts—such as subsidiary development predicted to occur in the watershed—it is recommended that the wetland replacement ratio be increased from approximately 2:1 to between 10:1 and 15:1, similar to the Seneca Meadows restoration project.<sup>15</sup> (see Seneca Meadows Wetland Restoration Design-Build Mitigation for Landfill Impacts to Wetlands).

### **Compliance with New York State Freshwater Wetlands Regulations**

Micron is required to comply with New York State’s new freshwater wetlands regulations.

Micron’s current determination of impacted New York State jurisdictional wetlands and its compliance with the new state freshwater regulations remains unclear. In 2021, Micron hired Ramboll Americas Engineering Solutions, Inc. (Ramboll) to identify wetlands types and acreages that should be included under both the U.S. Army Corps of Engineers (USACE) and New York State’s permitting authority. The DEIS includes tables, charts, and maps that largely reflect information from old DEC jurisdictional paper maps confirmed through surveys and determinations issued by NYSDEC under ECL Article 24. It also includes approved jurisdictional determinations from USACE and categories of non-jurisdictional wetlands, which Ramboll describes as “definitively excluded from Federal and State jurisdiction.”

The DEIS does not explain the criteria Ramboll used to exclude certain wetlands from permitting protection. While it acknowledges wetlands permitting reforms passed by the State Legislature in 2022 and the subsequent regulations for freshwater wetlands that became effective on January 1, 2025 (DEIS appendix F-2.2), it remains unclear whether Micron is applying the old or the new rules in deciding which wetlands merit protection. Under the former law, state-jurisdictional wetlands were only those shown on approved maps measuring 12.4 acres or more. If a wetland was not on a map, its destruction required no state permit. The new law requires permits for any wetland, regardless of mapping status, and covers wetlands smaller than 12.4 acres (7.4 acres after 2028) if they meet certain criteria, such as attenuating significant flooding, filtering drinking water, providing rare species habitat, or being located in an urban area.

The Generic Environmental Impact Statement (GEIS) (Appendix F V-1 P-1) notes that Micron’s campus was evaluated for potential federal- and state-regulated wetlands by Ramboll biologists in the fall of 2021, summer of 2022, and the spring, summer, and fall of 2023. Site visits were also conducted in the spring, summer, and fall of 2023 and the spring of 2024 with USACE Buffalo District and NYSDEC Region 7 personnel to observe, verify, and supplement the delineations conducted by Ramboll.

It is unclear if the delineations happened before or after the legislative reforms were enacted in 2022, or if the delineations and site advisories happened, before the release of the final regulations in December 2024. It is also unclear whether the delineations meet the new law’s requirements. The DEIS does not mention identifying smaller wetlands of “unusual importance” or mapping vernal pools—two critical elements under the new rules.

The GEIS indicates that certain jurisdictional determinations were signed off by DEC staff in February 2024, while others remain pending in 2025. Proceeding with a wetlands protection and mitigation plan under outdated standards would leave portions of the impacted landscape without the protections afforded by the new law. The DEIS suggests that state jurisdictional determinations were based on historic delineations shown in green on DEC Environmental tracker. It is wholly inappropriate to create a wetlands protection / mitigation plan for the entire Micron complex with some of the wetlands unprotected due to the weaknesses of the old law.

The wetlands in purple depict “informational wetlands” where DEC predictive mapping identifies potential locations for jurisdictional wetlands, beyond what was originally mapped.

Ramboll compiled lists and maps of wetlands deemed “non-jurisdictional,” likely because they were not on official maps or did not meet the federal “significant nexus” test to Waters of the United States. Without clear standards, it is uncertain whether all wetlands covered by the 2025 regulations have been identified or whether the count was constrained by outdated rules. This is a key deficiency for both the 404 permit and the DEIS.

In total, the Micron project is projected to result in the permanent loss of about 193.38 acres of federal-jurisdictional wetlands, which overlap with about 174.77 acres of state-jurisdictional wetlands. The company acknowledges about 10.5 acres of impacted non-jurisdictional wetlands and intends to compensate for their loss through mitigation, resulting in roughly 210 acres of total wetlands loss. State jurisdictional wetlands require protective 100-foot buffers, yet it is unclear whether non-jurisdictional wetlands or undercounted state wetlands will receive these higher protections or be held to outdated less protective standards.

Micron’s publicly subsidized proposal has been presented as a project that will both uplift New Yorkers and advance technology, but it cannot meet its public obligations if it avoids the full requirements of the updated environmental review process by shielding its wetlands obligations from the new law.

Micron and DEC must clarify through the EIS process that the project will not be exempt from the new freshwater regulations effective January 1, 2025.

A revised wetlands protection plan must include a clear statement that the Micron project will comply with the 2025 wetland regulations and a full analysis of all wetlands on the project regardless of size, and consideration of all wetlands larger than 7.4 acres<sup>16</sup> as state-jurisdictional with associated buffers, protections, and mitigation. It should also include a review of wetlands smaller than 7.4 acres to determine if they meet “Local Importance” criteria, especially given the potential for endangered species on the Micron property.

### **Biological Resources – Wildlife and Endangered Species**

White Pine Commerce Park (WPCP), the location chosen for Micron’s megafab, is home to three federally and state-listed endangered species: the Sedge Wren, the Indiana Bat, and the Northern Long-Eared Bat. A 2023 study found that the number of Indiana bats detected on site suggests the presence of a summer maternity colony, where females give birth to and raise their young.<sup>17</sup> These species are protected under both the U.S. Endangered Species Act and the New York State Endangered Species Act.<sup>18</sup> The site also lies within the range and provides potential habitat for other endangered or threatened species, including the American Hart’s-Tongue Fern, the Bog Turtle, and the Eastern Massasauga Rattlesnake.<sup>19</sup> Both the American Hart’s-Tongue Fern and the Bog Turtle are dependent on particular types of wetlands or wet forest habitats. Even if these species are not currently present on the Micron property, construction will eliminate areas suitable for their survival, thereby shrinking their already limited habitat range.

Community members in the Syracuse area have voiced concerns that Micron’s development will harm endangered bat species. Micron has stated it will delay certain construction activities until November to avoid disturbing bats during the warmer months when they roost in trees before retreating to hibernacula in caves in the fall. However, the loss of over 500 acres of trees, including nearly 100 acres of forested wetlands, will create long-term harm to these populations. While Micron plans to purchase land off-site to replace destroyed bat habitat, this measure will not undo the damage to hundreds of bats that rely on WPCP for summer roosting and especially for maternity colonies.

State and federal agencies should require stronger mitigation measures to protect these vulnerable species, along with the hundreds of other animals whose habitats include the wetlands of WPCP. <sup>20</sup>The final EIS must include:

- Greater consideration for reptiles and amphibians, such as provisions for road crossings and vernal pool protections in line with recent state legislation;

---

<sup>16</sup> As of January 1, 2028, the threshold will decrease to 7.4 acres (3 hectares). NYDEC.N.d. “Freshwater Wetlands Program.” <https://dec.ny.gov/nature/waterbodies/wetlands/freshwater-wetlands-program>.

<sup>20</sup> Coin, Glenn. 2024.

- Wildlife corridors;
- Require conservation housing to reduce habitat loss due to subsidiary development;
- Require native plant landscaping both on the Micron site and in related developments). Native plant nurseries should be supported to counteract regional habitat loss;
- Additional protections should extend to creek habitats supporting mussels, fisheries such as sturgeon, and floodplain forest, etc.
- The plan should also incorporate native plant rescue and seed collection, including large tree relocation;
- Connected Actions - such as breeding disruption, habitat loss, carbon storage reduction, and greenhouse gas emissions—must be more thoroughly addressed.

#### *G-3.5.1 Indiana Bat*

The Indiana Bat, listed as endangered at both state and federal and state level (p. 3-123). is present on the Micron campus. The DEIS states that “The Micron Campus site and the Rail Spur Site are within 1 mile of a known Indiana bat maternity roost, within 3 miles of other known Indiana bat roost trees and capture locations, and within 14 miles of a known hibernaculum.” (p.G-63). The DEIS reports severe population declines in Indiana Bat populations due to white-nose syndrome (WNS), a fungal disease first documented in the Howe Caverns in New York in 2006 (Cheng et al. 2021; Reeder and Moore, 2013).” (p. G-63). In particular, the draft states that, “In New York State, pre- and post-WNS count data on hibernating Indiana bats showed an average statewide population decline of 72 percent between 2006 and 2011 (Turner et al. 2011).” (p.G-64) and that “Declines in New York State since the introduction of WNS have been among the most severe of all monitored states and are approaching 100 percent (Cheng et al. 2021).” (pdf page 64).

#### *G-3.5.1 The Northern Long-Eared Bat*

The Micron campus is also home to the Northern Long-eared Bat, which is listed as an endangered species at both the federal and state level. Like the Indiana Bat, the Northern Long-eared Bat has experienced a steep population decline in recent years. According to the DEIS “The northern long-eared bat has experienced the steepest population decline of the six species of bats in the northeast that are affected by WNS, with numbers at monitored hibernacula in several states dropping by an average of 98 percent between 2006 and 2011 (Langwig et al.2012; Reeder and Moore, 2013; Turner et al. 2011) and approaching 100 percent in the years since (Cheng et al. 2021). Ninety percent of hibernacula where northern long-eared bats are still found contain fewer than 10 individuals (Cheng et al. 2021). In New York State, pre- and post-WNS count data from 18 northern long-eared bat hibernacula showed local population extinction at all but 4 of the sites as of 2011 and suggested an average statewide population decline of 97 percent (Turner et al. 2011). Surveys at these 18 hibernacula in New York State during the winter of 2012-2013 found only 14 Northern Long-eared bats where there had previously been more than 1,100 before WNS (Niver, 2015).” (p. G-65–66).

### G-3.5.1 The Tricolored Bat

The DEIS also lists the Tricolored Bat as a species with the potential to be found on the Micron Campus and notes that the Tricolored Bat is “a species proposed to be listed as endangered under the ESA.” (p. G-65). The DEIS notes that, “The tricolored bat has experienced local population declines of 90-100 percent across 59 percent of its geographic range due to WNS (Cheng et al. 2021). The range-wide population is predicted to decline by 89 percent over the next few years, resulting in a 65 percent reduction in spatial distribution (USFWS, 2021, 2022).” (p. G-66).

#### 5.2.1 Background on Noise Sensitivity in Bats

Although the DEIS notes that research is limited in relation to noise sensitivity related to the species of concern, it is important to note that their references are from different regions. This is better than no references and this information should be considered, but it should be more clear that one is related to European *Myotis* and another in California. (p. G-157)<sup>21</sup> Even though the little brown bat is in the same genus (*Myotis* species) as the Indiana and Northern Long-eared bats, the impact of noise and other development to the little brown bat should not be compared to that of the federally endangered species. Little brown bats are known to be more tolerant of using anthropogenic resources and more generalist compared to Indiana and Northern Long-eared bats. (p. G-157).<sup>22</sup>

In sum, while the DEIS discusses noise sensitivity in bats, it draws on limited and geographically inconsistent research. References include studies of European *Myotis* species and California populations, which may not accurately reflect the needs of federally endangered species in New York. The little brown bat, for example, is more tolerant of human disturbance and habitat modification than the Indiana or Northern Long-Eared Bat, making it an unsuitable stand-in for assessing potential impacts.

Some of Micron’s proposed mitigation measures resemble those used in Indiana Bat conservation at the Indianapolis Airport, where there has been over a decade of research that may be useful for improving the mitigation measures (p. 188). However, roost fidelity—the tendency of bats to return to the same maternity roosts—is not addressed, even though it is an important factor for endangered bats.<sup>23</sup> Artificial

Kennedy, eds.). *Bat Conservation International*, Austin, Texas:143-152, <https://copperheadconsulting.com/wp-content/uploads/2021/01/Gumbert-et-al-2002.pdf>.

roosts are included as a mitigation measure, but recent research on their effectiveness for Indiana Bats should be reviewed before implementation.<sup>24</sup>

The DEIS also discusses a separate project to monitor bat dispersal from the Jamesville hibernaculum. To maximize the data collected from such a disturbance, funding should cover aerial telemetry and numerous stationary antennas, as previous efforts without aerial support have had limited success.<sup>25</sup>

Micron's DEIS acknowledges "Impacts to population size and viability from the loss of roosting and foraging habitat on the Micron Campus would therefore be possible through potential reductions in fecundity, adult survival, or both." (p. G-151). However, given roost fidelity, bats are likely to return to their original roost sites, forcing them to find new ones at a critical time in early spring emergence. The proposed alternative roost sites are miles away, and it is uncertain whether bats are aware of these locations or if they provide suitable habitat. For the bats to find these sites requires a lot of energy and poses quite a risk.

### **Reptiles and Amphibians**

Urban and suburban development is one of the greatest threats to reptile and amphibian populations.<sup>26</sup> Micron's construction is expected to cause mass mortality among these species, as they are "not mobile enough to avoid the paths of most site clearing and earthmoving activities" (p. 3-118). In addition to direct mortality, noise, artificial lighting, and changes to water balance and quality in the Youngs Creek basin could cause further harm.

Micron's mitigation plan includes stormwater Best Management Practices (BMPs), Stormwater Management Practices (SMPs), and an Erosion and Sediment Control Plan (ESCP) as measures to "minimize adverse effects" of construction on reptiles and amphibians (3-119). While these measures may reduce some harm, the DEIS does not include a plan for rescuing or relocating affected animals. Regulators should require wildlife crossings to facilitate safe passage for turtles, salamanders, snakes, frogs, and toads, and the impact of noise and light pollution—particularly on frogs—should be evaluated. Micron should also provide case studies demonstrating the success of similar measures in minimizing harm to reptiles and amphibians in other developments.

---

<sup>26</sup> U.S. National Park Service. 2010. "Reptiles and Amphibians - Threats and Concerns." <https://www.nps.gov/articles/reptiles-and-amphibians-threats.htm>.

To facilitate animal movement and limit road mortalities, regulators should require Micron to construct road crossings for fauna such as turtles, salamanders, snakes, frogs, and toads. The extent of the impact of noise and lighting disturbances, particularly on frogs, should also be evaluated and addressed. Lastly, Micron should provide studies of other developments where their proposed measures (BMPs, SMPs, and ESCP) were successful in minimizing adverse effects on reptiles and amphibians. Additionally, both artificial light at night (ALAN) and noise pollution affect amphibians, particularly frogs. The final EIS should also address the impact of artificial light on impacted species.

### **Aquatic Life**

The DEIS acknowledges that filling wetlands and surface waters will reduce habitat value of the Youngs Creek wetland complex and associated aquatic features. The elimination of wetlands and headwater streams, as described in Section 3.3 (Water Resources), could permanently alter the transport of sediment, organic matter, nutrients, and macroinvertebrates that are critical to downstream physical, chemical, and biological attributes and processes, including species composition, nutrient cycling, and food web dynamics (Gomi et al. 2002, Meyer et al. 2007)."

The DEIS also makes clear that vegetation clearing and other construction activities may have detrimental impacts on nearby water bodies and sensitive species. In particular, the DEIS states that: "Vegetation clearing and other construction effects may elevate stream temperatures, which could cause temperatures to exceed the tolerance levels of sensitive species, including many cold-water fish and macroinvertebrates (Nelson and Palmer 2007). Changes in topography and soil exposure may temporarily increase soil erosion, which could increase sediment, turbidity, and nutrient loading in receiving waterbodies. This could lead to harmful algal blooms and decreased dissolved oxygen levels, which could lead to fish kills, increased establishment and spread of invasive plants, or other adverse effects on aquatic biota (Driscoll 2003, Fleming and Dibble 2015). As described in Section 3.3 (Water Resources), Micron would conduct water level and flow monitoring during construction to assess surface water and groundwater inflow and outflow in response to seasonal variations and precipitation events. In addition, Micron would implement the stormwater BMPs and SMPs and the ESCP described above to prevent discharge of sediment into wetlands and waterbodies during construction. These measures would help minimize adverse effects on the Youngs Creek complex downstream of areas of disturbance and on aquatic life in the complex." (p. 3-119)

Insufficient studies have been done to show that the measures proposed here will in fact minimize the stated effects.. The final EIS should include studies demonstrating that the proposed mitigation methods will successfully reduce the impacts on aquatic life.

### **Birds**

Bird populations are in steep decline across North America.<sup>27</sup> The most recent *State of the Birds* report warns that "more than one-third of U.S. bird species are of high or moderate conservation concern."<sup>28</sup> Even species once considered common are experiencing sharp population declines in habitats where they

---

<sup>27</sup> Kenneth Rosenberg *et al.* 2019 "Decline of the North American Avifauna." *Science*. : <https://www.science.org/doi/10.1126/science.aaw1313>.

<sup>28</sup> "State of the Birds 2025." *US North American Bird Conservation Initiative*. <https://www.stateofthebirds.org/2025/>.

are known to be abundant.<sup>29</sup> A leading cause of these declines is habitat loss and fragmentation caused by development. Large-scale developments like the Micron project not only threaten specific groups, such as grassland birds, but also affect the broader diversity of avian species in the region. While the DEIS places emphasis on conserving grassland birds, effective mitigation strategies should address impacts across all bird species. These strategies could include creating and restoring habitat near the Micron site, as well as providing financial support to local conservation organizations such as the CNY Land Trust, Onondaga Audubon, and other environmental groups, including those promoting the use of native plants.

Open habitats in New York State are disappearing rapidly, contributing to population declines among grassland songbirds. According to the NYSDEC *Strategy for Grassland Bird Habitat Management and Conservation 2022-27*: “Current grassland habitat on State land is limited and insufficient to meet the needs of grassland birds.”<sup>30</sup> Early successional habitats require regular natural or human disturbances, such as fire, wind, haying, or grazing, to remain viable. Two species of conservation concern in New York State - the Northern Harrier and the Short-Eared Owl - depend on large, contiguous tracts of grassland for breeding and overwintering. Many grassland songbirds are also area-sensitive, meaning they require minimum habitat thresholds to sustain viable populations. Mitigation measures must incorporate minimum thresholds suitable to conserve such species.

Both Northern Harriers and Short-Eared Owls have been observed within the proposed project site (G-3.5.5, page G-67) and are species of special concern in New York State. In the case of Northern Harriers, Ramboll staff documented a harrier egg on the ground, suggesting an attempt to nest at the site and “a short-eared owl was documented at the Micron Campus site by NYSDEC and members of the public on eBird during the winter of 2022-2023.” (G-3.5.5, page G-67). The DEIS references a single Short-Eared Owl sighting, but observers have reported three individuals at the site in 2023, which may indicate a communal roosting site. This discrepancy underscores the need for more detailed information about the presence of Short-Eared Owls.

The Short-Eared Owl is particularly vulnerable to habitat destruction and fragmentation. It requires large, intact grassland areas for both breeding and wintering. Therefore, the primary threat to the Short-eared Owl is threats include habitat loss or fragmentation of habitat due to development, wetland loss, reforestation, and changing farming practices.<sup>31, 32</sup>

According to the Grassland Bird Trust, wintering flocks of 40 – 50 Short-eared Owls were historically easily observed in the large grassland areas that occurred across the state. Once one of the most common owls in the State, they are now listed as endangered in New York. Mitigation for any habitat with potential use as a wintering site by Short-eared Owls should be implemented. Because Northern Harriers

<sup>30</sup> NYS DEC. NYSDEC Strategy for Grassland Bird Habitat Management and Conservation 2022-2027. <https://dec.ny.gov/sites/default/files/2024-04/grasslandbirdsstrategyfinal.pdf>.

<sup>31</sup> Corwin, Kimberly. 2012. “Species Status Assessment: Short-eared Owl.” New York State Department of Environmental Conservation.

<sup>32</sup> Post, Tim. 2004. “State wildlife comprehensive plan- draft species group report for grassland birds.” New York State Department of Environmental Conservation. Comprehensive wildlife conservation, September. <https://guides.nynhp.org/northern-harrier/#:~:text=One%20of%20the%20most%20significant,1984%20cited%20in%20NatureServe%202003>.

and Short-eared Owls have similar habitat requirements and are often observed in the same area, providing and managing large blocks of grasslands for mitigation will benefit both species.

Successful habitat management for Short-Eared Owls—and for Northern Harriers, which have similar habitat needs—requires conservation or restoration of large blocks of grassland exceeding 247 acres, with adequate prey populations such as small mammals. Mitigation for any habitat with potential wintering use by Short-Eared Owls should therefore be prioritized.

The DEIS requires Micron to achieve a 3:1 ratio of new or improved grassland bird habitat to habitat lost through the proposed project and connected actions. However, this ratio is not adequate (p. 3-136).

Due to the extreme amount of habitat loss expected from the Micron site development and the secondary impacts of related infrastructure and population growth, the mitigation ratio should exceed 3:1 to provide a new conservation benefit. In addition to the 1,400 acres developed for Micron's primary operations, land along Route 31 has been purchased for supply chain industries, additional parcels near the site are being sold, and large tracts will be used for road widening, new power lines, solar and wind projects, and infrastructure rights of way. Housing developments, shopping centers, entertainment venues, schools, and medical facilities are also expected to follow. Cumulatively, this will result in significant habitat loss over the next sixteen years.

Given these impacts, a habitat replacement ratio of at least 5:1 is reasonable to provide a net conservation benefit. The newly created grassland habitat is currently planned at a minimum size of 25 acres each, located in Oswego, Chenango, Yates, Cortland, Broome, Tompkins, and Tioga Counties at distances of approximately 10-60 miles from the Micron site. While this meets the NYSDEC's minimum threshold for grassland habitat parcels, it is insufficient to ensure the long-term success of grassland bird populations. See NYSDEC's *Strategy for Grassland Bird Habitat Management and Conservation 2022-27*. The minimum parcel size should be increased to 75 acres. While the Grasshopper Sparrow has not been detected on the Micron property, they could possibly occur in the area (Table G-4). Ultimately, Grasshopper Sparrows need more habitat across New York State. Given that they are most successful in at least 75 acres of habitat, they could represent an umbrella species for grassland habitat mitigation. Mitigating habitat suitable for Grasshopper Sparrows would ultimately result in suitable habitat for most other grassland bird species that are less area sensitive.

Mitigation should prioritize fewer, larger contiguous tracts over many small parcels to reduce habitat fragmentation. The DEIS also notes that the mitigation plan will operate in five-year cycles but does not provide detailed site management plans or address long-term management responsibilities. This deficiency must be corrected.

### **Bird Migration**

A major gap in the DEIS is the lack of consideration for migratory bird stopover use of the property. Central New York lies along the Atlantic Flyway, a critical migration corridor for numerous bird species, from small warblers to large raptors. Stopover habitat is essential for both short-distance migrants, such as sparrows traveling to Florida, and long-distance migrants, such as neotropical species, which require safe resting and feeding areas to complete their journeys.

Migratory bird surveys should be conducted during both spring and fall in addition to the breeding and wintering seasons. The majority of bird migration occurs at night, and artificial lighting can disorient or lure birds off their migration paths. To reduce this risk, construction lighting should be turned off between 11 p.m. and 6 a.m. during peak migration periods in spring and fall.

#### Excavation of the Site for Construction

The DEIS notes that the construction of the facility will require excavating over 1.6 million cubic yards (2.70 to 3.67 million total tons) of soil and muck from the existing wetlands and fields at the WPCP. This material is designated for “beneficial reuse” (p. 3-224 et seq). Micron should coordinate with the Wetlands Trust to see whether this material which is rich in wetland plant seeds, spores, and microorganisms could be utilized to create new wetlands as part of the wetlands mitigation plan. This would minimize long-distance transport of this huge amount of material, and could accelerate the establishment of new wetlands.

## **FLOODING**

### **Loss of Water Storage & Increased Runoff**

Micron’s development plans will convert approximately 200 acres of wetlands and nearly 8,000 linear feet of streams into 645 acres of impervious surfaces such as asphalt and concrete, and 58 acres of semi-impervious surfaces. The company will clear 445 acres of trees and shrubs, remove 1.4 million cubic yards of soil and 978,000 cubic yards of bedrock, and import nine million cubic yards of fill to create a stable construction foundation.

In total, almost 10,000 acres of ground will be disturbed, resulting in permanent changes to how water flows through the site. Where water once pooled in wetlands, recharged into the ground, and was released gradually into streams, it will now run rapidly off pavement and rooftops toward remaining permeable land and downstream areas. This change will be especially pronounced during heavy rainstorms, which climate change is expected to make more frequent and intense. Micron’s proposed wetland restoration sites are not located downstream of the campus, meaning they will not offset the loss of water storage capacity on-site.

Although Micron’s Draft Environmental Impact Statement acknowledges an increase in stormwater runoff, it does not provide detailed stormwater management plans. Once complete, the project will include 66.6 acres of stormwater management areas, and Micron states it will use stormwater best management practices and adaptive management in compliance with state laws and permits. However, preliminary runoff calculations are not included in the DEIS. Using the Rational method (the standard yet simplified equation for estimating stormwater runoff) the site is expected to generate about 1,360 cubic feet per second of runoff during rainfall of two inches per hour.<sup>33</sup> For comparison, the Oneida River downstream of the site typically ranges from 2,000 to 8,000 cubic feet per second just downstream of the

---

<sup>33</sup> Thompson, D.B. 2006. “The rational method, Regional regression equations, and site-specific flood-frequency relations.” Texas Department of Transportation Research and Technology, Report No. 0-4405-I: 78763–5080, <https://library.ctr.utexas.edu/hostedpdfs/texastech/0-4405-1.pdf>.

Micron site in Euclid, New York. Additionally, climate-driven increased heavy rain could further raise runoff levels, but this factor is not considered in the plan.

Stormwater quantities associated with the rail spur, childcare center, and wastewater treatment plant expansion have not been calculated, and the DEIS does not address potential water quality impacts from runoff. Without this information, it is impossible to evaluate whether the proposed 66.6 acres of stormwater management and wetland restoration can adequately mitigate the increased water quantity and quality issues resulting from site development. This omission must be remedied.

Micron’s flood analysis is limited to comparing its sites to FEMA flood maps to determine whether they fall within the existing 100-year or 500-year floodplain. The DEIS acknowledges that development will increase stormwater runoff and potentially expand floodplain boundaries, stating that, “Flooding can endanger human life and damage property, particularly in floodplains where development has occurred (NYSDEC, 2024c). Changes in land use and precipitation and runoff patterns, impervious surfaces, and obstructions in floodways can alter floodplain boundaries and potentially expand floodwater footprints (Tetra Tech, 2019).” (p. F-30) But their analysis does not include any such modeling or calculations. They also acknowledge that significant growth of residential and commercial areas in the surrounding region is likely and will lead to the loss of more wetlands and streams and an increase in impervious surfaces. This will raise downstream flood and pollution risks but is not considered in the DEIS. The DEIS also fails to incorporate projected increases in heavy precipitation events caused by climate change. Instead, it concludes there is no flood risk because the site is not currently within or directly adjacent to a floodplain.

The lack of consideration of downstream flood risks means that impacts on downstream communities—particularly Phoenix and Fulton, which already face severe and extreme flood risks—are not adequately considered. Once the Micron facility is fully operational, it will discharge roughly 40 million gallons of treated industrial and sewage wastewater daily into the Oneida River, compared to the current 6 million gallons per day from the existing treatment plant. This wastewater discharge, combined with increased stormwater runoff, could exacerbate downstream flooding.

While upstream Brewerton is projected to have only moderate flood risk, downstream towns of Phoenix and Fulton have severe and extreme flood risks respectively, according to First Street Map analysis (see maps below).<sup>34</sup> These risks will only increase with climate change and increased impervious surfaces in the watershed.

The DEIS says the Micron development will not result in significant adverse or cumulative effects on water resources and floodplains. However, sufficient information has not been provided to take a hard look at cumulative flooding impacts or to justify that the proposed stormwater management and wetland restoration is enough mitigation to address all of these impacts and claim no significant adverse effects.

Impervious surface cover (ISC) is a strong predictor of stream degradation, with runoff doubling when ISC reaches 10–20 increasing more than fivefold at 75–100%.<sup>35</sup> The Micron site’s conversion to a highly

---

<sup>35</sup> M. J. Paul and J. L. Meyer. 2001. “Streams in Urban Landscape.” *Annual Review of Ecology, Evolution and Systematics*, Vol. 32, No. 1.

impervious surface will degrade surrounding wetlands and food webs, disrupt wildlife with noise and lights, and lead to runoff pollution that promotes invasive plant monocultures. The wetlands on site are good quality, including red maple swamps, hemlock hardwood swamps, floodplain forests, and dogwood and willow shrub swamps. These wetlands contain a high proportion of native species that benefit insect production that serve as the basis of food webs. Lowering the water table for construction over a 15-year period will further affect surrounding streamflow and aquatic ecosystems, potentially eliminating small streams and wetlands entirely. These impacts will be compounded by additional development in Clay, Cicero, and the broader Onondaga and Oswego County areas.

Given these cumulative risks, regulators should require a higher wetland replacement ratio of 10–15:1, similar to the Seneca Meadows wetlands restoration project to adequately compensate for the loss of wetland function and flood protection.<sup>36</sup>

### **Dewatering for Construction**

Groundwater at the Micron site lies between 0.1 and 7.8 feet below the surface. To build the fabrication facilities and other underground infrastructure, Micron will need to pump water out of the construction area, a process known as dewatering. This will artificially lower the water table, potentially draining nearby wetlands, streams, and wells. The water will be stored and discharged, creating additional environmental considerations. Construction is expected to take 16 years, and the DEIS does not fully evaluate the environmental consequences of long-term dewatering or present a mitigation plan to protect nearby aquatic systems.

### **Interim Wastewater Discharge During Build-Out**

Before the full wastewater treatment plant is upgraded, Micron plans to discharge water from construction, initial equipment testing, and possibly initial manufacturing in Fab 1. A temporary water treatment system will be built, consisting of biological treatment methods. By the time Fab 1 is operational in 2029, it is expected to be producing 8.7 million gallons per day of industrial wastewater. This temporary system could operate for at least four years, handling significant volumes of wastewater, yet the DEIS provides few details about how it will treat potential pollutants. Without a thorough plan, there is no assurance that this discharge will avoid significant environmental harm.

### **Water Contamination from Construction**

Throughout the 16-year construction period, large portions of the Micron site will be cleared and excavated, exposing sediment previously stabilized by vegetation increasing erosion. The DEIS says “temporary erosion and sediment controls, stormwater management areas, and stormwater infrastructure” (p. 2-9) will be put in place. Utility installation will disturb 420 acres of land through trench excavation, pipe laying, and backfilling, or through jack-and-bore and horizontal directional drilling under streams. However, without detailed analysis of sediment transport, nutrient loading, and water quality impacts, it is unclear whether these measures will be sufficient to prevent contamination of surrounding water bodies.

## **UTILITIES AND SUPPORTING INFRASTRUCTURE**

### **Energy Use**

Micron proposes to burn 9.7 billion cubic feet of natural gas annually, primarily to incinerate process gases containing perfluorocarbons (PFCs) (p. 3-272). PFCs are powerful greenhouse gases. Micron will build a 16” diameter gas pipeline to their site, pictured in brown. Burning PFCs will create more hazardous fluorinated compounds, as discussed under Air Pollution.

To improve natural gas infrastructure the DEIS proposes upgrades to an existing facility located in Onondaga County at tax parcel 029.-01-13.1. In particular, the DEIS also proposes building a “new” natural gas line from GRS 147 to the Micron site, approximately 3 miles long (p. 2-27). The DEIS does not make clear who will pay the cost of building the new gas line. The creation of the use of a new natural gas line raises questions about the compliance with, and impacts to, CLCPA goals.

National Grid will provide power to the new Micron facility at a discounted utility rate through the Excelsior Jobs Program Rate Discounts, as part of the broader CHIPS agreement. This discount will apply to the first 10 years of the project, or Phase 1, and will amount to an estimated \$244 million. In addition, National Grid will provide a \$13.5 million revenue assurance contract and a \$8.5 million economic development grant to Micron. The DEIS does not make clear who will cover the cost of Micron’s discount. It is crucial that these discounts are not passed on to ratepayers.

### **Electricity Consumption**

Micron will use 15,674 GWh of electricity annually, equivalent to the total power used by customers in CNY (Load Zone C) in 2023 (p. 3-269). To accommodate this enormous power demand, the DEIS calls for the expansion of the existing National Grid Clay substation by approximately 10 acres and new electric transmission lines of approximately one mile. However, it is unclear who is paying the cost of this expansion. It is also unclear how this level of electricity demand will impact the cost of electricity for CNY ratepayers and the reliability of the grid. The EIS must detail both who will bear the cost of this expansion and how this expansion along with Micron’s massive electricity needs will impact the reliability of the electrical grid. The National Grid new natural gas line will not run along any property besides Micron (p. 3-8-9).

### **Telecommunications**

The DEIS notes “the Preferred Action Alternative would not result in any significant adverse effects on broadband internet connectivity or telecommunications infrastructure, as existing systems are expected to meet both current and future Proposed Project related and regional demand” (p. 0-11). The DEIS calls for the re-routing of two fiber optics lines along Caughdenoy Road and NYS Route 31 (p. 2-42).

We urge the lead agencies to ensure these investments also benefit the local community by expanding broadband access. To do so, we recommend that the telecom improvements proposed also serve the communities surrounding the facility, as the area is predominantly rural and lacks sufficient broadband

access. This would align with the recommendations of the CEC Priorities Document, which lists expanding high-speed broadband access as one of its additional priorities to “Modernize and sustainably manage utilities and natural resources for a resilient and sustainable Central New York.”<sup>37</sup>

## Water Use

Micron’s megafab is expected to use 48 million gallons of water per day (p. 2-31), and liquid waste generation per day is expected to be 8-20 million gallons, according to Micron’s OCIDA application.<sup>38</sup> Micron will receive its water from the district’s water source, which is Onondaga Lake. The water will be treated at Oak Orchard Wastewater Treatment Plant. Micron is working with the Onondaga County Water Authority to expand capacity by installing new wastewater force mains, pumping stations, and improvements to the Oak Orchard Wastewater Treatment Facility. Due to expanded capacity, a new wastewater/sewage treatment district will be created. The receiving water for this new wastewater treatment district will be the Oneida River. The DEIS also states the site will include on-site infrastructure to reuse water (2-37).

Onondaga County will plan, construct, and operate this expanded wastewater treatment plant, and Micron will pay for their services. However, Onondaga County will be responsible for removing any toxic chemicals from Micron's industrial wastewater that are not eliminated during pretreatment (see discussion of PFAS). Recent news reports indicate that Onondaga County’s sewage plant on Hiawatha Boulevard was shut down due to unhealthy air quality, suggesting that the County does not have a strong track record in managing wastewater treatment plants.<sup>39</sup>

During the four years needed to construct this expansion, Micron will construct a temporary water treatment project for construction, initial equipment testing, and possibly initial manufacturing. The temporary plant will be responsible for treating up to 8.7 million gallons per day of industrial wastewater. However, very few details about the design, operation, or oversight of this temporary wastewater treatment are provided. The final EIS must provide more details about how both the temporary and future treatment plants will be managed to prevent adverse health and safety impacts.

According to reporting from 2023, the cost of the wastewater and water system expansion is estimated to be \$625 million.<sup>40</sup> However, the DEIS does not confirm whether this estimate is accurate. Nor is it clear who will pay for the cost of the expansion. According to OCWA, they expect Micron to pay for the

<sup>39</sup> Coin, Glenn. 2025. “The air is so toxic in Onondaga County’s new \$23 million sewage building that workers can’t go inside.” *Syracuse.com*, July 14, <https://www.syracuse.com/news/2025/07/the-air-is-so-toxic-in-onondaga-countys-new-23-million-sewage-building-that-workers-cant-go-inside.html>.

<sup>40</sup> Coin, Glenn. 2023. “It could cost \$625 million to bring water from Lake Ontario to Micron. It’s not clear who’s paying.” *Syracuse.com*, October 18. <https://www.syracuse.com/business/2023/10/it-could-cost-625-million-to-bring-water-from-lake-ontario-to-micron-its-not-clear-whos-paying.html>.

majority of the costs, while Micron has said they will only pay for part of the expanded water system.<sup>41</sup> It's critical that ratepayers do not bear the burden of Micron's massive water use and that infrastructure upgrades designed exclusively to meet Micron's needs do not come at the expense of other necessary upgrades to ensure a safe and reliable water system for the general public.

Although County water authorities have stated that ratepayers are unlikely to bear the full cost of upgrades, "OCWA reports that if its users were to bear the entire cost, the typical homeowner's bill would increase by 60%."<sup>42</sup> Additionally, will Micron receive any discounts from OCWA for its water use? The final EIS must clearly state whether any discounts will be provided to Micron, and if so, who will bear the cost of those discounts.

### **Utilities and Supporting Infrastructure Recommendations**

*Commit to affordability and abundance of energy & clean water for communities* - Micron must ensure that their massive energy and water use does not compromise the affordability or availability of energy and clean water in Central New York or elsewhere. The costs of infrastructure upgrades and increased energy demand to benefit Micron should not be borne by ratepayers. The EIS must clearly state who will pay for the upgrades and expansion to water, electricity, energy, and telecom infrastructure. Additionally, the EIS must make clear if the cost utility tax abatements that Micron will receive will be offset onto ratepayers.

## **GREENHOUSE GAS EMISSIONS, CLIMATE CHANGE, AND CLIMATE RESILIENCY**

### **Renewable Energy and Scope 2 Climate Impact**

The DEIS concluded, "The GHG [greenhouse gas] emissions that would result from construction and operation of the Proposed Project are expected to be **unavoidably significant**. Even with significant avoidance and minimization efforts as well as mitigation, GHG emissions associated with operation of the Micron fabs and related facilities will represent a significant increase in overall GHG emissions in the Five County Area and New York State." (p. 5-2)

To their credit, the authors of the DEIS acknowledge that the GHG emissions will significantly contribute to climate change. However, we are shocked that more has not been done to make these emissions avoidable, especially given the urgency of local and global efforts to combat climate change.

The most significant GHG emissions from semiconductor processing, distinct from Micron's energy use, are fluorinated gases, which are extremely potent and persistent greenhouse gases. Some of these gases remain in the atmosphere for tens of thousands of years. The DEIS estimates that the project will release 881,699 metric tons CO<sub>2e</sub> per year of these gases, even after on-site thermal oxidation (incineration) (p. 3-205). Furthermore, stack emissions are treated by wet scrubbing to reduce acid releases. These

---

<sup>41</sup> Ibid.

<sup>42</sup> Ibid.

scrubbers discharge pollutants, including PFAS, into wastewater, where they must then be removed and/or treated.

The DEIS identifies another category of processed greenhouse gas emissions, heat transfer fluids (HTFs). The DEIS projects annual fugitive HTF emissions of 199,699 metric tons/y CO<sub>2e</sub> per year. While the DEIS notes that the semiconductor industry is researching ways to prevent such releases, it offers few details. For now, Micron expects to pass the environmental costs of its greenhouse gas emissions onto the public.

The DEIS claims that the company will mitigate 2.4 million tons of CO<sub>2e</sub> through the purchase of renewable electricity (p. 3-215), yet it provides no procurement guidelines and fails to acknowledge the mitigation limitations of renewable energy credits (RECs). Unless it actually creates renewable energy generation, the Micron project will cause the release of a huge amount of carbon dioxide from energy generation. Without significantly more stringent mitigation, the proposed project will have substantial negative impact on New York's renewable electricity targets, necessitating the continued operation of fossil gas power generation beyond current plans and introducing significant additional on-site gas burning as is discussed more in the section analyzing the project's impact on the state's CLCPA goals.

To reduce greenhouse gas emissions from electricity production, a huge buildout of renewable energy will be needed. Micron plans to install solar panels on a few office buildings, locomotive sheds, and parking garages, generating 4,161 MWh per year; however, this is less than .03% of Micron's electricity needs (p. 3-203). Much more must be done to meet CLCPA requirements.

### **Best Management Practices and Renewable Energy Credits**

The DEIS asserts that "To further avoid and minimize GHG emissions and effects to climate change and climate resiliency during construction and operations, Micron would implement the best management practices (BMPs) noted within this Chapter and additionally in Table 3.7-14" (p. 0-9). In the context of addressing the significant climate impacts of this project related to its electricity consumption, Micron makes disconcerting claims.

1. Micron will "install on-site renewable energy systems and onsite battery storage systems to supplement the Proposed Project's energy supply to the extent practicable" (p. 3-215).

This represents one of several sustainability requirements set out in the New York Green CHIPS legislation.<sup>43</sup> However, while the claim is included several times throughout the DEIS, the scale of the project severely limits its usefulness in climate mitigation to little more than a box-ticking exercise. Table 3.7-13 reports that the 4MW solar array will mitigate a projected 457 metric tons of Scope 2 emissions per year, out of a total projected Scope 2 emissions footprint of 2,273,587 metric tons, or 0.02%.

2. "Micron also has committed to reduce its Scope 2 emissions by purchasing 100 percent carbon-free electricity utilizing power purchase agreements and renewable energy credits for the power consumption of the Micron Campus, thus avoiding up to approximately 2.4 MMT of CO<sub>2e</sub>

---

<sup>43</sup> "Micron Green CHIPS Sustainability Requirements." Empire State Development. <https://esd.ny.gov/micron-green-chips-sustainability-requirements>.

(p. 3-215). “When compared to pre-mitigation GHG emissions, Micron avoids approximately 77 percent of potential GHG emissions.”

Micron has committed to 100% carbon-free electricity emissions to reduce Scope 2 emissions as a result of the purchase of renewable electricity (p. 3-215), offsetting the full projected 2,394,307 metric tonnes of emissions included in table 3.7-10 (p. 3-205).

The purchase of renewable electricity represents a significant portion of its claim of mitigating 77% of potential GHG emissions - a claim which must be closely examined (p. 3-46). The DEIS states that Micron will utilize power purchase agreements and renewable energy credits, but fails to commit Micron to any specific ratio, nor does it preclude Micron from relying entirely on unbundled renewable energy credits to meet this claim.

The purchase of unbundled RECs is widely understood to be ineffectual as a strategy for reducing fossil fuel emissions. The U.S. Department of Energy, for example, has explicitly concluded that RECs are not effective in reducing GHG emissions or deploying additional renewable energy:

Given the impacts of adding load to the grid... purchasing an Energy Attribute Certificate<sup>44</sup> from any low-GHG generator is not in and of itself sufficient to justify a claim of low lifecycle GHG emissions due to the presence of induced effects.<sup>45</sup>

The use of RECs as a best management practices (BMP) is contrary to the common usage of BMPs in other contexts, and as a practice is inappropriate to apply here. The EPA’s Guidance Manual for BMPs states “Best management practices are **inherently pollution prevention practices.**”<sup>46</sup> It has been widely and firmly established that the purchase of RECs does not prevent or reduce pollution, and as such cannot be considered a BMP.

Agencies, including the U.S. Department of Energy (DOE), has explicitly said that RECs are not effective in reducing GHG emissions (pollution) or deploying additional renewable energy. Per the DoE Assessing Lifecycle Greenhouse Gas Emissions Associated with Electricity Use for the Section 45V Clean Hydrogen Production Tax Credit.

Numerous academic studies have shown that the relatively small revenue generated from the sale of unbundled RECs, given their low per unit price, has done little to expand renewable energy capacity.<sup>47</sup>

---

<sup>44</sup> EAC is another term for REC.

<sup>45</sup> “Assessing Lifecycle Greenhouse Gas Emissions Associated with Electricity Use for the Section 45V Clean Hydrogen Production Tax Credit,” Department of Energy, 2023, 8, [https://www.energy.gov/sites/default/files/2023-12/Assessing\\_Lifecycle\\_Greenhouse\\_Gas\\_Emissions\\_Associated\\_with\\_Electricity\\_Use\\_for\\_the\\_Section\\_45V\\_Clean\\_Hydrogen\\_Production\\_Tax\\_Credit.pdf](https://www.energy.gov/sites/default/files/2023-12/Assessing_Lifecycle_Greenhouse_Gas_Emissions_Associated_with_Electricity_Use_for_the_Section_45V_Clean_Hydrogen_Production_Tax_Credit.pdf).

<sup>47</sup> Holt, E., Sumner J. and L.Bird, “The Role of Renewable Energy Certificates in Developing New Renewable Energy Projects,” National Renewable Energy Laboratory, (2011): <https://docs.nrel.gov/docs/fy11osti/51904.pdf>; M. Brander, M. Gillenwater & F. Ascui, “Creative accounting: A critical perspective on the market based method for reporting purchased electricity (scope 2) emissions,” *Energy Policy*, vol. 112, (2018): 29-33. <https://www.sciencedirect.com/science/article/pii/S0301421517306213>.

Recent studies indicate that the purchase of unbundled RECs rarely results in the addition of renewable energy to the grid, and in fact, are significantly undermining the credibility of voluntary corporate targets under the Science Based Target initiative.<sup>48</sup>

**As an action to effectively reduce or eliminate GHG emissions from electricity generation, the purchase of RECs is inappropriate and insufficient, and cannot be considered a BMP.**

Further, neither the DEIS nor Micron’s Sustainability Report provide any details to demonstrate whether the company’s REC procurement practices would meet criteria for high-impact sourcing, or simply prioritize lowest-cost options. According to Micron’s latest available CDP report, renewables currently accounted for 10.4% of the company’s total U.S. electricity consumption in its current operations (in Idaho and Virginia), of which only 4.9% is from sources that may meet high-impact criteria, namely, those connected to local transmission and additional to the grid. To meet the company’s goal of sourcing 100% renewable electricity for its U.S. demand by the end of 2025, Micron will likely be heavily reliant on REC purchases.

The DEIS acknowledges that “Scope 2 emissions from offsite fossil fuel combustion to generate electricity account for almost half of total GHG emissions from the semiconductor manufacturing sector (U.S. Department of Commerce NIST-CPO 2024),” emissions that will be merely hidden if the company pursues a low-impact sourcing approach for renewable electricity.

To accurately represent its impacts, the environmental review should clearly state the criteria by which RECs/ EACs will be sourced, and how Micron will prioritize high impact Power Purchase Agreements (PPAs) and battery storage.

In sum, contrary to the fanciful claims in the DEIS, neither the purchase of RECs nor the purchase of renewable power from generators that are already connected to the grid mitigate carbon dioxide emissions from electricity generation. Mitigation can only be done through additional renewable energy generation that is added to the grid or serves Micron directly.

**Furthermore, even if Micron’s renewable electricity goal is achieved, it is inaccurate to claim that purchasing renewable electricity will mitigate 100% of Micron’s Scope 2 emissions.**

Micron’s commitment and its renewable electricity matching approach are not sufficient to mitigate its emissions, as they do not adequately reflect actual demand and induced power generation. This is because mitigation is calculated on an annual, rather than granular temporal basis (e.g. hourly or less). The annual matching model used by Micron calculates the total MWh of electricity consumed by the company over the course of a year, which it then offsets with an equivalent quantity of MWh of purchased renewable electricity. However, semiconductor fabs such as the one proposed by Micron rely on significant and relatively constant electricity supply to operate 24/7.<sup>49</sup> Matching annual electricity consumption with

---

<sup>48</sup> Lloyd Bjorn and Matthew Bander, Matthew, “Renewable energy certificates threaten the integrity of corporate science-based targets.” *Nature Climate Change*, volume 12, (2022): 539–546, <https://www.nature.com/articles/s41558-022-01379-5>.

<sup>49</sup>Chen, Steven; Gautam Apoorv; and Weig Florian. 2013. “Bringing energy efficiency to the fab.” McKinsey on Semiconductors. [https://www.mckinsey.com/~media/mckinsey/dotcom/client\\_service/operations/pdfs/bringing\\_fabenergyefficiency.ashx](https://www.mckinsey.com/~media/mckinsey/dotcom/client_service/operations/pdfs/bringing_fabenergyefficiency.ashx).

annual renewable electricity purchases implies that the fab is powered by solar power at night, or by wind power on still days – an inaccurate and misleading claim. This hides a significant additional fossil fuel load demand added to the grid to ensure that the fab can keep operating when renewable power sources are unavailable.

To put this in context, Google has a commitment to 24/7 carbon-free energy to power its operations. Despite having been claiming to run on 100% renewable electricity for several years prior to the announcement, when calculated on a 24/7 hourly-matching basis, Google’s actual carbon-free energy ratio, accounting for grid energy, was just 66%.<sup>50</sup>

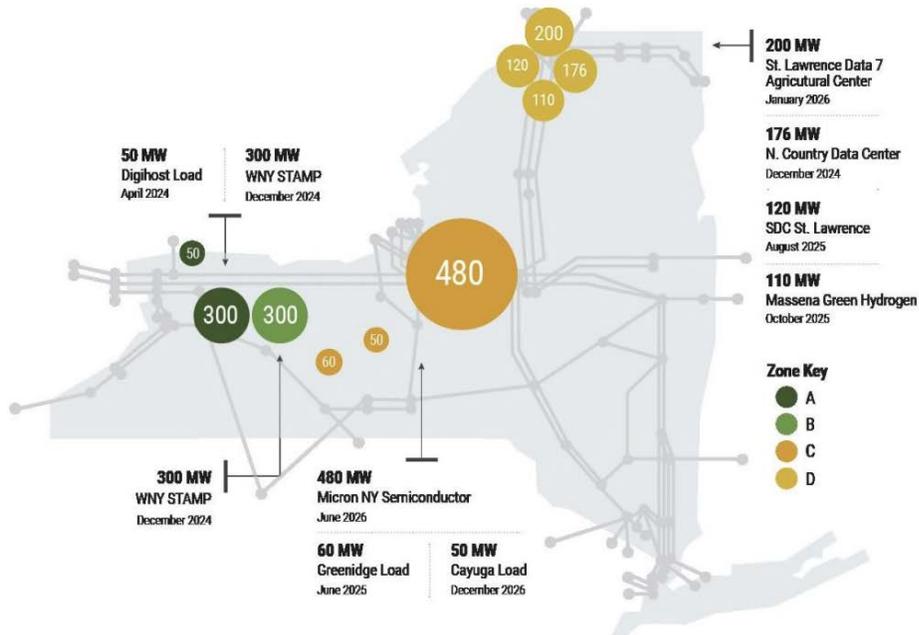

**To deliver real Scope 2 emissions mitigation, Micron must commit to power its facilities using 24/7 hourly-matched carbon-free energy, prioritizing new renewable electricity and battery storage. This is the only approach that would meaningfully decarbonize the grid and avoid additional fossil fuel buildout.**

The New York Integrated Systems Outlook already projects that fossil fuel power generation will need to remain online longer due to increased demand, including the Micron plant, which is identified as the most significant single demand source, at an additional 480MW:

---

<sup>50</sup> “Google Environmental Report.” Google, 2025: 107.  
<https://www.gstatic.com/gumdrop/sustainability/google-2025-environmental-report.pdf>.

Capital Regions. Most of these new loads consist of manufacturing facilities and data centers, as well as potential hydrogen production operations. The following diagram highlights the large loads that are assumed to be connected in the Base Case:

51

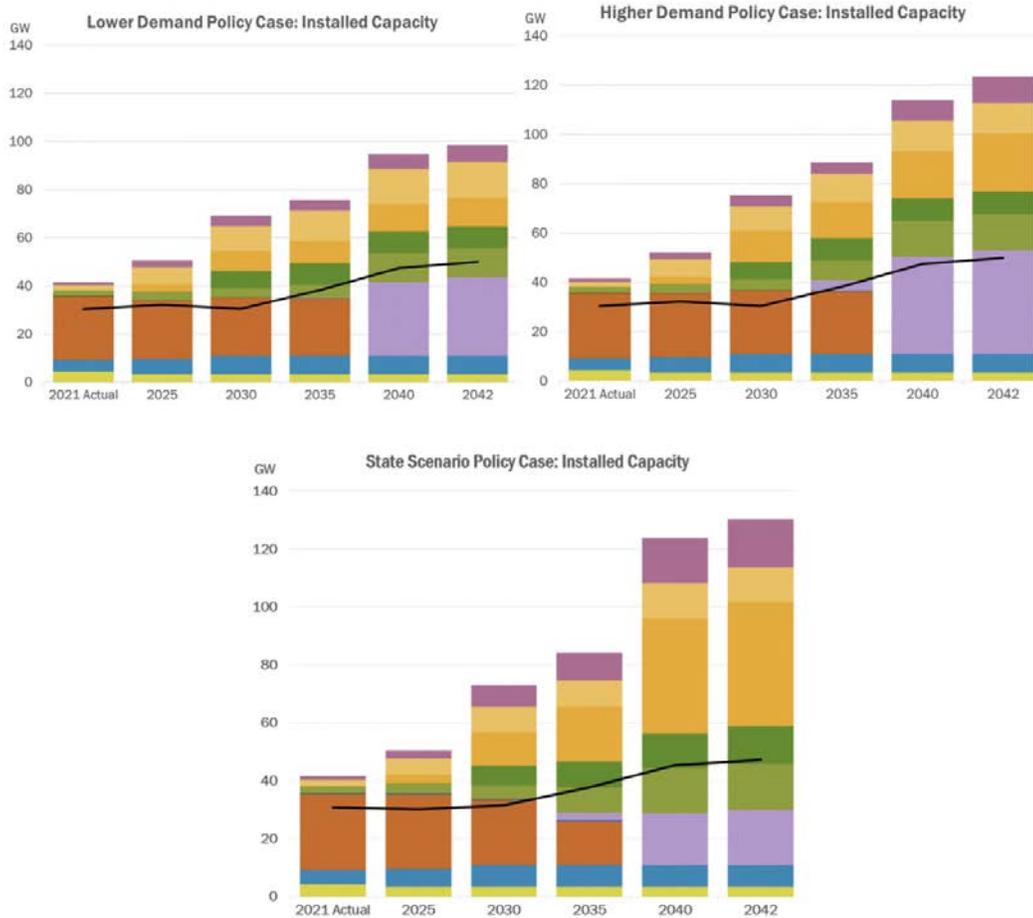

Under all growth scenarios, the NYISO expects electricity demand to grow significantly through 2042, requiring generation capacity to triple. According to the *Outlook*, since the previous forecast was published the ISO now projects a “greater need for grid energy to be supplied from dispatchable resources (e.g., fossil fuel or DEFR) compared to past evaluations,” in part due to a revised forecasted hourly demand profile, likely influenced by major load sites such as the Micron fab. The tables below show fossil fuel generation (orange) and “DEFR” (purple), which includes fossil fuels, as well as new and as-yet unproven technology. If the unproven small modular reactors (SMRs) and green hydrogen do not materialize, the increased demand could be met by fossil fuels that would otherwise be slated for retirement, undermining New York’s climate goals.

<sup>51</sup> “2023-2042 System & Resource Outlook (The Outlook).” New York Independent System Operator, 2024: <https://www.nyiso.com/documents/20142/46037414/2023-2042-System-Resource-Outlook.pdf>.

✓ **New York will require three times the capacity of the current New York generation fleet to meet projected future electricity demands.**

The total installed generation capacity to meet policy mandates within New York is projected to range between 100 GW and 130 GW by 2042. This conclusion is consistent with the findings from the prior Outlook. The following diagrams show the installed capacity required for each of the three Policy Case scenarios. Each color represents a different resource type as follows:

■ Nuclear 
 ■ Hydro 
 ■ Fossil 
 ■ Other 
 ■ DEFR 
 ■ LBW 
 ■ OSW 
 ■ UPV 
 ■ BTM-PV 
 ■ ESR 
 — Load+Charge+Electrolysis

NY-ISO identifies load flexibility as a key mitigation measure for new large-load projects connecting to the grid, of which the Micron proposed project is the largest:

“For new large load projects connecting to the New York power system, the ability to move load from times of greater system demand to times with lower system demand or higher renewable energy production, or load flexibility, should be considered. Load flexibility can significantly reduce the generation capacity requirements and, in turn, potentially reduce the generation capacity buildout needed to meet policy mandates. For every one megawatt (MW) of peak load flexibility enabled, the amount of renewable capacity required is reduced by at least one MW and potentially much more.”

This technology is already available and ideally suited for large-load industrial processes such as the proposed Micron fab, presenting significant potential benefits and mitigation potential.<sup>52</sup> However, the DEIS fails to address the potential or importance of demand flexibility in avoiding significant spikes in fossil fuel demand.

While New York state is investing significantly in improved transmission lines and prioritizing renewable power generation to meet new demand growth and achieve renewable electricity targets, it is worth noting that the State Comptroller has identified that this build-out can negatively impact ratepayers. The costs of incentivizing renewable electricity development and transmission upgrades are borne almost entirely by New York’s utility customers through a charge per kilowatt-hour of electricity consumed. New York’s ratepayers already face among the highest charges on a state by state basis.<sup>53</sup>

While Micron’s plan includes provisions to support the improvement of state transmission lines directly to the facility, further improvements required at the state level to maintain and upgrade the grid will be borne by ratepayers and other electricity consumers. Micron is proposing no more than purchasing low-cost RECs, with no obligation to contribute to state renewable generation or grid infrastructure. This is unacceptable and contrary to CLCPA requirements.

**The DEIS fails to consider the project’s impact on New York’s attainment of its statutory renewable energy mandates, which are not advanced by Micron’s proposed purchase of RECs.**

Under the Climate Leadership Community Protection Act, by 2030, a minimum of 70% of the statewide electric generation secured by jurisdictional load serving entities to meet the electrical requirements of end-use customers in New York state “shall be generated by renewable energy systems,”<sup>54</sup> en route to achieving statewide greenhouse gas emission reductions of at least 85% below 1990 levels by 2050.<sup>55</sup> As discussed in the New York Public Service Commission’s order on the Biennial Review of the state’s Clean Energy Standard, New York has a considerable distance to go in achieving the 70% renewable

<sup>53</sup> New York State comptroller, Thomas P. DiNapoli. 2023. “Renewable Electricity in New York State: Review and Prospects.” <https://www.osc.ny.gov/files/reports/pdf/renewable-electricity-in-nys.pdf>.

<sup>54</sup> P.S.L. § 66-p(2)(a).

<sup>55</sup> Env. Conserv. L. § 75-0107(1)(b).

energy by 2030 mandate. As of 2022, renewable and zero-emission electric generation comprised only 46.1% of statewide load.<sup>56</sup>

The state's ability to reach 70% renewables has been challenged by a number of factors including global interest rates, inflation, supply chain pressures, transmission system inadequacies, interconnection delays, changes to capacity accreditation at the New York Independent System Operator, changes in federal incentives, siting complexities, and growing statewide electric load.<sup>57</sup>

Micron represents a massive new source of electricity demand in New York State and will further impede the state's efforts to achieve 70% renewable energy by 2030. Total retail electricity sales in 2023 were 139,422 GWh,<sup>58</sup> meaning that Micron's 15,673 GWh would represent 11.2% of New York's total electricity consumption. Introducing a single load that increases statewide electricity consumption by more than 11% has major implications for the state's ability to meet its climate and clean energy legal mandates, an issue the DEIS fails to adequately address.

To comply with the CLCPA's 70% renewable energy mandate, the state would need to procure an additional 10,971 GWh of renewable energy—70% of Micron's anticipated demand. Yet, the DEIS does not assess the environmental impacts of this additional energy development burden.

Micron's use of fossil fuels and the expansion of a natural gas line move New York further away from the CLCPA goals of 70% renewable energy by 2030 and 100% zero-emission energy by 2040. This appears to be a violation of the CLCPA. In addition, the DEIS fails to explain why Micron is not utilizing another form of energy, preferably renewable, rather than proceeding with a new gas line to the facility.

## **Renewable Energy Recommendations**

**Generate renewable energy and minimize contributions to the global climate emergency** - To meet Micron's 100% renewable energy commitment and comply with the NY State's requirement to significantly mitigate the factories' greenhouse gas emissions, the company must create a comprehensive plan to generate or purchase new renewable energy using wind, solar, and grid and storage infrastructure - without relying on the purchase of renewable energy credits.

The State of New York should incentivize the reduction of Micron's GHG process gas emissions by withholding incentives or imposing penalties for those emissions. If officials accept the project's GHG emissions are "unavoidable", Micron will effectively be granted a blank check to contribute significantly to climate change.

<sup>57</sup> *Id.* at 8.

<sup>58</sup> EIA. 2023. New York Electricity Profile. <https://www.eia.gov/electricity/state/newyork/>.

## **Additional Recommendations**

- Require 24/7 renewable electricity that meets criteria for temporal, location and additionality-based matching, to avoid contributing to fossil fuel late retirement and to safeguard New York’s climate goals.
- Incorporate load flexibility as key mitigation strategy to reduce grid strain and fossil fuel reliance.
- Eliminate the use of unbundled RECs entirely, as they do not deliver real emissions reductions or support new renewable generation.

## **SOLID WASTE, HAZARDOUS WASTE, AND HAZARDOUS MATERIALS**

### **High Level Takeaway**

Micron, like other semiconductor producers, has always utilized and released into the environment a wide range of hazardous substances. In fact, the industry introduces hazardous substances into wafer fabrication faster than researchers can determine their toxicity and government agencies can regulate them. The Clay environmental review provides an opportunity to address potential semiconductor pollution in advance.

Unfortunately, the draft Environmental Impact Statement (DEIS) is vague, providing the public and relevant agencies insufficient information to determine if best practices will be used to prevent human and environmental exposure to chemicals from the Micron factory.

While we understand that Micron cannot stop using hazardous substances that are intrinsic to production, the costs—health, environmental, and financial—of releases of these substances are borne by others. Micron, therefore, has an obligation to reduce the use of such substances and prevent their release into surface water, groundwater, and the atmosphere, as well as comply with state and federal regulations and statutes.

Furthermore, the sixteen-year-plus timeframe in the DEIS does not appear to provide a mandatory mechanism for updating the review, which is a material omission. The semiconductor industry is constantly upgrading its products and modifying its processes, so approval of the EIS should include a requirement for periodic updates to ensure that the potentially additional impacts from updated processes do not become significant.

Finally, the semiconductor industry, through organizations such as the Semiconductor Research Consortium, is sponsoring research with the objectives of understanding and addressing the potential environmental impacts of the use and release of PFAS “Forever Chemicals.” We believe that this is because the companies expect PFAS to be both monitored and regulated. Therefore, careful review and documentation, in the final EIS, of the current state of PFAS impacts of semiconductor production is key to a thorough assessment of the issue. Such an assessment would promote better management practices as well as beneficial substitution of other substances.

### **Failure to identify chemicals & quantities.**

The DEIS needs to include far more detail about what chemicals are being used by Micron. New York State has issued regulations specifying the content of an adequate EIS. NYCRR 617.9 (b)(1) states “ An EIS must assemble relevant and material facts upon which an agency's decision is to be made. It must analyze the significant adverse impacts and evaluate all reasonable alternatives.” The DEIS fails to meet this standard.

Table 3.8-9 (p. 3-242) lists various hazardous chemicals: flammable gases, pyrophoric gases, corrosives, toxic gases, oxidizers, asphyxiants, flammable liquids, and water reactive substances. (Pyrophoric chemicals spontaneously catch fire when exposed to air.) The DEIS needs to list the identity and quantities of these chemicals to properly define health and safety risks for both workers and the surrounding community. Moreover, the environmental impacts of a sudden release of hazardous chemicals can only be assessed if the identity and potential quantities are given in the EIS.

The Programmatic Environmental Impact Statement for Modernization and Expansion of Existing Semiconductor Fabrication Facilities offers an example of the level of detail needed in an EIS for a semiconductor fab, whether new or existing. Appendix D of said document has ten pages listing about 200 “representative” chemicals used by the semiconductor industry. All of these are listed under the Toxic Substances Control Act (TSCA).<sup>59</sup> NIST also offers specific information regarding hazardous chemicals used by the chips industry in Table 3.8-1, shown on the next page.<sup>60</sup>

In contrast, the DEIS (p. 3-244) lists *only* eight chemicals (ammonium hydroxide, anhydrous ammonia, hydrogen, hydrogen chloride, silane, chlorine, dichlorosilane, and HF) which meet the narrow definition of “extremely hazardous substances” above applicable threshold quantities given in 40 C.F.R. § 68.130. Fewer than ten other chemicals are mentioned on pages 3-237 and 3-239. This is completely inadequate for the agencies to analyze the significant adverse impacts. All of the chemicals used by Micron in its manufacturing process must be identified and approximate quantities provided.

Table 3.8-10 (DEIS, p.3-242) illustrates the inadequacy of the chemical information in the DEIS. This table, titled Hazardous Materials, reveals that 13.5 million gallons of “Liquid corrosives” will be stored at each fab. Critically, the type of corrosives is not identified. Sulfuric acid is a corrosive. So is ferric chloride. These pose completely different types of risk and environmental impacts. Therefore, the failure to specify the type of corrosives makes it impossible to provide a meaningful impact analysis.

This issue is repeated for all other categories of chemicals. For example, the DEIS lists 94,600 pounds of toxic gases stored at each fab but it is impossible to tell how toxic these “toxic gases” are. It is well established that the chips industry uses deadly gases like arsine, phosphine and nitrogen trifluoride (see e.g. NIST 2024, Table 3.7-1).<sup>61</sup> The DEIS needs to specify how much of these gases will be stored on site, and how they will be handled, to meet the requirements of NYCRR 617.9 (b)(1).

| Specialty gases                              | As precursors to deliver a substance such as arsenic or tungsten onto the wafer or into the silicon lattice (used in small quantities); to dry-etch a pattern onto the surface of the wafer. | Silane                                                                                     | 2.1 Flammable Gas                  |
|                                              |                                                                                                                                                                                              | Ammonia, nitrogen trifluoride, sulfur hexafluoride                                         | 2.2 Non-Flammable Compressed Gas   |
|                                              |                                                                                                                                                                                              | Ammonia, phosphine, tungsten hexafluoride, arsine, CO, fluorine, chlorine, diborane        | 2.3 Poisonous Gas                  |
| Organic compounds (commonly solvents)        | As constituents in specialty chemicals; to clean the wafer; as part of the photolithography process.                                                                                         | Isopropanol, xylene, propylene glycol ethers, acetone                                      | 3 Flammable and Combustible Liquid |
| Metallic compounds                           | Applied to the wafer in specific locations to create transistors; to plate wafers to provide electrical connections.                                                                         | Copper sulfate                                                                             | 9 Miscellaneous Hazardous Material |

Sources: ISMI, 2006; 49 C.F.R. Part 172; EPA, 2022a.

The DEIS says Micron will request “detailed chemical constituent documentation from its chemical vendors, including PFAS content. Those vendors often require a non-disclosure agreements before divulging such information.”<sup>62</sup> Here, such non-disclosure is unacceptable. The public has a right to know the identity of hazardous substances used and released in their communities. Most assuredly, Micron’s competitors rely on the same chemical suppliers, so it’s difficult to justify anything but full disclosure of the constituents of the industry’s process and product chemicals.

### Forever Chemicals

The DEIS language on per-and polyfluoroalkyl substances (PFAS) “forever chemicals” is sketchy and general, providing no information about the types of PFAS to be used and/or discharged from the facility. PFAS constitute a large class of over 12,000 fluorinated chemicals that have gained notoriety due to their

<sup>62</sup> *Micron Semiconductor Manufacturing Project, Clay, NY Draft Environmental Impact Statement, (DEIS)CHIPS Program Office and Onondaga County Industrial Development Agency, June, 2025, EISX-006-55-CPO-001, p. 3-240. <https://ongovod.com/wp-content/uploads/2025/06/Micron-Draft-EIS.pdf>.*

persistence, their ability to accumulate in the bodies of human beings and wildlife, and their toxicity. The CHIPS Program Office PEA (2024) in its *Final Programmatic Environmental Assessment for the Modernization and Expansion of Existing Semiconductor Fabrication Facilities* contains considerable detail about the use of PFAS in wafer fabrication. It reported, “Semiconductor manufacturers use PFAS as an essential material in multiple steps in the fabrication process.”<sup>63</sup> However, the entire semiconductor industry, including Micron, has stopped using PFOA and PFOS, the only two PFAS with federal drinking water standards. Appendix C of that document includes a 10-page table listing the numerous types of PFAS used by the semiconductor industry. The DEIS must be revised to include far greater detail about the types and quantities of PFAS used in the Micron fabs to facilitate a thorough assessment of their likely impact.

Regulation of PFAS has not caught up to the reality that hundreds of types of PFAS are employed in modern chip manufacturing. Most regulations are focused on just two types of PFAS: perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS). The state of New York and USEPA have issued drinking water standards only for these two types of PFAS.<sup>64</sup> NY state has also issued drinking water quality guidelines for PFOA and PFOS only.<sup>65</sup>

However, these types of PFAS are no longer used by the chips industry. As noted in CHIPS (2024; p. C-15), “Long-chain PFAS compounds, such as PFOS, have been replaced by short-chain PFAS. Another long-chain PFAS, PFOA, was phased out in the United States by 2015 and is projected to be eliminated globally by 2025.”<sup>66</sup>

### **Treatment of PFAS in wastewater**

Wastewater generated at Micron’s facility will be treated in a pre-treatment system on the Micron campus, and portions thereof sent to a specialized facility owned and operated by Onondaga County: “Industrial wastewater generated on the Micron Campus that is not treated at the campus for reuse would be sent as secondary residual wastewater via the wastewater conveyance to the IWWTP at the Oak Orchard Site. For compliance with ECL Article 17 (6 NYCRR Part 750), the IWWTP would be required to obtain an individual SPDES permit issued by NYSDEC to permit discharge of treated industrial wastewater into surface waters associated with the Oneida River.” (DEIS, p. 3-83).

The DEIS (p. 3-83) acknowledges that the wastewater sent to the IWWTP will contain PFAS, since the “IWWTP also would include technologies specifically designed to remove emerging contaminants, such as per- and polyfluoroalkyl substances (PFAS), including reverse osmosis and nanofiltration ... granular activated carbon ..., ion exchange resins ... and advanced oxidation processes.... To comply with its SPDES permit for the IWWTP, OCDWEP would be required to perform regular analytical testing of surface water and effluent samples collected using NYSDEC-approved methods and would be subject to ongoing sampling, monitoring, and reporting requirements.”

<sup>65</sup> NYS Dept of Environ. Conservation. 2023. “2023 ADDENDUM TO JUNE 1998 DIVISION OF WATER TECHNICAL AND OPERATIONAL GUIDANCE SERIES (TOGS) NO. 1.1.1.” [https://extapps.dec.ny.gov/docs/water\\_pdf/togs111addendum2023.pdf](https://extapps.dec.ny.gov/docs/water_pdf/togs111addendum2023.pdf)

<sup>66</sup> EPA, 2022; WSC, 2023.

The DEIS claims that “Based on these measures, industrial wastewater discharges from operation of the IWWTP would not be anticipated to result in significant adverse effects on water resources outside the mixing zone.”

This claim is false for several reasons. First, NYSDEC-approved analytical methods, namely USEPA draft Method 1633, only measures 40 types of PFAS. Research conducted at Cornell University<sup>67</sup> and elsewhere<sup>68, 69</sup> demonstrates that wastewater created by semiconductor manufacturing contains potentially hundreds of different types of PFAS. In particular, the study noted that, “Nontarget analysis revealed the presence of 41 homologous series of PFASs comprising 133 homologues.”<sup>70</sup> Of these, a fraction can be identified using sophisticated analytical techniques. The remainder are “non-target” PFAS which can constitute a significant fraction of the total mass of PFAS in the wastewater. The same study found that concentrations of non-targeted PFAS—that is, chemicals not detected using official analytic methods—significantly exceed the concentrations of known, “targeted” compounds in chip plant effluent. Furthermore, wastewater may include transformation products not found in chemical inputs. It is important to recognize that one type of “forever chemicals” may transform into other “forever chemicals.” Micron must test its wastewater using a combination of methods for the whole range of PFAS that may be present.

Second, the claim that, by treating the wastewater, that there will not be “significant adverse effects on water resources outside the mixing zone” is based on the false assumption that dilution of PFAS will eliminate their ill effects. Nothing could be further from the truth. PFAS are called “forever chemicals” because they do not break down in the environment. PFAS are known to bioaccumulate in humans, animals, and in some cases, plants. The CHIPS PEA (2024; p. C-15) states that “Wastewater discharge from semiconductor fabrication facilities presents a substantial risk for PFAS contamination of the environment.”

The treated wastewater will be discharged to the Oneida River, which merges with the Seneca River to become the Oswego River, which discharges into Lake Ontario. The Onondaga County Water Authority, along with many other water suppliers around this great lake, draws its water supply from Lake Ontario. PFAS which is discharged in Micron’s treated wastewater will eventually contaminate Lake Ontario and potentially the OCWA drinking water supply.

The CHIPS PEA explains that “most facilities send 100 percent of TARC [Top Anti-Reflective Coating] waste to industrial wastewater drains, unless segregated in a separate drain and collection system for disposal. TARCs currently account for over 50 percent of total PFAS used in photolithographic processes worldwide and thus contribute a large portion of the PFAS found in wastewater discharges.”<sup>71</sup>

Micron’s approach to PFAS treatment is also discussed on page 3-241: “Early evaluations suggest that the most effective wastewater treatment solution for the Proposed Project will involve installation of PFAS segregation technology targeted to the relevant process wastewater streams. Micron’s final design will include wastewater treatment for regulated PFAS-containing wastewater that meets current regulatory requirements under New York and Federal law prior to discharge to the IWWTP.”

Micron is correct to segregate process wastewater streams that contain PFAS. However, to mitigate the serious environmental harms created by discharges of PFAS via wastewater, Micron needs to do more than “meet current regulatory requirements.” As explained above, current regulatory requirements are **not protective of the environment** because they do not address the hundreds of persistent and toxic PFAS found in the semiconductor industry’s wastewater. Micron needs to install at its pre-treatment plant or cause to be installed at the Onondaga County plant, state-of-the art treatment technology (such as reverse osmosis, advanced oxidation, surface plasma treatment) which completely eliminates the entire range of PFAS compounds. It then needs to monitor performance of the treatment system using sophisticated analytical technologies to demonstrate its effectiveness.

The DEIS (p.3-241) states “Micron would dispose of or otherwise manage waste known to contain regulated PFAS in accordance with applicable regulations and as appropriate given its content and characteristics.” Again, current regulatory requirements are not protective of the environment and mere assurances of regulatory compliance are insufficient to ensure that there will be no significant impacts

## Relative PFAS Toxicity (noncancer Reference Dose) (based on references in HIDOH PFAS guidance February 2025)

Furthermore, while the *persistence* of all forever chemicals is a given because of the strong carbon-fluorine bond, the *toxicity* of most of them varies, and for many, it is largely unknown. The state of Hawaii prepared the following chart, showing the relative non-cancer risk of several PFAS compounds. In general, it shows that short-chain PFAS—that is, where the molecules have fewer carbons than long-chain PFAS such as PFOA and PFOS—tend to be less toxic than PFOA and PFOS. However, they are still as toxic as other well-known contaminants of concern. And one PFAS found widely in the environment and chip plant wastewater, HPFO-DA (also known as Gen-X) ranks with the long-chain compounds even though it has fewer carbons per molecule. Thus, concludes Roger Brewer, to adequately assess the risk of PFAS exposure, one must measure all PFAS in mixtures, not just the top two or even EPA’s target list.<sup>72</sup>

Supporting Brewer’s findings, decades of research have shown that exposure to mixtures of different PFAS chemicals can result in cumulative adverse health effects. Even if the individual chemicals are at levels considered to be “safe,” a mixture may cause significant adverse health effects. EPA recognized this in developing the Hazard Index approach to Safe Drinking Water Act limits on four PFAS, which states, “The high likelihood for different PFAS to co-occur in drinking water; the additive health concerns when present in mixtures; the diversity and sheer number of PFAS; and their general presence and persistence in the environment and the human body are reflective of the environmental and public health

<sup>72</sup> Roger Brewer. 2025.

challenges the American public faces with PFAS, which poses a particular threat for overburdened communities that experience disproportionate environmental impacts.”<sup>73</sup>

The DEIS reports, “The IWWTP [Industrial Wastewater Treatment Plant] also would include technologies specifically designed to remove emerging contaminants, such as per- and polyfluoroalkyl substances (PFAS), including reverse osmosis and nanofiltration (membranes used to filter out PFAS, effectively removing them from the water), granular activated carbon (an effective method for removing PFAS through adsorption), ion exchange resins (which selectively capture and remove PFAS from wastewater)...” (p. 3-83). Including such a statement in the DEIS does not guarantee the adequacy and reliability of the treatment technologies. Their effectiveness depends upon the other constituents of the waste stream, water volume, and PFAS concentrations. There is no single best method for removal, and none of the filtration methods actually destroys PFAS.

While other factors may influence the choice of technology, the starting point should be the measurement of all PFAS in source wastewater as well as removal system effluent. The DEIS promises, “To comply with its SPDES permit for the IWWTP, OCDWEP [Onondaga County Department of Water Environment Protection] would be required to perform regular analytical testing of surface water and effluent samples collected using NYSDEC-approved methods and would be subject to ongoing sampling, monitoring, and reporting requirements.” (p. 3-84). The same requirements would apply to Micron’s wastewater pretreatment system, governed by an indirect discharge permit negotiated with the OCDWEP.

To measure PFAS in wastewater, Qiao *et al* recommend using the TOP [Total Oxidizable Precursor] Assay method: “The TOP assay results emphasize the importance of implementing an integrated PFAS monitoring strategy that incorporates the TOP assay, along with routine monitoring of ultrashort-chain PFAS (e.g., TFA and PFPrA).”<sup>74</sup> Going further, Jacob et al concluded: “However, this [the elevated levels of combined target and non-target PFAS] does reinforce the idea that PFAS monitoring should incorporate complementary target and nontarget analyses or otherwise include measures of total organic fluorine to accurately assess PFAS abundance and potential environmental impacts. These data also support the recent push by policymakers to regulate total PFASs, rather than individual compounds, underscoring the importance of total PFAS concentration monitoring.”<sup>75</sup>

To understand how to address wastewater from the Micron Clay facility, the company and agencies need not wait for production to begin. Micron’s new fab in Boise, Idaho will be using the same or similar chemicals. The New York’s evaluation could and should begin with analysis of Boise effluent.<sup>76</sup>

<sup>76</sup> National Institute of Standards and Technology .2024. *Draft Environmental Assessment for Micron ID1, Boise, Idaho*. NIST-CPO/EA-004, dated July 10. U.S. Department of Commerce, National Institute of Standards and Technology, CHIPS Program Office. Washington DC.

It is unclear in the DEIS why OCDWEP is taking on the difficult task of treating PFAS contaminated wastewater. As far as we are aware, OCDWEP has no existing expertise in this area while Micron operates a number of chip production facilities where it must already deal with similar wastewaters. Outsourcing the treatment responsibility leads to the danger that Micron will evade responsibility for any discharge of PFAS and be subsidized if OCDWEP fails to charge Micron the full cost of treatment. Surely a simpler and more efficient arrangement would be locating the treatment plant close to the fab and have Micron manage it? At minimum, this should have been one of the alternatives included in the analysis of alternatives.

It is problematic that a county agency is being left with the lion's share of the responsibility for a difficult, almost impossible task of sufficiently treating wastewater to avoid harmful downstream impacts from the Proposed Project's activities. Can this agency realistically be expected to maintain the level of resources and expertise over the long life of the fab to prevent significant downstream harms? Micron should be required to bear the responsibility, financially and otherwise, of ensuring fully functioning, regularly updated waste water treatment systems are in place.

The bottom line is that Micron will be using and potentially discharging a wide range of PFAS, only a few of which are identified, and none of which are currently regulated. Much more information is required to assure the public, as well as officials, that Micron will not significantly impact the environment by adding PFAS to the already PFAS-contaminated environment. Furthermore, Micron should adopt more protective PFAS management than what is promised in the draft EIS. We recommend that All PFAS discharge pathways from the Micron plant should be monitored and eliminated. The Oak Orchard plants and Micron should commit to using, and the New York State Department of Environmental Conservation should require, sampling and analysis methods that capture all PFAS in wastewater from Micron, starting with samples from the Micron Boise plant.

In addition to the removal technologies cited above, the DEIS reports:

“Micron also would segregate process solvent waste containing PFAS from facility wastewater streams to closed bulk storage systems for off-site management by licensed and permitted treatment and disposal facilities.... Micron would dispose of or otherwise manage waste known to contain regulated PFAS in accordance with applicable regulations and as appropriate given its content and characteristics.” (p. 3-341). The DEIS names Veolia, all of whose disposal facilities are outside of New York State, as the primary waste disposal vendor.

Even if Micron is able to segregate a portion of its PFAS-laden wastewater, these provisions are inadequate. First, there is no assurance that the permitted treatment and disposal facilities—likely incinerators located in communities of color—would destroy the particular mixtures transferred from the Micron plant without creating toxic transformation products. In fact, mixing chipmaking wastes with other hazardous wastes would increase the likelihood that new hazardous substances would be emitted. If such off-site “disposal” is allowed, Micron should be responsible for proving that PFAS and other hazardous substances from its waste streams, such as solvents, are destroyed. It should also be required to show that thermal treatment does not create hazardous products of incomplete combustion.

The DEIS promises, “Micron would continue to review the waste and reuse facilities to which it would send hazardous waste,” (p. 3-353) but there is insufficient detail to assure the public and regulators that PFAS, PFAS-containing media, and PFAS byproducts will be destroyed safely.

Second, the promise to comply with regulations is hollow. Of course, Micron should be expected to obey the law. However, we are unaware of any regulations governing the treatment and disposal of collected PFAS wastes, particularly when they are shipped out of state.

Similarly, removal technologies such as Granular Activated Charcoal, Anion Exchange Resins, and Foam Fractionation do not destroy PFAS. In general, the filtration media and gas emissions contain essentially the same PFAS that were contained in the original liquid. The filtration media are typically sent off site for landfilling or thermal treatment, neither of which is environmentally acceptable.

Fortunately, the federal government, through the Department of Defense, has been supporting the development of new technologies that actually destroy PFAS, breaking down the otherwise persistent molecules into non-toxic substances. The DEIS actually mentions one category of these technologies, Advanced Oxidation. These technologies may either treat the wastewater directly or destroy concentrated PFAS removed from wastewater through technologies such as foam fractionation. Use of these technologies is the most protective approach to treating wastewater that contains a wide range of PFAS compounds. Again, at minimum, this approach should be included in the analysis of alternatives.

### **Recommendation**

Micron should commit to, and NYSDEC should require that Micron evaluate available PFAS destruction technologies for use on site with the goal of implementing one or more as close to the points of use as feasible. NYS DEC should regulate these systems.

The goal of any program of removal, treatment, or destruction for PFAS should be ZERO releases, as much as practical. That is, technologies, not numerical standards—which do not exist—should be the basis of the approach to eliminating PFAS in chipmaking wastewater.

The DEIS points out that New York state has guidance values for PFOA and PFOS in “raw water.” However, there are no standards for the PFAS that Micron will actually be using. In fact, even in the best of cases there will not be standards or guidance values for the preponderance of PFAS used or released by Micron.

Yet current science demonstrates that all PFAS are toxic as well as persistent. Any release of PFAS into the environment adds to the already unacceptable load on the environment and human health.

### **Extremely Hazardous Substances**

The DEIS states, “Pending further review based on evolving Micron Campus designs, Micron would expect the RMP [Risk Management Plan] to cover eight regulated chemicals (ammonium hydroxide, anhydrous ammonia, hydrogen, hydrogen chloride, silane, chlorine, dichlorosilane, and HF [hydrogen fluoride]) and would evaluate and add additional chemicals to the RMP on a case-by-case basis.” Earlier it mentions sodium hydroxide, and it promises, “hazardous chemicals and materials would be properly stored in containers and drums in storage areas with secondary containment to provide added protection in

the event of a spill or release.” (pp. 341-344). This is a good start, but insufficient. Leaks and spills may still occur during transport or use, so it’s important that employees, neighbors, and government agencies be fully aware of the presence of extremely hazardous substances.

Semiconductor fabs typically also use arsine and phosphine, which are extremely toxic, even lethal, gases, and diborane, which is highly toxic and pyrophoric. Perhaps they aren’t mentioned because the DEIS uses EPA’s reporting thresholds, which are generally an order of magnitude less protective than California’s.<sup>77</sup> Even in low volumes, a leak or spill of extremely toxic gases may necessitate the evacuation of buildings as well as warnings to nearby properties.

This information is important to be included in the environmental review, because local planners need to know how close sensitive uses should be located to the potential toxic release site. For example, in Mountain View, California, the city banned childcare centers in parts of town with semiconductor production.

The DEIS reports, “Clay Fire and Cicero Fire coordinate with the City of Syracuse Fire Department for responses to incidents involving potential hazardous materials, as the Syracuse Fire Department employs a specialty hazardous material response unit.” ( p. 560). More detail should be provided. Does the Syracuse Fire Department have the expertise to handle the emergencies associated with semiconductor manufacturing? How close, by both time and distance, are personnel and equipment from the specialty unit to the Micron campus? Will the responsible first responders be trained and equipped to respond to emergencies at Micron? We cannot meaningfully comment on this aspect of the DEIS without the answers to these questions.

### **Recommendations**

The final Micron EIS should include a complete list of extremely hazardous substances expected to be used on the property, regardless of anticipated quantity. The public has a right to know even if the federal thresholds for storage are not exceeded.

Micron should conduct dispersion modeling for the most hazardous of the gases and include it in the final EIS, to guide decisions on the location of sensitive use. For example, would an arsine release from Micron put children at its nearby childcare center at risk?

### **Other Hazardous Substances**

Other than the extremely hazardous substances mentioned above, the DEIS does not specifically name hazardous chemicals. The Final PEA, on the other hand, contains a short list in Section 3.8 and a longer list in Appendix D. (p. 560).

The DEIS does not address the long-standing environmental threat caused by solvents used in production. Once again, the Final PEA provided more detail: “For example, traditional solvents used in fab cleaning

---

<sup>77</sup> Compare the tables as “CalARP Program Resources,” viewed July, 2025.  
<https://calepa.ca.gov/california-accidental-release-prevention/california-accidental-release-prevention-program-resources/>.

processes contain N-Methylpyrrolidone (NMP), which is known to cause harm to reproductive systems.”<sup>78</sup> It noted that some companies—in this case a Taiwan-based producer—was using alternatives.

### **Catastrophic impact due to spill, leak, or equipment failure.**

As noted, the DEIS includes very superficial discussion about spills, accidental releases and system upsets that can result in contamination of building interior spaces, the underlying soil, the groundwater and surface water. It is clear even from the limited information about stored chemicals given in Table 3.8-10 (DEIS, p.3-242) that large quantities of chemicals will be stored at the site. The table lists these categories of hazardous liquids (rounded to nearest 1000 gallons):

- Acidic Solutions: 172,900 gallons/fab x 4 fabs = 692,000 gal
- Caustic Solutions: 82,300 gallons/fab x 4 fabs = 329,000 gal
- “Liquid Corrosives:” 13.5 million gal/fab x 4 fabs = 52 million gal
- Flammable liquids: 121,900 gallons/fab x 4 fabs = 488,000 gal
- Peroxide: 124,000 gallons/fab x 4 fabs = 496,000 gal

In addition, the DEIS (p. 3-244) states that the “Micron Campus would have an aggregate aboveground oil or petroleum product storage capacity of approximately 1.55 million gallons, which would store diesel, gasoline, lubricating oil, hydraulic fluid, ...”

Altogether, over 55 million gallons of hazardous liquid chemicals and petroleum products could be stored on site once the four fabs are completed and operational. Of course, these chemicals are not simply stored. They must be transported to the site, transferred into storage tanks, or loaded into drum storage space; distributed to manufacturing areas; and dispensed as needed. Wastes need to be collected, containerized, and properly recycled, treated, and/or shipped off-site for disposal.

The DEIS (p. 3-80) states that groundwater contamination is not an issue during construction, asserting that “Micron would implement a SWPPP and SPCC/SPR [Spill Prevention Control and Countermeasure Plan and Spill Prevention Report] to reduce the risk of accidental releases, leaks, or spills of materials such as concrete, oil, fuel, lubricants, or hydraulic fluids during construction and provide for immediate containment and cleanup of any release.” The same language is applied to operations at the facility: “Micron also would be required to implement SWPPP and SPCC/SPR Plan measures to reduce the risk of accidental releases, leaks, or spills during facility operations and provide for immediate containment and cleanup of any release.” DEIS (p. 3-86). But accidents and spills do not necessarily go according to plan and containment is never “immediate.” To fully evaluate this issue, the EIS needs to assess the actual risk of spills, especially when chemicals are being transported to the facility, and when waste chemicals are being transported away from the facility.

The DEIS (p. 3-243) informs us that “Chemicals would be delivered to the Micron Campus by truck ... using a variety of packaging and containment methods, including tanks, drums, and pallets... Micron would contract with carriers and shippers of hazardous materials that maintain 24/7 emergency response support in the event of hazardous materials spills...” Trucks will be travelling on highways, competing

---

<sup>78</sup> *Final PEA*, p. 69.

with construction vehicles, employee vehicles, delivery vehicles, and vehicles of Clay and Cicero residents. The risk of accidents on these congested roadways is relatively high. How long would it take for a national chemical carrier to respond to an accident involving a spill?

We recommend that Micron reduce the potential for vehicular accidents by shipping the bulk of its chemical supplies by rail. It does not appear that this mitigation of spill risk has been considered. Once again, study of this alternative is essential to minimize the potential environmental impacts from the Micron fab.

The DEIS recognizes the susceptibility of the local groundwater to contamination in Section 4. Cumulative Effects. On p. 4-16 it states: “ It can be assumed that planned residential, industrial, and transportation development, along with the implementation of the Proposed Action and Connected Actions could reasonably ...[lead to] the increased risk of groundwater exposure to pollutants from spills or leaks, or from contaminated stormwater runoff.” The DEIS notes further that “surficial aquifers are *highly permeable* and could become contaminated from overlying *spills, leaks, or infiltration*, and *carbonate aquifers can transport groundwater long distances through solution openings, potentially transporting contamination on a regional scale*. Ultimately, depending on the severity of potential groundwater exposure to contaminants, *impacts could be significant and widespread*.” (emphasis added)

But the DEIS does not address, in any substantive way, the potential for spills, leaks and infiltration from the operations at the Micron facility to contaminate the local groundwater, and for that groundwater to transport contaminants long distances. Fox Professional Geology PLLC (2025) asserts in comments submitted regarding this Proposed Action that “The Micron Campus is located directly over a highly productive karst bedrock aquifer.” Fox makes the comment that “The presence of karst features on, beneath, and near the Micron Campus, including closed circular depressions and solution-enlarged joints and fracture zones, requires careful and thorough consideration, evaluation, planning, and monitoring to facilitate protection of human health, built structures, water quality, and the environment.” This level of analysis has been regrettably omitted from the DEIS, but it needs to be incorporated.

### **Recommendation**

The DEIS should provide a complete list of hazardous substances used in production, their function, and possible exposure pathways. Once again, the public has a right to know which hazards are present and may be released from semiconductor production.

### **Cumulative Effects**

The DEIS fails to assess the cumulative impacts of PFAS, industrial Greenhouse Gases, and Extremely Hazardous Substances in its Cumulative Effects analysis. The Micron project is expected to attract related activities, including research and development, chemical suppliers, and even competitors to the area. That is, other facilities may release hazardous substances to the environment, and in particular to Onondaga County’s wastewater system, in addition to the PFAS discharges from other, unrelated industries.

Therefore, the DEIS should analyze and mitigate for the cumulative impacts associated with hazardous substance use, storage, and release. Without a comprehensive understanding of the types and amount of PFAS discharges on site and for anticipated sites across the region, cumulative impacts for surface water, groundwater, air emissions, and environmental justice cannot be understood.

## Recommendation

The DEIS should include a comprehensive analysis of the cumulative impacts of Micron's PFAS discharges to the environment, with a focus on the releases to the Oak Orchard wastewater plants and, in turn, to surface water and wastewater biosolids. As stated earlier, Micron should commit to zero discharge of all PFAS, and its industrial pre-treatment permit should make this an enforceable requirement. Because the cumulative impacts are regional in nature, the environmental justice assessment (Section 3.16) should consider these regional impacts.

## In Summary

The draft Environmental Impact Statement for Micron New York contains valuable information, but in the case of hazardous substances it does not provide enough detail to satisfy the public's right to know or to guide decisions designed to protect worker health, public health, and the environment. Furthermore, over the course of the sixteen-year the Micron project is expected to constantly update its production technology, introducing new, un-assessed, process chemicals. In addition, there will be advances in environmental analysis and treatment. Therefore, there should be a mechanism to revisit key elements of the EIS. That is, impact analysis and the protection of workers, neighbors, and the environment should keep up with the remarkable progress of semiconductor chips and their applications.

## Fluoropolymers

Much of the equipment in semiconductor wafer fabrication is made from fluoropolymers, such as PFA, relatively stable but still hazardous PFAS. They represent a massive use of these persistent materials. Mark Newman, CEO of Chemours, explained:

“You cannot make chips without a whole PFA infrastructure,” he said. “We estimate that in a modern-day fab, there's a half-kilo of PFA in every square foot. So in a 400,000- to 600,000-square-foot fab, that's 200 to 300 metric tons of this stuff.” It's not just valves, of course, but all types of pipes, tubes and pumps in semiconductor equipment.<sup>79</sup>

The article continues, “On its website, Chemours says flat-out that “without PFA, domestic semiconductor manufacturing would not be possible.”

Chemours is the only domestic producer of PFA. In fact, in 2024 it announced the expansion of its notorious Washington Works plant in West Virginia to meet increased demand from the semiconductor industry.<sup>80</sup>

Fluoropolymers are particularly hazardous where they are manufactured, and at the end of their useful life. Lohmann *et al* concluded:

---

<sup>79</sup> Feldman, Amy. 2023. “More Domestic Chip-Making Means More ‘Forever Chemicals,’” *Forbes*, October 5. <https://www.forbes.com/sites/amyfeldman/2023/10/05/more-domestic-chip-making-means-more-forever-chemicals/>

<sup>80</sup> Samora, Sara. 2024. “Chemours expands Teflon PFA production in West Virginia.” *Manufacturing Dive*, August 22. <https://www.manufacturingdive.com/news/chemours-plans-teflon-pfa-forever-chemicals-plant-expansion-west-virginia/724609/>.

The evidence reviewed in this analysis does not find a scientific rationale for concluding that fluoropolymers are of low concern for environmental and human health. Given fluoropolymers' extreme persistence; emissions associated with their production, use, and disposal; and a high likelihood for human exposure to PFAS, their production and uses should be curtailed except in cases of essential uses.<sup>81</sup>

Furthermore, the semiconductor industry has introduced and embedded a wide variety of PFAS into semiconductor packaging and packages with no consideration of the potential environmental and worker safety risks. Chipmakers have little idea how much of which PFAS are contained in their final products. In fact, they admit that the absence of regulation is responsible for their lack of knowledge of the use of these chemicals. Chips produced at the Micron plant may end up in such packages. Since those products end up distributed in electronic equipment throughout the country and the world, there is no accounting of the environmental impacts of their disposal when no longer used. The Semiconductor Industry PFAS Consortium speculated, "it is unknown if end of life controls are necessary during the reclamation of electronic products."<sup>82</sup> In fact, the safe disposal of electronic equipment in general is a significant unsolved environmental problem.

### **Recommendations**

The final EIS should contain an estimate of the quantities of fluoropolymers in each Micron fab, by category of use. It should also contain a life-cycle analysis of the environmental impacts of fluoropolymers, including:

1. Analysis of the environmental releases and occupational exposures at fluoropolymer production plants. Since Chemours uses the "essentiality" of its products to the semiconductor industry to justify continuing, indeed expanded production of PFA, chipmakers should be held accountable for those environmental impacts.
2. Analysis of any Micron on-site releases caused by the use or machining of fluoropolymers.
3. Information about the likely end-of-life impacts from the fluoropolymer-containing equipment used at the Micron plant.
4. Information about the use and release of fluoropolymers in packaging the chips produced from wafers fabricated at Micron, as well as their end-of-life environmental impacts.

### Excavation of the site for construction

As discussed in the Wetlands and Wildlife section of this comment, the DEIS (pp 3-224 et seq) notes that the construction of the facility will require excavating over 1.6 million cubic yards (2.70 to 3.67 million total tons) of soil and muck from the existing wetlands and fields at the WPCP. This material is designated for “beneficial reuse.”

Micron should coordinate with the Wetlands Trust to see whether this material which is rich in wetland plant seeds, spores, and microorganisms could be utilized to create new wetlands as part of the wetlands mitigation plan. This would minimize long-distance transport of this huge amount of material, and could accelerate the establishment of new wetlands.

### Commercial Solid Wastes

It is anticipated that the Micron facility would generate substantial amounts of Commercial Solid Waste and wastes that could be potentially recycled. The waste quantities are summarized in Table 3.9-4, shown below:

| Material                                      | Disposal Method <sup>82</sup>                                            | Fab 1  | Fabs 1-2 | Fabs 1-3 | Fabs 1-4 |
|-----------------------------------------------|--------------------------------------------------------------------------|--------|----------|----------|----------|
| <b>Solid Waste</b>                            |                                                                          |        |          |          |          |
| Industrial waste (tpy)                        | Private hauler transport to private industrial waste disposal facilities | 800    | 1,300    | 1,800    | 2,300    |
| Commercial MSW (tpy)                          | Private hauler transport to municipally owned waste disposal facilities  | 15,800 | 25,000   | 34,300   | 43,500   |
| General MSW (tpy)                             | Private hauler transport to municipally owned waste disposal facilities  | N/A    | N/A      | N/A      | N/A      |
| RMW (30-gallon bins per year) <sup>83</sup>   | Private hauler transport to RMW disposal facilities                      | 11     | 22       | 34       | 45       |
| <b>Reusable or Recyclable Material</b>        |                                                                          |        |          |          |          |
| Micron RRR or other recyclable material (tpy) | (See Table 3.8-5 below)                                                  | 32,200 | 51,100   | 70,000   | 88,800   |

The Commercial Solid Waste is characterized as “metals, drums and cylinders, E-waste, batteries, plastic, foam, cardboard, scrap wood, office supplies, etc.” (p. 3-233) The DEIS goes on to say that: “The non-RRR portions of this commercial MSW would be collected via licensed commercial haulers for transport to municipally owned waste disposal facilities within the OCRRA service area ... The commercial MSW would be transported first to the WTE Facility, capacity permitting, to maximize

energy recovery. Overflow amounts would be sent to the RCR Transfer Station, which could receive up to 800 tons per day.”

According to **Table 3.8-5 Metals, drums and cylinders, E-waste, batteries, scrap wood, office supplies, plastic, foam** are all designated for recycling. However, the ability to recycle plastics and foam—especially when contaminated—is limited. The Onondaga County Resource Recovery Agency currently accepts a limited selection of solid plastic items for recycling and does not accept foam or film plastics (see current guidelines at [https://ocrra.org/wp-content/uploads/2024/03/Recycling\\_101\\_Web.pdf](https://ocrra.org/wp-content/uploads/2024/03/Recycling_101_Web.pdf))

The DEIS needs to define more fully what is in the non-recyclable commercial waste. This is a critical question because a large portion of the commercial SW is to be burned at OCRRA’s WTE plant. The semiconductor industry is highly reliant on PFTE, PFA and other fluoropolymers.<sup>83</sup> Fluorinated materials such as PFTE (Teflon) and PFA will not fully break down when burned, leading to emission of hazardous products of incomplete combustion, as well as hydrofluoric acid (HF), an extremely corrosive and toxic substance.

To mitigate air pollution impacts, Micron should segregate all waste materials made with fluoropolymers and not allow them to be incinerated. It would be best to find a way to recycle this material.

### **Wastewater sludge**

The DEIS in **Table 3.8-5 Industrial and Commercial Materials for Micron RRR Program** shows that “Non-hazardous sludge from on-site wastewater treatment” will be disposed of by “Send to [a] beneficial use vendor or recycle.”

What substances are anticipated to be in this sludge? Wastewater from the semiconductor manufacturing process is likely to be contaminated with a wide variety of substances, including: heavy metals, fluorides, PFAS, resins, microplastics, and polycyclic aromatic hydrocarbons.

No explanation is given as to how this sludge could be beneficially re-used or recycled. What is the feasibility of actually re-using this sludge? Where would it go? What are the environmental consequences? Will it be tested for hazardous substances to determine whether or not it should be classified as hazardous waste? If PFAS compounds are present, how will the sludge be managed so that it does not contaminate soils, surface water, plants, wildlife and groundwater with PFAS?

Appendix K-12 provides an example recycling program from the Micron facility in Boise, Idaho. That does not describe or even list a sludge re-use/recycling program.

What quantity of sludge is estimated to be generated? How much water will it contain? The environmental impacts of sludge disposal or beneficial use depend greatly on the quantity of sludge generated.

### **Hazardous Waste**

It is reported in **Table 3.8-6** that the Micron facility would initially generate 18,300 ton/yr of hazardous waste (Fab 1 in operation), ranging up to 50,300 ton/year with four fabs in operation. The sentence at the

---

<sup>83</sup> See Feldman, 2023.

bottom of p. 2-236 states that “As shown in Table 3.8-7, hazardous waste would consist mainly of acidic and solvent waste volumes.” Table 3.8-7 shows volumes of unspecified “acidic waste” and unspecified “solvent waste” generated per fab. To convert these volumes to tonnages requires the densities of the waste. Assuming a density of water (1.00 g/ml) for the acidic waste and a density of 0.785 g/ml, which is representative of acetone and isopropyl alcohol, for the solvent waste, the total amount of acidic and solvent waste generated is approximately 8,750 ton per year per fab. This accounts for less than half of the 18,300 ton/yr total waste estimated per fab in **Table 3.8-6**.

**Table 3.8-8** provides a bit more detail about types of waste generated, but no quantities or specific identities are reported. The types and quantities of hazardous waste should be specified. What specific solvents are in the solvent waste? What acids are in the acidic waste? What chemical wastes account for the missing 9,500 ton/year of hazardous wastes estimated for each fab? Hazardous wastes, by their nature, pose a threat to the health and safety of workers and the surrounding community. Unintentional releases of chemical wastes can have devastating effects on the environment as well. For example, the derailment of train cars carrying vinyl chloride, phosgene, and other chemicals in Palestine, Ohio on February 3, 2023, forced the evacuation of thousands of residents and contaminated air, water and soils.

On p.3-239 the DEIS says: Micron plans to explore the distillation of isopropyl alcohol and ammonia solutions to reduce waste and to increase potential for valuable reuse off-site. Other material streams such as bulk solvent, drummed solvent, and contaminated debris would be reused or recovered through fuel blending or energy recovery at approved permitted cement kilns that allow kilns to run on waste-derived fuel. Certain waste streams such as lab waste, cylinders, expired materials, glues, resins, a subset of solvents, and certain acids would likely need to be incinerated at permitted off-site disposal facilities in other states.

Micron is to be commended for maximizing the reuse and recycling of IPA, ammonia. Greater detail about the quantities of the various waste streams slated to be incinerated by Veolia is essential to assess potential off-site impacts.

## **Air pollution**

### *NAAQS and Hazardous Air Pollutants*

The DEIS asserts that air pollution emissions from the construction and the operation of the Micron facility will not violate the National Ambient Air Quality Standards (NAAQS) for the study area. However, most of the monitoring data for criteria air pollutants (those with established NAAQS) on which this assessment relies comes from monitors in Rochester, NY, more than 70 miles from the project site. Only ozone and small diameter particulate matter (PM<sub>2.5</sub>) are measured in the Syracuse area. Conditions in Rochester may be expected to be similar, but Micron should at least be required to demonstrate – with actual local monitoring data – that they are before relying on these figures to demonstrate that the facility will not have any significant environmental impacts.

In addition, in making this assessment, the DEIS does not allow for or consider the impacts of any exceedances, upsets, or violations in assessing the environmental impacts of air emissions. No equipment works perfectly. Again, based on its experience in chip manufacturing, Micron should have some sense of how often its facilities encounter upsets, exceedances, or unavoidable permit violations that may result in

excess air emissions. If Micron doesn't have that data, it could rely on industry-wide statistics. For example, the Environmental Working Group found that, as of October 25, 2024, 10% of active semiconductor manufacturing facilities had violated federal environmental laws and regulations in the last 10 years and 27% of the facilities with individual discharge permits had violated those permits.<sup>84</sup> Finally, assuming that the DEIS NAAQS compliance analysis is correct, modeled levels of both NO<sub>x</sub> and PM<sub>2.5</sub> are very close to NAAQS limits. (see Table 3.6-10 NAAQS Results p. 3-168). Modeled results for the hazardous pollutants HF, NF<sub>3</sub>, and total fluorides, shown in Table 3.6-11) are very close to annual guideline concentrations (AGC) established in NYSDEC Division of Air Resources guidance DAR-1.<sup>85</sup> Given the uncertainty inherent in modeling data, and the lack of local background monitoring data, Micron should be required to install air quality monitors for NAAQS pollutants and selected hazardous air pollutants (including HF, NF<sub>3</sub>, and total fluorides) in the airshed directly affected by the Micron facility. The data from those monitors could be used to both check NAAQS compliance under regular operating conditions and to identify the environmental impacts of exceedances, upsets, or other unavoidable violations of air emission limits. Micron can then modify its operations or improve emission controls if the localized air monitoring shows exceedance.

### **Incineration of perfluorinated compounds (PFCs) and related gases**

In the section on Greenhouse Gas emissions, the DEIS notes that “Semiconductor manufacturers use a variety of high GWP [global warming potential] gases to create circuitry patterns on silicon wafers along with chillers for certain process tools to prevent overheating. Examples of widely used high GWP fluorinated compounds include PFCs (e.g., CF<sub>4</sub>, C<sub>2</sub>F<sub>6</sub>, C<sub>3</sub>F<sub>8</sub>, and c-C<sub>4</sub>F<sub>8</sub>), HFCs (CHF<sub>3</sub>, CH<sub>3</sub>F and CH<sub>2</sub>F<sub>2</sub>), NF<sub>3</sub>, and SF<sub>6</sub>. Semiconductor manufacturing processes also use fluorinated heat transfer fluids and N<sub>2</sub>O.” (DEIS, p.3-188)

Micron plans to incinerate its process gases: “GHGs from the Proposed Project would be emitted as a result of using fluorinated GHGs, N<sub>2</sub>O, CH<sub>4</sub>, and CO<sub>2</sub> as raw materials in manufacturing processes, from oxidation of organic compounds in thermal oxidation systems and RCTOs, from the combustion of natural gas and diesel, and from leaks of HTF [Heat Transfer Fluid].” “Thermal oxidation systems and RCTOs would combust natural gas, and byproducts of combustion would exhaust alongside other unreacted process GHG emissions.” (DEIS, p.3-188)

The problem with incineration is two-fold. First, it is not 100% effective; some compounds are only reduced by about 60%. According to the Environmental Assessment for the Micron fab in Boise, ID:<sup>86</sup> “Micron Boise currently estimates that its POU abatement systems achieve DRE factors between 60 and 98 percent based on the individual chemical and the ability of the POU abatement system to control each species of process gas.” Thus, a significant fraction of some gases escape into the atmosphere despite

<sup>85</sup> New York State Dept. of Environmental Conservation. 2025. Division of Air Resources guidance DAR-1: “Guidelines for the Evaluation and Control of Ambient Air Contaminants.” Under 6 NYCRR Part 212.

<sup>86</sup> NIST, 2024. Final programmatic environmental assessment.

passing through thermal oxidation and wet scrubbing. This means the DEIS estimate of GHG emissions from oxidation of these wastes is much too low.

The other problem is that incineration produces toxic products of incomplete combustion, and hydrogen fluoride (HF), which is highly toxic and highly corrosive. This is discussed at length by Weitz et al (2024). The authors conclude that “Few studies have been conducted at full-scale operating facilities, and none to date have attempted to characterize possible fluorinated organic products of incomplete combustion (PICs). Further, the ability of existing air pollution control (APC) systems, designed primarily for particulate and acid gas control, to reduce PFAS air emissions has not been determined.”

They recommend “Further research is needed to examine the formation and measurement of PICs in full-scale treatment facilities.”

This is why the Department of Defense moved away from incinerating PFAS firefighting foam. The PICs as they are called are not regulated. They are not even monitored. So, we have the situation where toxic gases of unknown composition are being emitted into our community. What are the health effects?

The emission of products of incomplete combustion is completely overlooked in the DEIS. These hazardous chemicals are not being monitored, and are not regulated under the Clean Air Act or through NYS regulations. These air pollutants threaten the health of people and possibly wildlife who are exposed to them. The EIS needs to be revised to assess the danger these compounds pose.

Mitigation of these health risks can be accomplished in one of two ways:

- 1) Micron can replace these fluorinated gases with nontoxic degradable compounds; or
- 2) Micron can use an alternative technology to capture such gases and destroy them using a technology like wet air oxidation. Such technologies do not produce TICs, do not consume vast amounts of natural gas, and are generally less expensive to operate.

## **HUMAN HEALTH AND SAFETY**

### **Occupational Health Safety**

While the DEIS for Micron’s proposed Clay, NY facility presents encouraging commitments to environmental stewardship and worker safety, it falls short in specificity, transparency, and accountability required to meaningfully assess and mitigate occupational health and safety risks, especially regarding hazardous materials and per- and polyfluoroalkyl substances – known as PFAS-management. Across multiple categories, Micron outlines high-level goals—such as achieving near-zero hazardous waste to landfill by 2030, conducting internal chemical hazard evaluations, and implementing continuous workplace monitoring—but provides limited detail on how these goals will be operationalized, measured, or shared with the public.

Most critically, the DEIS does not disclose a full list of chemicals that will be used at the facility, nor does it include job-specific exposure assessments or risk matrices. Key safety documents, such as hazard procedures and waste contingency plans, are referenced but remain inaccessible or incomplete. Public

comments submitted during the SEQRA process—including those from NYSDEC—raised pointed concerns about chemical use, PFAS, waste management, and exposure risks. Many of these concerns remain unanswered rendering the DEIS inadequate in its current form. For a facility of this scale and complexity, the lack of disclosure raises serious concerns. To build public trust, meet the requirements of SEQRA (and NEPA), and uphold its stated commitments, Micron must provide transparent, facility-specific data, share internal evaluations and monitoring results, and ensure that hazardous material management strategies are robust, equitable, and publicly accountable.

## **Key Concerns Regarding Micron’s DEIS**

### **1. PFAS Management**

While the DEIS includes more information on PFAS than some environmental reviews, it falls short of offering a comprehensive PFAS management strategy. It acknowledges that some waste streams may contain PFAS including process-related wastewater (p. 3-239), that Micron will segregate PFAS-containing waste streams (p. 3-241), and that the company is evaluating emerging technologies capable of removing PFAS at parts-per-trillion levels (p. 3-241). It also includes Micron’s stated intent to select wastewater treatment options that “minimize generation of PFAS-containing waste” (p. 3-241) and the company’s commitment to collaborating with industry groups and regulators to improve PFAS detection and quantification (p. 3-240). However, it’s unclear how Micron will define, identify, or classify PFAS within its own internal policies. In addition, the need to evaluate emerging technology illustrates a current lack of comparable PFAS removal options.

#### *Gaps in Risk Management and Public Disclosure*

In parts of the DEIS, PFAS are acknowledged as emerging contaminants of concern (p. 3-83). Yet in other sections—such as the Phase I Environmental Site Assessments (ESAs)—the third-party consultants hired by Micron classify PFAS as “non-scope” issues (Appendix K, v1, p.20 of PDF), citing their current lack of designation as hazardous substances under federal law.<sup>87</sup> This contradiction raises a critical question that the DEIS fails to answer: will Micron include PFAS in its hazardous waste procedures? While the DEIS references plans to develop various hazardous waste management strategies, it does not specify which chemicals these will address.

The DEIS also acknowledges that PFAS used in semiconductor manufacturing may range widely in concentration - from less than 0.1% to 100% by weight - “depending on the definition applied—with the Organization for Economic Co-operation and Development (OECD) definition encompassing more than 10,000 substances” (p. 3-240). This highlights a contradiction: Micron recognizes the scope of the threat, yet stops short of making concrete, enforceable commitments to address it.

#### *Offsite Disposal and Destruction Technologies*

The DEIS provides no commitment to manage PFAS compounds identified as hazardous by emerging science and NYSDEC but not yet assigned occupational exposure limits (OELs) or other federal

---

<sup>87</sup> Despite the current lack of federal designation of PFAS as a hazardous substance, both the EPA and DEC have recognized the potential health and safety impacts of PFAS. Therefore, the use, handling, and discharge of PFAS is within the scope of review under SEQRA and NEPA.

government regulation limits. Nor does it commit to disclosing a full inventory of PFAS used on-site, even though such disclosure would significantly improve public health tracking and environmental monitoring. Without knowing which PFAS are present, it becomes substantially more difficult for regulators and scientists to detect and monitor them in wastewater. Additionally, the DEIS is vague about how PFAS waste sent offsite—whether to incineration or landfills—will be handled, offering no assurance that destruction technologies will be used or that environmental justice impacts will be considered (p. 3-241). These omissions are unacceptable given PFAS’s well-documented health risks, extreme environmental persistence, and ongoing problems with PFAS exposure that NYSDEC is working to address.

## **2. Occupational Health**

### *Absence of Job-Level Detail and Chemical Risk Transparency*

The DEIS includes Micron’s commitment to Global Environmental Health and Safety (EHS) programs and worker protection, but it fails to provide the operational detail needed to evaluate occupational safety at scale. Approximately 9,000 permanent on-site operational jobs are projected for the Micron campus at full buildout. The DEIS only offers broad categorizations of these roles (e.g., manufacturing, IT, security, procurement, etc.) (pp 3-488- 3-489), without breakdown of tasks by job category, associated exposures, or risk levels. In both the main DEIS and Appendix L, chemical-specific hazards are not tied to department, process stage or job title. Instead, the DEIS defers to general OSHA standards and vaguely references internally developed matrices (Appendix L, p. 8)—without examples, criteria, or reporting mechanisms.

### *Illness Rates*

While the DEIS discusses injury rates, it omits illness data (Appendix K, Vol. 2, p. 447), a major gap given that many occupational exposures, particularly to toxic chemicals, manifest as chronic illnesses rather than acute injuries. This omission limits the ability to assess long-term health risks. While injury statistics are discussed, the DEIS does not include information about illness rates (Appendix K, Vol. 2, p. 447)—chronic, chemical-related or otherwise—especially in the semiconductor sector, where long-term chemical exposures are a known concern. Micron’s occupational health clinic should not only provide treatment, but also collect and publicly share de-identified illness data in a format compatible with public health tracking.

### *Industrial Hygiene Monitoring*

Micron pledges to apply the most protective occupational exposure limits (OELs) across the facility (p. 3-258) and to revise standards within 90 days of new, more protective thresholds (p. 3-259). A faster revision time would be preferable. In addition, there is no commitment to public reporting—at minimum—summary data on its exposure sampling results (and exposures against OELs), worker health monitoring trends (with patient identities removed), or any corrective actions taken. These reports should be shared regularly with NYSDOH and made accessible to the public.

### *Reproductive and Developmental Hazards*

The DEIS makes no reference to the potential risk that microchip manufacturing poses to reproductive and developmental health. PFAS are persistent, toxic, bioaccumulative, and ubiquitous. Well-studied PFAS have been linked to cancer, immunotoxicity, reproductive and developmental harm, and other serious health effects at extremely low exposure levels. There are several hazards used in the chip manufacturing process that have been shown to negatively impact reproductive health. Indeed, among the 460 most commonly used chemicals in electronics manufacturing 115 are reproductive toxins.<sup>88</sup> In a study funded by the Semiconductor Industry Association 30 years ago: researchers from UC Berkeley and UC Davis found significantly more miscarriages in women working in fabrication compared to office workers, even though fab workers were exposed to chemicals that were a tiny fraction of their OSHA Permissible Exposure Limits (PELs).<sup>89</sup> Worker exposure to neurotoxins can also lead to birth defects, including the birth of a child whose brain fails to develop. Micron must make clear in the DEIS how it will implement exposure limits to mitigate reproductive harm to workers.

### *Safety Committees and Fear of Retaliation*

The DEIS mentions that Micron will establish Worker Safety Committees (WSCs) to promote hazard identification and resolution (3-256). However, it provides no detail on how these committees will be structured to protect worker voices. Key questions remain: Will employees have the right to raise concerns anonymously? Will committee participation be voluntary and protected from retaliation? Will committee proceedings be recorded or summarized for public or third-party review?

Too many communities have learned too late that internal EHS programs, however well-intentioned, can fail to catch or correct dangerous trends when there is inadequate transparency or worker empowerment. Micron should clarify how it will ensure these WSCs are structured to ensure worker empowerment, accountability, and independence from managerial suppression.

### *Construction vs. Operations: Asymmetry in Standards*

Appendix L provides over 100 pages of detailed EHS requirements for construction contractors—including risk controls, compliance inspections, and method statements with job hazard analyses (Appendix L, pp. 10-115). However, there is no equivalent standard or plan presented for operational workers, who will face long-term exposure to hazardous chemicals and process equipment.

Many of the same protocols - critical risk checklists, PPE documentation, emergency response procedures, pre-task planning - should apply during both construction and operations. Although the DEIS mentions these elements for operations (pp.3-255 – 3-261), it does not provide an operational counterpart to the construction EHS performance standard. The DEIS should contain these procedures to provide sufficient detail and answer questions such as: Will EHS metrics for operational staff be tracked and reported, as is for contractors? Will there be a reward and recognition program for EHS participation by

---

<sup>88</sup> “California Accidental Release Prevention Program,” CalEPA. N.d., <https://calepa.ca.gov/california-accidental-release-prevention/california-accidental-release-prevention-program-resources/>.

<sup>89</sup> Schenker *et al.* 1992. Epidemiologic Study of Reproductive and Other Health Effects among Workers Employed in the Manufacture of Semiconductors. Final Report to the Semiconductor Industry Association, December.

operational employees? These are foundational elements of a mature safety culture—and their absence from the DEIS is a significant omission.

In addition, the DEIS provides detailed EHS standards for construction contractors but fails to differentiate or commit to equivalent standards for temporary or third-party contract workers during operations.

#### *Risk Management Plans and Community Access*

Micron’s plan to develop a Risk Management Plan (RMP) for eight regulated chemicals is a positive step (p. 3-243). The company’s pledge to share the RMP with local first responders and the public is particularly encouraging. However, the DEIS does not explain how this information will be made accessible. Will the RMP be published online? Will hard copies be available through local agencies? Will updates be automatically shared or only available upon request?

It is also unclear whether PFAS or other emerging contaminants will be included in the RMP where applicable. Moreover, Micron has stated that it uses an internal chemical approval process to flag and control hazards, even those not currently regulated (Appendix K, Vol 2, p. 395), and refers to internal banned and restricted chemical lists (p. 3-258) as examples of best management practices. Consistent with a precautionary approach, Micron’s RMP should include any chemicals it internally identifies as hazardous, —whether formally regulated or not – and disclose these classifications publicly.

#### *ISO 45001*

Micron’s ISO 45001 certification is cited repeatedly as proof of strong health and safety practices (ex: 3-256). While ISO 45001 is a widely respected framework, the certification standard is not publicly available without purchase (\$222 USD or 177 CHF). This cost barrier prevents workers, community members, and researchers from understanding the commitments behind the certification. If Micron wishes to rely on ISO 45001 to bolster public confidence, it should provide clear summaries of what the certification requires and how it is being implemented on-site.

#### *Impact on Vulnerable Workers*

The DEIS makes no reference to vulnerable worker populations—including young workers, pregnant workers, contractors, limited English proficiency workers, or those engaged in repetitive or isolated tasks. Nor does it address the potential for disparities in risk exposure based on job classification, shift assignment, or subcontractor status. This is a significant omission that must be remedied.

### **3. Hazardous Materials**

#### *Missing Implementation Plans, Documentation Failures and Public Access Barriers*

The DEIS references a range of ambitious goals—such as achieving “near-zero hazardous waste-to-landfill” by 2030—but provides no implementation plan, timeline, or metrics for measuring progress. While the document mentions internal systems and procedures (e.g., chemical approval processes, hazardous waste reduction plans, contingency plans), many of these links are inaccessible, or behind password-protected portals in the appendices. Examples of hazardous waste procedure and

universal waste procedure are not provided in Appendix K except through links that require special logins (Appendix K, Vol. 2, p. 454). Other links, such as additional job hazard analysis information (Appendix K, Vol. 2, p. 452) lead to non-existent webpages. This lack of disclosure hampers the public's ability to comment meaningfully on Appendix K of the DEIS. These links should be fixed and the comment period should be extended thereafter.

The DEIS provides that several critical plans required by NYSDEC regulation, including the "Hazardous Waste Reduction Plan," "Hazardous Waste Contingency Plan" and "Hazardous Waste Procedure," will not be created until 6 months prior to the start of operations (p. 3-238). There is no commitment to make these plans available to the public. As a result, the public is left to guess how Micron defines "near-zero," how hazardous waste volumes will be tracked, or whether PFAS-containing waste streams will be included or excluded from these commitments. This makes meaningful comment on this aspect of the DEIS and the NYSDEC's ability to make necessary SEQRA Findings impossible.

Moreover, if Micron's waste reduction strategy relies on the offsite shipment of hazardous materials to contractors like Veolia (p. 3-237), the plan does not reduce hazardous waste—it simply displaces it, often to communities with less political and economic power. Given Veolia's documented record of environmental violations and the class action lawsuit raised against it for the Flint water crisis, community concerns about environmental justice impacts are entirely justified. In addition, if contractors plan to incinerate the hazardous materials, **incineration raises serious health risks, as incineration of hazardous materials can result in toxic air emissions and PFAS-laden ash.**<sup>90</sup> Waste-to-incinerator is not an acceptable substitute for meaningful landfill reduction. Once again, the lack of information in the DEIS makes it impossible to comment meaningfully on the environmental justice aspects of the waste management strategy.

#### *Undefined Chemical Approval and Control Processes*

The DEIS does not disclose details of Micron's internal programming for managing hazardous and restricted substances. Micron's Sustainability Report 2024 includes a page on hazardous and restricted substances (Appendix K, Vol 2, p. 395) which references a "rigorous review and approval process" for chemicals used at Micron facilities, but it fails to define the process, disclosure decision criteria, or identify any of the substances under review. Although the report mentions that Micron tracks its "chemical use profile" to support reduction and elimination efforts, neither the profile nor the outcomes of any of the related activities are disclosed. Micron's internal review is described as helping to prevent use of banned chemicals and ensures safe handling, recycling, and disposal. But the DEIS provides no decision criteria, no structure for oversight, no examples of restricted substances, and no indication of how workers or regulators might verify compliance. Which chemicals have been reduced? What alternatives are being considered? What is their chemical use profile? While we celebrate Micron's goal, it cannot act as a substitute for an explanation in the DEIS of the strategies and processes to attain the goal.

---

<sup>90</sup> Yoders, Jeff. 2025. "Veolia Settles With Michigan Over Flint Water Crisis for \$53M." *ENR Midwest*, February 24. <https://www.enr.com/articles/60332-veolia-settles-with-michigan-over-flint-water-crisis-for-53m>.

The Sustainability Report further states:

We have established a team of subject matter experts who identify emerging substances of concern and, to the extent feasible, work toward removing such chemicals and materials before they are restricted by customers or regulators. Being proactive in our regulatory monitoring, product compliance, validation and certification processes allows Micron to deliver innovative products while controlling restricted substances and conforming with applicable requirements. (Appendix K, Vol. 2, page 395)

In a regulatory landscape where science often outpaces policy, such internal hazard evaluation processes could play a critical role in protecting health and the environment. But without transparency, these efforts cannot serve as a basis for regulatory trust or community protection. If Micron has developed proactive mechanisms for identifying chemicals to restrict or eliminate, it must disclose this process in the DEIS - including criteria, oversight structures, and results.

#### *Failure to Address Public Comments*

These omissions are especially troubling given the extensive public concern around hazardous chemicals, as documented in the SEQRA comment period. NYSDEC and members of the public specifically requested chemical inventories, mitigation strategies, and clear commitments to avoid environmental harm. In many cases, the DEIS either did not respond or provided incomplete responses on the types and volumes of hazardous waste, processing chemicals, alternative substances, and regulatory oversight. For example:

- **NYSDEC Comment 23** asked for an “evaluation of processing methods and chemicals used in the manufacturing process to determine if alternative methods could reduce the generation of hazardous waste.” Micron’s response redirected to a previous comment about the types and handling of hazardous waste but failed to address the core issue – which chemicals are used in the manufacturing process and whether safer alternatives exist. (Appendix A-D, p. 67)
- **Comment 4 (Public Comment on Water Resources)** requested details on wastewater contents, treatment, and pretreatment systems. The request explicitly asked “chemicals must be identified [...] including hazardous materials, even if the weights and the volumes are not known.” The response deflected, referring to general water resource comments without ever naming the specific chemicals likely to be discharged into wastewater, or how they will be monitored and controlled? (Appendix A-D, p. 79)

These are not trivial oversights—they speak to a structural unwillingness to disclose basic information about the types, volumes, and risks of chemical hazards at one of the largest proposed semiconductor facilities in the United States. This lack of transparency erodes public trust and undermines the credibility and adequacy of the DEIS as a comprehensive environmental assessment.

#### **4. Monitoring and Reporting**

Throughout the DEIS, Micron outlines plans for continuous and periodic monitoring of hazardous substances, including toxic gases, radiation, and flammable chemicals. While this monitoring is essential,

the DEIS fails to address how job-specific exposures, particularly for operational workers, will be tracked, evaluated, or addressed. This omission represents a major blind spot in occupational health protections.

The DEIS also fails to disclose a comprehensive list of chemicals to be used, stored, or produced at the facility. Without this information, it is impossible to evaluate or comment upon exposure risks or establish adequate monitoring protocols. This lack of disclosure is especially concerning given the semiconductor industry's well-documented reliance on toxic chemicals and history of worker illness tied to long-term chemical exposures.

While there is considerable reference to monitoring plans, there are no provisions for how this data will be shared with regulators or the public. Without regular, disaggregated, facility-specific reporting—on emissions, chemical use, chemical hazards, exposure incidents, and health metrics—there is no way for local agencies, health professionals, or community organizations to track risks or intervene early in the event of a problem. If Micron intends to build trust, it must commit to sharing exposure monitoring data and health trends—de-identified to protect individuals but robust enough to support early intervention and scientific study.

## **Health and Safety Recommendations**

To meaningfully mitigate risks identified in the DEIS and address critical information gaps, we urge NYSDEC and other permitting agencies to incorporate the following recommendations as binding conditions in the final EIS and any project approvals:

### **1. Chemical Transparency and Hazard Disclosure**

- Require Micron to publicly disclose a comprehensive inventory of all chemicals used, stored, or produced at the facility—including those used in small quantities or considered proprietary.
- Mandate that the inventory include volumes (when available), hazard classifications, associated job functions or departments, storage methods, and waste treatment or disposal pathways.
- Require Micron to disclose internal chemical review processes, including criteria for eliminating “substances of concern” and examples of chemicals already phased out.

### **2. PFAS-Specific Protections**

- Require Micron to disclose all PFAS compounds used on-site.
- Mandate inclusion of PFAS and other emerging contaminants in plans for managing hazardous waste.
- Require Micron demonstrate destruction without toxic byproducts for disposal of PFAS waste offsite or onsite; require onsite treatment evaluations and adoption of destruction technologies where feasible.
- Set a “zero PFAS release” policy as the performance goal, rather than relying solely on limited federal thresholds.

- We also recommend Micron commit to managing all compounds of PFAS identified by scientific consensus as hazardous.

### **3. Job-Level Risk Assessments and Occupational Health Safeguards**

- Require public release of job-specific risk matrices and exposure data by job category and function.
- Mandate that Micron collect and report de-identified exposure monitoring results, illness data, and corrective actions taken.
- Require a detailed operations-phase EHS performance plan comparable to the construction-phase EHS performance standard in Appendix L.
- Require Micron to detail the structure and protection measures of Worker Safety Committees.

### **4. Monitoring and Reporting Requirements**

- Require facility-specific, disaggregated reporting on chemical use, emissions, worker exposures, and health monitoring results.
- Ensure all monitoring data and protocol as well as right-to-know policies for workers—including air, wastewater, worker exposure and illness results—are shared with workers, local agencies, including NYSDOH, and made accessible to the public on a regular basis. The DEIS lacks any worker-oriented or public-facing reporting portal to access monitoring data, incident summaries, or compliance records. There is also no mention of a right-to-know education or notification system for workers. Transparency and early warning are key to injury and exposure prevention. Right-to-know policies are core to chemical safety and should be operationalized through digital access to safety sheets, alerts, and risk data.

### **5. Public Access to Internal Safety Plans and Procedures**

- Require Micron to publish its Hazardous Waste Reduction Plan, Hazardous Waste Procedure, Waste Minimization Plan, and Risk Management Plan in full, available for public review with active links, no password barriers, and ensure ease of access to the publicly available information.
- Ensure that Micron’s Hazardous Waste Reduction Plan includes detailed steps of how they will implement their goal of reaching “near-zero hazardous waste-to-landfill by 2030”—including metrics, timelines, and scope of included materials.
- Make emergency response plans, prevention protocols, health and safety training materials and other chemical hazard-related designs available for public review, and ensure ease of access to the publicly available information.
- The DEIS mentions emergency response coordination but does not propose periodic simulations, joint drills with local responders, or a community hazard notification system in case of a release or spill.

- Require Micron publish the implementation details of its ISO 45001 and ISO 14001 certifications specific to the Clay facility, since the standard itself is not publicly available, and ensure ease of access to the publicly available information.
- Require Micron publish the implementation details of any SEMI standards used for the Clay facility that are not publicly available.

## **6. Address Unmet Public Comments and NYSDEC Concerns**

- Require full and formal responses to all substantive comments submitted by NYSDEC and the public during the SEQRA scoping period—including those requesting disclosure of hazardous waste types, wastewater contents, and chemical processing methods.
- Require a formal public response with complete follow-through on previously omitted details, explaining how each comment was addressed in the final EIS.

## **TRANSPORTATION AND TRAFFIC**

Micron must invest in and expand public transportation infrastructure to accommodate the anticipated population growth and ensure workers have reliable and affordable public transportation to the fab. This must include accessible transportation support safe, reliable, and low-emissions transportation, such as electric buses and trains, to and from their proposed factories, which is not currently accessible by public transportation—as well as service to other areas in the region which are inaccessible to impoverished populations. The projected socioeconomic benefits projected by Micron’s development will not be accessible to transit-dependent people if convenient, reliable, affordable, and safe transportation is not available.

At present, the DEIS does not show comprehensive plans to expand the limited public transportation infrastructure within Syracuse and the regional study area to meet increased demand. Nor does the draft provide sufficient details surrounding the listed plans to expand public bus routes. For instance, the DEIS states that there is only a “[p]otential introduction of a new [Bus Rapid Transit (BRT)] line in Onondaga County.” (Appendix Vol 1, p. 6-4). The people of Onondaga County deserve more than ‘potential’ plans. The EIS must detail comprehensive and clear plans for expanding BRT infrastructure, consistent with the priorities outlined by the Community Engagement Committee (CEC).

### **Public Transportation Infrastructure Analysis**

The DEIS notes: “The Central New York Regional Transit Authority (Centro) provides public transportation services throughout Onondaga County and the surrounding regions. Eight Centro bus routes operate daily within the transportation evaluation area and are regional rather than local, resulting in widely spaced and infrequent stops” (p. 3-293). Moreover, the DEIS does not document direct collaboration or agreements with Centro to support expanded routes, new services, or integrated scheduling. While Centro is mentioned, there is no evidence of joint planning, funding commitments, or timelines for implementation.

Transportation is also an economic and racial justice issue. There is currently no Centro route that people from Syracuse can use to get to the Micron site. The nearest accessible Centro route in Southside Syracuse is about four miles from Micron, making it nearly inaccessible for future workers without vehicles. Estimated one-way travel times using ride share services can exceed 1.5 hours. Transportation issues like these pose a barrier to employment for low-and moderate-income (LMI) city residents. The DEIS does not include a model of commute times for proposed BRT routes or a simulation of how long commutes from LMI neighborhoods (e.g., Southside Syracuse) would take by bus, BRT, or shuttle under any scenario. Transit time is a key determinant of job access and is used in both equity and economic development assessments. Without this modeling, there is no meaningful way to assess transit feasibility for low-income workers.

The CEC Priorities Document includes “Sustainable and Equitable Infrastructure Development” as a core priority, with the goal of “[c]reat[ing] a sustainable and inclusive transportation network that enhances connectivity, prioritizes safety, supports economic growth, and minimizes environmental impact, [while] moderniz[ing] and sustainably manag[ing] utilities and natural resources for resiliency and sustainability.”<sup>91</sup> The priorities document also states that when consulting with community groups about Micron’s impact on public transportation “diverse groups emphasize the need for improved public transportation to access jobs, education, and healthcare”<sup>92</sup> Community feedback cited in the document emphasized the importance of expanding reliable and sustainable public transportation to access jobs, education, and healthcare. Despite this, the DEIS and appendices offer few substantive details beyond limited bus route expansion.

### **Public Transportation Proposals**

Section D 3.1 of the DEIS reviews the 2050 long range transportation plan of the Syracuse Metropolitan Transportation Council (SMTC) from 2020, which was amended in 2022. Did the 2022 amendment utilize the latest Micron population and household projections that were developed by REMI Study and Micron’s consultant? It is unclear whether such projections were included when SMTC amended its plan to reflect progress on the interstate 81 viaduct project. (p. 190 of the PDF or p. D-11.)

Appendix D3.2 discusses Onondaga County’s Comprehensive Plan policy implications. The Plan, adopted in 2023, calls for a focus on transit-oriented development near identified centers and transit corridors. It also calls for enhancement of the bus rapid transit system to support the land use vision of the county. However, section 3.2.1 of the Plan states that the proposed Micron project would not directly advance some of the comprehensive plan’s goals relating to the development of this key employment center, and that the proposed project would not include improvements to public transit, such as expansion of the bus rapid transit services. The DEIS shifts responsibility to the county, offering no commitment that the Plan’s vision will be realized. The final EIS must include funded commitments and plans for transit services that will support, organize and service the growth which the Micron project will induce. Without such commitments, the environmental impact of the proposed project cannot be known. Will there be

---

<sup>91</sup> “Harnessing Opportunity: Community Priorities for Central New York: Community Priorities Document,” P. 16, CNY CEC, June 2024, <https://www.cnycec.org/community-priorities-document>.

<sup>92</sup> “Community Priorities Document.” P. 43, CNY CEC, June 2024.

transit service available to the visitors and employees of the Micron campus? Will induced growth, both residential and commercial, be accounted for when expanding public transit?

Under the Growth Inducing Effects section, the DEIS states that “The Comprehensive Plan includes policies to foster transit-oriented development near the centers, such as enhancing the County’s BRT system. Under the Comprehensive Plan, municipalities in Onondaga County would be expected to conform to future discretionary land use and zoning actions to facilitate new housing and business development in appropriate locations with the fewest adverse effects (e.g., adverse effects on infrastructure capacity or farmland).” (p. 3-33)

The draft also notes that Micron will construct four bus stops on its campus. However, there is no detail provided about these stops (p. 2-13). The final EIS must detail what bus routes these stops will service to determine how this helps expand public transit accessibility for future Micron workers. Moreover, under Table 4.2-1, in a list of Bus Rapid Transit Routes to be created under Present and Reasonably Foreseeable Actions, the bus line distance from Micron is “Unknown” (p. 4-11). Is this because the distance has not been mapped? Or are the distances not currently planned? The final EIS must clarify whether this is due to incomplete planning or mapping omissions.

The draft is also missing an analysis of how the ‘potential’ expansion of Centro’s bus routes will adequately meet the increased population demands, particularly for Micron workers commuting to the campus. The final EIS must include a comprehensive assessment of Centro’s current bus routes including existing service issues and an analysis of ridership, including income assessments, to determine transit adequacy for LMI residents. The EIS should also include more expansive analysis of future public transportation options that can be created to meet the needs of current and future residents who rely on public transit and how these plans will ensure future Micron workers have affordable, reliable, and sustainable access to public transportation.

## **Public Transportation Recommendations**

### ***Invest in public transportation infrastructure to ensure Micron’s facility is accessible to all CNY residents***

For Micron to make an effective commitment to equitable recruitment and hiring, Micron should invest in expanding access to public transportation. Micron can work with Centro to create practical bus routes to the site in LMI neighborhoods. Rapid transit service from designated places like the transit hub in downtown Syracuse can also be an option. There are clearly alternatives that should be considered rather than just building out the full amount of parking spaces Micron is planning. These alternatives would partially decrease the footprint of the development and lower vehicle emissions. Importantly, the DEIS does not mention how public transportation service schedules will be adjusted to accommodate non-standard work shifts. Micron’s fab will need to run 24/7, including night shifts, yet the DEIS does not assess whether existing or planned public transit routes will serve workers outside of peak commuting hours.

### ***Transportation Plans Need to Align with County Plans***

The EIS should make clear how plans for roads, buses, and other forms of transportation associated with Micron will support the Onondaga County Comprehensive Plan or “PlanON” for community development recommendations for future development. All regional development projects should be transit-oriented (see Greening USA “12 Traits for Sustainable Communities”,<sup>93</sup> and CNU New Urbanism Charter<sup>94</sup>). The County can adopt “Eco Friendly” planning standards including sustainable public transportation as cited in the CEC Priorities Document.

### ***Fund Syracuse Public Transit***

Micron could commit to funding a robust BRT route network that services the entire City of Syracuse as well as Clay and Cicero to support reduced greenhouse gas emissions from the region, reduce traffic congestion, and increase access to public transportation for all.

### ***Fund Free Shuttle to Micron Campus***

Micron could create a free or heavily subsidized shuttle covering several highly trafficked stops to support local communities accessing the Micron campus. This may also reduce traffic congestion.

### ***Assess Impacts of New Highway Interchanges***

The Micron FEIS should include assessment of community and environmental impacts of traffic within a 10-mile wide corridor around each new proposed highway interchange.

## **SOCIOECONOMIC CONDITIONS**

Micron’s proposed Project is slated to receive upwards of \$20B in public subsidies and tax credits from federal, state, and local governments. With this historic investment, the CNY community has been promised thousands of good jobs. However, Micron has made few concrete or enforceable commitments surrounding the permanent manufacturing jobs that define what constitutes a “good job” or how equitable access for these jobs will be ensured for current local residents, especially Syracusans.

This substantial public investment must result in real, quality jobs for members of the CNY community, especially those who have been historically left out of economic opportunity. A “good job” must guarantee family-sustaining wages and comprehensive benefits, safe working conditions, equitable hiring and employment practices, and access to an inclusive workforce pipeline and training opportunities. To meet this standard, Micron must provide specific details on its hiring process, compensation structures, working conditions, and training programs - and must make those commitments enforceable.

---

<sup>93</sup> “12 Traits of Sustainable Communities,” Greening USA, N.d.  
<https://greeningusa.org/2023/05/02/12-traits-of-sustainable-communities/#:~:text=Trait%20%20%E2%80%93%20Water%20Related%20Infrastructure,Engagement%20and%20participation%20by%20citizens.>

<sup>94</sup>Congress for New Urbanism (CNU). 2024. “The Charter of the New Urbanism.” Summer.  
[https://www.cnu.org/who-we-are/charter-new-urbanism.](https://www.cnu.org/who-we-are/charter-new-urbanism)

These issues are relevant considerations under SEQRA. The DEIS itself underscores the importance with which socioeconomic impacts must be weighed, noting that “ Under SEQRA, the protection and enhancement of the environment should be given appropriate weight with social and economic considerations, and the factors should be considered together in reaching decisions on proposed activities; environmental factors are not the sole consideration in decision-making (6 NYCRR § 617.1(d)).” (p. 3-465).

### **Worker Pay**

The DEIS notes: “At full operational capacity in 2045 the Proposed Project would generate more than 9,000 permanent on-site operational jobs and spur the creation of approximately 40,000 additional jobs in the regional economy and throughout New York State, including vendor, supply chain, construction, and community jobs. Upon completion, the Proposed Project would be the largest domestic producer of DRAM chips, 9,000 high-paying jobs by 2045” (p. 0-1). Of these 9,005 jobs, Micron estimates that 90% will be in manufacturing, with the remaining 10% in supportive services, which include IT, security, quality, procurement, supply chain, smart manufacturing technology, finance, HR, and legal services (p. 3-488). Of the 90% of manufacturing roles, 10% will be in leadership roles (supervisors, managers, directors), 44% will be engineering and professional roles (e.g., equipment and process engineers), and 36% will be equipment and process technicians. However, only 669 of the jobs created within the first three years will be eligible for workers without an advanced degree (p. Q-49-50).<sup>95</sup>

Micron reports that employees at the Fab Complex are expected to earn an average of \$100,000 in total compensation (base salary plus cash bonuses)(p. 3-489). However, it is not clear how often cash bonuses are distributed, making the actual base salary difficult to assess. The DEIS also fails to clarify the pay disparities between higher paid employees (such as engineers) and lower-paid roles (such as operators).

According to Micron’s PILOT application, engineers and technicians are projected to earn \$94,800 and \$68,600 per year, respectively.<sup>96</sup> With 36 percent of operational workers serving as technicians, nearly half of Micron’s operational workers will not be receiving the \$100,000 salaries Micron has publicized. Furthermore, Micron exhibits one of the highest pay disparities among federal CHIPS Act recipients. In 2023, Micron CEO Sanjay Mehrotra received the highest compensation among all CHIPS recipient CEOs at \$25.3 million - rising to \$30 million as of 2024<sup>97</sup> - while half of Micron’s workers earned less than \$54,570 the same year.<sup>98</sup>

To ensure transparency and accountability, the EIS must disclose the full pay ranges associated with each position. Micron must provide clear, enforceable salary ranges for each classification, explicitly

differentiating base pay from bonuses to allow accurate assessment of true economic benefit and equity across job categories.

## **Hiring**

The DEIS outlines several construction partnerships and commitments Micron has made to ensure there is equitable and inclusive access to construction jobs including: their commitment to hire 1,500 veterans in the region over two decades via the Center for Military Recruitment Assessment and Veterans Employment with the use of the “Helmets to Hardhats program” (p. Q-53), signing onto the CHIPS Women in Construction Framework (p. Q-49), committing to work with local construction partners to establish a target percentage of construction workforce from disadvantaged populations (p. Q-49), and entering into a Project Labor Agreement with local building trades (p. Q-49).

However, while the DEIS outlines some inclusive hiring efforts for the construction phase, it provides few details and no enforceable commitments about Micron’s plans to hire workers from disadvantaged communities such as disadvantaged communities with documented high rates of poverty for permanent manufacturing jobs. The EIS must clearly outline how Micron intends to recruit, train, and hire marginalized and underrepresented workers for its permanent operations positions to fully assess socioeconomic effects.

The draft states: “Given the Micron Campus’ proximity to colleges and universities, the regional collaborations, and initiatives for training already in place, and with additional investments through the Green CHIPS Community Investment Framework (CIF) it is reasonable to assume that Micron could exceed the 60 to 70 percent local job recruitment rates experienced at Micron’s Boise, Idaho and Manassas, Virginia facilities. For the Proposed Project, this equates to over 6,300 permanent operational high-paying jobs secured by existing local and regional study area residents, and approximately 2,700 secured by workers who would be in-migrating to the region” (3-489).

While we are pleased to see that Micron has this local hire target for its recruitment, Micron must commit to this goal in an enforceable manner for permanent production facility jobs. Additionally, the draft notes that these 6,300 permanent operational workers will come from both the local and regional study area. However, it is unclear how many of the 6,300 locally sourced positions will come from the City of Syracuse versus the broader regional study area. This distinction is critical. Syracuse has the highest child poverty rate (46%) of any U.S. city and a high overall poverty rate of 29.6% (p. Q-18-19), significantly higher than nearby areas like Cicero and Clay. It is essential that Syracuse residents, who face the greatest economic needs, are prioritized for access to these quality jobs. We should not miss a golden opportunity to improve the lives of children from low-income families.

Micron must guarantee that a meaningful percentage of new hires come from marginalized local communities, particularly within the City of Syracuse. Micron must establish a workforce development process that targets census tracts with the highest concentration of poverty in the CNY region. In addition, Micron must commit to inclusive hiring policies that remove unnecessary barriers, such as GED requirements, English language proficiency requirements, and prohibit discrimination against workers impacted by the criminal legal system.

## Training

The DEIS notes that Micron’s programs, developed in partnerships with regional universities, will “expand equitable access to education, increase retention and prepare all students—especially students from underrepresented groups and rural areas—for productive and fulfilling engineering careers” (Q-53). However, it is not clear how this program will specifically target underrepresented populations or which groups are included in the definition of “underrepresented” and “rural”. The vagueness of this commitment means that its impact is impossible to assess. The EIS should provide details on this program, clarify the intended beneficiaries of this initiative, and provide details on outreach strategy and structural design to ensure it effectively expands access for underserved communities.

While this is a good start in ensuring equitable access to engineering jobs at Micron, the company must make enforceable commitments to equitable access to training programs for production workers entering lower-tract and non-engineer positions. This includes entry-level and mid-skill roles, which offer more accessible pathways into the workforce for individuals with fewer academic credentials, as well as on-the-job training opportunities for upward progression.

The draft notes that technicians, who will make up 36% of the manufacturing workforce, offer the greatest opportunity for an onramp for less qualified workers with the lowest certification barrier requirements: “The qualifications are an Associate of Arts or Science degree or completion of a Micron Apprenticeship Program, another approved certification, or a combination of certifications under development with Micron community college partners or equivalent training and experience.” (p. Q-50) The draft also states that Micron will provide “on-the-job training for the role’s function” (Q-50).

However, the DEIS fails to provide sufficient detail on either the Micron Apprenticeship Program or the nature of the on-the-job-training. The EIS should clarify the structure, content, and delivery of both training components. Specifically, it should explain how the apprenticeship program and on-the-job training differ, which workers will be eligible for each, and whether either program is offered in collaboration with labor unions, registered apprenticeship sponsors, or nonprofits organizations.

For the Micron Apprenticeship Program in particular, the EIS should detail which workers will be eligible or prioritized for enrollment, whether the program is registered with state or federal apprenticeship agencies, whether the program is delivered in partnership with community-based or labor organizations, and, whether the program will intentionally target underrepresented or marginalized workers and if so how the targeting is implemented.

In addition to workforce entry training, Micron should commit to ongoing professional development for its employees to ensure equitable access to promotion and advancement opportunities within a highly technical work environment. The DEIS does not currently outline any plans to continue upskilling or retaining of operations workers, an omission that must be addressed if Micron is to offer true long-term career pathways and inclusive economic mobility in a highly specialized sector.

## Work Conditions and Opportunities for Advancement

The DEIS does not outline plans to ensure workers will have access to internal advancement opportunities within Micron. Reporting from the Institute for Policy Studies indicates that Micron workers in Manassas Virginia have experienced barriers to promotion opportunities and wage growth. In particular, multiple workers at the Manassas location have cited that internal job postings were removed before employees had the opportunity to apply. Workers have also reported being expected to work additional unpaid hours, on top of twelve hour shifts, in order to be considered for advancement. Additionally, Micron workers have noted that they have earned minimal pay increases of a dollar or two over a period of several years.

These concerns are compounded by broader issues facing semiconductor workers. Low-wages, limited advancement opportunities, workplace safety issues, and demanding schedules are pervasive issues for semiconductor workers here in the U.S.<sup>99</sup> The DEIS notes that “Micron would operate five (5) shifts over a 24-hour day. Day and night shifts would be utilized to sustain 24-hour manufacturing activities, as well as a Monday-Friday day shift” (p. 2-15). To maintain continuous production, the draft further states that production workers will be scheduled 11.5 hour overlapping shifts (p.2-15). Although DEIS identifies demanding 11.5 hour overlapping shifts, it does not provide clarity on how Micron plans to mitigate fatigue and related safety risks. Micron must explicitly detail measures to address potential health and safety risks associated with prolonged shifts, including rest periods, shift rotation practices and comprehensive fatigue management protocols. Working long hours and mandatory overtime are known to increase injury rates and health impacts. One large cross-industry study from the U.S. found that overtime increases the risk of workplace injury, measured as the injury hazard rate, by 61%. At least 12 hours a day was associated with 37% increases and at least 60 hours per week to 23% increases.<sup>100</sup>

These demanding work schedules, combined with a lack of clarity around advancement and training, raise serious concerns about job quality and long-term retention. The EIS should directly address these issues by outlining how Micron plans to provide safe working conditions, fair compensation, and transparent, equitable pathways for internal promotion and professional development.

## Workforce Reporting Information Collection

To ensure that Micron achieves the goals of the CHIPS Incentives Program and Green CHIPS Act, the CHIPS Program Office (CPO) and Empire State Development (ESD) must actively monitor workforce metrics, milestones, and compliance with health and safety standards. Collecting key baseline data is essential to determine whether the Green CHIPS program is, in fact, truly delivering good manufacturing jobs accessible to all. At minimum, Micron should be required to report the following:

1. **The number and geographic location of U.S. jobs created or supported.** Given that many semiconductor roles can be performed remotely, it is important to assess whether jobs offer economic benefits in the communities where subsidies are targeted.

---

<sup>99</sup> Mills Rodrigo. 2024.

<sup>100</sup> A. E. Dembe, et al. 2005. *The Impact of Overtime and Long Work Hours on Occupational Injuries and Illnesses: New Evidence from the United States*. 588–97. *Occupational & Environmental Medicine* 62, no. 9, September, <https://pubmed.ncbi.nlm.nih.gov/16109814/>.

2. **The minimum wages and benefits for each job title.** Relying on average compensation figures obscure pay disparities. For example, while the Semiconductor Industry Association cites \$170,000 as the average annual salary,<sup>101</sup> the U.S. Bureau of Labor Statistics reports that processing technicians earn a median hourly wage of \$21.49, with the lowest 10th percentile earning just \$15.92 per hour (or \$44,690 and \$33,120 annually, respectively).<sup>102</sup> Reporting minimum, not just average wages.<sup>103</sup>
3. **Recruitment, hiring, and training plans for marginalized and underrepresented workers in the manufacturing workforce.** Micron must describe how it will recruit workers who face barriers to employment, such as women, people of color, veterans, formerly incarcerated individuals, people who live in rural areas, residents of low-income census tracts, and workers transitioning from carbon-intensive industries.

CPO and ESD must monitor Micron to ensure these goals are achieved. According to The CHIPS & Science Act Section 105, the Government Accountability Office (GAO) requires the CPO, to the extent possible, to report on “aggregated workforce data, including data by race or ethnicity, sex, and job categories.”<sup>104</sup>

The most effective way to ensure compliance is to mandate regular, quarterly reporting from Micron. These reports should include, among other things, total U.S. Full Time Equivalent (FTE) work performed that quarter by job type and demographics; minimum wages and benefits paid, disaggregated by job title and demographics; information on each new hire; and descriptions of workforce development, apprenticeship, and training programs.<sup>105</sup>

In addition, Micron should be required to report on all applicable federal or state-mandated administrative and national policy requirements. The CHIPS Incentives Program NOFO and Green CHIPS requirements lists multiple administrative requirements, including compliance with prevailing wage laws under the Davis-Bacon Act and adherence to federal employment and labor laws such as the Civil Rights Act, Fair Labor Standards Act, Occupational Safety and Health Act, and the National Labor Relations Act.<sup>106</sup> Required documentation, such as firm level EEO-1 Component reports and OSHA 300 logs, should be included, along with disclosures of any violations and their overall compliance status.

<sup>103</sup> Reporting minimums provides insight into what the lowest-paid workers are making, while average pay can be skewed by the highest earners – the Semiconductor Industry Association uses \$170,000 annual pay as the average for the industry. Semiconductor Industry Association (SIA). 2022.

<sup>104</sup> Department of Commerce. 2023. CHIPS & Science Act. Division A Section §105(a)(2)(D)(iii). Pg.27; NIST. “Notice of Funding Opportunity: Commercial Fabrication Facilities.”

<sup>105</sup> Jobs to Move America (JMA). 2020. “U.S. Employment Plan.” April 10. <https://jobstomoveamerica.org/resource/u-s-employment-plan-2/>.

<sup>106</sup> Excelsior Jobs Program Regulations (updated for Green CHIPS 3/28/23). March 28, 2023. <https://esd.ny.gov/sites/default/files/ExcelsiorRegs%20-2023-GC-updated-final-050123.pdf>.

Lastly, to complete the foundation of strong workforce development programs, CPO, NIST, and ESD should impose penalties for non-compliance or rescind any other benefits the recipient may have earned related to these commitments. The CHIPS Incentives Program NOFO provides clawback provisions for failure to achieve construction target dates, around technology sharing with foreign entities, and recipient expansion into prohibited foreign countries.<sup>107</sup> Similarly, the Green CHIPS Program requires recipients to meet its targeted lower-bound net new jobs number or the lower estimate of annual net new jobs they identified in their signed agreement with ESD.<sup>108</sup> Both programs require recipients to comply with all reporting requirements. We urge for the implementation of similar penalties for non-compliance with workforce-related contractual commitments.<sup>109</sup>

The federal and state CHIPS Acts represent a historic opportunity for workers and their communities to ensure that the hundreds of thousands of construction and operations jobs created by CHIPS funding opportunities are good jobs. CPO, NIST, and ESD should institute robust and transparent reporting with the appropriate compliance mechanisms to ensure accountability.

### **Economic Development & Growth Inducing Effects**

Economic inequality and segregation is prevalent in CNY, particularly in Syracuse. Black and Latinx individuals have significantly higher poverty rates relative to white individuals and these rates are higher in CNY. This is most keenly felt in the economic disparities between central Syracuse and areas outside of the city center like Clay. In Syracuse, 29% of the population is Black, compared to just 4.5% in Clay. Despite these realities, Micron makes no clear or enforceable commitments to alleviating poverty in Onondaga County.

The DEIS subsection, Economic Development, Labor, and Employment concludes that the impacts of operational activities on economic development, labor, and employment will not result in significant adverse effects (p. 3–490). However, given the massive scale of Micron’s project, it seems preposterous that Micron’s hiring will not impact labor costs or workforce availability for other businesses and manufacturers in the central New York area. The DEIS implies that surrounding employers will not see an

---

<sup>107</sup> National Institute of Standards and Technology (NIST). 2023 “Notice of Funding Opportunity: Commercial Fabrication Facilities.

<sup>108</sup> Excelsior Jobs Program Regulations (updated for Green CHIPS 3/28/23). March 28, 2023.

<https://esd.ny.gov/sites/default/files/ExcelsiorRegs%20-2023-GC-updated-final-050123.pdf>.

<sup>109</sup> Micron has fallen well short of realizing their job creation commitments in the past. As part of its \$70 million grant from the State of Virginia to support the expansion of their manufacturing facility in Manassas City Virginia, Micron committed to making \$2.9 Billion in capital investments and increasing employment by 1,106 by 2027. While Micron has met overall payroll and capital investment goals, they have fallen well short of hiring commitments. As of fiscal year 2023, Micron has missed hiring targets by 73%. As of 2023, Micron had only created 150 new jobs at the Manassas plant compared to their goal of 553 by that year. Micron had been meeting their hiring commitments towards the beginning of the grant period in 2019 and 2020 but failed to meet requirements in subsequent years. In 2021, new jobs declined by 39. The company blamed the pandemic for the slowdown, but Micron only added 38 new jobs in 2022 and in 2023 new jobs again declined by 265. As of 2023, Micron had committed to 553 new jobs in Manassas but had only added 150, a shortfall of 73%. This decline coincided with a global repositioning by Micron which led to a 10% reduction in total workforce. It appears that Micron’s macro business considerations trumped the commitments they made to the State of Virginia related to hiring. Micron Technology Inc. 2019 - 2023. “FY19 - FY23 Annual Progress Report Semiconductor Manufacturing Grant Program: Micron 2018 Expansion Project.” (received via VFOIA request); Micron Semiconductor Manufacturing Performance Agreement Executed. 2018. (received via VFOIA request).

adverse impact in retaining or paying workers once Micron’s operations begin but provides no documentation to support this counter-intuitive claim. For example, have other employers been consulted to assess potential impact?

In its discussion of construction-phase labor shortages—which is expected to last 16 years—the DEIS claims that shortages of labor are expected to be limited and short-term (p. 3-485) but fails to provide adequate documentation about how this broad conclusion was reached. The EIS should include a detailed analysis explaining how this determination was made.

Labor shortages during both construction and operational phases are significant concerns that are not completely addressed in the DEIS. While it may be true that training programs will increase the labor supply and mitigate upward pressure on labor costs, the DEIS does not offer evidence to substantiate this and details supporting these claims are lacking. The DEIS should be amended to clearly detail all intentions and projections related to labor acquisitions, training, in-migration and impacts on existing employers. Absent this detail, the public cannot meaningfully evaluate the scope and credibility of the DEIS’s labor impact claim. The EIS should provide a clear, fair, unbiased, and detailed assessment of this impact.

The cumulative socioeconomic benefit from the project depends in large part on induced growth from worker spending in the regional economy. But those benefits are likely to diminish if Micron’s direct and indirect new jobs are skewed toward the low end of the industry wage scale, limiting workers’ disposable income to spend on locally serving businesses. This concern is especially relevant in a region where the top two industries are retail trade (21.8 %) followed by accommodation and food services (11.3%) (p. Q-38), sectors that consistently offer among the lowest wages. In Onondaga County, in particular, the DEIS notes: “approximately one-quarter of the resident labor force is employed in the retail trade sector” (p. Q-39).

Syracuse, the most populous city in Onondaga County,<sup>110</sup> has a poverty rate of 30.1%, nearly 20% higher than the national average,<sup>111</sup> and has the highest child poverty rate (48.4%) of all U.S. Cities (and overall poverty rate of 29.6%). With the project projected to create over 33,000 indirect jobs, many of these will likely be in the low-wage service sector. Within this low-wage sector, retail industry jobs pay the lowest, with most retail jobs earning less than the average private sector job. In real terms, retail wages have been in decline since the 1970s with current retail wages at just 72% of what they were in 1972. On top of low wages, retail workers rarely receive benefits or formal training.<sup>112</sup> Without properly accounting for the impact that Micron’s arrival will have on the creation of low-wage spinoff jobs, it is possible that Micron’s cumulative socioeconomic impacts will have negative impacts on the local and regional study area.

<sup>112</sup> Carré, Françoise, and Chris Tilly. 2017. “A Global Look at What Makes U.S. Retail Jobs so Bad.” Perspectives on Work: Retail Workers.

Additionally, knowing the earnings distribution among Micron’s expanded workforce would also help refine these plans. In other centers of high-tech employment, such as Silicon Valley, growth in high-wage tech jobs has been found to increase regional employment growth overall, but at the cost of inflating housing costs and eroding real wages for workers earning less, such as retail and hospitality workers.<sup>113</sup> Micron’s potential to widen inequality in metro Syracuse and Onondaga County and displace low-income residents must be explicitly addressed.

The DEIS’ subsection on growth inducing effects (Section 3.1 5.3.2) is unclear. Here, we see recognition that there will be adverse effects on such things as housing costs, housing availability, housing affordability, etc., but section after section, the DEIS claims that these effects will be short-term. The DEIS notes that as it relates to housing disruptions the “short-term” is asserted to be four years as the market adjusts. But still, all of this is conjecture. These sections seem to overstate the proposed or intended benefits, but understate the potential for adverse impacts.

In the mitigation measures (section 3.1 5.4 p 3–503) the claim is made that Micron does not control the housing market and cannot specifically mitigate such impacts, but Micron will “continue to work with agencies and stakeholders to identify specific actionable measures to avoid or minimize the potential for short term significant adverse effects” on the local housing market. The public needs more than ‘work with’” (p. 3-503). Additionally, one of the goals of Micron’s Community Investment Fund is to support affordable housing in the region.<sup>114</sup> The public needs assurances that the inevitable housing disruptions will be mitigated. The EIS should be clearer about what specific plans Micron has to work with agencies. We propose the following mitigation measure relating to growth--inducing impacts, all of which can be incorporated through a community negotiated and enforceable Community Benefits Agreement which is discussed in more detail below:

- To ensure proper community participation is involved, we recommend the creation of a citizens conservation type management and environmental mitigation council to oversee all actions relating to the environmental impacts of the fabs as well as the induced growth and mitigation of its effects.
- Creation of an independent planning team made up of professional, certified planners to oversee, review, and manage growth--related mitigation measures.
- Adequate funding for staffing of the planning team and the citizens’ council, as well as funding for incentives or subsidies needed to mitigate problems related to housing shortages, affordability, and avoidance of homelessness.

The intersection of household growth and GHG emissions is something that also deserves additional scrutiny and explanation in the EIS. This DEIS dismisses the GHG impacts of induced growth as minor compared to the fabs themselves. Perhaps this is true, but there is no assessment and no facts presented to substantiate this claim. But regardless of the relative magnitude of GHG emissions from each sector, the

---

<sup>113</sup> Dee Gill, and William Yu. 2019. “Does a Rising Tide of High-Wage Tech Jobs Really Lift All Boats?,” *UCLA Anderson Review*, October 30. <https://anderson-review.ucla.edu/forecast-tech-jobs/> .

<sup>114</sup> ESD. 2022. “Memorandum of Understanding for Micron Community Investment Framework in Central New York.” October 27. <https://esd.ny.gov/sites/default/files/Executed-MOU-NY-CIF-with-Exhibit.pdf>.

GHG emissions from induced residential and commercial (or even supply chain industries) should be accounted for and reported in the EIS.

Overall, the Growth Inducing Effects section of the DEIS does not adequately explain how the growth induced impacts of the community will be met. It praises the anticipated benefits of fab development in abstract terms while minimizing the likely adverse impacts. It fails to establish how these challenges will be met without adequate preparation, investment, and citizen oversight, particularly through a negotiated community benefits agreement (CBA), which has been notably absent from this project so far.

The DEIS admits that the region has not updated municipal plans and is unprepared to manage induced growth, which will consequently lead to adverse impacts. How can the fab development be approved without the community being prepared to deal effectively and sustainably with the recognized external socioeconomic and environmental costs and risks? Page 3-33 states:

Although other counties and municipalities in the five-county study area have enacted comprehensive plans, there are few recent plans. The City of Syracuse Comprehensive Plan was enacted in 2012, the Oswego County Comprehensive Plan was enacted in 2008, and the Cortland County Consolidated Plan was enacted in 2002. Over time, other counties and municipalities could enact updated policies similar to the Onondaga County, Clay, and Cicero plans described above to include measures to mitigate adverse growth inducing effects from the Proposed Project, while harnessing smart growth principles, such as the goals outlined in the Onondaga County Comprehensive Plan, to realize positive benefits from induced growth in the region. In particular, future planning policies could direct development to appropriate locations with the fewest adverse effects to farmland. (p. 3-33)

That paragraph references principles set forth in the Onondaga County Comprehensive Plan, yet it offers only aspirational goals. Unless towns and cities adopt those principles into enforceable local law, these principles will have no binding impact. Moreover, even full adoption may not go far enough to mitigate the impacts which the fab developments, or induced growth, will create. Leaving induced growth, its impacts, and mitigation to “future planning policies” opens the floodgates for adverse impacts. This is unacceptable and untenable.

Approvals for the fab development must be contingent upon robust, binding mitigation commitments that ensure induced growth occurs in a way that addresses concerns including greenhouse gas emissions, costly infrastructure, traffic congestion, housing affordability, and homelessness. A binding CBA that details a mitigation plan with measurable and achievable objectives will go far in helping to offset the adverse impacts of the induced growth.

### **Community Investments**

As part of the Green CHIPS investment, Micron has committed to invest at least \$250 million, making up half of the \$500 million Community Investment Fund, over 20 years into “Workforce Development and Expansion, Education, Community Assets and Organizations, and Affordable Housing,” according to the

CIF Memorandum of Understanding (MOU).<sup>115</sup> While many of these commitments are promising, all of these commitments are made in “good faith” and are therefore not enforceable.<sup>116</sup> To ensure that Micron makes good on these promises, it is critical that these commitments be both enforceable, have public oversight, and be publicly reported. The DEIS fails to articulate enforceable commitments or measurable community outcomes. Micron must detail enforceable accountability measures, including milestones, public reporting mechanisms, and structured community oversight committees to ensure community investments deliver tangible, measurable benefits.

According to the MOU for Micron CIF,<sup>117</sup> the purpose of the MOU “is to memorialize discussions and understandings between the Parties for the CIF, which the Parties anticipate will be incorporated into an approved ‘Green CHIPS Community Plan’ upon formal adoption of the regulations governing the ESD Green CHIPS program.”<sup>118</sup> The “Green CHIPS Community Plan” is not currently publicly available and despite FOIL requests we have yet to receive any documentation of this executed plan. Notably, the DEIS makes no references to the “Green CHIPS Community Plan” despite several references to the Green CHIPS Investment Fund. Without this final executed Plan it is unclear to what specific goals Micron is going to be held to account, how Micron will meet these goals, and on what Micron will publicly report.<sup>119</sup>

We appreciate the CPO’s emphasis on building resilient local economies by requiring applicants to make community investments and identify areas within their regional economies that require investments to ultimately help strengthen the economy under the Commercial Fabrication Facilities Funding NOFO.<sup>120</sup>

We encourage Micron to commit to milestones, to publicly report on outcomes, to provide community benefits (such as affordable housing, public transportation, and local investments in secondary and post-secondary education), protect community health, develop renewable energy infrastructure, and provide workforce development opportunities for historically marginalized community members. Opportunities such as these can be provided and enforced through CBAs between impacted communities and CHIPS grantees. Like job creation commitments, community investment commitments whether included in a CBA or not, should be subject to monitoring and public reporting. Because they directly involve impacted communities in their negotiation and enforcement, we believe robust CBAs are the best way for companies to comply with 15 U.S. Code § 4652, which requires recipients of CHIPS and Science Act funding to invest in surrounding host communities.

As part of a CBA, Micron should establish a community monitoring committee that includes community members and worker representatives to monitor and hold Micron accountable. Public reporting should occur on a regular and recurring basis (to be determined) to confirm Micron’s compliance. Reporting can be done either by Micron, or by a third-party expert selected and managed by the community monitoring

---

<sup>116</sup> Ibid.

<sup>117</sup> Ibid.

<sup>118</sup> Ibid.

<sup>119</sup> The MOU for the CIF states that, “Consistent with the Green CHIPS program regulations, the parties expect that progress regarding the commitments set forth in the Green CHIPS Community Plan will be subject to regular public reporting.” ESD. 2022. “Memorandum of Understanding for Micron Community Investment Framework in Central New York.”

<sup>120</sup> NIST. 2023. “Notice of Funding Opportunity: Commercial Fabrication Facilities.”

committee. We also recommend that Micron pay for any contracted monitoring expert. All reported information should be regularly reported and updated to the local community on a publicly accessible website that could be managed by the committee.<sup>121</sup>

Central New York has had too many experiences with private companies making lofty promises in exchange for hundreds of millions of taxpayer dollars, only for those promises to go unfulfilled. With one of the highest poverty rates in the country, Syracuse has perhaps the most to gain economically from Micron's investment. Central New York cannot afford another broken economic investment like Destiny USA.<sup>122</sup> Now must also be the time that Micron, with support from local, state, and federal public officials, makes enforceable commitments to creating good jobs for Central New York residents in exchange for this historic public investment.

## **Housing**

The DEIS does not provide adequate plans to mitigate the impact that Micron's induced population growth can have on an already stressed housing market. In particular, the DEIS understates the potential impact that Micron could have on the rental and housing market and fails to provide adequate evidence to back up its claims in this regard. The DEIS also does not detail any specific plans that Micron has to work with the state or county to mitigate stress on the housing market or expand affordable housing. Without meaningful details, it is unclear if or how Micron and state and county government agencies intend to expand the availability of mixed income affordable, climate friendly, and safe housing.

### *Regional Housing Market Trends*

Accessibility to affordable housing is a serious concern in the local and regional study area, particularly in Syracuse. Likely due to population growth in the Syracuse area over the last two years, the rental market in Syracuse is incredibly competitive, leading to high prices that cause low-income residents to struggle to afford housing. Syracuse was recently listed as one of the most competitive rental markets in the country according to a study by Apartment Advisor.<sup>123</sup> The cost of renting an apartment in the city of Syracuse rose 23% over the last two years alone.<sup>124</sup> The 2024 Empire State Development (ESD) study analyzing the impact that Micron will have on housing cited that median rents in Onondaga County are 40% higher than

---

<sup>121</sup> Los Angeles World Airports (LAWA) provides an example of how a CBA can incorporate both environmental and socioeconomic benefits. LAWA has a CBA with the local community that includes community benefits and impact mitigations provided by LAWA as part of the LAX Master Plan Program. Some of the environmental provisions include: three studies around the environmental impact on the community that LAWA will fund, measures to reduce emissions related to aspects of airport operations, and environmental mitigations and commitments related to airport construction. It also includes an ongoing role for the LAX Coalition to both implement and oversee these benefits and hold LAWA accountable with mitigation. Los Angeles World Airports (LAWA). N.d. "Community Benefits Agreement (CBA)."

what the standard renter can afford to pay and that median home prices in the county rose more than 85% from 2012 to 2023. Across counties in CNY, high rents are also an issue, with the ESD study citing that median rents across counties rose from 46 to 83% since 2011.<sup>125</sup>

Economic inequality and segregation are prevalent in Onondaga County, particularly in Syracuse. Syracuse's poverty rate is 30.1%, nearly 20% higher than the national average.<sup>126</sup> Onondaga County is highly segregated by income, with lower-income households concentrated in the city and higher-income households outside the city. Although Syracuse has 30% of the county's households, it only contains 20% of households with incomes above \$50,000. Furthermore, Syracuse has about 47% of county households with incomes of less than \$50,000, and the poverty rate inside Syracuse is four times the poverty rate in the rest of the county.<sup>127</sup> Forty percent of households in Syracuse are renters and the city is disproportionately made up of low-income households. Forty-six percent of Syracuse households earn less than \$35,000 and pay more than 30% of their income on housing. And only four of Syracuse's twenty-eight neighborhoods scored well for exterior upkeep according to the study.<sup>128</sup>

Onondaga county's housing infrastructure is a major issue with extremely outdated housing infrastructure that has led to health and safety issues for residents including numerous homes detecting lead contamination.<sup>129</sup> The DEIS also makes references to the City of Syracuse study noting that "the Syracuse housing market was struggling with chronic maintenance issues related to extensive low demand. Market conditions had disincentivized private, unsubsidized investment into the housing stock, leading to soft sub-markets with roughly one-third of all residential properties in the city in 'visible decline'."<sup>130</sup> In addition to creating new housing, Micron's in-migration impacts will require the county to update existing housing infrastructure to protect the safety of current residents.

### *Household Growth*

The DEIS states that "The household growth anticipated from Micron's worker populations at a community level would be of a scale that may be readily noticeable in terms of increased population densities, as well as increased commercial and residential activity" (p. 3-493). The estimated population growth is 64,000, with 27,000 new housing required in the 5 county study area (p. 3-491); 85% of this is estimated to be in Onondaga County and 32% of that within Syracuse. The DEIS states that this in-migration and growth would be "[l]arge enough to alter local and regional housing markets" (p. 3-493).

<sup>130</sup> Kanuss, Tim. 2023. "Study lays bare the devastating economics of Syracuse's affordable housing crisis." Syracuse.com, March 1. <https://www.syracuse.com/news/2023/03/is-syracuse-too-poor-to-attract-new-housing-study-cites-obstacles-to-grow/>h.html.

In addition, the DEIS includes conflicting information about Micron’s impact on the area housing and rental market. Section 3.15.3.2 notes: “The in-migration of workers and families for construction of the Proposed Project in the local and regional study areas would not create direct or indirect effects to real property and housing within the local and regional study areas” (p. 3-482). However, when it comes to providing housing for Phase 1 construction workers the DEIS states that, “Because Micron construction would begin as soon as practicable after all applicable regulatory approvals are secured, the local study area would likely not be able to provide new housing stock necessary to accommodate a substantial number of Phase 1 construction workers and their families.” (p. 3-493). Additionally, according to the DEIS, “there would be rent pressures attributable to the Proposed Project’s induced growth in markets beyond the local study area”(p. 3-494) and “The Preferred Action Alternative’s induced housing demand may lead to rent increases and the potential to indirectly displace residents who cannot afford rent increases” (p. 3-502).

In the Growth Inducing Effects section, the DEIS states, “The Proposed Project’s induced population would be large enough to alter local and regional housing markets. . . the Project’s induced growth would generate housing demand at a scale not experienced since the 1970s.” The report goes on to note, “The in-migrating labor force would increase the demand for housing and exceed available vacant supplies in the local study area.” (p. 3-493).

These contradictions must be clarified in the EIS. The DEIS fails to quantify the magnitude of expected impacts, raising serious questions about its claim that housing effects will be short-term. The EIS must provide further analysis and projections to support Micron’s claim that the project will only have short-term impacts on housing costs.

According to the Syracuse housing strategy, “7,605 households in Syracuse received some form of assistance in 2021 to alleviate cost burdens. Existing levels of housing cost assistance would have to triple to meet the needs of the 15,258 cost-burdened renters while continuing to assist these 7,605 households.”<sup>131</sup> This tripling isn’t even accounting for the rising housing cost which Micron related in-migration will induce.

The DEIS presents no details on projected price increases or housing cost trends tied to population growth. Without such projections, how can the DEIS claim that Micron’s impact on the housing market will only be ‘short term?’ Will there be an increasing number of unhoused residents as a result of rising housing costs? And if so, what mitigation measures will be established to avoid an adverse impact? What will be the implication for unhoused populations or residents on fixed income such as seniors? If such an assessment exists, the details should be included in the EIS. If such assessments are not available, these impacts must be estimated utilizing appropriate and best available methods and professional judgement, and disclosed as part of the EIS.

The ESD housing study determined that “Micron will require 30,000 new homes, most of them by 2038. This will require more than tripling the pace of home development in the coming years and then sustaining development at nearly 2X the current rate for at least a decade. The homes being built need to reflect what jobs pay. This will allow filtering up and down while reducing competition for existing and

---

<sup>131</sup> HRA, EDR, and Highland Planning. 2024. “Building a Healthy Housing Market in Central NY A Roadmap for Regional Action Amid Historic Investment in the Semiconductor Industry.” Empire State Development, December. <https://esd.ny.gov/sites/default/files/media/document/CNYHousingMarketStudy.pdf>.

new homes. Expected incoming residents will earn incomes across a wide spectrum generally higher than regional median income today.”

The study also determined that housing impacts will begin early on in Micron’s development noting that, “Job growth will lead to significant early net new housing demand, with up to 19,000 new homes needed by 2028 and up to 32,000 needed by 2038 and onward” and “Shorter-term, flexible solutions to absorb a rapid increase in housing demand will need to be accompanied by longer-term housing production at the price points affordable to incoming workers.”<sup>132</sup>

### *Housing Mitigation Measures*

In Section 4 (Cumulative Impacts), amongst other things listed in Table 4.2-1, *Present and Reasonably Foreseeable Actions*, are housing developments currently planned and in some stage of development. The table includes 5,852 housing units, far short of the 27,546 estimated to be required by Micron’s in-migration. Further, none of the listed units have been designated as “affordable.”

In Appendix Q, under the *Real Property, Housing, Relocation, and Displacement* section, it references identified housing plans that could create an estimated 4,000 new residential units in Clay and up to 6,800 new households could be introduced within the Towns of Clay and Cicero by 2041 (p. Q-29).

However, as the ESD study shows, this is: 1) not nearly enough housing to meet induced growth demands; 2) the DEIS does not include any reference to affordable housing in the listed new development plans; and, 3) these new developments are only specific to the local study area and therefore neglect Syracuse, which has the highest need for new housing development. In Syracuse, less than one in five residents could afford new and planned developments.<sup>133</sup> The ESD study underscores the unaffordability of new developments in the region, citing: “Fewer than half of new households will be able to afford newly built homes given current market conditions and costs. Only 1% of the estimated zoned capacity exists in strong markets, meaning the market cannot feasibly deliver homes to meet a range of needs.”<sup>134</sup>

The *Growth Inducing Effects* section poorly explains how the growth induced impacts of the community will be met. It praises, in the abstract, the benefits that are estimated or intended to result from fab development and from rising home values but minimizes the adverse impacts which will likely arise without adequate preparation, infusion of funding and citizen oversight and engagement. See Socioeconomic impact section.

It is unclear if there has been any analysis of existing comprehensive plans and zoning to assess the feasibility of developing the additional housing units needed to reach the projected 27,000 new homes. The DEIS asserts that the Onondaga County Comprehensive plan has this all laid out, though this plan is not enforceable on the county’s towns (p. 3-33). The EIS should include a table summarizing where development will or can occur to substantiate the ability for the region to accommodate in-migration. A table listing towns, status of their plans, and the estimated number of units reasonably expected to be

---

<sup>132</sup>Ibid.

<sup>133</sup> City of Syracuse by czbLLC. 2024. “Syracuse Housing Strategy.”

<sup>134</sup>HRA, EDR, and Highland Planning. 2024. “Building a Healthy Housing Market in Central NY A Roadmap for Regional Action Amid Historic Investment in the Semiconductor Industry.” Empire State Development. December. <https://esd.ny.gov/sites/default/files/media/document/CNYHousingMarketStudy.pdf>.

accommodated (given existing plans, zoning, travel patterns, etc.) would be useful to clearly see the basis for the claim that the housing market will adjust to meet demand.

In response to the project's 'short-term' impact of "rent increases and the potential to indirectly displace residents who cannot afford rent increases," the DEIS states: "potential significant adverse effect will be addressed through the provision of additional affordable housing supply facilitated by investments from the State of New York through Governor Hochul's long-term statewide housing approach and New

York Housing Compact initiatives; and local initiatives like the Onondaga County Housing Initiative Program (O-CHIP) and the OCIDA's tax exemption program for housing projects" (p. 3-502). While grant programs like these are important and are an example of the types of affordable housing subsidies needed, it is dubious that this program alone will mitigate the risk of increased housing insecurity in the region.

In the mitigation measures (section 3.15.4) the DEIS claims, "Micron does not control the housing market and cannot specifically mitigate such effects," stating only that Micron will "continue to work with agencies and stakeholders to identify specific actionable measures to avoid or minimize the potential for short term significant adverse effects [on the local housing market]." The EIS should detail Micron's specific plans to work with agencies and local stakeholders (p. 3-503). The public needs specific assurances that housing disruptions will be mitigated and needs more than a hopeful and non-committal 'work with.' As is discussed more below, we need specific and measurable objectives to which Micron must be held accountable.

To ensure these solutions are set into motion, the ESD study recommends that decision-makers must take advantage of what they call "Housing Opportunity Areas" or "places that have room to grow while also minimizing the costly impacts of sprawl and maximizing the revitalization potential of new housing." This must utilize "smart growth alignment," or solutions that take into consideration factors such as location, infrastructure, population density, natural resources, among other considerations. The DEIS makes a few references to smart growth alignment strategies but does not go into detail on how they expect to execute these plans.

In particular, in the *Funding for Local Governments and Taxing Districts* section, the DEIS states, "Many municipalities are planning for growth or have plans already in place to manage growth by applying smart growth principles" (p. 3-499).

As noted, the DEIS states that Micron will need to "work with local agencies and local stakeholders to identify specific actionable measures to avoid or minimize the potential for this short-term significant adverse effect on the local housing market." (p. 3-213) Has Micron set in motion these plans to start working with agencies and local stakeholders yet? The ESD housing study makes clear the urgency of developing these plans, stating: "Growth related to Micron will require 30,000 new homes, most of them by 2038. This will require more than tripling the pace of home development in the coming years and then sustaining development at nearly 2X the current rate for at least a decade."<sup>135</sup>

---

<sup>135</sup>HRA, EDR, and Highland Planning. 2024.

Notably, the ESD study states that due to job growth the region will need up to 19,000 homes by 2028, but the DEIS only makes note of the need for 32,000 by 2038.<sup>136</sup> The study highlights the need for policy intervention to mitigate the risks of undue stress on an already stressed housing market and warns that without regulatory action the risk of displacement to low-income residents becomes higher. The study recommends regulatory interventions such as creating more diversified housing and sustainable housing types by allowing for denser and smaller homes.

The study also emphasized the need for public subsidies by emphasizing, “Notably, about half of the rental demand is likely infeasible without subsidy.” However, it is unclear if there will be any additional public subsidies planned outside of the existing O-CHIP program or the Syracuse Choice Neighborhood. To meet demand for low-income housing, Micron and local agencies should invest in programs that will further subsidize affordable housing for low-income residents. The EIS should make clear if any additional subsidy programs are being planned and whether these are part of the municipal plans mentioned or Micron’s collaboration with local agencies and stakeholders. Furthermore, the EIS should clearly detail what, if anything, Micron will contribute to these programs.<sup>137</sup>

It is crucial that Micron create and implement plans to work with local agencies and stakeholders, including developing municipal smart growth plans, in order to prepare the region and ensure that low-income residents do not continue to bear the burden of adverse impacts. State and municipal agencies, alongside Micron, should work with local communities to build and inform these plans.

#### *Household Growth and Environmental Analysis*

Minimizing the carbon footprint of the induced household growth should be required in order to offset the emissions associated with Micron’s Clay, NY fabs, costs which Micron should be required to fund. Financial requirements to fund off-site mitigation measures should be imposed on Micron to offset fab-related GHG emissions that they claim are otherwise impossible to eliminate. Micron can take concrete steps by funding projects that could reduce the GHG emissions associated with induced residential and commercial growth. For example, Micron could contribute to financing renewable energy projects, offsetting the cost of higher standard energy codes for new development, incentivizing transit-oriented and walkable communities, encouraging commuting via transit, and supporting the construction of affordable and green housing. The costs of eliminating these GHG/climate-related impacts should be covered by Micron as a condition of approving the fab development project, binding mitigation measures, including a publicly reported mitigation plan with measurable objectives, must be established to offset the adverse impacts of the induced growth.

Micron will have a significant impact on housing needs as the number of employees grows. Therefore, a cooperative effort between Micron and state and county government agencies is needed to expand the availability of mixed income, affordable, climate friendly, and safe housing. This includes the protection of existing affordable housing, expanding code enforcement to protect tenants, and ensuring appropriate capital maintenance upgrades. Affordable housing must include state-of-the-art, climate-friendly designs that rely on renewable energy and provide low-cost energy access. Without strong commitments from Micron to protect and expand safe and affordable housing in CNY, and particularly within the city of

---

<sup>136</sup> Ibid.

<sup>137</sup> Ibid.

Syracuse, the project will only exacerbate the problems in an already inequitable and strained housing market.

## **ENVIRONMENTAL JUSTICE**

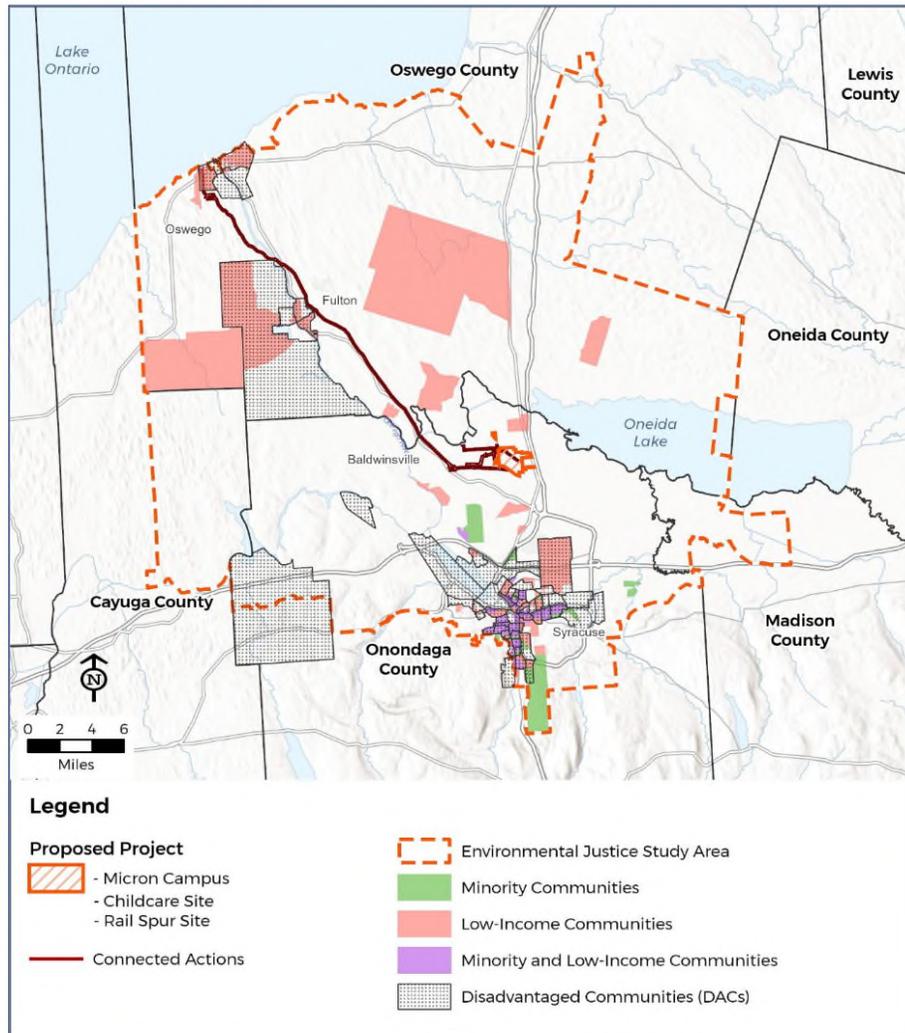

### **Disadvantaged Communities in Local and Regional Study Area**

Micron megafab has the potential to create significant environmental impacts to the local and regional study area. This is particularly concerning given the prevalence of racial and economic inequality in CNY and the megafab's proximity to disadvantaged communities like those in Syracuse.

One area of concern is that the DEIS fails to justify its decision to only include Disadvantaged Communities (DACs) within the five mile radius area. While the DEIS notes, "DACs have been designated within the study area, which largely overlap with the identified minority and low-income communities discussed above (see Figure 3.16-2). Within the study area, DACs were identified primarily in the City of Syracuse, Village of Baldwinsville, City of Fulton, and City of Oswego" (p. 3-511). The DEIS concludes that there are no environmental justice impacts and the Micron fab will not adversely impact DACs: "Because the closest DAC to the Proposed Project is five miles south in the North Syracuse area, the Proposed Project is not likely to disproportionately burden or otherwise impact a DAC and is therefore not subject to the requirements of policy DEP 24-1" (p. 3-511).

The draft's reasoning for limiting the radius to 5-miles is not clear, especially given the potential for impacts on DACs within a 10-mile radius that are not properly evaluated (more below). The DEIS claims, "Although an expansive study area was selected to be inclusive and to include study areas from other technical analysis, the potential adverse effects from construction and operation of the Preferred Action Alternative on DACs and minority or low-income communities are expected to be limited to within an approximately 5-mile radius around the Proposed Project sites, and a ½ mile of the Connected Actions." (p. 3-511-512). How can the impact be considered limited to 5-miles when the DEIS noted instances in which the project will affect DACs within a ten-mile radius through socioeconomic impacts from induced growth, and when it fails to comprehensively analyze potential impacts from air and water pollution caused by hazardous substances, flooding from increased impervious surfaces, health and safety risks from toxic chemicals, and occupational health safety risks to DAC workers handling these chemicals? The five mile limitation is a major flaw in the environmental justice analysis that must be rectified.

**Figure 3.16-2 DACs and Minority or Low-Income Communities in Study Area**

Sources: World Street Map: Esri, HERE, Garmin, SafeGraph, FAO, METI/NASA, USGS, EPA, NPS

## Human Health and Safety Impacts

The DEIS does not adequately incorporate analyses from other sections (e.g. GHG emissions, water pollution, and toxic waste disposal). In general, policymakers and customers have been shown to downplay the ecological footprint of semiconductor manufacturing in favor of prioritizing supply security.<sup>138</sup> Due to the huge quantities of raw material and waste produced during the fabrication process,<sup>139</sup> toxicity concerns will likely be more significant than stated in the DEIS.

<sup>138</sup> “Chip Production’s Ecological Footprint: Mapping Climate and Environmental Impact.” n.d. Accessed July 22, 2025. <https://www.interface-eu.org/publications/chip-productions-ecological-footprint#conclusion>.

<sup>139</sup> Ruberti, Marcello. 2023. “The Chip Manufacturing Industry: Environmental Impacts and Eco-Efficiency Analysis.” *Science of The Total Environment* 85, February:159873. <https://doi.org/10.1016/j.scitotenv.2022.159873>.

With this in mind, the DEIS does not properly address the Onondaga Nation's water quality concerns as stated in comment a comment letter dated March 26, 2024 (p. 3-519), especially regarding toxic water pollution (including PFAS forever chemicals), siphoning from Lake Ontario, and dumping into Lake Ontario and the Oswego river. The DEIS is also unacceptably vague in its description of water quality concerns (specifically toxic chemicals including PFAS) in and around the Oswego pumping station, as well as wastewater release into the Oswego River, which flows out of the ½ mile radius from connected actions and intersects several DACs near Himmansville.

As discussed in the Human Health and Safety and Solid Waste, Hazardous Waste, and Hazardous Materials sections of this comment, the DEIS fails to assess the cumulative impacts of PFAS, industrial Greenhouse Gases, and Extremely Hazardous Substances in its Cumulative Effects analysis. The final EIS should clearly assess the cumulative impacts on DACs in the region of potential drinking water contamination. If chemicals released in wastewater affect the safety of drinking water for the entire region, DACs and low income communities that suffer from pre-existing water contamination issues (e.g. from lead pipes) stand to be harmed most of all. This assessment should include the potential cumulative impacts of direct supply chain companies that the project is expected to attract to the area, including related activities, such as research and development, chemical suppliers, and even competitors. These facilities may also release hazardous substances into Onondaga County's wastewater system.

Without a comprehensive understanding of the types and amount of PFAS discharges on site and for anticipated sites across the region, cumulative impacts for surface water, groundwater, air emissions, and environmental justice cannot be understood.

As discussed further in the Human Health and Safety Section of this comment, the draft is vague about how PFAS waste will be handled offsite, offering no assurance that destruction technologies will be used or that environmental justice impacts will be avoided (p. 3-241). These gaps are unacceptable given the well-documented health risks and extreme environmental persistence of PFAS. The DEIS identifies several contractors for handling Micron's hazardous waste (p. 3-224). Hazardous waste generators in the study area typically contracted with private haulers authorized by NYSDEC and other out-of-state agencies to transport hazardous waste to permitted hazardous waste treatment, storage, and disposal facilities. Some types of hazardous waste may be transported to out-of-state facilities for reuse and recovery, such as fuel blending and energy recovery facilities with approved cement kilns, including Veolia in Middlesex, New Jersey; Green America in Hannibal, Missouri; and Systech in Fredonia, Kansas.

As noted, relying on offsite shipment of hazardous materials to third-party contractors does not eliminate hazardous waste—it simply displaces it, often to communities with less political and economic power. Moreover, if third-party contractors plan to incinerate the hazardous materials, this process produces an even more concerning environmental impact in the form of toxic air emissions and PFAS-laden ash.

#### *Waste Destination Safeguards Recommendations*

- Require Micron to disclose where all offsite hazardous waste—including PFAS-containing waste—will be sent for treatment or disposal.
- Prohibit shipment to facilities with poor environmental records or those located in environmental justice communities without prior public engagement and review.

- Conduct an environmental justice impact assessment for all offsite waste management strategies.

## **Air Quality**

The DEIS splits analysis between Disadvantaged Communities, Minority Communities, and Low-Income Communities – and is inconsistent in addressing all three in terms of impacts from Greenhouse Gases, changes in Air Quality, and other sections (p. 3-522).

As noted in the Solid Waste, Hazardous Waste, And Hazardous Materials Section of this comment, most of the monitoring data for criteria air pollutants (those with established NAAQS) on which this assessment relies comes from monitors in Rochester, NY, more than 70 miles from the project site. Only ozone and small diameter particulate matter (PM<sub>2.5</sub>) are measured in the Syracuse area. Conditions in Rochester may be expected to be similar, but Micron should at least be required to demonstrate – with actual local monitoring data – that the facility will not have any significant environmental impacts. In particular, the DEIS ought to address how its own air pollutant emissions may exacerbate pre-existing air quality concerns in DACs. In addition, the DEIS does not allow for or consider the impacts of any exceedances, upsets, or violations in assessing the environmental impacts of air emissions. Consequently, this analysis lacks how issues related to air quality could impact DACs especially within the larger 10-mile radius.

### *Health Monitoring and Transparency Recommendations*

The DEIS mentions air and water quality monitoring, but it lacks detail on how data will be shared with the public and how health outcomes will be tracked over time. We recommend establishing a community advisory board to oversee environmental monitoring and ensure transparency must be considered.

## **Community Engagement**

For community feedback on their proposal, Micron only lists two meetings with a total of 45 people. Micron mentions a consulting Community Engagement Committee, but this consultation only related to Micron's financial commitments, not environmental or community impacts. Micron unreasonably claims its contribution to climate change is a global and regional issue, and therefore not a local environmental justice issue.

While public hearings and translation services are a good start, many residents in EJ communities may still face barriers to participation, including digital access, transportation, and language. The project sponsors should consider proactive outreach, including door-to-door engagement, community liaisons, and partnerships with trusted local organizations.

Lastly, the CEC Priorities Document<sup>140</sup> outlines several community priorities that are not actualized in Micron's plans as detailed in the DEIS. These missing priorities are discussed in further detail under the Transportation & Traffic and the Housing sections of this comment. Comprehensive engagement and enforcement of community priorities particularly around issues that already impact DACs like rent

---

<sup>140</sup> CNY CEC. 2024. "Harnessing Opportunity: Community Priorities for Central New York: Community Priorities Document." June. <https://www.cnycec.org/community-priorities-document>.

burdens, inequitable transportation, and the adverse impacts of adverse growth on low-income communities are a key aspect of reducing environmental justice impacts.

As discussed in the Socioeconomics section of this comment, Micron should establish a community monitoring committee that includes community members and worker representatives to monitor and hold Micron accountable to community priorities.

### *Equity in Benefits Recommendations*

As stated in the Socioeconomic section of this comment, the commitments outlined in Micron's Community Investment Framework must be enforceable, as well as publicly overseen and reported, to ensure EJ communities have equitable access to tangible, measurable benefits. A robust Community Benefits Agreement (CBA) is the optimal vehicle to deliver both economic prosperity and environmental protection for those most deeply impacted by development projects.

To give an example of how this has been successfully executed in the past, Los Angeles World Airports (LAWA) has a CBA with the local community that includes community benefits and impact mitigations as part of the LAX Master Plan Program.<sup>141</sup> Some of the environmental provisions include: three studies around the environmental impact on the community that LAWA will fund, measures to reduce emissions related to aspects of airport operations, and environmental mitigations and commitments related to airport construction. It also includes an ongoing role for the LAX Coalition to both implement and oversee these benefits and hold LAWA accountable with mitigation.

### **Housing**

The draft DEIS notes that for DAC and low-income communities Micron would not “cause or increase a disproportionate burden within those communities, except a potential temporary adverse impact on housing and rent pricing” (page 3-529). This adverse impact is the result of in-migration of workers and families to work at Micron, with potential to increase rental rates and housing demands. The DEIS claims this will be mitigated over the long-term through creation of new housing stock in the surrounding region (e.g., page 3-518 - 3-519). However, there is no guarantee that this stock will mean affordable options for residents of low-income and DAC communities. The DEIS also suggests that this can be mitigated by the identification of federal, state and local initiatives to support affordable housing within the local and regional study areas, and that Micron “will continue to work with agencies and local stakeholders to identify specific actionable measures to avoid or minimize the potential for this short-term significant adverse effect on the local housing market” (page 3-527). As noted in the Housing section of this comment, the public needs assurances that housing disruptions will be mitigated, especially for DAC communities who already bear the burden of an inequitable housing market. The EIS must be more clear about what specific plans Micron has to work with agencies, and should not be contingent upon hypothetical policy actions or funding allocations by public bodies that may or may not materialize. At best this approach is hopeful, at worst it is an attempt to shift the burden of mitigating housing impacts to public agencies.

---

<sup>141</sup> Los Angeles World Airports (LAWA). N.d.

### *Housing Recommendation*

The final EIS must provide further analysis of how projected price increases in rental or housing costs tied to population will impact existing DACs or create new DACs. The final EIS should also include an analysis of actional alternatives that can adequately mitigate these adverse impacts on DACs. As noted in the Housing section of this comment, the final EIS must also detail Micron's plans to create and implement plans to work with local agencies and stakeholders, including developing municipal smart growth plans, in order to prepare the region and ensure that DACs do not continue to bear the burden of adverse impacts. Mitigating measures relating to growth-inducing impacts can be incorporated through a community negotiated and enforceable community benefits agreement (CBA).

### **On-Site Childcare**

Micron plans to provide on-site childcare for its workers. While this can be very beneficial to disadvantaged workers, especially in reducing gender gaps in the workforce, childcare proximity to industrial manufacturing poses several concerning health risks for the children and workers at the childcare center. Syracuse has the highest child poverty rate (46%) of any U.S. city and a high overall poverty rate of 29.6% (p. Q-18-19). Assuming affordable childcare alternatives are not available to low-income workers, then low-income children may be disproportionately represented at the on-site childcare center, and therefore disproportionately impacted by environmental hazards. If the proximity of the childcare center to industrial manufacturing is determined to pose a significant health risk to children and workers, then the EIS must account for the impact that children from DACs will face at the childcare center.

Children are particularly vulnerable to health risks associated with environmental and industrial contamination, and childcare facilities are important sites of potential exposure that can have cumulative effects across a lifetime.<sup>142</sup> Micron's planned childcare center is located downstream of its main campus, close to the existing Oneida River floodplains. Aside from noting that the childcare center will be "located outside of special flood hazard areas (SFHAs) and 500-year floodplains" (p. 3-70), the company does not seem to consider the impact of water pollution from their main campus potentially reaching the childcare center during a spill event. Additionally, the DEIS does not explicitly describe the impact of air pollution on the childcare center. As we note in the section on Solid Waste, Hazardous Waste, and Hazardous Materials, in order to ensure a release of toxic gas would not put children at its childcare center at risk, Micron or DEC should conduct dispersion modeling for the most hazardous gases such as arsine.

As noted in the Flooding section of this comment, the DEIS provides little evaluation of how the Oneida floodplain will change near the childcare site from the increased stormwater runoff from their main campus. In particular, stormwater quantities associated with the Rail Spur, Childcare Center, and the Wastewater Treatment Plant expansion have not been quantified. Water quality impacts of this stormwater are not addressed.

---

<sup>142</sup> Tollefson, Jonathan, Scott Frickel, Summer Gonsalves, Thomas Marlow, Robert Sucsy, Michael Byrns, and Melissa Orpen-Tuz. 2023. "Early Childcare and Education in a Post-Industrial Landscape: Inequalities in Proximity to Active and Relic Manufacturing in Metropolitan Providence, Rhode Island." *Environmental Justice (Print)* 16 (4): 309–20. <https://doi.org/10.1089/env.2021.0121>.

### *Childcare Recommendation*

The Final EIS should a) rigorously evaluate the range of potential impacts on children and childcare workers at the childcare site from exposure to toxic air emissions, wastewater runoff, flooding potentially involving toxic waste water, and groundwater and soil contamination; b) assess all possible measures that can be taken to mitigate exposure risks including the consideration of re-siting the childcare center.

### **Socioeconomic Impacts on DACs from Growth Inducing Effects**

The DEIS notes that “it can be reasonably concluded that many of the DACs and minority or low-income communities within the study area would be unaffected by the Preferred Action Alternative (aside from growth inducing effects, which are discussed qualitatively under “Growth Inducing Effects,” below)” (p.3-511).

As noted in the Socioeconomics section of this comment, economic inequality and segregation is prevalent in CNY, particularly in Syracuse. Syracuse, the most populous city in Onondaga County,<sup>143</sup> has a poverty rate of 29.6%, nearly 20% higher than the national average (p. Q-18-19).<sup>144</sup> In fact, using NYSDEC’s Disadvantaged Communities Assessment Tool (DACAT) Micron’s environmental justice study noted: “At least 52.42 percent of the population in an urban area reported themselves to be members of minority groups (NYSDEC’s CP-29 defines minority population as a population that is identified or recognized by the U.S. Census Bureau as Hispanic, African-American or Black, Asian and Pacific Islander or American Indian (i.e., Indigenous Nations populations); or At least 26.28 percent of the population in a rural area reported themselves to be members of minority groups; or At least 22.82 percent of the population in an urban or rural area had household incomes below the federal poverty level (NYSDEC, n.d.-e)” (p. 3-508). As such the study area clearly identifies DACs, notably concentrated in Syracuse and Baldwinsville. And Syracuse in particular encompasses both DACs, minority and low-income communities, and minority communities (see table 3.15-2 below, p. 3-509).

However, as noted above, the limited 5-mile radius excludes many of these portions of Syracuse who will still be impacted by Micron’s project in numerous ways. In particular, the induced impacts of the project may exacerbate income inequality in the region if Micron’s direct and indirect new jobs are skewed toward the low end of the industry wage scale, limiting workers’ disposable income to spend on locally serving businesses. As cited in the Socioeconomics section, this concern is especially relevant in a region where the top two industries are retail trade (21.8 %) followed by accommodation and food services (11.3%) (p. Q-38), sectors that consistently offer among the lowest wages. In Onondaga County, in particular, the DEIS notes: “approximately one-quarter of the resident labor force is employed in the retail trade sector” (p. Q-39).

With the projected creation of over 33,000 indirect jobs, many of these will likely be in the low-wage service sector. Within this low-wage sector, retail industry jobs pay the lowest, with most retail jobs

---

<sup>143</sup> Data Commons. 2023. “Ranking by Population: All cities in Onondaga County.” [https://datacommons.org/ranking/Count\\_Person/City/geoId/36067](https://datacommons.org/ranking/Count_Person/City/geoId/36067).

<sup>144</sup> Misiaszek, Emma. 2023. “Syracuse ranks 2nd in economic disparity for Black residents, according to LendingTree study.” CNY Central, September 6. <https://cnycentral.com/news/local/syracuse-ranks-2nd-in-economic-disparity-for-black-residents-according-to-lendingtree-study>.

earning less than the average private sector job. In real terms, retail wages have been in decline since the 1970s with current retail wages at just 72% of what they were in 1972. On top of low wages, retail workers rarely receive benefits or formal training.<sup>145</sup> Without properly accounting for the impact that Micron’s arrival will have on the creation of low-wage spinoff jobs, it is possible that Micron’s cumulative socioeconomic impacts will have negative effects on the local and regional study area and DACs in particular. This must be evaluated and recognized, not dismissed as insignificant as the DEIS attempts to do.

### *Socioeconomic Impacts on DACs Recommendations*

As recommended in the Socioeconomics section of this comment, to mitigate adverse growth inducing effects, we recommend the creation of a community advisory committee established under a CBA to oversee all actions relating to the induced growth and mitigation of its effects on DACS. Additionally, we recommend the creation of an independent planning team made up of professional, certified planners established under a CBA to oversee, review, and manage growth--related mitigation measures. These recommendations require adequate funding for staffing of the planning team and the advisory committee, as well as funding for incentives or subsidies needed to mitigate problems related to growth inducing impacts.

### EDUCATION

University of California, Berkeley, Goldman School of Public Policy, M.P.P. Sept 2020 - May 2024  
Relevant Coursework: Econometrics, Policy Analysis, Critical Race Theory, Public Management and Policy Implementation, Program Evaluation. Berkeley Public Policy Journal. *Nominated for Smolensky Prize for Outstanding Policy Analysis (for capstone).*

Columbia University, Graduate School of Arts and Sciences, M.A. in Art History Sept 2014 - May 2017  
Program: Modern Critical and Curatorial Studies, produced 9 publications.

Oberlin College, B.A. in East Asian Studies. *Received Freeman Research Grant.* Sept 2002 - May 2006

### SELECT PROFESSIONAL EXPERIENCE

**CHIPS Communities United** (remote) Jan 2024 – Present *Policy Analyst*

- Research & analyze policy on chemical safety, worker health, and environmental justice in the semiconductor industry. • Design & apply strategic advocacy research, e.g. DELPHI panels, best practice frameworks, campaign materials, etc. *Policy Consultant*
- Assess risk of toxic exposure to workers & fence-line communities of semiconductor manufacturing. • Needs assessment: fed & state regulation scans, archival research, info interviews, BLS & CHNA data analysis.

**UCSF Benioff Children’s Hospital of Oakland**, Oakland, CA (hybrid) Sept 2022 – Jan 2023 *Student Analyst*

- Analysis of hospital’s policies with goal of improving local hiring, workforce development and impact purchasing. • Quantitative and qualitative research and analysis including multiple surveys, facilitate stakeholder meetings.

**UC Berkeley School of Law Policy Advocacy Clinic** (PAC), Berkeley, CA (hybrid) Sept 2021 – Nov 2022 *Policy Student Researcher*

- Quantitative and qualitative research and analysis; drafted bill, fiscal memo for bill sponsor, testimony prep. • Research and identify stakeholders; facilitate stakeholder meetings, campaign strategy sessions.

**Mason Tillman Associates**, Oakland, CA (remote work) May 2021 – Aug 2021 *Policy Analysis Intern*

- For a firm specializing in disparity studies, produced literature reviews, quantitative (Excel) and qualitative analysis. • Reviewed disparity study drafts, identified missing/misrepresented data, edited structure, drafted additional content.

**Mission Economic Development Agency (MEDA), San Francisco** Jan 2021 – June 2021 *Graduate Consultant*

- Collected and analyzed data on the impact of the SF eviction moratorium on low-income residents of color.
- Produced literature review, designed and implemented data analysis, final report and presentation to leadership.

**Tapp's Arts Center, Columbia, SC** (remote work) Jun 2018 – Aug 2020 *Freelance Grants Writer*

- Prepared and managed grant proposals for program developing an economically self-sustaining creative sector in Columbia.
- Ran multiple RFP processes simultaneously; won largest 2019 NEA grant in South Carolina.

**Public Defender's Office, Richland County, SC** Jul 2017 - Aug 2017 *Intern for Assistant Public Defender Constantine Pournaras*

- Copyedited drafts for motions/complaints, reviewed investigations, performed prelim research with nonprofit Appleseed.

157 Strong Avenue 315-395-1887 (cell) Syracuse, N.Y. 13210 315-214-4060 (home)  
dhughes171@gmail.com

**EXPERIENCE**

**Hughes Environmental Consulting Services (Syracuse, N.Y.)** June 1992 - present: *Independent Consultant*

Self-employed, offering environmental consulting to government, industry, non-profit agencies and citizens. Projects have included:

- Provided technical assistance to citizen groups at the Former Marble Quarry Landfill site in Tuckahoe, NY; Onondaga Lake Superfund site in Syracuse, New York, and Kalamazoo River Superfund site in eastern Michigan,
- Technical review of industrial pretreatment study and VOC fate study in sewage treatment
- Technical review of former industrial waste site in metro-NYC area.
- Estimated contaminant losses during remediation of PCB-contaminated sediments ■  
Designed biological treatment system for contaminated sediments and prepared guidance document for remediation of contaminated sediments
- Set-up and managed data collection systems at an industrial landfill

### **LeMoyne College, Department of Chemistry**

August 2011 – present: Laboratory Coordinator (since January 2017); Adjunct Professor Coordinator of chemistry lab written materials, chemicals, and chemistry department equipment. Lecture courses taught: Environmental Chemistry (3 semesters); Energy & the Environment Laboratory Courses taught: Physical Chemistry (6 semesters), General Physics (2 semesters) and Freshman Chemistry (7 semesters)

### **Certified Environmental Services, Inc.**

May 2012 – March 2015: Assistant QA Officer; Environmental Engineer Laboratory: Performed daily QC review of data from metals lab; conducted a complete internal lab audit; revised/updated over 50 Standard Operating Procedures. Performed some bench work—sample prep, analysis, and calibration of equipment.

Engineering: Prepared environmental reports for investigations, remediation, and Phase I assessments.

### **SUNY Cortland, Department of Chemistry**

August 2010 – May 2012: Adjunct Professor

Courses taught: General Chemistry, Analytical Chemistry, and Chemistry & the Environment.

### **Onondaga Environmental Institute (Syracuse, N.Y.)**

August 2005 - January 2010: Senior Scientist

- Compiled and analyzed water quality data for the Onondaga Creek watershed, and produced a corresponding series of Fact Sheets for public and governmental use.
- Prepared a 700-page report cataloguing aquatic impairments in the Onondaga Lake watershed, based on a 37-year record of investigations of surface waters, sediments, fish tissue, macroinvertebrates, biotic communities, and habitat (co-author D. Gefell).
- Led an investigation of fish tissue contamination (metals & organics) and benthic communities in the Onondaga Lake watershed
- Led a comprehensive study of bacterial contamination in local urban waterways, focused on locating and evaluating dry-weather sources; coordinated field and laboratory work; prepared reports; and presented the study's findings to policy makers and at scientific meetings.

### **Atlantic States Legal Foundation (Syracuse, N.Y.)**

August 1990 - May 1992: Technical Writer; Staff Engineer

Prepared a citizen's guide to Lake Michigan Lakewide Management Plan. Provided technical support for negotiations and environmental projects. Reviewed documents related to the investigation and remediation of Onondaga Lake.

## **Blasland & Bouck Engineers, P.C. (Syracuse, N.Y.)**

November 1985 - June 1990: Sr. Project Engineer

Prepared plans, specifications, reports and cost estimates; supervised other personnel; performed process design, data analysis, laboratory oversight, and literature review. Past projects included RI/FS and related reports for both Superfund and non-Superfund sites, water treatment plant upgrade, industrial wastewater pre-treatment, permit development, pilot studies, groundwater treatment, and research on numerous environmental issues. Focused on sites contaminated with PCBs. Clients included many Fortune-500 companies.

## **EDUCATION**

Ph.D. in Chemistry (2005)

College of Environmental Science and Forestry, Syracuse, NY

Dissertation: An Evaluation of XAD Resins for Sampling of Trace Organic Compounds in Natural Waters. Advisor: John P. Hassett, Ph.D., Chemistry Department Chair

M.S. in Environmental Engineering (1986)

Cornell University, Ithaca, N.Y.

Thesis Title: The effect of pH on kinetics in a methanogenic acetate-enrichment culture.  
Advisor: James M. Gossett, Ph.D., Professor of Environmental Engineering

B.S. in Chemical Engineering (1981)

State University of New York at Buffalo, Buffalo, N.Y.

## **CERTIFICATION / LICENCES**

Registered Professional Engineer (064393) in New York State

## **AWARDS**

Received six graduate student awards while attending SUNY-ESF, with combined value of \$ 5,150.

## **COMMUNITY SERVICE**

1. Syracuse Track Club: Board of Directors, 2006 – present
2. Sierra Club, Atlantic Chapter: Executive Committee, 2007 - present
3. Onondaga County Resource Recovery Agency (OCRRA): Board of Directors, 2004 – 2009.
4. Syracuse Cooperative Federal Credit Union. Board of Directors, 1995 – 1998.

## **PUBLICATIONS AND PRESENTATIONS**

A complete list is available as an Appendix. It includes: 8 publications, 11 oral presentations, and 12 posters.

---

**RACHEL KITCHIN**

Senior Corporate Climate Campaigner for Stand.Earth

rachel@stand.earth

**CAREER HIGHLIGHTS**

**STAND.EARTH - Senior Corporate Climate Campaigner**

May 2022-present

Lead campaigner for Stand.earth's Fashion and IT campaigns, developing research-driven and impact focused campaigns to shift the global supply chains of major fashion and IT companies off fossil fuels and catalyzing a shift towards renewable energy. Has worked with major corporations including H&M, Inditex and Apple to achieve stronger climate targets and greater accountability. Leads the research and development of major campaign publications including the *Fossil Free Fashion Scorecard*, and *Supply Change* reports; corporate engagement; media relations and campaign strategy.

**Science Based Targets Initiative (SBTi) - Scope 2 Expert Working Group member - May 2025 - present**

Part of expert working group consulting on changes to SBTi Scope 2 target setting guidelines.

**ENVIRONMENTAL DEFENCE CANADA (EDC)**

**Senior Engagement Manager**

August 2020 – May 2022

Led all strategic public campaigns and communications on EDC's fast-moving Ontario Climate and Environment programs. Acted as campaign adviser to a large network of community and grassroots organizations across the province. Responsible for execution of major organizational initiatives that promote political advocacy, increase voter turnout and encourage members to take bold action on climate.

**Communications Manager**

May 2018 – July 2019

Led the development and launch of a new national program area including developing brand, messaging, strategic direction, media relations and all public communications. Responsible for developing and maintaining the tone and message consistency of all communications across public, government and corporate relations.

**Digital Engagement Manager**

November 2017—May 2018

Developed and project managed a major social media, digital, and thought-leader engagement campaign to increase public awareness

**FRIENDS OF THE EARTH, London, UK**

**Press Officer**

February 2020 – August 2020

**GUIDE DOGS UK, London, UK**

*Guide Dogs UK is a national charity supporting blind and partially sighted people to live independently through campaigning and support services.*

**Campaigns Officer**

November 2014 —June 2017

Responsible for the planning, delivery, and evaluation of policy campaigns targeting government and corporations, and managed supporter and public engagement through email, social media and print communications.

**EDUCATION**

**School of Oriental and African Studies (SOAS), University of London, UK**

MA Pacific Asian Studies – September 2013 - September 2014

**University of Edinburgh, UK**

MA (Hons) History – September 2008 - July 2012

---

**CATHERINE L LANDIS**

Science Advisor, Center for Native Peoples and the Environment

241 Illick Hall, 1 Forestry Drive

State University of New York - College of Environmental Science and Forestry (SUNY-ESF)

Syracuse, New York 13210

Beal, R., H. Busa, G. Lim, C. Landis, C. Deary-Petrocci, D. Leopold, and K.B. Sobering. 2007. Conservation and use of native plants: supplemental curriculum materials for secondary teachers and students in science, social studies, English, and technology. SUNY-ESF Outreach.

## **PROFESSIONAL PRESENTATIONS & POSTERS**

Landis, C.L. Of canoes and canals: Indigenous river science in the Oswego River watershed. Poster for American Society of Environmental History national conference, 2022, Eugene, OR.

Landis, C. L., R.W. Kimmerer, and D.J. Leopold. 2017. Historical ecology of Onondaga Lake. Presentation at Ecological Society of America conference, Portland, OR, August 4.

Landis, C. L., R.W. Kimmerer, and D.J. Leopold. 2015. Pursh's plants of Onondaga. Presentation at New England Botanical Club conference, Smith College, Northampton, MA, June 4.

Landis, C.L., R.W. Kimmerer, and D.J. Leopold. 2014. Historical ecological of a major superfund site, Onondaga Lake, NY. Society for Ethnobiology Conference, Cherokee, NC. May 14.

Landis, C.L., R.W. Kimmerer, and D.J. Leopold. 2011. Lost and found in Onondaga: historical ecology of a polluted lake. Oral presentation at conference "Creating the Natural," Cornell University, January 20-21.

Limburg, K. and C.L. Landis. 2008. Restoring American eel (*Anguilla rostrata*) to the Onondaga Lake watershed. Poster presented at Northeast Natural History Conference, Albany, NY (was among 10 finalists selected for Best Student Poster).

Fierke, M., R. Germain, C. Landis, M. O'Brien, J. Riddle, and N. Werner. 2008. Ecological and economic impacts of emerald ash borer (*Agrilus planipennis*) and *Sirex noctilio*. 2008. Oral presentation at Graduate Invasive Species Conference, National Center for Ecological Analysis and Synthesis (NCEAS). Santa Barbara, CA, February 4-8.

## **TEACHING AND CAMPUS ACTIVITIES (AT SUNY ESF)**

### *Teaching*

EFB 202. Ecological monitoring and biodiversity assessment. Taught plant ecology section of summer field course at Cranberry Lake Biological Station, 2013 and 2015.

Edible Wild Plants, EFB 796, 1 credit. Summer session class in wild edible plant field identification, harvest, preparation and other issues and topics related to foraging. Summer 2019.

Biocultural Restoration, EFB 797, 3 credits. Graduate level class in combining biological and cultural elements for ecological restoration and land healing. Co-instructor 2020, 2022.

Native Peoples, Lands, and Cultures, EST 140, 3 credits. Undergraduate level class introducing students to Native cultures and relationship to land, with emphasis on Haudenosaunee people and lands. Co-instructor 2019-2022.

Plants of CNY. Fall 2024. Instructor for plant biology field course.

Onondaga Land Rights and Our Common Future. Spring 2025. Co-Instructor along with representatives from Onondaga Nation, graduate seminar.

### *Campus activities*

Bee Campus Committee, 2021 to present. This Committee provides input regarding campus plantings and how they relate to educational programming, ecological function, and student experience.

Botany Club. Working with graduate students, we established this club in 2019 to fill a perceived gap around field botany skills; and, to counteract the epidemic of plant blindness. Role: Co-Advisor, along with Donald Leopold.

Student advising. Informal role advising students regarding their research in the field and otherwise, often related to bio-cultural topics; steering committee member.

## **COMMUNITY SERVICE AND EDUCATION**

### *Service and education 2006:*

2006-2008. Onondaga Creek Working Group member. This group met monthly to take field outings, conduct public input meetings, and learn about various facets of Onondaga Creek biology and history in order to produce a Management Plan (June 2008, through Onondaga Environmental Institute; EPA funded project).

September 2005-June 2006. Onondaga Creek Kids, effort to introduce home-school children to basic stream ecology including water dynamics, plants, animals, human impacts. Teaching via field trips and library sessions, development of skits, etc.

April 29. Onondaga Creek interpretive walk with Rapha Community Church.

May 7. Nature poetry reading, Sterling Nature Center, Sterling, NY.

May 13. Onondaga Creek for spring resident and migrant birds. Half day field trip for Onondaga Audubon Society (mostly within city of Syracuse, demonstrating value of urban wildlife habitat).

May 20. Onondaga Creek Community Forum, Petit Branch Library. "Onondaga Creek: Ten Things You Need to Know" (power point presentation).

June 11. "Nature of the Creek" interpretive walk, co-lead with Amy Samuels of Cornell Cooperative Extension, as part of Honoring Water event at Onondaga Lake Inner Harbor.

June 27. Trees and shrubs for the landscape. Co-lead all-day field trip as part of Northeast Symposium on Native Plant Education, Conservation, Gardening, Mexico, NY.

July 11. Served as co-moderator for presentation by Joe Heath and Dr. Lawrence Hauptman, "The Onondaga Nation and the US Courts," part of the collaborative educational series, Onondaga Land Rights and our Common Future.

August 11. "Plants for the Watershed." Tour of plant research plots along Onondaga Creek, as well as demonstration rain garden at Zen Center, with Syracuse's South Side garden group.

August 29. "This is Your Watershed," display at New York State fair highlighting Onondaga Creek and SUNY-ESF's habitat restoration project.

September 10. Onondaga Creek Nature Walk for New Environment Association.

October 17. “Lost Waters of the Onondaga Valley.” Presentation for all day Teach-in event, Onondaga Lands Rights & our Common Future, SUNY-ESF.

### 2007

Spring 2007. Assisting with planning and conducting Onondaga Creek program for first graders, Ed Smith school.

April 28. Instructor for one-day Teacher’s Workshop on Onondaga Creek, held at Clary Middle School.

April 23. Invited speaker on ecospirituality panel for Women Transcending Boundaries, local inter-religious group.

Jan – May 2007. Helped plan panel discussion on Onondaga Creek for Forty Below Summit conference to be held at Oncenter on June 1, 2007. Appeared on panel and co-lead field trip also.

June 10. “Birds along the Creek.” Led half day field trip for Onondaga Audubon Society focusing on Onondaga Creek avifauna.

### 2008

June 7. “Birds of Onondaga Creek” half-day field trip for Onondaga Audubon Society.

### 2009

May 17. “Healing and Sustaining Mother Earth” presentation for Women Transcending Boundaries.

June 18 & 20. “Gulls, Flycatchers, Cuckoos and Rails: Birds of Central NY” program for Naturally New York, a naturalist training program for community members, held at SUNY-ESF. Taught indoor session and led field trip.

Onondaga Nation Youth Summer Program. Taught plant ID and other natural history; helped plan & lead canoe trip down Onondaga Creek.

August 17. Native Youth Camp, Cranberry Lake Biological Station, Adirondack Park, NYS. “The Singing Birds” and “Birdsong Jeopardy.”

### 2010

June 17 & 19. “Gulls, Flycatchers, Cuckoos and Rails: Birds of Central NY” program for Naturally New York. Indoor session and half day field trip.

August 19. Native Youth Camp, Cranberry Lake Biological Station, Adirondack Park, NYS. “The Singing Birds” and “Birdsong Jeopardy.”

Invasive Plants Workshop for state employees (DEC, DOT, others). Co-led this ½ day training at October 7. SUNY-ESF and Clark Reservation State Park.

Urban Forest Restoration Initiative. Planned agroforestry project in 2 acres of woodland along Onondaga Creek. Worked with volunteers and local native plant growers to remove invasives, and then plant 60 native trees and shrubs in this urban woodland.

### 2011

August 18. Native Youth Camp, Cranberry Lake Biological Station, Adirondack Park, NYS. “The Singing Birds” and “Birdsong Jeopardy.”

### 2018

“Historical Ecology of Onondaga Lake,” presentation at Skä•noñh Great Law of Peace Center, Oct 2018.

### 2021

“Trees of Beaver Lake Nature Center” recorded instructional walk through BLNC arboretum; presented via Facebook, due to Covid restrictions. April 22, 2021.

“Indigenous Tenure and Access: Land Justice for NY Land Trusts,” May 2021, annual meeting plenary presentation with Neil Patterson, Curtis Berkey, Alex Page, for Land Conservation Conference, NYS program meeting.

### 2022

“Becoming allies: historical ecological at the Central Fire,” presentation for Hubbard Brook Research Foundation, Jan 6, 2022.

Winter Botany workshop, Akwesasne Mohawk Nation, with Neil Patterson. Feb 21-22, 2023.

“Know Your Trees: Beaver Lake Nature Center,” April 11, 2022, Earth Week walk.

Village of Fayetteville street tree walk, as part of Manlius Green Days, April 16, 2022.

“Haudenosaunee Plantways, Past & Present,” presentation for Finger Lakes Native Plant Society, with Neil Patterson, April 19, 2022.

“From fairy slipper to death camas: secrets of the lost cedars,” historical ecology public presentation at Everson Museum of Art, Nov 17, 2022.

### 2023

“Know Your Neighbors: Onondaga Nation,” presentation for Syracuse Garden Club, Jan 23, 2023.

“Indigenous river science in the Oswego River Watershed: a historical perspective,” presentation at NY Federation of Lake Associations conference. May 4, 2023.

“Gardening for Nature,” presentation at Climate Justice Weekend, UU Church, Canton, NY, Oct 14, 2023.

“Onondaga Plants, Land, People” for Onondaga Hill Historical Society, Nov 15, 2023. With Jeanne Shenandoah from Onondaga Nation.

---

### **MADLINE NYBLADE**

[madelinenyblade.com](http://madelinenyblade.com); [mlnyblad@esf.edu](mailto:mlnyblad@esf.edu); (315) 470-6887

Assistant Professor, Department of Environmental Studies

Faculty Co-Director, Center for Native Peoples and the Environment

State University of New York, College of Environmental Science and Forestry

235 Marshall Hall, 1 Forestry Drive, Syracuse NY 13210

### **EDUCATION**

2019 – 2023 Ph.D. Earth and Environmental Sciences

Graduate minor in American Indian and Indigenous Studies

The University of Minnesota – Twin Cities (UMN)

Kawe Gidaa-naanaagadawendaamin Manoomin Research Collaborative

Thesis: *Hydrologic Impacts of Climate and Land Use Change on Manoomin/Psin (Wild Rice) Ecosystems: Outcomes from a Tribal-University Research Partnership*

Focus: Tribal-university research methodologies, interdisciplinary environmental science, hydrology, ecology, limnology

Advisors: Dr. Crystal Ng and Dr. Michael Dockry

2014 – 2018 B.S. Geoscience, *summa cum laude*

The Pennsylvania State University (PSU), Schreyer Honors College

Honors in geoscience, mathematics, and community development

Thesis: *Numerical Modeling of the Hydrologic-Agricultural-Economic System in Punjab, India: An Analysis and Reflection on Interdisciplinary Modeling for Sustainability*

Advisors: Dr. Tess Russo, Dr. Kate Zipp, and Dr. Ludmil Zikatanov

## **WORK EXPERIENCE**

2024 – Assistant Professor, Department of Environmental Studies, State University of New York, College of Science and Forestry (SUNY ESF)

2024 – Co-Faculty Director, Center for Native Peoples and the Environment, SUNY ESF

2023 Interim Project Coordinator, Kawe Gidaa-naanaagadawendaamin Manoomin Research Collaborative, UMN

2022 – 2023 Hydrogeology Field Course Teaching Assistant, Department of Earth and Environmental Sciences, UMN

2019 – 2023 Research Assistant, Department of Earth and Environmental Sciences, UMN

2019 Out-camping Program Coordinator for summer camp programs at Merrowvista, New Hampshire

2018 – 2019 Youth Facilitation and Outdoor Education Specialist for community and school programs at Merrowvista, New Hampshire

2016 – 2018 Computational Math, Hydrology, and Economic Research Assistant at PSU for T. Russo, K. Zipp, L. Zikatanov

2016 Research Assistant in the Human Environmental Dynamics Lab at PSU for R. Bird and D. Bird

2014 – 2018 Summer Camp Counselor and Trip Leader, Merrowvista, New Hampshire

**RE: Comments on Micron Semiconductor Manufacturing Project Draft Environmental Impact Statement**

On behalf of Citizens Campaign for the Environment (CCE) and our 120,000 members across New York State, we appreciate the opportunity to submit comments on Micron Semiconductor Manufacturing Project Draft Environmental Impact Statement (DEIS). CCE is a 120,000 member, non-profit, non-partisan organization that empowers communities and advocates solutions to protect public health and our environment. While we recognize the potential economic benefits associated with Micron's Proposed Project and the need for a chips manufacturing facility, the environmental costs, as outlined in the DEIS, are deeply concerning and, if left unmitigated, pose an unacceptable threat to New York's environment and public health.

Micron must demonstrate its commitment to being a good corporate neighbor and environmental steward by supporting a thorough and meaningful environmental review process that prioritizes community health, environmental integrity, and long-term sustainability. However, the DEIS falls short of that standard, leaving the community and environment at risk of irreparable harm from pollution and the destruction of the region's ecological landscape. The DEIS fails to adequately address critical concerns regarding the use, treatment, and monitoring of per- and polyfluoroalkyl substances (PFAS), the destruction and degradation of valuable wetlands and surface waters, the impact on local and regional water quality and drinking water resources, and the facility's excessive energy demands.

CCE offers the following recommendations and improvements to be incorporated into the Micron Semiconductor Manufacturing Project Final Environmental Impact Statement:

**Limit The Use of PFAS Chemicals in Manufacturing Processes and Prioritize Safer Alternatives**

The semiconductor industry is a well-documented major user of PFAS chemicals. These toxic "forever chemicals" are known to be used throughout the fabrication processes including for photolithography and most frequently in plasma etching, a core step in the fabrication of microchips.

Micron states that they are evaluating potential non-PFAS containing alternatives, yet they claim that “there are no known substitutes for many PFAS uses.” However, this assertion is overly broad and misleading. While it is true that PFAS currently play a role in some semiconductor processes, a growing body of research and industry innovation has identified safer, effective alternatives for some of these applications. In fact, researchers have demonstrated success using alternative chemistries such as alkyl polyglucoside and polyoxyethylene surfactants in specific production steps. Toxicity assessments show that these alternatives pose significantly lower risks to human health compared to PFAS. More than 100 semiconductor companies have successfully tested and implemented these safer options.

Micron must not treat the absence of drop-in replacements as justification for business-as-usual use of toxic PFAS chemicals. Rather than focusing narrowly on whether identical substitutes exist, Micron should conduct a rigorous alternatives assessment that considers process redesign, material substitution, and other innovative solutions. A commitment to eliminating PFAS where safer options exist should be a minimum requirement for a project of this scale.

Additionally, Micron must avoid the common industry practice of replacing one harmful PFAS chemical with another. While industries have mostly phased out two PFAS compounds, PFOA and PFOS, many industries are simply substituting them with other short chain PFAS chemicals that pose similar risks to human health and the environment. Substituting one PFAS with another is not a meaningful solution, and it perpetuates a cycle of contamination and harm. ***Micron should commit to phasing out the use of all PFAS chemicals, not just those currently regulated, and prioritize safer, non-PFAS alternatives wherever technically feasible.*** This proactive approach would demonstrate true leadership in pollution prevention and align with New York State’s broader efforts to reduce PFAS contamination and exposure.

The urgency to limit the use of PFAS at the Proposed Project is heightened by the fact that Onondaga County is already overburdened with existing PFAS sources. The region is home to a wide array of industrial facilities that have historically used or continue to use PFAS chemicals. These include airports, waste management facilities, metal finishing operations, plastics and resin manufacturers, electronics production plants, chemical processors, cleaning product manufacturers, and glass production sites. These facilities are potentially releasing PFAS into the environment through air emissions, wastewater discharges, and improper waste handling, placing a significant burden on local water resources and public health.

In 2019, the U.S. Environmental Protection Agency (EPA) announced that it had compiled data on facilities across the country that may be handling PFAS. Though the agency initially withheld this information from the public, the nonprofit organization Public Employees for Environmental Responsibility (PEER) filed a Freedom of Information Act (FOIA) request and ultimately sued the EPA to compel its release. In July 2021, PEER obtained the data and developed a national map identifying more than 120,000 facilities nationwide that may be using PFAS. Approximately 3,200 of these facilities are located in New York State, including over 140 in Onondaga County alone.

This concentration of PFAS-handling facilities in Central New York poses a significant environmental and public health risk. Onondaga County is a water-rich region with an interconnected network of lakes, rivers, wetlands, and tributaries, including Onondaga Lake, the Seneca and Oneida Rivers, Nine Mile Creek, and other critical waterways. Water does not stay within county boundaries, and PFAS contamination released locally has the potential to travel extensively, affecting drinking water sources, aquatic ecosystems, and downstream communities far beyond the county line.

While Onondaga County already contends with significant PFAS use, the scale and volume of PFAS anticipated at the proposed Micron semiconductor facility far exceed those of any existing operation in the region. This would introduce a new and unprecedented PFAS burden, heightening the toxic legacy already present. PFAS chemicals are exceptionally persistent in the environment and resistant to natural degradation. Once released, they accumulate in water, soil, and living organisms. Human exposure is linked to serious health outcomes including cancer, thyroid and liver disease, reproductive harm, developmental delays, and immune system dysfunction.

Given these risks, it is critical that the DEIS not treat Micron's PFAS use and discharge in isolation. Instead, the analysis must address cumulative impacts and account for the broader regional context of ongoing PFAS use and contamination. The addition of a facility of this scale, projected to use and discharge vast quantities of PFAS, represents a significant threat to regional water quality, public health, and the environment. Without significant changes to eliminate or reduce PFAS use and adopt safer alternatives the proposed Micron facility risks becoming a major new source of long-term pollution in a community already grappling with a legacy of industrial contamination.

### **Chemical Vendor Transparency and PFAS Monitoring**

According to the DEIS, Micron would request detailed chemical constituent documentation from its chemical vendors, including PFAS content. Micron claims this often requires the use of non-disclosure agreements (NDAs) to obtain such information. However, invoking trade secrecy or relying on NDAs must not serve as a barrier to full chemical transparency and environmental accountability. The public has a right to know about the hazardous chemicals being used, stored, and discharged into their communities. Shielding such information undermines regulatory oversight, public trust, and the ability to assess risks.

New York State has a well-established history of rejecting the classification of emerging contaminants, including PFAS, as protected trade secrets when public health and environmental protection are at stake. The State has enacted multiple laws that prohibit manufacturers from using trade secret claims to conceal the presence or concentration of toxic substances, including the 1,4-dioxane and PFAS disclosure requirements in household cleaning and personal care products. While these are product-specific mandates, they reflect a broader legislative and policy direction that prioritizes transparency and rejects secrecy for hazardous emerging contaminants. This precedent reinforces the principle that trade secret protections cannot be used to circumvent environmental accountability or public right-to-know laws.

Regardless of whether PFAS-related information is shielded under NDAs from individual chemical vendors, Micron is explicitly aware of the types and quantities of PFAS present in the products they procure and use. As a global manufacturing giant, Micron has significant market leverage and should use that leverage to demand full disclosure of PFAS content, including which PFAS chemicals are present, at what concentrations, and what they are used for from all suppliers. Any claim of confidentiality must not override the obligation to provide full transparency to the public and regulatory authorities. Non-disclosure cannot justify withholding critical information that affects environmental health and safety.

Micron should be required to monitor, track, and treat for every PFAS chemical used at its facility and to disclose this information proactively and publicly. Transparent reporting and full disclosure are essential not only for building community trust but also for ensuring that appropriate regulatory controls and pollution prevention strategies are in place. Without this transparency, the community and environment remain at unacceptable risk from PFAS contamination.

***Micron must not allow trade secret claims or non-disclosure agreements to obstruct full transparency regarding the presence, type, and concentration of PFAS and other hazardous chemicals used in its operations.*** CCE urges Micron to use its significant purchasing power to demand this information from its suppliers and to ensure it is made publicly available, aligning with New York State's clear legislative trend toward chemical disclosure and environmental transparency.

#### **On-Site Pretreatment of PFAS and Unbuilt Industrial Wastewater Treatment Plant**

CCE supports Micron's commitment to pretreating wastewater on-site; however, on-site pretreatment must go beyond just PFOA and PFOS and include all PFAS chemicals detected or used in operations. Pretreatment presents a critical opportunity to prevent the introduction of a new source of PFAS pollution into the environment. Micron is fully aware of every type of PFAS that will be used at the facility as part of its chemical procurement processes. With this knowledge, Micron should be required to ensure that these chemicals are being captured and removed from wastewater on-site to the fullest extent possible before discharged or sent to wastewater treatment facilities that may not be capable of treating for PFAS. ***CCE recommends Micron commit to pretreating PFAS down to the lowest technically feasible and achievable standard and provide detailed plans on how this will be accomplished on-site.*** Without comprehensive pretreatment, the community and surrounding watershed could face long-term contamination risks from PFAS chemicals.

Most conventional wastewater treatment plants are currently unable to remove PFAS from effluent before it is discharged into surrounding water bodies. These facilities were not designed to handle or treat for contaminants like PFAS, meaning that once wastewater containing PFAS enters a treatment plant, the chemicals often pass through the system largely unaltered and are released directly into the environment. This creates a clear and concerning pathway for PFAS to contaminate surface water, sediment, and aquatic ecosystems. Given the expected volume of PFAS use at the Micron facility, every effort must be made to prevent PFAS from leaving the site in the first place. Sending PFAS-laden wastewater to a treatment plant that cannot effectively remove these substances is both environmentally irresponsible and a threat to regional water

resources and public health. ***CCE recommends that Micron ensures all PFAS chemicals are removed at the source through comprehensive on-site pretreatment to avoid offloading this burden onto already ill-equipped public infrastructure.***

While the DEIS notes that Micron would apply to the Onondaga County Department of Water Environment Protection (OCDWEP) for a permit prior to the start of operations, including submission of a Basis of Design report recommending engineering treatment technologies, this plan is incomplete and overly reliant on an unbuilt and undesigned industrial wastewater treatment plant. OCDWEP proposes a two-stage plan: an interim solution using the existing Onondaga Wastewater Treatment Plant and a longer-term plan to build a new Industrial Wastewater Treatment Plant (IWWTP) at the Oak Orchard site. However, the DEIS lacks concrete details on the timeline, capacity, and treatment capabilities of this facility.

The DEIS states that OCDWEP will be designing the IWWTP to use the most advanced pollutant treatment and removal technologies available including technologies specifically designed to remove emerging PFAS chemicals, such as reverse osmosis, granular activated carbon, ion exchange resins, and advanced oxidation processes. In the absence of a fully designed and operational IWWTP, Micron must commit to advanced pretreatment measures on-site. This includes a full evaluation of PFAS uses, monitoring for all PFAS compounds, and implementation of best available technologies to minimize discharges. ***CCE further recommends that Micron be required to submit a detailed pretreatment plan for public and regulatory review well in advance of any industrial discharges.***

Given the uncertainty around the county's timeline and treatment capabilities, Micron's pretreatment efforts must be robust to ensure environmental and public health protections are not compromised.

### **Risks to Water Quality and Drinking Water Resources**

The Proposed Project raises serious concerns regarding its potential long-term impacts on water quality and drinking water resources, both within the immediate project area and across the greater Lake Ontario watershed. The DEIS anticipates a significant and permanent increase in impervious surface coverage as a result of site development and industrial operations. Increased impervious surfaces significantly reduce natural infiltration, increasing surface runoff, and accelerating the transfer of pollutants, such as oils, heavy metals, nutrients, and sediment, into nearby waterways. These effects are especially pronounced during high-intensity precipitation events, which are becoming more frequent due to climate change, and could exacerbate flood risk, overwhelm aging water infrastructure, and degrade downstream water quality.

***CCE appreciates Micron's commitment to incorporating green infrastructure into its stormwater management practices but urges Micron to ensure this approach remains a priority moving forward.*** Green infrastructure represents the most effective and sustainable method to manage the substantial increase in stormwater runoff anticipated from the Proposed Project. Micron must be required to implement green infrastructure practices, such as permeable pavement, bioswales, green roofs, and preserved wetlands, to mitigate runoff and reduce the pollutant load entering regional water systems. These site design strategies are critical for offsetting the massive increase in stormwater runoff that will result from impervious surface

expansion. By maximizing infiltration, green infrastructure will play a key role in protecting local water quality and reducing the environmental impact of the Micron Campus.

Though the DEIS notes that water withdrawn for the Proposed Project would be returned to Lake Ontario, one of the largest freshwater sources in North America, this framing is misleading. Municipal drinking water supply and wastewater resources would be irretrievably committed to supporting Micron's operations, including the construction of entirely new water intake and distribution infrastructure designed solely to meet the extraordinary demands of the Proposed Project. While Lake Ontario may offer volume capacity, it is the *quality* of returned water, not just the quantity, that must be critically examined. Without robust, enforceable pretreatment and monitoring standards, there is a significant risk that industrial wastewater, including hazardous and emerging contaminants, could compromise drinking water safety and aquatic ecosystems of Lake Ontario. ***CCE recommends that Micron and regulatory agencies prioritize strict, enforceable pretreatment standards and continuous monitoring to ensure that all water returned to Lake Ontario is of the highest quality and does not pose a threat to drinking water or aquatic ecosystems.*** Public reporting on water withdrawal volumes, discharge composition, and any exceedances of pollutant limits should be made regularly available to the public in an accessible format.

The DEIS also fails to recognize the vital role that wetlands and streams play in maintaining clean water supplies and protecting communities from flooding. Wetlands act as natural filters, absorbing pollutants such as nitrogen, phosphorus, pesticides, and other contaminants before they reach lakes, rivers, and streams. They recharge groundwater supplies, support biodiversity, and buffer communities from extreme weather events. Many of New York's most critical wetlands have already been filled, dredged, or drained, contributing to widespread water pollution and increased flood risk. The proposal to permanently fill over 200 acres of wetlands in a water-rich region like Central New York poses a significant threat to water quality, drinking water supplies, and watershed integrity. Destroying these wetlands undermines long-standing state and federal efforts to protect drinking water and restore ecological balance.

Wetlands do not exist in isolation, they are integral components of the regional hydrological system and directly influence the health and integrity of downstream waters. The destruction of wetlands at the project site will have consequences that extend far beyond the project footprint, potentially impacting surface water quality, groundwater recharge, and aquatic ecosystems throughout the Lake Ontario watershed. ***Every effort should be made to preserve the high value wetlands within the Proposed Project site.***

In addition to wetlands, small streams play a critical role in water protection. Approximately 11.2 million New Yorkers depend on public water systems that rely on headwaters and small streams. These waterbodies, regardless of their size or frequency of flow, are hydrologically connected to larger downstream systems and contribute significantly to overall watershed health. While the DEIS claims that perennial streams will be avoided, the plan to fill thousands of linear feet of ephemeral and intermittent streams remains deeply concerning. These smaller streams provide essential ecological and hydrological functions, such as transporting sediment and nutrients, supporting aquatic life, and mitigating flooding during snowmelt or heavy rain events. The DEIS fails to adequately assess the cumulative and downstream impacts of filling these streams, which

could degrade regional water quality and undermine ecosystem resilience. *CCE recommends that Micron conduct a comprehensive assessment of the cumulative and downstream impacts of filling ephemeral and intermittent streams, and ensure their protection through first avoidance, second minimization, and only then robust mitigation measures.*

Given the scale and permanence of Micron's water infrastructure demands, the company must be held to a higher standard of environmental accountability. Protecting water quality is not only essential for ecological health but also for preserving the drinking water quality and public health of the neighboring communities.

### **Significant and Irreversible Wetland and Surface Water Losses**

New York's wetlands and streams are vital to clean water, critical habitats, and climate resiliency. According to the US Fish and Wildlife Service, since colonization, New York has lost approximately half of its wetlands. Wetlands are home to many of New York's threatened and endangered plant and animal species and water held in wetlands percolates into the ground, replenishing groundwater sources for private and municipal water systems. Permanently filling the streams and wetlands on the Proposed Project site is in stark contrast with state efforts to increase and expand protections.

CCE is deeply concerned by the scale and severity of wetland and surface water impacts identified in the DEIS. According to the DEIS, the construction of the Proposed Project and Connected Actions would result in the permanent loss of approximately 193.38 acres of federal jurisdictional wetlands and 6,283 linear feet of jurisdictional surface water features, primarily at the Micron Campus and Rail Spur Site. This level of impact represents one of the most substantial wetland disturbances for any single industrial project in New York State in recent decades and constitutes an unavoidable significant adverse environmental impact as acknowledged by the DEIS itself.

Wetlands are irreplaceable natural resources that provide critical ecosystem services, including water filtration, flood mitigation, carbon sequestration, essential habitats, and groundwater recharge. The affected wetlands are not isolated patches of land; they are part of a broader, interconnected hydrological system within the Oneida River watershed that ultimately connects to the Oswego River and Lake Ontario. Their destruction will have ongoing consequences affecting surface water quality, increasing flood risks, and disrupting habitat corridors that support native fish, bird, and amphibian populations.

According to the NYSDEC Environmental Resource Mapper, the Proposed Project site contains state-regulated freshwater wetlands, streams listed on the Waterbody Inventory/Priority Waterbodies List, and habitats for rare, threatened, or endangered plant and animal species. Many of these wetlands are classified as Class II and III, offering pollution control, species protection, and groundwater recharge. Destroying over 200 acres of these high-value wetlands contradicts the intent of the 2022 amendments to the New York State Freshwater Wetlands Act, which aimed to expand protections and prevent precisely this kind of ecological destruction and degradation.

According to the NYSDEC Environmental Resource Mapper, the streams on the Proposed Projects site are Class C streams that are part of the Oswego-Seneca-Oneida Drainage Basin. These streams support vibrant ecosystems and aquatic life in connecting waterbodies. The DEIS must consider the impacts of filling in streams on fish and aquatic life in the region. Oneida Lake, considered one of the best fisheries in the state for healthy walleye, yellow perch, and black bass, is also the main location for walleye egg collection. Additionally, lake sturgeon, a NYS listed threatened species, reside in Oneida Lake. Filling in wetlands and streams on the Proposed Project site could negatively impact water quality in Oneida Lake and diminish these critical fish populations.

While the Proposed Project avoids impacts to perennial streams, the loss of ephemeral and intermittent streams is substantial. Ephemeral and intermittent streams make up approximately 59% of all streams in the United States. These streams are vital for maintaining the overall health of perennial streams, the watershed, and water quality. According to the US EPA, ephemeral and intermittent streams provide the same ecological and hydrological functions as perennial streams by moving water, nutrients, and sediments through the watershed. The loss of over 6,700 linear feet of these streams on the proposed site will have a ripple effect throughout the watershed. During snow melt and heavy rains, these streams help drain and move excess water and nutrients, while also providing essential habitat for a variety of species.

***CCE strongly urges that Micron revise its site plan to avoid and minimize wetland and stream impacts to the greatest extent possible before relying on mitigation.***

#### **Inadequacies of the Proposed Mitigation Plan**

While CCE recognizes that Micron, in coordination with United States Army Corps of Engineers (USACE) and NYSDEC, is developing a mitigation plan under Section 404 of the Clean Water Act and Article 24 of the Environmental Conservation Law, the proposed 2:1 mitigation ratio and off-site restoration efforts do not sufficiently compensate for the ecological loss of over 200 acres of natural wetlands and over 7,800 linear feet of surface water features.

The mitigation sites may protect acreage and satisfy regulatory requirements on paper, but they do not replace the functions, values, or geographic context of the destroyed wetlands. Wetland restoration efforts, while important, rarely replicate the complexity, biodiversity, and resilience of mature, undisturbed wetlands. Additionally, the DEIS does not provide adequate detail on the specific hydrological, ecological, and management characteristics of the proposed mitigation areas to allow for meaningful public review or assessment of their long-term viability.

***CCE recommends that the mitigation ratio be increased to at least 10:1 and that mitigation be conducted on-site or within immediate hydrological proximity whenever feasible to better replicate lost ecosystem services and maintain watershed integrity.*** The Final EIS must also include a fully detailed mitigation plan with specific site selection criteria, ecological design principles, adaptive management plans, long-term monitoring protocols, and enforceable protection measures.

The DEIS notes that a portion of the wetland losses from construction of the Proposed Project would be subject to an existing conservation easement established as part of National Grid's

Clay-Teal Project. *CCE recommends that all proposed mitigation areas be protected in perpetuity through enforceable conservation easements or similar legal instruments to ensure long-term stewardship and prevent future degradation or development.*

### **Enhance Energy Efficiency**

It is estimated that the Proposed Project would increase New York's electricity demand by 10%. This level of demand is environmentally unsustainable, particularly in light of New York's climate targets under the Climate Leadership and Community Protection Act (CLCPA).

*CCE supports Micron's commitment to achieving LEED Gold certification for all fabrication facilities and urges the company to go further by committing to LEED Platinum certification for all office and administrative buildings associated with the campus.* LEED Platinum represents the highest standard of sustainable building design and energy efficiency, demonstrating leadership in minimizing environmental impact while promoting occupant health and long-term cost savings. Office buildings typically offer more flexibility for incorporating deep energy savings through building envelope improvements, smart HVAC systems, passive solar design, and high-efficiency lighting and appliances. Achieving LEED Platinum would not only align with New York State's climate mandates but would also set a strong precedent for responsible corporate development in the region.

The cleanest, most cost-effective energy is the energy that is never used. Given the unprecedented scale of energy consumption projected for this facility it is imperative that Micron implement the most aggressive energy efficiency strategies available. These strategies should include, at a minimum, real-time energy monitoring, process energy optimization, heat recovery systems, and other energy saving measures. All operational systems, whether for manufacturing, cooling, lighting, or computing, must be adjusted for minimal energy intensity.

By minimizing demand at the source, Micron can reduce its reliance on new or expanded energy generation, including potentially controversial nuclear development. *CCE strongly urges the incorporation of a transparent, facility-wide Energy Management Plan that includes annual reporting and continuous performance improvement benchmarks aligned with New York's CLCPA.*

### **Increase in On-Site Renewable Energy Generation**

CCE supports the proposed installation of on-site renewable energy systems and on-site battery storage systems to supplement the Proposed Project's energy supply. These systems are an important component of reducing dependence on fossil fuels and meeting New York's climate goals under the CLCPA. However, the level of renewable energy generation currently proposed in the DEIS is severely insufficient.

While the installation of approximately 4 MW of solar capacity is a positive step, it would provide only a minuscule fraction of the facility's total energy demand. Large-scale semiconductor fabrication campuses can consume hundreds of megawatts, by contrast, the proposed 4 MW solar would produce a negligible amount of power in comparison to Micron's projected energy consumption. CCE understands that it is not feasible to generate enough on-site solar energy to fully meet the facility's substantial electricity demands; however, the minimal

solar capacity proposed in the DEIS falls far short of a meaningful effort, and ***Micron must do significantly more to maximize on-site renewable energy generation.***

Moreover, the DEIS states only that “Micron would plan to install solar panels on the roofs of certain Micron Campus buildings,” yet it fails to provide sufficient details regarding the proposed locations, total available rooftop square footage, or design capacity. Without this information, the public and permitting authorities cannot evaluate whether Micron is making a good-faith effort to maximize its on-site solar generation potential. The DEIS states that solar panels are being considered for the rooftops of parking structures, water and wastewater treatment facilities, and biological treatment buildings; however, it remains unclear whether Micron has evaluated all viable rooftop, canopy, or adjacent land areas for solar deployment.

***CCE strongly recommends that the final EIS includes a detailed, site-specific solar energy deployment plan.*** This plan should evaluate all feasible and environmentally responsible solar installation areas across the campus, including building rooftops, parking canopies, adjacent unused land, and other infrastructure, to ensure maximum deployment. A transparent analysis of potential and expected energy generation should be included to demonstrate that Micron is taking its renewable energy obligations seriously.

In addition to solar, Micron should be required to assess other forms of renewable energy generation that may be feasible on-site or within its control. Geothermal heating and cooling systems are particularly effective at reducing energy loads in large-scale buildings and campuses. Central New York has favorable subsurface conditions for geothermal exchange systems, and a geothermal feasibility study should be required as part of the final EIS.

Finally, the DEIS does not provide any quantifiable benchmarks or timetables for renewable energy installation. ***CCE urges the inclusion of binding commitments to install on-site renewable energy systems that scale with the facility’s development phases.*** These commitments must include annual progress reporting, public transparency, and integration with broader climate mitigation planning.

While the proposed 4 MW solar installation is a welcome gesture, it is far from sufficient. Micron must produce a comprehensive and transparent renewable energy generation and deployment plan that reflects the scale of Micron’s energy demands and the urgency of New York’s climate goals. Passive efforts and vague language will not suffice.

### **Prioritize Proven Renewable Energy Over Speculative New Nuclear Development**

While it is commendable that Micron has committed to purchasing 100% carbon-free electricity through power purchase agreements and renewable energy credits (RECs), CCE strongly cautions against any attempt to rely on new nuclear power to meet its energy needs. While nuclear energy is technically carbon-free in terms of emissions during operation, it is far from environmentally benign. The nuclear fuel cycle from uranium mining to spent fuel disposal has serious and long-lasting environmental impacts, including radioactive waste that remains hazardous for thousands of years and for which there is still no permanent disposal solution.

New nuclear plants are also notoriously expensive to build, often exceeding initial budgets by billions of dollars, and take decades to permit, site, and construct, well beyond the timeframe needed to support Micron's phased development. In New York State, proposed nuclear projects have been plagued by major delays, siting challenges, lack of community support, and unresolved questions about long-term radioactive waste storage. While Governor Hochul recently announced a state initiative to explore the development of advanced nuclear technologies, this effort remains in its earliest stages. There are currently no licensed, sited, or shovel-ready new nuclear facilities in New York, and any resulting generation, if developed at all, would not come online until well after Micron's operational timeline. Therefore, it is neither realistic nor responsible to assume that future nuclear development could serve as a source of carbon-free energy for Micron within the required timeframe.

Any dependence on future nuclear development introduces unacceptable financial, environmental, and logistical risks into Micron's energy planning. Instead, Micron should prioritize renewable energy sources that are proven, safe, cost-effective, and rapidly deployable. Solar, wind, and geothermal technologies not only provide sustainable power but also foster local job creation, reduce long-term energy costs, and align with New York's legally binding climate goals under the CLCPA.

*CCE urges Micron to invest in scalable and achievable renewable energy solutions*, both on-site and through regional procurement, and to avoid speculative energy strategies like new nuclear, which are incompatible with the urgent need to reduce greenhouse gas emissions, protect public health, and meet development timelines responsibly.

### **Summary of Recommendations**

CCE strongly urges that the final EIS for the Micron Semiconductor Manufacturing Project reflect meaningful improvements that prioritize pollution prevention, environmental transparency, and sustainable development. CCE offers the following summary of recommendations:

- 1. Phase Out PFAS Use and Prioritize Safer Alternatives**  
Micron must commit to phasing out all PFAS chemicals, not just those currently regulated, and prioritize non-PFAS alternatives wherever technically feasible. A robust alternatives assessment must consider process redesign, material substitution, and safer alternatives already in use within the industry. Substituting one PFAS chemical for another is not acceptable.
- 2. Ensure Full Chemical Transparency and Reject NDAs**  
Non-disclosure agreements must not be used to conceal PFAS and other hazardous chemicals from the public or regulators. Micron should require full disclosure from chemical vendors and provide transparent, public reporting of all PFAS types and quantities used.
- 3. Require Comprehensive On-Site Pretreatment of PFAS**  
All PFAS compounds used at the facility—not just PFOA and PFOS—must be treated at the source to the lowest technically feasible and achievable standard. Micron should submit a detailed pretreatment plan for public and regulatory review, independent of the proposed, unbuilt industrial wastewater treatment plant. Given that conventional wastewater treatment

plants cannot effectively treat PFAS, Micron must prevent off-site discharges of PFAS-contaminated wastewater.

**4. Protect Water Quality and Drinking Water Resources**

Micron must be required to implement robust green infrastructure strategies to manage stormwater and minimize runoff. All discharges must meet stringent pretreatment standards and be subject to public reporting and monitoring.

**5. Avoid and Minimize Wetland and Stream Destruction**

The DEIS must be revised to prioritize avoidance and minimization of wetland and surface water impacts. Destruction of over 200 acres of wetlands and thousands of feet of stream systems is unacceptable and should prompt a re-evaluation of the site layout and project footprint.

**6. Strengthen and Localize Wetland Mitigation**

The proposed 2:1 mitigation ratio is inadequate. CCE recommends a minimum 10:1 mitigation ratio with on-site or hydrologically proximate mitigation wherever feasible. The final EIS must include detailed, enforceable mitigation plans, including long-term monitoring and legal conservation protections.

**7. Enhance Energy Efficiency and Commit to LEED Platinum**

Micron must implement aggressive energy efficiency strategies across all operations and commit to LEED Platinum certification for all non-fabrication buildings. A comprehensive Energy Management Plan with public performance tracking should be included in the final EIS.

**8. Maximize On-Site Renewable Energy Generation**

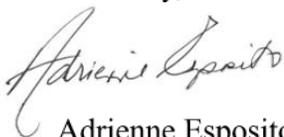

The proposed 4 MW of on-site solar capacity is wholly inadequate. Micron must evaluate and maximize all feasible rooftop, canopy, and adjacent land solar installations, and assess geothermal and other renewable options. The final EIS must include a binding, transparent deployment plan with measurable benchmarks and public reporting.

**9. Reject New or Advanced Nuclear as an Energy Solution**

New nuclear development is speculative, costly, and incompatible with Micron's operational timeline. Micron should instead prioritize proven, rapidly deployable renewable energy sources, such as solar, wind, and geothermal, to meet its carbon-free electricity goals.

Micron's proposed facility represents one of the largest and most resource-intensive industrial developments in New York State history. The scale of the project demands a correspondingly rigorous and precautionary environmental approach. CCE urges the CPO and OCIDA to incorporate these recommendations into the final EIS to ensure the project does not compromise public health, clean water, ecological integrity, or the state's climate goals.

Sincerely,

Adrienne Esposito  
Executive Director

**Subject:** [EXTERNAL] Homes in Clay

I have heard that Micron is trying to push people out of their homes, when they do not want to leave! If they don't want to leave why can't they just change their plans to work around their homes and land. The home I am referring to is the Kings on Caughdenoy Rd. I know they have been there a very long time and they are pillars of the community.

**Subject:** Micron Project

NYSUT Retiree Council 7, representing thousands of retired educators in Central New York, welcomes Micron as a good neighbor. To ensure that relationship is a long and beneficial one to both parties, we ask that certain guidelines be established.

NYSUT Retiree Council 7, along with many other union, environmental, workforce, public health and safety organizations ask that the organizations that control Micron's development in Central New York take into consideration workplace safety; creation of good paying jobs in a union- accepting climate; no adverse impact on school funding; environmental quality and continued monitoring; good housing and transportation.

First, the health and safety from toxic chemicals used to make chips must not pollute air, soil, fish, wildlife, and drinking water. A long term, continuing monitoring of this must be in the plan with enough resources to sustain it.

Second, commit to ensuring that clean water and energy in abundance will be affordable to the area into the future. Ratepayers should not shoulder the burden. Also, generate renewable energy with a low carbon impact.

Third, safe working conditions are necessary. We know the workers will be exposed to toxic chemicals and all measures must be taken for their sake as well as their families. In addition, we seek pay equity, and a diverse workforce that would be allowed to unionize without adverse ramifications. To further aid working families, public transportation and child care on site or near would be helpful.

Fourth, invest in housing needed for existing and new residents. Mixed income and affordable housing will be needed, and Micron must be involved in a cooperative effort to bring that about.

Fifth, tax abatements to Micron must not come at the expense of schools and students. According to a report issued by "Good Jobs First NY" schools lost a total of \$ 1.8 billion in property tax revenue due to tax abatements granted by IDAs.

We would appreciate support and actions on these guidelines. We look forward to your response.

Sincerely,  
NYSUT Retiree Council 7

**Subject:** [EXTERNAL] Micron DEIS EISX-006-55-CPO-001

---

Sent via the Samsung Galaxy S10e, an AT&T 5G Evolution capable smartphone

My purpose in writing is to express my concerns with the Draft Environmental Impact Statement for Micron Semiconductor Manufacturing Project EISX-006-55-CPO-001. I am a resident of the Town of Constantia, Oswego County, NY. I am a member of the Town's Planning and Zoning Board, as well as a director on the Oswego County Soil Water Conservation District Board. My comments do not reflect those of these organizations, agencies. They are based on my years of experience as the manager of a municipal Industrial Pretreatment Program.

The following are my comments.

1. The comment period is grossly inadequate for a document of this size (20,000 pages) and extensions for documents this large are common.
2. The impact report does not include a list of chemicals used in the chipmaking process and will be transported and stored on site. This information is necessary in order for an Industrial Wastewater Discharge Permit to be issued and should be public knowledge. (The compounds and formulae may be proprietary, but the chemicals are not).
3. Chemical storage is not detailed. Although spills are addressed, there is only a superficial discussion. The plant is being built on an aquifer and there is great potential for ground water contamination should a chemical spill, equipment malfunction or system upset occur. Further, downstream wells and waterways could be affected.
4. Stormwater management needs to be addressed. With the destruction of acres of Wetlands and replacement with impervious surfaces, areas downstream of the plant, including Clay, Phoenix, Schropel and Fulton have a greater risk of flooding.
5. The DEIS does not detail the method that will be used for sludge disposal. Additionally, since the waste water will be pretreated and sent to Oak Orchard Wastewater Treatment Plant, the sludge generated at the treatment plant will contain PFAS and cannot be land applied.
6. The actual impact from the destruction of wetlands may not be known for years and the effects may be more harmful than currently predicted.

In closing, I recognize that the economic growth and development that may result from this project will revitalize CNY. However, it should not come at the cost of the environment and the natural resources in our area. Thank you for considering my comments.

On 8/11/25 11:57 PM, Artesia Wagersreiter wrote:

Hello,

My name is Artesia. I'm a data analyst and a citizen of Syracuse concerned about the impacts of the Micron development of the health and safety of citizens of Syracuse and Onondaga county. Thank you for the opportunity to public comment. In case there is a concern, did not write any of this with AI and took the time and energy to learn about the topic and write it myself, so I would appreciate if my email was given the same attention.

I am writing to say that the draft does not adequately address how the Micron project will impact my community and CNY as a whole. Central New York deserves a facility that is well-built with the workers, citizens, and geography/environment all in mind, and one that will last for years to come. So far, Micron has done less than the bare minimum in terms of evaluating their planned spot and the many impacts it would have on the region. They have also provided a 45-day comment period – the federal minimum – to go over 20,000 pages of work, with a main body length of 700 pages. The working families who will be impacted by this project the most need more time to be made aware of the issue and be given fair opportunities to share their opinions. There needs to be a longer time available for public comment than less than two months in the middle of the summer when most people are on vacation mode, and I previously signed a petition stating the same. I imagine that Micron is hoping for a good relationship with our region, and doing things like this is getting off to a very bad start.

Here are my concerns:

- They need to disclose what chemicals are being used because the discharge is going into the river which is two miles away from where Onondaga drinking water is taken in. This county has already seen enough difficulty with poisoned drinking water, lakes, and building materials. It is abhorrent that Micron would be comfortable to do this, poisoning our entire region.
- The removal of that many trees, shrubs, and wetlands is going to pose a significant loss. At a time when we are seeing temperatures rising more than ever, we desperately need those natural resources to help mitigate the temperature rise and store CO2.
- The ground this is going to be built on is karst - there are gaps, it is notoriously porous, and sink holes on this land – where an impossibly heavy building is going to be – is not a question of “if” but “when.” I want this project to succeed, and not for the planned 16 years of construction – funded by taxpayers! – to be interrupted by a foreseeable event and for the entire project to be scrapped and abandoned, leaving us with the consequences, with no lasting or meaningful cost to Micron.
- At the point when sinkholes develop, any spills that do happen could spread underground, reaching other drinking sources like those who for folks who have wells. Micron did not even evaluate all of the bedrock that they are planning to build on, clearly demonstrating that they are not dedicated to ensuring that things are done right. We do not something this large to be a rushed job, done while everybody is still caught up in the good feelings of future economic prosperity – which won’t even reach us until 2040.
- The reports surrounding the aforementioned economic prosperity, however, appear inflated and unrealistic. While Micron says the average pay will be \$100,000 a year, averages are well-known to ironically be an inaccurate estimate of what is going on with the average worker. To get a true estimate of what we can expect workers to make, we would need the median and mode – or at least common salary ranges for workers. Additionally, \$100,000 means less and less with every year as inflation continues to rise, and they have provided no assurances that their pay will be kept with inflation or that the workers will be treated well.
- Furthermore, they claim to want to hire veterans and women but so far, not only have they not provided enforceable commitments, but their locations worldwide have partaken in aggressive union-busting techniques, which is particularly dangerous in an industry where many hazardous chemicals will be used – which have so far not been disclosed. A lot of talk has happened, but we have nothing to hold them to so that we can actually expect true reduction of poverty in Onondaga county.
- They are saying no more than 60 hours per work with no less than 1 day off per 7 days. Absolutely unacceptable, that is overwork for dangerous work and will kill at least one person. Our workers deserve no more than 50 hours per week with no less than 2 regular days off per 7 days. Having worked rotating shifts, I can confidently say that nobody can comfortably build a life or take care of their family – or even

have a solid sleep schedule, which is paramount to being in good shape and working order to not make mistakes on the job – without having consistent hours and days off. Central new Yorkers deserve more.

- I don't want Micron to have the impression that wetlands are just for environmental folks and hippies, because I feel that really is a smokescreen to hide behind what wetland removal really does, which is increasing flooding - which we're already seeing more of as the weather gets less predictable. Instead of water being absorbed and filtered through wetlands, it'll pick up any kind of chemicals or trash or oil or *whatever* from the area, and carry it into our water sources. There has been no detailed evaluation regarding managing stormwater runoff.
- Mature wetlands – ones that will actually reduce flooding, absorb CO<sub>2</sub>, and mitigate temperature – take a *long* time to develop. Many decades. And no amount of creating new wetlands in other locations can fix what would be destroyed by building this on this location. Micron needs to find a different location. The soybean fields that supposedly would be made into wetlands – or other already-developed land parcels in the area - could be developed into the new location instead. Once they're gone, they're gone.
- I would like to also add that the tragedy of Allied Chemical and the failed Onondaga lake cleanup are still fresh in everybody's memory. I know people who saw the sludge pouring into the lake growing up. We still can't swim in what should be a pristine, glorious body of water that otherwise has the potential to draw people from miles around, especially with the mineral springs. Every time I see the lake, I'm reminded of how one single company and a handful of executives singlehandedly destroyed a whole water source for generations to come, poisoning those who swim in or eat from it – and with no accountability. While some remediation was done, it is nowhere near enough, and the standard of large companies coming into areas, wreaking environmental harm and hurting the residents, and then escaping accountability is almost expected at this point. It will take a lot to earn the trust of these residents, and the many oversights that have been made apparent with just the sliver of what I have read of this proposal (in the few *days* I was aware of it) are not doing anything to help anybody's fears. The benefits will take ages to see, but the negative impacts will be seen immediately.
- Any wetlands that would be created to “replace” what would be destroyed by the Micron development are first of all being proposed to be replaced at a 2:1 ration which is significantly below the standard 1:15 ratio for the industry, and second of all, would be in the hands of Micron. Which is not an environmental company, and I cannot expect that what Micron deems is “enough” – like what 3M has deemed is “enough” for lake Onondaga – would truly be enough and what central new Yorkers deserve.
- They're planning on burning a lot of natural gas annually, which would result in poor air quality for the area - and we already have terrible air quality right now. Central New York used to have dependably excellent air quality and that's quickly slipping away as well, as wildfires from the Canadian border drift across. I spent a bit less than four hours outside a few weeks ago – on a day when it was supposedly only unsafe for unhealthy groups, and I don't have anything wrong with my lungs – and I

haven't been able to get rid of the cough since. I have to check the air quality before going outside now. How are our children's lungs being impacted by the smoke? How would the additional air pollution affect our children's health and chances of survival? Air pollution is a major killer worldwide, and Americans often don't think of it as something that impacts us, but we're seeing it more and more.

- The amount of gas they are planning on building would singlehandedly divert our entire state from their renewables goal, which again is not just for tree-huggers, but is created with the health of our citizens in mind as air pollution kills. They have no meaningful plans about renewables, and in fact they would require an existing solar array to move, possibly removing that benefit from our county. Their burning would create hazardous compounds that we don't need to breathe in, and Micron has not addressed how they would mitigate this significant risk at all.
- The amount of electricity they're planning on using would raise rates for all of us.
- They haven't released a list of PFAS and other chemicals, which exist forever. Burning PFAS is even worse
- They're not providing chemical exposure limits to the public or human health risks.
- They're planning on making a childcare center - this is reminiscent of the Aberfan disaster, where children were killed by a company who wasn't considering the impacts of them. It is irreverent, shows a frightening lack of understanding of the history of similar projects, and frankly insulting that they would presume to put the safety of the *children of their workers* at risk. Again, they have refused to release the chemicals they are using, and a spill event could reach the child care center. I wouldn't want my children to be there, and I don't imagine you – whoever you are reading this – would, either.
- The possible location for handling the waste is in Middlesex New Jersey. I'm from New Jersey, and Middlesex does not need any more trouble. There aren't even any commitments from Micron that they aim to reduce the amount of hazardous waste created by this process.

I am concerned that this project is being significantly rushed, done in the dark, and with as little thought put in as possible. Especially with the amount of taxpayer money that has been given to Micron, it is particularly insulting that they show so little regard for the lives of the Americans who will be their neighbors and employees for the decades to come. The very least that we – the people who pay our hard-earned tax dollars to have them given to huge corporations – deserve is a well thought-out plan that will truly benefit all parties involved. My asks are:

1. Extend the public comment period by at least 4 months and provide at least two more public hearings after the semester starts. At this point, everybody will be back from vacation and will be able to see and truly understand what is happening here. We are stronger together, and everybody's voices are needed in this monumental project – not just those of us who got lucky and found out about the regional impacts from a friend of a friend. We are paying for this, we will be subject to the ramifications, and we deserve a voice.

2. Reevaluate whether the originally planned size will be necessary in light of recent developments from Micron regarding other developments.
3. Find another location in the area suitable for development. We cannot afford the loss of these valuable natural resources of the wetlands and the services they provide. We cannot afford the air and water pollution that will directly impact half a million people. The fastest way to move forward – as I'm sure Micron would like to do – would be to select a less environmentally-sensitive location for the building and resulting operation to occur.
4. Make their grant money contingent on tangible and measurable commitments that they must fulfill. Central New Yorkers deserve accountability from the entity looking to be seen as a savior of the region.

Please consider how you would feel if your friends, family, children were in this area. Had to look at a poisoned lake every day. If your children would possibly work at a company unwilling to disclose the extremely toxic and persistent chemicals that they would be working with on a daily basis.

Thank you for your time and for hopefully having read what I painstakingly took the time to read instead of sleeping.

We have one opportunity to do this, for the best of our citizens, our relationship with Micron, and for the stability of the region. We need to do it right.

Regards,

Artesia Wagersreiter

Hello,

My name is Artesia. I'm a data analyst and a citizen of Syracuse concerned about the impacts of the Micron development of the health and safety of citizens of Syracuse and Onondaga county. Thank you for the opportunity to public comment. In case there is a concern, did not write any of this with AI and took the time and energy to learn about the topic and write it myself, so I would appreciate if my email was given the same attention.

I am writing to say that the draft does not adequately address how the Micron project will impact my community and CNY as a whole. Central New York deserves a facility that is well-built with the workers, citizens, and geography/environment all in mind, and one that will last for years to come. So far, Micron has done less than the bare minimum in terms of evaluating their planned spot and the many impacts it would have on the region. They have also provided a 45-day comment period – the federal minimum – to go over 20,000 pages of work, with a main body length of 700 pages. The working families who will be impacted by this project the most need more time to be made aware of the issue and be given fair opportunities to share their opinions. There needs to be a longer time available for public comment than less than two months in the middle of the summer when most people are on vacation mode, and I previously signed a petition stating the same. I imagine that Micron is hoping for a good relationship with our region, and doing things like this is getting off to a very bad start.

Here are my concerns:

- They need to disclose what chemicals are being used because the discharge is going into the river which is two miles away from where Onondaga drinking water is taken in. This county has already seen enough difficulty with poisoned drinking water, lakes, and building materials. It is abhorrent that Micron would be comfortable to do this, poisoning our entire region.
- The removal of that many trees, shrubs, and wetlands is going to pose a significant loss. At a time when we are seeing temperatures rising more than ever, we desperately need those natural resources to help mitigate the temperature rise and store CO2.

- The ground this is going to be built on is karst - there are gaps, it is notoriously porous, and sink holes on this land – where an impossibly heavy building is going to be – is not a question of “if” but “when.” I want this project to succeed, and not for the planned 16 years of construction – funded by taxpayers! – to be interrupted by a foreseeable event and for the entire project to be scrapped and abandoned, leaving us with the consequences, with no lasting or meaningful cost to Micron.
- At the point when sinkholes develop, any spills that do happen could spread underground, reaching other drinking sources like those who for folks who have wells. Micron did not even evaluate all of the bedrock that they are planning to build on, clearly demonstrating that they are not dedicated to ensuring that things are done right. We do not something this large to be a rushed job, done while everybody is still caught up in the good feelings of future economic prosperity – which won’t even reach us until 2040.
- The reports surrounding the aforementioned economic prosperity, however, appear inflated and unrealistic. While Micron says the average pay will be \$100,000 a year, averages are well-known to ironically be an inaccurate estimate of what is going on with the average worker. To get a true estimate of what we can expect workers to make, we would need the median and mode – or at least common salary ranges for workers. Additionally, \$100,000 means less and less with every year as inflation continues to rise, and they have provided no assurances that their pay will be kept with inflation or that the workers will be treated well.
- Furthermore, they claim to want to hire veterans and women but so far, not only have they not provided enforceable commitments, but their locations worldwide have partaken in aggressive union-busting techniques, which is particularly dangerous in an industry where many hazardous chemicals will be used – which have so far not been disclosed. A lot of talk has happened, but we have nothing to hold them to so that we can actually expect true reduction of poverty in Onondaga county.
- They are saying no more than 60 hours per work with no less than 1 day off per 7 days. Absolutely unacceptable, that is overwork for dangerous work and will kill at least one person. Our workers deserve no more than 50 hours per week with no less than 2 regular days off per 7 days. Having worked rotating shifts, I can confidently say that nobody can comfortably build a life or take care of their family – or even have a solid sleep schedule, which is paramount to being in good shape and working order to not make mistakes on the job – without having consistent hours and days off. Central new Yorkers deserve more.
- I don’t want Micron to have the impression that wetlands are just for environmental folks and hippies, because I feel that really is a smokescreen to hide behind what wetland removal really does, which is increasing flooding - which we’re already seeing more of as the weather gets less predictable. Instead of water being absorbed and filtered through wetlands, it’ll pick up any kind of chemicals or trash or oil or *whatever* from the area, and carry it into our water sources. There has been no detailed evaluation regarding managing stormwater runoff.
- Mature wetlands – ones that will actually reduce flooding, absorb CO2, and mitigate temperature – take a *long* time to develop. Manu decades. And no amount of creating new wetlands in other locations can fix what would be destroyed by building this on this location. Micron needs to find a different location. The soybean fields that supposedly would be made into wetlands – or other already-developed land parcels in the area - could be developed into the new location instead. Once they’re gone, they’re gone.

- I would like to also add that the tragedy of Allied Chemical and the failed Onondaga lake cleanup are still fresh in everybody's memory. I know people who saw the sludge pouring into the lake growing up. **Subject:** [EXTERNAL] Micron comments part 1

---

To Whom it may concern:

Please accept the following comments on the DEIS for the Micron Manufacturing Project in Clay, New York. These comments are based on past experience as a local government official in Colorado many years ago. At the time, our locality was the closest municipality to a new electrical generating facility. I was the chief administrative official there for 3 years during construction, requiring me to address many impacts, and receive and implement grant funding to mitigate impacts at the time.

#### Review Time and Availability Concerns

It is disturbing that the public was only given 45 days to review an approximately 2 foot thick document. I have eyesight limitations, and the central library of the county, where the only hard copy was located, was closed for 2 weeks during the 45 day period due to air conditioning problems. The DEIS was inaccessible at that time. However when I asked Carol Johnson, the manager of our local library branch if she could get the DEIS hard copy, she kindly went and picked it up so it could be available at Petit Branch for this last week.

Clearly, the review time should have been extended or more hard copies should have been provided by the county, but also because over a 1000 residents submitted a petition requesting more time for public review. I understand the county government did not respond?

#### Public Safety and Emergency Management Concerns

The DEIS states that the proposed site will be served by the Onondaga Sheriff's Office and the Clay, and possibly the Cicero, Volunteer Fire Departments. However there is no mention in the document that I could find that any of these agencies were contacted to inquire and determine their capacity to respond to a wide variety of potential problems that could occur during construction and/or operations. I called the Sheriff's office today to ask if they reviewed the document after I read this text on Saturday, but did not receive a reply from them.

Questions certainly should be asked about the professional and size of the capacity of these agencies to respond in a timely manner to unique events that would not necessarily happen at other facilities in their service areas. There is no information that I could find in the DEIS if there is a substation of the Sheriff's office near by, or if one will be built and what organization will pay for it and when. I also wonder if the volunteer fire departments have had the full training in hazmats that should be available on a 24/7 basis. This is very difficult to accomplish with volunteer departments, particularly during normal business hours when many of the volunteers are at their paid jobs. I have 7 years experience working with volunteer fire departments when I was a town manager in Colorado and it was a huge problem during the day Mondays through Fridays.

I also wonder how the federal official Incident Command System (ICS) will be implemented if any event occurs. The New York State Police also is nearby. How will quick decisions be made in this regard? I have experience with law enforcement and fire debating who is in charge when we experienced a helicopter crash in one town.

More recently I served as a consultant to the Congressional Government Accountability Office (GAO) main office and the Congressionally authorized National Academy of Public Administration (NAPA), both in Washington DC, and to the Federal Emergency Management Agency (FEMA) before that about wildland fire management and other emergency management matters.

In all of our almost 10 studies, our teams repeated reported issues with debating response agencies, including with state and local governments, as continues to exist in many cases today. In all cases the importance of following ICS with appropriate protocols are needed. Nothing is mentioned in the DEIS about response responsibilities or timeliness on or near the site from what I could see in my brief review of the documents including appendices.

The only government that I read was contacted in the DEIS was the the Town of Clay in the appendix about the rail spur siting. It was curious that the New York State FOIL had to be used to acquire documentation in this regard? The document states that repeated phone calls and email messages to the Town of Clay were not replied to. Was an effort made for these consultants to go in person to the Clay offices? Were other nearby local governments contacted to inquire about potential impacts and professional capacity that might be impacted? No other localities were mentioned in the DEIS as being contacted that I could find, again in such a short review time period.

A wide variety of events could happen on or near the site during construction and operations that could require public safety, medical and/or fire response. In my experience, we certainly had increased calls for liquor establishments, including trying to enforce the fire codes. We experienced more fighting and vehicle accidents, along with dangerous driving conditions near these establishments. This area has many social issues due to the confluence of 2 major interstate highways and the proximity to Canada that could likely be exacerbated with this growth in people working here. We also have a high population of New Americans here that are known to be at risk of aggressive behavior.

Much more detail is needed about how these local governments will respond, especially when PILOT payments, if like property tax revenue, are lagged.

#### Transportation Concerns

Some local agencies were identified as being contacted somewhat regarding transportation to conduct extensive modeling work. However, I was surprised that the Syracuse Metropolitan Transportation Council (SMTC), the Official Federal Metropolitan Planning Organization for this region according to the US Department of Transportation, was apparently not contacted about their extensive work in this regard for the 5 county area.

Sections 3, and 4 for cumulative effects, discuss some high traffic problem areas for 5 interchanges. For them the DEIS states that these intersections are "unmitigatable" which the public safety and emergency management agencies should also ask how these intersections will accordingly impact response capabilities and times, particularly during rush hours. how were these interchanges considered in the modeling? It is difficult for the public to understand these impacts.

I do not understand why these intersections are termed "unmitigatable", and otherwise complicating many matters as well as increasing dangerous conditions. Much more detail and public meetings should be held in particular about these transportation and emergency management concerns.

Under transit, there is mention that Centro, the local transit agency, would run more buses to the micron facility. However, why doesn't Micron provide some of its own transportation so that less parking spots would be needed on the campus? Incentives could be offered for car pooling as well to reduce parking spots needed. There is much more text needed in the DEIS about modern methods to reduce traffic, improve safety and risk management, and reduce air pollution to benefit everyone in many ways.

Moreover, there are modern techniques that could be used by Onondaga County to help address such dangerous intersections and related matters, such as land acquisition through eminent domain to increase the safety and capacity of these intersections, and thereby improving emergency response times.

#### General concerns

It was also surprising that no mention of contact with the county Planning agency, SOCPA, was done to acquire any existing or planning data, including geodata which would improved the legibility of the maps presented in the beginning of the DEIS. Needing to use private sector (Esri) and state data seems very incomplete for such a large project and site. The county has Esri licences and data that should be used to better help readers understand the maps presented in the beginning of Section 3.

A land ownership and jurisdictional boundaries map is needed as well.

Cumulative effects, Section 4, is needing much more details about many matters. For example, broadband will certainly be impacted as would flood plains potentially. Much more information is needed to increase green space as with less parking spots as suggested above.

Thanks very much for considering these comments. Please also extend the comment period, improve the maps, and add some more public meetings about emergency preparedness and management.

Sincerely,

Lisa Warnecke, MBA PhD

**Subject:** [EXTERNAL] Public Comment for Micron DEIS

**Importance:** Normal

**Sensitivity:** None

---

To Whom It May Concern:

I wish to submit a public comment in regards to the Micron DEIS. While there are many elements of this impact statement that are outside of my expertise, I would like to see more information regarding the follow:

- \* Who is responsible for the handling of the impacted water related to Micron? I am extremely concerned about its usage of potable water in our region, and the storage of the contaminated water for the incredible length of time that will be required.
- \* What are the job commitments to ensure that this economic development prioritizes employing and strengthening our local economy to the best of its ability?
- \* What public/private partnership is being undertaken by Micron and impacted municipalities regarding the impacts on housing and transportation?

Sincerely,

Nicole

Re: Draft Environmental Impact Statement for Micron Semiconductor Manufacturing Project, Clay, NY

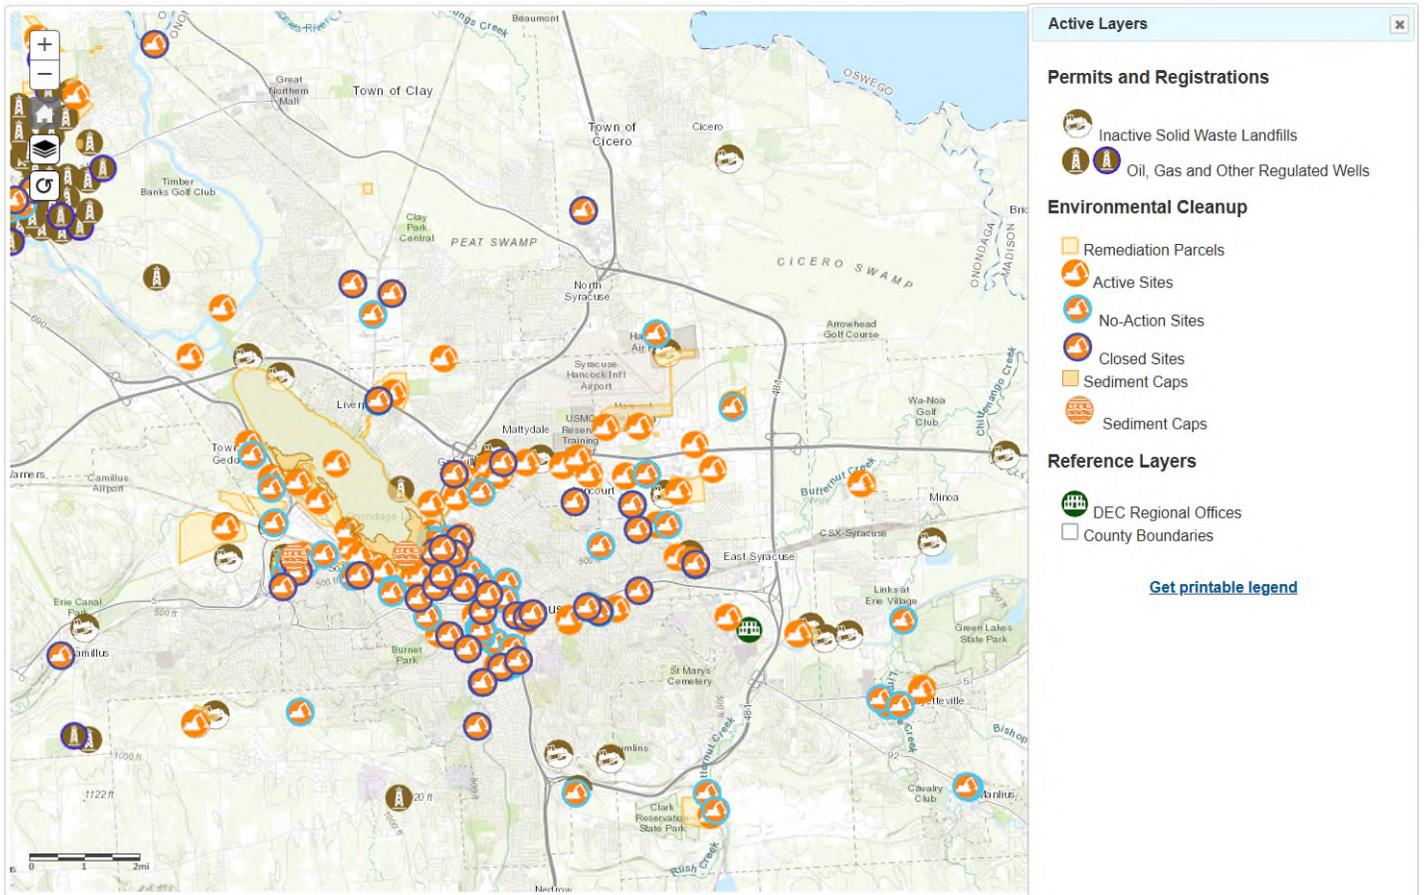

Dear Mr. Petrovich and Ms. McKay:

Clean+Healthy submits these comments on the Draft Environmental Impact Statement (“DEIS”) for the Micron Semiconductor Manufacturing Project in Clay, New York (the “Project”). Clean+Healthy is an environmental health nonprofit advocacy organization with a mission to build a just and healthy world where toxic chemicals are simply unthinkable. We co-lead the JustGreen Partnership, a statewide coalition working for environmental health and justice for New York’s people and communities.

We acknowledge that many upstate communities, built around historical rounds of industrial development, have been suffering economically from the movement of much product manufacturing to other parts of the world, especially Asia. We also recognize that those previous rounds of industrialization still leave their scars on the community with dozens of inactive hazardous waste sites in the greater Syracuse area alone. (See map on next page.<sup>1</sup>) Since that time, government regulations of the use and release of toxic chemicals have expanded, with the intention that they protect human health and the environment. However, the class of chemicals known as PFAS (per and polyfluoroalkyl substances) is currently not regulated in industrial uses as a class, with

---

<sup>1</sup> NYS Department of Environmental Conservation *DECIInfo Locator* <https://gisservices.dec.ny.gov/gis/dil/> Add Environmental Cleanup sites to the map.

only a handful of chemicals in this broad class regulated in air, water, or soil. See below for further discussion of this.

**We are concerned that, without careful attention, the economic boon of the Micron plant could again bring the bust of high health care costs for employees and community residents, and long-term environmental harm. These chemicals comprise the focus of our comments.**

Clean+Healthy is part of the PFAS-Free NY campaign, which is focused on eliminating the harm caused by a dangerous class of toxic chemicals called per and polyfluoroalkyl substances (“PFAS”) from production, use, disposal and in the environment. This class of chemicals, which includes over 15,000 different chemical structures, are often referred to as “forever chemicals” because of their extreme persistence and ubiquity in the environment. It is estimated that PFAS contaminate up to 45% of the nation’s tap water and are found in the blood of nearly the entire U.S. population.<sup>2</sup>

PFAS contamination has spread across the world, harming countless people and species.<sup>3</sup> The health risks associated with PFAS are well established and broadly recognized by international scientific

<https://searchlightnm.org/toxic-timeline-a-brief-history-of-pfas/>.

organizations,<sup>4</sup> federal and state regulatory agencies,<sup>5</sup> and other leading scientific bodies.<sup>6</sup> Many PFAS are associated with “significant and diverse” adverse health effects that include cancer, liver disease, decreased fertility, high cholesterol, reduced vaccine response, and more.<sup>7</sup> Clean+Healthy is concerned enough about this class of chemicals that we issued our own white paper on the topic: *PFAS: The Meaning of Forever*.<sup>8</sup>

New York is already experiencing the impacts from PFAS. Millions of New Yorkers are living with the legacy of unregulated PFAS releases.<sup>9</sup> Almost half of New York’s public drinking water systems are contaminated by PFAS, and more than two-thirds of the inactive landfills in the state leach unsafe levels of PFOA, PFOS, or both into groundwater impacting private well owners.<sup>10</sup> In addition, PFAS already contaminates multiple sites in the vicinity of the Project, increasing the potential for cumulative exposures. There is known PFAS contamination at the Hancock Field Air National Guard Base in Syracuse.<sup>11</sup> There is suspected PFAS contamination at the Oak Orchard Wastewater Treatment Plant site, where Micron intends to build the Project’s new industrial wastewater treatment facility.<sup>12</sup> And there are multiple facilities in the area that are suspected of using or having used PFAS, including two airfields immediately south of the Project site.<sup>13</sup>

With PFAS already costing the state up to \$4.4 billion in annual health care costs and millions in drinking water treatment and site remediation, New Yorkers cannot afford for this Project to worsen

<sup>13</sup> *Id.*; see also DEIS, Appendix K: Phase I Environmental Site Assessment Main Campus East, Childcare Site, Utility Infrastructure/Rail Spur Site at 9 (Feb. 2024).

the New York PFAS crisis.<sup>14</sup> Instead, the Project should be a model of sustainable semiconductor production, and a demonstration that domestic microchip production need not come at the expense of our health and the environment.

A necessary first step towards responsible semiconductor manufacturing is a comprehensive analysis of the environmental and social impacts of proposed manufacturing projects. Unfortunately, the Project's DEIS does not provide enough detail on Micron's use, disposal, and release of PFAS for the public to understand the Project's environmental and human health impacts. Because the scope and severity of the anticipated impacts are not disclosed, the mitigation needed to ensure health protective control of PFAS at the proposed facility remains unclear.

### ***DEIS must rely on the science-based definition of the PFAS class***

A threshold point for the DEIS, it must rely on a science-based class definition of PFAS. As acknowledged in the DEIS, the assessment and regulation of PFAS "depend[s]" in large part "on the definition of PFAS applied."<sup>15</sup> The New York Legislature,<sup>16</sup> United States Congress,<sup>17</sup> more than 100 leading scientists,<sup>18</sup> and 16 state attorneys general<sup>19</sup> have all defined PFAS as a class of chemicals containing "at least one fully fluorinated carbon [atom]." This definition has broad scientific support, since it is the presence of a fully fluorinated carbon that gives PFAS their common trait of persistence. We urge the project proponents to rely on this science-based PFAS definition, which is already enshrined in multiple provisions of New York State law.

While EPA claims to define the PFAS class on a "case-by-case basis," as opposed to relying on a single consistent definition, prior EPA definitions have excluded thousands of PFAS recognized by the Organisation for Economic Co-operation and Development ("OECD"), New York State, and others.<sup>20</sup> These exclusions have no scientific basis, and if applied to semiconductor manufacturing many PFAS would be excluded that are used or formed during production. For instance, EPA's prior definitions did not include polyvinylidene fluoride ("PVDF"), a PFAS used in semiconductor manufacturing,<sup>21</sup> or trifluoroacetic acid ("TFA"), which forms when the fluorinated gasses used to make semiconductors

break down in the environment.<sup>22</sup> To fully assess the Project's PFAS impacts, the DEIS must use a definition that encompasses the full PFAS class.

***DEIS must discuss Micron's use and discharge of PFAS chemicals***

PFAS are widely used during the production of semiconductors,<sup>23</sup> and while PFOA has predominately been phased out, semiconductor plants continue to use "short-chain" PFAS,<sup>24</sup> which are often associated with the same types of health effects as the long-chain PFAS they are used to replace.<sup>25</sup> PFAS in wastewater discharges has been detected at other facilities producing semiconductors. Based on information obtained from Global Foundries semiconductor manufacturing facility in Essex Junction, Vermont, at least 17 different PFAS have been detected in the wastewater discharged. Up to 78,000 parts-per-trillion of PFAS were detected in another domestic semiconductor plant's wastewater.<sup>26</sup>

The DEIS does not identify which PFAS Micron will use or specify how Micron plans to treat and dispose of its PFAS-containing waste. It only offers noncommittal assurances that PFAS concerns will be handled in future permitting processes, deferring the evaluation and mitigation of significant adverse impacts without any certainty that such permits would even address PFAS releases. This is an unacceptable level of detail given the serious risks PFAS pose and the knowledge that PFAS will be used at the proposed facility.<sup>27</sup> This approach is problematic and not protective, because New York does not sufficiently regulate PFAS as a class in permitting industrial facilities (DEC only regulates PFOA and PFOS). This regulatory gap gives no assurance that PFAS will not be permitted to be released into the environment.

The environmental analysis must identify the specific PFAS proposed to be used at the facility; how those PFAS would be used; available alternatives that meet requirements, and all anticipated releases via air emissions and surface and wastewater discharges, including discharges from the Project's industrial wastewater treatment plant ("IWWTP"). The Final EIS must incorporate mitigation measures to require safer, non-PFAS alternatives wherever available and specify permitting conditions that prohibit the release of PFAS used at the Micron facility. It should also require Micron to evaluate alternative techniques, materials, and technologies that would eliminate the need for PFAS chemicals that emerge during the projected 16-year construction timeline; new solutions are being developed and the final portions of the project should not rely on the available solutions of 2025.<sup>28</sup>

<sup>28</sup> The NYS Pollution Prevention Institute has been working with companies to identify safer solutions that go beyond regulatory requirements, including regarding the use of PFAS in manufacturing. They should be consulted on this project, [nysp2i.rit.edu](https://nysp2i.rit.edu); the Toxic Use Reduction Institute at UMass Lowell has also worked with companies, including in the semiconductor space, to identify safer solutions to PFAS use, and have access to technologies covered by confidential business information that are safer

### ***DEIS must discuss Micron's PFAS Air Emissions***

The DEIS acknowledges that Micron will use and release fluorinated gasses (“F-gasses”), with almost 2.5 tons of projected “fluorides” emissions from fabs 1 and 2 alone.<sup>29</sup> But the DEIS overlooks the fact that many F-gasses are themselves PFAS or PFAS-precursors, the adverse impacts of which extend far beyond their contribution to climate change.

F-gasses comprise more than 60 percent of the world’s annual PFAS emissions.<sup>30</sup> In the environment, most F-gasses degrade into trifluoroacetic acid (“TFA”), one of the most prevalent PFAS.<sup>31</sup> In addition to its high persistence, TFA is associated with developmental toxicity<sup>32</sup> and liver and thyroid harm.<sup>33</sup> TFA is ubiquitous in the environment and extremely difficult to control, since “methods to remove TFA from water are expensive and often inefficient due to TFA’s persistence and mobility.”<sup>34</sup> Here, not only does the DEIS fail to mention TFA, but the County “never considered the potential impacts of the Project’s [F-gas] emissions at all.”<sup>35</sup> “

The DEIS fails to discuss the limitations of thermal treatment options for PFAS, which resist thermal degradation. Despite industry’s claims of high PFAS destruction rates, recent air sampling around a Chemours thermal oxidizer in North Carolina detected high levels of PFAS.<sup>36</sup> Air permits for existing Micron facilities do not address PFAS air emissions,<sup>37</sup> and the DEIS contains “no ‘reasoned elaboration’ as to why . . . the issuance of a state facility permit . . . would result in no significant adverse environmental impact from the project’s air emissions.”<sup>38</sup> The final EIS must consider the Project’s PFAS air emissions and impose specific mitigation measures to address PFAS air emissions in subsequent state permits.

### ***DEIS must discuss Micron's disposal of PFAS chemicals***

Their unique chemical structure also makes PFAS difficult to treat and dangerous to dispose of. Conventional wastewater treatment processes will remove some, but not all PFAS, especially the short-chain PFAS that are most widely used in semiconductor manufacturing.<sup>39</sup> Even the successful removal of PFAS from wastewater creates waste products – such as spent carbon filters or reverse

<sup>39</sup> EPA, *Technologies for Reducing PFAS in Drinking Water at 1* (2019),

[https://www.epa.gov/sites/default/files/2019-10/documents/pfas\\_drinking\\_water\\_treatment\\_technology\\_options\\_fact\\_sheet\\_04182019.pdf](https://www.epa.gov/sites/default/files/2019-10/documents/pfas_drinking_water_treatment_technology_options_fact_sheet_04182019.pdf) (“[S]horter chain PFAS like perfluorobutanesulfonic acid (PFBS) and perfluorobutyrate (PFBA) do not adsorb as well [to GAC filters] resulting in earlier breakthrough”);

osmosis concentrate – with high PFAS concentrations.<sup>40</sup> The disposal of these treatment residuals presents further problems, since traditional means of waste disposal do not effectively contain or destroy PFAS.

The incineration of PFAS waste presents similar concerns. PFAS are widely used in firefighting foam precisely because they do not break down when burned. Those same properties make PFAS extremely difficult to incinerate, and EPA has acknowledged that “the effectiveness of incineration to destroy PFAS compounds ... is not well understood.”<sup>41</sup> The incomplete combustion of PFAS “can result in the formation of smaller PFAS,” as well as other toxic chemicals like hydrogen fluoride. These products of incomplete combustion are then released with any residual PFAS via the incinerator’s air emissions, “spread[ing] them into surrounding areas.”<sup>42</sup> The final EIS must consider the Project’s PFAS disposal and impose specific mitigation measures to ensure disposal.

### ***Micron Fails to Commit to Any Concrete PFAS Mitigation Measures***

The DEIS must identify practicable PFAS mitigation measures. As described above, there are significant gaps in the DEIS analysis in respect to PFAS air or water releases, and wastes, and the DEIS commits only to compliance with future administrative processes and regulations.

Below are a non-exhaustive list of mitigation measures that are needed to “minimize or avoid” the significant adverse effects associated with PFAS. These mitigation measures should be enshrined as conditions to facility permits (e.g., SPDES, Title V).

- **Monitoring:** Significant monitoring protocols should be employed to monitor the Project’s impacts and identify potential PFAS releases using EPA-approved methods that cover the greatest range of detectable PFAS. This monitoring should include monitoring of water discharges (surface and wastewater, before and after pretreatment), air emissions. Micron should fund the quarterly monitoring of PFAS in the influent, effluent and biosolids from the Industrial Wastewater Treatment Plant at the Oak Orchard Site (“IWWTP”).
- **Minimization:** Micron should be required to conduct a PFAS Alternatives Assessment to evaluate the specific PFAS that are known, intended, or reasonably foreseen to be used on site; the respective functions of such PFAS; and whether such PFAS can be reduced or eliminated. The PFAS Alternatives Assessment shall be made public on a dedicated, easy-to-find webpage. Micron should also be required to use less hazardous, non-PFAS alternatives wherever practicable, and prepare an annual report on its actions taken to reduce or eliminate PFAS use.

<sup>40</sup> John Wiegand, *The Race to Destroy PFAS, the Forever Chemicals*, MIT Tech. R. (Oct. 26, 2023), <https://www.technologyreview.com/2023/10/26/1082292/the-race-to-destroy-pfas-the-forever-chemicals/> (“Byproducts such as filters used to capture PFAS do not make the chemicals go away: often “[t]he filters are discarded or chemically washed for reuse, and the notoriously clingy PFAS reenter the environment through landfills and wastewater.”).

<sup>41</sup> EPA, Technical Brief, *Per- and Polyfluoroalkyl Substances (PFAS): Incineration to Manage PFAS Waste Streams 1* (2019), [https://www.epa.gov/sites/default/files/2019-09/documents/technical\\_brief\\_pfas\\_incineration\\_ioaa\\_approved\\_final\\_july\\_2019.pdf](https://www.epa.gov/sites/default/files/2019-09/documents/technical_brief_pfas_incineration_ioaa_approved_final_july_2019.pdf)

<sup>42</sup> Cheryl Hogue, *Incineration May Spread, Not Break Down PFAS*, Chem. & Eng’g News (Apr. 27, 2020), <https://cen.acs.org/environment/persistent-pollutants/incinerators-spread-break-down-PFAS/98/web/2020/04> (describing elevated PFAS levels in the soil around a Cohoes, New York incinerator); Noémi Brunschwiler, TNO, *Tracing Sources of Diffuse PFAS Contamination in Soil Near A Waste Incineration Plant* (June 30, 2023), <https://publications.tno.nl/publication/34641491/gr1mfT/TNO-2023-S11566.pdf> (reporting elevated PFAS levels in soil downwind of a Netherlands waste incinerator and concluding “the waste incinerator was . . . likely a substantial contributor to the observed PFAS content”).

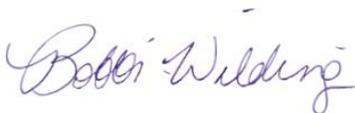

- **Pretreatment:** The Onondaga County Department of Water Environment Protection (“OCDWEP”) should be required to implement a Pretreatment Program for discharges to the Project’s IWWTP, in accordance with Clean Water Act regulations.<sup>43</sup> Such a pretreatment program shall prohibit the discharge to surface or groundwater of any wastewater containing any detectable PFAS to the IWWTP.
- **Other measures:** The SPDES permits issued to Micron and the IWWTP shall include effluent limitations and/or new source performance standards for all PFAS that Micron knows or foresees will be discharged from the facility, including degradation byproducts that are PFAS. Consistent with New York and federal law, if neither EPA nor New York has developed effluent limitations, standards, or guidance values for a PFAS that Micron foresees discharging, DEC should develop the effluent limitations and/or standards based on the best available technologies economically achievable using its best professional judgment.<sup>44</sup> The SPDES permit issued to the IWWTP shall prohibit the land application of biosolids.

## Conclusion

We urge Project Proponent and other involved agencies to fully evaluate the Project’s PFAS impacts, to consider feasible alternatives and mitigation measures, and to require mitigation that eliminates significant adverse impacts by preventing PFAS releases and exposures.

The current DEIS inappropriately defers PFAS impacts and lacks sufficient assurances to protect the community and New York’s environment. The Project should be a model of sustainable semiconductor production, and a demonstration that domestic microchip production need not worsen the nation’s PFAS contamination crisis. The final EIS should require mitigation that eliminates significant adverse impacts by preventing PFAS releases and exposures.

Respectfully submitted,

Bobbi Wilding, MS

## COMMENTS

### #1 of 2

Traffic Analysis, Page 3-325

The DEIS indicates that there will be no traffic mitigation completed by 2027, yet the project will impose a significant worsening of traffic along the Route 31 corridor, especially during the afternoon rush hours. This represents a major external cost being imposed on the residents of Clay and Cicero.

The intersections along Route 31 between Route 11 and Thompson Road are currently significantly congested, and the DEIS proposes increasing traffic in that area without any increase in the capacity of the roads. Micron and OCIDA need to increase the capacity of these roads *before* adding traffic. The delay to the start of construction will be offset by the efficiencies of better traffic flow. Additionally, the railroad spur at Caughdenoy Road should be completed before fill is transported to the construction site.

At a minimum, the proposed new interchanges on Route 81 at Sneller Road should be constructed first in order to divert traffic from the Route 31 intersections.

The DEIS only analyzes traffic during the morning rush hour - 6AM to 8AM and the evening rush hour 4PM to 6PM. This is insufficient to capture the full effect the project will have on the residents of this area. The schools in the area add traffic at earlier hours in the afternoon, leading to significant congestion at hours not considered in the DEIS.

The project is complex and requires more coordination among various agencies, including NYSDOT and the Towns of Clay and Cicero. It is not acceptable to simply declare road improvements not possible in the near term while creating significant additional traffic congestion.

**#2 of 2**

Time Frame for comments

The DEIS was published with a comment period of 45 days, the minimum allowed under the law.

This creates the impression that the agencies want to limit input from the public regarding this project.

The Micron project promises to transform the Clay and Cicero areas into an entirely different character from the present. The impacts on residents and businesses will be enormous. The comment period must be extended to give the public a chance to absorb and react to an enormous report which the agencies needed 3 years to complete.

David Frenkel  
Environmental Division Director  
CHIPS for America  
U.S. Department of Commerce

Dear Robert & David:

I am submitting this comment for the public record on behalf of Empire State Development (ESD), the state's chief economic development agency, an involved agency in the preparation of the Environmental Impact Statement by the Onondaga County Industrial Development Agency as Lead Agency under New York's State Environmental Quality Review Act. The aim of this comment is to highlight the robust community engagement and ambitious commitments to Central New York communities that ESD and Micron have undertaken around this project.

Micron's \$100 billion investment in Central New York will bring transformative growth to the region and has the potential to reshape the economic trajectory of the entire state. This project will create more than 50,000 New York jobs, including tens of thousands of construction jobs, and put Central New York at the forefront of an advanced manufacturing renaissance. Under Governor Hochul's leadership, ESD is realizing major investments and partnering with Micron to ensure that the benefits of this historic investment are felt equitably and that Central New York communities have a hand in shaping this coming growth.

This unprecedented investment was made possible by New York's Green CHIPS Program, championed and signed into law by Governor Hochul and overseen by ESD, which requires ambitious sustainability and community commitments. These commitments include investments that support local workforce development and the host community, including training and education programs to expand employment opportunity for economically disadvantaged individuals.

As part of the project agreement, Micron CEO Sanjay Mehrotra and Governor Hochul signed a Community Investment Framework in October 2022. In the agreement, Micron & New York State made strong commitments to community and sustainability including:

- The establishment of a \$500 million Community Investment Fund and the creation of a Community Engagement Committee made up of local stakeholders work with Micron to support ongoing community engagement, help to recommend community investment grants to be made from Micron's contribution to the Green CHIPS Community Investment Fund, and support implementation framework and monitoring of the overall and subsequent Green CHIPS Community Plan between Micron and ESD.
- A commitment to volunteering and giving in Central New York communities. The company pledged to provide two days paid volunteer time per year for each team member; volunteer opportunities may include serving in community-based organizations.
- Micron also agreed to set diverse hiring and contracting goals; sustainability requirements; and other community investments.

Since then, ESD and Micron have been working, in partnership with the community, to realize these commitments.

### **Green CHIPS Community Investment Fund & the Central New York Community Engagement Committee**

In April 2023, Governor Hochul announced the formation of the Central New York Community Engagement Committee made up of local stakeholders to ensure meaningful, ground-up participation and discussion of Micron's implementation and investments in the region.

In their first year, the Committee engaged nearly 13,000 Central New Yorkers in public hearings, focus groups, one-on-one-interviews, and online surveys to identify and compile local priorities for inclusive growth and benefits to the greater Central New York region. These engagements included:

- Public events and meetings attended by over a thousand Central New Yorkers
- Canvassing efforts in communities across the region
- Presentations both online and in person
- Focus groups targeted at diverse and underrepresented groups
- Digital engagements, including regular mass emails, online surveys, and a website available in both Spanish and English

The Committee reviewed and analyzed these engagements at monthly meetings, adapting and refining their outreach efforts to strive for a comprehensive representation of the region's diverse communities and ensure that the voices of underrepresented and

marginalized groups were heard and integrated into the planning process. To ensure inclusivity, the Committee provided materials in Spanish and employed bilingual facilitators to address language barriers. 12,734 residents and over 316 local organizations participated in the Committee's engagement efforts.

The Committee's findings were published in the [Community Priorities Document](#) (CPD) published in June 2024. The CPD represents a critical strategic framework to help guide the \$500 million Green CHIPS Community Investment Fund (CIF) towards the community's most pressing needs and aspirations. The CIF was created in partnership with ESD with Micron contributing at least \$250 million, ESD contributing \$100 million, and the remaining funding being raised from local, statewide and national partners.

In the CPD, the Committee identified immediate priority areas including education, workforce development, supports for minority, women, and veteran-owned small businesses, housing, and childcare.

The first round of applications for the CIF closed in January 2025 with initial awards expected to be announced in the near future. Beyond the CIF, Micron and New York State are already making major investments aligned with the priorities identified by the community in workforce development, education, housing, support for small and diverse businesses, and workforce development.

Recognizing that the Micron project is a generational opportunity, the \$500 million CIF is designed to be spent over the course of the next two decades. The Committee continues and will continue to meet regularly and engage the public and revisit the CPD as needed to ensure that it continues to reflect the changing needs and perspectives of Central New Yorkers throughout the duration of the CIF.

### **Diverse Contracting Goals**

In the Community Investment Framework agreed to by Micron and New York State, Micron committed to use good faith efforts to achieve 30% of eligible construction spend from eligible categories with businesses owned by socially and economically disadvantaged individuals (SEDI). Micron is partnering with ESD to identify business and industry specific skills that could benefit the small businesses who are interested in these opportunities and help them with navigating through existing and new resources, such as gaining access to capital and bonding.

Building Micron's campus will generate hundreds of millions of dollars' worth of contracts that SEDI-owned firms in New York are able to pursue. Micron and ESD are collaborating to develop a dynamic database of ready, willing, and able SEDI-owned businesses, with the ultimate goal of matching Micron and other semiconductor-related industries with businesses looking to pivot or grow into semiconductor supply chain and construction sectors.

Once in operation, Micron's megafab complex will also spark operating contracts for a wide range of suppliers and service providers. Micron has also pledged to use good faith efforts to achieve 20% of eligible operating spend with SEDI-owned businesses. To ensure that

these goals are met, Micron will require applicable Tier 1 and Tier 2 suppliers to establish spend goals on their contracts as well.

ESD has hired full time-staff dedicated to helping Micron realize these diverse contracting commitments as a part of the Governor's Office of Semiconductor Expansion, Management, and Integration (GO-SEMI). GO-SEMI staff are engaging small and diverse businesses in Central New York and across the state and building a robust database of SEDI-owned firms that could be eligible for contracts to ensure these businesses get the information and assistance they need to access these opportunities.

Micron and its preconstruction phase general contractor are working closely with ESD to realize these goals as its project moves to break ground this year. Micron and its general contractor hosted an opportunities and awareness session for local and diverse subcontractors, vendors, suppliers, and professional service providers in Syracuse. This promises to be the first of many engagements to empower local and diverse businesses to benefit from the Micron project.

### **Diverse Hiring Goals & Workforce Development Initiatives**

Micron's investment will create tens of thousands of good paying jobs, the majority of which will not require a four-year college degree.

Governor Hochul is committed to ensuring that New Yorkers, especially New Yorkers from communities historically left out of economic growth, are empowered with the skills they need to seize these opportunities.

In the Community Investment Framework signed by Governor Hochul and Micron, the company has pledged to work with state and local partners and construction contractors and subcontractors to establish a target percentage of the construction workforce to be from disadvantaged populations. Additionally, Micron has committed to establish a target percentage of permanent hires for facility operations to be made from targeted census tracts and historically disadvantaged populations.

Under the Governor's leadership, ESD is making ambitious investments in new workforce development programs and partnering with Micron on new and innovative education and training programs in Central New York to empower workers with the skills they need to take on these new jobs and meet those targets.

Governor Hochul, Micron, the American Federation of Teachers, New York State United Teachers and the United Federation of Teachers partnered to create and launch the Advanced Technology Framework, a curriculum and learning toolkit to help high school students hone the foundational skills necessary for career success in the booming semiconductor industry. The Framework is currently being piloted with the Board of Cooperative Educational Services (BOCES) in 10 school districts through 2027.

Micron is also realizing commitments to local community colleges. In 2023, Governor Hochul unveiled plans for a new state-of-the-art cleanroom simulation lab at Onondaga Community College (OCC). The lab was made possible by a \$5 million grant from Micron,

the largest ever single donation in OCC history. Students at OCC and other SUNY community colleges can also take advantage of Micron's new internship program that provide hands-on, experiential learning for New York students in either its Boise, Idaho or Manassas, Virginia fabs, in preparation for joining the Clay, NY fab once the facility is operational.

Beyond the Community Investment Framework, ESD has been making major investments to prepare Central New Yorkers for future jobs. Governor Hochul's signature \$200 million ON-RAMP program will build four new workforce development centers in strategic, high impact locations across upstate. The South Side of Syracuse will be home to the state's flagship ON-RAMP Center and will provide robust wraparound services to connect diverse and skilled New Yorkers with careers in dynamic, high-growth advanced manufacturing industries like semiconductors.

These investments and initiatives will help empower Central New Yorkers from diverse and historically disadvantaged communities access the tens of thousands of jobs that will be created by Micron's project.

### **Housing**

Micron's investment will reverse decades of population decline in Central New York, likely bringing the population of Syracuse back to its 1970s levels at a growth rate not seen since the 1950s.

To ensure that the region can sustain this growth while preserving its most vulnerable communities, ESD commissioned a comprehensive regional housing study. The housing study found that the region will need to dramatically increase housing production in the near term to handle this growth and made policy recommendations to accomplish that.

In July 2024, ESD brought local, state, and national leaders and housing experts together for a summit at LeMoyne College. Over the course of the day long intensive, attendees were presented the study findings and discussed potential solutions including financing, zoning updates, and areas where state support can assist effectively.

Since then, ESD has supported a number of mixed-use housing initiatives in Central New York including:

- A \$1.25 million grant to support the \$40,733,830 redevelopment of the Chimes Building at 500 South Salina Street in Syracuse into a mixed-use, mixed-income building with 152 new residential units.
- A \$1.25 million grant to support the \$25,145,547 development of Bridgeview Commons in Cortland. The development will create 60 new, affordable, residential units targeting families with 30 units designated for victims of domestic violence, two non-profits (Seven Valleys Food Rescue and Cortland ReUse), as well as retail space in a rehabilitated strip mall.

- A \$1 million grant to support the \$18,739,361 conversion of a vacant office building in downtown Syracuse into a mixed-use development that will create 39 new mixed-income residential units.

Governor Hochul has made housing and affordability a top priority and has enacted several sweeping programs aimed at increasing the production of housing including unlocking \$650 million in state funding for Pro-Housing communities and \$100 million in capital funding to assist with infrastructure to build new housing.

In July 2025, New York State Housing and Community Development announced a \$100 million Housing Acceleration Fund, the state's first revolving loan fund designed to unlock new housing – half of which will be dedicated for upstate projects.

Additionally, housing was identified as an immediate priority by the Community Engagement Committee and will be a central focus of the \$500 million CIF in Central New York.

Taken together, the scale and scope of these commitments rank among the most ambitious community investments ever to accompany an economic development project. They demonstrate Governor Hochul's commitment to realizing the incredible potential of Micron's investment while centering the needs and voices of Central New Yorkers and their communities.

Sincerely,

Kevin Younis

*Chief Operating Officer and Executive Deputy Commissioner, Empire State Development*

**Subject:** [EXTERNAL] Micron Environmental Impact Comments

I believe there are legitimate concerns with Micron but without the proper amount of time given to our community to analyze this environmental impact study, we are at a complete disadvantage. We were given just one day of public hearings for something that will impact every one of our lives and future generations. Without the opportunity to vote on any of this, given the huge and forever impacts - this is completely unfair to those who have lived in this area for decades.

I believe if people truly cared about the environment and this community, a task force would be set up of experts and community members to help us understand what is at stake. Those of us who are not scientists, environmental professionals, engineers, etc., can not accurately comprehend an environmental impact study of this size, especially in such a short time frame. (I guess maybe if people don't have to work, or take care of their families.) And I believe it is intentionally being handled this way to give every advantage to Micron project supporters.

My husband and I have previously lived in area where there was explosive population growth so we know first hand what it is like; Orlando, Florida when Disney was first developing in 1970-90's. The crime, the traffic and building boom changed the area completely and not for the better. Visiting Disney, tourists think it's all magical, but those of us actually living and working in the area full time - not so much.

We made the decision to move to CNY over 28 years ago to be near family and we were attracted to the rural feel of this area. Our plan was to live out the rest of our lives here, but now we talk about where we will move if Micron project actually moves forward. We have no desire to live in a congested community that doesn't even have enough medical and police staffing needed for the current population, nor can we bear to witness this great landscape as it is forever destroyed.

I don't have any new comments or environmental concerns that haven't already been brought up, but I am deeply concerned about this Micron plant for many of the same reasons others have tried to address: The forever highly toxic chemicals damaging our water, ground and air. What chemicals exactly?

The obscene amount of fresh water and power Micron will need.

The negative effect on wildlife, wetlands.

The increased traffic and population.

Lack of affordable housing.

Effect on the water table.

Who is really going to be footing the bill for everything needed?

We can't even get our street re-paved after they did most of the streets in the subdivision in recent years, plus they stopped doing touch up repairs on the cracks 3 years ago. If we can't even maintain the streets we already have, what happens when all the attention/resources goes to the new roads Micron and related businesses need?

What happens if this chip plant is no longer needed when new technology comes along, making chips obsolete?

As usual these projects affecting every single person in this community are developed without giving the residents a chance to vote but yet we all have to deal with the consequences of what a few people in government decide to do. They sure do love their photo ops with the shovels and ribbon cuttings. Someone is going to make a lot of money, but it's not going to be the taxpayers.

And as usual, when they pitch these projects like Destiny Mall, the Aquarium, Amazon Warehouse, etc., they don't want to address the negative effects or properly plan. They are not interested in being good stewards of this fragile environment. It's all about \$\$\$. They show us beautiful artist renderings of magical things like Destiny Mall but by the time they break ground, it's shrinks down to half the size of what they planned and costs way more than we were originally told.

What a disappointment Destiny has turned out to be; the owners defaulting on their mortgage, so many stores and restaurants that have left, so many tenants that have had problems with the owners, plus most of us residents stopped going there a while ago because of the crime. The Aquarium project, already struggling to complete construction because of rising costs. Not to mention the huge drop in international tourism this year and unstable economy that needs to be considered when projecting realistic attendance numbers.

**These mega projects are particularly concerning because of the mega consequences. Instead of pushing these massive "super-sized" projects I'd rather see smaller scale projects that are well done with sustainability, innovation, the environment and the entire community's best interests in mind. And not just for the current moment in history, but for the future generations.**

Unfortunately I really don't think my comments will make any difference but here they are.

Thank you for your time,  
Mary Seliger  
Baldwinsville

**Subject:** [EXTERNAL] Public comment DEIS Micron project

To: chipsnepa@chips.gov

Subject: DEIS for Micron Project (Clay, NY)

To whom it may concern,

I am writing to provide a public comment on the draft environmental impact statement related to the Micron project proposed for Clay, NY. I have the following comments on the DEIS document:

1. Removal of wetlands. The project proposes to remove over 300 natural wetlands and replace them with artificial wetlands elsewhere. Wetlands provide essential ecosystem services, including cleaning water. The nearby Oneida River and Oneida Lake face increasing pressure from pollution and removing these wetlands in the area will increase the potential for these waterways to become more contaminated and unfit for their current use. The Micron project should not remove any wetlands in the area and should construct is project in a manner that would eliminate any impact on wetlands. Any wetlands that are removed should not be replaced dozens of miles away but instead be replaced as close as possible to the original wetlands.
2. Animal habitats. Several animal habitats for endangered and threatened species are at risk. The DEIS does not propose very much to ensure that equal or better habitat will be provided for these animals. Endangering them further would be a great act of negligence.
3. Parking lots. The project proposes massive parking areas that are seas of asphalt and concrete creating new impervious surfaces. These parking areas do not maximize the space appropriately and should be reduced in size or consolidated into some kind of parking garage. The parking lots will only increase runoff of water and increase flooding in the area. A smaller footprint for the parking lots would reduce these impacts as well as using certain pervious materials or construction to ensure proper drainage.
4. Solar and wind energy. The DEIS does not include much information on renewable energy. The roof of the fabrication facilities could include solar panels and micro-wind turbines to efficiently generate energy onsite and reduce the reliance on external energy sources.

5. The project would result in millions of pounds of waste being produced each year, much of which would be released into the air or water. The project should seek to use biodegradable chemicals and not use “forever chemicals” like PFAs that cannot be reliably removed from wastewater treatment plants. Micron should not take any proprietary exemptions from releasing the names and types of chemicals used on site. The safety of nearby residents and the environment is at risk if first responders do not know what chemicals are being stored on site. Further, the project will be receiving billions of dollars from taxpayer subsidies. Thus, the project should not do anything to risk or harm the nearby community. The least the project developers and owners of Micron could do is ensure that everyone knows what chemicals are being released on site or being stored to ensure the safety of the community. Harmful pollution releases will occur, so planning for that response and reducing the pollution to the maximum level possible should be required. Achieving minimum source reduction of pollution is unacceptable for a project that is receiving public tax dollars.

To summarize, the project in its current form will destroy wetlands, pollute our local waterways, increase risk of flooding, and harm the community’s overall health. The DEIS does not adequately address these concerns given that the project is receiving so much tax-payer support. For these reasons, I think the DEIS needs to be revised for this project. I hope you take my comments into consideration.

Respectfully,

Dustin T. Hill

**Subject:** [EXTERNAL] Micron swamps

**Importance:** Normal

**Sensitivity:** None

---

I am concerned about the lack of information that was provided about swamp land that is being created in Oswego County. There were no meetings in Oswego County and no information was distributed by the county or town of Hastings. I feel these swamp lands should have been created in the county that Micron is in. Cicero swamp is nearby to Micron and I'm sure that could have been increased in size.

I live right next to Buxton Creek and I would like to know who will be monitoring the mosquitoes that will be multiplying in these swamps? With Triple E already present in the mosquitoes in Central Square this is going to be a problem. Also the herbicides that will be used in the creation of the Caughdenoy and Buxton Creeks swamps will be draining into the Oneida River.

RE: Micron Semiconductor Manufacturing Project, Clay, New York  
NYSDOT Comments on Draft Environmental Impact Statement

Dear Mr. Petrovich:

Thank you for the opportunity to comment on the Micron Semiconductor Manufacturing Project Draft Environmental Impact Statement (DEIS).

The New York State Department of Transportation (NYSDOT) acknowledges the assessment in the DEIS of potential transportation improvements on state-owned roadways and the recommendations to mitigate the traffic impacts resulting from the Micron Project as summarized in Section 3.1. As part of a separate environmental review, the NYSDOT, in coordination with FHWA, will further study the improvements that are needed to the state transportation network. To preserve transparency in this process, the NYSDOT would like to note that the improvements studied in this separate review may differ from what is presented in the Micron DEIS.

The NYSDOT appreciates the coordination to date and will continue to work with the Onondaga County Industrial Development Agency as the Micron Project progresses. If you have any questions or would like to further discuss these comments, please contact me at 518-457-8327 or [Stephanie.Winkelhake@dot.ny.gov](mailto:Stephanie.Winkelhake@dot.ny.gov) [OR please contact Catherine Leslie at 518-485-9449 or [Catherine.Leslie@dot.ny.gov](mailto:Catherine.Leslie@dot.ny.gov)].

Sincerely,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 (The public hearing commenced at 10:02  
3 a.m.)

4 MR. PETROVICH: Good morning. This is  
5 the morning session public hearing on the NEPA-SEQRA,  
6 Draft Environmental Impact Statement and Clean Water  
7 Act Section 404 Permit relative to the Micron  
8 Semiconductor Manufacturing Project in Clay, New  
9 York.

10 Good morning. Thank you for coming.  
11 Before we get started with this session, I wanted to  
12 take care of some preliminary safety matters.

13 Please note the exits are plainly  
14 marked at the back of the auditorium, and restrooms  
15 are located just outside, in the lobby in case those  
16 are needed. Please note that in case of emergency,  
17 we have law enforcement and security personnel  
18 present on site.

19 We also have American Sign Language  
20 and Spanish Language interpreters, so if you need  
21 those services they're down in front here, and they  
22 will be happy and glad to accommodate you in those  
23 needs. I'm Robert Petrovich. I am the executive  
24 director of the Onondaga County Industrial  
25 Development Agency or OCIDA.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 I'm here along with OCIDA's legal  
3 counsel, Jeff Davis from Barclay Damon, who will be  
4 moderating this public hearing. This is a  
5 prescriptive process, so I have prepared remarks that  
6 I'm going to read to make sure that we dot all the  
7 I's and cross all the t's.

8 Seated with me at this head table is  
9 Mr. David Frenkel, who is the director of the  
10 Environmental Division of the CHIPS Program Office or  
11 C.P.O., which is part of the Department of Commerce.  
12 Mr. Frenkel will also be making brief opening remarks  
13 shortly.

14 I would also like to introduce  
15 Lieutenant Colonel Robert Burnham, Commander of the  
16 Buffalo District of the U.S. Army Corps of Engineers.  
17 Mr. Colonel Burnham will be making opening remarks as  
18 well.

19 And -- and also seated at the table is  
20 Marty Wargo, Chief of the Buffalo District Regulatory  
21 Branch. The purpose of today's hearing is to give  
22 members of the public an opportunity to provide  
23 verbal comments on the environmental review of  
24 Micron's proposed semiconductor manufacturing project  
25 and connected actions, which OCIDA and C.P.O. are

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 jointly conducting under the New York State  
3 Environmental Quality Review Act or SEQRA, and the  
4 National Environmental Policy Act or NEPA.

5 As well as to provide comments on the  
6 review of Micron's proposed impacts to waters of the  
7 United State under Section 404 of the Clean Water  
8 Act, which is being conducted by the Army Corps of  
9 Engineers.

10 OCIDA and C.P.O. released the draft  
11 Environmental Impact Statement, or E.I.S., for the  
12 Micron project on June 25, 2025. The Army Corps of  
13 Engineers issued the public notice of Micron's permit  
14 application under Section 404 of the Clean Water Act  
15 on June 27, 2025.

16 Information on how to provide written  
17 comments on either the draft E.I.S. or the Section  
18 404 review is displayed on alternating slides in the  
19 front of the room.

20 With respect to the SEQRA process  
21 today, most of you in attendance are familiar with  
22 the proposed project, however, I would like to  
23 provide a brief review of what has occurred thus far  
24 in the environmental review process.

25 On July 14, 2023, OCIDA received an

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 application for financial assistance from Micron semi  
3 -- New York Semiconductor Manufacturing, LLC. As  
4 most of you are aware, Micron intends to invest  
5 approximately one hundred billion dollars over the  
6 next twenty years to build a leading edge  
7 semiconductor manufacturing campus in the town of  
8 Clay at the expanded White Pine Commerce Park located  
9 at 5171 Route 31, the town of Clay, New York.

10 The proposed project must be reviewed  
11 under SEQRA in accordance with requirements of SEQRA  
12 on September 14, 2023, OCIDA declared itself as the  
13 lead agency of the SEQRA process.

14 OCIDA issued a positive declaration  
15 due to the project's potential to result in one or  
16 more significant adverse impacts and declared its  
17 intent to prepare a draft environmental impact  
18 statement.

19 OCIDA then undertook the next step,  
20 which was scoping. Scoping is a process that  
21 develops a written document, scope, which outlines  
22 the topics and analysis of potential environmental  
23 impacts to be studied and addressed in the draft  
24 E.I.S.

25 Following public comment, OCIDA

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 adopted the final SEQRA scope on December 14, 2023.  
3 The public was also previously given an opportunity  
4 to comment on the scope for this project in March  
5 2024.

6 Following adoption of the final SEQRA  
7 scope, OCIDA engage with C.P.O. and others to begin  
8 the process of drafting the E.I.S., which evaluates  
9 the potential environmental effects of the proposed  
10 project.

11 During development of the draft  
12 E.I.S., OCIDA regularly consulted with other SEQRA  
13 involved and interested agencies including the New  
14 York State Department of Environmental Conservation,  
15 and the New York State Department of Transportation  
16 to ensure that all environmental impacts were  
17 identified and fully evaluated in the draft E.I.S.

18 On June 25, 2025, OCIDA determined  
19 that the draft E.I.S. was complete for commencement  
20 of the public review pursuant to SEQRA and opened the  
21 public comment period.

22 The purpose of this morning session,  
23 and we will be having two other sessions throughout  
24 the day, is for the public hearing to receive  
25 comments on the draft E.I.S., as well as, for the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Section 404, which Colonel Burnham will outline  
3 shortly.

4 Please note, this is not a question  
5 and answer session. We will not respond or reply to  
6 comments expressed by the public during this hearing.  
7 We will likewise not respond to any questions posed  
8 by the public during this hearing.

9 OCIDA and C.P.O. will respond to all  
10 comments as part of the final E.I.S. This is an  
11 opportunity for the public to place their comments on  
12 the draft E.I.S. under Section 404 review on the  
13 record. OCIDA encourages the public to participate  
14 in this process.

15 This is your opportunity to have your  
16 voice heard. However, this hearing is not your only  
17 opportunity to submit comments on the draft E.I.S. or  
18 the 404 review. If you do not wish to make a comment  
19 here at this hearing, you may also submit your  
20 comments on the draft E.I.S. or the 404 review, which  
21 Colonel Burnham will address shortly using the  
22 information displayed on the alternate -- alternating  
23 slides in this room.

24 We have extra copies of notices on how  
25 to comment available for you if you wish to make a

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 copy. The OCIDA notice and contact information for  
3 submitting comments can also be found on OCIDA's  
4 website.

5 Public comments will be accepted  
6 through August 11, 2025, your input, both verbal  
7 comments received here today and tonight, and all  
8 written comments that are received by OCIDA and  
9 C.P.O. will help OCIDA and C.P.O. prepare a final  
10 E.I.S., which will be released after all comments  
11 have been received and considered.

12 Equal weight is given to both verbal  
13 and written comments, it's an important point. There  
14 is a court reporter here this -- today, throughout  
15 the day who will be making a record of all comments  
16 made. We ask those in attendance to please show  
17 respect for the person that is speaking, even if you  
18 do not agree with the comment.

19 And also, please hold applause or  
20 other noise so that we may take an accurate record of  
21 this proceeding. At this point, I would like to turn  
22 it over to my colleague, David Frenkel from C.P.O.  
23 for his remarks.

24 MR. FRENKEL: Good morning, ladies and  
25 gentlemen. As Bob mentioned, my name is David

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Frenkel. I am the director of the environmental  
3 division for the CHIPS Program Office or C.P.O.,  
4 which is part of the U.S. Department of Commerce.

5 C.P.O. is the lead federal agency for  
6 the environment review of this project under the  
7 National Environmental Policy Act, or NEPA based on  
8 C.P.O.s -- P.C.P.O.s role in providing direct funding  
9 to Micron for its proposed semiconductor  
10 manufacturing facility.

11 When a project requires both a federal  
12 and state environmental review, it is not uncommon  
13 for lead agencies at the federal and state level to  
14 work together to prepare a single comprehensive  
15 document. C.P.O. has been working with OCIDA to  
16 prepare the draft E.I.S. on that basis.

17 The E.I.S. is a joint document under  
18 NEPA and SEQRA. My role today is to accept public  
19 comments as part of the NEPA process on behalf of  
20 C.P.O. and the U.S. Department of Commerce. C.P.O.  
21 also encourages public participation in the process  
22 and welcomes all comments on the draft E.I.S.

23 We will give equal weight to verbal  
24 comments at today's hearing and written comments  
25 submitted to C.P.O. or OCIDA by August 11th. As Bob

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 noted, after the close of public comment period,  
3 C.P.O. and OCIDA will respond to all comments  
4 received when we prepare the final E.I.S. document.

5 While C.P.O. and OCIDA jointly  
6 prepared this E.I.S., because it is a comprehensive  
7 document that identifies the potential environmental  
8 effects on the Micron project, will also serve as a  
9 resource for other agencies conducting their own  
10 review of the Micron Project and other actions  
11 connected to the project.

12 On that note, I would now like to turn  
13 it over to Lieutenant Colonel Burnham for open  
14 remarks from the U.S. Army Corps of Engineers. Thank  
15 you for your attendance today at this public hearing,  
16 and we appreciate your participation in the process.

17 MR. BURNHAM: Thank you. Good  
18 morning, ladies and gentlemen. As previously said,  
19 I'm Lieutenant Colonel Rob Burnham, Commander of the  
20 Buffalo District, U.S. Army Corps of Engineers.

21 I will be the presiding officer for  
22 the -- the Clean Water Act Section 404 aspect of this  
23 public hearing on behalf of the Army Corps of  
24 Engineers. Seated at the desk with me today, to my  
25 right and your left, is Mr. Marty Wargo, chief of the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Buffalo District Regulatory Branch.

3 While the Department of Commerce is  
4 the lead federal agency on the E.I.S. for this  
5 project, the Corps of Engineers is a cooperating  
6 agency on the E.I.S. And we are here to specifically  
7 obtain information and evidence and receive public  
8 comment to assist in the regulatory review of the  
9 permanent application by Micron, New York  
10 semiconductor -- semiconductor.

11 As well as, for two connected actions  
12 proposed by National Grid for a gas main and electric  
13 substation expansion. Because of the Micron and  
14 National Grid project proposed a placement of fill  
15 into federally regulated wetlands and streams,  
16 collectively referred to as the waters of the United  
17 States.

18 Permits are required for the corps of  
19 engineers pursuant to Section 404 of the Clean Water  
20 Act. Department of the Army authorization is  
21 therefore required the following.

22 For the Micron Semiconductor  
23 Manufacturing Campus, the permanent loss of  
24 approximately hundred and ninety-four acres of  
25 federally regulated wetlands, and temporary impacts

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 to an additional two point nine five acres, as well  
3 as, the permanent loss of six thousand two hundred  
4 and eighty-three feet of federally regulated streams  
5 and ditches, and temporary impacts to an additional a  
6 hundred and thirty feet.

7 For the National Grid Substation work,  
8 the permanent -- the permanent impact to  
9 approximately four acres of wetlands, and one  
10 thousand five hundred and forty-five feet of  
11 regulated ditches, as well as, temporary impacts to  
12 an additional eleven acres of wetland, and six eighty  
13 three feet of stream.

14 And for the National Grid, gas main  
15 work, the permanent impact to approximately point  
16 zero eight seven acres of wetland, conversion of  
17 point zero three three -- point zero three three  
18 acres of forested wetlands, and temporary impacts to  
19 approximately seven point four acres of wetlands, and  
20 a hundred and seventy-five linear feet of stream.

21 The purpose for the proposed work is  
22 to -- is to construct and operate commercially viable  
23 and globally competitive advanced D.R. -- DRAM  
24 fabrication facility on a single unified site in New  
25 York State.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 The Corps of Engineers is neither a  
3 proponent for, nor an opponent of the proposed  
4 projects. Our role is to determine whether these  
5 proposed fill activities are contrary to the public  
6 interest or not.

7 This hearing will play an important  
8 part in that determination. The hearing will be  
9 conducted according to the procedure set forth in  
10 Title 33 of the code of Federal Regulations Part 327.  
11 The public comment period for the Corps of Engineers  
12 public notice also closes on August 11th, 2025.

13 Hard copies of the public notice are  
14 available in the registration area. Please note that  
15 there -- there was a typo -- there is a typo in some  
16 copies of the public notice indicating the comment  
17 period closes on August 18th, the correct date is  
18 August 11th.

19 Details on how to comment on the  
20 proposed wetland and stream impacts may be found in  
21 the public notice, as well as, displayed on the  
22 screen in the front of the room, right behind me.

23 The comments made here, plus all  
24 submitted written information will become part of the  
25 Corps of Engineers Section 404 administrative record,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 and will be used to evaluate the probable impacts,  
3 including the cumulative impacts of the proposed  
4 activity on the -- on the public interest.

5 The ultimate decision on the submitted  
6 applications will reflect the national concern for  
7 both the protection and utilization of important  
8 resources. The Corps of Engineers permit decisions  
9 will come after completion of the E.I.S., because we  
10 are also relying upon that for the purposes of NEPA  
11 compliance.

12 Based on the time limitations, if  
13 anyone desires an opportunity for rebuttal to any of  
14 the information presented at the hearing, we ask that  
15 you please do so in writing and provide that to  
16 someone at the registration table today, and it will  
17 become part of the administrative record.

18 General comments may also be submitted  
19 until close of the public comment period. Thank you  
20 and I look forward to -- to hearing your comments  
21 this morning.

22 MR. PETROVICH: Thank you, Lieutenant  
23 Colonel Burnham. I would like to now introduce  
24 OCIDA's counsel, Jeff Davis, who will go over the  
25 process of how we will conduct the hearing. Mr.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Davis.

3 MR. DAVIS: Good morning. Thank you  
4 for coming. If you do wish to make a comment, will  
5 ask that you please state your full name and address  
6 and speak clearly and slowly so that the reporter can  
7 make an accurate record.

8 Comments will be limited to three  
9 minutes to afford everyone who wishes to comment an  
10 opportunity to do so. There will be no ceding of  
11 time to others. If there is time at the end of the  
12 session, speakers may return to the microphone and  
13 will be afforded one additional three-minute  
14 opportunity to speak.

15 We'll call those who have signed up to  
16 submit comments up to the microphone. We have two  
17 microphones at the end of each aisle here to allow as  
18 many people to be heard as possible. I'm going to  
19 announce the names of the speakers and then also the  
20 person that's on deck, if you will, that will be  
21 speaking next so that you can quietly proceed down to  
22 a microphone on either side and be prepared to speak.

23 We ask that you do that so quietly so  
24 you do not interrupt the current speaker. Again, if  
25 you've not signed up to speak, but you wish to do so,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 please complete a comment card in the lobby. I have  
3 those cards here, which are going to allow us to work  
4 through this session.

5 So with that, we're going to kick off  
6 the session and our first speaker is Tonya Eza, and  
7 next would be Beth Lauzon.

8 MS. EZA: Hi, I am Tonya Eza. I -- I  
9 reside at 113 Eagles Point Circle in Liverpool, and I  
10 work for Emmanuel Lutheran Church in Clay. So  
11 Emmanuel Lutheran Church is located about a mile or  
12 two down the road from where Micron's first fabs will  
13 be built.

14 The first impact that we will feel is  
15 the effects from the physical construction that will  
16 be happening. Micron has estimated that up to five  
17 hundred and fifty trucks will be needed every day to  
18 begin their construction.

19 Many of those trucks will be rumbling  
20 by our church building, clogging up traffic and  
21 creating noise as we seek to create a haven of peace  
22 where we can worship God in our church building.

23 The increased traffic will also create  
24 difficulties for our programs, many of which reach  
25 out to feed our local community, including seniors.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 The people to whom we minister will  
3 not want to fight the traffic to get here and will  
4 not be able to access the food and community that  
5 they need. The next impact lies in Micron's need to  
6 widen Route 31 in response to the increased traffic.

7 Our front steps to the church building  
8 are only twenty-five feet away from Route 31. Not  
9 only will widening the road force us to lose at least  
10 part of our historic building, which is over one  
11 hundred years old, but it will also hurt our ability  
12 to worship, and it will also hurt our ability to  
13 minister to the community around us.

14 Furthermore, not knowing when this  
15 roadwork will happen is right now hampering our  
16 ability to plan for major maintenance projects on the  
17 building, which need to be done for the safety of all  
18 who come here.

19 Finally, we are also concerned about  
20 the environmental impacts these fabs will have on us  
21 and on the community around us. With the sewer going  
22 in, we need to know if this will raise or lower our  
23 water table.

24 We already suffer from periodic floods  
25 due to torrential rains. If the water table is

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 raised this will only become worse. We are also  
3 concerned about the potential for harmful PFAS  
4 chemicals and rainwater runoff and what that will do  
5 to our water supply.

6 We need to understand this better so  
7 that we know the risks and what we can do to mitigate  
8 them. Emmanuel is an asset to the community, and  
9 we've been in Clay for over two hundred years. We  
10 host A.A. meetings, we host grief support meetings.

11 We run a food pantry. We run a  
12 monthly senior luncheon where seniors can come and  
13 get a free meal. We offer spiritual support to those  
14 in need. We hold community events for children like  
15 trunk or treat at Halloween and an Easter egg hunt in  
16 the spring.

17 We are afraid that Micron's plans will  
18 remove us from the community when we could be a real  
19 asset to all of the people who are coming to work in  
20 these fabs.

21 We're not here to complain, but we're  
22 here to vocalize our fears and the potential impacts  
23 and to ask Micron, the state of New York, Onondaga  
24 County, and the Town of Clay to work with us so that  
25 we can find a way to remain in the community and

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 continue to be an asset. Thank you.

3 [Applause]

4 MR. DAVIS: Thank you. Next, Beth  
5 Lauzon, and then after Beth would be Sarah Ferguson.

6 MS. LAUZON: Good morning. I'm Beth  
7 Lauzon. I reside both in Camillus and in the town of  
8 Canastota out in Madison County. Two areas that may  
9 possibly be affected by Micron, specifically in  
10 regards to industrial and water waste.

11 My questions basically come from  
12 living here my entire life and seeing what happened  
13 to the previous big employer, Allied Solvay Chemical,  
14 and what they did to Onondaga Lake and the Town of  
15 Camillus and their industrial waste sites.

16 I live -- actually, I live -- I grew  
17 up in a house that actually was on and owed  
18 industrial waste that from Allied Chemical and I saw  
19 the cancers coming from that. But that's that,  
20 Allied's gone, Honeywell is doing what they do.

21 And I want to make sure we don't do  
22 that with Micron. This is going on for forty to a  
23 hundred years. Do not come in destroy the  
24 environment, and take off. So my questions,  
25 specifically regarding industrial waste that will be

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 generated by Micron for decades -- decades is for the  
3 draft.

4 I understand it's a draft, nothing was  
5 really specific in there. So I expect to see the  
6 specific report, a detailed list of the chemicals  
7 that are going to be dispersed in Lake Ontario per  
8 the draft report.

9 How does the disbursement take place,  
10 who does the monitoring and how often? Are you just  
11 going to dump it and say goodbye to you, or is  
12 somebody actually going to see what's going to happen  
13 when it's dumped? Second, the mixing zone in the  
14 Onondaga River.

15 More detailed information is required  
16 in how that works, how large it is, where it is  
17 located, and a list of chemicals dispersed. Why the  
18 chemicals are allowed to be higher than New York  
19 State allows, that should all be detailed out in the  
20 final report.

21 And third and final, a detailed list  
22 of industrial waste that is going into local  
23 landfills because I know it will, because that's what  
24 they're going to do, they done before, they'll do it  
25 again. And specifically, because like I said, I do

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 have a house in Canastota, the Madison County  
3 Landfill.

4 Those are my questions, concerns, they  
5 have to be addressed, we'd like to see addressed in  
6 the final report. And let's do this, let's do it  
7 right from the get go. Our grandchildren, our  
8 children, our great grandchildren, and our great,  
9 great grandchildren are going to be dealing with this  
10 mess.

11 If we mess it up now, we're never  
12 going to be able to live this down ever. Thank you.

13 [Applause]

14 MR. DAVIS: Thank you. Sarah  
15 Ferguson, and then after that is Hillary McManus.

16 MS. FERGURSON: Sarah Ferguson, 308  
17 Catherine Street in North Syracuse. I am a thirty-  
18 year resident of the Clay area. I am also a  
19 seventeen-year member of the Operating Engineers  
20 Local 158. Our local represents four thousand union  
21 members in the Upstate New York area.

22 My position with the local is  
23 overseeing all the apprentices as the training fund  
24 coordinator. The opportunities provided by the  
25 Micron Project will help our local community not only

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 with the construction jobs for our members, but  
3 careers for our apprentices.

4 It will also create jobs for our  
5 neighbors in this community, I support this project.

6 MR. DAVIS: Thank you. Next, Hillary  
7 McManus, and after Hillary is Bill Pelkey.

8 MS. MCMANUS: Good morning, I'm Dr.  
9 Hilary McManus, professor of Biological and  
10 Environmental Sciences, and I live in Fayetteville,  
11 New York. Thank you for hearing us today. I'd like  
12 to address that close to three hundred acres of  
13 identified wetlands will be destroyed and filled with  
14 the Micron construction.

15 Wetlands are powerful natural allies  
16 in the fight against climate change. Just three  
17 hundred acres of freshwater wetlands can store over  
18 three hundred thousand metric tons of carbon dioxide.  
19 That's the same as the annual emissions from sixty-  
20 six thousand cars.

21 When wetlands are destroyed, that  
22 carbon is released into the atmosphere and the land  
23 loses its ability to store carbon in the future.  
24 Even more concerning is disturbing these wetlands can  
25 also release methane, a greenhouse gas many times

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 more potent than carbon dioxide.

3 And these emissions are not fully  
4 accounted for in Micron's environmental review. And  
5 it's not just about the emissions, wetlands and hot  
6 water streams move nutrients, sediments, and tiny  
7 organisms that keep entire ecosystems healthy.

8 If we remove them, we disrupt food  
9 webs, species balance, and water quality.  
10 Construction activities like clearing vegetation can  
11 heat up nearby streams beyond the tolerance of cold-  
12 water fish and macroinvertebrates.

13 Soil erosion and runoff from disturbed  
14 land can cause harmful algal blooms, releasing  
15 toxins, depleting oxygen in the water, and kill fish.  
16 That also opens the door for invasive species to  
17 spread. These impacts are not fully addressed in the  
18 D.E.I.S. and are lacking in mitigation proposals.

19 There is also more. Amphibians and  
20 reptiles, such as frogs, salamanders, and turtles are  
21 not mobile enough to escape heavy machinery, and this  
22 is stated in the D.E.I.S. and just said, they'll die.

23 The result is mass mortality during  
24 construction, even animals nearby will suffer from  
25 the noise, the lighting, and the changes in the water

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 quality. These impacts are not fully addressed in  
3 the D.E.I.S., and mitigation measures are lacking.

4 I would like to close with just saying  
5 that this isn't just a loss of land, it is a loss of  
6 climate resilience of biodiversity, and of a living  
7 system that protects us all. Thank you.

8 [Applause]

9 MR. DAVIS: Thank you. If I could ask  
10 everyone to please turn your cell phones to off or  
11 mute -- mute them, please, so they don't interfere  
12 with the speakers, thank you. All right. Bill  
13 Pelkey, and after that is Jim D'Agostino.

14 MR. PELKEY: Yeah, good morning. My  
15 name is Bill Pelkey. I live at 4987 Burbank Road.  
16 Seems to be we got this information a couple of weeks  
17 ago from the -- was it corporate engineers. And  
18 apparently, where the substation is going to be for  
19 National Grid, our house sits right in the center of  
20 it.

21 So I -- I just wanted to ask a  
22 question, where does that leave my wife and I, that  
23 we've -- we've lived there for forty-three years, but  
24 as the match -- the way the map looks, we're right in  
25 the center of it. Thank you.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 [Applause]

3 MR. DAVIS: Thank you. Jim  
4 D'Agostino, and after that will be Pat Schaefer.

5 MR. D'AGOSTINO: Good morning,  
6 everyone. My name's Jim D'Agostino. I'm a resident  
7 of Baldwinsville. And I'm the C.E.O. of the Central  
8 New York Technology Development Organization,  
9 otherwise known as T.D.O.

10 We're the local manufacturing  
11 extension partnership center based here in Liverpool,  
12 and we provide technical consulting services and  
13 training across the five county Central New York  
14 region.

15 I'd like to take a moment to express  
16 my personal and professional support for Micron in  
17 their project in Clay, New York. This isn't just a  
18 game changer for the state and for the region, but  
19 also a tremendous opportunity for our local  
20 manufacturing community, as well as, for T.D.O.

21 Micron's investment represents one of  
22 the largest semiconductor projects in U.S. history,  
23 and it's happening right here in Central New York.  
24 This isn't just about one company. It's about a  
25 complete transformation of the regional supply chain,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 workforce, and innovation ecosystem.

3 At T.D.O. we exist to support small to  
4 mid-sized manufacturers, Micron's arrival will create  
5 incredible demand for high quality reliable suppliers  
6 right here in our backyard.

7 With the right support and  
8 development, our local manufacturers are perfectly  
9 positioned to become key players in Micron's robust  
10 supply chain, delivering precision parts, automation,  
11 packaging, clean room support, auxiliary services,  
12 and much more.

13 Having personally worked at New  
14 Process Gear years ago, I've had a front row seat for  
15 the exodus of good paying manufacturing jobs in  
16 Central New York.

17 Micron's investment is a turning of  
18 the tides. They're planting a flag right here, and  
19 it's going to continue to attract national and global  
20 attention.

21 With regional support and help from  
22 companies like T.D.O., local manufacturers won't just  
23 benefit from this moment, they'll lead it. This is  
24 why T.D.O. supports Micron's Project in Clay, New  
25 York. Thank you.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 [Applause]

3 MR. DAVIS: Thank you. Next is Pat  
4 Schaefer, and after Pat is Dave Caprio.

5 MS. SCHAEFER: Hi, I'm Pat Schaefer at  
6 7225 Myers Road in Syracuse. I wanted to follow up  
7 with what the lady said about the swamps and the  
8 water lands.

9 Paving those over or removing them,  
10 you can't expect all the organisms to pack their  
11 suitcases and move elsewhere. Even if you give them  
12 wetlands someplace else, you're destroying whatever  
13 is there. They are main carbon storage areas and we  
14 should be really careful about how we mess with the  
15 environment.

16 They want to remove the bats. There's  
17 news lately about infectious mosquitoes. We need  
18 every bat we can get. And for Micron to just come  
19 and level the -- the area and pollute the area, we  
20 need to be really careful about what we do to the  
21 land.

22 And that's a lot of wetland and stream  
23 to mess with, and it is federally regulated, so there  
24 should be a reason why it's regulated. I think that  
25 Micron should reformulate its campus and leave those

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 areas alone. That's all I have to say.

3 [Applause]

4 MR. DAVIS: Thank you. Dave Caprio,  
5 and after that is Paul Ossenbruggen. Apologies if  
6 I'm mispronouncing the names.

7 MR. CAPRIO: Hi, good morning. My  
8 name is David Caprio. I'm a Town Of Clay counselor  
9 here in Clay. And this may not be the -- a question,  
10 like that most people would ask, but I have a  
11 concern. And it's more not the -- about the  
12 statement here, but it's more directed to OCIDA.

13 And when I ran for Town of Clay board  
14 last year, I promised everyone, my big thing was  
15 transparency and things like this. I think Micron is  
16 a great opportunity, and I'm looking forward to it.

17 But my question, this is more to OCIDA  
18 is that, they want to have a pilot agreement for a  
19 hotel coming here in the town of Clay, payment in  
20 lieu of taxes. And I told everybody when I ran that  
21 I want to make sure that when Micron comes it  
22 benefits everybody.

23 The citizens of Clay and everything  
24 like that, not just the big businesses and things  
25 coming in. But there is no reason a hotel we've been

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 hearing for years that we need more hotels in this  
3 area, on Onondaga County.

4 There's no reason OCIDA should be  
5 wanting a payment in lieu of taxes for a hotel. I  
6 could see it if it was a business bringing people to  
7 work and everything in here, but it's just going to  
8 set us slippery slope, I don't believe we've done it  
9 before ever for a hotel.

10 And I just want to make sure that when  
11 everything does come here, businesses and things,  
12 because of Micron, that it benefits everybody. And  
13 not just some certain business owners like a  
14 multinational corporation that wants to build a hotel  
15 here and where they're awarded, something a pilot  
16 agreement when I don't believe it's necessary.

17 Many of my constituents do not believe  
18 so. The other board members do not. And most of the  
19 residents of Clay have brought this up to, everybody  
20 thinks it's a crazy idea, so I'm just letting you  
21 know I do not support that whatsoever, and I've  
22 talked to Ryan McMahon about it.

23 He supports it, I do not, and I just  
24 think it's a -- a crazy idea. So I apologize, this  
25 was a little bit out of ordinary here, but I just

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 wanted OCIDA to know that most -- everybody disagrees  
3 with it except you guys who support it, so thank you.

4 [Applause]

5 MR. DAVIS: Thank you. Next is Paul  
6 Ossenbruggen --

7 MR. OSSENBRUGGEN: Ossenbruggen.

8 MR. DAVIS: Ossenbruggen, and after  
9 that is Sue Gately.

10 MR. OSSENBRUGGEN: I'm Paul  
11 Ossenbruggen. I live in Clay at 4993 Greenberry  
12 Drive. I misinterpreted what I was told at the desk,  
13 my comment is most appropriate be put in as an email,  
14 not as a -- a statement.

15 MR. DAVIS: That's fine.

16 MR. OSSENBRUGGEN: Is that alright?  
17 Thank you.

18 MR. DAVIS: Thank you. Okay. Next is  
19 Sue, and after that is Dan Larson.

20 MS. GATELY: Sue Gately, Sterling, New  
21 York. I'm echoing some of the things that have  
22 already been said. I am concerned about storm water  
23 runoff, if the area really is a six hundred plus  
24 acres and given the expected increase in extreme  
25 weather events, including intense downpours that we

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 can expect in the near future from climate change.

3 This presents real potential for  
4 flooding, erosion, and a lot of damage to the water  
5 quality downstream. Wetland loss also poses more  
6 potential groundwater depletion risk, and it seems  
7 inevitable that our electricity rates for the general  
8 public are going to be going up.

9 Wastewater discharge is a concern,  
10 it's not very far from the drinking water intake for  
11 OCWA up on Lake Ontario, so is the waste that's going  
12 to be discharged from secondary development  
13 associated with the plant.

14 Wastewater and spills are inevitable.  
15 The plant is apparently located in an area of geology  
16 known as karstic or karst. This poses special  
17 contamination of ground water risk, maybe even  
18 potential subsidence issues, and that should be a  
19 concern in any construction area activity.

20 Contamination can move fast and far in  
21 a karstic aquifer. It can move thousands of feet in  
22 a few hours. So please, one more last comment  
23 quickly, I believe the wetland mitigation appears to  
24 be inadequate, fragmented, and just not up to the  
25 job. Thank you.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 [Applause]

3 MR. DAVIS: Thank you. Dan Larson.

4 After Dan is Karen Haas.

5 MR. LARSON: Dan Larson, 498 Main  
6 Street, Sterling. For millennia, humans have banded  
7 together for mutual support and protection. From  
8 that communal urge, we have developed governments  
9 whose main purpose, whatever other purposes they may  
10 serve, is to protect our constituents from harm.

11 Fostering commercial and economic  
12 growth while important must be secondary to ensuring  
13 the health and safety of the population you serve.

14 To allow a commercial enterprise like  
15 Micron to dump unidentified or unknown toxins in  
16 unspecified quantities with unproven and  
17 underdeveloped treatment technologies into our  
18 groundwater supply is a serious abdication of  
19 governmental responsibilities.

20 Micron's D.E.I.S. says that they will  
21 treat their wastewater with state of the art  
22 technology for removing so called forever chemicals,  
23 PFAS and PFAS. However, there is no known technology  
24 that will remove those chemicals on an industrial  
25 scale.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 Further, as Professor Niblett pointed  
3 out in her letter to syracuse.com, Micron does not  
4 address how their development or the company surge in  
5 urban growth will raise downstream flooding risk.

6 Micron provides vague promises about  
7 adaptive storm water management, but does not provide  
8 any detailed or specific plans to mitigate downstream  
9 flooding. In short, as several have pointed out or  
10 will point out today, the Micron D.E.S. in its  
11 current form is woefully inadequate to support your  
12 civic oversight responsibilities.

13 Those who say we haven't missed  
14 anything are sadly mistaken. I only ask that you  
15 finish the E.I.S. you've started. Thank you.

16 [Applause]

17 MR. DAVIS: Thank you. Next is Karen  
18 Haas, and then Gwendolyn Muok.

19 MS. HAAS: Hello, I'm Karen Haas. I  
20 reside in Sterling and I represent an organization  
21 called Sterling Water Stewards. We are a grassroots  
22 organization. Primarily our mission is to protect  
23 drinking water.

24 The semiconductor industry uses  
25 forever chemicals, PFAS, and many other hazardous

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 chemicals. Chemicals released into ground or surface  
3 waters have the potential to pollute drinking water  
4 and groundwater, aquifers, streams, and Lake Ontario.

5 PFAS type chemicals are very toxic and  
6 they don't break down. They can cause a variety of  
7 health problems, and they're essential to micro --  
8 microchip manufacture. Their use in microchip plants  
9 is essentially unregulated in New York State at this  
10 point.

11 Work on federal regulation of  
12 microchip facilities has been halted under the  
13 current administration. Micron's D.E.I.S.  
14 acknowledges that wastewater could contain PFAS, but  
15 provides no information on the types or amounts of  
16 PFAS that will likely be present.

17 Micron boldly asserts that the Micron  
18 facility and the plant knew oak orchard treatment --  
19 industrial treatment plant, which Onondaga County  
20 plans to build for Micron will use the latest  
21 advanced treatment technologies, which they list, but  
22 they provide no details on which will be used how.

23 And that they will comply with their  
24 respective Clean Water Act permits. Based on a  
25 promise of permit compliance, Micron asserts that its

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 wastewater discharges will have no significant  
3 environmental impact.

4           Whereas it's a known fact that this  
5 industry, one out of ten PFAS manufacturing plants  
6 has incidence of -- of -- of contamination of  
7 wastewater. Onondaga County's recently constructed  
8 facility to process wastewater sludge is currently  
9 not operating due to toxic air conditions.

10           The county has agreed to design and  
11 build the pretreatment facility for Micron. If  
12 Onondaga County cannot competently build and operate  
13 a facility to process ordinary wastewater into  
14 sludge. How can we trust it to build a pretreatment  
15 facility that will eliminate PFAS and other harmful  
16 chemicals.

17           While there are innovative  
18 technologies that can remove PFAS from wastewater  
19 streams, none of them have ever been deployed at an  
20 industrial scale.

21           Unless Micron can just demonstrate  
22 otherwise, the D.E.I.S. should assume -- the final  
23 E.I.S. should assume that all or a percentage based  
24 on past experience in existing plants --

25           MR. DAVIS: Ten seconds, Karen.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MS. HAAS: -- of PFAS will escape  
3 detection or capture by any industrial wastewater  
4 treatment plant and assess the impacts of its  
5 discharge into the environment.

6 MR. DAVIS: Thank you. Gwendolyn is  
7 next, and then Ben Sio.

8 MS. MUOK: Good morning, I'm Gwendolyn  
9 Muok, president of the Syracuse Onondaga N.A.A.C.P.  
10 The National Association for the Advancement of  
11 Colored People has reviewed the Micron semi --  
12 Semiconductor Manufacturing Project Clay, New York,  
13 draft environmental impact statement.

14 Our review focuses on the project's  
15 potential implications for environmental justice and  
16 the well-being of all communities, particularly those  
17 identified as disadvantaged minority or low income.  
18 There are specific areas of interest and  
19 recommendations that we have, housing affordability  
20 and indirect displacement.

21 The E.I.S. identifies a potential  
22 short term significant adverse effect on housing due  
23 to induced growth, specifically the risk of increased  
24 rents and property values in communities within the  
25 local study area, such as the low-income community in

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Brewerton.

3 Although the E.I.S. states that  
4 planned housing projects in Micron's coordination  
5 with stakeholders are expected to mitigate this, the  
6 N.A.A.C.P. demands concrete, measurable commitments  
7 to support and expand affordable housing initiatives  
8 to prevent indirect displacement for existing  
9 residents.

10 Transparent plans outlining how Micron  
11 and local agencies will ensure adequate affordable  
12 housing options are available are essential to  
13 prevent displacement of vulnerable populations.

14 Water resources and indigenous  
15 concerns, we note the concerns raised by the Onondaga  
16 Nation regarding fish and water quality in Onondaga  
17 Lake, Lake Ontario, and the Oneida River.

18 While the E.I.S. states that the  
19 preferred action alternative would not result in  
20 significant adverse impacts on water quality or  
21 aquatic life, and proposes mitigation measures such  
22 as a wetland mitigation plan and storm water best  
23 management practices.

24 The unavoidable permanent loss of  
25 approximately one hundred ninety-three point thirty-

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 eight acres of federal jurisdictional wetlands, and  
3 ten point five acres of non jurisdictional wetlands  
4 is a significant environmental impact.

5 We urge continuous transparent  
6 monitoring of water quality and the effectiveness of  
7 all mitigation efforts with active involvement and  
8 affected communities including indigenous nations in  
9 the oversight process.

10 Beneficial effects and community  
11 investment fund, we acknowledge the projects --

12 MR. DAVIS: Ten second, Gwendolyn.

13 MS. MUOK: -- beneficial effects and  
14 we would demand transparency in the allocation and  
15 impact of these funds.

16 [Applause]

17 MR. DAVIS: Thank you. Next is Ben  
18 and after Ben is Susan Crossett.

19 MR. SIO: You don't want to try and  
20 pronounce my last name?

21 MR. DAVIS: Sio.

22 MR. SIO: You're pretty good.

23 MR. DAVIS: Thank you.

24 MR. SIO: Not bad. Hi, I'm Ben Sio,  
25 I'm with Center State C.E.O., we are a Regional

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Chamber of Commerce and Economic Development  
3 Organization here in Central New York. You'll hear  
4 from a number of companies and community partners  
5 today speaking about their excitement with the  
6 project.

7 I have two brief messages for you and  
8 for the folks in this room. And the first one is  
9 hope, right? Central New York has been beaten down a  
10 lot. Upstate New York has been beaten down a lot, we  
11 don't always win.

12 And the idea that we have the  
13 opportunity to win here with the Micron Project is  
14 massive. I was, yesterday morning, with the Deputy  
15 Mayor in Downtown Syracuse at an M.W.B.E. forum.  
16 There are over two hundred individuals, mostly from  
17 minority women owned businesses, who want to work in  
18 the Micron Project attending that session.

19 They're excited about it. They see  
20 opportunity for them. They see opportunity to build  
21 wealth for them and for their employees. We need to  
22 make sure that happens. Also, I was at a bank last  
23 night talking with their board about the project.

24 And there was skepticism about whether  
25 or not it happened, it happened on time, but there

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 was also excitement. The bank wanted to win. The  
3 bank wanted to bring more capital into the market,  
4 and the bank wanted to support the businesses and we  
5 know will hire because of this.

6 So hope, let's not forget that this  
7 project has given our community, all of you, even if  
8 there are concerns, hope and what we can do in  
9 Upstate New York.

10 The second message I want to deliver,  
11 and this is something that was in the paper this  
12 morning with a letter to the editor signed by over a  
13 hundred business members and nonprofit members, that  
14 Central New York is the best place in the country to  
15 build these four fabs.

16 I'll say that again, we are the best  
17 place in the country to build these four fabs. We  
18 have the best environmental regulations that we're  
19 talking about a lot today to make sure that this  
20 project is done well.

21 We have the coalitions that have  
22 already come together to be in training individuals  
23 to work in these fabs. We have the community  
24 investment framework that was mentioned earlier that  
25 will invest in mitigating negative impacts from this

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 work and accelerating positive things coming out of  
3 this.

4 I have two kids. I grew up in Central  
5 New York. I want my kids to stay in Central New  
6 York. I want them to be excited, not just about what  
7 dad goes to work on every single day, but that they  
8 see opportunity for themselves when they get old or  
9 older, let's say.

10 When they get older and -- and  
11 graduate, I want them to stay, I want our kids to  
12 stay, and I want their kids to stay. So I'm happy to  
13 offer our support. And please let us know if we can  
14 do anything else to continue that support. Thank  
15 you.

16 [Applause]

17 MR. DAVIS: Thank you. Next is Susan  
18 Crossett, after Susan is Greg Lancette.

19 MS. CROSSETTE: Hi, I'm -- I'm kind of  
20 short. Good morning, I'm Susan Crossett. I'm the  
21 C.E.O. and owner of Sapphire Recruitment here in,  
22 Central New York. A thirty-five year old business  
23 working to develop talent and match that great talent  
24 with our employers.

25 This morning I'd like to comment a

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 little bit on -- on the project and as you know, I  
3 think everybody's experiencing, Central New York is  
4 in experiencing a bit of a renaissance. One that  
5 many of us had hoped for, but many were skeptical  
6 would it even come.

7 What was once a very vibrant  
8 industrial region with good paying jobs at companies  
9 like General Electric, Smith Corona, Syracuse China,  
10 and others became another rust belt region with more  
11 jobs in health care than any other industry.

12 Our local leaders really worked  
13 tirelessly to attract new investment that would  
14 create jobs and provide opportunities for our  
15 residents and keep our young people here as Ben said  
16 earlier.

17 The White Pine Commerce Park in Clay  
18 was an ideal site for that development. The county  
19 had a vision for that site. One that meant taking  
20 the long view of what might be possible and  
21 developing a strategy to attract companies in the  
22 semiconductor industry.

23 They certainly had their setbacks. It  
24 was discouraging to lose opportunities to other  
25 regions and other states when we had the necessary

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 resources, including an educated workforce, top  
3 universities and colleges, electric and gas  
4 infrastructure with exceptional power quality and  
5 excess capacity, water and land needed for industrial  
6 -- for the semiconductor industry.

7           When Micron announced their plans to  
8 build a state-of-the-art dynamic random access memory  
9 semiconductor manufacturing facility here, that's a  
10 mouthful, our future really began to brighten.  
11 Micron was exactly the right partner that our region  
12 wanted to realize our vision with.

13           New York State has long been the  
14 leader of protecting our environment. It is part of  
15 who we are. It is part of something we should all be  
16 proud of. Our environmental laws and regulations  
17 have often been used against us by other states  
18 trying to attract business.

19           Micron was not deterred. The CHIPS  
20 office and OCIDA prepared to draft environmental  
21 statement to evaluate all the potential impacts, and  
22 they included state and federal agencies and all  
23 interested parties along with a number of public  
24 hearings.

25           More than twenty, actually,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 participated in the process. They studied the impact  
3 of the project on a long list of areas, including  
4 water quality and resources, land use, air quality,  
5 climate, solid waste, human health safety, utility  
6 infrastructure, transportation noise, environmental -  
7 -

8 MR. DAVIS: Ten seconds.

9 MS. CROSSETTE: -- and other issues.  
10 The Micron Project will generate approximately nine  
11 thousand jobs, and forty thousand additional jobs.  
12 That's what we need. Thanks.

13 [Applause]

14 MR. DAVIS: Thank you. Next is Greg  
15 Lancette, and then Jeff Norensky.

16 MR. LANCETTE: Good morning. I stand  
17 here today as the president of the Central and  
18 Northern New York Building and Construction Trades  
19 Council president representing almost ten thousand  
20 workers in the region.

21 A few years ago, when Micron announced  
22 that they chose our site, of course everybody was  
23 ecstatic and elated with that. But what that meant  
24 to us is the community with hard hats, with tools in  
25 their hands, is that we have decades of opportunities

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 for not only our current members, but also our future  
3 members for the next generations to come to learn,  
4 work, stay, and play in Central New York.

5 In our industry, the jobs don't always  
6 get built in your backyard or in your community. I  
7 had raised my family in the town of Clay. Our  
8 children graduated from Cicero, North Syracuse High  
9 School.

10 We still have one in school that's on  
11 that path to have this opportunity where trades and  
12 craft workers of today and tomorrow will not have to  
13 go hundreds of miles away from home to earn a  
14 paycheck and maintain their health insurance, to work  
15 on a cutting edge, global leading advanced  
16 manufacturing technology.

17 Not only the sector, but the  
18 technology that is being brought and engineered into  
19 these fabs are industry leading world class. So, we  
20 are talking about STEM and STEAM, C.T.E. programs in  
21 the educational world, all of that -- that Micron  
22 opportunity that we support that brings a tangible,  
23 relatable, touchable project where you can apply all  
24 of the science technology, the engineering and  
25 everything else.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2                   There has been hundreds of people  
3 working for the last couple of years on the scaling,  
4 the preparation of our training programs, of our  
5 recruitment cycles with our community partners.

6                   It is a grander scale of what the  
7 building trades has been doing leading up to the  
8 replacement of Interstate 81, where there are  
9 community partners, community opportunities.

10                   And there is quite a cohesive group  
11 with our community where people that are having  
12 opportunities to work in the construction industry  
13 from the neighborhood where the project is.

14                   This is just a continuation of that,  
15 where our community has an opportunity, where our  
16 children can grow up, educate, work, and stay in  
17 Central New York instead of the continuous out  
18 migration that we have been in -- in this community  
19 for the last three decades.

20                   This is an opportunity where so many  
21 earners of wages --

22                   MR. DAVIS: Ten seconds.

23                   MR. LANCETTE: -- there is going to be  
24 a lot of first time opportunities for generational  
25 wealth and work opportunities in a community that

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 does not have many. Thank you.

3 [Applause]

4 MR. DAVIS: Thank you. Next is Jeff  
5 Norensky.

6 MR. NORENSKY: Here.

7 MR. DAVIS: And on deck is George  
8 Lorefice.

9 MR. NORENSKY: Hello. My name is Jeff  
10 Norensky. I live on Fuchsia Path in Clay, which is  
11 right off of Caughdenoy. I'm listening to many  
12 people talking about the environment, which I do have  
13 concerns.

14 But my concerns are not exactly where  
15 the bats live and the bear -- and the bears live,  
16 although I think we should have to take them into  
17 consideration. I'm more concerned about the road  
18 between Maple Drive and Route 31.

19 There's a rural road, it's two lanes.  
20 It doesn't have a shoulder. It has a very deep  
21 drainage ditch next to it. It has a lot of kids and  
22 people jogging and walking and biking on the road.

23 More recently, I've seen that there  
24 are quite a few kids that have electric bicycles or  
25 they have electric scooters or they can stand on

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 something and that looks like they're -- you know,  
3 that there's nothing underneath them, other maybe  
4 than some skates.

5 But they seem to be going at twenty or  
6 twenty-five miles an hour, which I'm not sure is  
7 safe. But if we put five hundred trucks going to  
8 Micron, they were either coming on Route 81 or 481.  
9 The only exit that I know that is real close to  
10 Micron on 481 is Caughdenoy Road.

11 The people are going to go the  
12 quickest way they can get there. If there's  
13 congestion off of 81, they're going to be on  
14 Caughdenoy Road. Again, it's a two-lane road. It  
15 doesn't have a shoulder. It's a rural road and it  
16 has kids driving bikes and people walking on it all  
17 the time.

18 I'm hoping you're going to put some  
19 bike paths in or do other things to help the  
20 environment there so people can live a safe life and  
21 not be amongst all this traffic. Thank you.

22 [Applause]

23 MR. DAVIS: Thank you. Next is  
24 George. George, sorry for the last name if I  
25 mispronounced it. And then next after George is

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Jamie Shinn.

3 MR. LOREFICE: I'm George Lorefice.

4 MR. DAVIS: George, if I could ask you  
5 to try to speak into that mic a little bit. That  
6 will help --

7 MR. LOREFICE: All right.

8 MR. DAVIS: -- with the recording.

9 UNIDENTIFIED MALE SPEAKER: Yeah,  
10 powered off.

11 MR. DAVIS: Just a second.

12 MR. LOREFICE: Okay. Here we go. I  
13 am George Lorefice, a resident of Manlius New York,  
14 and also president of Climate Change Awareness and  
15 Action. It's -- we're a local group located here in  
16 Central New York.

17 A concern of ours is in -- on the  
18 energy usage of Micron, specifically their fossil  
19 fuel use. And we would like to see how they're going  
20 to do the reduction in their fossil fuel use.

21 As a start, one of the ideas came up  
22 was using solar on -- on a lot of your roof area and  
23 some of the other areas to reduce some of that usage.  
24 And we'd like to see more specificity in -- in how  
25 you may reduce your energy use.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Micron can be an asset to our  
3 community if they take care to protect our  
4 environment, as you heard before. Thank you.

5 [Applause]

6 MR. DAVIS: Thank you. Next is Jamie,  
7 and after Jamie is -- is it Michael --

8 MS. SHINN: Check. One, two.

9 MR. DAVIS: -- Mikulewicz, sorry, that  
10 one's tough, M-I-K-U-L-E-W-I-C-Z.

11 MS. SHINN: I'm glad mine was easier  
12 for you.

13 MR. DAVIS: Yes.

14 MS. SHINN: Hi, I'm Jamie Shinn. I'm  
15 a professor at the SUNY College of Environmental  
16 Science and Forestry, but I actually -- while I have  
17 several environmental concerns, want to talk about  
18 something different today though related.

19 I want to talk about the difference  
20 between the opportunity for public participation and  
21 true community engagement. So, I appreciate this  
22 opportunity today and that everybody is taking the  
23 time to be here.

24 I'm more interested in who is not in  
25 this room and who won't be in this room today because

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 they're not able to, because of transportation  
3 barriers, childcare barriers. They don't have the  
4 time or they just don't know that they have a voice  
5 at this table.

6 If Micron is meant to be truly the  
7 economic driver or the driver of economic  
8 transformation that it promises to be and that I have  
9 a belief that has the potential to be, then we need  
10 greater actual engagement with the communities that  
11 require that transformation, including those in the  
12 City of Syracuse where I live, who suffer from the  
13 highest rate of child poverty in the country and one  
14 of the most difficult and least accessible housing  
15 markets in the country.

16 Do you know their concerns? If not,  
17 why? How can this project engage with those  
18 communities if we don't know what their concerns are?  
19 I appreciate in the D.E.I.S. that you talk about  
20 engaging in robust public outreach, that's a direct  
21 quote, but only two such community engagement  
22 meetings are listed.

23 Forty-five people were said to be in  
24 attendance, but there's no mention of what concerns  
25 were raised and how those concerns were addressed

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 afterward in the D.E.I.S.

3 If we don't have that level of  
4 transparency, I don't believe we have trust that  
5 there's true community participation happening. And  
6 so, I think we need opportunities to maximize the  
7 engagement for those communities that most require  
8 the transformation that's promised by this project.

9 At the very least, we need commitment  
10 and a requirement that Micron has a community  
11 advisory panel that is there to foster and oversee  
12 truly authentic and ongoing community participation  
13 to make sure that the voices who can't be in this  
14 room today are at the table moving forward. Thanks.

15 [Applause]

16 MR. DAVIS: Thank you. Michael. And  
17 after Michael is Desiree Matthews.

18 MR. MIKULEWICZ: Hi, I'm Dr. Michael  
19 Mikulewicz. I'm a professor at SUNY E.S.F., and I'm  
20 here -- but I'm here as a concerned resident of the  
21 City of Syracuse. My comment pertains to the  
22 environmental justice impacts of this development.

23 For those who may not be aware of what  
24 it is, environmental justice is concerned with the  
25 unequal environmental impact caused by developments

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 like this one on historically marginalized and  
3 underserved communities and individuals.

4           Meanwhile, the D.E.I.S. states, the  
5 preferred action alternative would not result in any  
6 significant adverse effects with respect -- with  
7 respect to these policies, nor would it have any  
8 environmental justice impacts.

9           It would likely result in beneficial  
10 effects by fulfilling economic development policy  
11 goals. Further, the D.E.P.24-1 form submitted to the  
12 Department of Environmental Conservation States, it  
13 can be reasonably concluded that many of the  
14 disadvantaged communities and minority or low income  
15 communities within the study area would be unaffected  
16 by this development.

17           First, it is unreasonable to assume  
18 that one of the largest investments in the history of  
19 this region will have no adverse environmental  
20 justice impacts. That statement is naive at best and  
21 cynical at worst.

22           Second, Micron claims that the  
23 development will have no such impact based on the  
24 study impact area, which has been set to a five-mile  
25 radius narrowly missing multiple disadvantaged

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 communities in North Syracuse, Liverpool, and the  
3 city of Syracuse, among others.

4 Moreover, the impact of connected  
5 actions, the water supply and discharge  
6 infrastructure and electricity infrastructure has  
7 been limited to point five miles, including the  
8 pumping station in Oswego, which sits right in the  
9 middle of communities designated as disadvantaged by  
10 New York State.

11 Micron must increase the impact radius  
12 and resubmitted D.E.P.24-1 form to the D.E.C. to  
13 reflect this. Ultimately, this should trigger  
14 enhanced participation, which as my colleague  
15 mentioned, has not been sufficient.

16 The last comment I would like to put  
17 on record, which would -- should in no way be taken  
18 personally by this -- by the representatives present  
19 here, is that the diversity of the panel facing us  
20 today does not instill me as an individual with  
21 optimism regarding the ability of this project to  
22 appreciate and adequately address the needs and  
23 concerns of the diverse population that our region is  
24 home to. Thank you.

25 [Applause]

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. DAVIS: Thank you. Next is  
3 Desiree Matthews, and after Desiree is Brian  
4 Bouchard.

5 MS. MATTHEWS: Hi, good morning,  
6 everyone. Desiree Matthews. I represent the Lee and  
7 the Matthews family. We have property interests off  
8 of Henry Clay Boulevard, which does include obviously  
9 a riverfront and waterfront community.

10 We do support Micron and the  
11 investment that it has in this community. I work in  
12 mental health and we know that having jobs, income,  
13 stability is so very important.

14 So, we certainly support Micron, but  
15 also, we have to think about those people in the  
16 riverfront communities. I'm actually very shocked  
17 that the property values are still so depressed on  
18 some of those properties.

19 I've been all the way over the country  
20 and usually the riverfront waterfront properties have  
21 the highest value, but unfortunately, basic services  
22 like sewer, they don't have it.

23 And we know that these riverfront  
24 homes could provide extra taxes, development. They  
25 could be beautiful, but having public access is so

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 important. So, thinking about those septic systems  
3 that are there, they are old, they are ancient.

4 They probably need to be ripped out,  
5 but we know these engineering systems are so  
6 expensive and if people can't sell their home for,  
7 you know, an adequate resale value, we're going to  
8 continue to see those property values very depressed.

9 We can attract investment. We can  
10 have cheaper connections, and we want to make sure  
11 that with Micron we're getting those riverfront  
12 properties and having access along with the  
13 properties that are already slated in the phase one.

14 So, I don't have that information if  
15 those properties are going to have sewer access, but  
16 I think it's really important because it's going to  
17 cost us a lot more in the long run. So, thank you  
18 guys and thank you for consideration.

19 [Applause]

20 MR. DAVIS: Thank you. Brian  
21 Bouchard, and after Brian is Keanna Serviss.

22 MR. BOUCHARD: Good morning, Brian  
23 Bouchard with C.H.A. Consulting. I'm a civil  
24 engineer with eighteen years of experience focused in  
25 commercial and residential land development projects,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 primarily in Central New York, but also across the  
3 country.

4 Here speaking in support of the  
5 D.E.I.S. and the process to identify and mitigate any  
6 potential significant environmental impacts related  
7 to the project.

8 C.H.A. Consulting is a highly  
9 diversified engineering firm and is writing to  
10 express support for the Micron, New York  
11 semiconductor manufacturing project in the town of  
12 Clay based on the draft environmental impact  
13 statement.

14 C.H.A. has served the Central New York  
15 region for decades with deep expertise, unwavering  
16 commitment, and shared vision for sustainable growth.  
17 Our roots in this community run deep, and we have  
18 witnessed firsthand the transformative power of  
19 strategic investment paired with responsible  
20 planning.

21 The Micron Project represents a  
22 generational opportunity that promises to revitalize  
23 our local economy. Create thousands of high paying  
24 jobs, and position the region as a national leader in  
25 advanced manufacturing and innovation.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 We are especially encouraged by  
3 Micron's proactive approach to environmental  
4 stewardship, including its commitment to purchase  
5 carbon free electricity, water conservation, and  
6 inclusion of community centered infrastructure,  
7 including childcare, healthcare, and recreational  
8 facilities, which thoughtfully balanced economic  
9 growth with environmental responsibility and  
10 community wellbeing.

11 As a longstanding partner in the  
12 region's development, we stand ready to support the  
13 project in any way we can. This initiative aligns  
14 perfectly with the values we've upheld for decades,  
15 innovation, sustainability, and shared prosperity.

16 We support the timely advancement of  
17 Micron Project and recognize the profound benefits it  
18 will bring to our community and beyond. Thank you.

19 [Applause]

20 MR. DAVIS: Thank you. Keanna. And  
21 then after Keanna is Don Hughes.

22 MS. SERVISS: Hi, Keanna Serviss. I  
23 live on 31 in Cicero. I have a lot of environmental  
24 concerns that a lot of people have already brought  
25 up. And then one of them addressed, back in 2014 in

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the Manassas in Virginia, where a Micron plant had  
3 already been established.

4 There was a news article about  
5 residents complaining about the smell of like rotten  
6 eggs and soiled sewage coming through the city. So  
7 basically, hydrogen sulfide is created at the micron  
8 manufacturing process that discharges the odor when  
9 the chemical transforms from a liquid to a gas.

10 And so, like between the runoff water  
11 that was pooling in this pond that's kind of a  
12 storage is also seeping into their sewage, and the --  
13 that city was treating the pond water and trying to  
14 control the release of it into their sewer system.

15 And I'm sure there were other  
16 chemicals within that. And so, since that actually  
17 happened at a Micron plant in another part of the  
18 country, I'd like to know like, what are the -- what  
19 are they going to do to like, be proactive and  
20 prevent that kind of thing happening here.

21 Like, I wouldn't want to live amongst  
22 the smell and I'm sure a lot of other people  
23 wouldn't. That's it.

24 [Applause]

25 MR. DAVIS: Thank you. Next to Don

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Hughes. And then after that we have an individual  
3 that has identified himself as John Doe.

4 MR. HUGHES: Okay. Well, hi, my name  
5 is -- is Don Hughes. I'll try not to break this.  
6 So, I am a longtime resident of Syracuse since 1985,  
7 and I volunteer with the Sierra Club and with a  
8 coalition of groups, fourteen local groups called  
9 SustainCNY.

10 And my first comment to you is about  
11 this public comment period, allowing only forty-six  
12 days for the public to read, digest, and develop  
13 comments on twenty thousand pages of text, technical  
14 texts with tables and figures is simply inadequate.

15 And I hear what you folks are saying  
16 about the opportunities of Micron and jobs and  
17 development, but I find it troubling that the  
18 agencies and Micron have chosen to limit the public  
19 input period with the minimum public comment period.

20 One set of public hearings today, if  
21 you wanted to engage the public, you would follow the  
22 example of the New York State Department of  
23 Transportation in soliciting input for the E.E.I.S.  
24 on Interstate 81.

25 And that project, we had multiple

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 public engagement sessions over a year. That was  
3 what -- that's a model that you should follow.  
4 Number two, in contrast what a previous speaker said,  
5 the White Pine Commerce Park is actually a terrible  
6 place to build a huge CHIPS factory.

7 It is home to endangered bats,  
8 threatened species of birds, hundreds of other  
9 creatures, hundreds of acres of high quality wetlands  
10 and forests. Flooding is already an issue in Clay.

11 Putting hundreds of acres close to a  
12 thousand acres of impervious services in its place is  
13 going to exacerbate that problem. In the time I got  
14 remaining, I just want to talk about chemicals.

15 So, semiconductor manufacturing uses a  
16 lot of chemicals, many of which are highly toxic. A  
17 table in the D.E.I.S. lists hazardous chemicals,  
18 flammable chemicals, pyrophoric, those are the ones  
19 that spontaneously catch fire and expose to air.

20 Corrosives, toxic gases, oxidizers,  
21 asphyxiants, flammable liquids, water reactive  
22 substances, a lot of chemicals, chemicals going to be  
23 moving into this plant by truck.

24 What about spills? Spills are simply  
25 -- trust us, that's what the document says. Trust

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 us, we're going to develop a spill control plan. But  
3 accidents happen. They will happen over the course  
4 of this -- of this project as it's being built and as  
5 it goes into operation.

6 MR. DAVIS: Ten seconds.

7 MR. HUGHES: I did a calculation, how  
8 much chemicals will be on site, fifty-five million  
9 gallons if this whole project is built. That's a lot  
10 of chemicals.

11 [Applause]

12 MR. DAVIS: Thank you. Next is John  
13 Doe.

14 MR. DOE: Thank you. Good morning.  
15 Appreciate the opportunity to speak here today. I've  
16 heard a lot of comments about the endangered species  
17 that occupy the proposed build site. You got the  
18 harrier hawk, the Indiana bat, and the short-eared  
19 owl.

20 Indiana bat and the harrier hawk are  
21 protected under federal migratory bird laws, Wildlife  
22 Conservation Acts of 1956 and '73. The previous  
23 speaker brought up the storage of fifty-five million  
24 gallons of corrosive chemicals on what basically is a  
25 wetland.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Cicero swamp's less than six miles  
3 from the build site. Oneida Lake's probably within  
4 fifteen miles. So, I oppose the building site. And  
5 basically, Micron's getting a two hundred and forty-  
6 nine-million-dollar tax break sped out over forty-  
7 nine years.

8 And they expect us, the taxpayers to  
9 bear the brunt of the price of the infrastructure.  
10 The I-81, 481 Conrail, National Grid, Sunday's paper  
11 last week, national grid's already looking at a  
12 twenty percent rate increase to help pay for what  
13 obviously is the infrastructure that Micron will  
14 require.

15 I don't think it's a good idea to  
16 build on a site where those endangered species occupy  
17 underground caves, which would be tainted by chemical  
18 spills. And then Micron offered fifty million  
19 dollars for bat research.

20 In my opinion, take your fifty million  
21 dollars and go find another build site. Thank you so  
22 much. Have a good day.

23 MR. DAVIS: Thank you. For the record  
24 for our stenographer, Mr. John Doe refused to provide  
25 his real name, so I just -- if we could put that in

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the record, please. Thank you. Excuse me. No  
3 profanity, thank you. Excuse me. There are -- there  
4 are no other speakers that have filled out a comment  
5 card.

6 If you would like to speak and you've  
7 not filled out a common card, please come to the  
8 front and state your name. I would like to have new  
9 speakers that have not spoken yet, that can up and  
10 state your name and where you're from, please. And  
11 we'll go with that. Thank you.

12 [Applause]

13 MR. PRZEPIORA: Thank you very much.  
14 For the record, I did fill out a comment card. Don't  
15 know what happened, but --

16 MR. DAVIS: Can you repeat your name  
17 again?

18 MR. PRZEPIORA: I'm -- yes. My name  
19 is John Przepiora. I reside in the city of Syracuse.

20 MR. DAVIS: Thank you, John.

21 MR. PRZEPIORA: Major components of  
22 this project deserve public scrutiny of at least  
23 thirty to forty-five days. To lump it all together  
24 into one is irresponsible.

25 These multi components lump together

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 with this project's overlapping multiple phases make  
3 the D.E.I.S. difficult for anyone, including the most  
4 intelligent and experienced planning and development  
5 expert to review, understand and respond within the  
6 forty-five or forty-eight days that have been  
7 allowed.

8 Please revise the public comment  
9 period to at least a hundred and twenty days until  
10 October 23rd. I was planning here to -- to come and  
11 talk about the socioeconomic conditions, especially  
12 about the real estate, housing and growth inducing  
13 effects.

14 But I - I -- I decided to just come  
15 here today to talk about my opinion about this  
16 project. And it is my opinion based on the  
17 environmental impacts associated with this project  
18 that the project must not go forward without major  
19 changes.

20 I've come to this conclusion after  
21 consideration of such things as the project will  
22 destroy a critical ecological resource by filling the  
23 White Pine wetlands that serve many useful purposes,  
24 which aren't thoroughly assessed in the D.E.I.S.

25 We are in the era of climate crisis

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 with heat disrupting people's lives in profound ways.  
3 This site is a sink not only for carbon -- to keep  
4 carbon out of the atmosphere, but serves as an air  
5 conditioner to cool the surrounding environment and  
6 the bathtub to keep flooding in check.

7 Adding a huge concrete factory and  
8 surrounding pavements only adds to the heat island  
9 effect. Construction activity will impact the  
10 surrounding area for years to come with noise and  
11 traffic, which could make the area an intolerable  
12 location on which to live.

13 Once operational, the twelve thousand  
14 car parking lot will impact residents in the  
15 surrounding area by attracting increased automobile  
16 traffic.

17 The development is proposed to solve  
18 the region's longstanding poverty, yet there is no  
19 assurance that local workers and local residents will  
20 reap the benefits purported to be an objective of the  
21 project.

22 The project that workers -- the  
23 projection that workers will immigrate to the region,  
24 increasing the population by over sixty-four thousand  
25 and adding twenty-seven thousand new households flies

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 in the face of the promise that the good paying jobs  
3 will come to local residents.

4 There is also no assessment, nor  
5 assurance that the induced rising housing costs will  
6 not adversely affect the city of Syracuse.

7 MR. DAVIS: Ten seconds.

8 MR. PRZEPIORA: The renters who, you  
9 know, currently are cost burden. Gentrification with  
10 attendant displacement and increased homelessness is  
11 a potentially adverse impact, which is not  
12 sufficiently addressed in the D.E.I.S. Thank you.

13 [Applause]

14 MR. DAVIS: Thank you. Are there any  
15 other speakers that would like to come forward and  
16 speak?

17 MR. DOODY: Yeah. Yeah, my apologies  
18 for not filling out a card here.

19 MR. DAVIS: That's okay. If you could  
20 just state your name --

21 MR. DOODY: Sure. Yes.

22 MR. DAVIS: -- and maybe spell it since  
23 we do have the cards for spelling for our  
24 stenographer here, so if you could spell it for her.  
25 That would be helpful.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. DOODY: Sure thing. My name is  
3 Paul Doody, that's D-O-O-D-Y. I'm a retired chemical  
4 environmental engineer, living in Baldwinsville. I  
5 spent the last thirty-five years of my career as a  
6 consulting engineer, cleaning up legacy contamination  
7 at hazardous waste sites, with the early part of my  
8 career spent as a chemical environmental facilities  
9 engineer at I.B.M. Semiconductor facility in East  
10 Fishkill New York.

11 So, I've seen what can go wrong, and I  
12 want to make sure this job is done right from the  
13 beginning. So, I do have a number of comments. While  
14 there are twenty thousand pages in the E.I.S.,  
15 there's inadequate detail with which to truly assess  
16 the potential for significant adverse environmental  
17 effects.

18 As an example, I could not find  
19 anywhere in the E.I.S. a listing of all the chemicals  
20 and quantities planned to be used at the facility.  
21 As such, we can't independently assess whether the  
22 conclusions about wastewater and air discharges, as  
23 well as, waste management and health and safety are  
24 reasonable.

25 Also, the public deserves to know what

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 chemicals will be transported along our roadways,  
3 increasing the risks to the community. Probably my  
4 most important comment is, there's only a very  
5 superficial discussion about spills, system upsets  
6 and equipment malfunctions that can result in  
7 contamination of building materials, soil,  
8 groundwater, surface water in the atmosphere.

9 The report only provides very brief,  
10 simplistic statements that spills will be quickly  
11 cleaned up and there will be spill kits available.

12 One area of particular concern I have  
13 is related to a release that could enter the Oneida  
14 River eventually discharging to Lake Ontario.

15 The Oswego River mouth is not too far  
16 from OCWA's water intake, potentially resulting in  
17 contamination of our multi-county water supply. More  
18 discussion and recognition of this potential risk is  
19 critical.

20 I would recommend a thorough  
21 vulnerability assessment or risk management approach  
22 to more fully assess the risk of spills, their  
23 consequence and appropriate mitigation measures such  
24 as additional potable water treatment, for example.

25 I recommend the public actively

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 participate in such an assessment as we will be  
3 accepting a lot of those risks. Now, on that topic,  
4 I also would recommend that a community oversight  
5 council be developed that has equal authority and a  
6 seat at the table with other oversight agencies to  
7 review the project.

8 It's likely many things are going to  
9 change over the nearly twenty-year period of  
10 construction and fifteen years of operation. We're  
11 inevitably going to learn more and technologies are  
12 going to be developed warranting ongoing review and  
13 adjustments.

14 As such, an adaptive management  
15 program with active public involvement should be  
16 implemented. And finally, it appears the traffic  
17 analysis did not consider the traffic delays during  
18 construction of the proposed traffic improvements.

19 The summary charts show traffic  
20 impacts in 2027 and 2031, yet the text states that  
21 the planned traffic improvements will begin after  
22 2027 and be completed by 2031. Therefore, the  
23 conclusions --

24 MR. DAVIS: Ten seconds.

25 MR. DOODY: -- about delays ignore the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 inevitable traffic headaches during the construction  
3 of those improvements. Thank you very much.

4 [Applause]

5 MR. DAVIS: Thank you. Any other  
6 speakers wish to come forward? Please state your  
7 name and spell it, please.

8 MR. JENNEJAHN: Yes, Rick Jennejahn,  
9 J-E-N-N-E-J-A-H-N. I live in Baldwinsville. I'm a  
10 thirty-four-year member of the area. So, I am  
11 supportive of the Micron development program or  
12 project here.

13 Just to echo what the last speaker  
14 just said, I think the traffic concern is something  
15 that needs to be looked at now versus later. Already  
16 on Route 31, the corridor between Route 31 and 11,  
17 that intersection is very difficult for residents in  
18 the area.

19 My family lives in Cicero, in  
20 Brewerton, in Central Square in -- in that area --  
21 and as well. And so, I think it's very, very  
22 concerning to -- to see that the traffic mitigation  
23 isn't going to happen until years down the road. So,  
24 that would be my comment on that.

25 Secondly, I think the -- the other

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 aspects that were spoken about today, particularly  
3 the chemical concerns, the environmental concerns, I  
4 -- I have read through as much of the -- the state --  
5 draft statement as possible.

6 I do think that there needs to be a  
7 little bit more transparency on the -- the chemicals.  
8 I think that's a pretty big concern. So, just  
9 supportive of the project and thank you for what  
10 you've done here today. Thank you.

11 [Applause]

12 MR. DAVIS: Thank you. Any other  
13 speakers that have not spoken? Yes, please come  
14 forward.

15 MR. DAMICO: Sam Damico, D-A-M-I-C-O.  
16 I had no intentions in speaking until I heard about  
17 all the chemicals. I own a property across from the  
18 -- the site. It's -- we're going to build a fourth  
19 fab.

20 There's no public water available to  
21 the property. I don't feel comfortable having a well  
22 after I've heard everything that's being discussed  
23 today about the chemicals.

24 So, I'm hoping that Micron or Onondaga  
25 County can assure us that we'll get access to public

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 water if we live around the project. I haven't heard  
3 that being discussed yet. They're getting a lot of  
4 water. We would like some public water as well.  
5 Thank you.

6 [Applause]

7 MR. DAVIS: Thank you. Any other  
8 speakers who have not spoken and would be interested  
9 in speaking?

10 MR. BULLA: Yes. Name is Joe. Last  
11 name is Bulla, B-U-L-L-A. I just want to say one  
12 thing. This whole project seems to have the cart in  
13 front of the horse. Nobody did all this  
14 investigating and everything before we had this great  
15 announcement that Micron was coming here.

16 It's a wetland. How can we demolish a  
17 wetland and where are we going to create the -- the  
18 new wetland to supplement taking all that out of the  
19 -- the ecosystem, it makes absolutely no sense.

20 [Applause]

21 MR. DAVIS: Thank you. Any -- other  
22 speakers, again, reminder that you don't need to  
23 speak for your comments to be provided here. Written  
24 comments are the same as spoken comments here today.

25 So, if you're uncomfortable speaking,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 you can provide a written comment. If you have it  
3 with you, it can be provided to someone in the lobby  
4 or up here at the front desk. We can take it, or you  
5 can -- on the back behind us here is an -- identifies  
6 the opportunities where you can provide your written  
7 comment.

8 Any other speakers who have not  
9 spoken? Okay. I'm going to open it up to any  
10 speakers who would like to speak a second time.  
11 There were a few that got cut off at the three-minute  
12 limit. So, as I said at the beginning of the  
13 session, speakers are afforded another three-minute  
14 opportunity.

15 So, if there's someone that would like  
16 to come forward that has spoken already and would  
17 like to have that opportunity, please come forward.  
18 Just please restate your name again and your address  
19 so we can have it for the record to track that.  
20 Thank you.

21 MS. HAAS: Hi, I am Karen Haas, 498  
22 Main Street, Sterling, New York. I'm representing  
23 Sterling Water Stewards. So, I had gotten to the  
24 point that unless Micron can demonstrate otherwise,  
25 the D.E.I.S. needs to assume that PFAS will escape

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 detection or capture by an industrial wastewater  
3 treatment plant and assess the impacts of discharge  
4 into the environment.

5 And -- and they could actually cite  
6 how much PFAS escapes from existing facilities  
7 because it is known. For example, the global  
8 industries microchip factory in Malta, New York is  
9 known to have PFAS discharge -- discharges that are  
10 not being addressed by D.E.C. at this point.

11 Micron should be required to provide  
12 data on the pollution reduction that can be achieved  
13 by its -- its state-of-the-art controls and assess  
14 the impacts of the resulting emissions discharges  
15 directly.

16 They should commit to using treatment  
17 and monitoring technology that assures that no PFAS's  
18 are released into the United -- the Oneida River or  
19 other bodies of water, including Lake Ontario.

20 The D.E.I.S. states, oh, there's going  
21 to be a plume that's going to have some stuff in it,  
22 but since a certain distance from that plume, it must  
23 meet regulatory requirements. It will. So, don't  
24 worry. And that's the extent of analysis.

25 They don't tell us amounts. They just

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 say it's a tautology. They say, we're going to meet  
3 all requirements, and so there won't be a problem.  
4 Micron should conduct a thorough risk assessment.  
5 I'm echoing here what Mr. Doody recently pointed out  
6 that we have no risk assess -- assessment in the  
7 D.E.I.S.

8 This plant is projected to operate for  
9 decades and one out of ten PFAS facilities has an  
10 incident. So, there's a ten percent chance of a  
11 major environmental incident. Not to have your  
12 environmental impact statement assess what would  
13 happen in a spill or an incident is a major  
14 oversight.

15 You're trucking PFAS in other  
16 chemicals into the Clay facility, as Mr. Doody  
17 pointed out, a spill could go to Young Creek Oneida,  
18 Oswego Rivers, Lake Ontario. Contamination of the  
19 Great Lakes is a violation of the Great Lakes Water  
20 Quality Agreement between the United States and  
21 Canada.

22 Releases of chemicals into Lake  
23 Ontario would be near the water intake. You should  
24 proactively support the water quality anti-  
25 degradation policy of NYSDEC and findings and

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 objectives of the Great Lakes St. River -- St.  
3 Lawrence River Basin Sustainable Water Resources  
4 agreement.

5 MR. DAVIS: Ten seconds.

6 MS. HAAS: The scale of the Micron's  
7 projected water usage and its potential consumptive  
8 use from the manufacturing operation should trigger  
9 an immediate review of OCWA's water withdrawal permit  
10 in light of --

11 MR. DAVIS: Thank you.

12 MS. HAAS: -- the requirements of the  
13 Great Lakes Compact.

14 [Applause]

15 MR. DAVIS: Thank you. I would  
16 encourage you to submit your written statement at the  
17 end. Thank you.

18 MS. HAAS: We will.

19 MR. DAVIS: Jump over here. Don.

20 MR. HUGES: Thank you. When is this  
21 hearing over?

22 MR. DAVIS: This hearing ends at one  
23 o'clock. This session ends at one o'clock.

24 MR. HUGHES: Okay. So as I understand  
25 it, it's eleven thirty now. We have ninety minutes

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 left. Why are we limiting the comments to three  
3 minutes?

4 MR. DAVIS: That's the quorum.

5 MR. HUGHES: Sorry?

6 MR. DAVIS: That is the quorum.

7 MR. HUGHES: That's the rule?

8 MR. DAVIS: I ask you to speak.

9 MR. HUGHES: All right. All right.

10 To continue on the issue of chemicals. So, the --  
11 the D.E.I.S. lists a total of about eighteen  
12 chemicals that are actually identified. The  
13 D.E.A.I.S. should identify all the chemicals that  
14 Micron is using.

15 As I mentioned before, fifty-five  
16 million gallons of chemicals will be stored on site.  
17 The federal government has certainly done a better  
18 job in this respect in their programmatic  
19 environmental impact statement for the semiconductor  
20 industry.

21 They list a whole table of two hundred  
22 hazardous processed chemicals. These things include  
23 hydrochloric acid, hydrogen fluoride, sulfuric acid,  
24 nitric acid, a lot of corrosive chemicals, peroxides,  
25 which are strong oxidants, silane, ammonia, nitrogen

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 trifluoride, sulfur hexafluoride.

3 Some of this stuff is highly, highly  
4 toxic. A chemical known as arsine, deadly. The  
5 community needs to know about this. D.E.I.S. to  
6 properly assess environmental impacts and that  
7 includes human health impacts needs to include  
8 information about how much of this stuff is going to  
9 be used.

10 How much is going to be transported  
11 through the community on Route 31 or however it gets  
12 there. I would -- the Micron has stated in the  
13 E.I.S. that they're going to transport all the  
14 chemicals by truck. I would recommend that they  
15 rethink that. Rail transport is much safer in  
16 general.

17 Let me talk a little bit about PFAS.  
18 PFAS are not explicitly identified in the document  
19 just like the other chemicals. They're mentioned but  
20 there are hundreds and hundreds of types of PFAS that  
21 are used in the semiconductor manufacturing process.

22 Again, federal government through its  
23 E.I.S., the programmatic environmental assessment,  
24 has ten pages listing PFAS, types of PFAS used in the  
25 semiconductor industry.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. DAVIS: Ten seconds.

3 MR. HUGHES: And we need to see this  
4 level of detail in this document. You can't possibly  
5 do a proper environmental review without that kind of  
6 information it's going into the wastewater, it's  
7 going into the air.

8 [Applause]

9 MR. DAVIS: Thank you.

10 MR. PRZEPIORA: Thank you.

11 MR. DAVIS: State your name again.

12 MR. PRZEPIORA: Yes. My name is John  
13 Przepiora. I reside in the City of Syracuse. That's  
14 P-R-Z-E-P-I-O-R-A. The impact of developing an  
15 estimated twenty-seven thousand new household units  
16 is ill assessed in the D.E.I.S.

17 To rely on the hope that future  
18 policies will match the vision of the Onondaga County  
19 comprehensive plan for smart growth isn't sufficient.  
20 Real planning and commitments are necessary. And I  
21 see little of that detail in this D.E.I.S.

22 The carbon footprint of the induced  
23 residential and commercial development isn't  
24 estimated in the D.E.I.S., nor any mitigation  
25 specified or required. They should be. The

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 infrastructure expansion of -- for the induced  
3 residential and commercial growth isn't as estimated.

4 How many miles of new roads, water  
5 lines and sewers will be needed to serve twenty-seven  
6 thousand new households? How much land is needed to  
7 be developed? None of these are presented in the  
8 D.E.I.S.

9 Micron claims that the only  
10 alternative is -- to this project is to build four  
11 fabs. That fewer than four is uneconomical, robbing  
12 them of the needed rate of return to make the Clay  
13 New York project viable.

14 This is searched and isn't  
15 sufficiently supported by evidence, particularly when  
16 other fab projects elsewhere have created fewer fabs  
17 at one location.

18 If four fabs are required for the  
19 White Pine Park, the approval process should be  
20 modified to allow build and assess incremental --  
21 build and assessed -- I lost my place here --  
22 incremental phasing sequence to ensure that  
23 commitments made are kept before continuing to build  
24 out additional fabs.

25 Finally, Micron should be required to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 fund mitigating measures to protect the region from  
3 adverse impacts. It is unclear that pilot payments,  
4 wages paid or rising real estate values will offset  
5 those adverse impacts.

6 Offsets against added municipal  
7 services, incentives to assure sufficient affordable,  
8 housing is available and payments to offset  
9 environmental degradation should all be on Micron and  
10 its shareholders, not current residents. Thank you  
11 very much.

12 MR. DAVIS: Thank you.

13 MR. DOODY: Thanks again. I'm Paul  
14 Doody, retired chemical environmental engineer living  
15 in Baldwinsville. I appreciate the opportunity to be  
16 able to throw a couple more comments out here that I  
17 intended to --

18 MR. DAVIS: No problem.

19 MR. DOODY: -- say in the first place.  
20 So, the first one is, I just want to reinforce my  
21 opinion that the comment period -- the forty-five-day  
22 review period is woefully insufficient.

23 Asking the public to digest twenty  
24 thousand pages of this report, which is five hundred  
25 pages a day of technically dense content in the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 middle of the summer vacation season, I think is --  
3 is just wrong. We deserve more time and I don't see  
4 any reason why we shouldn't have more time to be able  
5 to review this and digest it properly.

6 Another comment I have is I'm  
7 concerned with the impact this is going to have on  
8 housing affordability. You know, many homeowners  
9 expect to -- like myself, expect to see home values  
10 rise with this development.

11 And the increase in housing and rental  
12 prices on the other hand are going to make housing  
13 even more unaffordable than it is today for many  
14 people in the region. Now, the report refers to a  
15 New York State initiative, but I question whether  
16 that will be enough.

17 This is an issue someone other than  
18 Micron needs to take ownership of and not just kick  
19 it to the state of New York. And my final comment is  
20 really more of a question.

21 In looking at the massive development  
22 that's going to go on here, are there an adequate  
23 number of qualified contractors and rail accessible  
24 aggregate availability to be able to handle all this  
25 construction under the schedules presented?

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 I guess your engineers have probably  
3 looked at this, but I think that's a pretty serious  
4 concern. And what that would do is delay the  
5 project. So, I think everybody's anxious to get this  
6 project. Personally, I'm kind of in support of this.

7 I think long term it's a great  
8 project, but I want to see it done right. I was a  
9 spill control leader for the I.B.M. semiconductor  
10 facility in East Fishkill. I've seen what can go  
11 wrong. You can do everything you want to do, but  
12 accidents happen.

13 And I think you've not done a good  
14 enough job in this report to address spills and those  
15 consequences. And that's it. Thank you very much.

16 [Applause]

17 MR. DAVIS: There I see new  
18 people coming into the room at various times  
19 throughout this session. So, if there's anyone that  
20 would like to speak that has not filled out a comment  
21 card then I ask that you please come down, identify  
22 yourself in the microphone and have an opportunity to  
23 speak.

24 MS. BRIDGES: Hi, I'm Elizabeth  
25 Bridges, B-R-I-D-G-E-S. I live in Clay, just off of

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Moyers Corners at Route 31 57. So, my question has  
3 to do with the HAZMAT response. HAZMAT in the  
4 D.E.I.S. they spoke about the Syracuse and Clay Fire  
5 Departments coordinating with the Micron HAZMAT.

6 This has to do with the increased  
7 population and size that would come with this. So,  
8 would that not mean that the fire departments would  
9 also have to increase their professionals so that  
10 they can handle the new population and if something  
11 happened on the highway or even in the facility that  
12 there's enough people to not only handle the Micron  
13 HAZMAT, but just the general population that would be  
14 in the area? That's -- that's just my question.

15 [Applause]

16 MR. DAVIS: Thank you.

17 MS. BRIDGES: Thank you.

18 MR. DAVIS: Any other speakers that  
19 have not spoken? Okay. I'm going to afford the  
20 speakers that were cut off. We had two speakers that  
21 I provided additional three minutes of time to  
22 before. So, if you would like to come down to those  
23 two speakers and provide some additional comments,  
24 you're welcome to.

25 Again, I'll ask you to keep it to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 three minutes because we do have people that are  
3 coming into the room and I want to make sure that  
4 everyone that here within their time period has an  
5 opportunity to speak and comment. State your name  
6 again, please.

7 MS. HAAS: It's Karen Haas from  
8 Sterling. So, I was talking about the water intake.  
9 Micron -- New York State Law as some of you probably  
10 know was updated to incorporate the Great Lakes  
11 Compact, which is compact between the United States  
12 and Canada, that addresses water withdrawal limits.

13 And so, you have to get a permit for  
14 any type of water withdrawal system that has a  
15 capacity to draw more than a hundred thousand dollar  
16 -- hundred thousand gallons a day. D.E.I.S. notes  
17 that forty-eight million gallons a day will be  
18 required at full build out.

19 And the project, of course, it's going  
20 -- Micron's water source will be Lake Ontario through  
21 the OCWA through the Lake Ontario water treatment  
22 plant. The water treatment plant currently has a  
23 practical sustained output of approximately fifty-  
24 four million gallons a day.

25 And it has a maximum capacity of sixty

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 million gallons a day and a permitted waste with --  
3 permitted water withdrawal limit of up to sixty-two  
4 point five million gallons a day.

5 So, the current existing permit is  
6 going to accommodate the freshwater demand for the  
7 first two fabs. But you've chosen to make this the  
8 only public hearing for all four fabs that we'll ever  
9 have. And so, we're now -- you're going to approve  
10 the project to build the PFAS that are going to be  
11 built and completed sixteen years from now. It's the  
12 only comment period we're ever going to have. So, to  
13 accommodate the last two fabs, you're going to have  
14 to get a modification of that water withdrawal  
15 permit.

16 And so, since you've chosen to analyze  
17 the environmental impacts just this once in 2025 for  
18 the next sixteen years, you really ought to be  
19 investigating. You should be reviewing the existing  
20 water withdrawal -- withdrawal permit as you're  
21 required to do under the Great Lakes Compact, which  
22 is an international agreement with Canada.

23 MR. DAVIS: Thank you. Go ahead, Don.

24 MR. HUGHES: Okay. This is Don Hughes  
25 again. I want to just continue and finish up about

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 PFAS. It's a pretty wonky subject, but it's  
3 important that we address it. I want to read a  
4 couple things from my friend and colleague, Lenny  
5 Siegel, who is out in California and he's written  
6 some good comments. He will be submitting comments  
7 on Micron.

8 It's the high-level takeaway. Micron,  
9 like other semiconductor producers, has always  
10 utilized and released into the environment a wide  
11 range of hazardous substances. In fact, the industry  
12 introduces hazardous substances into wafer  
13 fabrication faster than researchers can determine  
14 their toxicity and government agencies can regulate  
15 them.

16 The Clay Environmental Review provides  
17 an opportunity to address potential semiconductor  
18 pollution in advance. In other words, let's build it  
19 right. Let's design it right. As Paul Doody has  
20 pointed out with spills, he want to design it right  
21 from the get-go. Continue with Lenny Siegel's  
22 comments.

23 Unfortunately, the Draft Environmental  
24 Impact Statement is vague, providing the public and  
25 relevant agencies insufficient information to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 determine if best -- best practices will be used to  
3 prevent human and environmental exposure to chemicals  
4 from the Micron factory. The technical term for this  
5 is kicking the can down the road.

6 So PFAS, we have -- we have a perfect  
7 storm here. We have this giant universe, thousands  
8 of types of PFAS. Toxicities vary, but we know that  
9 they -- many of these things are extremely toxic or  
10 very toxic. What's provided in the E.I.S. is vague,  
11 and the regulation of these compounds has not caught  
12 up to the reality that hundreds of these PFAS  
13 compounds are used in modern chips manufacturing.  
14 The regulations are focused on two compounds: PFOA  
15 and PFAS. The State of New York and E.P.A. have  
16 issued drinking water standards for those two  
17 compounds.

18 The fact is that these types of PFAS  
19 are no longer used by the chips industry, as noted by  
20 the CHIPS office in their environmental assessment.  
21 Long chain PFAS compounds, such as PFOS have been  
22 replaced by short chain PFAS. Another long chain  
23 PFAS, which is the PFOA, the octanoic acid, was  
24 phased out in the United States ten years ago and is  
25 expected to be eliminated globally this year.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 So, we're looking at the wrong things.  
3 The regulatory agencies are looking at the wrong set  
4 of compounds. Two compounds which the chips  
5 manufacturers don't use.

6 MR. DAVIS: Thank you. Thank you.  
7 State your name again, please.

8 MR. LANCETTE: Thank you. My name is  
9 Greg Lancette and I don't think I mentioned that I  
10 live in the Village of North Syracuse in the Town of  
11 Clay.

12 MR. DAVIS: Can you spell your last  
13 name for Greg so we can just make sure it's recorded.

14 MR. LANCETTE: Yes. My last name is  
15 L-A-N-C-E-T-T-E.

16 MR. DAVIS: Thank you.

17 MR. LANCETTE: I understand it's quite  
18 the hot topic here, and it's such a massive project  
19 that has been proposed to our community. And there  
20 is always a lot of anxiety, concern, excitement, all  
21 blended into one big hot ball of energy.

22 And you know, some of the concerns  
23 with the economic opportunities coming in all of that  
24 is that we don't want to get into splitting our  
25 community over all of the concerns that come into

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 these conversations when it comes to the fact of many  
3 of the demographics of our county are older by age  
4 and demographic, and many have already worked and  
5 earned a career and have retired and still reside  
6 here. And that where it appears that sometimes the  
7 concerns are all very valid and they're all very good  
8 questions and comments that we are hearing at these  
9 hearing today and throughout today.

10 But closing the door on any type of  
11 prosperity to -- when we're talking about a parcel  
12 here that I have hunted on personally. I've had  
13 friends that actually moved off of Burnett Road and  
14 all of that. I mean, it's always been that and it  
15 has been an industrial park designated for over two  
16 decades.

17 And that -- and I understand  
18 everybody's concerns, but to have the end game or the  
19 desire to not only force an extraction of more and  
20 more information that we could go on for years with  
21 in an industry that is heavily regulated, and in a  
22 state that has some of the most stringent  
23 environmental review and regulations, air quality,  
24 water quality and all of that. We feel that, I feel  
25 that, these steps are necessary process, but I am

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 also concerned of the continuous extension of the  
3 review product, the continuous bombardment with the  
4 industry attacking the industry itself to keep it out  
5 of our community when it's very similar to what goes  
6 on, whether it's energy policy or any of that.

7 It's paralysis by analysis in a  
8 community we could -- we're already the community  
9 that used to be and I don't want our community to  
10 turn into the community of what it could have been  
11 and what we are. Tremendous amount of upside, like I  
12 said earlier, generational employment opportunities  
13 that are sustainable. Thank you.

14 MR. DAVIS: Thank you. Any further  
15 speakers?

16 UNIDENTIFIED SPEAKER: Someone over  
17 here.

18 MR. DAVIS: Sure. Thank you. Please,  
19 come forward. State your name again, please.

20 MS. LAUZON: My name is Beth Lauzon,  
21 L-A-U-Z-O-N. And I totally agree. We don't want to,  
22 you know, get out of here Micron, we're not  
23 interested. But my whole life has been allied --  
24 nobody talks about this, allied chemical Solvay  
25 process. Onondaga Lake's been most polluted lake in

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the whole country.

3 I mean, do we have to start this over  
4 again? And yes, how do we get there? And yes, it  
5 was the 1800s, I get that. How do we get to that?  
6 We got there by people saying jobs, jobs, jobs, jobs,  
7 jobs. And that's wonderful. I would love to apply  
8 to Micron right now. They wouldn't hire me, but I  
9 would love to apply for them.

10 But can't we just bring in  
11 manufacturing industry and not freaking pollute our  
12 land for forty, fifty years? We had -- we can't even  
13 swim in Onondaga Lake still. I suppose we could, but  
14 nobody's going to swim in Onondaga Lake anymore.  
15 They go eat one or two fish maybe, possibly, because  
16 their mixing zone was the lake.

17 Mixing zone from Micron is going to be  
18 the Oneida River. If we don't look at it now, we  
19 will never look at it. And you know what's going to  
20 happen? Because this industry works so fast, in  
21 about ten years, they won't even be making the same  
22 chips. It will be different. The chemicals will be  
23 different, as they say. The chemicals are different  
24 now, but we're not looking at that because we're ten  
25 years behind.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 That's how we operate in New York  
3 State. That's how we get paralyzed, understood. We  
4 get paralyzed that way, but there's got to be a  
5 common ground. There's got to be a middle ground.  
6 Bring the industry in. Yes, our young people should  
7 have jobs. But yes, they shouldn't have to not swim  
8 in Lake Ontario, not swim in our Oneida Lake, not  
9 swim in Oneida River because we let them destroy it  
10 like we let them destroy Onondaga Lake. Don't do it  
11 again.

12 You're sitting right here, all these  
13 people, they have jobs, they have great jobs; you can  
14 do it. You don't need to slow it down to a crawl so  
15 Micron says, I'm out of here. Even that -- that may  
16 happen, but you don't need to do it.

17 You can do that. There's a middle  
18 ground we're saying, whatever you want Micron, you  
19 got it. And forget it, Micron. We'd like to  
20 maintain our rivers clean. There's a middle ground  
21 somewhere in there. They could -- and Micron can do  
22 it. Make them spend the money. That's all I need to  
23 say.

24 MR. DAVIS: Thank you. Any further  
25 speakers?

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. KOSKOWSKI: Hello. I'm Justin  
3 Koskowski, K-O-S-K-O-W-S-K-I. I live in Oswego, New  
4 York. I'm a representative for Local 669, Road  
5 Sprinkler Fitters. We're about sixteen thousand  
6 strong across the whole United States, about a  
7 thousand in New York.

8 This is a building that would be a  
9 great success for us, be a game changer for  
10 everybody, middle -- middle class and moving forward  
11 from elementary kids to kids graduating now, who have  
12 a career either in the trades or in the industrial  
13 moving forward. Thank you.

14 MR. DAVIS: Thank you. Any further  
15 comments? Okay. I'm going to take a five-minute  
16 break because I need to. And I mean, the comment  
17 period's open. We have people that likely could be  
18 showing up for lunchtime, so that's why we extended  
19 this period through a lunchtime break, so people  
20 could arrive.

21 So as new people come in, the hearing  
22 is not closed. It will not close until one o'clock,  
23 but to afford those people that may be coming at  
24 their lunchtime to speak. But I am going to take a  
25 five-minute break, so that I can run to the restroom.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Thank you.

3 Giving a minute here for people to get  
4 settled, so that the speakers have their opportunity  
5 to speak.

6 (Off the record; 11:54 a.m.)

7 (On the record; 12:19 p.m.)

8 MR. DAVIS: Great. Thank you,  
9 everyone. I don't have to speak as loud. It's more  
10 echoing in here. The first to speak will be Steph  
11 Adams. Thanks, Steph. Three minutes. If you need  
12 more time after that, the -- Mary Thompson's going to  
13 speak next. And then if you need more time, you can  
14 come back.

15 MS. ADAMS: Okay. Thank you. My name  
16 is Steph. I live in Syracuse. I'm a historian. I  
17 work in a local history museum, but my comments today  
18 are entirely my own.

19 A number of times politicians have  
20 said Micron is our next Erie Canal moment. And while  
21 the canal did have a tremendous economic impact, that  
22 came at great cost and that the canal had severe  
23 negative environmental impacts, displaced native --  
24 native communities and was a workplace safety  
25 nightmare. I'm concerned that history is, in a way,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 repeating itself.

3 I'm worried about the forever  
4 chemicals, not just for myself and other residents,  
5 but for people working in the facility. In my  
6 opinion, the D.E.I.S. does not adequately outline  
7 workplace safety plans or systems of community  
8 oversight, and more importantly accountability.

9 The D.E.I.S. again and again feels  
10 like it's asking for our blind trust, but how can we  
11 trust when you give us only forty-five days to review  
12 a massive plan and one day to publicly comment, half  
13 an hour's drive away from the city no less? I want  
14 good, safe jobs for people already here in the  
15 facility, not just building the facility.

16 In vague promises of opportunity for  
17 the local community and historically marginalized  
18 groups do not necessarily translate to reality  
19 without good faith engagement as the makeup of  
20 today's meeting has shown. The vague notion of  
21 opportunity for a rubber stamp is not engagement nor  
22 is it justice.

23 From a past two hundred years,  
24 Syracuse and the surrounding area has seen  
25 infrastructure and massive industrial projects coming

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 in benefiting few and then disrupting the many,  
3 disrupting the environmental area. And what point is  
4 there to studying and teaching and talking about  
5 history if we don't ever learn from it?

6 We have an opportunity to do this  
7 right from the start. So I encourage you to please  
8 do that, starting with extending the comment period  
9 and opening up more opportunities for people to  
10 publicly comment not just in one municipality. Thank  
11 you.

12 MR. DAVIS: Thank you. Next would be  
13 Mary Thompson.

14 MS. THOMPSON: Good morning, afternoon  
15 I'm not sure which it is. My name is Mary Thompson.  
16 I'm the C.E.O. of the Home Builders and Remodelers of  
17 Central New York. We're a regional trade  
18 organization with eight counties in the region, here  
19 to voice our strong support for the Micron project  
20 and for the conclusions presented in the draft  
21 environmental review.

22 Our members that develop land  
23 recognize the high standards in this review. Micron  
24 has demonstrated a strong commitment to mitigating  
25 environmental impacts by incorporating rigorous

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 sustainability measures into its development plans.  
3 Their active engagement with local, state and federal  
4 environmental agencies have ensured compliance with  
5 regulations and transparency throughout the project.

6 By taking accountability for potential  
7 environmental effects and working proactively to  
8 address them, Micron is setting a high standard for  
9 responsible development in the region, and we thank  
10 them for that. This project represents more than  
11 just a major investment in our region's economy.  
12 It's a generational opportunity to build a stronger,  
13 more resilient community.

14 Micron's presence will bring thousands  
15 of high-quality jobs, spark innovation, and  
16 strengthen our local workforce. But most  
17 importantly, it underscores a pressing need that we  
18 can no longer afford to ignore: the urgent demand for  
19 more housing.

20 Micron's arrival highlight --  
21 highlights a critical need for more housing in our  
22 region. This project should be viewed as a catalyst  
23 for proactive, smart planning, encouraging state and  
24 local governments, developers and communities to work  
25 together on solutions that meet housing demands while

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 preserving environmental quality.

3 As Micron and its supporting  
4 businesses bring in new workers and their families,  
5 our region must grow in a way that is inclusive,  
6 sustainable, and forward thinking. That means making  
7 housing a central part of this effort, not just for  
8 newcomers but for those of us that already live here.  
9 This is our chance to plan smart, to prioritize  
10 affordability, and to ensure we don't leave anyone  
11 behind.

12 Micron is not just building a factory;  
13 it is helping to build a future. The company's  
14 investment in education, training and partnerships  
15 with local schools and colleges will ensure that  
16 today's students are prepared for tomorrow's careers.  
17 This is an opportunity to keep our young people here  
18 in New York with good paying jobs, meaningful  
19 futures, and as productive citizens.

20 MR. DAVIS: Ten seconds.

21 MS. THOMPSON: The Micron project also  
22 offers a powerful reminder that progress doesn't have  
23 to happen in isolation. It takes community  
24 collaboration. Thank you.

25 MR. DAVIS: Thank you. Again,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 there'll be an opportunity to speak again for  
3 additional three minutes. I do have another speaker  
4 that is registered. Bill Spreter.

5 MR. SPRETER: First of all, thank you  
6 very much for holding this hearing. I do appreciate  
7 it. I'm Bill Spreter. I'm the President of the  
8 Central New York Chapter of the New York State  
9 Alliance for Retired Americans. So, I want to say as  
10 a union member, as a person in the community, I  
11 welcome the fact that Micron's coming to our town.

12 I remember the time when we had real  
13 good manufacturing in this town. And I remember that  
14 it was unionized manufacturing that made this town  
15 and made the middle class. And I appreciate that.  
16 And I hope that is what Micron is aiming for in the  
17 future.

18 However, I do have concerns. We've  
19 heard from various environmental groups. We've heard  
20 from professors, some from E.S.F., we've heard from a  
21 Le Moyne professors. We've heard from workers  
22 groups. And we're concerned because Micron doesn't  
23 necessarily, in its past, have the same kinds of  
24 things that we anticipate in New York State, such as  
25 good paying labor jobs.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 We would like to have the jobs as  
3 middle-class jobs. Many of the jobs that will be in  
4 manufacturing may not be, in fact, middle class.  
5 We're concerned about that. We're concerned about  
6 workers' safety. I attend Workers Memorial every  
7 year. And a lot of people in New York State die as a  
8 result of being on the job. And these workers are  
9 going to be working with hazardous chemicals, PFAS,  
10 PFOS. And I -- I'm not one to tell you what they  
11 mean and how dangerous they can be, but I know that  
12 they can be dangerous after hearing presentations on  
13 them.

14 So, I'm just hoping that Micron does  
15 everything in its power to mitigate any effects on  
16 the workers, to make sure that the workers are really  
17 protected. It's not just the product that's  
18 protected, but that the workers are protected in a  
19 safe environment, that they can go home to their  
20 families.

21 So, these are some of our concerns.  
22 Our concerns also rise with the idea of wetlands. I  
23 remember where I lived in Baldwinsville, we had an  
24 awful lot of problems with water. Well, with all of  
25 this concrete being built, which is great, all of

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 this being taken over, we have to have wetlands. And  
3 from what I've heard, if Micron could make a  
4 commitment that the wetlands would be greater than  
5 what they anticipate now to create, to take place --  
6 to take the place of the wetlands that now exist, we  
7 would really appreciate it.

8 Because all those people who are  
9 around them and the whole community will depend on  
10 the fact that there will be no flooding. And you  
11 know that's been in the news elsewhere. Som we're  
12 con -- concerned about the safety of the environment,  
13 concerned about the safety of the water, concerned  
14 about the safety of the employees and we want them to  
15 have good paying jobs.

16 And in that sense, I hope that Micron  
17 doesn't take the -- the kinds of things that other  
18 employers have done, like T.C.G. Player and other  
19 employers where they actively fight against the  
20 union, threaten the unions and threaten them to get  
21 out.

22 So please, Micron, make good on real  
23 commitments that you've heard here today with other  
24 speakers. Thank you very much. Appreciate it.

25 MR. DAVIS: Thank you. Anybody else

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 that hasn't spoken that would like to speak? Mary,  
3 would you like to come back up?

4 MS. THOMPSON: No.

5 MR. DAVIS: I hit -- I cut you out  
6 before. No?

7 MS. THOMPSON: That's okay.

8 MR. DAVIS: Okay. Thank you. Anybody  
9 else? Okay. This is a notice hearing that will end  
10 at one, so people again could arrive during their  
11 lunchtime to speak. So, it will remain open as I get  
12 more Coke, I might have one coming my way as we  
13 speak. Perfect. All right. Next speaker, Richard  
14 Wood. You hardly had time to settle into your seat.

15 MR. WOOD: Yeah, really.

16 MR. DAVIS: Yes.

17 MR. WOOD: Where do I --

18 MR. DAVIS: Microphone right here in  
19 front of you.

20 MR. WOOD: Oh, excellent.

21 MR. DAVIS: Yeah. You will have three  
22 minutes to speak. At the end of the three minutes, I  
23 will ask you if there is any other speakers. If  
24 there is an additional opportunity for you to speak,  
25 you will have an additional three minutes, okay?

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. WOOD: Thank you.

3 MR. DAVIS: Sure.

4 MR. WOOD: Sorry about that. I didn't  
5 get my --

6 MR. DAVIS: That's Okay. Your time  
7 hasn't started yet.

8 MR. WOOD: All right.

9 MR. DAVIS: You can stand at the mic  
10 and face up if that's -- so that the Stenographer can  
11 hear you.

12 MR. WOOD: Oh, Of course.

13 MR. DAVIS: Yes. Thank you.

14 MR. WOOD: Sorry about this. Okay.  
15 So, good afternoon. My name is Richard Wood. I'm a  
16 licensed professional engineer in New York State. I  
17 represent the Faith Impact Team of the Central  
18 Crossroads Conference of the Upstate New York Synod  
19 of the Evangelical Lutheran Church in America.

20 My comments today speak to the need  
21 throughout the life of the Micron facility. I'm  
22 terribly sorry about this. My comments speak to the  
23 need throughout the life of the Micron facility for a  
24 strong mutual good neighbor relationship with open  
25 two-way communication between the community and

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Micron.

3 To help maintain this relationship, we  
4 urge, that is our consultancy, the community  
5 engagement board be created to monitor and address  
6 the many facets of facility construction, operation  
7 and community impact that are identified in the  
8 D.E.I.S. as well as impacts that may well arise over  
9 facilities lifetime that are not identified.

10 The C.E.B., this Community Engagement  
11 Board, should be charged and empowered to monitor  
12 facility operation regulation and interaction with  
13 the community and to provide a strong open  
14 communication channel with Micron and the community,  
15 with and between Micron and the community.

16 The C.E.B. could be an expansion of  
17 the current community engagement committee which so  
18 far appropriately has addressed itself mainly to  
19 economic impacts and community benefits, or it could  
20 be a new body charged with monitoring facility  
21 operation and interaction with the community.

22 The role of the D.E.I.S. is to provide  
23 factual basis for deciding between facility options  
24 including the option of no facility based on present  
25 knowledge. Many impacts can be addressed at this

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 stage only by reference to compliance with applicable  
3 regulations. The application of regulations and in  
4 some cases the regulations themselves cannot be  
5 specified clearly at this stage.

6           Impacts not foreseen in the D.E.I.S.  
7 may arise as well. Thus, many impacts will be fully  
8 understood only in the future when details of  
9 regulation, facility technology and facility  
10 operation are established and actual operations  
11 observed. Further, many changes in technology,  
12 environmental conditions, facility operation, and the  
13 surrounding community can be expected over the forty-  
14 year life of this facility.

15           Thus, community understanding of an  
16 engagement with facility impacts on the environment  
17 and the community must be an ongoing process  
18 sustained by the C.E.B. This process must be  
19 informed by detailed understanding of facility  
20 technology, construction, operation, impact  
21 monitoring and interaction with the environment and  
22 the community.

23           MR. DAVIS: Ten seconds.

24           MR. WOOD: Ten seconds?

25           MR. DAVIS: Ten seconds.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. WOOD: Okay.

3 MR. DAVIS: You can have additional  
4 opportunity but --

5 MR. WOOD: Okay.

6 MR. DAVIS: -- finish up right now and  
7 -- and how about that --

8 MR. WOOD: Okay.

9 MR. DAVIS: -- you continue your chain  
10 -- your train of thought.

11 MR. WOOD: Yup. In closing, the  
12 Micron facility will bring many benefits and changes  
13 to Central New York. The Faith Impact Team wishes to  
14 welcome Micron as a neighbor both now and into the  
15 future. Micron will bring many opportunities for  
16 community interaction and growth.

17 To embrace these opportunities and the  
18 changes they will bring a good neighbor relationship  
19 with strong open communication is essential. This  
20 includes understanding the facility and its  
21 operations and impacts. We hope that Micron will  
22 engage the community in decisions affecting Central  
23 New York and our environment with openness and good  
24 faith.

25 We believe that a strong adequately

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 resourced Community Engagement Board is essential to  
3 create and maintain this relationship to benefit the  
4 entire community. The faith impact team looks  
5 forward to participating in this relationship. Thank  
6 you.

7 MR. DAVIS: Thank you. Any other  
8 speakers that would wish -- wish to speak? Okay.  
9 Please, come forward. Please, state your name and  
10 spell it for the Stenographer please.

11 MR. CAPLAN: Peter Caplan, C-A-P-L-A-  
12 N. I live in Baldwinsville. Not having had the  
13 opportunity to review the E.I.S., I wanted to, one,  
14 find out within that community fund that Micron is  
15 setting aside for various improvements, if there's  
16 any thoughts about supporting or underwriting some  
17 alternative energy for the Micron employees that are  
18 going to be buying homes, whether or not there is any  
19 provisions for solar or wind power to offset what  
20 Micron might be using and whether or not they would  
21 be investing in community energy programs throughout  
22 the region.

23 I was also interested, has there been  
24 any assessment on the -- the businesses that will  
25 come in as a result of Micron coming here? Have they

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 done an economic analysis? And again, I apologize  
3 for not having had the opportunity to read the E.I.S.  
4 But I'm just curious what the downstream economic  
5 impact beyond Micron is, if they are anticipating  
6 other businesses, industries that are planning on  
7 relocating in support of Micron or as a means of just  
8 providing additional services.

9 So, I wasn't sure if that was included  
10 or if there are some insights as to what other  
11 economic activities would be a result of Microns  
12 coming to town. And I appreciate the time. Thank  
13 you.

14 MR. DAVIS: Thank you. Any other  
15 speakers that would like to speak at this time?  
16 Okay. I will -- again, it's twelve thirty-seven.  
17 Well, come --

18 MR. WOOD: I have a couple of  
19 additional points.

20 MR. DAVIS: Please -- please stand  
21 back up. Yeah, you can make additional points at the  
22 microphone. Thank you.

23 MR. WOOD: All right. Okay. Just a  
24 couple of additional things in my statement. Some  
25 examples of facility impacts that should be addressed

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 by a Community Engagement Board process include,  
3 without limitation the following. Ground water  
4 impacts that may be observed during construction as  
5 identified by groundwater monitoring, impacts on  
6 wetland species habitats. So, we've certainly have  
7 done analysis, but until we actually observe what  
8 happens, there may be differences.

9 Advances in pollution control  
10 technologies such as management of P.F.A.S.,  
11 understanding that regulations require the use of  
12 best available technology. Advances in facility  
13 process technology and operating methods which are  
14 almost certain to come over the life of this facility  
15 and create perhaps important changes. So to fulfill  
16 this -- fulfill this role, the C.E.B. must have a  
17 close collaborative relationship with plant  
18 management and communication channels with the  
19 public, such as a website and public meetings.

20 It must have sufficient resources to  
21 implement its mission, including funding for  
22 technical and communication support. And that's the  
23 additional points that I was not able to get into my  
24 previous statement. So, thank you very much.

25 MR. DAVIS: Thank you. And for the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 record, that was Richard Wood for the transcript.  
3 Thank you. Any further comments to be made? Okay.  
4 Please, come back to the mic. State your name again,  
5 please.

6 MR. SPRETER: Bill Spreter, New York  
7 State Alliance for Retired Americans. I have a  
8 further question or comment. I know in some  
9 industrial development agencies when a company comes  
10 in, they get tax breaks. It's frequently those tax  
11 breaks that run school taxes. And the schools here  
12 need the money to keep on going.

13 And it's, of course, from the property  
14 taxes a lot of it. Much many people don't like it,  
15 but if more of that money gives -- comes to a tax  
16 break to a facility coming into that area and  
17 deprives a school of needed money, then the rest of  
18 the taxpayers have to take up the burden.

19 So, I would hope under any facilities  
20 agreement that the schools in this area, the whole  
21 Central New York area, will not be adversely impacted  
22 by a lack of tax revenue as a result of some  
23 giveaways to a Micron. We love Micron. We'd like to  
24 see it come in. We'd like to see it thrive and  
25 people thrive with it, but that's part of the future.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 Another concern that I would have is  
3 that Micron wants to be a good neighbor. And I think  
4 that's what this gentleman was talking about. Micron  
5 needs to be a good neighbor and keep in communication  
6 with the people about all the other things that are  
7 going on with Micron and how it affects them.

8 And we know that we've had a neighbor  
9 before called Allied Chemical that created an awful  
10 lot of problems for us, for the future. And while  
11 we're an organization of retirees, we look to the  
12 future and we're concerned about what will happen to  
13 our kids and our grandkids if something gets out of  
14 hand in terms of the chemicals in the water or in the  
15 air.

16 And I know that through new  
17 technology, that probably can be mitigated. So we  
18 hope that Micron invests in that as well. Thank you.

19 MR. DAVIS: Thank you. Again, any  
20 further speakers?

21 MR. WOOD: Yeah, one more time.

22 MR. DAVIS: Sure. Yes.

23 MR. WOOD: I would just like to say  
24 thank you for being here and for providing this  
25 process. I think it's important. Appreciate the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 opportunity. Thank you.

3 MR. DAVIS: And again, that was  
4 Richard Wood for the -- appreciate it. Further  
5 speakers, commenters at this time? We may have some  
6 more folks that arrive within the next nineteen  
7 minutes that wish to speak like Mr. Wood did. So,  
8 this remains open for the next nineteen minutes. You  
9 can all sit and -- and wait for that time period. It  
10 will not officially close until one o'clock. Thank  
11 you.

12 (Off the record; 12:42 p.m.)

13 (On the record; 12:59 p.m.)

14 MR. DAVIS: For anyone in the  
15 audience, if there's any more speakers that would  
16 like to speak in this morning public hearing session.  
17 Okay. Hearing none, I'm going to adjourn the hearing  
18 at this time for this morning session.

19 Any comments that the public would  
20 like to be included in the administrative record for  
21 this hearing need to be presented and submitted to  
22 our staff at this hearing. Please leave any prepared  
23 remarks with staff if you wish to leave your prepared  
24 remarks.

25 If you elected not to speak, you may

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 still submit written comments until August 11 to  
3 OCIDA and C.P.O. using the email and mailing address  
4 that have been posted on the screen behind me and are  
5 also available on both the OCIDA and C.P.O. websites.  
6 Written comments carry the same weight as comments  
7 given here today.

8 We appreciate having you turn out to  
9 make your comments. We respect all your comments.  
10 And you can be assured that they'll be given the  
11 appropriate consideration in our evaluation regarding  
12 the -- this proposal. Thank you very much. The  
13 hearing is now adjourned.

14 (Off the record; 01:00 p.m.)

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 (The public hearing commenced at 6:00  
3 p.m.)

4 MR. PETROVICH: Good evening,  
5 everyone. Before we get started here, I want to make  
6 the audience aware that we have a Spanish-language  
7 interpretation, so, Carlos.

8 (Translator speaks)

9 Okay. Thank you. Good evening.  
10 Thank you for coming. Before we get started with  
11 this session, we did hear of a couple of housekeeping  
12 matters.

13 There are obviously illuminated exit  
14 signs at the back of this auditorium, and we also  
15 have restrooms around the corner from the exits as  
16 well, if those are needed. We also have, in case of  
17 emergency, law enforcement security personnel on site  
18 this evening.

19 We have, in addition, American Sign  
20 Language, and as we just heard, a Spanish-language  
21 interpreters available for anyone that needs -- in  
22 the audience that needs those services. And should  
23 they be required, please let us know at the front of  
24 the registration desk, and we will accommodate you in  
25 that regard.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 My name is Robert Petrovich. I'm the  
3 Executive Director of the Onondaga County Industrial  
4 Development Agency, or OCIDA. I, along with OCIDA's  
5 legal counsel, Jeff Davis, will be moderating this  
6 public hearing this evening.

7 Seated with me at the table is David  
8 Frankel, who is the Director of the Environmental  
9 Division of the CHIPS Program Office, or C.P.O.,  
10 which is part of the U.S. Department of Commerce.  
11 Mr. Frankel will be making his brief opening --  
12 opening remarks shortly.

13 I would also like to introduce  
14 Lieutenant Colonel Robert Burnham, Commander of the  
15 Buffalo U.S. Army Corps of Engineers. Colonel  
16 Burnham will be making opening remarks as well in a  
17 few minutes. And also seated at the table is Martin  
18 Wargo, the Chief of the Buffalo District Regulatory  
19 Branch.

20 The purpose of this evening's hearing  
21 is to give members of the public an opportunity to  
22 provide verbal comments on Environmental Review of  
23 Micron's proposed Semiconductor Manufacturing Project  
24 and Connected Actions, which OCIDA and C.P.O. are  
25 jointly conducting under the New York State

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       Environmental Quality Review Act, or SEQRA, and the  
3       National Environmental Policy Act, or NEPA, as well  
4       as to provide comments on the review of Micron's  
5       proposed impacts to the waters of the United States  
6       under Section 404 of the Clean Water Act, which is  
7       being conducted by the Army Corps of Engineers.

8                   OCIDA and C.P.O. released the Draft  
9       Environmental Impact Statement, or D.E.I.S., for the  
10      Micron project on June 25, 2025. The Army Corps of  
11      Engineers issued the Public Notice of Micron's permit  
12      application under Section 404 of the Clean Water Act  
13      on June 27, 2025.

14                   Information on how to provide written  
15      comments on either the Draft E.I.S. or the Section  
16      404 review is displayed on alternating slides on the  
17      stage -- on the screen on the stage. For -- most of  
18      you in attendance who are familiar with the proposed  
19      project. However, I would like to provide a brief  
20      review of what has occurred thus far in the  
21      environmental review process.

22                   On July 14, 2023, OCIDA received an  
23      Application for Financial Assistance from Micron New  
24      York Semiconductor Manufacturing, L.L.C.

25                   As most of you are aware, Micron

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       intends to invest approximately one hundred billion  
3       dollars over the next twenty years to build a  
4       leading-edge semiconductor manufacturing campus in  
5       the Town of Clay, the expanded White Pine Commerce  
6       Park located at 5171 Route 31 in the Town of Clay,  
7       New York.

8                       The proposed project must be reviewed  
9       under SEQRA. In accordance with the requirements of  
10       SEQRA, on September 24, 2023, OCIDA declared itself  
11       as a leading agency for SEQRA -- for SEQRA purposes.  
12       OCIDA has issued a Positive Declaration due to the  
13       Proposed Project's potential to result in one or more  
14       significant adverse impacts and declared its intent  
15       to prepare a Draft Environmental Impact Statement.

16                      OCIDA then undertook the next step,  
17       which is scoping. Scoping is a process that develops  
18       a written document, the Scope, which outlines the  
19       topics and analyses of potential environmental  
20       impacts to be studied and addressed in the Draft  
21       E.I.S.

22                      Following public comment, OCIDA  
23       adopted the Final SEQRA Scope on December 14, 2023.  
24       The public was also previously given an opportunity  
25       to comment on the Scope for this project in March

1           7/24/2025 - Micron Semiconductor Manufacturing Project  
2           2024. Following the adoption of the Final SEQRA  
3           Scope, OCIDA engaged with C.P.O. and others to begin  
4           the process of preparing the Draft E.I.S., which  
5           evaluates the potential environmental effects of the  
6           proposed project.

7                               During development of the Draft  
8           E.I.S., OCIDA regularly consults with other SEQRA --  
9           SEQRA involved and interested agencies, including the  
10          New York State Department of Environmental  
11          Conservation and the New York State Department of  
12          Transportation, to ensure that all environmental  
13          impacts were identified and fully evaluated in the  
14          Draft E.I.S.

15                              On June 2025, OCIDA determined that  
16          the Draft E.I.S. was complete from commencement of  
17          the public review, pursuant to SEQRA, and opened the  
18          public comment period. The purpose of this evening's  
19          session is for the public hearing -- at this public  
20          hearing is to receive comments on the Draft E.I.S.,  
21          as well as for the Section 404 review, which Colonel  
22          Burnham will outline shortly.

23                              Please note, this is not a question-  
24          and-answer session. We will not respond or reply to  
25          comments expressed by the public during this hearing.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 We will likewise not respond to any questions posed  
3 by the public during this hearing. Think I said that  
4 twice. OCIDA and C.P.O. will respond to all comments  
5 as part of the Final E.I.S.

6 This is an opportunity for the public  
7 to place their comments on the Draft E.I.S. and  
8 Section 404 review on the record. OCIDA encourages  
9 the public to participate in the process. This is  
10 your opportunity to have your voice heard. However,  
11 this hearing is not your only opportunity to submit  
12 comments on the E.I.S. -- Draft E.I.S. or the 404  
13 review.

14 If you do not wish to make a comment  
15 here this evening at the -- at this hearing, you may  
16 also submit your comments on the Draft E.I.S. or the  
17 404 review, which Colonel Burnham will address  
18 shortly, using the information displayed on the  
19 alternating slides in this room.

20 We have extra copies of notices on how  
21 to comment available for you if you wish to take a  
22 copy with you. The OCIDA notice and contact  
23 information for submitting comments can also be found  
24 on OCIDA's website. Public comments will be accepted  
25 through August 11 of 2021.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Your input both verbal comments  
3 received here tonight as well as written comments  
4 received by OCIDA and CPO will help C -- OCIDA and  
5 C.P.O. prepare a Final E.I.S., which will be released  
6 after all comments have been received and considered.  
7 It's important to note that equal weight will be  
8 given to both verbal and written comments.

9 There is a Court Reporter here who is  
10 making a record of all comments made. We ask those  
11 in attendance to please show respect for the person  
12 that is speaking, even if you do not agree with the  
13 comment. And also, please hold applause or other  
14 noise down so that we may make an accurate record of  
15 this proceeding.

16 At this juncture, I would like to turn  
17 the microphone over to David Frankel.

18 MR. FRANKEL: Good evening, ladies and  
19 gentlemen. As Bob mentioned, my name is David  
20 Frankel. I am the Director of the Environmental  
21 Division of the CHIP Program Office, or C.P.O., which  
22 is part of the U.S. Department of Commerce.

23 C.P.O. is the lead federal agency for  
24 the environmental review of this project under the  
25 National Environmental Policy Act, or NEPA, based on

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 C.P.O.'s role in providing direct funding to Micron  
3 for the proposed semiconductor manufacturing  
4 facility.

5 When a project requires both a federal  
6 and state environmental review, it is not uncommon  
7 for lead agencies at the federal and state level to  
8 work together to prepare a single comprehensive  
9 environmental document. C.P.O. has been working with  
10 OCIDA to prepare the Draft E.I.S. on that basis. The  
11 E.I.S. is a joint document under NEPA and SEQRA. My  
12 role today is to accept all comments as part of the  
13 NEPA process on behalf of C.P.O. and the U.S.  
14 Department of Commerce.

15 C.P.O. also encourages public  
16 participation in the process and welcomes all  
17 comments on the Draft E.I.S. We will give equal  
18 weight to verbal comments at today's hearing and  
19 written comments submitted to CPO or OCIDA by August  
20 11th. As Bob noted, after we close the public  
21 comment period, CPO and OCIDA will respond to all  
22 comments received when we prepare the Final E.I.S.

23 While C.P.O. and OCI -- OCIDA jointly  
24 prepared this E.I.S., because it is a comprehensive  
25 document that identifies potential environmental

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       effects of the Micron project, it will also serve as  
3       a resource for other agencies conducting their own  
4       reviews of the Micron project in other connected  
5       actions to the project.

6                   On that note, I will now like to turn  
7       it over to Lieutenant Colonel Burnham for open  
8       remarks to the U.S. Army Corps of Engineers. Thank  
9       you for your attendance today at this public hearing,  
10      and we appreciate your participation in the process.

11                   MR. BURNHAM: Thank you, David. Good  
12      evening, ladies and gentlemen. Again, I'm Lieutenant  
13      Colonel Rob Burnham, Commander of the Buffalo  
14      District U.S. Army Corps of Engineers. I will be the  
15      presiding -- I will be the Presiding Officer for the  
16      Clean Water Act Section 404 aspect of this public  
17      hearing on behalf of the U.S. Army Corps of  
18      Engineers.

19                   Seated at the desk here with me to my  
20      right, your left, is Mr. Martin Wargo. He's the  
21      Chief of Buffalo District's regulatory branch.

22                   While the Department of Commerce is  
23      the lead federal agency on the E.I.S. for this  
24      project, the Corps of Engineers is a cooperating  
25      agency on the E.I.S. and we are here to specifically

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       obtain information evidence and receive public  
3       comment to assist in the regulatory review of a  
4       permit application by Micron New York Semiconductor,  
5       as well as for two connected actions proposed by  
6       National Grid for a gas main and electric substation  
7       expansion.

8                       Because the Micron and National Grid  
9       projects proposed the placement of fill into  
10       federally regulated wetlands and streams,  
11       collectively referred to as the Waters of the United  
12       States, permits are required from the Corps of  
13       Engineers pursuant to Section 404 of the Clean Water  
14       Act.

15                      Department of the Army authorization  
16       is therefore required for the following. For the  
17       Micron Semiconductor Manufacturing Campus, the  
18       permanent loss of approximately one hundred and  
19       ninety-four acres of federally regulated wetlands and  
20       temporary impacts to an additional two point nine  
21       five acres, as well as the permanent loss of six  
22       thousand two hundred and eighty-three feet of  
23       federally regulated streams and ditches and temporary  
24       impacts to an additional one hundred and thirty feet.

25                      For the National Grid substation work,

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       the permanent impact to approximately four acres of  
3       wetlands and one thousand five hundred and forty-five  
4       feet of regulated ditches, as well as temporary  
5       impacts to an additional eleven acres of wetlands and  
6       six hundred and eighty-three feet of streams.

7               And for the National Grid gas main  
8       work, the permanent impact to approximately point  
9       zero eight seven acres of wetlands, conversion of  
10      point zero three three acres of forested wetlands,  
11      and temporary impacts to approximately seven point  
12      four acres of wetlands and one hundred and seventy-  
13      five linear feet of streams.

14              The purpose of the proposed work is to  
15      -- to construct and operate a commercially viable and  
16      globally competitive advanced DRAM fabrication  
17      facility on a single unified site in New York State.

18              The Corps of Engineers is neither a  
19      component for, nor an opponent of, the proposed  
20      projects. Our role is to determine whether these  
21      proposed fill activities are contrary to the public  
22      interest or not. This hearing will play an important  
23      part in that determination.

24              This hearing will be conducted  
25      according to the procedures set forth in Title 33 of

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the Code of Federal Regu -- Regulations Part 327.  
3 The public comment period for the Corps of Engineers  
4 Public Notice also closes on August 11, 2025. Hard  
5 copies to the Public Notice are available in the  
6 registration area.

7 Please note that there is a typo on  
8 some of the copies of the Public Notice indicating  
9 the comment period closes on August 18. The correct  
10 date is August 11. Details on how to comment on the  
11 proposed wetland and stream impacts may be found in  
12 the Public Notice as well as displayed on the screen  
13 in the front of the room.

14 The comments made here plus all  
15 submitted written information will become part of the  
16 Corps of Engineers Section 404 administrative record  
17 and will be used to evaluate the probable impacts,  
18 including the cumulative impacts, of the proposed  
19 activity on the public interest.

20 The ultimate decision on the submitted  
21 applications will reflect the national concern for  
22 both the protection and utilization of important  
23 resources. The Corps of Engineers permit decision  
24 will come after completion of the E.I.S. because we  
25 are also relying upon that for -- for purposes of

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 NEPA compliance.

3 Based on time limitations, if anyone  
4 desires an opportunity for rebuttal to any of the  
5 information presented at this hearing, we ask you to  
6 -- to please do so in writing and provide that to  
7 someone at the registration table and it will be --  
8 become part of the administrative record.

9 General comments may also be submitted  
10 until close of public comment period. Thank you and  
11 I look forward to hearing from your comments tonight.

12 MR. FRANKEL: Thank you, Colonel  
13 Burnham. I would now like to turn the administration  
14 of the public hearing over to OCIDA's Counsel, Jeff  
15 Davis, who will go through the process and how we  
16 will conduct the hearing and receive comments. So,  
17 Jeff?

18 MR. DAVIS: Thank you. Good evening.  
19 If you do wish to come forward and make a comment  
20 this evening, I'll ask that you please state your  
21 name and address and do so clearly and slowly so that  
22 the Reporter can make an accurate record.

23 Comments will be limited to three  
24 minutes to afford everyone who wishes to comment an  
25 opportunity to do so. There is no ceding of time to

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       others. If there's time at the end of the session,  
3       speakers may return to the microphone and we -- and  
4       will be afforded an additional three-minute  
5       opportunity to speak.

6                If anyone has spoken at the early --  
7       this morning session or this afternoon session and  
8       you wish to speak again, we will take those comments  
9       after everyone in this session has had their first  
10      opportunity to speak. However, time permitting, our  
11      goal is to allow everyone who wishes to speak the  
12      opportunity to do so.

13               So, I'm going to call up the names.  
14      We have microphones at the front of each aisle, and  
15      I'll call names in order. I'll call the first and  
16      then the second speaker, so the person on deck, if  
17      you will, so that we can move through as quickly as  
18      possible, getting you -- so everyone has an  
19      opportunity to speak.

20               I just ask that you move to the front  
21      of the microphone quietly to not interfere with the  
22      current speaker. I also ask if you could please take  
23      your cell phones and turn them to mute or off so that  
24      no one is interrupted when they are speaking.

25               With that, our first speaker will be

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Andy Mager, and our second speaker will be Nicholas  
3 Gernhardt. And I may have mispronounced that last  
4 name, but I think it's G-E-R-N-H-A-R-A-T.

5 MR. MAGER: Good evening. Thank you  
6 for the opportunity to speak here. My name is Andy  
7 Mager, M-A-G-E-R, address 559 Buckingham Avenue in  
8 Syracuse, 13210.

9 I'd like to start by recognizing that  
10 we gather tonight on the land of the Onondaga Nation,  
11 a sovereign indigenous nation who has inhabited this  
12 region and sought to teach us how to live  
13 harmoniously with all of the natural world. And I  
14 hope that all will keep that in mind as we move  
15 forward with considering this project.

16 I also want to respectfully say that I  
17 appreciate hearing the desire to hear public comments  
18 from a number of you. But if you really wanted the  
19 public to be able to comment thoughtfully on this,  
20 you would not hold one single public hearing. You  
21 would not limit the comment time to forty-five days.

22 Onondaga County held this report for  
23 three months. According to many sources that  
24 violated public notice laws, so that should have been  
25 available to the public. Those of you considering it

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       for Onondaga County largely are paid professionals  
3       who do this on your work time. Those of us in the  
4       public are given half that time this -- when we're  
5       not professionals doing that, when we have our own  
6       jobs, our own families, our own lives.

7               So, I need to start by saying while  
8       I've followed this project for -- since discussion  
9       about it began, I've not had the time to review all  
10       the documents in -- in any -- by any means. But I  
11       bring a number of concerns.

12               And my overall perspective on this is  
13       that I ask that we move forward in a way that seeks  
14       to maximize the benefit for those who are already  
15       hurting in our community, those without jobs, those  
16       living in poverty, those who are marginalized in  
17       various ways.

18               And that we also seek to minimize the  
19       harms because a project of this scale is going to  
20       cause harm. It's going to use vast quantities of  
21       water and electricity of -- all of which are limited.

22               So, in terms of those environmental  
23       issues specifically, right? There's a massive energy  
24       demand for this project, right? I've heard it's the  
25       same amount of energy as consumed by the States of

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Vermont and New Hampshire. New York State has a  
3 really important commitment to reducing our  
4 greenhouse gas emissions and increasing renewable  
5 energy. That needs to be considered as part of this.

6 I don't know exactly what's included  
7 in the plan, but I urge that it -- that Micron be  
8 mandated to have very significant investments in on-  
9 site renewable energy, wind energy, solar energy.  
10 And that this idea that --

11 MR. DAVIS: Ten seconds.

12 MR. MAGER: -- that nuclear power is  
13 renewable needs to be cast aside because it's not  
14 renewable. The last thing I'll say is that in  
15 projects like this, the way to protect communities is  
16 to have a community benefits agreement, so that  
17 there's a guarantee that what is projected to happen  
18 does happen. So, I hope that that will happen moving  
19 forward. Thank you.

20 MR. DAVIS: Thank you. Nicholas and  
21 then next will be Christy Dannible.

22 MR. GERNHARDT: Hi, my name is  
23 Nicholas Gernhardt, and my address is 460 Stafford  
24 Ave, Syracuse, New York, 13206. I just wanted to  
25 come tonight to speak in support of the Micron

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       project and to share my gratitude with the  
3       opportunity for the community to comment on the  
4       project.

5                   I'm a lifelong member of Central New  
6       York. I do believe that Micron will have a positive  
7       impact on our community. And I -- I believe that the  
8       project supports strong labor practices, as well as  
9       workforce engagement and apprenticeships. It  
10      includes investments in education and skill  
11      development.

12                   I also believe the plan emphasizes  
13      meaningful, local and sustainable economic  
14      investment. I believe that overall, it promotes long  
15      term community growth. And I believe that having  
16      this project here is a good idea because I think New  
17      York State supports the strong environmental  
18      practices that from what I've seen Micron has shown.

19                   And I think if this project is held in  
20      a different area, that those standards might not be  
21      upheld the way they would here. So, I think that's  
22      important to note, and that's what I got. Thank you.

23                   MR. DAVIS: Thank you. Christy  
24      Dannible. And after that would be Guy Hart, Jr.

25                   MS. DANNIBLE: Hi, my name is Christy.

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       Thank you for giving us this opportunity. And I have  
3       some things written down. I am actually opposed to  
4       having this plant here because of the environmental  
5       impact that it could possibly have.

6                   Some of the past Micron plants in  
7       Manassas, Virginia have already had pollution  
8       citations and stuff and health issues that have been  
9       coming up. Also, Micron is going to be generating a  
10      substantial amount of wastewater containing various  
11      chemicals, some potentially hazardous and designated  
12      as forever chemicals.

13                   What are the precise details of  
14      Micron's wastewater treatment processes in removing  
15      harmful substances before they discharge into the  
16      county sewage system? Also, what are the specific  
17      plans for the long-term management and disposal of  
18      hazardous waste generated by the plant, given that  
19      they could also be shipping to facilities across  
20      several states?

21                   What are the plans for robust,  
22      independent oversight and enforcement of  
23      environmental regulations to prevent accidents,  
24      leaks, or spills during chemical transport, storage,  
25      or usage?

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 Micron's operations are projected to  
3 emit nearly five million tons of carbon dioxide  
4 annually. That's equivalent to the emissions of  
5 about five hundred thousand cars, potentially  
6 jeopardizing the state's climate goals. What  
7 specific, independently verifiable measures will  
8 Micron implement to significantly reduce these  
9 emissions and ensure the project aligns with state  
10 and federal climate goals?

11 Also, Micron's construction are -- is  
12 going to impact the wetlands and potentially displace  
13 endangered species like the Indiana bat. What are  
14 the detailed and scientifically sound mitigation  
15 plans to address the loss of these wetlands and  
16 habitats and to project -- and to protect endangered  
17 species?

18 Will there be independent experts  
19 involved in evaluating and monitoring the  
20 effectiveness of mitigation measures, and will their  
21 findings be publicly accessible? It's also -- Micron  
22 is projected to create significant traffic  
23 congestion, particularly during the initial  
24 construction phase, what specific and immediate  
25 infrastructure upgrades are planned to mitigate

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 traffic impacts during construction --

3 MR. DAVIS: Ten seconds.

4 MS. DANNIBLE: -- in the long-term  
5 operation? Thank you.

6 MR. DAVIS: Thank you. Guy Hart Jr.,  
7 and then Austin Miller.

8 MR. HART: Good evening, Guy Hart Jr.,  
9 6 Broadhead Drive, Cicero. So, I'm a lifelong  
10 resident of Central New York. I lived on Oneida Lake  
11 most of that time. I moved in and out of town for  
12 university studies and chasing some things in the  
13 south, but in general, I've lived here.

14 And I remember Oneida Lake when it was  
15 brown because everybody's raw sewage went into the  
16 lake, on the whole lake. And I had an uncle who  
17 hasn't been here in twenty years and was out fishing  
18 with my dad yesterday, and he said, I couldn't  
19 believe we are in fifteen feet of water I could see  
20 all the way to the bottom.

21 And I informed him that Oneida Lake is  
22 now a pelagic lake, how much cleaner it is than it  
23 used to be. Thanks partly to invasive species from  
24 ships coming through the lake, but also mostly  
25 because of the state's program with sewage treatment

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 around the lake.

3 And that kind of example is what I  
4 look at when I see a company like Micron come into  
5 Syracuse. There are impacts that they will make, a  
6 couple hundred acres of wetland that are going to  
7 have to be mitigated. I would love to get that kind  
8 of treatment I know I never will, but all kidding  
9 aside, we need those chip fabs in this country. They  
10 are going to come to this country. They are going to  
11 have an environmental impact. There's going to be  
12 carbon footprint from those chip fabs coming to this  
13 country, whether it's in Texas or it's in Michigan or  
14 it's in Syracuse.

15 For too long, our region has seen a  
16 drain of our brain power, our population, and our  
17 resources to other places. And I think this is the  
18 opportunity for Syracuse to sort of be that shining  
19 city on a hill where we welcome something like this  
20 coming into our region. It works, and then there's  
21 more of it.

22 I'm amazed by how many people I talk  
23 to who go to places like Asheville, North Carolina,  
24 or they go to places like Charleston, South Carolina,  
25 or they move to somewhere like Boulder, Colorado, or

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       Denver, because they want to get away from all the  
3       things here that they don't like.

4                   And those places have high traffic and  
5       carbon footprints that are ever growing because the  
6       population is growing, because they welcome growth.  
7       So, I'm hoping that that's what we end up with here.  
8       I think it's a sensible project, and I just wanted to  
9       make my -- my statement about it. Thank you.

10                   MR. DAVIS: Thank you. Austin Miller,  
11       and after Austin will be Jim Wheeler.

12                   MR. MILLER: Thank you, everyone. My  
13       name is Austin Miller, and I have lived on 5756 New  
14       Street for the past nineteen years of my life. Spent  
15       the majority of my childhood here. Now, first of  
16       all, I would like to thank you all for allowing this  
17       public speaking event to happen, even if it is only  
18       for one event, for only one day.

19                   Now, I would like to start this off  
20       with asking a rhetorical question to everyone that  
21       lives here. How many times have you been bitten by  
22       mosquitoes this summer? How many times have we  
23       needed to fog out our neighborhoods with chemicals,  
24       many of which haven't been tested with long-term  
25       effects on non-animal house pets or minor wildlife,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 including insectoids, not in -- not including  
3 mosquitoes?

4 This will be our new reality we are  
5 heading to, I fear, if our natural -- if the natural  
6 habitat for bat populations around this area  
7 disappear. Bats that have already been in sharp  
8 decline around this area before Micron has started  
9 the project in this area.

10 The things that will be affected just  
11 from Micron opening the -- the buildings around these  
12 areas would be light pollution disturbing their  
13 flight paths, noise pollution driving them for  
14 roosts, polluted air and water conditions ruining  
15 their food supply, and because of the destruction of  
16 the forests, net -- they may not return to nests that  
17 they have to in the past.

18 It's not just bats; every bird, fox,  
19 amphibian, and pollinator will be impact -- impacted,  
20 especially the ones small enough to be silenced  
21 before they're even noticed. Many of these impacts  
22 will begin on day one if you guys opening Micron.

23 Now, I recognize Micron has pledged to  
24 restore wetlands and create new green spaces. I  
25 must, however, clarify that restoration is not

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       preservation. Many restorations efforts, especially  
3       in large developments done by other companies, end up  
4       had -- being thin, shallow, limitations of the  
5       ecosystems they -- they have replaced. You cannot  
6       bulldoze an area that takes decades or centuries to  
7       form naturally and plant with freshly planted trees  
8       in a line pond and call it equal.

9                       Now, with billions of dollars sitting  
10       in the -- sitting in this, I understand very clearly  
11       like this much -- like this project must continue on  
12       for the local community. However, I think that  
13       things -- I ask Micron and every official here today  
14       to make a real commitment when it comes to both  
15       serving the community and serving the environment  
16       that is around said community. Commit to clear,  
17       legal-binding protections for remaining habitats.  
18       Commit to wildlife corridors and habitat  
19       connectivity, not just buffer zones. And commit to  
20       third-party monitoring of air, water, and noise  
21       pollution from day one of opening.

22                       Because if you truly want to be a part  
23       of this community, then you do start protecting what  
24       makes this place worthwhile. Thank you.

25                       MR. DAVIS: Thank you. Jim Wheeler,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 and then Lauren Kochian.

3 MR. WHEELER: Hi, my name is Jim  
4 Wheeler, 9146 Mill Road. I've lived at that address  
5 for forty years. I have a brief operation. And my  
6 concern is that the -- I had a meeting at the Town of  
7 Clay, Army Corps of Engineers, and I asked the  
8 question to them as to what -- what's -- what's your  
9 answer to displacing all the wetlands? Where's the  
10 water going to go?

11 I know you're doing wetland mitigation  
12 twenty miles north. Water doesn't magically go from  
13 there up to the new wetlands. What's going to happen  
14 to all the extra water that's going to run through my  
15 property? And I'll probably end up with Lake Micron,  
16 I guess.

17 I asked the question before, and I was  
18 told I would get a response. To this date, I have  
19 not. That was like a year and a half ago or so. So,  
20 I guess that's my concern. Thank you.

21 MR. DAVIS: Thank You. Thank you,  
22 Lauren, and we have Ed Stronski.

23 MS. KOCHIAN: Hello, my name is Lauren  
24 Kochian. I'm the President of the Museum of Science  
25 and Technology in Downtown Syracuse. So, I want to

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       speak about my experience with Micron having worked  
3       with them for about three years and working in the  
4       field of STEM Science Education for about a decade.

5               What I've enjoyed about working with  
6       Micron is we're very likeminded institutions.  
7       They're incredibly committed to STEM education in the  
8       communities in which they exist. And we really do  
9       live in a STEM region. Micron is not the only STEM  
10      institution in Central New York, but they will be  
11      obviously one of the largest.

12              My experience with Micron is it's not  
13      just that they bring incredible financial resources  
14      to STEM education, but they also bring a really great  
15      boots-on-the-ground grassroots commitment to STEM  
16      education. K through twelve too, so they really  
17      understand that the commitment to education starts at  
18      an early age.

19              So, working with places like the MOST,  
20      YMCA Boys and Girls Club, and with schools, because  
21      it really is this sort of holistic approach that gets  
22      kids ready for all of the jobs that, quite frankly,  
23      our kids are not ready for.

24              All of these jobs in Central New York,  
25      in STEM, and when I say STEM, I mean everything. The

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       M is not just math, it's medicine and manufacturing.  
3       Our kids are not filling these jobs. A lot of these  
4       companies, the Lockheeds and all these companies are  
5       recruiting from other places. Companies like Micron  
6       specifically want the kids to come from our  
7       community, and that is really important.

8                   And -- and I think also Micron  
9       understands that if they help us prepare these kids  
10      for these types of jobs, and they don't actually work  
11      at Micron, even though these jobs are six-figure  
12      great jobs, and they do other things in our  
13      community, that's okay. They're still willing to  
14      make that investment for our kids.

15                   And I -- I think what's really  
16      important about that is I understand, as somebody who  
17      also cares about the environment, I understand the  
18      concerns about our environment, but let's face it,  
19      Chips are in everything everybody is holding in their  
20      hands today. Your phone, your computer, your video  
21      games, your car, your medical, everything that we  
22      use, chips are not going away. Those jobs are not  
23      going to go away. I don't think any of us are  
24      willing to give those up. So, the transformative  
25      effect that this can have on this community, I don't

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       think we should give that up.

3                   And I certainly don't think that we  
4       should overlook the opportunity that Micron could  
5       bring specifically to some of the poorest kids in our  
6       entire country right here in Central New York, and I  
7       think that's a really important thing to consider  
8       when you're also considering the environmental  
9       impact. So, I thank you for your time today.

10                   MR. DAVIS: Thank you. We have Ed and  
11       then Melissa Lopez.

12                   MR. STRONSKI: Hello, Ed Stronski, S-  
13       T-R-O-N-S-K-I, and I'm from Liverpool, New York.  
14       It's my understanding that liquid helium is used for  
15       cooling in the production of microchips. While  
16       helium is an inert gas and not a dangerous  
17       environmental contaminant, the energy, fluids,  
18       materials used to sustain and employ it in liquid  
19       form could be in the scope of hazardous materials.

20                   I haven't had a chance to look at this  
21       in-depth because of the short timeframe between the  
22       release of the report, but my cursory review of the  
23       D.E.I.S. found no mention of helium.

24                   So, what the question boils down to  
25       is, are the helium systems included in the report and

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 just not identified as related to the helium, or is  
3 this an omission that requires being addressed in the  
4 Final E.I.S. report? Thank you.

5 MR. DAVIS: Thank you. Melissa Lopez.  
6 And after Melissa would be Hilary-Anne Coppola.

7 MS. LOPEZ: Good evening, everybody.  
8 My name is Melissa Lopez, and I grew up here in  
9 Syracuse, New York. I'm a member of Local 81  
10 plumbers, pipefitters, HVAC technicians, and welders,  
11 and I just wanted to make sure that everybody knew  
12 that this project has the potential of benefiting  
13 every tradesperson in our Central New York area.

14 A lot of our guys have to travel even  
15 out of state just to support their family. And this  
16 could mean that the next generations of workers don't  
17 have to go anywhere. They can stay right here where  
18 their kids are, where their loved ones are.

19 They don't have to spend six months,  
20 you know, in Washington or in Texas and -- and just,  
21 you know, miss everything. Their -- their kids'  
22 games, their, you know, the graduation ceremonies,  
23 like, you name it. Our guys and gals have missed  
24 important family moments because they could not stay  
25 home for work, and this is so huge that I feel like

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 it's very important.

3 Yes, I -- I agree the environmental  
4 concerns are very important to -- to address and to  
5 solve in the future. However, I also believe that  
6 this has the potential to benefit every single person  
7 in the Syracuse -- Central New York area, including,  
8 you know, educators.

9 Like, the amount of money, I -- I was  
10 going to -- going to say, that is going to come into  
11 our school districts is -- is -- is going to be so  
12 huge because people are going to be coming from  
13 everywhere. So, I just want you guys to con -- to  
14 consider that. Thank you.

15 MR. DAVIS: Thank you. Hillary-Anne  
16 Coppola, and after Hillary will be Chip Fike.

17 MS. COPPOLA: Good evening, all.  
18 Thank you. My name is Hillary-Anne Coppola. I live  
19 in the Town of Fayetteville. I was born in the City  
20 of Syracuse, and I've lived in Onondaga County my  
21 whole life. I'm a graduate of SUNY E.S.F. and a  
22 local community organizer working around  
23 environmental issues that affect the land and water  
24 where we live.

25 I first want to begin by reminding

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 everybody that you cannot drink money. I think it's  
3 wonderful that Micron is investing so much in our  
4 community, but the fact of the matter is that there  
5 is the potential for polluting the entire Great Lakes  
6 watershed.

7 PFAS, forever chemicals, as well as  
8 hundreds of other chemicals are used to wash the  
9 chips. It's part of the process, and there is a lack  
10 of regulation in that area. That is a gap in the  
11 D.E.I.S. that needs to be addressed.

12 Another gap in the D.E.I.S. is  
13 mitigating greenhouse gas emissions. Micron has said  
14 that they will purchase clean energy credits. Those  
15 energy credits do not exist in the State of New York.  
16 There simply are not enough. The energy resources  
17 that Micron will need are beyond what we have the  
18 capacity for. Therefore, Micron needs to also invest  
19 in renewable energy infrastructure such as  
20 geothermal, solar, and wind, as well as improving  
21 battery storage and grid infrastructure.

22 I mentioned the PFAS and the chemicals  
23 issues. We already have a highly polluted lake.  
24 Yes, restoration has been done, but that is a  
25 Superfund site that will need ongoing remediation,

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       containment, and monitoring forever. That happened  
3       because of industrial pollution. We do not want that  
4       here again.

5                   Lastly, as folks probably know, this  
6       is the largest industrial development project in New  
7       York State history. It is the largest semiconductor  
8       facility plan in the U.S. to this point. Forty-five  
9       days is not enough. The document with its appendices  
10      are nearly twenty thousand pages long.

11                   It is not humanly possible to read  
12      that and get a good sense of what is being planned,  
13      what needs to be addressed, and submit that comment  
14      to the lead agencies. It is not enough. I am  
15      requesting hundred and twenty days for public  
16      comment.

17                   This was released during the summer.  
18      A lot of the public is very busy during the summer.  
19      A lot of the public may not be paying attention to  
20      comms where this information is going out and more  
21      time is needed in order for them to do that.

22                   In terms of the public interest that  
23      the Army Corps representative mentioned in terms of  
24      the wetlands, as a member of the public, my interest  
25      is in wetlands conservation, endangered species

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 conservation. We are in a mass extinction event.  
3 And mitigation and restoration for wetlands and  
4 habitats, roosting sites for the endangered bats  
5 needs to be done to the highest possible standard.  
6 Thank you very much.

7 MR. DAVIS: Thank you. Chip Fike and  
8 following Chip will be Raymond C. Yang.

9 MR. FIKE: Good evening. My name is  
10 Chip Fike. I live at 7567 Florian Way, Liverpool,  
11 New York. I've lived in this area -- excuse me, I've  
12 lived in this area since 1961. I've seen a lot of  
13 jobs leave. I want this to go through only because  
14 we need the jobs.

15 I respect everybody's views and  
16 comments, but if you go up to the Walmart in Central  
17 Square, there is a restored wetland to the left. I  
18 tell everybody this because they didn't get that  
19 Walmart built for almost ten years because of the  
20 comments and everything. They restored the wetland.  
21 It's not perfect. But after twenty years of being up  
22 there, the wildlife has come back, and it has gotten  
23 better over time.

24 The other thing I want to ask is we  
25 all know what's going on in the Pacific. We all know

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       what's going on with Taiwan. We all know who the --  
3       who the country is next door. If they decide to go  
4       in there, that chipset has better -- better ramp it  
5       up quick because like one person said, we all have  
6       microchips in everything in our lives now.

7                   If that country goes into that  
8       country, because I was in the military for twenty-  
9       five years, I was on peacekeeping missions in the  
10      Sinai, if that country goes in there, they're going  
11      to control ninety-five percent of the microchips in  
12      the United States -- or not in the United States, but  
13      in the world, excuse me.

14                   The Chips Are For America Act, as far  
15      as I'm concerned, it needs to ramp up very, very  
16      quickly. I understand the political applications.  
17      We have to have these talks and everything, but I  
18      think for me and for everybody else, this is -- this  
19      has to go real quick.

20                   Another thing I want to bring up real  
21      quick, who is going to pay for the twenty-seven-mile  
22      water pipeline from Lake Ontario? Okay. I did some  
23      research two years ago. Somebody said it was six  
24      hundred million dollars. I guarantee you it's  
25      probably over a billion dollars. And I guarantee you

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       it's probably going to be on us to pay for that.  
3       Micron's putting in hundred billion dollars. Could  
4       they pay for it? I mean, it would be nice if they  
5       could.

6                               And the only other thing is, has  
7       Micron or the State of New York talked to Onondaga  
8       County about the road infrastructure and everything?  
9       You see it going on in Cicero. It's a nightmare  
10      getting home. And it's a nightmare down near  
11      Brighton Ave. But I'm wondering if they're going to,  
12      you know, expand 31 all the way through Cicero.

13                              MR. DAVIS: Ten seconds.

14                              MR. FIKE: Okay, thank you. But  
15      that's all I have to say. Thank you very much.

16                              MR. DAVIS: Thank you. Raymond Yang -  
17      - Yang, excuse me. And after Raymond is Mike Greco.

18                              MR. YANG: Good evening, everyone. My  
19      name is Raymond Yang. I just purchased a property in  
20      Clay, zip code is 13041. And I'm originally from  
21      Taiwan. I spent the past twelve years in Downstate  
22      New York City, Queens.

23                              I had a good opportunity to learn all  
24      the projects because last year I went to be the  
25      interpreter for Mayor Ben Walsh and the executive

1           7/24/2025 - Micron Semiconductor Manufacturing Project  
2           Ryan Mahone, with a Taiwan Chiayi City Mayor, Mayor  
3           Huang. So, I'm very excited to know all the  
4           information.

5                               I'm so happy for all the community  
6           here because everyone is going to be very good  
7           because, you know, like the gentleman just mentioned  
8           that ninety-five percent of the chips are from  
9           Taiwan. And now the tension is, you know, with China  
10          is very significant right now.

11                              I do believe that we might need to  
12          rush, but I don't want to -- want people here to be  
13          the victims for all the, like, rough decisions. Like  
14          for the hearings, I believe we only have one hearing,  
15          and I think we should do more and do more research  
16          for that.

17                              My only question is, if everything is  
18          good, perfect, the worst-case scenario, something bad  
19          happens. Let's say there's bad traffic, air  
20          pollution, water pollution. Who is responsible for  
21          that, and how do we fix all the problems? Thank you.

22                              MR. DAVIS: Thank you. Mike Greco,  
23          and then Loreen Printup. Am I pronouncing that  
24          correctly?

25                              MR. GRECO: Good evening, everybody.

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       It's been so far a very enlightening, this hearing  
3       today, of all the problems that this plant can exists  
4       to have. I live in 8204 Justin Drive here in Clay,  
5       Country Meadows. I love the area. It's very nice,  
6       and the community is great.

7                   Now that Micron's coming in about a  
8       mile down the road, we've had some problems in our  
9       community area with 481 exit ramps coming through  
10      Country Meadows. We've had -- we've had a traffic  
11      light put up there to save on accidents.

12                   But as a construction concern starts  
13      in November, I don't see anything from the state  
14      developing any new roads to conduct all the traffic  
15      for the trucks and diesels going down -- oh, probably  
16      right off of 41 Down Caughdenoy Road. That road  
17      cannot handle the traffic. We're not building  
18      anything. The state's not moving -- putting a new  
19      exit in. The construction's going to start in  
20      November, and the people of Country Meadows, which is  
21      right down the street from it is concerned.

22                   I think the delay in construction  
23      should start -- start past November into December,  
24      maybe January, until new roads can be built to  
25      facilitate the proper traffic from the plant.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Because right now, if you -- the traffic concerns now  
3 in 31 are terrible.

4 I mean, the Route 481 Exit should be  
5 built to allow truck traffic to -- to go to the plant  
6 without affecting residential areas. And it's our  
7 major concern for our development. But I'm excited  
8 about the project, but I'm not happy about the road  
9 construction problems that we have in the area.  
10 Thank you.

11 MR. DAVIS: Thank you. Is there a --  
12 I think it's Loreen Printup.

13 MS. PRINTUP: Greetings. Nyawenha  
14 Sgenon (native language). I am -- I live in Tully,  
15 5439. I was born and raised here. I'm a member of  
16 the Tuscarora Nation, part of the Haudenosaunee. I'm  
17 here to speak for the wetlands. I'm here to speak  
18 for the fish, for the birds, for the grasses, for  
19 they are my brothers and my sisters. They do not  
20 have a voice. That's my responsibility to caretake  
21 and to protect them.

22 I'm not very familiar with this  
23 process. This is all new to me. I have lived in  
24 harmony with the land since I was born and so has my  
25 ancestors. I want to express that we need to open

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 our hearts to our land and our surroundings,  
3 especially our waters, to not take that for granted.

4 This man here mentioned what will  
5 happen if there's an accident. This lady mentioned  
6 the danger of the Great Lakes. It's easy for you to  
7 say it's going to be fine. There's no guarantees for  
8 that. I'm also here to speak for my grandkids and  
9 their kids.

10 Who in here is thinking about the  
11 young ones that are being born, what they'll have to  
12 deal with? Can you honestly say it's going to be  
13 perfect? Honestly. I'm here to be honest, and I  
14 expect that from you. I didn't expect to speak, but  
15 I've kept my voice quiet all my life.

16 So now I speak for the Earth. And I  
17 have one word to say. You might not all know this  
18 word and what it means, but I -- I suggest you look  
19 it up, Cobalt Red. Children are being made to work  
20 for pennies a day for a chip.

21 MR. DAVIS: Ten seconds.

22 MS. PRINTUP: Thank you.

23 MR. DAVIS: Thank you. Next is a name  
24 I cannot read, but I think I can read the last name,  
25 and it is Price, P-R-I-C-E. Is it Darin? Thank you.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Sorry, I just couldn't read the handwriting. After  
3 Darin will be Frank Farnsworth.

4 MR. PRICE: Good evening. I'd like to  
5 say that I'm -- well, first of all, I'm a Cicero  
6 resident for over thirty years, and I'm in full  
7 support of this project. It is time that we have the  
8 opportunity, our children have the opportunity, and  
9 families, our children can stay at home. They can  
10 stay at home and have real, livable wage, good jobs  
11 in our community.

12 I've heard people speak, and you know,  
13 I feel, you know, what they're talking about and I  
14 understand what they're talking about, but now I  
15 think it's time with this investment that Mike Brown  
16 is putting and what the New York State is putting  
17 forth, this is going to be a great opportunity moving  
18 forward for our families and to have a strong  
19 community right here in Cicero, Central New York.  
20 And I'd just like to say I fully support this  
21 project. Thank you.

22 MR. DAVIS: Thank you. Frank  
23 Farnsworth, and after Frank will be David Caselas.

24 MR. FARNSWORTH: Good evening. My  
25 name is Frank Farnsworth, and I reside in Syracuse.

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       Aside from my time in college at the Rochester  
3       Institute of Technology, I've spent my entire life,  
4       thirty-seven years, here in Onondaga County. Grew up  
5       in North Syracuse, lived in Liverpool, Brewerton,  
6       Cicero.

7                       For the past eleven years, I've made  
8       my home in the City of Syracuse. For over thirteen  
9       years, I've worked in Enterprise computer design and  
10      manufacturing, designing the very types of hardware  
11      that Micron's product will ultimately power.

12                      For twelve of those years, I worked at  
13      a private, family-owned company here in Central New  
14      York, doing that work at a relatively impressive  
15      scale. But after we were brought -- bought out by a  
16      large out-of-state corporation, the facility was  
17      eventually shut down and over one hundred and fifty  
18      jobs were lost.

19                      I now work for a remote -- remotely  
20      for a tech company based in Nevada. Not necessarily  
21      because I wanted to work for an out-of-state company,  
22      but because the opportunities in my field are  
23      relatively limited, if not non-existent.

24                      I love this area. My family loves  
25      this area. We want to stay here. But simply put, we

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       absolutely need companies like Micron to make that  
3       possible. And that's why I'm here speaking in  
4       support of the Micron project today.

5                   This facility isn't just about making  
6       microchips. It's about restoring a future for those  
7       of us who want to live, work, and raise families  
8       right here in Central New York. A future where  
9       talented people don't have to leave to just make a  
10      living.

11                   I've heard the concerns raised here  
12      today. I was watching it on Facebook live earlier,  
13      listening here tonight, and I truly do respect them.  
14      But we need to look at the full picture. Micron has  
15      a global track record of environmentally responsible  
16      fabrication, including ISO 14001 certified  
17      facilities, dangerous long-chain PFAS eliminations,  
18      and water reclamation systems.

19                   This isn't just a build now, ask  
20      questions later. The state and federal government  
21      will be watching closely and enforcing every step.  
22      It's not a free pass. It's a partnership.

23                   Ultimately, the greater Syracuse area  
24      has a real and likely once-in-a-lifetime chance to  
25      lead, not just in job creation, but in building

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       something responsibly in the open, with local voices,  
3       and for the next generation. Let's not let fear stop  
4       us from building something extraordinary. Let's do  
5       this together the right way. Thank you.

6                   MR. DAVIS: Thank you. David, and  
7       then Kristina Fitzsimmons.

8                   MR. CASELAS: Good evening. My name  
9       is David Caselas. I live in Geddes Street, Syracuse,  
10      New York, zip code 13204. I'm here representing the  
11      Latino community, specifically the Mexican community.  
12      Understand that there's a million Mexicans living in  
13      this state. So, I'm representing the Mexican  
14      community and the Latino community.

15                   So, my question is, why haven't you  
16      given us this material in Spanish? We want the  
17      material in Spanish. We want a report of the process  
18      and disposal of the -- the water that you're going to  
19      be contaminating. We want it in Spanish.

20                   And we do not need your jobs. We do  
21      not need your jobs. We need a clean environment. We  
22      reject contamination of the lakes. We reject the  
23      lies of -- of capitalism. We demand respect for the  
24      Latino community. We demand respect for the Mexican  
25      community. One million Mexicans living in this

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 state. Thank you.

3 MR. DAVIS: Thank you. Kristina  
4 Fitzsimmons.

5 MS. FITZSIMMONS: Hello. My name is  
6 Kristina. I grew up here. I moved away due to lack  
7 of opportunity. I moved down to Jupiter, Florida,  
8 West Palm Beach, hotbed of engineers. I came home  
9 recently to realize we do have a hotbed of engineers  
10 here. We have so much talent here from music, so  
11 Micron's lucky to be having us.

12 My high hopes are that we get the most  
13 amount of innovation from the company. We get the  
14 best water filtration tech for our water. I'm also  
15 concerned about our wildlife. I love the idea of  
16 wildlife corridors. I love the idea that we could be  
17 the shining city on the hill.

18 The spirit of Syracuse is strong, and  
19 I think Micron will find a very nice home here. It  
20 isn't a matter of national security that we have  
21 these chips. We are in a war for compute with A.I.  
22 coming around, and I would love for this city to  
23 become a stronghold for all of our children.

24 I love our waters. I love Oneida  
25 Lake. I grew up around here, and I believe that we

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       can find the compromise if we all work together. I  
3       don't think that we could -- that we should -- if we  
4       mess up, you know, ten acres of wetland, who's to say  
5       we can't put in, you know, five hundred more acres of  
6       wetland? Micron has a good budget for  
7       sustainability, guys, just so you know.

8                       So, we really can -- we can -- I see a  
9       vision where we could make this lot in this area even  
10      more beautiful with that budget and have this be  
11      Micron's shining example of sustainability. So, I am  
12      -- I am -- I am excited for this, and I am hopeful,  
13      and I feel very fortunate. So, thank you.

14                     MR. DAVIS: Thank you. Those are all  
15      the speakers that filled out a comment card at the  
16      beginning of this evening's session. So, I will open  
17      it up now for anyone that wishes to speak that did  
18      not fill out a comment card to please, if you would  
19      like to, acknowledge yourself. I'll have you come  
20      down.

21                     Since you don't have a -- a name  
22      written, I'll ask you to state your name and spell it  
23      for the Court Reporter. But I'll open up this  
24      opportunity for anyone that has not spoken that would  
25      like to speak.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. SCHAROUN: Yes. My name is -- oh,  
3 sorry. My name is Hunter Scharoun. Hunter, S-C-H-A-  
4 R-O-U-N. I live in Liverpool, New York. I feel like  
5 when we come with big projects like this, they say,  
6 like, on paper it works. But I feel like we focus  
7 more on if we can do it and whether or not we should  
8 do it.

9 These environmental concerns are  
10 scary, to say the least. And I feel like with the  
11 rejection of a hundred twenty days for public  
12 comment, that it feels like we are just trying to  
13 push this project along as fast as possible, while  
14 also a little bit disregarding the opinions of the  
15 public with their only being one hearing, because  
16 people are busy. They sometimes can't make it on  
17 this one day.

18 Also, the concerns brought up that  
19 these documents are not translated into Spanish, it  
20 feels like this project is being pushed along just as  
21 fast as possible and were trying to -- they're trying  
22 brush us off.

23 I feel like -- especially with -- at a  
24 town hall meeting this Monday, there was a wide  
25 rejection towards the building of a McDonald's on

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Taft Road. And I feel like the public, we don't want  
3 to be -- we don't want to urbanize for multi-billion-  
4 dollar corporations to come in here, when I feel like  
5 money could be better invested into the community to  
6 help the average person, like, succeed, rather than  
7 giving contracts to multi-billion-dollar  
8 corporations. Thank you.

9 MR. DAVIS: Thank you. Any further  
10 speakers?

11 MR. PRZEPIORA: Hello, my name is John  
12 Przepiora, P-R-Z-E-P-I-O-R-A. I reside in the City  
13 of Syracuse. Born here, lifelong resident. Became a  
14 professional engineer after going away to college,  
15 studied regional planning at the Maxwell School  
16 before becoming city engineer in Syracuse and  
17 Commissioner of water.

18 But my concerns about this project are  
19 -- are many, but what I don't hear a lot talked about  
20 is the -- the induced growth that the project will --  
21 will spur. The estimates in the D.I.S. is for sixty-  
22 four thousand population, twenty-seven thousand new  
23 households.

24 That -- the number of households that  
25 were -- are estimated to happen in Onondaga County,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 you know, equal to about forty percent of the  
3 existing number of households in the City of  
4 Syracuse. So, this is not a small impact that's  
5 going to be spurred by the Micron in migration.

6 The Section 3.15.32 is -- covers a lot  
7 of these growth inducing impacts, but it's very  
8 confusing to -- to understand. And I think the --  
9 the potential for adverse impacts of this is not well  
10 thought through. People have talked about how this  
11 project is being rushed. The tran -- the  
12 transportation issues are -- are lagging be -- you  
13 know, lagging behind. But I think that the growth of  
14 the community hasn't been thought through in a -- in  
15 -- in an important way.

16 In the cumulative impact section,  
17 Table 4.2.1, it talks about that there's maybe fifty-  
18 eight hundred housing units are -- are in the  
19 pipeline right now. But that's way short of the  
20 twenty-seven household units that are -- that are  
21 projected to be necessary.

22 The growth inducing effects section  
23 poorly explains how -- how that -- how that growth  
24 will be met. It praises in the abstract the benefits  
25 of -- of -- of -- or you know, resulting from the --

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       the fab development, the rising home values, but  
3       minimizes the adverse impacts which will likely arise  
4       without adequate preparation, infusion of funding,  
5       and citizen oversight and engagement, which has been  
6       grossly lacking with this project to date.

7               So, my suggestion is, and I will  
8       submit my detailed comments in -- in writing, but the  
9       whole section on growth inducing effects needs to be  
10      looked at carefully. It talks about the fact that --

11             MR. DAVIS: Ten seconds.

12             MR. PRZEPIORA: -- comprehensive plans  
13      need to be updated. We -- we are not ready for that  
14      migration that this project is going to promote.  
15      Thank you very much.

16             MR. DAVIS: Thank you. Any further  
17      speakers that have not spoken yet that would like to?

18             MS. KAPUTA: Hi, my name is Emma  
19      Kaputa, that's K-A-P-U-T-A. I live at 114 Redfield  
20      Place in Syracuse. Obviously, this is a huge  
21      project. With it is going to come a potential for a  
22      lot of growth for our community economically.  
23      There's also a lot of risks that we haven't talked  
24      about. So just the things our community is going to  
25      have to endure, like the traffic concerns, you know,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 tax increases as property values rise in the area.

3 I'm wondering, these high paying jobs  
4 that are coming into the area, are there any, you  
5 know, movements to make sure that those jobs are  
6 going towards revitalizing our local economy rather  
7 than promoting, you know, transplants?

8 I'm, you know, for our community  
9 that's going to be under these strains, I think it's  
10 important that those jobs revitalize our area rather  
11 than bringing in outside talent. We have a lot of  
12 very smart people in this area. And I just think  
13 it's important that we work together as a local  
14 entity to make sure that our people get these jobs,  
15 since we're the people dealing with these  
16 consequences. So, thank you.

17 MR. DAVIS: Thank you. Any other  
18 folks that would like to speak that have not spoken  
19 yet? Yes, please. Please state your name and where  
20 you're from.

21 MS. HUNT: Hi, my name is Barbara  
22 Hunt. I'm from Baldwinsville, New York. And I'm --  
23 I am a little upset that this environmental impact  
24 statement has only -- it's only taking place today.  
25 And I don't feel that there's enough time to really

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 prepare to be able to, like, read through everything  
3 to be able to study all of the papers to give it the  
4 full understanding.

5 And I also feel, along with other  
6 people, that this is being rushed. I'm not saying  
7 that there aren't good aspects to bringing Micron  
8 here, but the environment is where a lot of people  
9 are getting disconnected from. We rely on the  
10 environment for our health. The organisms are  
11 connected to us, and a lot of people don't understand  
12 that big picture.

13 And you know, there's been some talk  
14 about some of the things that Micron is doing to help  
15 alleviate some of the environmental impact, but I  
16 don't feel that enough care has been in that.

17 And one of the questions that I have  
18 is if they are purposely working to help some of the  
19 endangered animals, like the harrier and the Indiana  
20 bat and some of the other organisms, are they  
21 bringing in biologists that have had success with  
22 those organisms? Are they making sure that they're  
23 building a team that is going to be -- have the --  
24 have a lot of experience to be able to help those  
25 organisms?

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 And there are so many more organisms  
3 that are not being addressed, like the pollinators.  
4 Pollinators are really important, and we're  
5 decreasing the amount of pollinators just on a  
6 regular basis. And then to clear, you know, over  
7 five hundred acres is going to decrease that even  
8 more, and there's a lot of negative impacts regard --  
9 because of that.

10 And I just don't feel that the public  
11 really understands the connection. Organisms, clean  
12 water, it's all stuff that we rely on. People are  
13 too accustomed to entering Wegmans and buying what  
14 they need and then going back home, and they're  
15 missing that connection.

16 So, I feel that there needs to be a  
17 better education about that environmental impact, and  
18 I feel that it is the duty of the -- of Micron to be  
19 able to bring in the best who are super knowledgeable  
20 to try to alleviate any of the negative environmental  
21 pressures that organisms that are voiceless are going  
22 to have to endure.

23 MR. DAVIS: Ten seconds.

24 MS. HUNT: Thank you.

25 MR. DAVIS: Thank you. Any further

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 speakers that would like to speak? Yes. Oh --

3 UNKNOWN MALE: Grab my microphone.

4 MR. DAVIS: Sorry, I thought you were  
5 coming in front.

6 MR. MERCIER: Roger Mercier, 8248  
7 Wheatberry Way, Clay. I just want to say I'm against  
8 this because it's going to change Cicero and the Town  
9 of Clay in a negative way, and we live there, and we  
10 have to put up with all the congestion of the city  
11 right now, and then that's going to be moved all to  
12 the northern suburbs. It's too much to handle.

13 MR. DAVIS: Thank you. Any further  
14 speakers that have not spoken yet? One coming here.  
15 Please state your name.

16 MR. LONGO: Anthony Longo, Bayberry,  
17 Liverpool. I'm listening to a lot of the comments  
18 here, and I respect the environmental comments, and I  
19 think this project, in my opinion, remember, it was  
20 originally supposed to start in June of 2024, and now  
21 it's been pushed to November 2025.

22 And again, I respect the environmental  
23 concerns, and I think Micron and the Commerce  
24 Department and OCIDA has done a wonderful job at  
25 mitigating this project, but there are people in this

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 community who are in poverty, who want a step up, who  
3 want to stay here.

4 There are a lot of people in this  
5 community who don't want to go to another community.  
6 They want to stay here. They want Syracuse to go to  
7 the next level. And for me, I support this project  
8 one hundred percent. My frustration is it's not  
9 moving fast enough. I wish we were coming out of the  
10 ground now.

11 And -- and again, the environmental  
12 concerns are important, but I think that people take  
13 more precedent over some environmental issues like an  
14 Indiana bat, I'm sorry. So, again, I support this  
15 project one hundred percent. This project needs to  
16 move forward.

17 I had to leave this area back in the  
18 '90s when I graduated college. I've moved back. I  
19 remember Syracuse in the 1990s when one factory after  
20 another was closing. I saw families ripped apart. I  
21 saw neighbors leave, and there was nothing more  
22 depressing than that. I decided to pursue my career  
23 elsewhere. I also have a master's degree in urban  
24 planning.

25 But sometimes you have to take that

1           7/24/2025 - Micron Semiconductor Manufacturing Project  
2           next step up, and you have to move forward, and you  
3           have to trust the system that it's worked, that  
4           you're mitigating this thing correctly, and I think  
5           that's what Micron has done, and I think that's what  
6           a lot of people in this community are trying to do.

7                         So, again, I support this project, and  
8           I want to thank everybody for putting these public  
9           meetings together.

10                        COURT REPORTER: Can you spell the  
11           last name, please?

12                        MR. DAVIS: Excuse me, sir, could you  
13           spell your last name for us?

14                        MR. LONGO: L-O-N-G-O, L-O-N-G-O. L-  
15           O-N-G-O. First name is Anthony.

16                        MR. DAVIS: Yes.

17                        MR. LONGO: All right.

18                        MR. DAVID: Now that's stuck in my  
19           head. Thank you. It's been a long day. Anyone else  
20           that would like to speak at this time that hasn't  
21           spoken? Okay. So, I'll open it up for anybody that  
22           spoke earlier in this session that either had more to  
23           say, maybe got cut off at the three-minute cutoff,  
24           and that would like to come back up for an additional  
25           opportunity to speak.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 Okay. Anybody would like to speak?

3 I'll ask one more time. We're here until nine  
4 o'clock, so if there's no one that wants to speak at  
5 this time, what we have been doing in the other  
6 sessions is taking a break. People may come into the  
7 lobby over the -- and what we've found is that people  
8 come in later on for the later part of the session.  
9 They might come into the lobby and fill out some more  
10 cards.

11 So, we will pause the public hearing  
12 if there's no one else that wants to speak now, and  
13 then as more people arrive and want to fill out cards  
14 or want to speak, we will then come back and un-pause  
15 and let people speak again.

16 So, I'll ask one more time if anyone  
17 here would like to speak right now for a second  
18 opportunity, please do so. Yeah, one individual  
19 coming. Thank you.

20 MR. CASELAS: Hello. My name is David  
21 Caselas. It's me again, representing the Latino  
22 community, the Mexican community. I forgot to say  
23 something. We also want the report in Spanish  
24 proving that you're going to be following  
25 international environmental laws and policies. We

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 want those reports in Spanish and, of course, in  
3 English.

4 UNIDENTIFIED SPEAKER: We demand the  
5 respect of the Latin community and the Mexican  
6 community.

7 MR. CASELAS: Thank you.

8 MR. DAVIS: Any further comments at  
9 this time?

10 MR. STRONSKI: Yes. Hi, Ed Stronski.  
11 Just a point on the quick turnaround, the quick  
12 release of the report. I just draw the analogy to  
13 the I-81 issues where there were a lot of iterations,  
14 and the D.E.I.S. did bring up some important points.

15 One of the things there was East  
16 Genesee and Linden Corridor, some big traffic stuff  
17 that really hadn't been fully addressed. So, the  
18 timeframe of having the D.E.I.S. come out and people  
19 being able to comment on it, look at it in depth  
20 actually did address some real issues. So, and --  
21 that was then finalized in the F.E.I.S.

22 I see that -- I see that as, you know,  
23 people talking about this quick turnaround. I've  
24 seen an example where, you know, the legitimate  
25 amount of time for people to chime in had a real

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 effect on the final report.

3 So just to give some substance to that  
4 idea that, yeah, it does make a difference in the  
5 amount of time on something. So that's just my  
6 observation that sticks in my head about that. Thank  
7 you.

8 MR. DAVIS: Thank you. Any further  
9 speakers at this time? I'll ask one more time. Any  
10 further speakers at this time? Okay. Seven twenty.  
11 We will pause. Perhaps some more folks will come in  
12 throughout the remaining hour and forty minutes of  
13 this comment session. Thank you.

14 (Off the record; 07:20 p.m.)  
15 (On the record; 07:47 p.m.)

16 MR. DAVIS: I am going to ask people  
17 if they could come back in and sit back down that are  
18 interested in speaking, listening to the remaining  
19 portion of the public hearing. It is seven forty-  
20 seven. We're going to un-pause. During this break,  
21 we did receive two comment cards for speakers, and so  
22 I will call up the commenters to speak.

23 As have been the rules from the  
24 beginning, you'll have three minutes to speak, and  
25 then I'll ask -- at the end of that three minutes,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 I'll call the next speaker. If there's an  
3 opportunity to speak after that, you will be  
4 recalled. The first speaker will be Fred Miller.

5 MR. MILLER: Good evening. My name is  
6 Fred Miller. I'm a resident of the Town of Clay. I  
7 assume about thirty years with community issues,  
8 conservation issues, and other issues involved with  
9 the cleanup of Onondaga Lake. Somewhat there are  
10 correlations to this project, and another other side  
11 of the fence, there are none.

12 Nonetheless, my comment will be brief.  
13 My main concern happens to be with PFAS water  
14 quality, PFAS pollution on-site, off-site, into the  
15 river, and into the water quality that would affect  
16 our drinking water system.

17 My position is very clear that every  
18 possible element of engineering and science that's  
19 available now, and as it morphs into better  
20 technologies in the future should be implemented to  
21 protect the people of the Town of Cicero, Town of  
22 Clay, and Onondaga County.

23 As you well know, the Army Corps and  
24 your New England Office and PFAS fiasco in the  
25 Skowhegan, Maine area, recent research ongoing has

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       detected PFAS from the site right off in the coastal  
3       area of Maine. But I hope that -- my intent is that  
4       the Corps and all the parties interested work at  
5       hundred and one percent and make sure that the future  
6       generations of these communities are not affected by  
7       PFAS drinking water pollution.

8                   At my age bracket, I'm not too  
9       concerned with twenty forty-one, but those who are  
10      twenty, forty, fifty-years-old, even sixty with  
11      grandchildren, that's what we have to focus on with  
12      all intensity and make sure that all the agencies  
13      involved do not fall victim to the tremendous  
14      political outside pressure from both parties to  
15      cheerlead this project forward, and that those  
16      agencies aren't subjected to political pressure, and  
17      they use engineering and science and the best sources  
18      possible to move forth and make sure that the current  
19      people and the future generations and the children of  
20      the future in this community in this county, in this  
21      state, that we can do the best for this specific  
22      project to make sure that we're hundred and one  
23      percent to do a total job on it.

24                   That's the conclusion of my comment.

25      Thank you for your time. I appreciate it.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. DAVIS: Thank you. Next speaker  
3 will be Lorenzo Tesoriero.

4 MR. TESORIERO: Good evening. My name  
5 is Lorenzo Tesoriero. I'm a Liverpool High School  
6 Alumni, and I currently live in Brewerton in the Town  
7 of Cicero. I am the business manager of Syracuse  
8 Local 30 Heat and Frost Insulators and I represent  
9 over hundred members.

10 We stand in support of Micron coming  
11 to Clay, New York. Local labor unions are already  
12 working heavily in our communities with pre-  
13 apprentice programs to gear up for the influx of work  
14 we will be receiving. Micron is going to generate  
15 hundreds of construction jobs on top of thousands of  
16 career opportunities that will already be bringing.

17 Micron will not only provide jobs for  
18 our current generation but for many generations to  
19 come thereafter. It will open the door to many new  
20 career opportunities in STEM and STEAM. This is a  
21 huge step in putting Syracuse back on the map.

22 I'm a father of three children, and  
23 I've had countless conversations with people whose  
24 children have had to leave Syracuse to pursue careers  
25 that aren't in demand here. With Micron, it will

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 provide our children and Syracuse residents an  
3 opportunity to stay, to grow, and to excel. Thank  
4 you.

5 MR. DAVIS: Thank you. Next speaker  
6 will be Neil Webb.

7 MR. WEBB: Good evening. My name is  
8 Neil Webb. I'm a twenty-year resident of the Town of  
9 Cicero and was raised and moved away from this area.

10 As I was growing up, watching kind of  
11 a poor economic state deteriorate in the city region,  
12 and it's really encouraging to see a project of this  
13 scale and magnitude come to the area and actually  
14 offer promise from what we've seen is a long drain of  
15 industry overall in the past history of the decades  
16 before now.

17 It's really promising for both me and  
18 my family, with the hope of having family actually  
19 remain in the area like many of the others have come  
20 in the past. So, I am here to cheer for and support  
21 this project. Thank you.

22 MR. DAVIS: Thank you. Once again,  
23 I'll open it up if there's anyone that did not fill  
24 out a comment card yet that would like to speak at  
25 this time. Anyone else that would like to speak at

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 this time? Was that a hand wave? Okay, yes. Thank  
3 you. Please state your name.

4 MS. COPPOLA: Hilary-Anne Coppola.  
5 Sorry, I didn't have enough time to say the rest of  
6 what I wanted to say previously, and this will be  
7 very short. Another gap in the D.E.I.S. is around  
8 workplace development, worker safety, and uplifting  
9 jobs for people in this area who need them the most.

10 Micron has provided investments, made  
11 promises, but it has made no enforceable commitments  
12 for good jobs for people, which means people are able  
13 to advocate for themselves, people are able to  
14 unionize, people have a good rate of pay, and people  
15 can actually access those jobs.

16 So, there's no plan for public  
17 transportation for people in the poorest parts of our  
18 county to actually get to those jobs in order to  
19 receive the benefits. So that's another gap at the  
20 D.E.I.S., and there's a gap in Micron's coming to the  
21 table around -- entering into public commitments with  
22 groups and leaders that are organizing around that  
23 issue. Thank you.

24 MR. DAVIS: Thank you. Any other  
25 folks who would like to speak at this time? Okay.

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       filtered, it's put back into circulation as opposed  
3       to taking on, like, maybe fifty million gallons as a  
4       closed system, using it, recycling it within your  
5       system, but not putting it back into the waterways?

6               My other question I have is regarding  
7       the traffic situation. I know I saw one of the  
8       reports said they realized -- that you realized that  
9       thirty-one is going to need to be greatly expanded.  
10      As a Clay resident and traveling on the roads, are --  
11      already they're fairly busy.

12              We're going to need infrastructure and  
13      traffic control points to manage that, and I just  
14      want to know clearly what the plan is for that. I  
15      understand with this, you're not really answering the  
16      questions, but you will comment on them in the -- in  
17      the future. So, those are my two big things,  
18      particularly with the water -- with the amount of  
19      water that's being used.

20              My concern, being the health  
21      profession, is there's going to be chemicals and  
22      effects from that that may not show up for ten to  
23      fifteen to twenty years. And so, we got to make sure  
24      that this is safe for our families currently and our  
25      children and grandchildren of people who are to be in

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 this area if this is going to be here.

3 We've all seen and heard of pollution  
4 that's occurred. We want to make sure that this  
5 doesn't happen here.

6 MR. DAVIS: Great. Thank you very  
7 much.

8 MR. KEYS: Thank you.

9 MR. DAVIS: Yes, we will be  
10 responding. You didn't hear the opening remarks, but  
11 I'm taking all comments now in the comments we  
12 responded to in the Final E.I.S. document, all  
13 comments, both written and provided here this  
14 evening.

15 MR. KEYS: Perfect.

16 MR. DAVIS: Okay.

17 MR. KEYS: Thank you, guys.

18 MR. DAVIS: Thank you.

19 MR. KEYS: Have a good evening.

20 MR. DAVIS: You too. Is there anyone  
21 else that wishes to speak at this time? I see a lot  
22 of the same faces in the room as the last time I  
23 asked this, but I will continue to ask. Anyone else  
24 who wish to speak at this time? Okay. Seeing none,  
25 I will once again pause for -- we have thirty-eight

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 minutes left in the scheduled hearing time. Thank  
3 you.

4 (Off the record; 08:22 p.m.)

5 (On the record; 08:40 p.m.)

6 MR. DAVIS: Okay. I'm going to go  
7 back live. I've turned the mic on over here so we  
8 should be good. I think we're all set with the mic.  
9 We're good. I got it. So, I'm going to un-pause.  
10 We did have a speaker come in and register to speak  
11 in the last few minutes, George Robbins.

12 So, George, I'd ask you to come to the  
13 mic. Now, that one, please, because that one's on.  
14 State your name, address, and then please provide  
15 your comments for the record. Thank you.

16 MR. ROBBINS: Hello. Thank you for  
17 having me. My name is George Robbins. I live in the  
18 City of Syracuse. I just had one question because  
19 I've been to a number of Micron meetings. The last  
20 one was the -- you had the Army Corps of Engineers in  
21 Clay at the town -- at the Town Hall, and very  
22 interesting on the water issues.

23 I've been to a number of eighty-one  
24 project meetings too, and I just had one question  
25 because the number of employees over the years that

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       you're going to hire, I'm trying to recall, somewhere  
3       between ten and fifty thousand, eventually, and then  
4       each one of those employees has families that drive  
5       cars.

6                       So, with the 81 project especially 481  
7       and 690 and traffic out here, are they going to be  
8       able to accommodate when there's multiple family  
9       members driving at the same time too? Are they  
10      really accounting -- I know they had plenty of  
11      statisticians -- statisticians for the eighty-one  
12      project. But are they really accounting for the  
13      amount of traffic for the size that Micron is and the  
14      proposed jobs that are going to be coming down the  
15      pike? Because they're not expanding lanes on four  
16      481.

17                      I used to live out in Los Angeles, so  
18      the smartest thing they did when they were building  
19      the freeways was to expand them six to -- four to six  
20      lanes. They're not doing that here. They're not  
21      forward thinking, actually. So, you've got a huge  
22      company here with huge -- not very big plans. Any  
23      thoughts on that?

24                      MR. DAVIS: So, this is not a  
25      question-and-answer period. It's a question only

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 period. This session will respond to all questions  
3 that are provided here in written comment in the  
4 Final E.I.S.

5 MR. ROBBINS: Uh-huh. Okay. Do you  
6 coordinate with 81 at all? Are you coordinating at  
7 all with the 81 project?

8 MR. DAVIS: Again, we'll -- we'll  
9 respond to all questions and comments in the Final  
10 E.I.S.

11 MR. ROBBINS: Oh, okay.

12 MR. DAVIS: Thank you.

13 MR. ROBBINS: All right. Thank you.

14 MR. DAVIS: Is there anyone else that  
15 wishes to speak at this time? Okay. Any other  
16 questions, comments at this time? Okay. We will  
17 pause again and see if anyone else shows up for  
18 further comment.

19 (Off the record; 08:43 p.m.)

20 (On the record; 08:51 p.m.)

21 MR. DAVIS: Okay. We have another  
22 speaker that has come in to register, so we will go  
23 back on the record, un-pause if you will. And we  
24 have MoAde Jagusah, and I'll ask you to please come  
25 to the mic. This is a question period. It's not a

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 question-and-answer period, but please state your  
3 questions and comments for the record. We have a  
4 Court Reporter here and offer your time. Thank you.

5 MS. JAGUSAH: My first question is in  
6 regards to the lead in the water of the pipes when it  
7 comes to the City of Syracuse, whether there is any  
8 intention on replacing or providing funding to  
9 replace the lead water pipes in order to ensure the  
10 safety of the human beings who live here, as well as  
11 ensure that the water you guys are using is clean.  
12 So that's my -- my first question.

13 My second question is regarding the  
14 land that is going to be needed. There's going to be  
15 housing needed around that, and I'm wondering whether  
16 there is any consideration as to the demographic  
17 shifts that are being enforced by the City of  
18 Syracuse and whether anybody in any governmental  
19 agency or any business or any nonprofit involved in  
20 this project has any interest specifically in any  
21 piece of land that exists within the City of Syracuse  
22 when it comes to housing, because there is currently  
23 talk of a lot of housing demolition being going on.

24 And that housing demolition is  
25 something that would be done across a large number of

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       people, and I'm wondering if there's any  
3       consideration for the displacement plan for those  
4       people. Because those people currently do not have a  
5       displacement plan, and the moving of people is being  
6       done, supposedly at least in the intention of making  
7       sure that there are the correct types of workers for  
8       this project in the correct locations.

9                   And I am wondering if Micron or anyone  
10       involved in Micron, or like I said, is involved in  
11       any of those demographic shifts that are happening,  
12       because the ethnic cleansing that is going on in  
13       Syracuse right now of African-Americans specifically  
14       from the south side of Syracuse is something that  
15       should interest everybody involved in the project.  
16       Yeah, do you guys answer questions or anything like  
17       that? Okay.

18                   MR. DAVIS: Not at this session, no.

19                   MS. JAGUSAH: Uh-huh.

20                   MR. DAVIS: This time we may go off.  
21       We have a three-minute consistent for every speaker.  
22       And so, if it does go, I'll ask if anyone else wants  
23       to speak.

24                   MS. JAGUSAH: Uh-huh.

25                   MR. DAVIS: If you want to speak again

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       and no one else comes up, you will have another three  
3       minutes to speak, so you can compose yourselves more  
4       if you'd like to think about what your thoughts are  
5       going to be.

6                   MS. JAGUSAH: Sounds good. Thank you.

7                   MR. DAVIS: You're welcome.

8                   MS. JAGUSAH: Yeah. In regards to the  
9       wetlands, I'm wondering if there's any thoughts in  
10      mind regarding insurance as to flooding that will be  
11      happening.

12                   MR. DAVIS: Sure. Is there anyone  
13      else that wishes to speak at this time? Seeing no  
14      one, if you would like another opportunity to speak.

15                   MS. JAGUSAH: In regards to the  
16      flooding that will be happening as a consequence of  
17      this project, I do believe that the filling in of  
18      this unprecedented number of wetlands will increase  
19      flooding in the general water basin area that the  
20      project is happening.

21                   And because Syracuse is close enough  
22      to that water basin, the fact that Syracuse's south  
23      side, which is predominantly African-American,  
24      already experiences predominant, how do you say,  
25      higher rates of flooding than other parts of cities.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 When you overlay the map of redlining and covenants  
3 that happened in Syracuse, that map overlays with the  
4 flood zones.

5 So, if you guys are going to be  
6 filling in the wetlands, what sorts of financial  
7 incentives are you going to be giving people in order  
8 to ensure that their flooding is assuaged? Thank  
9 you.

10 MR. DAVIS: Thank you. Are there any  
11 other speakers that wish to speak at this time?  
12 Okay. We have four minutes. We may have another  
13 speaker that arrives late, so three minutes. We'll  
14 have three more minutes, and then at that time, I'll  
15 officially close the public hearing session. Thank  
16 you.

17 (Off the record; 08:57 p.m.)

18 (On the record; 08:59 p.m.)

19 MR. DAVID: Is there anyone here at  
20 this time that wishes to speak? Hearing none, seeing  
21 none, I will close the public hearing. All comments  
22 that were submitted at this public hearing and those  
23 that were received in writing will be responded to in  
24 the Final E.I.S.

25 Any comments that the public would

1       7/24/2025 - Micron Semiconductor Manufacturing Project  
2       like to include in the administrative record for this  
3       hearing need to be presented or submitted to our  
4       staff so that we can respond to those in the F.E.I.S.

5                   If you elected not to speak this  
6       evening, you may still submit written comments until  
7       August 11 to OCIDA or C.P.O. using the mailing  
8       address or email address that have been posted on the  
9       screen behind me and are -- they're both also  
10      available on the OCIDA and C.P.O. websites. Written  
11      comments carry the same weight as comments that have  
12      been given here today.

13                   All of us here appreciate you having  
14      turned out this evening and presenting your views.  
15      We respect your comments and can be assured that  
16      we've given the appropriate consideration in the  
17      evaluation regarding this -- this proposal. Thank  
18      you very much. At this time, we are adjourned.  
19      Thank you.

20                   (The hearing concluded at 09:00 p.m.)

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 (The public hearing commenced at 2:01  
3 p.m.)

4 MR. PETROVICH: Good afternoon,  
5 everyone. This is a continuation of the public  
6 hearing, the afternoon session public hearing on the  
7 NEPA, SEQRA Draft Environmental Impact Statement and  
8 Clean Water Act Section 404 Permit Application in  
9 connection with the Micron Semiconductor  
10 Manufacturing Project in Clay, New York.

11 A couple of housekeeping items for  
12 this afternoon before we get started is to make sure  
13 that you understand where the exits are, that are  
14 clearly marked, and that the restrooms are located  
15 just outside of the exits if they're needed. And we  
16 have law enforcement and security personnel on site,  
17 should that also be needed this afternoon.

18 We also have American Sign Language  
19 and Spanish Language Interpreters available right  
20 over here. And should anyone need those services,  
21 please let the registration desk personnel know, and  
22 we'll be happy to get you connected with those  
23 services. And I think now we're going to have it  
24 said in Spanish.

25 (Spanish translation)

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. PETROVICH: Okay. Thank you. My  
3 name is Robert Petrovich. I'm the Executive Director  
4 of the Onondaga County Industrial Development Agency,  
5 or OCIDA. I, along with legal counsel, Jeff Davis,  
6 who will be moderating this public hearing.

7 Seated with me at the table is David  
8 Frenkel, who is the Director of the Environmental  
9 Division of the CHIPS Program Office, or C.P.O.,  
10 which is part of the U.S. Department of Commerce.  
11 Mr. Frenkel will also be making some opening remarks  
12 very shortly.

13 I would also like to introduce  
14 Lieutenant Colonel Robert Burnham, Commander of the  
15 Buffalo District of the U.S. Army Corps of Engineers.  
16 Colonel Burnham will be making opening remarks as  
17 well. Also seated at the table is Marty Wargo, Chief  
18 of the Buffalo District Regulatory Branch.

19 The purpose of today's hearing is to  
20 give members of the public an opportunity to provide  
21 verbal comments on the Environmental Review of  
22 Microns Proposed Semiconductor Manufacturing Project  
23 and Connected Actions, which OCIDA and C.P.O. are  
24 jointly conducting under the New York State  
25 Environmental Quality Review Act, or SEQRA, and the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 National Environmental Policy Act, or NEPA, as well  
3 as to provide comments on the review of Microns  
4 proposed impacts to waters of the United under  
5 Section 404 of the Clean Water Act, which is being  
6 conducted by the Army Corps of Engineers.

7 OCIDA and C.P.O. released the Draft  
8 Environmental Impact Statement of E.I.S. for the  
9 Micron Project on June 25, 2025. The Army Corps of  
10 Engineers issued public notice of Microns permit  
11 application under Section 404 of the Clean Water Act  
12 on June 27th, 2025.

13 Information on how to provide written  
14 comments on either the Draft E.I.S. or the Section  
15 404 review displayed on alternating slides behind us  
16 and -- and also I think in the front the room, unless  
17 this is in front of the room.

18 With respect to the SEQRA process  
19 today, most of you in attendance are familiar with  
20 the project. However, I would like to provide a  
21 brief review of what has occurred thus far in the  
22 environmental review process.

23 On July 14th, 2023 OCIDA received an  
24 application for financial assistance from the Micron,  
25 New York Semiconductor Manufacturing, L.L.C. entity.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Most of you are aware Micron intends to invest  
3 approximately one hundred billion dollars over the  
4 next twenty years to build a leading-edge  
5 semiconductor manufacturing campus in the Town of  
6 Clay and to the expand in White Pine Commerce Park  
7 located at 5171 Route 31 in the Town of Clay, New  
8 York.

9 The proposed project must be reviewed  
10 under SEQRA in accordance with the requirements of  
11 SEQRA. And on September 14th, 2023, OCIDA declared  
12 itself as the lead agency for SEQRA purposes. OCIDA  
13 issued a positive declaration due to the proposed  
14 projects potential to result in one or more  
15 significant adverse impacts and declared its intent  
16 to prepare a Draft Environmental Impact Statement.

17 OCIDA then undertook the next step,  
18 which is scoping. Scoping is a process that develops  
19 a written document, The Scope, which outlines the  
20 topics and analysis of potential environmental  
21 impacts to be studied and addressed in the Draft  
22 E.I.S.

23 Following public comment, OCIDA  
24 adopted the final SEQRA Scope of December 14th, 2023.  
25 The public was also previously given an opportunity

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 to comment on the Scope for this project on in March  
3 of 2024. Following the adoption of the final SEQRA  
4 Scope, OCIDA to engage with C.P.O. and others to  
5 begin the process of preparing the Draft E.I.S.,  
6 which evaluates the potential environmental effects  
7 of the proposed project.

8                   During development of the Draft E.I.S.  
9 OCIDA regularly consulted with other SEQRA involved  
10 and interested agencies, including the New York State  
11 Department of Environmental Conservation and the New  
12 York State Department of Transportation to ensure  
13 that all environmental impacts were identified and  
14 fully evaluated in the -- in the Draft E.I.S.

15                   On June 25, 2025, OCIDA determined  
16 that the Draft E.I.S. was complete for commencement  
17 of the public review pursuant to SEQRA and open the  
18 public comment period. The purpose of this afternoon  
19 session, as well as this evening session to come, is  
20 for the public -- it is for a public hearing to  
21 receive comments on the Draft E.I.S., as well as for  
22 the Section 404 review, which Colonel Burnham will  
23 outline shortly.

24                   Please note this is not a question-  
25 and-answer session. We will not respond or reply to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 comments expressed by the public during this hearing.  
3 We will, likewise, not respond to any questions posed  
4 by the public during this hearing. OCIDA and C.P.O.  
5 will respond to all comments as part of the final  
6 E.I.S.

7 This is an opportunity for the public  
8 to place their comments on the Draft E.I.S. and the  
9 Section 404 review on the record. OCIDA encourages  
10 the public to participate in the process. This is  
11 your opportunity to have your voice heard, however,  
12 this hearing is not your only opportunity to submit  
13 comments on the Draft E.I.S. or the 404 review.

14 If you do not wish to make a comment  
15 here at this hearing, you can also submit your  
16 comments on the Draft E.I.S. or the 404 review, which  
17 we'll address shortly, using the information  
18 displayed on the slides in this room. We have extra  
19 copies of notices on how to comment available for you  
20 if you wish to make -- if you wish to take a copy.

21 The OCIDA notice and the contact  
22 information for submitting comments can also be found  
23 on OCIDA's website. Public comments will be accepted  
24 through August 11th, 2025. Your input, both verbal  
25 comments received here this afternoon, as well as all

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 written comments that are received by OCIDA and  
3 C.P.O. will help OCIDA and C.P.O. prepare a final  
4 E.I.S., which will be released after all comments  
5 have been received and considered.

6 It's important to note that equal  
7 weight will be given to both verbal comments and  
8 written comments. There is a Court Reporter here  
9 this afternoon, who will be making a record of all  
10 comments made. We ask those in attendance to please  
11 show respect for the person that is speaking, even if  
12 you cannot agree with the comment and also to please  
13 hold applause or other noise, so that we may make as  
14 an accurate record as possible in this proceeding.

15 At this point, I would like to turn  
16 this over to David Frenkel, our C.P.O. colleague, for  
17 his comments.

18 MR. FRENKEL: Good afternoon. As Rob  
19 mentioned, my name is David Frenkel. I am the  
20 Director of the Environmental Division for the CHIPS  
21 Program Office or C.P.O., which is part of the U.S.  
22 Department of Commerce.

23 C.P.O. is the lead federal agency for  
24 the environmental review of this project under the  
25 National Environmental Policy Act, or NEPA. Based on

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 C.P.O.'s role in providing direct funding to Micron  
3 for the proposed semiconductor manufacturing  
4 facility.

5 Our project requires both the federal  
6 and state environmental review. It is not uncommon  
7 for lead agencies at the federal and state level to  
8 work together to prepare a single comprehensive  
9 document. C.P.O. has been working with OCIDA to  
10 prepare the Draft E.I.S. on that basis. The E.I.S.  
11 is a joint document under NEPA and SEQRA, and my role  
12 today is to accept public comments as part of the  
13 NEPA process on behalf of C.P.O. and the U.S.  
14 Department of Commerce.

15 C.P.O. also encourages public  
16 participation in this process and welcomes all  
17 comments on the Draft E.I.S. We will give equal  
18 weight to verbal comments of today's hearing and  
19 written comments submitted to C.P.O. or OCIDA by  
20 August 11th.

21 As Rob noted, after the close of the  
22 public comment period, C.P.O. and OCIDA will respond  
23 to all comments received when we prepare the final  
24 E.I.S. While C.P.O. and OCIDA jointly prepared this  
25 E.I.S, because it is a comprehensive document that

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 identifies the potential effects of the Micron  
3 project, it will also serve as a resource for other  
4 agencies conducting their own reviews of the Micron  
5 project and other actions connected to the project.

6 On that note, I would now like to turn  
7 it over to Lieutenant Colonel Burnham for opening  
8 remarks of the U.S. Army Corps of Engineers. Thank  
9 you for your attendance today at this public hearing,  
10 and we appreciate your participation in this process.

11 MR. BURNHAM: Thank you, David. Good  
12 -- good afternoon, ladies and gentlemen. Again, I'm  
13 Lieutenant Colonel Rob Burnham, Commander of the  
14 Buffalo District Army Corps of Engineers. I -- I  
15 would be pre -- presiding. I would be the presiding  
16 officer for the Clean Water Act Section 404 aspect of  
17 this public hearing on behalf of the Army Corps of  
18 Engineers. Seated up here with me to my right, your  
19 left is Mr. Marty Wargo, the Chief of the Buffalo  
20 District Regulatory Branch.

21 While the Department of Commerce is  
22 the lead federal agency on the E.I.S. for this  
23 project, the Corps of Engineers is the cooperating  
24 agency on E.I.S., and we are here to specifically  
25 retain information and evidence and receive public

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 comment to assist in the regulatory review of a  
3 permanent application by Micron, New York  
4 Semiconductor as well as for two connected actions  
5 proposed by National Grid for a gas main and electric  
6 sub -- substation expansion.

7 Because of the Micron in that National  
8 Grid Projects proposed the placement of fill into  
9 federal regulated wetlands and streams, collectively  
10 referred to as the waters of the United States,  
11 permits are required from the Corps of Engineers  
12 pursuant to Section 404 of Clean Water Act. The  
13 Department of the Army authorization is therefore  
14 required for the following.

15 For the Micron Semiconductor  
16 Manufacturing campus, the permanent loss of  
17 approximately one hundred and ninety-four acres of  
18 federally regulated wetlands and temporary impacts to  
19 an additional two point nine five acres, as well as  
20 the permanent loss of six thousand two hundred and  
21 eighty-three feet of federally regulated streams and  
22 ditches and temporary impacts to an additional a  
23 hundred and thirty feet.

24 For the National Grid Substation work,  
25 the permanent impact to approximately four acres of

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 wetland and one thousand five hundred and forty-five  
3 feet of regulated ditches, as well as temporary  
4 impacts to an additional eleven acres of wetland and  
5 six hundred and eighty-three feet of stream.

6 And for the National Grid gas main  
7 work, the permanent impact to approximately point  
8 zero eight seven acres of wetlands, conversion of  
9 point zero three three acres of forested wetlands,  
10 and temporary impacts to approximately seven point  
11 four acres of wetlands and one hundred and seventy-  
12 five linear mainstream.

13 The purpose of -- the purpose for the  
14 proposed work is to construct and operate  
15 commercially viable and globally competitive advanced  
16 DRAM fabrication facility on a single unified site in  
17 New York State. The Corps of Engineers is neither a  
18 proponent for, nor an opponent of the proposed  
19 projects. Our role is to determine whether these  
20 proposed field activities are contrary to the public  
21 interests or not.

22 This hearing will play an important  
23 part in that determination. The hearing will be  
24 conducted according to the procedures set forth, the  
25 Title 33 of the Code of Federal Regulations Part 327.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 The public comment period for the  
3 Corps of Engineers, public notice also closes on  
4 August 11th, 2025. Hard copies of the public notices  
5 are available in the registration area. Please note  
6 that there is a typo in some of the public notices  
7 indicating that comment period closes on August 18th.  
8 The correct date is August 11th.

9 Details on how to comment on the  
10 proposed wetland and stream impacts may be found in  
11 public notice, as well as displayed on the screen in  
12 the front of the room.

13 The comments made here, plus all  
14 submitted written information will become part of the  
15 Corps of Engineers Section 404 administrative record  
16 and will be used to evaluate the probable impacts,  
17 including the cumulative impacts of the proposed  
18 activity on the public interest.

19 The ultimate decision on the submitted  
20 applications will reflect the national concern for  
21 both the protection and utilization of important  
22 resources. The Corps of Engineers permit decisions  
23 will come after completion of the E.I.S. because  
24 we're also relying upon that for the purposes of NEPA  
25 compliance.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Based on the -- based on time  
3 limitations, if anyone desires an opportunity for  
4 rebuttal to any of the information presented in this  
5 hearing, we ask that you please do so in writing and  
6 provide that to someone at the registration table  
7 today, and it will become a part of administrative  
8 record.

9 General comments made may also be  
10 submitted until close of the public comment period.  
11 Thank you, and I look forward to your comments.

12 MR. PETROVICH: Thank you, Lieutenant.  
13 Thank you, Lieutenant Colonel Burnham. I would like  
14 to now introduce OCIDA's Counsel Jeff Davis, who will  
15 go over the process for how we will conduct the  
16 hearing and also manage the flow of speakers. Jeff?

17 MR. DAVIS: Thank you. Good  
18 afternoon. If you do come forward to make comments,  
19 we'll ask that you please state your name and address  
20 and also speak clearly and slowly so that the Court  
21 Reporter can make an accurate record.

22 We have two microphones here at the  
23 front of the room. Your comments will be limited to  
24 three minutes to afford everyone who wishes a comment  
25 an opportunity to do so. There's no ceding of time

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 to others. If there is time at the end of the  
3 sessions, speakers may return to the microphone and  
4 will be afforded an additional three minute  
5 opportunity to speak.

6 Please note that if you already  
7 commented in the earlier session today and wish to  
8 make additional comments during this session, we're  
9 allowing persons who have not made comments the  
10 opportunity to go first. However, time permitting,  
11 our goal is to allow everyone who wishes to speak at  
12 this session an opportunity to do so.

13 I'll call those who have signed up to  
14 submit comments to the microphone one by one in order  
15 to allow as many, to be heard as possible, and we'll  
16 announce the next person to comment and ask them to  
17 proceed quietly to the front of the room while the  
18 commenter before them is speaking.

19 If you've not yet signed up but you  
20 wish to make a comment, you can complete a comment  
21 card in the back of the lobby. Again, there's two  
22 microphones on either side. And we're going to start  
23 things off today with our first speaker, Jody  
24 Manning. And the next speaker after that would be  
25 Johnny M.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. MANNING: Thank -- thank you.

3 Jody Manning, Cicero, New York. As the Executive  
4 Director for New York State's first ever regional  
5 STEAM high school in the Syracuse City School  
6 District, I want to express my sincere appreciation  
7 for Micron's unwavering commitment to education in  
8 our region.

9 From day one, Micron has been a  
10 crucial partner in getting this transformational  
11 project off the ground. Their support has gone far  
12 beyond just funding. They have brought vision,  
13 collaboration, and a genuine investment in our  
14 students' futures. Thanks to Micron, we're building  
15 more than just a school; we're building a launchpad  
16 for the next generation of innovators right here in  
17 Central New York.

18 They've shown up at the table, not  
19 just as a sponsor, but as a true thought partner.  
20 This is the kind of public-private partnership that  
21 redefines what's possible for our schools, students  
22 and community. Thank you.

23 MR. DAVIS: Thank you. Next is Johnny  
24 M. And after Johnny, will be Dan Troiano?

25 MR. TROIANO: Troiano.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. DAVIS: Troiano.

3 MR. JOHNNY M: Hello. John M. of  
4 Clay. I just understand that you're not able to  
5 respond. So, my understanding that there's about  
6 five million gallons of water coming out of one  
7 watershed, Lake Ontario, into another -- going into  
8 Micron. And then eventually being dumped into the  
9 Oneida river.

10 It's five million gallons per day not  
11 being used to make anything there, just being used  
12 for cooling, whatever. Primary -- probably all of  
13 those five million gallons are then going to be  
14 dumped into the Oneida River. And I just want to  
15 make sure that environmental issue has been touched.

16 Arizona has Taiwan Semiconductor built  
17 in Phoenix in the desert. So, I'm a little confused  
18 here with this water issue. I consider that a lot,  
19 as a layman, flooding potential. Thank you.

20 MR. DAVIS: Thank you. Dan? And then  
21 after Dan, is Linda LeMura.

22 MR. TROIANO: Dan Troiano. Hastings,  
23 New York, seven miles away. Welcome to the Micron  
24 bordello, home of the lying corporate welfare whore  
25 politician. Micron's locating here for our cheap

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 electricity.

3 Cheap electricity is news that  
4 thousands of National Grid customers are bailed out  
5 by politician Hochul, which they couldn't pay their  
6 bills. Ashley National Grid got the corporate  
7 welfare bailout check from Hochul. And speaking of  
8 corporate welfare, how about the millions given to  
9 three Oswego County nuclear plants every year to make  
10 them profitable? Nuclear plants that have had their  
11 licenses extended too many times at the expense of  
12 safety.

13 Building the Micron bordello is  
14 predicated on these three nukes that are scheduled to  
15 be decommissioned in four years. Experts agree to  
16 continue to operate these nukes as uncharted  
17 territory as far as accidents, leaks, meltdowns, et  
18 cetera, since no nuke has ever been run this long  
19 past its expiration date, not to mention no more than  
20 one hundred caps spent radioactive waste stored there  
21 on a fault line, that's had two earthquakes in the  
22 past year, waste that has to be kept safe for forty  
23 thousand more years. For reference, forty thousand  
24 years ago, we were spitting and pissing in caves.

25 And thanks to the Price-Anderson Act,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the nukes don't carry enough insurance to cover a  
3 meltdown, and they're indemnified in cases of  
4 negligence or willful misconduct. The rest of us  
5 have to go to evacuate to the fairgrounds without our  
6 pets, without our firearms, and taxpayers are on the  
7 hook for any cleanup.

8 Micron will also dump and accelerate  
9 millions of tons of PFAS forever chemical carcinogens  
10 into the air and waters of the Oneida Lake's  
11 watershed and Oneida's, Oswego rivers where tens of  
12 thousands of people live and obtain drinking water  
13 from OCWA.

14 New York State doesn't regulate PFAS  
15 compounds, but Minnesota does. They outlawed all  
16 PFAS use to production and fined three and a half  
17 billion dollars for contaminating drinking water that  
18 has led to cancer deaths of at least twenty-one  
19 primary, middle and high school students in fifteen  
20 years, laws named for Amara Strande, who fought for,  
21 while she was dying of liver cancer at the age of  
22 twenty years old. And Minnesota needs millions more  
23 for cleanup of toxic waste.

24 All this so taxpayers can dish out  
25 corporate welfare due to the tune of four million

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 dollars per job, most of the jobs pay twenty-one  
3 dollars an hour. Why would smart politicians like  
4 crying Schmuck Schumer and Chrisco Billygaffe pay  
5 four million dollars for a twenty-one dollar an hour  
6 job? Because this was never about jobs.

7 The first eleven recipients of CHIPS  
8 Act money spent over forty-seven billion dollars,  
9 buying back stock to artificially inflate stock  
10 value. And four more CHIP companies plan on spending  
11 fourteen billion dollars this year alone.

12 Stock buybacks. The CHIPS Act  
13 prohibits this, but it got lost on Pam Bondi's desk.  
14 And our local politicians are looking forward to  
15 creating a real estate feeding frenzy. Will raise  
16 our property taxes and throw us and our families out  
17 of our homes while their political pimps profit off  
18 our misfortune. That's Microns own words.

19 MR. DAVIS: Ten seconds.

20 MR. TROIANO: Confirm. Unfortunately,  
21 some people will no longer be able to afford to live  
22 here. The best part is that both political parties  
23 are in on it. A true bipartisan corporate welfare  
24 whore politician lovefest at our expense, the expense  
25 of our families, our health, our safety, our

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 environment, and our futures.

3 MR. DAVIS: Thank you.

4 MR. TROIANO: No problem.

5 MR. DAVIS: Linda is next and then  
6 Ellen Block.

7 MS. LEMURA: Good afternoon. Thank  
8 you for this opportunity. Linda LeMura, LeMoyne  
9 College, 1419 Salt Springs Road, Syracuse, New York.  
10 I am not a geologist nor a climatologist, and I do  
11 not play one on T.V.

12 However, I am married to one. And on  
13 our campus there's great debate about the carbon that  
14 will be released into the atmosphere. So I would  
15 like to speak to that in the spirit of the topic of  
16 today's meeting.

17 I quote, the issue of carbon storage  
18 in the wetlands to be disrupted is not quite as large  
19 as people might think. Yes, wetlands store large  
20 amounts of carbon in the soil because the high water  
21 saturation prevents decomposition.

22 So, the removal of all the wetland  
23 soil over several hundred acres seems like a lot. If  
24 the soil is allowed to decompose, the carbon goes  
25 back into the atmosphere. But if the soil is used

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 elsewhere for the fill, the carbon impact will be  
3 lessened.

4 Now, Micron has stated that they will  
5 construct new wetlands as an offset for the release  
6 of the wetlands. I think that's important to note.  
7 The other message regarding flooding. We are given  
8 this opportunity to express our concerns and can  
9 mitigate that during processes like these, and they  
10 can and will be in fact addressed. I'd like to say  
11 as a native of Syracuse, a Northsider, I grew up in a  
12 time, and I'm trying not to age myself, when this was  
13 the patent capital of the world with manufacturing,  
14 and it's been a rough forty years here.

15 Nothing makes me happier than as a  
16 native Syracusan, Northsider, New Yorker, to see the  
17 hope and the promise that Micron will bring to our  
18 community to ameliorate poverty and to excite the  
19 next generation of young people regarding the -- the  
20 importance of science in the Twenty-first Century.

21 It's not a perfect project. If we  
22 could find one of those, call me at LeMoyne College,  
23 I'll make myself available. I am deeply grateful for  
24 this opportunity. And then I am at the end of,  
25 toward the end, don't date me, of my career. And to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 know that we'll be able to entice individuals to come  
3 to this community because of all that Micron, its  
4 supply chain businesses will do for this -- for this  
5 area that has already endured enough, I cannot thank  
6 Micron enough and everyone who made this possible,  
7 and to God for putting all the water here. I thank  
8 you.

9 MR. DAVIS: Thank you. Next is Ellen  
10 Block. And after Ellen will be Andy Taddeo.

11 MS. BLOCK: Good afternoon, gentlemen.  
12 My name is Ellen Block. I'm a sixteen-year homeowner  
13 in the town of Salina, and I'm also a candidate for  
14 legislator that would represent people in parts of  
15 Salina, Dewitt, Clay, and Cicero.

16 I think Micron could be a significant  
17 win for the area if the project is implemented with  
18 thought and care for the people and environment that  
19 already live here. I'm concerned that Micron has not  
20 shown that they will give back enough to our  
21 community. The country is experiencing a housing  
22 crisis and the building of above and market rate  
23 properties for employees moving to the area will only  
24 perpetuate this problem in greater Syracuse. I would  
25 want to know what exactly is Micron doing to create

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 safe, affordable housing in the Syracuse area.

3 My other concern along the same vein  
4 is how many jobs will be created for the people in  
5 the community. I want to see a number of how many  
6 jobs at minimum will be created for people at the  
7 entry level or without higher education. These jobs  
8 will be necessary for fostering a good relationship  
9 with our community and for allowing many of our  
10 current residents to afford housing.

11 I'd also like to echo previous  
12 sentiments from this morning that I heard that Micron  
13 is putting the cart before the horse and buying up  
14 other available property before breaking ground. As  
15 someone who supports investing back into their  
16 community, these acquisitions decrease the  
17 availability of spaces that could be used to enrich  
18 our community in the next twenty years and in the  
19 more immediate future, rather than sitting dormant  
20 until more main Micron facilities are up and running.  
21 Thank you for your time.

22 MR. DAVIS: Thank you. Next is Andy  
23 Taddeo. If I could also ask the people silence their  
24 cell phones so it does not interrupt the speaker,  
25 that would be appreciative. After Andy will be Tom

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Lavi.

3 MR. TADDEO: Yeah, my name is Andy  
4 Taddeo. I live in Cicero, New York. I've been in  
5 Cicero for two-and-a-half years. I've already been  
6 impacted by this project because my previous address  
7 was Burnett Road in -- in Clay, which we love living  
8 there, so that was a -- a big -- big change for us.

9 I'm also talking about Emmanuel  
10 Lutheran Church, which is just recently celebrated  
11 our two hundred anniversary. We're about three-  
12 tenths of a mile from the Micron project, so we're  
13 worried about the impact that that's going to have on  
14 us.

15 One, is our church entrance is only  
16 about twenty-five feet from Route 31, so we're  
17 worried about the impact that that's going to have.  
18 That road is going to have to be widened. And what  
19 we'd like to have is, you know, some heads up when  
20 these things, you know let us know what's going to  
21 happen so we were able to prepare.

22 We have several things that the church  
23 we want to proceed with, but we can't make changes  
24 when we don't know what, even our future is going to  
25 be. We have several ministries that we do. We do

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 them a monthly senior luncheon, and we do A.A.  
3 meetings once a week. We have the Kyle Schneider --  
4 Schneider Foundation, which helps veterans.  
5 Compassionate friends. We meet there once a month.  
6 I'm part of the Compassionate Friend Support Group,  
7 which is a support group for people who have lost  
8 their child or grandchild.

9 Are we going to be able to have those  
10 meetings if the, you know, the -- the construction is  
11 going to have major impacts on us? So, those are  
12 some of the things we're just concerned about. So,  
13 if you can take that into consideration, show some  
14 compassion and empathy for the -- the impact that's  
15 going to have on us, that would be greatly  
16 appreciated. Thank you.

17 MR. DAVIS: Thank you. Tom Lavi.  
18 After Tom will be Evelyn Ingram.

19 MR. LAW: I'm Tom Law, L-A-W.

20 MR. DAVIS: Well, then that might be a  
21 handwriting error or a reading error on my part. But  
22 let's go with Tom Law, L-A-W.

23 MR. LAW: Tom Law, Syracuse 140  
24 Mildred Ave, 13206. First comment is, this is, I --  
25 I can write a lot of notes and this is very, what you

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 just say, tech -- technically clumsy for me not to  
3 have a place to set them down.

4 I would recommend that your -- your  
5 protocol for -- for the speakers be improved. I  
6 mean, these are normal setups, but podiums are also  
7 normal for an official speaker. So, I know you can't  
8 change this at the moment, but as you can see, I've  
9 got a few things here, and my time is precious as  
10 yours is. Okay?

11 So, first thing is an objection to  
12 your process. There are a few -- a few approaches to  
13 this, Mr. Petrovich and -- and our panel. One, I  
14 could complain about the size that it's too big, it's  
15 too small. I could complain about the considerations  
16 that the considerations we're not -- you might say  
17 heu -- heuristic. You know, broad enough and scaled  
18 and scoped properly.

19 Or I could complain about your method.  
20 That, what you're doing has questions and  
21 consequences, or limits to the consequences that are  
22 artificial, like the discharge permit. Is it going  
23 to actually pol -- re -- reflect a -- an incentive to  
24 polish the discharge water? That's my first major  
25 question.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 Is the technology to pretreat and then  
3 treat this discharge water, is it going to be  
4 adequate? Because from what I've heard, Onondaga  
5 County's wastewater people have been given a great  
6 plant, so to speak on Onondaga Lake, but if they're  
7 going to be responsible at some part for this  
8 treatment protocols or being a peer-review  
9 professional, I have no great confidence that this  
10 volume of water with corrosives and with metals,  
11 stray metals from layer depositions that we are up to  
12 ready for this.

13 Okay? That's a major question.  
14 Because in the public interest, is the water which we  
15 intake from Lake Ontario for drinking water, for this  
16 County is one of the main sources for drinking water.  
17 So, the effluent is going to go down to within maybe  
18 five, ten miles at the most of where --

19 MR. DAVIS: Ten seconds.

20 MR. LAW: -- the water drinking water  
21 comes in. Finally, wetlands don't get a lot of  
22 weight because we don't walk there. They haven't got  
23 a voice.

24 MR. DAVIS: Thank you.

25 MR. LAW: Yeah. And I'll be -- I'll

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 be adding written comments so I don't feel like  
3 cutoff is --

4 MR. DAVIS: As I said, you'll have  
5 another opportunity to speak. Next is Evelyn Ingram.  
6 After Evelyn will be, I think it is Leo Monostory?  
7 Monostory from Fayetteville, the C.N.Y. chapter. So  
8 Evelyn.

9 MS. INGRAM: Good afternoon. Evelyn  
10 Ingram, 7519 Oswego Road, Liverpool, New York. I  
11 serve as the regional spokesperson for Wegmans Food  
12 Markets, and I do not come here today alone. We have  
13 our executive store management team who was with us  
14 from our nine Central New York stores.

15 Jim Gosch is here with me, who serves  
16 as the store manager for our great northern location,  
17 which is in close proximity to the Micron site. And  
18 we are simply here today to share that we recognize  
19 the challenges and things that sometime may come with  
20 a business of project of this nature.

21 But Wegmans is in support of this  
22 initiative, recognizing the possibilities it has for  
23 our area, as well as the impact it will have on our  
24 community. We also have a very strong value system  
25 related to community service and community

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 opportunity, and we are here in partnership with  
3 Micron to recognize that we want to do all we can to  
4 support our community and hope that this project will  
5 continue in the matter as it has -- in the matter as  
6 it has been.

7 MR. DAVIS: Thank you. Did I get the  
8 first name correct?

9 MR. MONOSTORY: It's Les Monostory.

10 MR. DAVIS: Okay. After Les will be  
11 David Bottar.

12 MR. MONOSTORY: I'm the Vice President  
13 of the Central New York Chapter of the Izaak Walton  
14 League of America, a national conservation  
15 organization, and President of the League's New York  
16 State Division, and also a member of the League's --  
17 well, we have a Green Lakes committee, I'm the New  
18 York State representative on that committee. I  
19 worked for the County of Onondaga, both as an  
20 environmental planner and for the county health  
21 department for thirty some years.

22 Most of my experience is with the  
23 cleanup of Onondaga Lake, which was a thirty-year  
24 process. I actually am the author of a short history  
25 of the Onondaga Lake reclamation, basically covering

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the period of 1960s to 2020.

3 And the reason I bring up Onondaga  
4 Lake is because it was a process started with Senator  
5 Patrick Moynihan in the late '80s. And it created  
6 the Onondaga Lake management conference and that  
7 turned into the Onondaga Lake Partnership.

8 And my main point here in talking  
9 about the Micron project is that I would like to see  
10 a process for the Micron project that would  
11 incorporate a partnership similar to what we had with  
12 the Onondaga Lake cleanup, covering about three  
13 decades.

14 And we could call this the Micron  
15 partnership, or perhaps a Micron community  
16 partnership. But you know, we have a very short  
17 period here to comment on a twenty-thousand-page  
18 report.

19 What we need is continued public  
20 involvement and also communication with the federal,  
21 state, and county agencies that are involved with  
22 this Micron project. And so, my main point is not so  
23 much to comment or criticize the Micron D.E.I.S., but  
24 to recommend that the public be involved with this  
25 project over to period of, we don't know how many

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 years. And we also need information from the  
3 federal, state, and county agencies --

4 MR. DAVIS: Ten seconds, Mr. Les.

5 MR. MONOSTORY: -- that are going to  
6 be involved here. We were fortunate with the  
7 Onondaga Lake cleanup that we could hear from these  
8 agencies. Today, that is more limited than it was at  
9 that time. Thank you.

10 MR. DAVIS: Thank you. Next is David.  
11 After David is Terry King.

12 MR. BOTTAR: Good afternoon. My name  
13 is David Bottar, and I'm the Executive Director of  
14 the Central New York Regional Planning and  
15 Development Board. We're a -- we're a public  
16 planning agency formed by our five member counties  
17 here in Central New York back in 1966. So, we've  
18 been involved in this community for many years.

19 Besides being Director of the Regional  
20 Planning Board, I'm -- I'm also a life resident of  
21 Central New York. And it couldn't please me more to  
22 know that Micron has chosen our community to be the  
23 host community for their one hundred-billion-dollar  
24 investment. Think about it. One of the largest and  
25 most successful semiconductor companies in the world

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 has chosen to come to Central New York.

3 We know a company like this must  
4 complete their own due diligence before making a  
5 decision to invest such a large amount of money, in  
6 one project, in one community. Micron has evaluated  
7 our community, and concluded we have the capacity to  
8 host this project. We have the infrastructure, the  
9 people, the education, resources, healthcare, public  
10 safety, environmental resources, and public  
11 commitment to make this project a success. This is  
12 clearly addressed in the Draft D.E.I.S.

13 In evaluating this project, is as  
14 important to note, it's consistent with comprehensive  
15 plans, which have been completed in recent years by  
16 several counties in Central New York.

17 The project is also consistent with a  
18 plan, the regional planning board adopted in 2013.  
19 One of the major goals incorporated in this plan is  
20 to support the growth of a diverse economic base that  
21 will provide employment opportunities for a broad  
22 cross section of citizens across the five county  
23 region, increase the region's population from seven  
24 hundred and ninety-one thousand residents to a  
25 million residents, and increase the number of jobs

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 from three hundred and twenty thousand to over four  
3 hundred thousand by 2050. Who would've ever thought  
4 when we adopted these goals that we would have a  
5 chance to realize them in our lifetime, or at least  
6 our children's lifetime?

7 Based on the strong citizen  
8 involvement in preparing these plans, I'm not  
9 surprised that communities across Central New York  
10 have embraced this project. County-based Micron  
11 strategic planning committees have been a forum  
12 across Central New York. Towns and villages are  
13 updating their comprehensive plans or completing  
14 their first comprehensive plan ever to ensure that  
15 they're positioned to support and capitalize on the  
16 opportunities presented by Micron.

17 Major infrastructure improvements are  
18 being planned and implemented to ensure we meet the  
19 needs of the Micron project and the community at  
20 large. Our higher education institutions, and K  
21 through schools -- K through twelve schools have  
22 stepped --

23 MR. DAVIS: Ten seconds.

24 MR. BOTTAR: -- and healthcare  
25 organizations are moving forward with significant

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 expansion of their facilities. We were very  
3 fortunate that early in the process, the Town of Clay  
4 and Cicero supported this project, and we're  
5 fortunate that the entire -- entire region has  
6 stepped up to move it forward. Thank you.

7 MR. DAVIS: Thank you. Terry King,  
8 followed by Matthew Tarolli. Is there a Terry?  
9 Coming down the front, okay. No Terry? Okay. How  
10 about Matthew?

11 MR. TAROLLI: Good afternoon. My name  
12 is Matthew Tarolli. I live in Syracuse, New York,  
13 and I represent Onondaga and Cortland-Madison BOCES.  
14 O.C.M. BOCES has been at the forefront of providing  
15 meaningful educational opportunities to youth and  
16 adults for over fifty years.

17 This region has never seen the  
18 opportunity for advancement in educational capital  
19 and regional growth. We see the opportunity to work  
20 with community agencies, educational providers, and  
21 industry leaders and an opportunity for our regional  
22 population to prosper.

23 Micron has been a fantastic partner  
24 over the last couple of years, is they've taken the  
25 time to communicate with us at O.C.M. BOCES about

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 their needs for the region when it comes to workforce  
3 development. It is encouraging to work with a  
4 partner that is willing to be a learner and to help  
5 us know the skills needed to help workers have what  
6 they need know to be successful. Thank you for your  
7 time.

8 MR. DAVIS: Thank you. Next speaker  
9 will be Alice Dove, followed by Joss Willsbrough.

10 MR. DOVE: Hello, my name is Alice  
11 Dove, like the bird, soap and chocolate. I'm here  
12 because of SustainCNY's mission to ensure Micron's  
13 presence in New York happens with the smallest  
14 negative impact as possible and the greatest positive  
15 impact.

16 I live in Syracuse, I work in  
17 Syracuse. I was just recently let go from T.C.G.  
18 Player when eBay decided to close down our  
19 authentication center outside of the Syracuse  
20 Galleries with an announcement that was so short it  
21 triggered the WARN Act.

22 The reason why I mentioned that is  
23 with the impact -- with the experience that the hands  
24 of a large corporation in mind, we need to review  
25 dates. We need the review date to be extended from

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 forty-five days to a hundred and twenty days.

3 The document is twenty thousand pages  
4 long. A month and a half is barely enough time to  
5 assess what's in there, much less process and respond  
6 in a holistic sense. The decision made on this will  
7 impact not just your life, but the lives of children  
8 and your children's children.

9 Another seventy-five days is nothing  
10 in contrast to that, or even the scope of this  
11 project's intended timetable. We need to guarantee  
12 that Micron will be equitable in their hiring  
13 practices that must take place locally. I'm not even  
14 being an altruist here. I want to work in Micron.  
15 I'm interested in semiconductors, but that barrier's  
16 going to be significantly harder if Micron isn't  
17 interested in hiring people that live here and people  
18 that are in disadvantaged communities.

19 We need Micron to commit to renewable  
20 energy. Our energy grid here is already looking at  
21 an oncoming struggle. Electric bills are already  
22 high. The draw of these plants have -- will be the  
23 equivalent of states. States.

24 That's going to have a noticeable  
25 impact on the prices public consumers pay. They have

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 to ease that burden through renewable resources of --  
3 and renewable sources of energy and buy an agreement  
4 to subsidize energy costs.

5           Lastly, I will reiterate that I live  
6 in Syracuse, I'm extremely nervous about the effects  
7 that this will have on the cost of living around  
8 here. It's so hard to find affordable places to  
9 rent, and this relocation for thousands of workers is  
10 going to squeeze that even more.

11           Micron has to ensure that they operate  
12 with care in regards to facilitating transportation  
13 to the plant for citizens of C.N.Y. that live beyond  
14 Clay. And they absolutely need to back housing  
15 growth to alleviate the burdens they're going to  
16 generate. Thank you for your time.

17           MR. DAVIS: Thank you. Next is Joss,  
18 followed by Merike Treier.

19           MR. WILLSBROUGH: My name is Joss  
20 Willsbrough. I'm a Syracuse City resident and a grad  
21 student at Syracuse University who is speaking in  
22 unanimous support of the recommendations outlined by  
23 SustainCNY, Neighbors of the Onondaga Nation, NYCLU  
24 and Jobs to Move America, including their legitimate  
25 request for a community benefits agreement.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 I begin with a demand to extend the  
3 current common period from forty-five days to a  
4 hundred and twenty days and to organize additional  
5 public hearings like this in multiple locations, the  
6 D.E.I.S. is a twenty-thousand-page document; forty-  
7 five days is woefully insufficient to allow time for  
8 a public response.

9 As a federally subsidized project, the  
10 recommendations of Sustain CNY reflect the minimum  
11 standards for equitable quality of life protections  
12 for the community impacts of Microns development in  
13 Central New York. And it addressed urgent and  
14 salient concerns about the environmental,  
15 socioeconomic health and safety harms of Micron.

16 Some specific concerns. Micron must  
17 create a comprehensive plan to generate or purchase  
18 new renewable energy using wind, solar, and grid and  
19 storage infrastructure without relying on the  
20 purchase of renewable energy credits.

21 Micron must ensure that their  
22 mitigation plan adequately replaces the valuable  
23 wetlands habitat, watershed and habitat for multiple  
24 endangered species that the project will destroy.

25 Micron must create a workforce development process

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 focused on census tracks with the highest  
3 concentration of poverty in the C.N.Y. region. With  
4 hiring processes and programs that are free of access  
5 barriers, such as G.E.D. requirements, English  
6 language proficiency requirements, and discrimination  
7 against workers who are impacted by the criminal  
8 legal system.

9 And Micron must prioritize a  
10 cooperative effort with state and county government  
11 agencies to expand the availability of mixed income,  
12 affordable climate-friendly, and safe housing. Thank  
13 you.

14 MR. DAVIS: Thank you. Merike,  
15 followed by Louise Hotaling.

16 MS. TREIER: Hello, I'm Merike Treier,  
17 the Executive Director of the Downtown Committee of  
18 Syracuse, located in Syracuse, New York. And I'd  
19 like to thank Micron for their investments, their  
20 community partnerships, and their engagement to date.

21 For fifty years, our organization has  
22 focused on the revitalization of Downtown Syracuse.  
23 I've been fortunate to be part of this activity for  
24 the last twenty years. And over this time we have  
25 worked with many partners and stakeholders to adapt

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 to changes around us, lay the groundwork and build a  
3 vibrant downtown center that attracts businesses,  
4 employees, residents, and visitors through the  
5 experiences and opportunities offered.

6 This revitalized Downtown and  
7 transformation story of Syracuse helped attract  
8 Micron to Central New York, and now the growth is  
9 going to be accelerated.

10 Like an ecosystem that fuels itself,  
11 the growth that comes with Microns investment in our  
12 community will now help us to continue to create a  
13 more vibrant downtown Syracuse for our entire region.  
14 Thank you.

15 MR. DAVIS: Thank you. Louise  
16 Hotaling, followed by Anthony Tubolino.

17 MS. HOTALING: Hi, my name's Louise  
18 Hotaling. I live in the Town of Clay. I'm right  
19 next to the Micron facility. My concern is the  
20 watershed that's going to come off of this project.

21 The few houses that are along that  
22 road within a quarter mile there will not even be  
23 able to use their septic systems any longer, because  
24 the water has to go somewhere. Where they took the  
25 test and they did the water testing down by where the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 railroad tracks were, they did it on a very dry  
3 summer. Any other time you go down there, you could  
4 have water up to your knees. Thirty-five years I've  
5 witnessed this. And then, we've had where the sewer  
6 system has gone into Oneida River recently.

7 Now, when you add a project this large  
8 with extra people, how can we ensure that we're not  
9 going to totally ruin our waterways? And we had  
10 problems with Onondaga Lake. Are we going to turn  
11 Oneida into the same thing?

12 We're promised many jobs, but how  
13 many? And we're -- we're -- they're dangling a  
14 golden chain in front of us. But at what cost? How  
15 many of us has looked at other Micron facilities and  
16 how the people live after they were there? Is this  
17 going to be another one where they're there for a few  
18 years and then they leave after the tax dodge wears  
19 out?

20 Also, the fact that too many people  
21 don't pay attention to the environment. And we are  
22 blessed to have water in this area. But if we ruin  
23 it, there's no bringing it back. We need to be  
24 assured that Micron will take the responsibility of  
25 cleaning up any waste and spills that they produce.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 It's hard to imagine that our kids  
3 drink water that could be polluted. And what about  
4 all the work that's going to be done? Us people that  
5 live next to that, are we supposed to listen to  
6 construction twenty-four seven? It's nice if you  
7 live in the city and you don't have to deal with it.  
8 But if you're right next door to it, trust me, it  
9 won't be pleasant.

10 The other thing that we have to take  
11 into consideration that we don't currently have  
12 enough medical personnel, schools large enough to  
13 handle this amount of project. So, we need to take a  
14 close look at what we're really agreeing to, and we  
15 need more time. More time for the people to actually  
16 read all those pages and be able to comment. This  
17 has been pushed out for this, to get the reports.  
18 But now it's pushed on us to hurry and make a  
19 decision. This isn't fair.

20 We need this time to really study  
21 what's going to happen and ask for Micron to really  
22 commit to keeping this environment that we've been  
23 blessed to have clean. And we're going to -- the  
24 ones that are living right next to it, we're going to  
25 breathe all that stuff that your plant is going to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 do.

3 So, I'm at the end of my life mainly.  
4 But what about the kids and that, that live close to  
5 that facility?

6 MR. DAVIS: Ten seconds.

7 MS. HOTALING: What will they be  
8 breathing? Think about this when you're so gung ho  
9 for Micron.

10 MR. DAVIS: Thank you. Next is  
11 Anthony, followed by Robert Lasko -- Laskowski.

12 MR. TUBOLINO: Good afternoon. I want  
13 to thank you for allowing me this opportunity to go  
14 on record. Hello, my name is Anthony Tubolino. I --  
15 I am a twenty-seven year member of the Operating  
16 Engineer's Local 158 out of the Syracuse, New York  
17 office.

18 I'm a business representative in the  
19 Local. We represent four thousand members in New  
20 York State. Our members operate heavy equipment on  
21 projects such as this. The project will help employ  
22 our members for many years to come, will not only be  
23 a job but a career builder for many years for our  
24 members.

25 It'll give a pathway to many of the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 trades to bring in new generations of members through  
3 apprenticeships, which offer great wages and  
4 benefits. It will give the surrounding areas a place  
5 for them to have careers and not leave the area. The  
6 project will build up the middle class.

7 Additionally, I am the Vice President  
8 of the Jefferson Lewis and St. Lawrence County  
9 Central Trades and Labor Council, A.F.L.C.I.O.O. Our  
10 council represents union workers from across the  
11 diversified fields, from aluminum workers to nurses,  
12 teachers, firefighters in the building trades over  
13 ninety-three hundred strong in the three counties.

14 We support Micron and the  
15 opportunities that it'll bring not only to Clay, but  
16 also the surrounding areas for growth and job  
17 creation. Thank you for my time.

18 MR. DAVIS: Thank you. Robert  
19 Laskowski, followed by Steven Koegel. Robert? Okay,  
20 Steven.

21 MR. KOEGEL: Good afternoon. My  
22 name's Steven Koegel, I'm the Vice President of  
23 Business Communications with Centro. Centro supports  
24 all projects that foster economic development and  
25 provide employment opportunities that help

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 individuals better their lives.

3 And to fulfill our mission, to help  
4 move communities forward, our intent is to provide  
5 transportation services, bringing individuals to  
6 Micron and surrounding support businesses once  
7 operations at the site begin. Thank you.

8 MR. DAVIS: Thank you. Roggie Drew,  
9 followed by Jim Nistico.

10 MR. DREW: Good afternoon. Could I  
11 have a one minute warning instead of a ten second  
12 warning?

13 MR. DAVIS: Absolutely.

14 MR. DREW: Thank you so much. My name  
15 is Roggie Drew. I'm a Syracuse City resident. I'm  
16 glad to be here today and I'm glad to be a resident  
17 here on Onondaga Nation lands, where we are all  
18 speaking from. I'm speaking, I -- I was listening  
19 the beginning and hearing the representative from the  
20 Army Corps of Engineers said that your role is not to  
21 be for or against, but responsible to determine if  
22 it's the best interest of the public.

23 And, you know, the question that comes  
24 to mind is how do we determine that? How is -- what  
25 -- what is determined the best interest of the public

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 when we're talking about, someone mentions five  
3 million gallons per day just for cooling, loss of  
4 hundreds of acres of wetland?

5 There's no replacing a wetland that  
6 has developed over millions of years. That's lost  
7 forever. When we're discussing increased cost of  
8 housing --

9 UNIDENTIFIED SPEAKER: I'll hold that  
10 for you -

11 MR. DREW: I'm still going to hold it,  
12 but I appreciate you. Increased cost of housing.  
13 When we're talking about PFAS chemicals, forever  
14 chemicals that we -- I'm sure so many folks here have  
15 -- have experienced with cancer.

16 When there's so many places in this  
17 region from past development that -- that are cancer  
18 hotspots. That's what we're talking about, forever  
19 Chemicals. So, when we're -- when we're in this  
20 question of the best interest of the public, how is  
21 that determined? What is weighed, is -- is economic  
22 benefit weighed above these things? Irreplaceable  
23 lands, irreplaceable waterways, irreplaceable the  
24 health of our communities?

25 And I -- I want to say that I do

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 support this -- this hearing. And this is a twenty  
3 thousand page document. I also support this -- ask  
4 for more time. And that seems like a very reasonable  
5 request. I didn't look at the document at all. I  
6 looked at some summaries. I looked at Syracuse.com  
7 article, Twenty thousand pages? I -- I will never  
8 read it.

9 But certainly for folks that have that  
10 time and ability, there needs to be more time  
11 allotted for that. There needs to be an extension of  
12 public hearings in multiple locations. I've heard  
13 this request for hundred and twenty days. I support  
14 that as well.

15 MR. DAVIS: One minute.

16 MR. DREW: Thank you so much. And I -  
17 - yeah. I think -- I think I just want to end with  
18 that question. What -- that -- that we are clear  
19 about. To me, public -- public benefit with these  
20 questions of how many jobs are created?

21 These -- these are critical questions.  
22 These are the questions, right? These aren't --  
23 these aren't the side notes. So, when -- when -- if  
24 -- if this is being taken seriously, and these --  
25 this hearing means anything, I hope that these things

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 are weighed very seriously, and that the bent, the  
3 desire of a multi-billion dollar corporation --  
4 corporation is not put -- put above the people here.  
5 I don't believe Micron has these -- these people --  
6 any of our interests in mind, number one. Micron has  
7 an interest in creating facility to make a product to  
8 sell.

9                   You all are responsible to consider  
10 everyone else's concerns here, and I hope that that  
11 is taken seriously. Thank you.

12                   MR. DAVIS: Thank you. Jim Nistico,  
13 followed by Steve Fournier.

14                   MR. NISTICO: Hi, my name is Jim  
15 Nistico, and I am a resident and a business owner in  
16 the Town of Clay. In fact, my residence is about a  
17 quarter mile from the Micron facility. And I here --  
18 I'm here to strongly support Micron.

19                   First of all, for the economic  
20 development and for the opportunity that Syracuse has  
21 not had for fifty years. Back when manufacturing was  
22 king here in Central New York, Syracuse was a fast  
23 growing metropolitan area, and that has since slowed  
24 down from 1970 to the year 2020, there has only been  
25 a three percent population growth, while all other

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 areas in the country have grown more substantially.  
3 Thus, limiting the opportunity and economic  
4 availability in our area.

5 As a business owner, I look forward  
6 to, you know, working with Micron on various  
7 projects. And I know many of my fellow business  
8 owners in the area do as well. This is a real  
9 transformational project that a lot of people here in  
10 Central New York have been waiting for for a long,  
11 long time.

12 I do hear a lot of concerns about the  
13 environment. This nearly three-year process shows  
14 that there has been some diligence taken to make sure  
15 and ensure that there is the least -- the least  
16 damaging effects to the environment that a chip fab  
17 can do.

18 Especially for -- this is an immense  
19 project, one of the largest projects in the United  
20 States. Micron is a steward of the environment.  
21 There is an executive April Arnzen who lives in  
22 Boise. I guess she lives close enough to siphon a  
23 Wi-Fi from the Micron facility in Boise and doesn't  
24 seem to bother her, as far as the environmental  
25 thing.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 But anyways, I'm here to support  
3 Micron and I look forward to seeing this project move  
4 forward. Thank you very much.

5 MR. DAVIS: Thank you. Okay. Steve  
6 Fournier, followed by Sydni Barnett.

7 MR. FOURNIER: Good afternoon. I'm  
8 Steve Fournier, I'm the Market President for KeyBank  
9 here in Central New York, a lifelong resident of  
10 Central New York, and I'm thrilled to have an  
11 opportunity to speak to you, with you today.

12 I'm here as -- as well to support the  
13 Micron project, the progress they've made today but a  
14 little bit more context. As -- as a resident and --  
15 and with one organization for just about forty years,  
16 I had the opportunity to move several times to the  
17 Midwest and to the far west.

18 I chose to keep my family here for the  
19 quality of life. And for all this area has afforded,  
20 hasn't been without its challenges, but I truly  
21 believe there's a lot of resources that avail us here  
22 in Central New York.

23 The pros -- first of all, the -- the  
24 good work that this DEIS study has done over the  
25 course of the last couple years and where it's

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 brought us to today, I -- I think it's the last  
3 speaker spoke to, it -- it -- I think it's -- it  
4 proves that, you know, this is the right place in the  
5 right time.

6 I -- I will also tell you that some of  
7 the things that Micron is looking to invest, close to  
8 a half a billion dollars in -- in various community  
9 projects, really augments some of the work that we're  
10 trying to undertake between affordable housing,  
11 standing up our neighborhoods and workforce  
12 development, and that is a sweet spot for us.

13 And what we've done over the last  
14 several years, since 2022 we've invested close to  
15 two-and-a-half million dollars into these three  
16 pillars of our foundation. And we need more help.  
17 We need more help, not just from the community we  
18 have but other outside sources to the -- to the  
19 community.

20 And -- and Micron has made that  
21 commitment, so, thrilled at the prospect of them  
22 helping augment some of the work that we're doing in  
23 -- in the community and what we're trying to do going  
24 forward.

25 The other thing I will share with you

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 since the announcement is how well this business  
3 community here. I have a chance to work across the  
4 state, between Buffalo and Albany. And I can see  
5 firsthand how the both, the banking community and  
6 other aspects of this community has come together  
7 particularly in the financial services community.

8 You know, I've never in my forty years  
9 seen how we've tried to coalesce and solve some of  
10 the problems, or I should say, good problems that we  
11 might have as a result of what it's going to have.  
12 So, thank you for the opportunity to speak to you  
13 today. Thank you.

14 MR. DAVIS: Thank you.

15 MR. FOURNIER: Yeah.

16 MR. DAVIS: Next is Sydni, followed by  
17 Cal Robinson.

18 MS. BARNETT: Hello. My name is  
19 Sydni. I've lived in Cicero my whole life and  
20 recently moved to Syracuse. And I'm here to voice my  
21 concern over the environmental impact of this  
22 project. It's been said that the impact statement is  
23 twenty thousand pages long, so obviously it's an  
24 immense document. We kind of need more time to  
25 review it as a -- as a community. So, I'm here to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 support the one-hundred-and-twenty-day extension for  
3 -- for public comment.

4 I'm concerned over the environmental  
5 impacts of this project because it's been said that  
6 it will essentially double the water usage of  
7 Syracuse. The project will use the same amount of  
8 water as the entire City of Syracuse in one day, like  
9 each day that the facility is functioning. I'm very  
10 concerned over that because right now this region is  
11 rich in water. We know that's why Micron has been  
12 attracted to this region for its abundance of water.

13 But if the water usage of this  
14 facility will jeopardize that and deplete our waters,  
15 I think that's something we should be very watchful  
16 and concerned over. I'm also concerned over the use  
17 of PFAS chemicals in the microchip fabrication  
18 process. PFAS are forever chemicals that can fluid  
19 our waterways and subject us to health impacts over  
20 long periods of time.

21 I'm also concerned over the loss of  
22 wetlands, which are a habitat for many endangered  
23 species. So, the environmental impacts of this  
24 project are very concerning. And I know there is  
25 economic benefits to this project, but as has been

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 said, I think, when determining what's best for a  
3 community, we should also consider the health impacts  
4 and environmental impacts over the long-term for our  
5 community. Thank you.

6 MR. DAVIS: Thank you. Next, Cal  
7 Robinson followed by Timothy Riina-Ferrie.

8 MR. ROBINSON: Good afternoon. My  
9 name is Cal Robinson. I'm a biology teacher and a  
10 resident of Liverpool, New York. I come with some  
11 concerns particularly about the environmental impact  
12 of this project as well as some of the economic  
13 claims that are being made.

14 Notably, this wetland that is going to  
15 be built upon, hosts populations of the Indiana bat  
16 and the northern long-eared bat. The Indiana bat has  
17 already lost fifty percent of its population since  
18 being listed on the endangered species list, and  
19 we're taking out a massive part of their habitat.

20 If this site is developed, Micron will  
21 be required to either build or set aside in new  
22 wetlands. Even if that occurs, that does not erase  
23 the fact that two hundred acres of wetland are going  
24 to be eliminated. And any new wetland that's set  
25 aside or that is created is not going to host the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 exact same community of species that this currently  
3 existing wetland does. Additionally, wetlands serve  
4 as a filter for pollutants and runoff.

5 The construction of a large facility  
6 such as that proposed by Micron is going to produce  
7 absolutely massive amounts of pollutants including  
8 PFAS, and there will be wet -- less wetland available  
9 to filter these pollutants. And that is one of the  
10 main jobs that wetlands do for us is they filter  
11 pollutants out of the environment.

12 Another key aspect of being a resident  
13 of Central New York is our large access to fresh  
14 water. As climate change persists, this is a very  
15 important resource. Micron may use, as the previous  
16 speaker mentioned, as much or more water per day than  
17 the entire City of Syracuse already does. Why do we  
18 want to allow a multi-billion-dollar company to have  
19 access to that water versus the residents of this  
20 area, when individuals and families need it?

21 On the topic of job creation, I want  
22 to know how many actual long-term jobs are going to  
23 be created by this. I know there's going to be a lot  
24 of construction jobs, which is excellent for that,  
25 that community, that industry. But after the

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 construction is done, what jobs are going to be left?  
3 How many of the jobs in the facilities are going to  
4 be left for actual working employees versus  
5 automation and artificial intelligence performing a  
6 lot of the manufacturing?

7 Of those jobs that are there for  
8 people, what kind of educational requirements will  
9 they be? Are they going to require master's degrees,  
10 college degrees, vocational school? What about the  
11 people who can't afford that kind of debt that might  
12 be brought upon them -- brought upon them, excuse me,  
13 by that kind of requirement.

14 I'm also aware that there's going to  
15 be housing constructed along with the creation of  
16 this facility. These houses, are they going to be  
17 affordable for people who live in this area? Or are  
18 they just going to be cookie cutter, very large,  
19 several hundred-thousand-dollar houses that actual  
20 normal working people can't afford?

21 As a final statement, if Micron is  
22 allowed to build this -- over these wetlands, it's  
23 going to serve as an indication that endangered  
24 species and wetlands don't matter, water security  
25 doesn't matter, and money is always the priority.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 Thank you.

3 MR. DAVIS: Thank you. Timothy  
4 followed by Trent Gardner.

5 MR. RIINA-RERRIE: Hello. My name is  
6 Timothy. I'm a resident of Syracuse, New York. I've  
7 been for a long time. I'd just like to say that,  
8 it's -- Micron is a very exciting thing for us, I  
9 believe. I think everyone in Syracuse is very  
10 hungry.

11 We understand what this community has  
12 been through, how Carrier just left and left us  
13 essentially destitute. And how essentially large  
14 corporations come in, take our resources and then  
15 leave because they can. And we are left.

16 I guess, my worry is that -- I'm  
17 excited for Micron. I'm excited for economic  
18 development. This is an environmental impact  
19 statement. And the environmental impact of that  
20 Micron has the ability to unleash on the future  
21 generations of people all across New York State is  
22 absolutely astronomical. And they can always just  
23 leave.

24 Like, some of the previous speakers  
25 said, water is going to become more and more

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 important as the years go by. We're extremely lucky  
3 to have such access to fresh water. And it's  
4 worrying that a plant like this could potentially  
5 ruin that groundwater, ruin that aquifer.

6 I'd also like to admonish, honestly,  
7 the County for putting this together in such a  
8 haphazard way. The twenty-thousand-page document  
9 that is meant to be for community outreach should  
10 also have supplementary documents.

11 You could have interviews. You could  
12 even have A.I. summarize parts of it and release that  
13 to the public after it's been vetted for accuracy. I  
14 mean, there are tools that could have been done to  
15 make this outreach actual outreach instead of just  
16 what seems like a hand wave to say, well, we did  
17 something forty-five days, twenty thousand pages, one  
18 day of public hearings.

19 I'd also like to point out that Micron  
20 is here for our resources. As some of the small  
21 business owners have pointed out, people all over  
22 Syracuse, small business owners, larger business  
23 owners, people who are interested in the community  
24 have done tremendous work to get to where we are  
25 today.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 It has not been easy after large  
3 manufacturing left. And I just like to point out  
4 that, I just like to be wary of Micron that they are  
5 just abusing these resources. They're going to take  
6 these communities, these channels that have been so  
7 purposely created, use them for their own purposes  
8 and essentially bleed the place dry.

9 And what if they're successful, are  
10 they going to build another plant? In the  
11 introduction of the proposal, the impact statement, I  
12 saw that it's a twenty-year plan. Twenty years is  
13 not a very long time to reassess something. And when  
14 they do reassess --

15 MR. DAVIS: Ten seconds.

16 MR. RIINA-FERRIE: And I would also  
17 just like -- oh, excuse me. I apologize. And I'd  
18 just like to say that the environment affects people,  
19 not just plants and animals that they pave over.

20 MR. DAVIS: Thank you. Trent Gardner  
21 followed by Warren Hilton.

22 MR. GARDNER: Good afternoon. I would  
23 like to also reiterate the hundred-twenty day comment  
24 period. I feel that the document is a little too  
25 extensive for the average person to be able to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 consume in the forty-five day period.

3 I would also like to highlight the  
4 socio-economic impacts that the proposed Micron  
5 facility would have. We already have a shortage of  
6 teachers, specifically in -- oh, specifically in  
7 special education for young kids. There is a  
8 shortage of available resources for these students,  
9 and I know many families are fighting and -- and  
10 competing for these resources for their children to  
11 get the services they need.

12 This is also reiterated in the health  
13 care systems, where mental health services and  
14 addiction services are understaffed. I know serve --  
15 several facilities have way more patients than is  
16 what they should be what is advised per therapist and  
17 per counselor.

18 The affordable housing, you're --  
19 we're already kind of hitting a bubble, where many  
20 housing developments have already shot up in value  
21 just because of the talks of Micron coming in. And  
22 then, when the plan is actually implemented, we're  
23 talking about all of these houses skyrocketing in  
24 value with first time homebuyers being  
25 disproportionately disadvantaged.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 We also talk about the rental  
3 properties that are available in Syracuse where  
4 there's -- it's hard to find for the average person  
5 an affordable apartment, affordable house to start a  
6 family. So, I know many young people are starting to  
7 delay having families as a way to save money, as a  
8 potential of buying a house or potential of getting  
9 into a neighborhood or potential of getting into a  
10 school that they want to go to.

11 Additionally, a lot of local areas are  
12 announcing budget cuts right now, which doesn't  
13 install much confidence in this plant coming into  
14 this area. With Mayor Walsh announcing over ten  
15 million dollars in budget cuts for 2026, how can we  
16 feel confident that a private company is going to  
17 come in, take some resources while all the rest of us  
18 are, we're fearful. We're afraid.

19 Additionally, all these services that  
20 are available to the public are already  
21 disadvantaged. With the burst of population, with  
22 the burst of economics coming into Syracuse --

23 MR. DAVIS: Ten seconds.

24 MR. GARDNER: -- how can the local  
25 people feel more confident that they are going to

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 receive the services that are already disadvantaged  
3 against them? Thank you.

4 MR. DAVIS: Thank you. Warren Hilton.

5 DR. HILTON: Good afternoon. Thank  
6 you. My name is Dr. Warren Hilton. I'm honored to  
7 be the President of Onondaga Community College.  
8 Thank you for hosting this forum, giving me the  
9 opportunity to speak.

10 I want to briefly tell you about our  
11 experience at Onondaga Community College with Micron  
12 Technology and how it is changing lives of the  
13 students of all ages at Onondaga Community College.

14 For the last three years, Micron has  
15 been a tremendous partner in education with us at  
16 O.C.C. Micron has given us the equipment, valued at  
17 five million dollars to help us outfit and build the  
18 Micron Clean Room Simulation Laboratory on our  
19 campus.

20 That gift was matched by Onondaga  
21 County and the State of New York. And Micron also  
22 committed an additional two point five million mainly  
23 for scholarships for students and others to -- other  
24 support to train technicians, most of which will work  
25 at companies locally, not just at Micron.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 The lab will open this coming fall.

3 And I hope each of you will have the opportunity to  
4 experience it, because it'll be a wonderful  
5 opportunity. Along with the funding that Micron has  
6 provided for us for the Clean Room and scholarships  
7 as I just described, Micron verified our academic  
8 curriculum before we began to offer it to ensure that  
9 it would lead to sustaining wage jobs in the semi-  
10 conductor industry.

11 We welcomed our first students in our  
12 Electromechanical Technology program in the fall of  
13 2023. This past May, several of them graduated and  
14 were the first to complete that degree. Five of  
15 those individuals are -- are currently working for  
16 Micron Technology in Boise. You may know one of  
17 them. One of them is R.J. Tinsley. R.J. graduated  
18 from Liverpool High School, where we're sitting.

19 In 2017, he earned an associate's  
20 degree at O.C.C., then went on to get a bachelor's  
21 degree at SUNY Cortland. He struggled to find a job  
22 after his bachelor's degree. And he was delivering  
23 food for local establishment. He found his way to  
24 O.C.C. for our Electromechanical degree and the rest  
25 is history, R.J. will be -- has started his career

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 working for Micron in Boise.

3 After the -- his first year with us,  
4 he actually had a paid internship with ten other  
5 O.C.C. students. We have experienced tremendous  
6 growth in that program and -- and we are thankful  
7 that we're able to have it.

8 In the years since we started the  
9 program, our educate -- our education efforts have  
10 continued. We've hosted Micron Chip Camp. We've  
11 also hosted teachers from the area who are learning  
12 our curriculum. And we have over four hundred  
13 students in high school school who are taking this  
14 curriculum.

15 MR. DAVIS: Ten seconds.

16 MR. HILTON: So, as you can see from  
17 all of that, Micron has been an exceptional partner  
18 for us to work with. It is a partner that I believe  
19 should enjoy the support for their construction  
20 project. Thank you.

21 MR. DAVIS: Thank you. Those are the  
22 cards that I have for all new speakers that did not  
23 speak at a previous session. I have one card from a  
24 speaker who spoke earlier, which I will ask to come  
25 up. And then, I will open it up to anybody that has

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 not spoken and would like to speak. So, Greg  
3 Lancette, please, you're up next.

4 MR. LANCETTE: Thank you. My name is  
5 Greg Lancette. I am a resident of Clay, and I grew  
6 up in the City of Syracuse, student of Syracuse City  
7 School District. I'm here to talk and give comment  
8 on that, of course, in support of Micron and the  
9 project.

10 But I'm going to give a brief summary  
11 on a Syracuse Build Pathways to Apprenticeship  
12 Program that is underway. It's a multi-year program.  
13 When I first met Micron and started talking about our  
14 job opportunity program, they were very interested to  
15 hear some of the details.

16 They were very quick to ask if it was  
17 a theory or a program or if it was actually up and  
18 running. And fortunate for us, the program was a  
19 couple of years old that had already graduated four  
20 cohorts. And the program is designed for underserved  
21 communities, non-traditional construction workers,  
22 and it provides a basic skill set that makes  
23 residents of our community that have been typically  
24 overlooked prepared for a career in construction.  
25 They are taught curriculum that is NABTU, North

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 America Building Trades Union, multi-core craft  
3 curriculum, and they are given preparatory skills.  
4 And many of the graduates are currently apprentices  
5 in building trades local unions. And they are going  
6 through their pres -- progressions.

7 The original design of the program was  
8 built for the upcoming replacement of Interstate 81,  
9 and the proof is then in the pudding and the data and  
10 Micron has agreed to support that both intellectually  
11 and even financially, because that is one of the  
12 criteria to give job and career opportunities in the  
13 construction industry to residents and demographics.

14 And people in our community that  
15 traditionally have not had those opportunities or  
16 have not learned skill sets in their schooling system  
17 prior to us meeting them. The program has graduated  
18 its ninth cohort currently. And there is a -- we do  
19 not have an open cohort right now, because the  
20 Pathways to Apprenticeship Program is doing a summer  
21 camp with the Syracuse City School District right now  
22 as we speak. It's one p.m. to five p.m. this summer.

23 So, they're not here today to speak on  
24 that, but I am here to tell you that that is one of  
25 Micron's commitments that they made to our community,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 to make sure everybody in the Central New York  
3 community has an opportunity to learn, earn, and stay  
4 with sustainable wages in Central New York.

5 The program has had so much success.  
6 It has expanded into Tompkins County Ithaca,  
7 graduated their first cohort a few weeks ago.

8 MR. DAVIS: Ten seconds.

9 MR. LANCETTE: And the Oswego cohort  
10 actually starts in two months. So, thank you for  
11 your time and thank you for this opportunity.

12 MR. DAVIS: Thank you. Are there any  
13 speakers who did not fill out a card but now having  
14 sat here for a little while are interested in  
15 speaking? Yes. So, if you could come down, come  
16 down to microphone. Since you didn't complete a  
17 card, I'm going to ask you to please state your name  
18 and spell your name, so that the Reporter can  
19 appropriately capture it. And we'll start here with  
20 you.

21 MR. HUERTA: I'll give her my card, so

22 --

23 COURT REPORTER: Your name?

24 MR. HUERTA: Sure.

25 MR. DAVIS: Please state your name.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. HUERTA: My name is Raul Huerta.

3 MR. DAVIS: Okay.

4 MR. HUERTA: I'm from the Southwest.

5 And this is what I want to say to you. I'm from a  
6 family that founded Santa Fe. We enslaved people to  
7 steal gold out of the hills. What you are doing will  
8 have an impact on you and your families and your  
9 families' honor from now till the end of time. Okay?

10 I moved here in 1985 over a lot of  
11 objections. My wife took a job at Colgate. We came  
12 here. I went down to Onondaga Lake. You can't eat  
13 the fish there. You cannot eat the fish out of that  
14 lake. They're poisoned.

15 And that process started when the  
16 Jesuits decided to destroy the salmon that were --  
17 that were coming there, and that destroyed chunks of  
18 the people, the Onondaga people. Now, just a few  
19 yards away from that is where the great law of peace  
20 was declared and created when Hiawatha worked with in  
21 Onondaga.

22 And that is what created the great law  
23 of peace. Now, probably you all don't know about the  
24 great law of peace. You should learn about it. And  
25 you should learn from the fact that you cannot eat

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 any of those fish.

3 And you guys are starting a mess with  
4 twenty percent -- twenty percent of the world's fresh  
5 water, which is what is in the Great Lakes. I  
6 watched in my home State of New Mexico people pumping  
7 water out of the Ogallala Aquifer, and that created  
8 huge desertification. It could drop the water table.  
9 You guys have to really think about that.

10 Now, I'm a Rotarian. And what do you  
11 do when you're a Rotarian? What's the first thing?  
12 Is it the truth? Is it fair to all concerned, is the  
13 second one. And I want you to think about the very  
14 last part of that. Will it be beneficial to all  
15 concerned? That involves the planet, that involves  
16 everyone on this planet, that involves the Earth and  
17 that involves everything.

18 And seriously, stealing that gold that  
19 we did made us wealthy. Okay? But we still are  
20 ashamed of what happened. Okay? You guys need to  
21 think like that. Seriously, twenty percent of the  
22 world's fresh --

23 MR. DAVIS: Ten seconds.

24 MR. HUERTA: -- water is in the Great  
25 Lakes. Thank you. Take care. Bye.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. DAVIS: Thank you. Any other  
3 speakers that would like to speak, please? If you  
4 could state your name and address, that'd be helpful.  
5 Thank you.

6 MR. D'HOLLANDER: Yeah, I'll give her  
7 the information in detail.

8 MR. DAVIS: Sure.

9 MR. D'HOLLANDER: Raymond D'Hollander,  
10 Manlius, New York. I'm a retired civil engineer that  
11 worked for decades on cleaning up Superfund and other  
12 contaminated sites that originated before modern  
13 environmental laws and regulations came into effect.  
14 Modern industrial plants in New York do not create  
15 these impacts.

16 I can tell you from personal  
17 experience cleaning things up. We don't clean up  
18 modern industrial plants. Federal and state  
19 regulations beginning in the 1970s and 1980s largely  
20 eliminated pollution, so we now have clean water and  
21 clean air.

22 I was around back then. It's very  
23 different today for the quality of water. Also,  
24 we're now protecting wetlands. We're also managing  
25 stormwater, which was not being done in the 1960s,

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 1970s. I've actually read much of the D.A.I.S.

3 I am pleased to see that Micron is not  
4 taking shortcuts and requesting waivers of the  
5 numerous rigorous environmental laws and regulations  
6 that have been enacted over the past fifty-five  
7 years. New York State has rigorous environmental  
8 laws. Pushing Micron away from New York would  
9 actually increase global environmental impacts,  
10 because they would likely locate in a place with much  
11 less rigorous requirements, including greenhouse gas  
12 emissions. Thank you.

13 MR. DAVIS: Thank you. Are there any  
14 further speakers who would like to speak at this time  
15 that have not spoken? Okay. If there are any  
16 speakers who have already spoken, who would like an  
17 additional opportunity, an additional three minutes  
18 to speak, if you got cut off before, then I will ask  
19 you to come to the -- to the microphone.

20 We'll have you restate your name, so  
21 that we can capture that for the Reporter. And --  
22 and then, you have another three minutes to speak.  
23 Yes, ma'am?

24 MS. HOTALING: Louise Hotaling. One  
25 thing I forgot to mention is that I've been in

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 manufacturing a good part of my life working with  
3 circuit boards and things like that. I'd like to  
4 know what's going to happen with the chemicals.

5 It's not all water. There's Ethylene,  
6 M.P.C., Freon, all these other chemicals. Where are  
7 they going to go? That's a big concern. Also, take  
8 a look at what we've done in the past, like over at  
9 Carrier. Yes, they did move out. But if any of  
10 you've drove by there lately, look at all the tons of  
11 dirt that they brought in there. Do you wonder why  
12 those tons of dirt was put in there? Because now if  
13 you drill down twenty feet, you're not going to see  
14 the chemicals.

15 But if you drill down before, two  
16 feet, you'd see chemicals. So, it's very important  
17 that we take a really strong look and really hold  
18 Micron responsible. If we do end up with this later  
19 on and end up with a spill, we can never replace what  
20 we've lost. Thank you.

21 MR. DAVIS: Thank you. Any other  
22 speakers that would like to speak that have spoken  
23 prior?

24 MR. LAW: Yeah, Tom Law. The question  
25 of brine -- brining the freshwater wetlands, there is

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 some science I've read that -- and -- and it's  
3 relatively common sense that, with all this use of  
4 salt on our roads, it gets washed into adjacent  
5 lands.

6 And this is, you know, month after  
7 month around here, with the snow and ice, December,  
8 January, February, March, probably the highest. But  
9 you are really changing fresh water into salt water  
10 when this happens.

11 And we're not talking about just four  
12 months. We're talking about years. And so, the  
13 question becomes, you may be rebooting wetlands in  
14 another location, which has positive wetland impact,  
15 but are you long-term, I mean, I didn't see design  
16 drawings in the water resources section of this. But  
17 is there consideration that the overflow, I mean,  
18 say, for example, there's a scenario. You've got  
19 salt. You've got heavy salt. The storm didn't show  
20 up exactly when you thought, but you salted the roads  
21 twice, the parking lot at Micron.

22 And then you have a rainstorm at the  
23 end of February. And it's two inches of rain or an  
24 inch-and-a-half of rain. It washes everything right  
25 away pretty much, depending on the sheet wash and --

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 and -- and the dynamics of it. It washes that salt,  
3 you know, someplace.

4 So, what I'm getting at is you really  
5 are going to kill a wetland if you salt it up. It's  
6 not going to be a freshwater wetland anymore. And  
7 there aren't too many substitutes for using salt that  
8 -- that I've heard about. There are some, even  
9 strange ones, but I think it's a real issue. You  
10 know, how -- how are you going to really protect the  
11 wetlands long-term from the salt? Thank you.

12 MR. DAVIS: Thank you. Any further  
13 speakers? Yes.

14 MR. GARDNER: Trent Gardner, town --  
15 Town of Geddes. I also want to -- my background is  
16 in environmental services, industrial, specifically.  
17 I want to ask that when this plant is implemented a  
18 bit, that we carefully choose the companies doing the  
19 construction on these projects.

20 As we all know, the -- the trickle  
21 down is -- the administrative can make so many  
22 controls, engineering controls to help keep everybody  
23 safe, but it ultimately comes down to the individual  
24 workers as that are doing the job as to whether  
25 these, any sorts of chemicals or industry standards

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 are adhered to.

3 Choosing companies more selectively  
4 that have higher safety standards that have higher  
5 environmental rapport, know the -- have more training  
6 within themselves. When selecting these companies to  
7 do the construction of the plant, the waterways to  
8 get these operations into Syracuse and all of the  
9 existing infrastructure that is going to be needed  
10 for this project, if we carefully select the  
11 companies that we choose to develop the  
12 infrastructure, we can help to eliminate some of the  
13 potential -- mitigate some of the potential effects  
14 that maybe cause environmentally or socio-  
15 economically as well in order to minimize the impact  
16 on local residents, local environment, et cetera, et  
17 cetera. Thank you.

18 MR. DAVIS: Thank you. Any further  
19 speakers? Please state your name again.

20 MR. TROIANO: Dan Troiano. Two things  
21 you left off your D.E.I.S. You destroy three hundred  
22 acres of wetlands, you're going to release three  
23 hundred and five thousand metric tons of carbon  
24 dioxide. It's the yearly emissions of sixty-six  
25 thousand cars, stored in the wetlands.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 You destroy that, you're going to  
3 remove the future carbon storage of that wetlands.  
4 You're going to release the emissions of sixty-six  
5 thousand cars, seven miles from my house. You cannot  
6 restore wetlands elsewhere.

7 Even after a hundred years of restored  
8 wetlands do not replicate the elect -- ecological  
9 functions of an intact wetlands. Out of six hundred  
10 and twenty-one restored wetlands, the ability for  
11 carbon storage is twenty-three percent lower than  
12 undisturbed wetlands.

13 And it has twenty-six percent less  
14 biodiversity. Replacing two hundred acres of  
15 wetlands in eight thousand feet of streams with six  
16 hundred and forty-five acres of impervious surfaces,  
17 parking lots, roads and roofs, and fifty-eight acres  
18 of semi-impervious surfaces results in increased  
19 flood risks downstream, storm water to Clay, the  
20 village of Phoenix and the City of Fulton have  
21 extreme flood risks.

22 Micron development will exacerbate  
23 flooding issues there and it's not even addressed in  
24 the D.E.I.S. Also, you're talking about sixty-four  
25 thousand more people. That also raises downstream

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 flooding risk because you're going to start paving  
3 over my backyard. Five hundred and fifty dump trucks  
4 a day in an area already clogged with traffic. Who  
5 pays for the road destruction? Already three hundred  
6 and fifty trucks pass through the intersection of 31  
7 and Caughdenoy each day. Taxpayers on the hook for  
8 upkeep, rebuilding, safety and emergency situations,  
9 like accidents, spills, et cetera.

10 And who gets to tell the next of kin,  
11 their family was killed in a dump truck mishap.  
12 Like, the two people that just got flattened up an  
13 ass shoe by a dump truck. Nice. We're still here.

14 MR. DAVIS: Thank you. Any further  
15 speakers at this time? Yes. Please come forward and  
16 state your name.

17 MR. BLEIER: Thank you. My name is  
18 Brent Bleier, B-L-E-I-E-R. I live in the City of  
19 Syracuse. I came a little late. I'm -- I'm a little  
20 concerned because there's five of you gentlemen here.  
21 I don't see any people of color, and I don't see any  
22 women.

23 Now, I realize the whole industrial  
24 development agency is not necessarily represented at  
25 present, but I'm a little concerned about at least on

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the surface here today, a lack of diversity and  
3 inclusion.

4 The thought I had discussing this a  
5 few days ago with another gentleman, was if and I  
6 believe the plant calls for four plants, and is built  
7 sequentially, I think. Is there any mechanism in  
8 place who can be added? So, after the first plant is  
9 built, a review could be made of -- of the impact and  
10 of the technology and particularly environment.

11 I realize a lot of things need to be  
12 done for that first plant that wouldn't need to be  
13 replicated for each additional plant if -- if the  
14 whole thing goes that far. But there may be some  
15 improvements, so to speak, to the infrastructure, to  
16 the way electricity and gas is handled, particularly  
17 the way the traffic and transportation is handled.

18 Because all of us or many of us on  
19 light -- in light wise is a learning curve. So, I'm  
20 wondering if in a sequential project such as this,  
21 there -- there is, there will be mechanism to  
22 evaluate everything that has been done and it's  
23 potentially going to be done and maybe -- and the  
24 technology -- different technologies may well be  
25 available when this second plant is ready to go, I

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 would assume. So, I don't know if it's going to be  
3 another impact. I doubt it.

4 But another impact statement or review  
5 of the actual impacts that all of us have witnessed,  
6 including Micron, I'm sure Micron's going to make  
7 improvements to help their end of it, the  
8 manufacturing end of it. But in terms of the  
9 community and the environment and other factors that  
10 are shared by those of us regionally, I'm wondering  
11 if there's a way we could have a reviewing. Maybe  
12 the re -- maybe it's already in this, but I'm just a  
13 little bit concerned.

14 Because I know Micron will certainly  
15 learn whatever lessons they need to learn to improve  
16 their manufacturing efficiency and -- and profit and  
17 -- and whatever else. But I'm just wondering in  
18 terms of the community and the general public, if  
19 there's a way there can be a review, if we get to the  
20 point where the first one is up and running and we  
21 have new knowledge gained on -- on all -- almost all  
22 aspects that have --

23 MR. DAVIS: Ten seconds.

24 MR. BLEIER: -- been touched in here.  
25 So, thank you very much for your time, and I admire

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 your patience in listening to so many of us.

3 MR. DAVIS: Thank you. Any further  
4 speakers? Okay. This is a scheduled session that  
5 will go until five o'clock. It is roughly three  
6 forty-five now. There are more speakers that may  
7 show up during this time period. So, this session  
8 will remain open.

9 I am going to take a -- a brief bio  
10 break. And then we'll come back. As more people  
11 come into register, I will open up the comments  
12 again. And then, as we get closer to the end of the  
13 session, I will also open it up again.

14 I appreciate for anybody that is going  
15 to be leaving now, we really appreciate your  
16 comments, receiving your comments. Thank you very  
17 much for participating. The session will remain open  
18 until five o'clock. Thanks.

19 (Off the record; 03:42 p.m.)

20 (On the record; 04:01 p.m.)

21 MR. DAVIS: Back on the record now.  
22 After a quick break, I'm going to ask you to please  
23 take your seats. Thank you. So, I do have some more  
24 speakers that have registered to speak. First, we'll  
25 have Brad Santee. Let me make sure I have my glasses

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 on.

3 Yup. And then, Gene Cooper. I will,  
4 you know, we have a three minute time limit for  
5 speakers. You can use the three minutes. I will  
6 then, ask the next speaker to speak at the conclusion  
7 of that. There's an opportunity to come back up if  
8 you needed additional time. Okay? And if you could  
9 please state your name for the Reporter.

10 MR. SANTEE: I -- I appreciate.

11 MR. DAVIS: So, Brad?

12 MR. SANTEE: Yes. Test, test. Yeah.

13 My name is Brad Santee. And I live directly across  
14 from the Oak Orchard Wastewater Treatment Plant. I'm  
15 here today to place some concerns about proposed  
16 industrial Wastewater Treatment Plant's expansion  
17 being planned as part of the Micron semi-conductor  
18 project.

19 First, I wanted to emphasize this is  
20 not a temporary disrupt - disruption once built, the  
21 Wastewater Treatment Plant will become a long-term  
22 industrial utility site, processing millions of  
23 gallons of wastewater per day from a multi-fab chip  
24 facility.

25 The change to the landscape isn't

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 short lived or marginal. It's a permanent structural  
3 shift in how the area will look, function and affect  
4 those of us who live nearby or along the river. The  
5 D.E.I.S. provides very little detail about the  
6 physical layout or visual impact of the plant itself.  
7 What is mentioned is deeply concerned that the Oak  
8 Orchard facility will reportedly rival the Hiawatha  
9 Boulevard Treatment Plant, which has long been  
10 associated with odor and more commonly recent serious  
11 air quality issues.

12           Importantly, that facility is located  
13 in a commercial zone, not in a residential community.  
14 That is the precedent for what will be constructed  
15 across the street from my house. This is alarming.  
16 There are no public facing renderings yet. No  
17 elevation drawings. No clear plans describing what  
18 this facility will look like. Or how close to  
19 property lines would be. Let's see. It's supposed  
20 to fill every inch of the seventy-six acre parcel,  
21 which Oakwood -- Oakwood currently occupies.

22           I'm mostly deeply concerned about the  
23 chemical risks. The D.E.I.S. confirms Microns  
24 wastewater treatment will contain PFAS forever  
25 chemicals, corrosive acids, industrial solvents and

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 heavy metals. While treatment methods like reverse  
3 osmosis and carbon filtration are referenced, these  
4 systems are not yet built or proven and no specific  
5 discharge thresholds have been provided.

6 We are being asked to trust that  
7 everything will work perfectly. That trust was  
8 recently compromised in March 2024. And following --  
9 following the power outage, over five million gallons  
10 of untreated sewage were discharged into the Oneida  
11 River.

12 In a single point of failure under  
13 current low flow conditions, it can cause that kind  
14 of damage. You know, what will it look like when we  
15 have a much more high volume? Another major issue is  
16 the so called buffer zone.

17 Again, the D.E.I.S. references a  
18 hundred foot wooded buffer between the plant and  
19 nearby homes. Based on what I see every day, those  
20 trees may not be able to -- they're not -- they're  
21 not county owned for one thing.

22 And the risk of old growth that has  
23 been between the fields for, since they built the  
24 plant. It provides zero protection from the  
25 facility's impact. From my front yard, I can hear

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 the loudspeakers from the plant, maybe a mass  
3 certification tests, I would assume.

4 The vibrations are so strong, they  
5 shake the ground, wake up the children, or interrupt  
6 your sleep when the -- the machines spin up.

7 MR. DAVIS: Okay. I'll -- I'll ask  
8 you to stop there. But I will call --

9 MR. SANTEE: Uh-huh.

10 MR. DAVIS: -- call you back with  
11 another opportunity to finish up. But I give the  
12 next speaker their three minutes and then, I'll have  
13 you come back.

14 MR. SANTEE: Okay. That's okay.

15 MR. DAVIS: Thank you.

16 MR. SANTEE: I'll -- I'll submit to  
17 the email.

18 MR. DAVIS: Yeah.

19 MR. SANTEE: Thanks, Davis.

20 MR. DAVIS: Thank you. Gene -- Gene  
21 Cooper. Brad, you might have a quicker opportunity  
22 to come back. Gene Cooper? No. All right. Brad,  
23 another three minutes on the clock.

24 MR. SANTEE: That won't take that  
25 long. So, the hundred foot strip is unmanaged tree

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 growth. This is inadequate. Best practices for  
3 wastewater facilities recommend at least five hundred  
4 when you're near residential. And of course, that's  
5 without any other mitigations, like berms, buffers,  
6 walls, like you would see on the eighty-one project,  
7 stuff like this. This is what we want to see in the  
8 drawings eventually.

9 So, in closing, I ask the County and  
10 Micron has been leaders to consider the following,  
11 significantly expand the required buffer zone and  
12 include a targeted mitigation measures, such as  
13 berming and screening, release detailed publicly  
14 accessible building plans before final site approval  
15 and enforce some chemical discharge thresholds.

16 So, in essence, that's it. A lot of  
17 people probably don't talk about the vibration or  
18 noise. But if you're anywhere in the area, this is a  
19 -- an effect that we all feel. So, all right.  
20 That's it. Thank you.

21 MR. DAVIS: Thank you. Okay. Any  
22 additional speakers at this time that would like to  
23 come forward and speak? Okay. So, just like we just  
24 did the last time with no speakers here currently, it  
25 remains open. We will just go into a little bit of a

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 pause period in case new speakers arrive, that would  
3 like to speak over the next fifty-three minutes.

4 So, you can resume your conversations.  
5 And as more speakers come in, I will interrupt and  
6 bring those forward. Thank you.

7 (Off the record; 04:07 p.m.)

8 (On the record; 04:23 p.m.)

9 MR. DAVIS: So, I will reopen.

10 COURT REPORTER: Yes.

11 MR. DAVIS: Are you ready?

12 COURT REPORTER: Yes.

13 MR. DAVIS: Okay. Perfect. Thank  
14 you. And Susan M.H. Flick, please come forward.  
15 Susan, if you could state your name. We're giving  
16 the same procedure for everyone. You'll have three  
17 minutes to speak, okay?

18 If you needed additional time after  
19 that, the -- the buzz -- the buzzer will go off.  
20 I'll ask if there's anyone else that wants to speak,  
21 give them an opportunity. If not, then I'll open it  
22 back up to you for an additional three minutes.

23 MS. FLICK: Thank you. My name is  
24 Susan Flick, F-L-I-C-K. And this will be very brief  
25 because I'm submitting a written statement as well.

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 I just wanted to say that given omissions and  
3 incomplete or inadequate plans in the D.E.I.S. to  
4 address certain environmental energy, economic, and  
5 quality of life issues, I ask that the plan include  
6 ways that local experts can voluntarily suggest  
7 potential solutions that allow the potential for  
8 creative best practice, practical ideas, creative  
9 ideas, based on local conditions. And that's all for  
10 now. Thank you.

11 MR. DAVIS: Thank you. Okay. I will  
12 again ask anyone in the audience, is there anyone  
13 here that would like to speak that has not spoken?  
14 Any new speakers? Any repeat speakers? Okay. We  
15 still have another thirty-six minutes under this  
16 session.

17 And then we'll take a break at five  
18 o'clock. And then, the evening session will start at  
19 six. So, we'll go back on pause.

20 (Off the record; 04:25 p.m.)

21 (On the record; 04:44 p.m.)

22 MR. DAVIS: On -- on the record and I  
23 will ask Liza Bernard, if she could come down and  
24 speak, Liza, three minutes. You'll have additional  
25 three minutes if you go beyond that. But I have one

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 other speaker that I -- I'll put in the middle.  
3 Okay? So, turn over to you for three minutes. Could  
4 you please state your name for the Court Reporter?

5 MS. BERNARD: Yeah. My name is Liza  
6 Bernard. I'm a resident of Syracuse. And I have  
7 concerns about the -- the water pollution that  
8 Micron's plant will have on this region. I  
9 understand that it's going to be the greenest chip  
10 plant probably in the world if their plans go well,  
11 but it still sounds like a -- a large chunk of that  
12 water will not be cleaned for forever chemicals,  
13 heavy metals. And I'm concerned about what that will  
14 do to the water table.

15 I also understand that this is a  
16 historic investment opportunity for this region  
17 that's been in decline for, you know, decades. But I  
18 don't think sacrificing our environmental and  
19 physical health is worth it. Yeah. So, I think -- I  
20 think the water should be clean. I think we need to  
21 keep that in mind.

22 MR. DAVIS: Thank you. Any other  
23 speakers that would like to speak? Yes, sir. If I  
24 can just ask you to state your name again.

25 MR. HUERTA: Sure.

1 7/24/2025 - Micron Semiconductor Manufacturing Project

2 MR. DAVIS: Thank you.

3 MR. HUERTA: She's got my card.

4 Hello, I'm Raul Huerta. I'm from Liverpool now,  
5 originally, from New Mexico, one of the families  
6 founded in Santa Fe. And so, before you all were on  
7 this continent, my family was here on this continent  
8 in 1530 just to give you a context. Okay?

9 One of the things that I did in  
10 college was think a lot about mechanization. There's  
11 a wonderful book by Sigfried Gideon called  
12 Mechanization Takes Command, in which in anything  
13 that touches an object, bread, whatever, it changes  
14 it inextricably and -- and -- and forever.

15 The singularity is very close. We all  
16 know that. The singularity is very close. And  
17 twenty years from now, to assume that there's going  
18 to be a pantheon of workers at Micron is foolish.  
19 There won't be anyone there. It's all going to be  
20 machines. It's all going to be machines. The  
21 trucks, driven by machines. Everything will be  
22 automated because of those chips, which is a good  
23 thing or a bad thing. Depends on your perspective.

24 So, I really don't see how this plant  
25 will not occur for lots of reasons. But as I said

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 before, you have to really think about what this  
3 means for you and your family. You all aren't going  
4 to have jobs either, because the machine will do it  
5 better and more efficiently; and you don't have to  
6 pay for health care. You don't have to pay anything.

7 So, please, please, please think about  
8 the water at least. Again, it's twenty percent of  
9 the world's fresh water. We have to preserve it.  
10 You can't poison it for the others. I think the  
11 Canadians will get a little upset if that stuff  
12 starts showing up in Canada, okay?

13 So, I thank you very much. I know how  
14 hard this is. People coming up and some people  
15 yelling at you. But seriously, think about it. And  
16 the first part as in the rotary four-way test, is it  
17 the truth? And the last part was, will it be  
18 beneficial for all?

19 So, please think of that. Please  
20 consider it. We won't need any lawyers. I mean,  
21 after all, what did -- what did they say in Richard  
22 II? What's the first thing we do? We get rid of all  
23 the lawyers, right? So, take care. Thank you.

24 And enjoy. Have a nice lunch, dinner,  
25 whatever you're about to have and then, come back and

1 7/24/2025 - Micron Semiconductor Manufacturing Project  
2 have everybody yell at you once again. So, take  
3 care. We'll see you. Bye.

4 MR. DAVIS: Thank you. Any other  
5 speakers at this time? Okay. We have ten minutes.  
6 I will keep this open for ten minutes at four fifty-  
7 nine, barring anybody else coming into who want to  
8 speak, I will then come back and we will proceed with  
9 you folks. So, ten more minutes. Thank you.  
10 Briefly, we're good?

11 COURT REPORTER: Good.

12 MR. DAVIS: Okay. It is -- are there  
13 any speakers in the audience that would like to speak  
14 at this time? Any new speakers? Okay. Seeing none,  
15 I am going to close this afternoon session of the  
16 public hearing. We appreciate everyone coming.  
17 Appreciate your comments.

18 We will close this session, and the  
19 evening session will start at six o'clock. Thank  
20 you.

21 (The public hearing concluded at 5:00  
22 p.m.)

**APPENDIX B**  
**MICRON CAMPUS SITE SELECTION BACKGROUND, CONSTRUCTION**  
**PHASES, SITE LAYOUT ALTERNATIVES, REVISED CONSTRUCTION**  
**SCHEDULE, AND TECHNICAL MEMO**

## **Appendix B-1**

### **Micron Campus Site Selection Background**

## **B-1 Micron Campus Site Selection Background**

This section describes: (1) the process that the State of New York conducted to identify semiconductor technology parks sufficient in scale to advance the State's semiconductor manufacturing sector; (2) the process that OCIDA conducted to identify sites in Onondaga County sufficient in scale to host a large-scale semiconductor manufacturing facility; (3) the process and criteria that Micron used to identify a sufficient location for a large-scale memory chip manufacturing facility; and (4) the additional property search Micron conducted to identify potential alternative locations for its facility.

### **B-1.1 New York State Selection of WPCP**

In 1997, New York State initiated the CHIP FAB 98 / SEMI-NY Program to promote the growth of the State's semiconductor manufacturing industry. Led by the Governor's Office for Regulatory Reform and the Empire State Economic Development Council (NYSEDC), this initiative began by identifying suitable sites. A list of 55 candidate sites throughout the State was narrowed to 13 sufficient to meet then-current industry standards. (Apte, 1998; Gargano, 2006).

By the year 2000, three sites—Luther Forest (in Malta, NY, Saratoga County), Marcy Nanocenter (in Marcy, NY, Oneida County), and the WPCP—were identified as “shovel ready,” i.e., they had completed certain pre-permitting requirements applicable at that time. In 2017, NYSEDC updated its site suitability criteria and arrived at four potentially suitable sites: the Marcy Nanocenter; the Western NY Science, Technology, and Advanced Manufacturing Park (STAMP) near Batavia in Genesee County; Luther Forest; and the WPCP. NYSEDC's evaluation included 5 primary criteria with 108 geographical viability factors, including site quality, and reliability. The evaluation benchmarked the four sites against six other competing locations nationwide. Of the evaluated sites, only the WPCP and Marcy Nanocenter ranked the highest nationally for utility access and development readiness (Newmark Knight Frank, 2018).

The Marcy Nanocenter is a 434-acre greenfield campus. A substantial portion of that campus was developed in 2022 by Mohawk Valley EDGE for semiconductor manufacturing, and only approximately 130 acres remain for stormwater management infrastructure, compensatory wetland mitigation, and development buffers. Therefore, this location is no longer available and would be too small for the Proposed Project (see Section 1.1).

The STAMP site, covering 1,250 acres, has seen significant development by other companies, reducing its available space to five non-contiguous parcels totaling 540 acres, the largest of which is 310 acres. This location would be too small for the Proposed Project.

The Luther Forest site was developed for semiconductor manufacturing and is currently occupied by GlobalFoundries, which has purchased the only remaining 800 undeveloped acres at the site. This location is no longer available and would be too small for the Proposed Project.

### **B-1.2 Onondaga County Selection of WPCP**

Onondaga County presented the WPCP to the State as a suitable site for semiconductor manufacturing as part of a longstanding process to identify and develop a suitable site in the County for industrial manufacturing. In 1991, OCIDA and the City of Syracuse Chamber of

Commerce initiated an Industrial Park Feasibility Study to identify potential locations for industrial businesses in Onondaga County. Of the two sites the study identified—a site in the Town of Lysander and the WPCP—the WPCP emerged as the preferred choice due to its proximity to National Grid’s electric substation in Clay, excellent highway access, and ability to be rezoned for industrial use. From 1991 to 1999, the County acquired seven properties, forming the original 340-acre WPCP.

Onondaga County received feedback from prospective site selectors and companies that the 340-acre site would be insufficient for the economic needs of contemporary large-scale semiconductor manufacturing. The County expanded the WPCP on multiple occasions until it ultimately reached its current 1,339-acre area. In addition to expanding the size of the WPCP, the County began addressing other essential project requirements, including access to adequate, reliable electricity, natural gas, and water supply, and wastewater treatment capacity.

OCIDA completed a GEIS, which was supplemented in 2021, that identified and screened various alternatives to the WPCP within Onondaga County. The analysis concluded that the WPCP was the only viable option to meet the semiconductor industry’s needs, as it meets specific project pre-requisites, including a large, contiguous parcel of land controlled by a single owner, and access to significant, redundant, and resilient transportation and utility infrastructure (OCIDA, 2013).

### **B-1.3 Micron Site Search**

In 2021, Micron initiated a search for potentially suitable sites to construct a large-scale memory chip manufacturing facility that would also be able to achieve U.S. national and economic security goals, based on then-emerging consideration in Congress of new legislation to incentivize re-shoring of chip manufacturing, including large-scale, commercially viable fab clusters capable of enduring foreign competition—goals that ultimately became the basis for the CHIPS Act and the Department of Commerce’s priorities in the NOFO for commercial semiconductor fabrication facilities (see Section 1.1).

Consistent with the above goals, which form the basis of CPO’s purpose and need described in Section 1.1, and Micron’s analysis of memory chip fab cluster trends described in Appendix A-1, the combination of then-developing Federal priorities for large fab clusters and Micron’s annual long-range SNOP process coincided to shape Micron’s site search. Specifically, to attract Federal and other sources of investment and achieve global competitiveness, Micron determined that it would need to identify a site capable of hosting a commercially viable, four-fab memory chip manufacturing facility with a cleanroom size of at least 600,000 sq. ft. and a fab size of at least 1.2 million sq. ft. (for a total 2.4 million sq. ft. of cleanroom space and 4.8 million sq. ft. of fab space). This four-fab configuration also would be necessary to achieve a memory chip production output of 52,000 wafers per week on average over the life of the facility capable of meeting Micron’s market-based forecast for the output required to be commercially viable given memory chip industry competition in East Asia.

Micron also determined that construction of 2.4 million sq. ft. of cleanroom space would necessitate the construction of ancillary buildings, such as central utility buildings, hazardous process materials buildings, bulk and specialty gas storage, and other on-site infrastructure, as described in Section 2.1.1.5 and Table 2.1-3. Given the competitiveness and cost sensitivity of the DRAM market, Micron determined that it would require a single site of sufficient size to co-locate

and accommodate all of the fab space and infrastructure described above, and that developing disparate parcels with duplicative infrastructure and supply chain needs would preclude Micron from achieving a cost-efficient memory chip operation capable of global competitiveness and attracting Federal and other sources of investment. For the above reasons, Micron determined that it would require a minimum single site footprint of 1,000 acres or more.

This approach is consistent with semiconductor industry competitiveness trends that drive companies in this space to co-locate multiple fabs on a single site to achieve economies of scale and efficient supply chain and feedstock management, while minimizing costs, as well as minimizing total project footprints and ground disturbance (see Section 1.1).

In the context of these goals, Micron began exploring potential sites for a four-fab memory chip manufacturing facility in New York State in late 2021. To facilitate its search, Micron developed a set of site selection criteria, detailed in Table B-1 below, including the minimum 1,000-acre site size, utility and energy availability, transportation accessibility, workforce development capacity, time-to-market (permitting and approvability), climate-related risks, place enhancement (livability) considerations, advanced manufacturing ecosystem (including supply chain) considerations, and the availability of Federal and State financial incentives, among various other technical and socioeconomic factors.

**Table B-1 Micron Site Selection Criteria**

| Criteria                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Site availability                           | Potential sites would need to be available for acquisition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Minimum site size of 1,000 contiguous acres | <p>See explanation of 1,000-acre size requirement in text above.</p> <p>Sufficient parcel size would be essential to accommodate the necessary size of the manufacturing buildings to economically meet production goals while maintaining adequate spacing between the fab buildings and providing the space needed for ancillary structures, utilities, and other infrastructure.</p> <p>The parcel also would need to be fully contiguous and could not be irregularly shaped or preclude a uniform manufacturing facility layout capable of maximizing fab interoperability, efficiencies, and economies of scale, driven by minimizing automated device travel times across fabs (see Appendix B-3). The contiguous land criterion also would be necessary to ensure that all facility components could be efficiently integrated and operated on a single campus, reducing the need for multiple utility or other site connections that would make the facility uncompetitive with its peers and global competitors.</p> |
| Zoning                                      | Potential sites would need to be zoned or readily able to be zoned to accommodate the proposed manufacturing use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Geological conditions                       | <p>Potential sites would need to have a relatively flat topography with geological conditions capable of supporting an efficient four-fab layout and adequate foundations to support such a design.</p> <p>A site with a geotechnical makeup and topography that would require substantial excavation and import of fill material also would need to have proximity to rail transport or other cost-effective transportation methods capable of bringing substantial volumes of fill and other construction materials</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                               | <p>on-site, while avoiding prohibitive increased costs and environmental and community effects from transporting large volumes by truck.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Electricity supply            | <p>Potential sites would need to have proximity to robust electric transmission infrastructure capable of providing electricity at 345 kV or higher to the entire site, with sufficient available on-site or adjacent land for dedicated substations and transformers, or to a technically and economically feasible and practicable plan to expand such capacity and capability to connect to such supplies.</p> <p>A multi-fab facility requires a stable and continuous 24/7 electricity supply from highly resilient, non-intermittent sources, including dual feed electrical service with high resistance to voltage fluctuations. Any disruption in power can dramatically impact the semiconductor manufacturing process and lead to substantial operational inefficiencies and production and financial losses.</p> |
| Natural gas supply            | <p>Potential sites would need to have ready access to substantial natural gas supplies and distribution capacity, or to a technically and economically feasible and practicable plan to expand such capacity and a route to connect to such supplies.</p> <p>Natural gas is required for its thermal value in semiconductor manufacturing, which depends on several heating processes that together could overwhelm otherwise reasonable electricity supplies and infrastructure.</p>                                                                                                                                                                                                                                                                                                                                        |
| Water supply                  | <p>Potential sites would need to have ready access to substantial water supplies and transmission capacity, or to a technically and economically feasible and practicable plan to expand such capacity and a route to connect to such supplies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Wastewater treatment capacity | <p>Potential sites would need to have ready access to substantial wastewater treatment infrastructure with adequate capacity to accommodate a large-scale semiconductor facility, or to a technically and economically feasible and practicable plan to expand such capacity and a route to connect to such service.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Highway access                | <p>Potential sites would need to be located within 20 miles of an interstate highway. Proximity to highway access would be required to facilitate efficient transportation of materials, products, and personnel for a four-fab facility.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Airport access                | <p>Potential sites would need to be located within 30 miles of a domestic commercial airport and 50 miles of an international commercial airport. Proximity to air transport is needed to support efficient movement of personnel and critical components to a large-scale semiconductor manufacturing facility.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Specialized workforce         | <p>Potential sites would need to be in an area with a sufficiently large, specialized labor force capable of supporting highly advanced manufacturing processes and specialized equipment operation and maintenance needs.</p> <p>In addition, potential sites would need to be in proximity to institutions of higher learning and institutions for research and development, training, and innovation, such as military bases, technical colleges, universities, and other sources of technical direct labor, which are essential to providing skilled labor, continuing education, and training programs to keep a specialized workforce familiar with relevant technological advancements and industry practices.</p>                                                                                                    |

Source: Micron Technology.

At the time that Micron began exploring sites in New York State in late 2021, three of the four viable State-identified technology sites (Marcy Nanocenter, STAMP, Luther Forest, and the WPCP) were unavailable or too small for the four fabs needed to satisfy Micron’s search criteria. Marcy Nanocenter only had 130 acres available, GlobalFoundries held an option contract on Luther Forest, and STAMP offered only 540 non-contiguous acres. Only the WPCP remained, which satisfied all of Micron’s site selection criteria in Table B-1.

**B-1.4 Micron Updated Site Search**

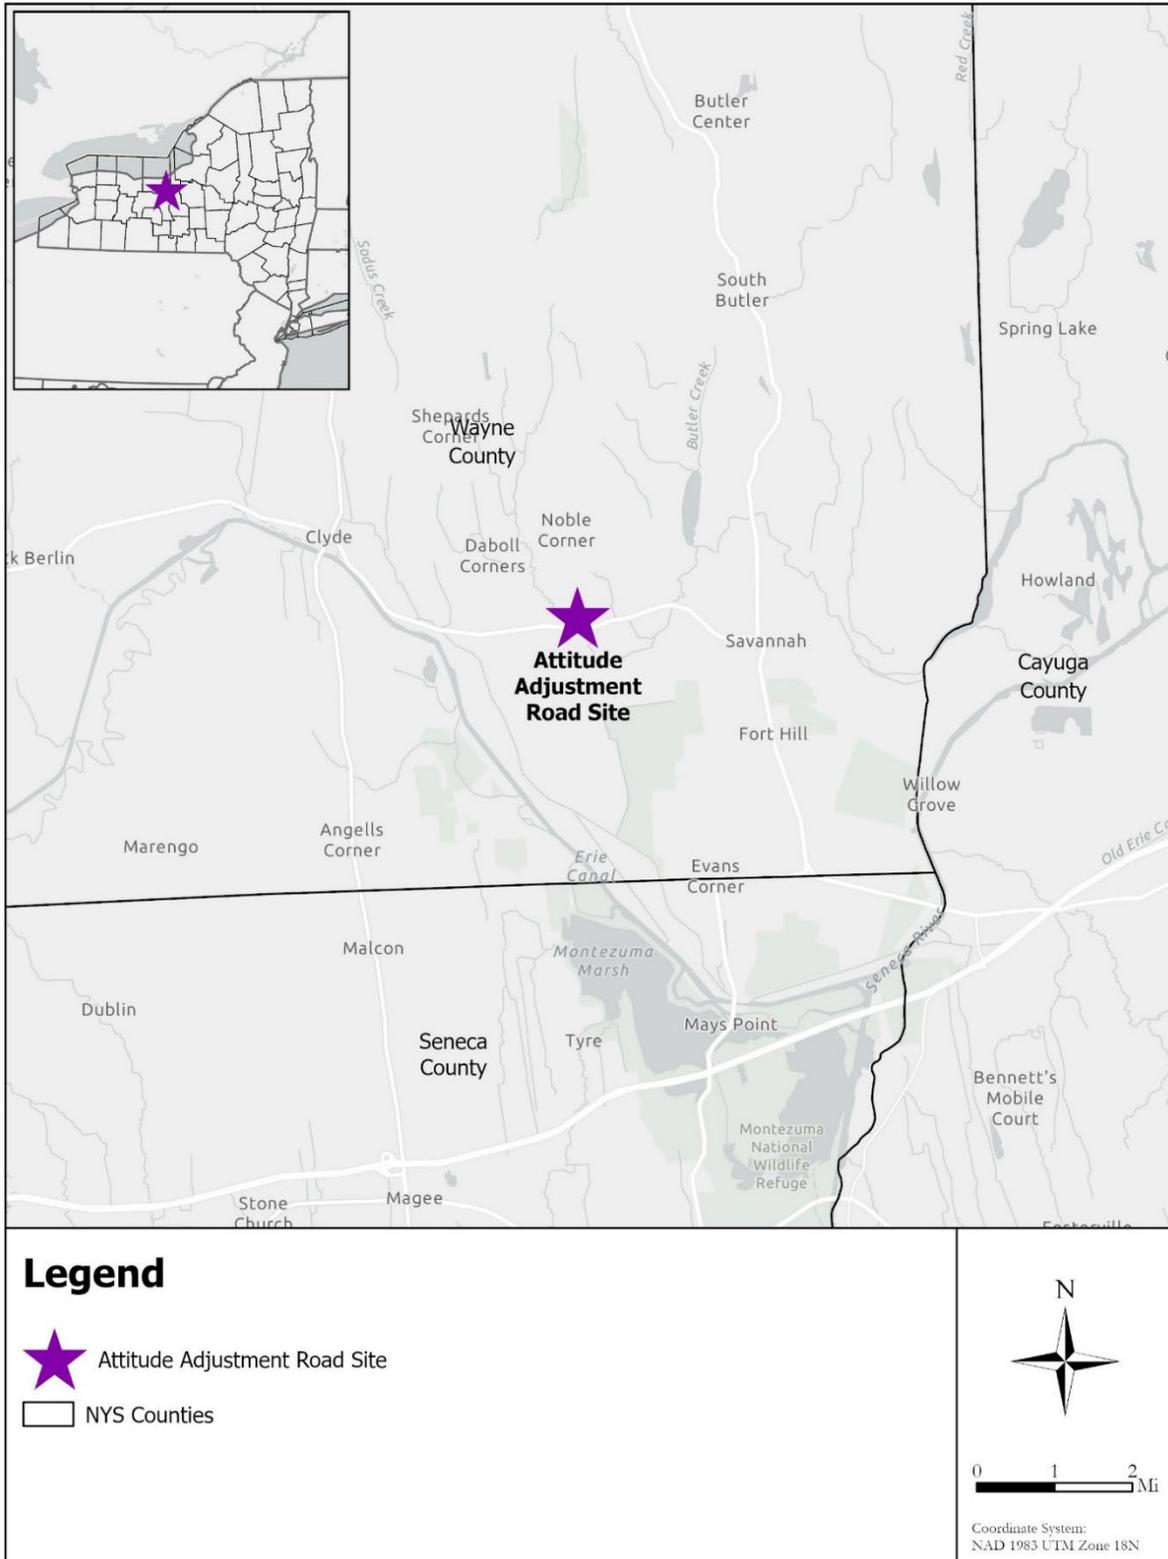

In 2024, Micron conducted an updated property search to identify other potentially reasonable alternative sites for the Proposed Project. Using an available parcel listing survey, Micron identified three sites, including the WPCP, that were available for purchase and that were 1,000 acres or greater in size. See Figure B-1, Figure B-2, and Figure B-3 for site locations. Micron evaluated each site against its site selection criteria. The results are summarized in Table B-2 below. Of the three sites, only the WPCP was located in a NYISO Load Zone with the potential to provide a sufficiently reliable and stable electricity supply to the Proposed Project. In addition, the WPCP satisfied all of Micron’s other site selection criteria, whereas the other two sites failed several criteria.

**Table B-2 Updated Site Search Results**

| Site                                                              | 1                      | 2            | 3                               |
|-------------------------------------------------------------------|------------------------|--------------|---------------------------------|

### **Micron Campus Construction Phases**

## B-2 Micron Campus Construction Phases

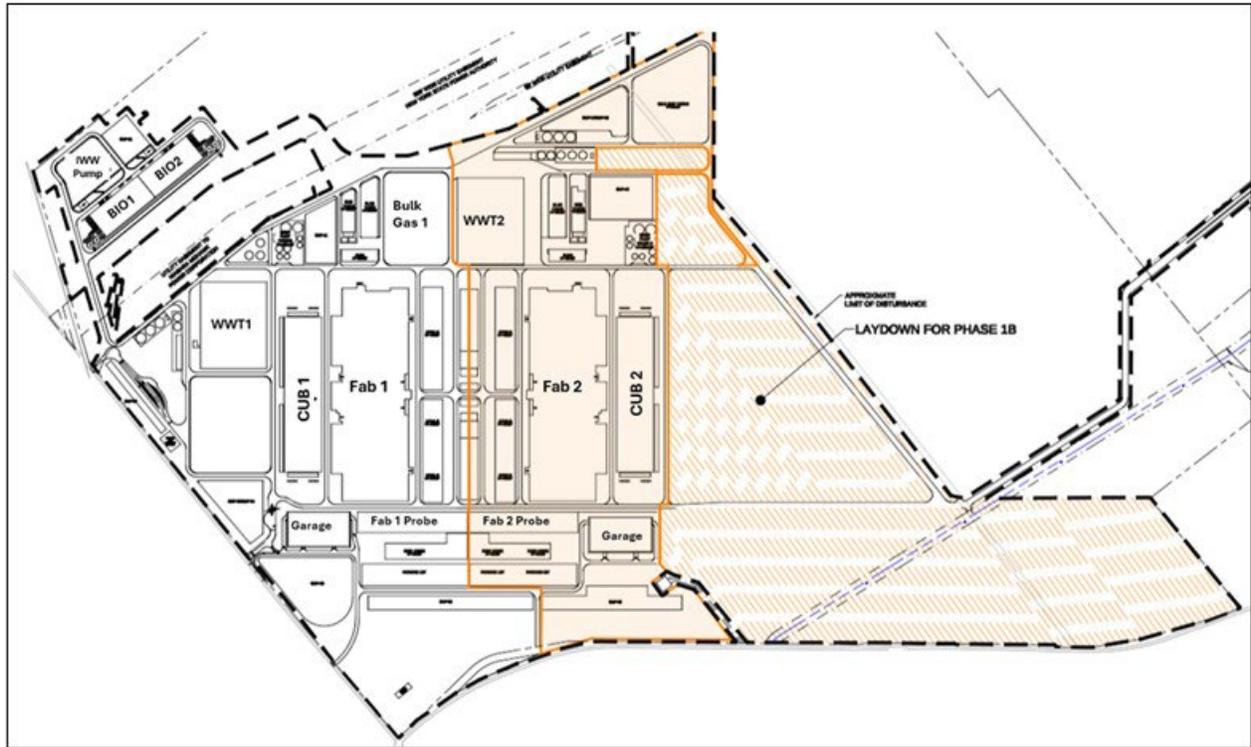

As noted in Section 2.1.1.1, the four fabs at the proposed Micron Campus would be built sequentially from west to east. The four figures below show schematics of the build-out.

**Figure B-4 Micron Campus Construction – Phase 1A<sup>6</sup>**

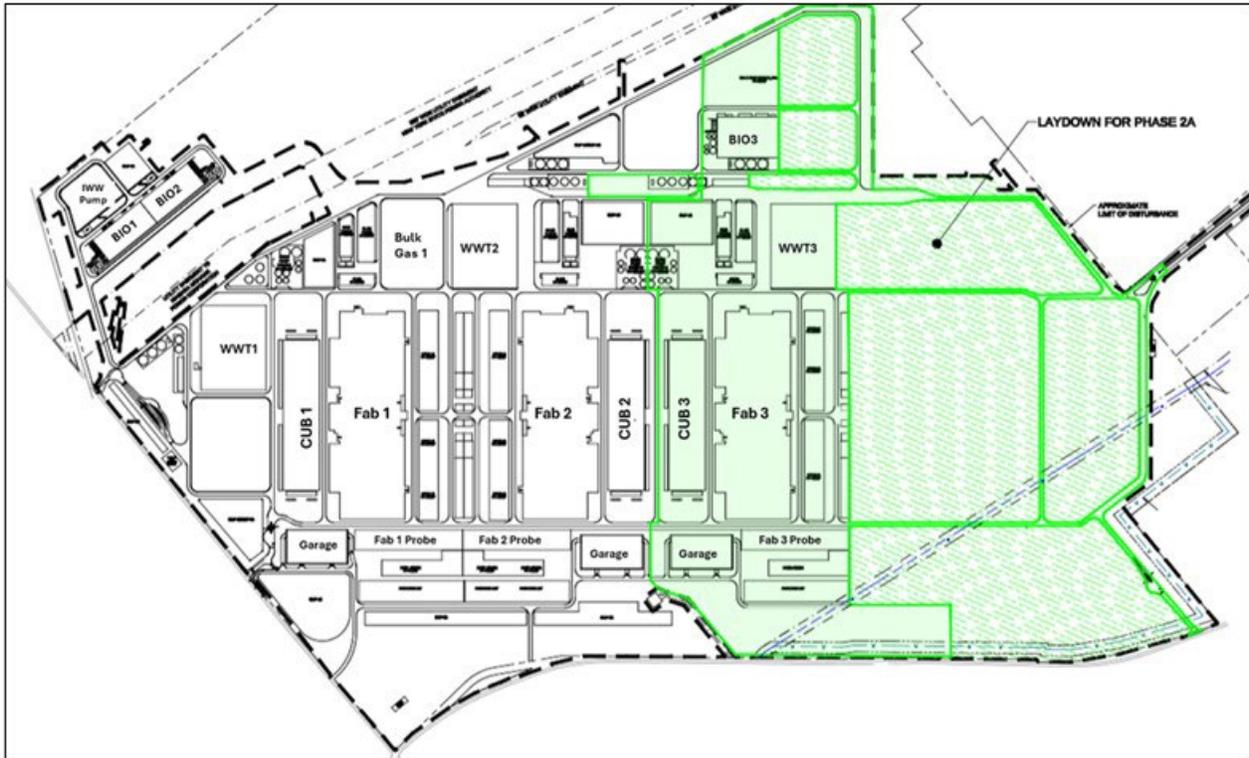

<sup>6</sup> Ground clearing of the entire Phase 1A area would occur in Q4 2025, during the bat hibernation period.

**Figure B-5 Micron Campus Construction – Phase 1B<sup>7</sup>**

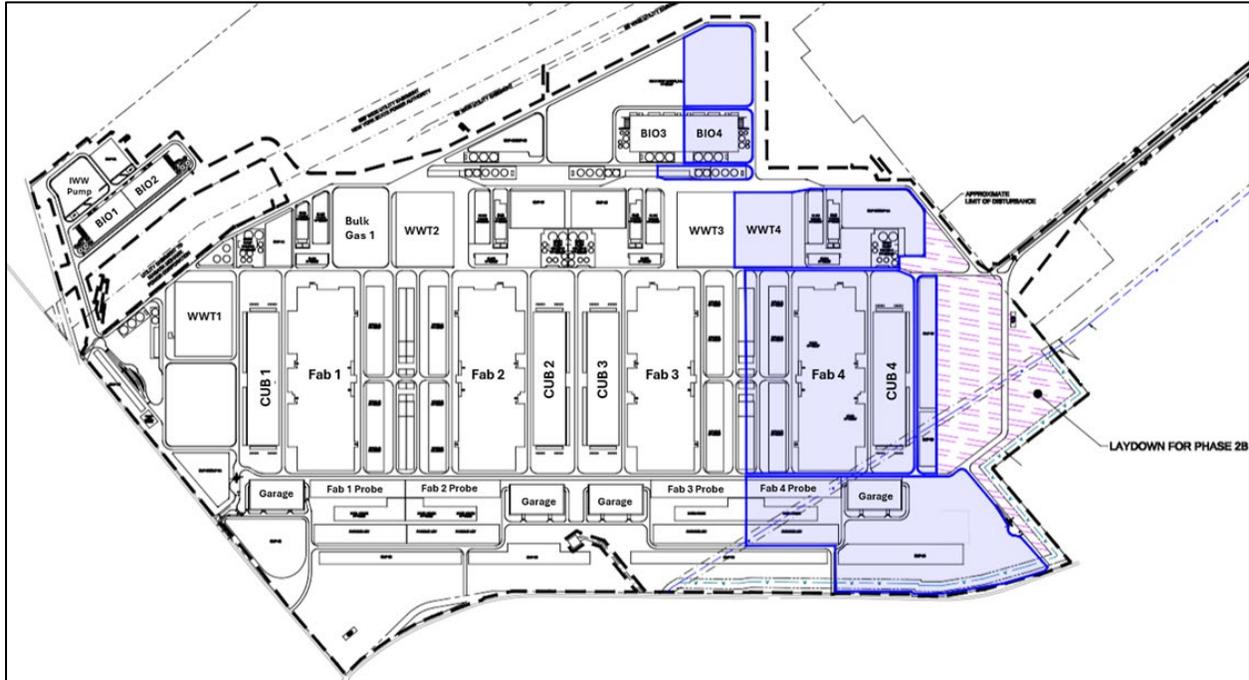

<sup>7</sup> Although construction would be scheduled for Q3 2028, additional ground clearing in the Phase 1B area would occur in Q4 2028, during the bat hibernation period.

Figure B-6 Micron Campus Construction – Phase 2A<sup>8</sup>

<sup>8</sup> Although construction would be scheduled for Q3 2033, additional ground clearing in the Phase 2A area would occur in Q4 2033, during the bat hibernation period.

Figure B-7 Micron Campus Construction – Phase 2B<sup>9</sup>

<sup>9</sup> Although construction would be scheduled for Q2 2039, additional ground clearing in the Phase 2B area would occur in Q4 2039 or Q1 2039, during the bat hibernation period.

## **Appendix B-3**

### **Micron Campus Site Layout Alternatives**

### B-3 Micron Campus Site Layout Alternatives

In coordination with Micron, CPO and OCIDA considered a series of potential site layout alternatives for the proposed Micron Campus to determine whether a different layout of the fabs and supporting buildings from the Preferred Action Alternative site layout would result in fewer impacts to waterbodies on the WPCP. Specifically, six site layout alternatives were considered in addition to the Preferred Action Alternative. For the reasons explained below, CPO and OCIDA determined that none of the site layout alternatives besides the Preferred Action Alternative would be practicable because each would create inefficiencies that would prevent the Micron Campus from achieving the semiconductor wafer output necessary to achieve commercial viability.

In addition, CPO and OCIDA found that the Preferred Action Alternative would impact fewer Federal jurisdictional wetlands (190 acres) compared to other site layout alternatives, all of which would impact 200 acres or more of Federal jurisdictional wetlands.

Therefore, CPO and OCIDA determined that the Preferred Action Alternative site layout makes it the only alternative that meets CPO's purpose and need under NEPA and Micron's purpose and need under SEQRA (see Section 1.1) and did not carry the six other site layout alternatives forward for further analysis in the EIS.

Maximally efficient site layouts are critical to the successful operation of large-scale, multi-fab semiconductor manufacturing facilities such as the proposed Micron Campus manufacturing facility. These advanced facilities depend on the ability to minimize transport time for material traveling from one fab to another to maximize the utilization of extremely high-cost fab equipment. An AMHS (Figure B-8) is an integrated system of robots that travel along the ceilings of the fabs and across links between the fabs to transport wafers from one step of the manufacturing process to the next. Since there are limitations on the number of robot paths between fabs that can be built, site layout alternatives must carefully consider variations to entry and exit points from each fab to avoid unacceptable levels of robot congestion that could hamper facility productivity.

**Figure B-8 AMHS Example**

Table B-3 on the next page further details key site layout criteria relevant to ensuring efficient semiconductor manufacturing facility operations.

**Table B-3 Site Layout Criteria**

| Criteria                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMHS Cross-Fab Travel Time                       | This is the measure of time to transport material from one fab to another. Travel time would need to be minimized to maximize the utilization of the more than \$60 billion that Micron would need to spend on semiconductor manufacturing equipment, to ensure that wafer output is optimized as more materials are processed in less time.                                                                                                                                                                                                          |
| AMHS Risk of Overhead Transport (OHT) Congestion | Similar to roadways, the paths that AMHS robots take can become congested and there are limited paths that can be built. For the Micron Campus, any inefficient design of the entry and exit points from each fab would negatively affect cross-fab travel time and diminish Micron’s utilization of the more than \$60 billion estimated cost of fab equipment needed for the campus.                                                                                                                                                                |
| Utilities Layout and Routing                     | Semiconductor manufacturing uses a large variety and volume of chemicals, gases, and water. For the Micron Campus, air in the fabs would need to be conditioned to precise temperature and humidity ranges. Delivery of the chemicals, gases, water, and air needed for fab operations would require special support buildings (the central utilities buildings and hazardous process materials buildings located between the fabs). To minimize energy usage, the distances between these support buildings and the fabs would need to be minimized. |
| Construction Laydown Space                       | The Micron Campus would require a large area for contractor parking and storage of construction materials. Once the fabs would be built, the construction laydown area would still be needed due to continuous construction activities inside the fabs as they are retrofitted for new memory chip production technology nodes. The need for a large laydown area therefore operates as a constraint on efficient layouts.                                                                                                                            |
| Constructability                                 | Design of the fab buildings would only be feasible based on currently available construction means and methods, which also can operate as constraints on alternative layouts.                                                                                                                                                                                                                                                                                                                                                                         |
| Other                                            | Other requirements that can operate as constraints on alternative layouts include stormwater management, vibration specifications, and access points.                                                                                                                                                                                                                                                                                                                                                                                                 |

Table B-4 below shows CPO’s and OCIDA’s application of the alternative evaluation criteria described in Section 2.2 and the site layout criteria in Table B-3 above to the Preferred Action Alternative and the six other site layout alternatives. Based on the below comparison, CPO and OCIDA found that none of the site layout alternatives besides the Preferred Action Alternative would meet purposes and needs or be technically or economically feasible or practicable, and all of them would result in either the same amount of permanent losses of Federal jurisdictional wetlands or the permanent loss of approximately 16-20 additional acres of Federal jurisdictional wetlands. Following Table B-4, Figure B-9 to Figure B-15 display each site layout alternative.

**Table B-4 Site Layout Alternative Analysis**

| <b>Layout</b>                                                                                   | <b>Meets Alternative Evaluation Criteria?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>Wetland / Surface Water Losses<sup>10</sup></b> |
|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| Site Layout Alternative 1 (Preferred Action Alternative)                                        | Yes. Would meet purposes and needs; would be technically and economically feasible and practicable; would result in fewer permanent losses of wetlands compared to other site layout alternatives.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 184.47 acres / 6,283 LF                            |
| Site Layout Alternative 2 (similar to 1 but requires underground parking garages)               | <p>No. Would not meet purposes and needs because:</p> <ul style="list-style-type: none"> <li>• Layout would reduce wafer output per week (WOPW)<sup>11</sup> due to bottlenecks and inefficiencies from underground parking (limited underground access and garage congestion, longer employee garage to workstation travel times, and longer fab material, equipment, and maintenance delivery times would all affect production process efficiency).</li> </ul> <p>Would not be technically or economically feasible or practicable because:</p> <ul style="list-style-type: none"> <li>• Parking garages could not be constructed underground due to high water table and prohibitive amount of near-grade bedrock.</li> </ul> <p>Would not result in permanent losses of wetland or surface water features compared to the Preferred Action Alternative.</p> | 184.47 acres / 6,283 LF                            |
| Site Layout Alternative 3 (Fabs 2-4 shifted to southeast; requires underground parking garages) | <p>No. Would not meet purposes and needs because:</p> <ul style="list-style-type: none"> <li>• Layout would reduce WOPW by approximately 2 to 3 percent primarily due to longer delivery travel times between fabs.                             <ul style="list-style-type: none"> <li>○ Distance between fabs and non-linear connections between fabs would require AMHS robot turning and bending, causing bottlenecks, congestion, and increased robot travel times from Fabs 1-2 to Fabs 3-4.</li> <li>○ AMHS inefficiencies would reduce the amount of process tool sharing across fabs.</li> <li>○ Design would break up and thereby diminish efficiency of unified</li> </ul> </li> </ul>                                                                                                                                                                 | 204 acres / 5,701 LF                               |

<sup>10</sup> Figures represent losses of acres of Federal jurisdictional wetlands and linear feet (LF) of Federal jurisdictional surface water features. For additional information, see Section 3.3 (Water Resources).

<sup>11</sup> Unaddressed or unmanageable inefficiencies in memory chip production processes result in reductions in WOPW; even marginal reductions in WOPW result in significantly increased costs (see Appendix A-1).

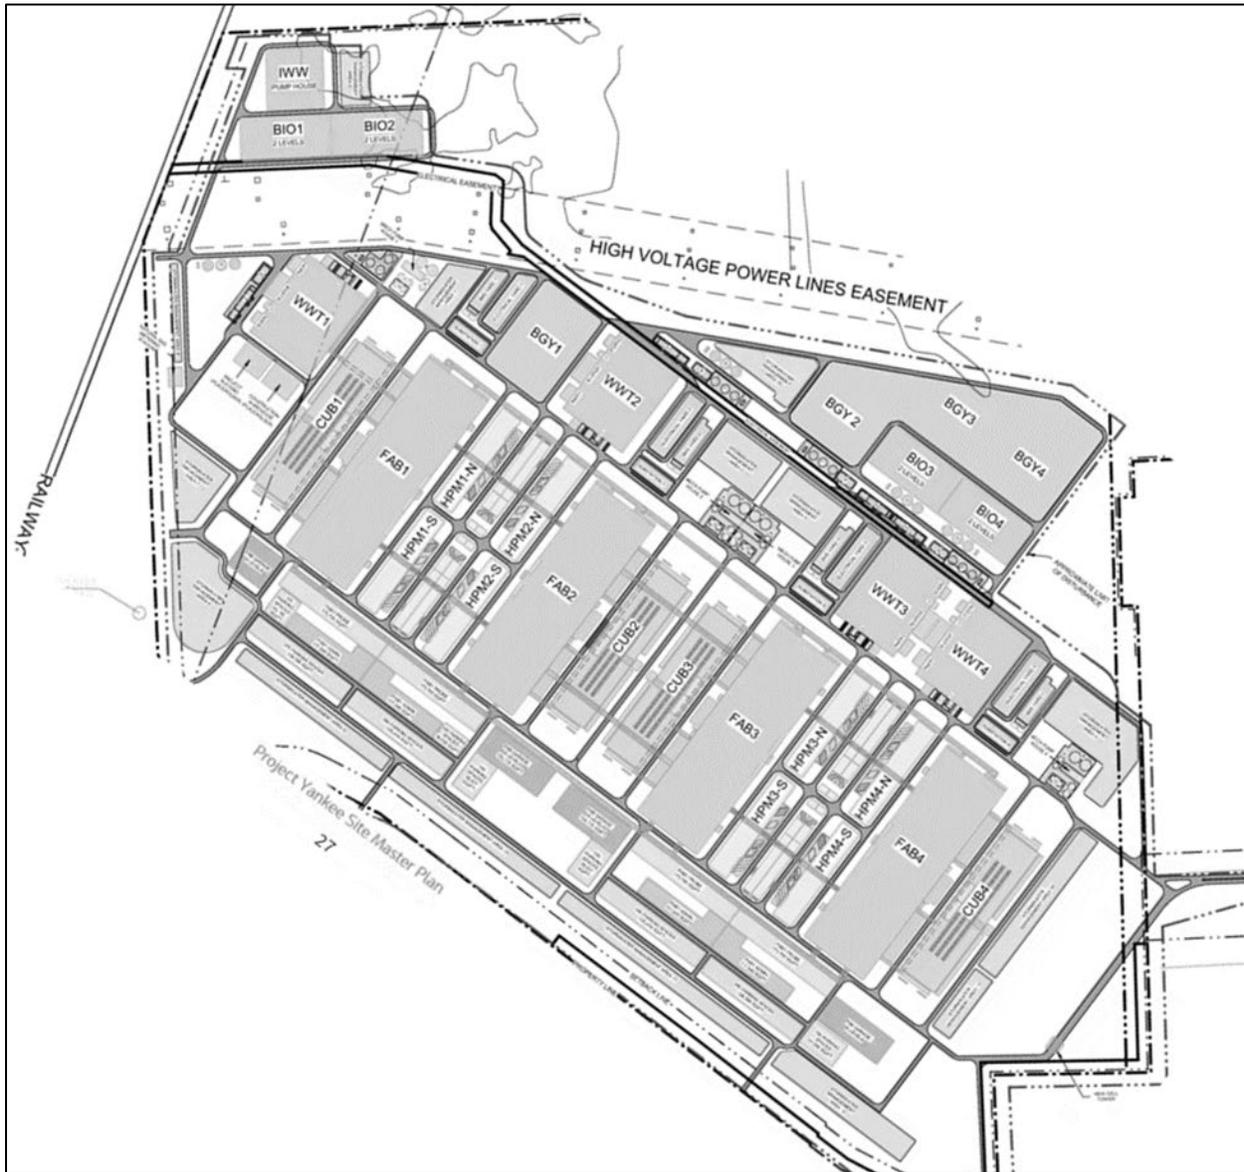

|                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                             |

## **Appendix B-4 Micron Campus Parking Space Needs**

## **B-4 Micron Campus Parking Space Needs**

The proposed Micron Campus would include a total of 11,600 above-ground parking spaces, divided between four 500-space surface parking lots located south of the administration and probe buildings, and four 2,400-space structured parking areas (see Figure 2.1-5). As outlined below, the design of the campus includes this number of parking spaces to accommodate the anticipated peak headcount for full-time employees, construction workers, general visitors, and visitors to large on-site events, while also factoring in considerations for snow storage.

### **Workforce Parking**

As discussed in Section 2.1.1.6, at full production in 2045, the Micron Campus would support a full-time employee peak headcount of 9,005 workers, along with 300 construction workers who will remain on-site for ongoing refinements. Parking spaces would be allocated to ensure that every full-time employee and construction worker has access to on-site parking and to accommodate shift overlap. This overlap would be necessary to allow for a pass-down period between shifts, during which both incoming and outgoing shift vehicles would be parked simultaneously. Overall, this parking allocation would be necessary to maintain a smooth flow of traffic within the property.

### **General Visitor Parking**

In addition to parking for employees and construction workers, Micron anticipates a regular flow of visitors. Approximately 400 parking spaces would be allocated to visitors to ensure safe visitor access to the campus. This allocation would minimize disruptions to employee parking areas and day-to-day operations.

### **Large Event Parking**

Micron anticipates the need to occasionally host large events that would require additional visitor parking. Approximately 800 parking spaces would be allocated to accommodate peak anticipated attendance during these events. These spaces would be necessary to ensure that large groups can park on-site and safely access the campus. Micron would plan for these events in advance to avoid potential congestion or parking shortages.

### **Snow Storage**

Given the climate in New York State, snow storage is an essential element of parking lot design. Approximately 1,100 spaces, representing 25 percent of the surface parking lots and the top level of the structured parking areas, would be allocated to snow storage during the winter months. Adequate snow storage space would be necessary to manage snow accumulation without interfering with the availability of parking spaces, and would ensure that snow removal would not impede traffic flow or create hazards for employees or visitors.

**Appendix B-5**  
**Revised Proposed Project Construction Schedule**  
**Details and Impact Analysis**

## **B-5 Revised Proposed Project Construction Schedule Details and Impact Analysis Review**

### **B-5.1 Revised Construction Schedule**

As described in Section 2.3, Micron could revise the construction schedule and commencement of construction for each fab as well as the Child Care Site, compared to what is currently presented in the FEIS. A detailed description of the potential revisions to the construction schedule is provided in the tables below. The following tables and graphs present the possible revised construction schedules for each component of the Proposed Project and Connected actions as well as a graphical comparison between the DEIS timing and the potential revised construction and commencement of operations schedule.

Under the revised construction schedule, Micron would still mobilize for initial site preparation beginning in the fourth quarter of 2025, including commencement of tree clearing, just as it would have under the timeline presented in the DEIS. However, the initiation of construction of Fabs 1 and 2 would be later, with each being constructed over a longer period of time. Specifically, construction of Fab 1, which previously was anticipated to begin following tree clearing in Q4 of 2025 and end at the end of Q2 2028, would, under the revised construction schedule, begin in Q2 of 2026 and extend to Q3 2030, whereupon operations of Fab 1 would begin. Under the revised construction schedule, construction of Fab 2 would begin in Q4 of 2030 and end in Q4 of 2033, instead of beginning in Q3 2028 and ending in Q4 2030 as contemplated in the DEIS. See Table B-5.

Because the revised construction schedule for Fabs 1 and 2 would push back the arrival of operational workers at the Micron Campus (See Figure B-16), initiation of construction at the Childcare Site would change from 2026 to 2028 for the childcare center, and from 2030 to 2032 for the healthcare and recreation centers. Securing warehouse space also would be changed to November 2028 because initiation of wafer production would occur later in time. Finally, the initiation of construction of Fab 3 would be changed from Q3 2033 to Q3 2035 and Fab 4 would be delayed by one calendar quarter. Despite these potential construction schedule changes, final construction on the Micron Campus (including Fab 4) would still be completed in 2041 as discussed in the DEIS and ramp up to full four-fab production would still occur by the end of 2045.

The construction schedule for the Connected Actions would also change to meet the utility needs of the Proposed Project, which would occur at different times under the potential revised construction schedule than discussed in the DEIS. As illustrated in the tables below, construction of the electrical, natural gas, freshwater, industrial wastewater, sanitary wastewater, and telecommunications-related connected actions all would be postponed and/or implemented over a longer period of time if Micron elects to move forward under the revised construction schedule scenario. See Figure B-17 and B-18. Finally, under a revised construction schedule, the interim bridging project that was discussed in the DEIS and would have been necessary to handle industrial wastewater flows from the Micron Campus while OCDWEP constructed the new IWWTP, would no longer be necessary. See DEIS Section 2.1.8.2.

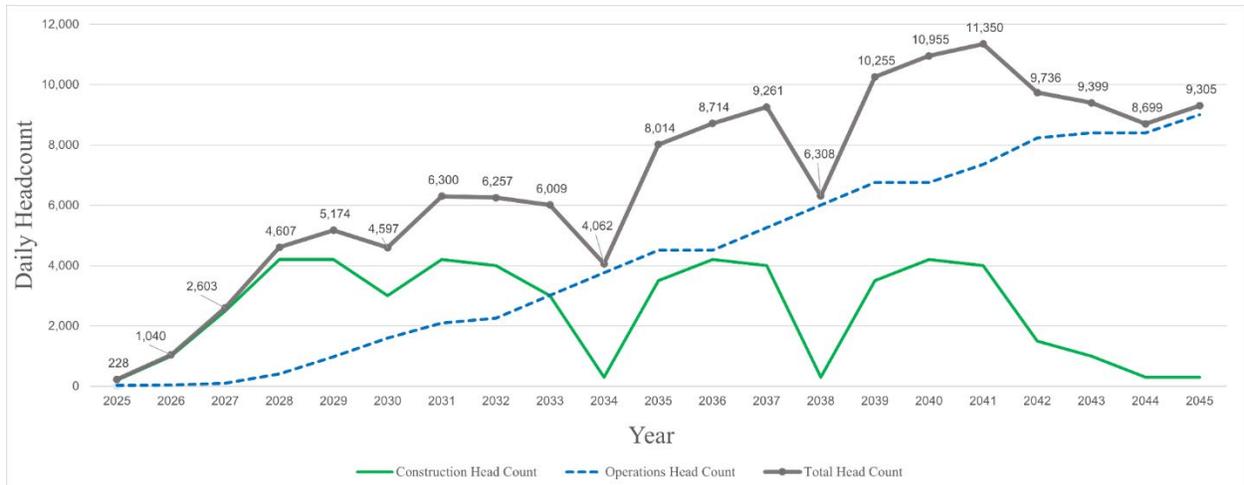

For more detailed information about the potential revised construction schedule, and a side-by-side comparison of these potential construction schedule changes and the construction schedule analyzed in the DEIS, see Table B-5 and Figures B-16 through B-18 below.

**Table B-5 Potential Revised Micron Campus Fab Construction Schedule**

| Phase    | Fab   | Tree Clearing | Construction Start | Ready for Equipment | Building Construction End | Operations Start |
|----------|-------|---------------|--------------------|---------------------|---------------------------|------------------|
| Phase 1A | Fab 1 | Q1 2026       | Q2 2026            | Q2 2030             | Q3 2030                   | Q3 2030          |
| Phase 1B | Fab 2 | Q4 2030       | Q4 2030            | Q3 2033             | Q4 2033                   | Q4 2033          |
| Phase 2A | Fab 3 | Q1 2035       | Q3 2035            | Q2 2037             | Q3 2037                   | Q3 2037          |
| Phase 2B | Fab 4 | Q1 2039       | Q3 2039            | Q3 2041             | Q4 2041                   | Q4 2041          |

Source: Micron Technology (n.d.). Note: Fab 4 building construction would end in Q4 2041 and ramp up to full production by 2045.

**Figure B-16 Potential Revised Project On-Site Construction, Operation, and Total Headcount (2025-2045)**

Source: Micron Technology (n.d.). Note: Although Fab 4 construction would end in Q4 2041, Fabs 3 and 4 would not ramp up to full production until 2045.

**Figure B-17 Potential Revised Proposed Project and Connected Actions Construction Timeline**

Sources: Micron Technology (n.d.); National Grid (n.d.); OCWA (n.d.); OCDWEP (n.d.).

Note: Phases 1 and 2 of the OCWA improvements and Stages 1 and 2 of the OCDWEP improvements would be timed to serve Phase 1 (Fabs 1-2) and Phase 2 (Fabs 3-4) of the Micron Campus. The Warehouse Site is not shown but Micron would anticipate leasing warehouse space for a 7-10-year term beginning in November 2028.

 Note: Solid bars represent construction timeline in DEIS; striped bars represent revised construction timeline

## **B-5.2 Potential Revised Construction Schedule Impact Analysis**

The potential construction schedule revisions are not anticipated to materially change the reasonably foreseeable effects that were described in the DEIS for the Proposed Project and Connected Actions, or alter the significance of those effects. As a result, no changes were made to the assessment of environmental effects in Chapters 3 and 4 of the FEIS.

Table B-6 below provides a resource-by-resource assessment of how the potential construction schedule change might alter the intensity of environmental effects associated with the Proposed Project and Connected Actions. This assessment concluded that the potential construction schedule changes would either have no effect on, or slightly lessen, the environmental effects that otherwise would be associated with the Proposed Project and Connected Actions. As explained in the table, this is primarily because the potential construction schedule changes generally would reduce the intensity of development during the initial stages of Proposed Project implementation, while preserving the overall Proposed Project construction period. This is particularly the case for transportation-related effects under the revised construction schedule, which are further analyzed in the traffic technical memorandum (See Appendix B-6), which shows a less acute effect on traffic due to longer ramp-up periods for Fabs 1 and 2, and allows more time for NYSDOT and other authorities to implement traffic improvements to handle the traffic increase associated with the Proposed Project. Reduction in short-term traffic impacts also would reduce other effects associated with traffic, such as noise and air pollution. See Table B-6 and Appendix B-6.

As explained in Table B-6, though impacts to some resource areas would be slightly altered, the potential revisions to the construction schedule would not materially change the anticipated environmental effects associated with the Proposed Project and Connected Actions, or affect the significance of the impacts that the Proposed Project and Connected Actions would have on any environmental resource.

**Table B-6 Impact of Potential Revised Project Construction Timeline on Anticipated Environmental Effects**

| Resource Area                       | Material Change to Impacts Associated with Construction? | Material Change to Impacts Associated with Operations? | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|----------------------------------------------------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Land Use, Zoning, and Public Policy | No                                                       | No                                                     | The revised timeline would not affect the geographic scope, nature, or extent of the land use changes that would be associated with the Proposed Project and Connected Actions. The revised timeline would only affect the timing of these changes, which would not alter the effects on Land Use, Zoning, and Public Policy analyzed in the DEIS.                                                                                                                                                                                                                             |
| Geology, Soils, and Topography      | No                                                       | No                                                     | The revised timeline would not affect the geographic scope, nature, or extent of the land use changes that would be associated with the Proposed Project and Connected Actions. The revised timeline would only affect the timing of these changes, which would not alter the effects on Geology, Soils, and Topography analyzed in the DEIS.                                                                                                                                                                                                                                  |
| Water Resources                     | No; slightly reduces anticipated effects                 | No                                                     | The revised timeline would result in a slower construction pace during the construction of Fabs 1 and 2. This would modestly reduce the immediacy and intensity of many of the short-term impacts associated with the early phases of construction (e.g., soil runoff, potential for construction equipment spills). There are no proposed changes to the remainder of the construction schedule and long-term impacts for water resources that would result in additional effects.                                                                                            |
| Biological Resources                | No                                                       | No; changes effects duration                           | The revised timeline would increase the time during which Fabs 1 and 2 would be constructed. This revised timeline would extend the period under which wildlife expected to occur in remaining habitats during the construction period, including aquatic biota and threatened and endangered species, would be exposed to lighting and noise disturbances associated with the construction. However, this exposure would be anticipated to be at a lower intensity than previously considered. As a result, the revised timeline would not change the conclusions in the DEIS |

| Resource Area                                                    | Material Change to Impacts Associated with Construction? | Material Change to Impacts Associated with Operations? | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Resource Area                                         | Material Change to Impacts Associated with Construction? | Material Change to Impacts Associated with Operations? | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|----------------------------------------------------------|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                       |                                                          |                                                        | <p>intensity of GHG emissions associated with construction, but would not affect overall construction GHG emissions, which would still have the same climate related effects described in the DEIS. The revised timeline delays, but does not affect, the intensity of GHG/climate related impacts from the startup and operation of the Proposed Project.</p> <p>The revised timeline would not affect Proposed Project location, design, or operation, and will not affect the climate resiliency attributes analyzed in the DEIS.</p>                                                                                                                                                                                                                                                                                                        |
| Solid Waste, Hazardous Waste, and Hazardous Materials | No; slightly reduces anticipated effects                 | No                                                     | <p>The revised timeline would increase the time during which Fabs 1 and 2 would be constructed, and, therefore, would push back and reduce the intensity of generation of solid waste over that time. Generation of hazardous waste and use of hazardous materials during construction is anticipated to be minimal; therefore, the revised timeline, if anything, would only serve to further reduce the intensity of generation of hazardous waste or use hazardous materials during construction for Fabs 1 and 2. The remainder of the construction schedule would be unaffected. Therefore, the revised timeline would modestly reduce construction-related solid waste generation impacts. The revised timeline does not affect the intensity of impacts from the startup and operation of the Proposed Project analyzed in the DEIS.</p> |
| Human Health and Safety                               | No                                                       | No                                                     | <p>The revised timeline would not materially affect human health and safety at the Proposed Project; slower construction schedules for Fabs 1 and 2 may reduce peak on-site workers during this period, which may result in a minor reduction of risk to workers at the Micron Campus during this time. The revised timeline would not affect the analysis in the DEIS on human health and safety associated with operating the Proposed Project.</p>                                                                                                                                                                                                                                                                                                                                                                                           |

| Resource Area                           | Material Change to Impacts Associated with Construction? | Material Change to Impacts Associated with Operations? | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|----------------------------------------------------------|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Utilities and Supporting Infrastructure | No                                                       | No; possible slight decrease in anticipated effects    | Overall utility demands associated with implementing the Preferred Action Alternative would remain unchanged under the revised Proposed Project construction timeline. The only change would be the dates on which Proposed Project-related utility demand would occur. A potential delay will provide additional time for the various utility providers (including gas, electricity, freshwater supply, wastewater and broadband services) and utility planning entities to prepare for Proposed Project-related and induced growth increases in demand. Accordingly, the effects of the revised timeline on utilities likely would be slightly reduced from that analyzed in the DEIS.                                                                                                                       |
| Transportation and Traffic              | No; slightly reduces anticipated effects                 | No; slightly reduces anticipated effects               | The revised timeline reflects a longer, less intensive commencement of the construction period, reducing peak-hour traffic. It also would enable the implementation of recommended mitigation measures prior to Fab 1 and 2 related traffic volumes that were not feasible under the Preferred Action Alternative. The revised timeline would result in a reduction of significant adverse traffic impacts and no new significant adverse impacts, as presented in a traffic technical memo (see Appendix B-6), though it would not reduce the impacts disclosed and analyzed in the DEIS below the level of significance. Given the reduction in construction intensity and overall traffic effects, no new traffic impacts are anticipated. See Appendix B-6, traffic technical memo for additional details. |
| Noise and Vibration                     | No                                                       | No                                                     | The revised timeline would increase the time it would take to complete Fabs 1 and 2 and, therefore would reduce the anticipated overlapping peak intensity of construction-related noise associated with those Fabs compared to the Preferred Action Alternative. The analysis would be anticipated to remain unchanged for Fabs 3 and 4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Resource Area                          | Material Change to Impacts Associated with Construction? | Material Change to Impacts Associated with Operations? | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                        |                                                          |                                                        | <p>Construction-related peak vibration levels, which are below impact thresholds under the Preferred Action Alternative, are not expected to change. Additionally, the traffic technical memo indicates that the longer construction period is expected to reduce peak-hour traffic volumes associated with construction of Fabs 1 and 2 and, therefore, should result in lower traffic noise exposure levels of longer duration than those levels under the Preferred Action Alternative. Although the peak noise levels would be lower, they would not necessarily be below significance levels. Accordingly, the total combined effects of construction noise plus traffic noise plus operational noise will not be perceptibly different from those levels described in the DEIS, and recommended noise mitigation measures associated with construction and operations would remain unchanged.</p> <p>Further, given the reduction in construction intensity and overall traffic effects, traffic-generated noise impacts would also be the same or better under a modified schedule.</p> |
| Visual Effects and Community Character | No                                                       | No                                                     | <p>The revised timeline would not affect the geographic scope, nature, or extent of the land use changes, and, therefore, the analysis of visual or community character changes in the DEIS would not change. While the pace of construction of Fabs 1 and 2 would be slower than assumed in the DEIS, the overall construction period would not change. Construction and operation of the Micron Campus and Rail Spur Site would continue to be highly visible from certain surrounding areas and would produce noticeable visual effects from multiple viewpoints. There would be no significant aesthetic impacts on any designated aesthetic resources in range of the Proposed Project or Connected Actions. The Proposed Project would continue to result in changes to community character based on the combination of visual effects with other effects described in the FEIS, such as increased traffic and noise, and the effects of</p>                                                                                                                                             |

| Resource Area                                           | Material Change to Impacts Associated with Construction? | Material Change to Impacts Associated with Operations? | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                                         |                                                          |                                                        | <p>induced growth. However, the revised timeline would reduce the intensity of construction-related effects during the time period when Fabs 1 and 2 are under construction. Overall, these changes would continue to be consistent with community character as expressed in local land use regulations, policies, and plans.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p>Community Facilities, Open Space, and Recreation</p> | <p>No</p>                                                | <p>No</p>                                              | <p>The revised timeline would not materially affect the conclusions of the DEIS with respect to community facilities, open space, and recreation. Slower construction schedules for Fabs 1 and 2 may reduce peak on-site workers during this period, reducing the demand for police services, fire services, EMS, healthcare facilities. Increased student enrollment from induced growth associated with the construction and operation of Fabs 1 and 2 would be more gradual but would continue to bring increased economic activity and an expanded regional tax base capable of providing increased funding for school district budgets, facilities, and staffing. The revised timeline would not affect the conclusions of the DEIS with respect to open space and recreational resources. The induced residential growth would continue to contribute to property taxes and other fees that would support the maintenance of parks and recreational resources within the County. The potential significant adverse effects on volunteer fire services in the five-county region would continue, although the timing of these effects may be later. The proposed mitigation measures would not be affected by this change.</p> |
| <p>Socioeconomic Conditions</p>                         | <p>No; slightly reduces anticipated effects</p>          | <p>No</p>                                              | <p>The revised timeline would result in a slower construction pace in the early project period, reducing the immediacy and intensity of short-term demands on housing and construction labor and materials. This would enable local and regional markets to better respond to market changes, reducing the potential adverse effects associated with potential shortages in building material</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Resource Area                            | Material Change to Impacts Associated with Construction? | Material Change to Impacts Associated with Operations? | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|----------------------------------------------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                          |                                                          |                                                        | and labor supply; it would reduce, but not eliminate, nor reduce below significance levels, the reasonably foreseeable significant adverse short-term impacts on housing costs in the local study area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Environmental Justice                    | No; slightly reduces anticipated effects                 | No                                                     | As noted for the resource areas listed above, the revised timeline would not result in significant adverse impacts not already identified in the DEIS. Rather, it would modestly reduce the intensity of some construction effects, due to the slower pace of construction for Fabs 1 and 2. Therefore, the conclusions in the DEIS would be unaffected as the construction or operation of the Proposed Project or Connected Actions would not cause or increase a disproportionate burden on a DAC or a minority or low-income community, except the potential temporary adverse impact on housing and rent pricing, which would be reduced. As discussed in the DEIS, the Proposed Project would continue to produce the beneficial effects for the local and regional communities, including the identified DACs and minority and low-income communities. |
| Cumulative Effect on Each Resource Above | No                                                       | No                                                     | The revised timeline would not be anticipated to directly affect the construction of the reasonably foreseeable future projects identified in the Cumulative Effects Analysis. However, the slower pace of construction during the early stages of the Proposed Project would allow for more of the reasonably foreseeable future projects identified to be constructed. Many of the reasonably foreseeable future projects, particularly those associated with housing and transportation are anticipated to support the increased demands for transportation and housing capacity. As a result, the revised timeline would not be anticipated to result in increased cumulative effects relative to those already disclosed in the DEIS.                                                                                                                    |

**Appendix B-6**  
**Revised Traffic Modeling Technical Memorandum**

## Revised Traffic Modeling - Technical Memorandum

**Date:** October 29, 2025  
**Project name:** Traffic Impact Study – Modeling & Analysis – Micron New York Semiconductor Manufacturing, Clay, NY  
**Jacobs PN:** EBXH2201  
**Client name:** Micron Technology, Inc.  
**Prepared by:** Jacobs

---

Since publication of the Draft Environmental Impact Statement (DEIS), CPO and Micron have amended their funding agreement. This amendment allows for modification of the timing within which Micron is required to commence operations of Fabs 1 and 2; which could lead to a different schedule than outlined in the DEIS. Although not included in the funding agreement, this potential modification could also delay the commencement of operation of Fab 3 while the commencement of operation of Fab 4 would remain largely unaffected. The potential modified schedule would allow for more gradual onboarding of the on-site construction workforce which would reduce peak head counts.

To assess the impacts of this potential schedule modification on the traffic impact study contained in the DEIS, Micron requested that its transportation consultant, Jacobs, model those potential changes and determine if they would result in any significant adverse traffic impacts<sup>1</sup> not previously addressed in the DEIS. To perform this review, the traffic analysis originally performed as part of the DEIS was revised to account for these potential changes to the construction and commencement of operations timeline. In addition, NYSDOT informed the modeling team of additional updates and a revision to the timing of certain mitigations available since the publication of the DEIS. The following sections provide more

---

<sup>1</sup> As detailed in the DEIS, significantly impacted intersections and freeway segments were determined using a criterion with thresholds developed using the Highway Capacity Manual (HCM) as the baseline. To summarize, if operations (intersections or freeway segments) in the No Action Alternative are identified at the LOS levels A, B, C, or D and those same operations degrade to the LOS E or F identified in the Preferred Action Alternative, then the impact is significant. Additionally, if operations along a freeway segment in the No Action Alternative are identified at the LOS E level and those same operations degrade to LOS F identified in the Preferred Action Alternative, then the impact is significant. Similarly, if operations (intersections) in the No Action Alternative are identified at the LOS levels E or F and those same operations degrade to the LOS E or F with an increase in average delay of 5 seconds/vehicle or more in the Preferred Action Alternative, then the impact is significant. If operations (freeway segments) in the No Action Alternative are identified at the LOS levels F and those same operations degrade to the LOS F with a reduction in speed of 5 mph or more along a segment 500 feet or longer in the Preferred Action Alternative, then the impact is significant. These thresholds were established in collaboration with NYSDOT and align with those used in Environmental Impact Statements for other major sites across New York State.

detailed information regarding changes to the potential construction schedule, information provided by NYSDOT, and the potential impacts to the traffic analysis.

#### Potential Changes in Construction Intensity, Activities, and Schedule

- **Peak Construction Year Shift:** The peak headcount of the on-site construction workforce and operations staff for Fab 1 would shift from 2027 to 2029<sup>2</sup>.
- **Construction Worker Shuttle:** The traffic analysis review conservatively does not take credit for construction worker shuttle use after 2031, as the revised modeling indicates the construction worker shuttle may no longer be necessary after 2031 to address traffic impacts due to the expected completion of transportation improvements.
- **Workforce Shift Adjustments:** Shift schedules were revised to reduce peak-hour traffic volumes. The table below provides an example of these reductions for 2041 and further information is provided in the bullet point following the table.

---

<sup>2</sup> The review of effects in 2031 and 2041 remains consistent with the DEIS as these continue to represent the final completion date for all recommended traffic mitigations and the maximum traffic/worker headcount timeframes.

**2041 Employee Vehicle Trips**

| Time Frame | FEIS (Proposed) |       |                               |     |                |       | DEIS           |       |               |     |                |       | Difference     |      |

\* Average occupancy of 1.72 considered for construction worker trips Source: 2022 NHTS and FDOT-2022 study

- Trip Generation Impacts:
  - Minor reductions compared to the DEIS due to revised construction timing and shift patterns.
  - Specific to 2041, slight increases anticipated during the 6 AM – 7 AM and 4 PM – 5 PM periods if shuttle is removed after 2031. However, the trip generation values during these hours are minor compared to the values for the other peak hours.
- Revised Traffic Analysis Scenarios:
  - 2029 (replacing 2027 due to revised maximum headcount associated with Fab 1): No Action Alternative, Preferred Action Alternative, and Partial Mitigation scenario (new scenario based on coordination with NYSDOT, more information provided in next section)
  - 2031: No Action Alternative, Preferred Action Alternative, and Mitigation Scenario C (same as DEIS)
  - 2041: No-Action Alternative, Action Alternative, and Mitigation Scenarios A, B, and C (same as DEIS)

### NYSDOT Requested Changes<sup>3</sup>

In addition to the aforementioned changes, NYSDOT has requested several intersection and network related modifications, primarily affecting the 2031 and 2041 forecast years, as well as the addition of the 2029 Partial Mitigation scenario:

- 2041 No Action Alternative & Preferred Action Alternative (without mitigation) – removal of:
  - Soule Road & Pepperidge Way Extension and NYS Route 481/NYS Route 31 Diverging Diamond Interchange (DDI). Note, the DDI is still included as part of Proposed Project’s mitigations in the 2031 Scenario C and 2041 Mitigation Scenarios A, B, and C.
  - Verplank Road and NYS Route 481 Interchange
- 2031 Mitigation Scenario C & 2041 Mitigation Scenarios A, B, and C – removal of:
  - Verplank Road & NYS 481 Interchange
- 2029 Partial Mitigation Scenario:

---

<sup>3</sup> The changes to recommended mitigations were requested by the New York State Department of Transportation (NYSDOT) and its federal counterpart, the Federal Highway Administration, the agencies undertaking the separate design and environmental review process for the recommended mitigation presented in the DEIS that is currently underway. These changes in assumptions were introduced to confirm alignment with the required subsequent review of the transportation mitigations by these agencies.

- With the analysis year being shifted from 2027 to 2029, NYSDOT anticipates being able to complete some of the Mitigation Scenario C improvements by this time such that they would become an inherent component of all future year mitigation scenarios. These partial mitigations include a new interchange at I-81/Sneller Road and the widening of U.S. Route 11 from NYS Route 31 to Sneller Road (not in previously modeled (DEIS) 2027 scenarios).
- This scenario also includes future studies of temporary signals at five locations: (i) Van Hoesen Road and NYS Route 31, (ii) Stearns Road and NYS Route 31, (iii) Morgan Road and Verplank Road, (iv) Grange Road W and NYS Route 31, and (v) NYS Route 31 and Weller Canning Road.

### **Changes in Results**

While the revised modeling shows more severe No Action and Preferred Action impacts, due primarily to the removal of the NYS Route 481/ NYS Route 31 DDI from these scenarios, the mitigation scenarios (Scenario C in 2031 and 2041 as well as Partial Mitigation in 2029) demonstrate a reduction in the number of significantly impacted intersections and freeways for the Preferred Action Alternatives compared to the DEIS. This confirms that if the construction schedule is modified, including with the implementation of revisions and the recommended mitigations, the assessment in the DEIS of significant adverse impacts on traffic remains a conservative worst-case assessment. Details for specific changes between the DEIS and the revised traffic modeling are presented below and in Tables 1-3:

- Changes in 2029:
  - Background Growth and Delay: The modeling year change from 2027 to 2029 reflects additional background growth and reflects the impact of partially completed and completed roadway improvements undertaken independent of this project.
  - Results: The modeling reflected in the DEIS identified several significant adverse traffic impacts. All significant adverse impacts along freeway segments and most intersections would be eliminated through the potential change in construction schedule of Fabs 1 and 2. This potential change in schedule would enable the implementation of targeted mitigation measures, including roadway improvements and signalized access points, that previously could not be implemented by the prior 2027 peak scenario. Table 1 below provides a summary of the reduction in the effects from the DEIS analysis to the revised modeling for 2029 (previously 2027). Full effects and

details for all significantly affected freeway segments and intersections from both the DEIS and revised modeling are included as an attachment to this document.

- **Similar Results in 2031:** Similar to the DEIS, the revised modeling shows the Mitigation Scenario C improvements mitigate all significant adverse traffic impacts at intersection and freeway segment locations. Table 2 below provides a summary of significant adverse traffic impacts between the DEIS and revised modeling for 2031.
- **Changes in 2041:** At full build-out in 2041 with Mitigation C in place, only one intersection, U.S. Route 11 & NYS Route 31, is projected to remain significantly impacted due to geometric constraints that limit further mitigation, compared to five intersections identified in the DEIS. Table 3 below provides a summary of this reduction. Full effects and details for all significantly affected freeway segments and intersections from both the DEIS and revised modeling are included as an attachment to this document.
- **Continuous Coordination:** NYSDOT continues to provide input and support the traffic modeling review for the Proposed Project. Agency input has contributed to the latest modeling assumptions regarding current and planned roadway improvements within the Transportation Evaluation Area.

\*Significantly impacted in both DEIS and revised analysis

**Conclusion**

Based on results of the revised modeling, there would be no new freeway segments or intersections within the Transportation Evaluation Area that show significant adverse traffic impacts not previously identified in the DEIS. This confirms that the potential construction schedule and commencement of operation changes, associated shift changes, and NYSDOT’s updated assumptions, would not result in any additional significant adverse traffic impacts not previously addressed in the DEIS.

**APPENDIX C**  
**GROWTH INDUCING EFFECTS**

**Appendix C-1**  
**Growth Inducing Effects Methodology and Study Area**

## **C-1 Growth Inducing Effects**

### **C-1.1 Overview and Study Area**

SEQRA and its implementing regulations (6 NYCRR § 617.9) specify that an EIS should identify and discuss any growth inducing aspects of a proposed action, where such effects are relevant to the analysis. As described in the SEQR Handbook published by NYSDEC, the analysis in an EIS of the reasonably foreseeable indirect effects of a proposed action should include growth inducing effects, such as “effects related to changes in the pattern of land use, population density or growth rate, and air, water, and other natural systems, including ecosystems” (NYSDEC, 2020, p. 79).

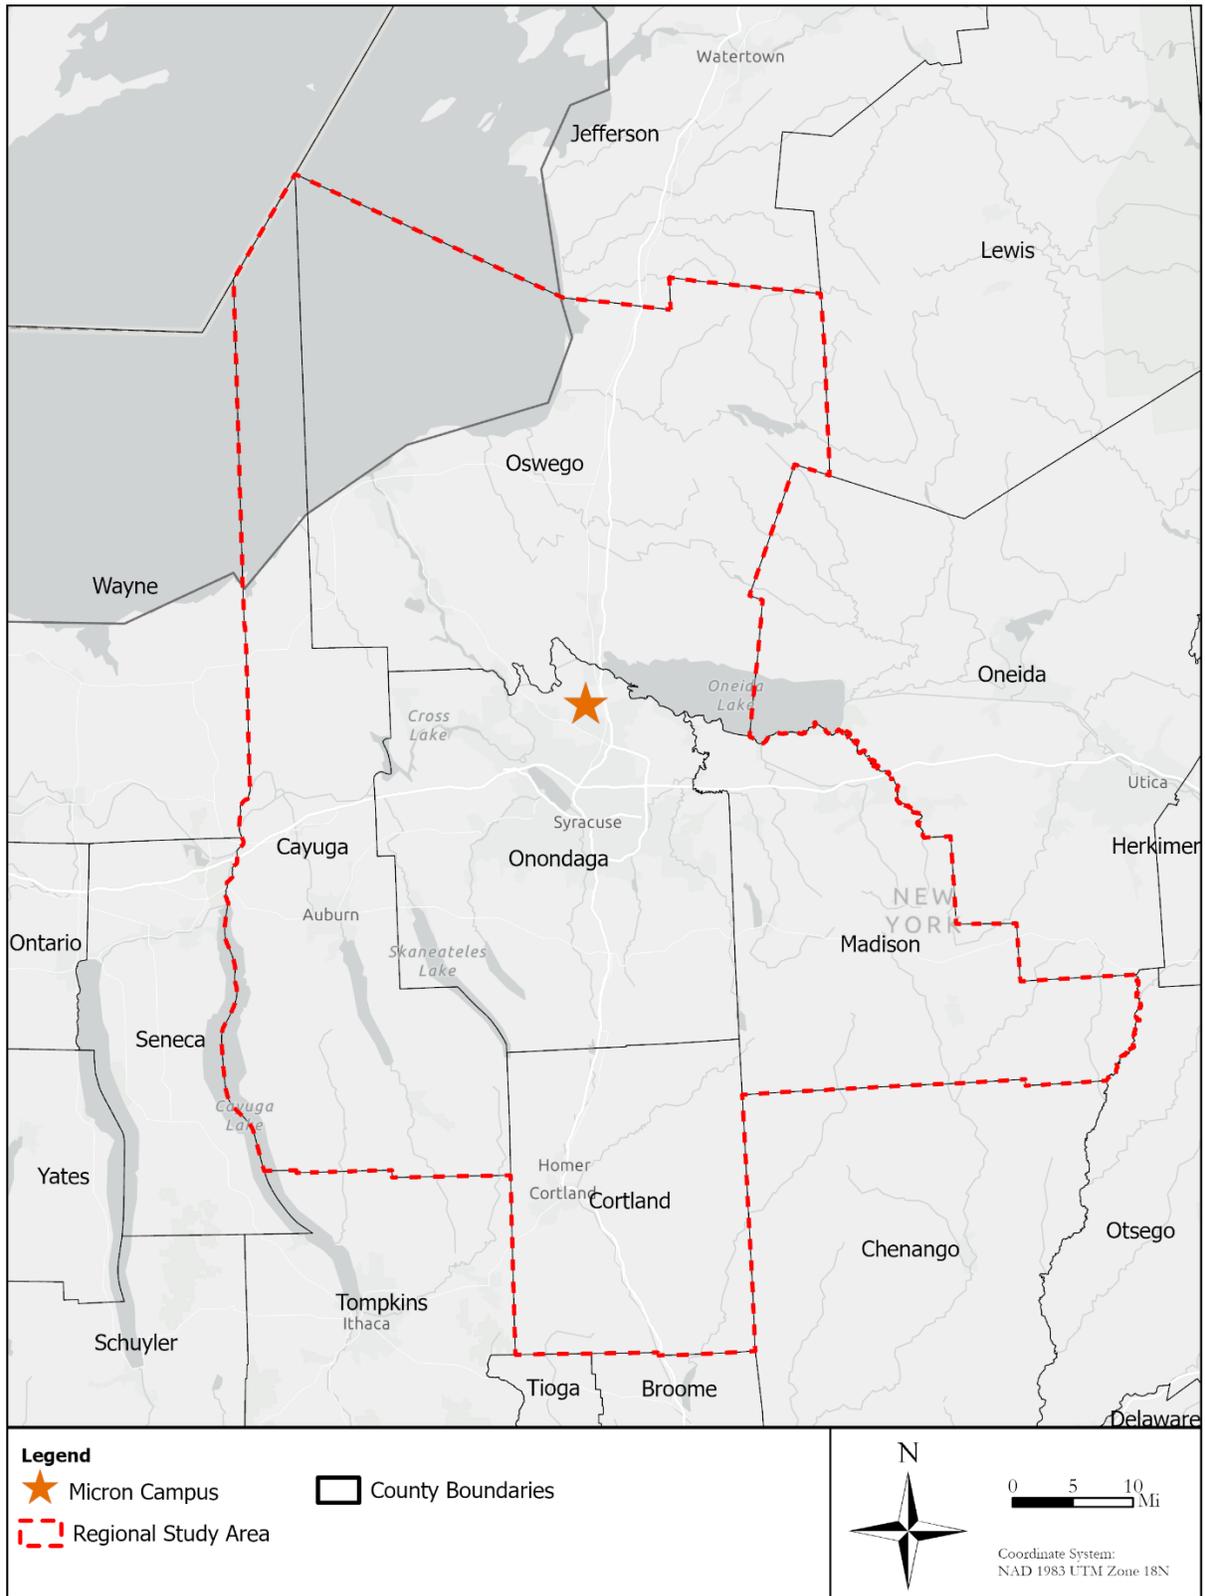

According to a 2022 study prepared by Regional Economic Models, Inc. (REMI) and sponsored by ESD (the “REMI Study”), 85 percent of induced job growth and 90 percent of induced residential growth from Micron establishing a four-fab semiconductor manufacturing facility in Onondaga County would occur within the five-county region (REMI, 2022). A copy of the REMI Study is included in Appendix C-2.

Therefore, this five-county region, shown in Figure C-1 on the next page, has been selected as the study area for analyzing growth inducing effects in this EIS. This study area represents the outer extent of the reasonably foreseeable growth inducing effects of the Preferred Action Alternative on the resource areas analyzed in the EIS, which describes such effects under Growth Inducing Effects in each section of Chapter 3. In general, although locations beyond the five-county region could experience some induced growth, such growth would likely be more limited in nature than that in the five-county region and would not occur at a scale that would be anticipated to result in significant adverse environmental effects.

Under the Preferred Action Alternative, the construction and operation of the Micron Campus in particular would be anticipated to induce job growth within the semiconductor supply chain, draw additional supply chain businesses to the area, and catalyze further development and growth in the regional economy. This economic revitalization could lead to increases in population, worker and household spending, and commercial and retail activity. At the same time, this induced growth could lead to changes in population density and land use patterns, and increased residential, commercial, and industrial activity that could produce additional effects on the surrounding human and natural environment.

The following sections provide additional information on the methodology and evaluation methods used to assess growth inducing effects in the EIS.

## C-1.2 Methodology and Modeling

The methodology for the growth inducing effects analysis in the EIS was developed based on a combination of the REMI Study, local planning sources, and data analytics. An analysis of growth inducing effects requires information on the types of growth anticipated, the scale and extent of growth, and where that growth is likely to occur. Therefore, the growth inducing effects analysis first considered the following broad categories of growth:

- **Increases in population:** the Preferred Action Alternative would lead to in-migration of Micron workers, supply chain workers, and other individuals attracted to the area by increased social and economic opportunities, the in-migration of the families of those groups, and the increased retention of existing residents and workers and their families who would support and benefit from increased local economic activity and household spending from additional population and labor income such groups would bring.
- **Increases in jobs and economic activity:** the Preferred Action Alternative would lead to increased economic activity, business revenues, and jobs within the semiconductor manufacturing supply chain in the region and would further stimulate other business growth, residential growth, and household consumer spending.
- **Increases in residential, commercial, and industrial development:** in-migrating workers and families would need housing, which would spur additional residential development; Micron's construction and operational activities would lead to growth in supply chain businesses supporting Micron's activities; and increases in population and labor income would spur further commercial development to support the anticipated growth in household consumer spending.

The REMI Study estimated induced job<sup>12</sup> growth and induced residential growth from the construction of a four-fab facility at the proposed Micron Campus site that would be likely to occur between 2025 and 2055.<sup>13</sup> These induced growth estimates indicate the overall extent and scale of anticipated induced growth in the five-county region as a whole, but the study was not intended to provide induced growth projections at a smaller scale.

To develop a more granular analysis of growth inducing effects at the community level, the EIS used information and data from local planning sources compiled by the Syracuse Metropolitan Transportation Authority (SMTA) to develop a model of induced household growth at the town, city, and county levels. The model distributed the REMI Study's induced population growth projections by municipality as follows:

---

<sup>12</sup> Although the REMI Study defined "induced jobs" as those jobs that would be generated by worker spending and "indirect jobs" as those jobs that would be generated within the semiconductor supply chain, the EIS considers both of those types of jobs as components of induced growth.

<sup>13</sup> The REMI Study found that induced population growth in the five-county region would be primarily driven by economic in-migration to the region due to the expanded availability of high-paying jobs. Economic in-migration is net population movement into (or out of) a region driven by changes in economic conditions such as job availability, compensation, cost of living, or taxes.

- The REMI Study’s induced population growth projections were converted to estimated numbers of induced households, based on a 2.31 persons-per-household assumption derived from 2016-2021 U.S. Census Bureau American Community Survey (ACS) data for the five-county region.
- The total induced households were apportioned into the following household types:
  - ▶ Micron construction workers and their families who would in-migrate to the region based on construction jobs at the Micron Campus. The estimated number of in-migrating construction workers is based on Micron’s estimated construction labor demand relative to the construction labor force supply within an approximately 90-mile radius of the Micron Campus, and assumes one Micron construction worker per in-migrating household.
  - ▶ Micron operational workers and their families who would in-migrate to the region for an operational job at the Micron Campus. The estimated number of in-migrating Micron operational workers is based on Micron’s estimated operational labor demand relative to an average 28 percent worker in-migration rate that has occurred at Micron’s existing facilities in Boise, ID and Manassas, VA, and assumes one Micron operational worker per in-migrating household.
  - ▶ Other workers and their families (also assuming one induced worker per household) who would in-migrate to the area to meet the growth in labor demand within Micron’s supply chain and the consumer needs from the induced population growth, as well as individuals and families attracted to the area by increased social and economic opportunities.
- The total induced households were then distributed to municipalities within the five-county region based on the known characteristics of these household types:
  - ▶ In-migrating Micron construction worker households were distributed based in part on ACS data on commuting distances within Onondaga County and for construction workers nationally. The modeling also accounted for existing population densities, short-term housing supply constraints that could push worker housing farther out than shorter commuting distances, and Micron’s intention to reimburse certain work-related travel expenses for construction workers traveling from as far away as 90 miles from the Micron Campus.
  - ▶ In-migrating Micron operational worker households also were distributed based on existing population densities and ACS data on commuting distances, including U.S. Census Bureau OnTheMap data on residence-to-workplace distances in the census tract where the Micron Campus would be located and the census tracts for Micron’s existing facilities in Boise, ID and Manassas, VA and the GlobalFoundries semiconductor facilities in Malta, NY, taking into account changing patterns in commuting distances from before and after those facilities began operations.
  - ▶ Other workers and their families who would be employed at supply chain businesses and other commercial businesses serving anticipated household consumer spending

growth were distributed not based on potential proximity to the Micron Campus but on existing municipal population densities within the five-county region; in-migrating residents who would be attracted to the region due to increased social and economic opportunities and who would not necessarily be tied to induced jobs also were distributed based on existing municipal population densities.

Because a vast majority of the projected in-migrating residents would not be employed with Micron, the modeled distribution of the REMI Study induced population projections as described above was not heavily concentrated around the Micron Campus location.

Separate from the modeling described above, SMTC generated future household and job growth projections for the Syracuse Metropolitan Planning Area (MPA) (all of Onondaga County, plus the Towns of Hastings, Schroepfel, and West Monroe in Oswego County), including anticipated growth associated with the Proposed Project. To generate these projections, SMTC staff met with local planning agencies, including representatives from the City of Syracuse, Onondaga County, and CenterState CEO, who identified general and site-specific locations of planned and anticipated household and employment growth or decline in their geographic areas of expertise. SMTC developed MPA projections for 2040 and 2050 based on this information, the REMI Study projections, and its local knowledge of other anticipated growth.

SMTC's MPA projections indicated a larger degree of induced growth than the modeling described above, whereas assuming the REMI Study's regional projections as an upper limit on the SMTC projections results in a reduced degree of induced growth occurring outside of the MPA but within the five-county region. Therefore, the EIS developed low- and high-range estimates of induced household growth at the town, city, and county levels to conservatively demonstrate the range of possible induced growth based on these varying information sources.

Induced commercial and industrial business growth within the semiconductor supply chain, and increased consumer demand generated by population increases, also would be anticipated to occur in the five-county region in addition to the induced household growth described above. The REMI Study did not provide estimates for induced commercial or industrial business growth, and it would be difficult to determine how much of that growth would occur largely within or through expansions of existing facilities versus through establishment of new facilities. Given the scale of anticipated supply chain growth and new worker and household spending, it is reasonable to assume that substantial new commercial and industrial development would occur over time. However, it would be premature to estimate ranges for such incremental commercial and industrial development at the municipal or regional level at this time.

### **C-1.3 Induced Growth Estimates**

As described above, the EIS developed a model of future induced household growth at the town, city, and county levels. Although it is not possible to predict all of the specific locations and sites where induced development would occur over time (including because such development would be subject to applicable laws and regulations, including local zoning requirements, site plan approvals, and other discretionary actions requiring separate site-specific reviews), the municipal and county level estimates indicate the potential scale of such induced growth, and inform the discussion of potential Growth Inducing Effects in the EIS.

The following tables show the induced growth projections developed based on the methodology and modeling described in the previous section. The projections are shown as low- and high-range estimated percentage changes compared to 2023 estimated household numbers at the municipal and county levels the five-county region for the years 2035 and 2041. Table C-1 and C-2 show the total induced growth projections at the county level in 2035 and 2041. The remaining tables show the municipal projections within each county for those years.<sup>14</sup>

**Table C-1 Induced Growth Projections by County (2035)**

| Geographic Area | Estimated Households in 2023 | Micron Induced Households |        | Percent Increase in Households over 2023 |      |
|-----------------|------------------------------|---------------------------|--------|------------------------------------------|------|
|                 |                              | Low                       | High   | Low                                      | High |
| Onondaga County | 194,963                      | 12,727                    | 18,223 | 6.5%                                     | 9.3% |
| Oswego County   | 47,132                       | 1,438                     | 3,721  | 3.1%                                     | 7.9% |
| Madison County  | 25,563                       | 751                       | 1,943  | 2.9%                                     | 7.6% |
| Cayuga County   | 31,334                       | 808                       | 2,090  | 2.6%                                     | 6.7% |
| Cortland County | 18,768                       | 464                       | 1,201  | 2.5%                                     | 6.4% |

**Table C-2 Induced Growth Projections by County (2041)**

| Geographic Area | Estimated Households in 2023 | Micron Induced Households |        | Percent Increase in Households over 2023 |       |
|-----------------|------------------------------|---------------------------|--------|------------------------------------------|-------|
|                 |                              | Low                       | High   | Low                                      | High  |
| Onondaga County | 194,963                      | 16,568                    | 23,518 | 8.5%                                     | 12.1% |
| Oswego County   | 47,132                       | 1,674                     | 4,561  | 3.6%                                     | 9.7%  |
| Madison County  | 25,563                       | 874                       | 2,382  | 3.4%                                     | 9.3%  |
| Cayuga County   | 31,334                       | 940                       | 2,562  | 3.0%                                     | 8.2%  |
| Cortland County | 18,768                       | 540                       | 1,473  | 2.9%                                     | 7.8%  |

<sup>14</sup> All tables in this Appendix are projections developed by AKRF, Inc. based on data from the REMI Study, existing household data contained in U.S. Census Bureau ACS 2019-2023 5-year estimates, and SMTC growth projections. The induced household growth estimates presented in the tables include all Proposed Project-induced new populations, including: in-migrating Micron workers and families; retained and in-migrating supply chain workers and families; retained and in-migrating workers and families supporting increased household and consumer spending; and other retained and in-migrating residents attracted to the region by increased social and economic opportunities. Totals may not sum due to rounding.

**Table C-3 Induced Growth in Onondaga County (2035)**

| Geographic Area                | Estimated Households in 2022 | Micron Induced Households |               | Percent Increase in Households over 2022 |             |

# Executive Summary

Micron Technology, Inc., a manufacturing company is considering a project to construct, fit-out, and equip several large facilities in Onondaga County, New York. Regional Economic Models, Inc. (REMI) was retained by Empire State Development to perform an economic and fiscal impact analysis of the facility at the state and local levels. REMI analyzed the facility's economic and fiscal impacts over the period 2025-2055 using a New York-specific multi-regional Tax-PI model.

The company would ramp up operations over two phases (Phase 1: 2025-2034, Phase 2: 2035-2044) while investing \$99.6 billion capital investment (construction and machinery and equipment). In addition, there would be infrastructure (utility construction) and other investments of \$1.5 billion. Ongoing direct employment in the facility would be 9,005 jobs as of 2045. Additionally, there would be Research and Development (R&D) spending of \$3.3 billion over the period 2026-2045. Given the propensity of chip fabs to remain in operation for decades, the economic impact analysis conservatively assumed an additional 11 years of operations on top of the 20-year period in which Phases 1 and 2 capital expenditures would be completed. R&D spending would continue over the period 2046-2055. This direct activity and spending would be accompanied by ongoing employment of 5,772 in-state resident and 1,924 out-of-state visiting contractors as of 2036.

REMI analyzed the facility's economic and fiscal impacts over the period 2025-2055 using a New York-specific multi-regional Tax-PI model, and found the following key results:<sup>1</sup>

- The facility would create an average annual employment impact of 45,418 at the state level over the time period 2025-2055, with 39,975 of those jobs coming from the Central New York region.
- For every direct company hire<sup>2</sup>, there would be about 5.5 other jobs created in the state economy.<sup>3</sup>
- By 2055, the facility would create 50,911 jobs at the state level (44,943 of which would be based in Central New York), including 9,005 of the facility's direct hires and 9,431 indirect and 32,474 induced jobs (indirect and induced 41,905).
- The average annual total investment employment impact associated with the capital and other infrastructure spending (2025-2044) would be 11,871 (6,647 direct; 1,146 indirect; 4,079 induced). In terms of the direct investment employment, construction related jobs would be over 84 percent (5,595) on average during the 2025-2044 timeframe.

---

<sup>1</sup> Unless stated otherwise, annual averages are over the entire 31-year period (2025-2055). Figures and numbers may not add-up exactly due to rounding.

<sup>2</sup> These refer to the facility's direct hires as well as jobs directly associated with the capital investments.

<sup>3</sup> Direct company hires are also referred to as Direct Operations Employment.

- The facility would grow the state economy significantly, adding an annual average of \$16.7 billion in real economic output and \$9.6 billion in real Gross Domestic Product (GDP) over the time period 2025-2055.<sup>4</sup>
- The facility would add an annual average of 59,575 in state population over the time period 2025-2055.
- The facility would add an annual average of \$5.4 billion in real disposable personal income for New York residents over the time period 2025-2055.
- The facility would generate an average annual increase of \$378.5 million in real state government revenue, for a present value (PV) of \$7.1 billion over 2025-2055 using a three percent discount rate, and a fiscal benefit-cost ratio of 2.0 relative to the PV of proposed real New York State incentives at a three percent discount rate.<sup>5</sup>
- The facility would generate an average annual increase of \$565.5 million in real revenue to local governments in New York State, for a PV of \$10.7 billion over 2025-2055 using a three percent discount rate. Most of these revenue gains would occur in Central New York region.
- The ROI real Gross Domestic Product ratio would be 51.5 using a three percent discount rate. The ROI (return on investment) real GDP ratio is defined as the PV of real GDP impact over the period 2025-2055 to the PV of real New York State Incentives over the period 2025-2055.
- *Economic Benefit* measure is defined by ESD as the sum of the real disposable personal income, real state government revenue, and real local government revenue impacts. The Economic Benefit ratio, which is calculated as the ratio of the PV of the real Economic Benefit to the PV of the real New York State Incentives, comes out to 33.6 (using a three percent discount rate over the period 2025-2055).

The Executive Summary Table below displays the 2055, average, and PV with three percent discount rate values of employment (direct, direct operations, indirect, induced), real GDP, real economic output, real disposable personal income, real state government revenue, real local government revenue, real Economic Benefit, and real New York State Incentives. During 2025-2055, real state government revenue increases by \$378.5 million on average. Approximately 66 percent of the real revenue is from the personal income tax. The table below also isolates the direct company hires (Direct Operations) for reference.

---

<sup>4</sup> For purposes of this report, real dollar figures are in fixed 2025 dollars.

<sup>5</sup> New York State incentives total \$5.8 billion current dollars, and are converted into 2025 dollars using a price deflator.

## REMI Background & Experience

Regional Economic Models, Inc. (REMI) is an independent company with offices in Amherst, MA and Washington, D.C. that provides non-partisan economic analysis and modeling software to its clients, who include federal, state, and local government agencies, non-profit organizations, universities, and private companies. With approximately 40 years of experience, REMI is a worldwide leader in providing dynamic regional U.S. macroeconomic and demographic models used to evaluate economic development as well as many other policy issues such as taxes, health care, transportation, energy and the environment, and trade. REMI consultative services and modeling software have been utilized on several economic development studies in New York, in addition to other semiconductor manufacturing facilities.

# REMI Glossary

**Disposable Personal Income:** Total after-tax income received by persons; it is the income available to persons for spending or saving.

**Economic Output:** The amount of production, including all intermediate goods purchased as well as value added (compensation and profit). This can also be thought of as sales or supply.

**Employment:** Employment comprises estimates of the number of jobs, full-time plus part-time, by place of work for all industries.

**GDP:** Gross Domestic Product. The market value of goods and services produced by labor and property. It is also the sum of value-added across all industries.

**Personal Income:** Income received by persons from all sources. It is the sum of wages and salaries, supplements to wages and salaries, proprietors' income, rental income, asset income, and personal current transfer receipts, net of contributions for government social insurance.

# Introduction

Micron Technology, Inc., is considering a project to construct, fit-out, and equip several large facilities, in Onondaga County, New York. The company would ramp up operations over two phases from 2025-2044 while investing approximately \$99.6 billion for capital expenditures (construction and machinery and equipment). In addition, there would be infrastructure (utility construction) and other investments of \$1.5 billion.

Ongoing direct employment in the facility would be 9,005 jobs as of 2045, and it would be accompanied by ongoing employment of about 5,772 in-state resident and 1,924 out-of-state visiting contractors as of 2036.

On behalf of Empire State Development (ESD), Regional Economic Models, Inc. (REMI) performed an economic and fiscal impact analysis of the facility at the state and local levels over the period 2025-2055 using a New York-specific Tax-PI model. Specifically, REMI considered how the capital expenditures, facility operations, and contractors would affect employment, economic output, Gross Domestic Product (GDP), disposable personal income, state government revenue, and local government revenue for New York and the Central New York model region in which Onondaga County is located.

REMI found strong positive economic and fiscal impacts, driven largely by the highly productive and well-compensated facility employees who create significant supply chain demand and spend robustly in the local economy. These include an average annual employment increase of 45,418 jobs, with almost 40,000 in Central New York and an associated state-level multiplier over four, an average annual increase in real economic output and real state GDP of over \$16 billion and \$9 billion respectively, an average annual increase of almost 60,000 in population, an average annual increase of more than \$5 billion in real disposable personal income, a present value (PV) of \$7.1 billion in additional real state government revenue generated given a three percent discount rate, which is greater than the present value (PV) of the proposed New York State Incentives, and a PV of \$10.7 billion in additional real local government revenue generated, of which about 85 percent accrues in Central New York.

# Methodology

In order to assess the economic and fiscal impacts of locating a semiconductor manufacturing facility in Onondaga County, New York, REMI uses ESD's currently licensed multi-region, 70-industry Tax-PI v2.5 model of New York. Onondaga County is in the Central New York model region. Tax-PI is a sophisticated dynamic regional macroeconomic, demographic, and fiscal policy model that simulates the year-by-year effects of public policy initiatives, and is widely used by state and local agencies, legislatures, universities, and other organizations and experts, both in New York and across the U.S. More detailed information is available about the model and the fiscal calibration in Appendix II.

The economic and fiscal impact of the Micron facilities on state and local economies comes from two sources. The first source is the development and construction of its facility, which is expected to last 20 years from 2025-2044. The second source of economic impact is the ongoing operations of the manufacturing facility, which includes the direct employment and compensation, ongoing R&D spending, and both in-state resident and out-of-state visiting contractors, and which is expected to commence in 2026 and ramp up until stabilizing in 2045. The capital investment and operations will both occur in two phases, with Phase 1 starting in 2025 and Phase 2 starting in 2035. The direct, indirect, and induced impacts in spending and job creation are estimated through the REMI Tax-PI model. In addition, state and local tax revenue is estimated, where totals for both New York and Central New York are reported for the latter. The analysis covers the 31-year period from 2025-2055.<sup>6</sup> Unless otherwise noted, averages are calculated over the 2025-2055 period. In Appendix I, a table of nominal values (current dollars) is available.

## *Capital Expenditures, Infrastructure, and Others*

**Phase 1.** Capital Expenditures are categorized as (1) Construction and (2) Machinery and Equipment. Infrastructure Expenditures are categorized as (3) Utility Construction (i.e., Water and sewer system upgrades, Infrastructure Grant, Site Development, and Façade Grant). Table 1.1a displays the spending for each category from 2025-2034 and in 2055, entered as demand for (i.e., a state GDP contribution from) the corresponding industry. For categories (1) and (3), the corresponding industry is Construction, and for category (2), it is Machinery Manufacturing. Additionally, there are Workforce Training expenditures of \$10 million per year during 2026-2034, which are counted as demand for the Educational Services industry.

---

<sup>6</sup> Given the propensity of chip fabs to remain in operation for decades, the economic impact analysis conservatively assumes an additional 11-year operating on top of the 20-year period in which Phases 1 and 2 capital expenditures are complete. Please see section on Capital Expenditures.

**Table 1.1a: Capital Expenditures, Phase 1**

| Spending Type         | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 | 2034 | 2055 | Average | 2025-2034 Average |
|-----------------------|------|------|------|------|------|------|------|------|------|------|------|---------|-------------------|
| Land & Building       | 2.1  | 3.1  | 2.8  | 0.8  | 2.0  | 1.2  | 0.3  | 1.6  | 2.5  | 4.5  | -    | 0.7     | 2.1               |
| Machinery & Equipment | 0.1  | 0.8  | 1.0  | 3.6  | 3.0  | 4.6  | 5.0  | 3.4  | 3.3  | 1.9  | -    | 0.9     | 2.7               |
| Utility Construction  | 0.1  | 0.1  | 0.1  | 0.1  | 0.1  | 0.1  | 0.1  | 0.1  | 0.1  | 0.1  | -    | 0.0     | 0.1               |
| Total                 | 2.3  | 4.0  | 3.9  | 4.5  | 5.1  | 5.9  | 5.4  | 5.1  | 5.9  | 6.5  | -    | 1.6     | 4.9               |

Note: Units in Billions of Nominal Dollars. Components may not sum to totals due to rounding.

**Phase 2.** Capital Expenditures are categorized as (1) Construction and (2) Machinery and Equipment. Infrastructure Expenditures are categorized as (3) Utility Construction (i.e., Water and sewer system upgrades, Infrastructure Grant, Site Development, and Façade Grant). Table 1.1b displays the spending for each category from 2035-2044, and in 2055, entered as demand for the corresponding industry, which is the same as in Phase 1. Additionally, there are Workforce Training expenditures of \$10 million in 2035, which are counted as demand for the Educational Services industry.

**Table 1.1b: Capital Expenditures, Phase 2**

| Spending Type         | 2035 | 2036 | 2037 | 2038 | 2039 | 2040 | 2041 | 2042 | 2043 | 2044 | 2055 | Average | 2035-2044 Average |
|-----------------------|------|------|------|------|------|------|------|------|------|------|------|---------|-------------------|
| Land & Building       | 2.1  | 2.9  | 3.4  | 1.7  | -    | -    | -    | -    | -    | -    | -    | 0.3     | 1.0               |
| Machinery & Equipment | 5.0  | 4.5  | 4.2  | 4.9  | 5.7  | 5.0  | 4.6  | 2.7  | 2.7  | 2.7  | -    | 1.4     | 4.2               |
| Utility Construction  | 0.1  | 0.1  | 0.1  | 0.1  | -    | -    | -    | -    | -    | -    | -    | 0.0     | 0.0               |
| Total                 | 7.0  | 7.5  | 7.5  | 6.6  | 5.7  | 5.0  | 4.6  | 2.7  | 2.7  | 2.7  | -    | 1.7     | 5.2               |

Note: Units in Billions of Nominal Dollars. Components may not sum to totals due to rounding.

## Operations

Direct employment for Engineers, Quality Engineers, and Technicians, classified in the Semiconductor and related device manufacturing industry, would ramp up over 20 years starting in 2026, after which it would remain constant at 8,211. Table 1.2 displays this direct employment from 2026-2030 and 2036-2040, and in 2055, the final analysis year.

**Table 1.2: Direct Employment – Semiconductor and related device manufacturing**

| Variable   | 2026  | 2027  | 2028  | 2029  | 2030  | 2036  | 2037  | 2038  | 2039  | 2040  | 2055  | Average |
|------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|---------|
| Employment | 1,570 | 2,381 | 2,979 | 3,685 | 4,223 | 6,488 | 7,021 | 7,426 | 7,558 | 7,825 | 8,211 | 6,271   |

Note: Units in Jobs. Components may not sum to totals due to rounding.

The R&D spending would ramp up to an annual value of \$301.3 million by 2045, growing by the projected inflation rate thereafter. Table 1.3 displays the spending in R&D from 2026-2030 and 2035-2039, and in 2055, the final analysis year.

**Table 1.3: Direct Employment and Spending, Professional, scientific, and technical services**

| Variable | 2026 | 2027 | 2028 | 2029 | 2030 | 2035  | 2036  | 2037  | 2038  | 2039  | 2055  | Average |
|----------|------|------|------|------|------|-------|-------|-------|-------|-------|-------|---------|
| Spending | 2.6  | 4.9  | 7.3  | 16.3 | 31.3 | 161.5 | 185.7 | 216.8 | 234.9 | 241.0 | 367.6 | 213.5   |

Note: Units for Spending in Millions of Nominal Dollars. Components may not sum to totals due to rounding.

Direct employment for Management, classified in the Management of companies and enterprises industry, would ramp up over 20 years starting in 2026, after which it would remain constant at 610. Table 1.4a displays this direct employment from 2026-2030 and 2036-2040, and in 2055, the final analysis year.

**Table 1.4: Direct Employment – Management of companies and enterprises**

| Variable   | 2026 | 2027 | 2028 | 2029 | 2030 | 2036 | 2037 | 2038 | 2039 | 2040 | 2055 | Average |
|------------|------|------|------|------|------|------|------|------|------|------|------|---------|
| Employment | 208  | 326  | 320  | 273  | 314  | 482  | 521  | 552  | 562  | 581  | 610  | 477     |

Note: Units in Jobs. Components may not sum to totals due to rounding.

Direct employment in Administrative / Other Management, classified in the Administrative and support services industry, would ramp up over 20 years starting in 2026, after which it would remain constant at 184. Table 1.5 displays this direct employment from 2026-2030 and 2036-2040, and in 2055, the final analysis year.

**Table 1.5: Direct Employment – Administrative and support services**

| Variable   | 2026 | 2027 | 2028 | 2029 | 2030 | 2036 | 2037 | 2038 | 2039 | 2040 | 2055 | Average |
|------------|------|------|------|------|------|------|------|------|------|------|------|---------|
| Employment | 94   | 125  | 122  | 82   | 95   | 146  | 156  | 166  | 169  | 174  | 184  | 146     |

Note: Units in Jobs. Components may not sum to totals due to rounding.

## Contractors

The number of contractors would remain constant at 4,000 from 2026-2035, grow to 7,697 in 2036, and remain constant afterwards. Table 1.6 displays the numbers of contractors by location and industry in 2026, 2036, and 2055, the final analysis year.

**Table 1.6: Contractor Employment**

| Industry                              | 2026  | 2036  | 2055  | Average |
|---------------------------------------|-------|-------|-------|---------|
| <i>In-State Contractors</i>           |       |       |       |         |
| Semiconductor machinery manufacturing | 2,000 | 4,079 | 4,079 | 3,277   |
| Services to buildings and dwellings   | 1,000 | 1,693 | 1,693 | 1,415   |
| <i>Out-of-State Contractors</i>       |       |       |       |         |
| Semiconductor machinery manufacturing | 1,000 | 1,924 | 1,924 | 1,564   |

Note: Units in Jobs. Components may not sum to totals due to rounding.

Aggregate out-of-state visiting contractor consumer spending during on-site would be \$97.5 million in 2026, growing by the projected inflation rate from 2026-2035. The number would rise to \$229.5 million in 2036, and would grow by the projected inflation rate thereafter. Table 1.7 displays the contractor consumer spending by category in 2026, 2036, and 2055, the final analysis year.

**Table 1.7: Out-of-State Visiting Contractor Consumer Spending**

| Commodity                     | 2026 | 2036  | 2055  | Average |
|-------------------------------|------|-------|-------|---------|
| Accommodations                | 65.0 | 153.0 | 223.3 | 143.1   |
| Purchased meals and beverages | 19.5 | 45.9  | 67.0  | 42.9    |
| Ground transportation         | 13.0 | 30.6  | 44.7  | 28.6    |

Note: Units in Millions of Nominal Dollars. Components may not sum to totals due to rounding.

# Results

This section reports the economic and fiscal impacts of the Micron facilities on New York and Central New York over the period 2025-2055, specifically on employment, economic output, GDP, personal income, disposable personal income, and state and local government revenue.

## Employment

Table 2.1 displays the employment impacts for New York and Central New York, including both the totals and breakdowns into direct, indirect, and induced impacts, from 2025-2029, from 2035-2039, and in 2055. During 2025-2055, the average total employment impact in New York is an increase of 45,418 jobs, with 39,975 occurring in Central New York. The average number of new direct jobs in the state is 11,182, implying an employment multiplier of approximately 4.1.

**Table 2.1: Employment Impacts (New York & Central New York)**

| Category                | 2025   | 2026   | 2027   | 2028   | 2029   | 2035   | 2036   | 2037   | 2038   | 2039   | 2055   | Average |
|-------------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|---------|
| <i>New York</i>         |        |        |        |        |        |        |        |        |        |        |        |         |
| Employment              | 15,468 | 40,272 | 40,268 | 30,724 | 38,260 | 38,829 | 58,961 | 61,989 | 55,611 | 48,511 | 50,911 | 45,418  |
| Direct                  | 8,992  | 15,229 | 14,680 | 8,217  | 13,018 | 13,033 | 17,696 | 19,297 | 14,640 | 9,763  | 9,005  | 11,182  |
| Direct Operation        | -      | 1,872  | 2,832  | 3,421  | 4,040  | 4,680  | 7,116  | 7,698  | 8,144  | 8,289  | 9,005  | 6,894   |
| Indirect                | 1,436  | 6,534  | 6,428  | 5,589  | 6,225  | 6,336  | 10,701 | 10,888 | 10,349 | 9,774  | 9,431  | 8,294   |
| Induced                 | 5,040  | 18,510 | 19,160 | 16,918 | 19,016 | 19,460 | 30,564 | 31,804 | 30,622 | 28,975 | 32,474 | 25,943  |
| <i>Central New York</i> |        |        |        |        |        |        |        |        |        |        |        |         |
| Employment              | 14,367 | 36,293 | 36,236 | 26,069 | 33,406 | 33,821 | 52,007 | 55,071 | 48,782 | 41,798 | 44,943 | 39,975  |
| Direct                  | 8,964  | 15,085 | 14,505 | 7,650  | 12,557 | 12,455 | 17,187 | 18,849 | 14,132 | 9,196  | 9,005  | 10,922  |
| Direct Operation        | -      | 1,872  | 2,832  | 3,421  | 4,040  | 4,680  | 7,116  | 7,698  | 8,144  | 8,289  | 9,005  | 6,894   |
| Indirect                | 1,281  | 6,251  | 6,152  | 5,380  | 5,951  | 6,037  | 10,327 | 10,496 | 10,017 | 9,507  | 9,231  | 8,047   |
| Induced                 | 4,121  | 14,957 | 15,579 | 13,040 | 14,898 | 15,329 | 24,493 | 25,727 | 24,633 | 23,095 | 26,707 | 21,006  |

Note: Units in Jobs. Components may not sum to totals due to rounding.

## Economic Output & Gross Domestic Product

Table 2.2 displays the real economic output and real GDP impacts for New York and Central New York from 2025-2039, from 2035-2039, and in 2055. During 2025-2055, the average economic output and GDP impacts in New York are increases of \$16.7 billion and \$9.6 billion respectively. For Central New York, the corresponding impacts are \$14.9 billion and \$8.6 billion. Central New York accounts for about 90 percent of the economic output impact and 90 percent of the GDP impact. This is driven by the aforementioned high productivity of the semiconductor manufacturing facility employees, generating a sizable economic footprint in the state relative to their employment presence.

**Table 2.2: Economic Output & Gross Domestic Product Impacts (New York & Central New York)**

| Variable                | 2025 | 2026 | 2027 | 2028 | 2029 | 2035 | 2036 | 2037 | 2038 | 2039 | 2055 | Average |
|-------------------------|------|------|------|------|------|------|------|------|------|------|------|---------|
| <i>New York</i>         |      |      |      |      |      |      |      |      |      |      |      |         |
| Output                  | 2.8  | 10.2 | 10.5 | 9.4  | 11.0 | 12.0 | 19.4 | 20.3 | 19.4 | 18.4 | 22.8 | 16.7    |
| GDP                     | 1.6  | 5.6  | 5.9  | 5.2  | 6.2  | 6.9  | 11.0 | 11.6 | 11.2 | 10.5 | 13.2 | 9.6     |
| <i>Central New York</i> |      |      |      |      |      |      |      |      |      |      |      |         |
| Output                  | 2.6  | 9.1  | 9.5  | 8.1  | 9.6  | 10.4 | 17.3 | 18.2 | 17.3 | 16.2 | 20.7 | 14.9    |
| GDP                     | 1.5  | 5.0  | 5.3  | 4.5  | 5.4  | 6.1  | 9.9  | 10.5 | 10.0 | 9.4  | 11.9 | 8.6     |

Note: Units in Billions of 2025 Dollars. Components may not sum to totals due to rounding.

## Population

Table 2.3 displays the population impacts for New York and Central New York from 2025-2029, from 2035-2039, and in 2055. During 2025-2055, the average population impact in New York is 59,575, with 53,388 accruing in Central New York. This is primarily driven by the economic migrants<sup>7</sup> flowing into the region, largely due to the expanded availability of high compensation jobs.

**Table 2.3: Population Impacts (New York & Central New York)**

| Variable                | 2025  | 2026   | 2027   | 2028   | 2029   | 2035   | 2036   | 2037   | 2038   | 2039   | 2055   | Average |
|-------------------------|-------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|---------|
| <i>New York</i>         |       |        |        |        |        |        |        |        |        |        |        |         |
| Population              | 4,285 | 14,112 | 21,178 | 24,212 | 29,216 | 48,429 | 56,050 | 62,791 | 66,605 | 68,072 | 84,530 | 59,575  |
| <i>Central New York</i> |       |        |        |        |        |        |        |        |        |        |        |         |
| Population              | 4,056 | 12,992 | 19,368 | 21,607 | 26,038 | 43,203 | 50,094 | 56,278 | 59,595 | 60,642 | 76,264 | 53,388  |

Note: Units in Individuals. Components may not sum to totals due to rounding.

<sup>7</sup> Economic migration is net population movement into (or out of) a region driven by a change in economic conditions such as job availability, compensation, cost of living, or taxes.

## Personal Income & Disposable Personal Income

Table 2.4 displays the real personal income and real disposable personal income impacts for New York and Central New York from 2025-2029, from 2035-2039, and in 2055. During 2025-2055, the average personal income impact in New York is \$6.8 billion, with \$5.8 billion accruing in Central New York; the average disposable personal income impact in New York is \$5.4 billion, with \$4.7 billion accruing in Central New York. This is primarily driven by the high compensation of the direct employees, as well as the additional labor income earned in the many spillover jobs generated in other industries.

**Table 2.4: Personal Income & Disposable Personal Income Impacts (New York & Central New York)**

| Variable                   | 2025 | 2026 | 2027 | 2028 | 2029 | 2035 | 2036 | 2037 | 2038 | 2039 | 2055 | Average |
|----------------------------|------|------|------|------|------|------|------|------|------|------|------|---------|
| <i>New York</i>            |      |      |      |      |      |      |      |      |      |      |      |         |

## State Government Revenue<sup>8</sup>

Table 2.5a displays the real state government revenue impacts for New York during 2025-2029 and 2035-2039, and in 2055. During 2025-2055, real state government revenue increases by \$378.5 million on average. Approximately 66 percent of the real revenue is from the personal income tax.

**Table 2.5a: State Government Revenue**

| Variable                 | 2025 | 2026  | 2027  | 2028  | 2029  | 2035  | 2036  | 2037  | 2038  | 2039  | 2055  | Average |
|--------------------------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|---------|
| Total Revenue            | 17.4 | 110.9 | 230.3 | 237.6 | 219.3 | 329.3 | 329.4 | 443.0 | 463.3 | 443.5 | 544.7 | 378.5   |

### Local Government Revenue<sup>9</sup>

Table 2.6a displays the real local government revenue impacts for *All of New York* and Central New York during 2025-2029 and 2035-2039, and in 2055. During 2025-2055, local government revenue for *All of New York* increases by \$565.5 million on average. For Central New York, the corresponding impact is \$490.4 million. Approximately, 85 percent of the real local government revenue is generated from Central New York. It is important to note that the local government revenue impact reported for Central New York is the region’s contribution to the *All of New York* local government revenue based on Central New York local government tax rates.

**Table 2.6a: Local Government Revenue - All of New York & Central New York**

| Variable                                         | 2025 | 2026  | 2027  | 2028  | 2029  | 2035  | 2036  | 2037  | 2038  | 2039  | 2055  | Average |
|--------------------------------------------------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|---------|
| <i>All New York Local Government Revenue</i>     |      |       |       |       |       |       |       |       |       |       |       |         |
| Total Revenue                                    | 96.4 | 322.9 | 348.7 | 303.9 | 359.1 | 416.7 | 629.3 | 672.5 | 647.2 | 608.6 | 800.2 | 565.5   |
| <i>Central New York Local Government Revenue</i> |      |       |       |       |       |       |       |       |       |       |       |         |
| Total Revenue                                    | 84.9 | 280.1 | 302.2 | 251.7 | 303.4 | 354.7 | 542.8 | 583.0 | 557.7 | 520.1 | 700.1 | 490.4   |

Note: Units in Millions of 2025 Dollars. Components may not sum to totals due to rounding.

<sup>9</sup> For the Micron facilities, instead of collecting real estate tax, Onondaga County will utilize a Payment in Lieu of Taxes (PILOT) agreement. From 2025 to 2055, the total PILOT payment will be \$43.7 million, or the total PILOT savings will be \$146.8 million. New York State and Onondaga County have a sales tax rate of 4.0 percent. Sales of equipment for manufacturing businesses are exempt from sales tax. The sales tax on purchases of construction materials and other supplies is also waived.

Table 2.6b displays the current dollar local government revenue impacts for *All of New York* and Central New York during 2025-2029 and 2035-2039, and in 2055. During 2025-2055, local government revenue for *All of New York* increases by \$826.1 million on average (\$25.6 billion in total). For Central New York, the corresponding impact is \$694.5 million on average (\$21.5 billion in total). Approximately, 85 percent of the current dollar local government revenue is generated from Central New York. It is important to note that the local government revenue impact reported for Central New York is the region’s contribution to the *All of New York* local government revenue based on Central New York local government tax rates. Approximately 57 percent of the Central New York local government revenue is generated in Onondaga County.

**Table 2.6b: Local Government Revenue (Current Dollars) - All of New York & Central New York**

**Incentives Offer Analysis: Current Dollar \$5.8 Billion, 3 Percent Discount Rate**

Table 2.7 displays the real GDP, real disposable personal income, real state government revenue, and real local government revenue impacts, the real Economic Benefit, and the real New York State Incentives during 2025-2029 and 2035-2039, and in 2055. The table also displays the PV of each under a three percent discount rate. The Economic Benefit measure is defined by ESD as being the sum of the real disposable personal income, real state government revenue, and real local government revenue impacts.

During 2025-2055, the PV of the real GDP, real disposable personal income, real state government revenue, and real local government revenue impacts are \$182.5, \$101.4 billion, \$7.1 billion, and \$10.7 billion respectively, yielding a real Economic Benefit PV of \$119.2 billion. The PV of the real New York State Incentives for 2025-2055 is \$3.5 billion.

The fiscal benefit-cost ratio, which is calculated as the ratio of the PV of the real state government revenue impact to the PV of the real New York State Incentives, comes out to 2.0. The Economic Benefit ratio, which is calculated as the ratio of the PV of the real Economic Benefit to the PV of the real New York State Incentives, comes out to 33.6. The ROI real GDP ratio, which is calculated as the ratio of the PV of the real GDP impact to the PV of the real New York State incentives, comes out to 51.5.

**Table 2.7: Disposable Personal Income, State Government Revenue, Local Government Revenue, Economic Benefit, New York State Incentives, Combined Phases, 3 Percent Discount Rate**

# Conclusion

REMI conducted an analysis of the Micron facilities on behalf of ESD to evaluate how the semiconductor manufacturing facilities would impact the New York and Central New York economies. The findings show that from 2025-2055, the average total employment impact in a given year is an increase of 45,418 jobs, with close to 90 percent occurring in Central New York. The average impact on the size of the state economy is \$16.7 billion in real economic output and \$9.6 billion in real GDP, the average impact on state population is 59,575, and the average impact on state real disposable personal income is \$5.4 billion. Importantly, the facility also generates \$378.5 million in additional real state government revenue on average, 2.5 times the value of the proposed real New York State Incentives on average (\$150.9 million), and more than \$565.5 million in additional real local government revenue statewide on average during the analysis period. Ultimately, these results point to substantial positive impacts on New York's economy and budget, supported by productive and high-paying jobs and a fostering of further growth in the semiconductor manufacturing ecosystem in the state.

# Appendix I: Supplemental Tables

## *Incentives Offer Analysis: Current Dollar \$5.8 Billion, 6 Percent Discount Rate*

Table 3.1 displays the real GDP, real disposable personal income, real state government revenue, and real local government revenue impacts, the real Economic Benefit, and the real New York State Incentives during 2025-2029 and 2035-2039, and in 2055. The table also displays the PV of each under a six percent discount rate. The Economic Benefit measure is defined by ESD as being the sum of the real disposable personal income, real state government revenue, and real local government revenue impacts.

During 2025-2055, the PV of the real GDP, real disposable personal income, real state government revenue, and real local government revenue impacts are \$120.3, \$65.7 billion, \$4.6 billion, and \$7.1 billion respectively, yielding a real Economic Benefit PV of \$77.4 billion. The PV of the real New York State Incentives for 2025-2055 is \$2.8 billion.

The fiscal benefit-cost ratio, which is calculated as the ratio of the PV of the real state government revenue impact to the PV of the real New York State Incentives, comes out to 1.7. The Economic Benefit ratio, which is calculated as the ratio of the PV of the real Economic Benefit to the PV of the real New York State Incentives, comes out to 28.0. The ROI real GDP ratio, which is calculated as the ratio of the PV of the real GDP impact to the PV of the real New York State incentives, comes out to 43.5.

# Appendix II: REMI Model Framework & Fiscal Calibration

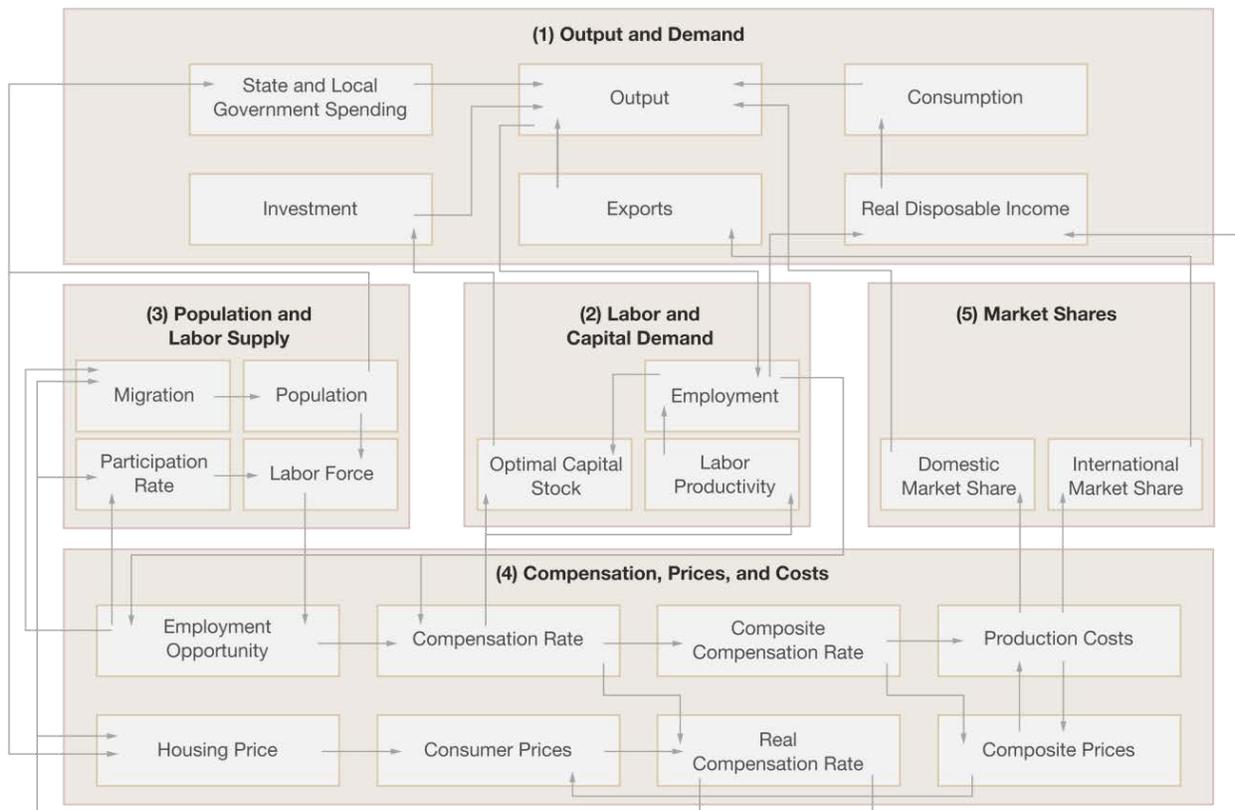

## REMI Model Framework

Tax-PI is a structural economic, demographic, and fiscal forecasting and policy analysis model. The following core framework applies to all REMI model builds. The model integrates input-output, computable general equilibrium, econometric and economic geography methodologies. The model is dynamic, with forecasts and simulations generated on an annual basis and behavioral responses to compensation, price, and other economic factors.

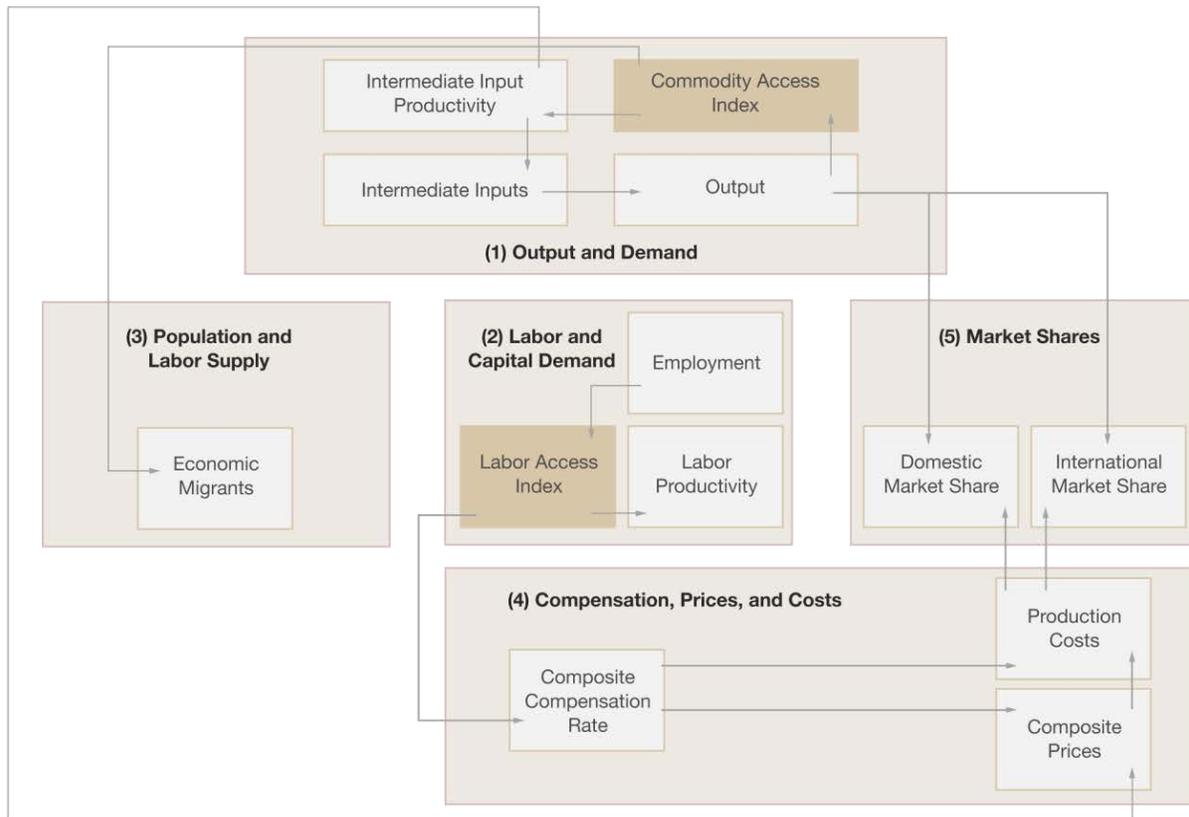

The model consists of thousands of simultaneous equations with a structure that is relatively straightforward. The exact number of equations used varies depending on the extent of industry, demographic, demand, and other detail in the specific model being used. The overall structure of the model can be summarized in five major blocks: (1) Output and Demand, (2) Labor and Capital Demand, (3) Population and Labor Supply, (4) Compensation, Prices, and Costs, and (5) Market Shares. The blocks and their key interactions are shown in Figures 1 and 2.

**Figure A1.1: REMI Model Linkages**

REMI Model Linkages (Excluding Economic Geography Linkages)

**Figure A1.2: Economic Geography Linkages**

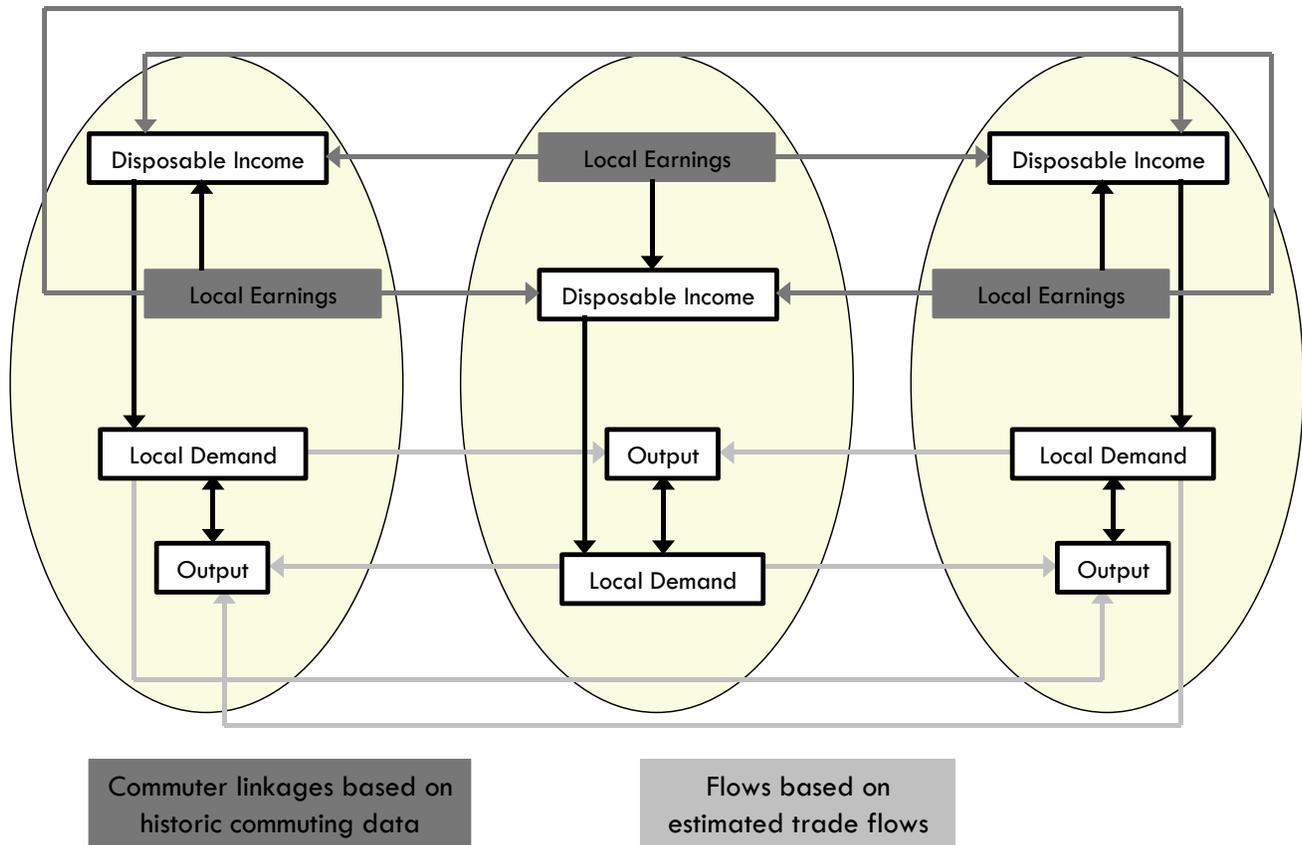

The Output and Demand block consists of output, demand, consumption, investment, government spending, exports, and imports, as well as feedback from output change due to the change in the productivity of intermediate inputs. The Labor and Capital Demand block includes labor intensity and productivity as well as demand for labor and capital. Labor force participation rate and migration equations are in the Population and Labor Supply block. The Compensation, Prices, and Costs block includes composite prices, determinants of production costs, the consumption price deflator, housing prices, and the compensation equations. The proportion of local, inter-regional, and export markets captured by each region is included in the Market Shares block.

Models can be built as single region, multi-region, or multi-region national models. A region is defined broadly as a sub-national area, and could consist of a state, province, county, or city, or any combination of sub-national areas.

Single-region models consist of an individual region, called the home region. The rest of the nation is also represented in the model. However, since the home region is only a small part of the total nation, the changes in the region do not have an endogenous effect on the variables in the rest of the nation. Multi-regional models have interactions among regions, such as trade and commuting flows. These interactions include trade flows from each region to each of the other regions. These flows are illustrated for a three-region model in Figure 3.

Figure A1.3: Trade and Commuter Flow Linkages

## Trade and Commuter Flow Linkages

Multiregional national models also include a central bank monetary response that constrains labor markets. Models that only encompass a relatively small portion of a nation are not endogenously constrained by changes in exchange rates or monetary responses.

### Block 1. Output and Demand

This block includes output, demand, consumption, investment, government spending, import, commodity access, and export concepts. Output for each industry in the home region is determined by industry demand in all regions in the nation, the home region's share of each market, and international exports from the region.

For each industry, demand is determined by the amount of output, consumption, investment, and capital demand on that industry. Consumption depends on real disposable income per capita, relative prices, differential income elasticities, and population. Input productivity depends on access to inputs because a larger choice set of inputs means it is more likely that the input with the specific characteristics required for the job will be found. In the capital stock adjustment process, investment occurs to fill the difference between optimal and actual capital stock for residential, non-residential, and equipment investment. Government spending changes are determined by changes in the population.

### *Block 2. Labor and Capital Demand*

The Labor and Capital Demand block includes the determination of labor productivity, labor intensity, and the optimal capital stocks. Industry-specific labor productivity depends on the availability of workers with differentiated skills for the occupations used in each industry. The occupational labor supply and commuting costs determine firms' access to a specialized labor force.

Labor intensity is determined by the cost of labor relative to the other factor inputs, capital and fuel. Demand for capital is driven by the optimal capital stock equation for both non-residential capital and equipment. Optimal capital stock for each industry depends on the relative cost of labor and capital, and the employment weighted by capital use for each industry. Employment in private industries is determined by the value added and employment per unit of value added in each industry.

### *Block 3. Population and Labor Supply*

The Population and Labor Supply block includes detailed demographic information about the region. Population data is given for age, gender, and race, with birth and survival rates for each group. The size and labor force participation rate of each group determines the labor supply. These participation rates respond to changes in employment relative to the potential labor force and to changes in the real after-tax compensation rate. Migration includes retirement, military, international, and economic migration. Economic migration is determined by the relative real after-tax compensation rate, relative employment opportunity, and consumer access to variety.

### *Block 4. Compensation, Prices and Costs*

This block includes delivered prices, production costs, equipment cost, the consumption deflator, consumer prices, the price of housing, and the compensation equation. Economic geography concepts account for the productivity and price effects of access to specialized labor, goods, and services.

These prices measure the price of the industry output, taking into account the access to production locations. This access is important due to the specialization of production that takes place within each industry, and because transportation and transaction costs of distance are significant. Composite prices for each industry are then calculated based on the production costs of supplying regions, the effective distance to these regions, and the index of access to the variety of outputs in the industry relative to the access by other uses of the product.

The cost of production for each industry is determined by the cost of labor, capital, fuel, and intermediate inputs. Labor costs reflect a productivity adjustment to account for access to specialized labor, as well as underlying compensation rates. Capital costs include costs of non-residential structures and equipment, while fuel costs incorporate electricity, natural gas, and residual fuels.

The consumption deflator converts industry prices to prices for consumption commodities. For potential migrants, the consumer price is additionally calculated to include housing prices. Housing prices change from their initial level depending on changes in income and population density.

Compensation changes are due to changes in labor demand and supply conditions and changes in the national compensation rate. Changes in employment opportunities relative to the labor force and occupational demand change determine compensation rates by industry.

### *Block 5. Market Shares*

The market shares equations measure the proportion of local and export markets that are captured by each industry. These depend on relative production costs, the estimated price elasticity of demand, and the effective distance between the home region and each of the other regions. The change in share of a specific area in any region depends on changes in its delivered price and the quantity it produces compared with the same factors for competitors in that market. The share of local and external markets then drives the exports from and imports to the home economy.

### *Fiscal Calibration*

Each Tax-PI budget category is assigned an “Economic Indicator” that allows it to respond to changes in a specific economic variable (e.g., Personal Income for Personal Income Tax Revenue). Because the Tax-PI model integrates the economic outlook into fiscal projections, this analysis captures the interaction between economic activity and the level of tax revenue.

**APPENDIX D**  
**LAND USE, ZONING, AND PUBLIC POLICY**

**Appendix D-1**  
**Land Use, Zoning, and Public Policy Methodology**

## **D-1 Land Use, Zoning, and Public Policy Methodology**

This section defines the study area for land use, zoning, and public policy and explains the methodology, data, and sources of information used to describe the affected environment. This section also explains the evaluation methods used to determine the direct and indirect effects of the alternatives on land use, zoning, and public policy. The analysis considers the Preferred Action Alternative's direct effects on uses and development trends within the study area and its compatibility with the surrounding built and natural environment. The analysis also considers the Preferred Action Alternative's relationship to applicable zoning regulations and public policies. Finally, the analysis considers potential indirect growth inducing effects on land use, zoning, and public policy in the region. Potential cumulative effects on land use, zoning, and public policy are evaluated in Chapter 4.

The land use study area encompasses the full scope of the Proposed Project and the proposed Connected Actions. The study area for the Proposed Project includes the Micron Campus, the Rail Spur Site, and the Childcare Site, as well as the area within a 1-mile radius surrounding the Micron Campus and the Rail Spur Site and a ¼-mile radius surrounding the Childcare Site, as shown in Figure 3.1-1. These study area limits represent a conservative estimate of the broader area potentially susceptible to land use changes from the Proposed Project. The build-out of the Micron Campus and the Rail Spur Site would create industrial uses in an area generally surrounded by vacant land, residential uses, and agricultural land. Therefore, the 1-mile radius around the Micron Campus and the Rail Spur Site represents the area that would be most likely to experience potential adverse effects from the manufacturing and industrial activities on those sites, such as noise and vibration effects from construction activities and the effects of increased traffic. The Childcare Site would include childcare, medical, and recreational uses more common in residential and commercial areas with more limited potential to disturb adjacent properties. Therefore, the ¼-mile radius was selected based on the lower likelihood of potential adverse effects from that site to extend beyond that distance.

The land use study area also encompasses the Connected Actions (electricity, natural gas, telecommunications, water, wastewater, and utility improvements; see Table 3.1-3). The Connected Actions would include upgrades to existing utility properties and certain linear infrastructure located primarily in existing rights-of-way and easements that would be unlikely to generate noticeable post-construction effects beyond the utility boundaries. Therefore, the study area for the Connected Actions is limited to the extent of the new utilities and improvements upon build-out but considers any potential effects on surrounding properties, including privately owned parcels along utility easement areas. The analysis also considers relevant effects on surrounding land uses and relevant zoning and public policy considerations.

Various sources were used to comprehensively analyze the land use, zoning, and public policy characteristics of the study area, including land use data supplied by Onondaga County; zoning maps from both the Town of Clay and the Town of Cicero as well as those towns' respective zoning codes; and comprehensive plans and other planning documents published by Onondaga County, the Town of Clay, and Town of Cicero. The methodology accounts for all existing land uses in the study area, including existing residences, businesses, and community facilities in the vicinity of the Proposed Project, as well as the other planned projects identified in Table 3.1-2.

The analysis also summarizes the existing zoning regulations applicable to the area of the Preferred Action Alternative and the land use study area and describes any changes to zoning regulations that are anticipated by the Preferred Action Alternative.

As explained in Section 3.1.3.2, the analysis of growth inducing effects due to reasonably foreseeable increases in population, jobs and economic activity, and residential, commercial, and industrial development under the Preferred Action Alternative relies on a study area that includes the five-county region. Because this study area supports the analysis of the alternatives' potential growth inducing effects on multiple resource areas, the detailed methodology for this study area is provided in Appendix B-3.

Finally, the methodology also considers the Preferred Action Alternative's relationship to applicable local or regional planning and economic development policies, including the Onondaga County Comprehensive Plan, the SMTC 2050 Long Range Transportation Plan 2020 Update, the Town of Clay Northern Land Use Study, the Town of Cicero Comprehensive Plan, and the New York Green CHIPS Program.

## **Appendix D-2 Zoning Regulations**

## D-2 Zoning Regulations

This section summarizes the zoning regulations that would be applicable to the Proposed Project, including design standards, site plan conditions, and mitigation requirements potentially applicable to new development.

### D-2.1 Industrial-2 District (Town of Clay)

The majority of the Micron Campus and the entire Rail Spur Site would be located within the Town of Clay Industrial-2 (I-2) zoning district.

As shown in Table D-1 below, development in the I-2 district must comply with the dimensional/bulk (i.e., building size and shape), density, and design requirements in the Town of Clay Zoning Code. The I-2 district does not have minimum lot area, width, or depth requirements, and does not restrict maximum building height, number of floors, or gross floor area, but does include a maximum building coverage of 60 percent and a total maximum lot coverage of 80 percent. The district also requires minimum frontage and perimeter landscape areas and additional side and rear yards when a lot abuts a non-industrial district. In addition, the district imposes performance standards on activities that emit noise exceeding certain maximum levels, vibration, dust and dirt, smoke, noxious gases, and odors, as well as standards relating to lighting and glare, radioactive materials, fire, and safety hazards.

**Table D-1 Town of Clay I-2 District Requirements**

| Requirement                                              | Principal Structure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Accessory Structure |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Minimum Required Dimensions/Bulk</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                     |
| Lot Area / Width / Depth                                 | -                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | -                   |

| <b>Performance Standards</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                 |
| Noise and Vibration             | Noise from activities generally limited to a maximum of 70 decibels between 6:00 a.m. and 10:00 p.m., or 60 decibels between 10:00 p.m. and 6:00 a.m., with provisions for limited intermittent exceedances. Activities that result in vibration that creates an unreasonable displacement are prohibited.                                                                                                                                                                                                                    |                                                 |
| Dust and Dirt                   | Activities required to meet USEPA or NYSDEC standards for limiting emissions of soot, cinders or fly ash, other kinds of dust, dirt and other particulate matter. Emissions of dust and/or dirt crossing the property lines of the subject property are prohibited.                                                                                                                                                                                                                                                           |                                                 |
| Smoke, Noxious Gases, and Odors | Activities required to meet USEPA or NYSDEC standards for limiting emissions of smoke. Emissions of noxious acids, fumes, or gases at levels with the potential endanger public health or safety are prohibited. Emissions of odors that are unreasonably offensive are prohibited.                                                                                                                                                                                                                                           |                                                 |
| Lighting and Glare              | Activities that illuminate a property or emit direct or reflected glare that is determined to be unreasonably intense or offensive is prohibited. Lighting of signs, buildings or yards is prohibited, unless it is of intensity, location, direction and shielding that does not impair the vision of any motor vehicle driver. Any activity, structure, or site improvement on property that is entirely or partially within 500 feet of a residential zone district may be subject to more restrictive lighting standards. |                                                 |
| Radiation, Fire, and Safety     | Activities that emit any form or quantities of radioactive materials that are considered unsafe under standards established by NIST or the NYS Department of Labor are prohibited. All buildings, operations, storage, waste disposal, etc. are required to be in conformance with applicable provisions of the NYS Uniform Fire Prevention and Building Code relating to fire protection and safety.                                                                                                                         |                                                 |

Source: Town of Clay Zoning Code.

**D-2.2 Highway Overlay District (Town of Clay)**

The Micron Campus also would be located in the Town of Clay Highway Overlay district, which applies to properties that abut major roadways. The Highway Overlay district was created to protect the function, safety, and efficiency of primary roadways by allowing additional space for roadway expansion while providing for additional setbacks. The district classifies NYS Route 31 as a Type A road, which means it has the potential to become a five-lane roadway. Developments in the Highway Overlay district that would abut Type A roads may include increased lot sizes but would be subject to increased frontage requirements (double the base district minimum), as well as a 165-foot setback for primary structures, a 115-foot setback for accessory structures, and a 90-foot setback for parking areas.

**D-2.3 Residential/Agricultural District (Town of Clay)**

Three parcels in the WPCP are currently zoned as Residential/Agricultural (RA-100). The Childcare Site also would be located in an RA-100 district. RA-100 districts are intended for agricultural activities, low-density family dwellings, and supportive non-residential development. Other uses not specifically permitted in an RA-100 district may need to obtain special use permits from the Town of Clay Planning Board.<sup>15</sup>

**D-2.4 General Commercial District (Town of Cicero)**

Two portions of the Micron Campus would be located in the Town of Cicero General Commercial (GC) district, which permits a mix of commercial uses such as shopping centers, hotels and motels, gas stations, and restaurants. Table D-2 shows the GC bulk regulations.

**Table D-2 Town of Clay GC District Bulk Regulations**

| <b>Dimension</b>      | <b>Bulk Limit</b> |
|-----------------------|-------------------|
| Minimum Building Line | 100 ft.           |
| Minimum Lot Depth     | 200 ft.           |
| Minimum Front Yard    | 50 ft.            |
| Minimum Rear Yard     | 25 ft.            |
| Minimum Side Yard     | 15 ft.            |
| Maximum Coverage      | 40%               |
| Maximum Building Size | 100,000 sq. ft.   |
| Maximum Height        | 60 ft.            |

Source: Town of Cicero Zoning Code

<sup>15</sup> Section 230-13 A (2) (c) [7] of the Town of Clay Zoning Code permits “Special Uses” defined as “An accessory use to a principal use which, because of its unique characteristics, requires special consideration in each case by the Planning Board before a building permit can be issued.”

## **Appendix D-3 Public Policies**

### **D-3 Public Policies**

This section summarizes the public policies that would be applicable to the Preferred Action Alternative, including policies related to land use and planning in the local region (e.g., local comprehensive, land use, and transportation plans) and the New York Green CHIPS economic development program. The section includes analyses of the relationship between the Preferred Action Alternative and each of these public policies.

#### **D-3.1 2050 Long Range Transportation Plan 2020 Update**

SMTC adopted its 2050 Long Range Transportation Plan 2020 Update (LRTP) in September 2020 to provide goals, objectives, targets, and performance measures, utilize transportation planning, and lay out capital investments. SMTC amended the LRTP in 2022 to reflect progress on the Interstate 81 Viaduct Project, including by incorporating a new financial analysis and adding anticipated future short-term highway projects to the LRTP.

In developing the LRTP, SMTC reviewed local and regional planning documents and compiled public input to create goals for the future. The LRTP analyzes past and current regional population growth, the region's economic growth, potential future growth patterns, travel, and tourism, and proposed future employment centers. The LRTP specifically identifies the WPCP as a proposed future employment center that would bolster the region's economic growth.

The LRTP comprehensively documents the existing transportation system, examining factors such as freight volumes, challenges and opportunities in freight movement, and issues related to injuries, fatalities, accessibility, mobility, environmental impacts, reliability, preservation, and equity. The LRTP also incorporates predictive modeling for future conditions and evaluates emerging transportation trends, including the potential integration of autonomous vehicles. The LRTP designates I-81 as a key freight corridor and an integral part of the Congestion Management Process (CMP) Freight Network and identifies both I-81 and NYS Route 31 as primary commuter corridors. The LRTP also outlines two designated on-street bike routes: one aligning with NYS Route 31 and the other following U.S. Route 11.

The LRTP identifies future short-term projects, including: capacity improvements on NYS Route 31 at Caughdenoy Road; maintenance on I-81 between NYS Route 31 and Route 49; and railroad grade crossing improvements planned at the intersection of the CSX Railroad with Old Liverpool Road. The LRTP also identifies mid-term projects (2025-2034) including interchange improvements at I-81 and NYS Route 31, and NYS Route 31 intersection turn lanes from Morgan Road to U.S. Route 11 (SMTC, 2020).

##### **D-3.1.1 Analysis**

As the Preferred Action Alternative is not a transportation system improvement project, it would not directly advance the SMTC LRTP's goals relating to the region's transportation system. However, the Preferred Action Alternative would be consistent with SMTC's LRTP goals relating to community planning, which seek to support the planning goals of the region and local communities. This includes supporting smart growth development patterns and commercial and industrial development.

The LRTP specifically identifies the WPCP, where the Micron Campus would be located, as a future employment center to help support the region’s economic growth. The Proposed Project would be adjacent to major roadways evaluated in the LRTP, including I-81, NYS Route 31, and U.S. Route 11. The LRTP includes capacity improvements and upgrades on each of these roads in the short-term, with interchange and intersection improvements identified as mid-term projects.

Section 3.11 (Transportation and Traffic) identifies potential transportation improvement projects that could address anticipated traffic effects from the Proposed Project. The transportation improvements also would address capacity on the roads evaluated in the LRTP and their interchanges, which would support the LRTP’s goal of improving road access to intermodal freight facilities and major freight generators. Any proposed transportation improvements would be subject to review by NYSDOT and the FHWA.

### **D-3.2 Onondaga County Comprehensive Plan**

Onondaga County adopted the Onondaga County Comprehensive Plan (the Comprehensive Plan) in 2023 to envision the future of the County. Through public input, the County developed the Comprehensive Plan around five themes—Strong Centers, Housing and Neighborhoods, Community Mobility, Greenways and Blueways, and Agriculture—and included goals and recommendations for all five themes.

The Comprehensive Plan evaluates the County’s current conditions and trends, which include a decline in job growth, and establishes a global economic competitiveness framework for the County. The Comprehensive Plan recognizes the County’s competitiveness in three defined areas that contribute to regional economic competitiveness—Human Capital, Strong Centers, and Economic Collaboration—but notes the need for continued improvement in Economic Collaboration.<sup>16</sup> Under the Strong Centers theme, the Comprehensive Plan calls for infrastructure investments and economic development to encourage private sector investment and improve the quality of life through the creation of higher paying jobs. It also identifies employment centers, such as industrial parks, as a type of development that should be prioritized for continued investment. The Comprehensive Plan specifically identifies the Proposed Project as a major economic development initiative that would positively influence growth in the region.<sup>17</sup>

---

<sup>16</sup> Human Capital, also referred to in the Comprehensive Plan as “Investments in People,” concerns social elements that support growth in the knowledge-based economy, such as support for entrepreneurship, improving quality of life to attract talent, and education. Economic Collaboration concerns coordinated efforts to guide economic development, such as support for institutions that encourage economic growth and developing strong relationships between jurisdictions and with the private sector.

<sup>17</sup> See Comprehensive Plan at 11 (Countywide Profile): “In October 2022 Micron Technology Inc. announced that it would be locating its largest semiconductor manufacturing facility in the Town of Clay, in the northern portion of Onondaga County. This facility is the largest economic development project to date in the history of the nation and will provide 9,000 jobs at the facility and an estimated 40,000 induced jobs in the region, especially in Onondaga County. The location of the plant in the Town of Clay will create a dramatic shift in employment centers. The project will also introduce jobs and an industry that will support our existing and planned mixed-use centers. From the initiation of Plan Onondaga, the planning team has been aware that this type of opportunity was inevitable, and the themes and approaches put forward in this plan are consistent with both a fast-growth and slow-growth reality.”

The Comprehensive Plan includes a land use plan for the County that reflects the County's vision for its future growth, calls for new development and future investment to be concentrated in areas that are served by existing infrastructure, and specifically identifies "centers" throughout the County that have the ability to support additional growth: Traditional Centers (existing walkable, mixed-use, and amenity-rich neighborhoods); Emerging and Town Growth Centers (existing commercial corridors and downtown areas with potential for growth); the City Center (downtown Syracuse); and Employment Centers (locations with potential for increased economic activity, such as manufacturing). The Comprehensive Plan identifies the proposed Micron Campus as a potential Employment Center and nearby locations along the NYS Route 31 and I-81 corridors as Emerging Centers.

The Comprehensive Plan calls for a focus on transit-oriented development near the identified centers and transit corridors and enhancement of the BRT system to support the land use vision for the County. It identifies the portion of I-81 near the proposed Micron Campus as a corridor to target for enhanced BRT services and recommends that the County take a broader approach to the BRT system as it works to advance the WPCP redevelopment that accounts for potential increases in people travelling to and from the site.

### **D-3.2.1 Analysis**

The Preferred Action Alternative would advance key goals in the Comprehensive Plan to expand economic development in Onondaga County. The Comprehensive Plan cites the proposed Micron Campus as an opportunity to bolster the County's competitiveness in Human Capital, Strong Centers, and Economic Collaboration. The Proposed Project also would support the Comprehensive Plan's recommendations relating to continued investment in industrial parks and other businesses that would bring high paying jobs to the County and promote development near existing utilities and transit corridors. The Proposed Project would become an Employment Center under the Comprehensive Plan capable of driving the County's economic development goals.

The Proposed Project would not directly advance some of the Comprehensive Plan's goals relating to development of key Employment Centers; in particular, the Proposed Project would not include improvements to public transit such as expansion of BRT services, which were actions intended to be taken by the County.

### **D-3.3 Town of Clay Northern Land Use Study**

The Town of Clay adopted its Northern Land Use Study (NLUS) in 2013 to guide Town officials and planners with regard to future land use development in the northern portion of the Town. It evaluates existing land uses in the area north of NYS Route 31 as well as development-constraining features, such as sewage and water access, wetlands, soils, and floodplains. The NLUS aims to preserve open space and project future patterns of growth, and includes a plan for appropriate land uses adjacent to the Town of Cicero.

The NLUS encompasses three main themes: environmental, economic, and public infrastructure. The study's environmental objectives focus on safeguarding environmentally sensitive areas, preserving open space, and mitigating the development impacts on water quality. The NLUS also recognizes the Town of Clay Local Waterfront Revitalization Program as part of

an overarching goal to protect riverfront areas in the Town. The NLUS includes recommendations to maintain the rural character of the area by focusing growth in suitable locations. These recommendations include permitting higher-density, large-lot residential uses with a minimum lot size of 100,000 sq. ft and encouraging cluster developments with minimum lot sizes of 40,000 sq. ft. where suitable.

The NLUS' economic goals include promoting the development of the WPCP and leveraging its proximity to I-81 and essential public infrastructure. The NLUS also includes a public infrastructure goal that calls for restricting sewer and water extensions north of NYS Route 31 except as needed to support the WPCP redevelopment.

The NLUS also finds that the OOWWTP would have the capacity to support a large manufacturing use with substantial water requirements located on the WPCP property.

Finally, the NLUS notes that NYS Route 31 is currently operating at full capacity and recommends that any proposed future development that would increase the intensity of uses in Northern Clay provide adequate traffic impact. The NLUS states that such future development should also consider access points and development of alternative transportation routes to NYS Route 31 (Town of Clay Department of Planning and Development, 2013).

#### **D-3.3.1 Analysis**

The Preferred Action Alternative would be generally consistent with the economic growth and development goals in the NLUS. In particular, construction of the Micron Campus would fulfill the study's goal to establish an industrial development at the WPCP. The Proposed Project also would fulfill goals in the NLUS to expand water supply infrastructure and sewer systems near the WPCP and increase the OOWWTP's capacity to serve a large industrial development. Although construction of the manufacturing facility on the Micron Campus would not support the NLUS' goal to preserve the rural character of the area, it would be consistent with the study's goal to concentrate larger-scale development around the WPCP while the Town undertakes efforts to relieve development pressure in other rural areas further away from the I-81 corridor and public infrastructure.

#### **D-3.4 Town of Cicero Comprehensive Plan**

The Town of Cicero initiated a process to establish its first comprehensive plan in late 2022, which would supersede a draft plan from 2006 that was not adopted. In November 2024, the Town released a draft of the new Comprehensive Plan, titled Vision Cicero, which is currently undergoing public review and is expected to be adopted in 2025. Although Vision Cicero has not been formally adopted, the draft Comprehensive Plan is considered here.

Vision Cicero is intended as a guide for decision-making relating to growth, with a focus on promoting balanced growth, sustainability, and preservation of the town's community character and quality of life. The plan specifically identifies the Proposed Project as a major potential factor

for economic growth that would likely bring jobs and infrastructure development to the area.<sup>18</sup> At the same time, Vision Cicero acknowledges that potential effects of the Proposed Project on growth would present challenges, particularly the need for an expanded transportation network, diverse housing options, and expanded public services. As a whole, Vision Cicero cites the Proposed Project as “a once in a generation opportunity to improve our already high quality of life.”

Vision Cicero includes goals relating to housing and residential growth, transportation, public services to enhance quality of life, economic development and business growth, preservation of natural areas, and sustainability. Vision Cicero’s economic development goal focuses on attracting and supporting the economic growth that the Proposed Project would likely generate by calling for marketing efforts to attract businesses, particularly in the semiconductor industry, upgrades to Town infrastructure to support businesses, and identifying opportunities for additional industrial development along the Town’s major freight corridors.

Vision Cicero includes a land use plan intended as a guide for future land use decisions, including a comprehensive update to the Town zoning code that is anticipated to follow the adoption of the Comprehensive Plan. The land use plan identifies the area along the U.S. Route 11 corridor as an area of commercial and light industrial development with potential to attract new businesses, including high-tech manufacturing facilities. The land use plan also identifies higher density residential and other development areas near the U.S. Route 11 corridor (referred to as Regional Mixed Use, Mixed Residential, and Town Center areas) with potential to facilitate a variety of housing types and increase the housing supply to meet the increased demand and growth the Proposed Project would likely generate in the area (Town of Cicero, 2024).

### **D-3.4.1 Analysis**

Although the proposed Micron Campus manufacturing facility would be located in the Town of Clay and only two portions of the campus with access roads, driveways, and utility lines would be located in the Town of Cicero, the Preferred Action Alternative would be generally consistent with Vision Cicero and would directly support the plan’s primary economic development goal. In addition, the Proposed Project would be consistent with the Vision Cicero land use plan, which is intended to attract high-tech businesses, including those that would serve Micron’s supply chain, to the U.S. Route 11 corridor.

---

<sup>18</sup> See Vision Cicero at 10 (Micron Technology Invests in CNY): “The Micron semiconductor manufacturing facility is expected to generate a significant number of jobs and have a substantial economic impact on the central New York region. The plant will create approximately 9,000 direct high-tech jobs over the next 20 years, with positions ranging from engineering and manufacturing to maintenance and administrative roles. In addition to these direct jobs, the construction phase alone is projected to support around 5,000 temporary jobs. Beyond direct employment, the Micron facility will also create tens of thousands of indirect jobs across various sectors, including suppliers, logistics, construction, and service industries that will support both the plant and the growing workforce. The influx of workers will likely boost local demand for housing, retail, and services, leading to further job creation in these sectors. The broader economic impact is expected to be transformative for the region ... The Micron plant will act as a catalyst for broader economic growth in Cicero. Increased demand for housing, retail, and services will likely spur new residential and commercial development, particularly along major corridors like I-81, Route 11, and Route 31.”

The Proposed Project would not directly support some of the plan's goals; in particular, it would not directly provide any housing or enhanced public services to support the anticipated residential growth and would not provide for enhanced mixed-modal transportation options. However, the Proposed Project would include infrastructure improvements to support the manufacturing use (generally located in the Town of Clay and outlying areas, and not in the Town of Cicero) and traffic mitigation to address capacity on major roadways (discussed in Section 3.11, Transportation and Traffic), consistent with the plan's recommendations to support growth. The Proposed Project is also consistent with Vision Cicero's land use plan, which identifies the area that contains the Micron Campus as an area for commercial and light industrial development. Therefore, the Preferred Action Alternative is generally consistent with Vision Cicero.

### **D-3.5 New York Green CHIPS Program**

In 2022, the New York State Legislature enacted the Green CHIPS Program, which includes approximately \$10 billion in economic incentives for environmentally friendly semiconductor manufacturing projects with the potential to create thousands of jobs in the State and address issues relating to semiconductor supply chain shortages, inflation, and national security. The Green CHIPS Program includes several provisions to help reduce the cost of constructing and operating semiconductor manufacturing facilities.

To receive benefits under the Green CHIPS Program, a project must be qualified through an application to the State Urban Development Corporation (also known as ESD). There are several requirements to qualify as a Green CHIPS facility, including creating a minimum of 500 new jobs and providing \$3 billion in investment over a 10-year period. Projects also must adopt sustainability measures to mitigate greenhouse gas emissions, pay construction workers a federal prevailing wage, and commit to worker and community investment, including training and educational programs to expand employment opportunities for economically disadvantaged individuals. Projects may apply for an additional 10 years of benefits, subject to new job requirements, capital expenditures, and ESD approval, which may allow some Green CHIPS projects to be eligible for 20 years of incentives.

Incentives available to Green CHIPS projects include a tax credit for research and development expenditures and an investment tax credit for capital expenditures. The Program also offers a tax credit on salaries and wages, and a real property tax credit. The Program also includes reductions in private utility services through discounted delivery rates. Green CHIPS projects that achieve their job and investment commitments and meet eligibility requirements are eligible for refundable tax credits under ESD's Excelsior Jobs Program, a pay-for-performance program that allows companies to receive tax credits as they meet investment and job targets.

#### **D-3.5.1 Analysis**

The Proposed Project would use incentives from the New York Green CHIPS Program, enacted in August 2022 to provide financial support for on-shoring semiconductor manufacturing to spur economic growth in New York State. To be eligible to receive Green CHIPS Program incentives, Micron must meet the statutory requirements of creating at least 500 new jobs, adopting sustainability measures to reduce GHG emissions (see Section 3.7, Greenhouse Gas Emissions, Climate Change, and Climate Resiliency), paying construction workers the Federal prevailing

wage, and committing to worker and community investments. In furtherance of the Green CHIPS Program and New York’s policy of incentivizing semiconductor manufacturing in New York, in September 2022, Micron, ESD, Onondaga County and OCIDA entered into a “Key Terms and Conditions for Development of the Micron Green Manufacturing Memory Chip Fab Campus in Clay, New York” (“Term Sheet”) to incentivize Micron to locate a semiconductor facility at the WPCP.

The Term Sheet outlines Micron’s commitments to creating more than 9,000 new jobs and paying the Federal prevailing wage to construction workers, and further outlines preliminary sustainability commitments designed to reduce GHG emissions. The Term Sheet further illustrates Micron’s commitments to worker and community investments, including a CIF of \$500 million for CNY communities, which will be used to develop the local workforce, invest in education throughout CNY, promote affordable housing, and provide additional benefits to CNY communities. Micron also committed to installing on-site renewable energy systems and implementing water conservation and efficiency measures.

## STEPS IN THE PROCESSING THE FARMLAND AND CONVERSION IMPACT RATING FORM

- Step 1 - Federal agencies (or Federally funded projects) involved in proposed projects that may convert farmland, as defined in the Farmland Protection Policy Act (FPPA) to nonagricultural uses, will initially complete Parts I and III of the form. For Corridor type projects, the Federal agency shall use form NRCS-CPA-106 in place of form AD-1006. The Land Evaluation and Site Assessment (LESA) process may also be accessed by visiting the FPPA website, <http://fppa.nrcs.usda.gov/lesa/>.
- Step 2 - Originator (Federal Agency) will send one original copy of the form together with appropriate scaled maps indicating location(s) of project site(s), to the Natural Resources Conservation Service (NRCS) local Field Office or USDA Service Center and retain a copy for their files. (NRCS has offices in most counties in the U.S. The USDA Office Information Locator may be found at [http://offices.usda.gov/scripts/ndISAPI.dll/oip\\_public/USA\\_map](http://offices.usda.gov/scripts/ndISAPI.dll/oip_public/USA_map), or the offices can usually be found in the Phone Book under U.S. Government, Department of Agriculture. A list of field offices is available from the NRCS State Conservationist and State Office in each State.)
- Step 3 - NRCS will, within 10 working days after receipt of the completed form, make a determination as to whether the site(s) of the proposed project contains prime, unique, statewide or local important farmland. (When a site visit or land evaluation system design is needed, NRCS will respond within 30 working days.
- Step 4 - For sites where farmland covered by the FPPA will be converted by the proposed project, NRCS will complete Parts II, IV and V of the form.
- Step 5 - NRCS will return the original copy of the form to the Federal agency involved in the project, and retain a file copy for NRCS records.
- Step 6 - The Federal agency involved in the proposed project will complete Parts VI and VII of the form and return the form with the final selected site to the servicing NRCS office.
- Step 7 - The Federal agency providing financial or technical assistance to the proposed project will make a determination as to whether the proposed conversion is consistent with the FPPA.

## INSTRUCTIONS FOR COMPLETING THE FARMLAND CONVERSION IMPACT RATING FORM

*(For Federal Agency)*

**Part I:** When completing the "County and State" questions, list all the local governments that are responsible for local land use controls where site(s) are to be evaluated.

**Part III:** When completing item B (Total Acres To Be Converted Indirectly), include the following:

1. Acres not being directly converted but that would no longer be capable of being farmed after the conversion, because the conversion would restrict access to them or other major change in the ability to use the land for agriculture.
2. Acres planned to receive services from an infrastructure project as indicated in the project justification (e.g. highways, utilities planned build out capacity) that will cause a direct conversion.

**Part VI:** Do not complete Part VI using the standard format if a State or Local site assessment is used. With local and NRCS assistance, use the local Land Evaluation and Site Assessment (LESA).

1. Assign the maximum points for each site assessment criterion as shown in § 658.5(b) of CFR. In cases of corridor-type project such as transportation, power line and flood control, criteria #5 and #6 will not apply and will, be weighted zero, however, criterion #8 will be weighed a maximum of 25 points and criterion #11 a maximum of 25 points.
2. Federal agencies may assign relative weights among the 12 site assessment criteria other than those shown on the FPPA rule after submitting individual agency FPPA policy for review and comment to NRCS. In all cases where other weights are assigned, relative adjustments must be made to maintain the maximum total points at 160. For project sites where the total points equal or exceed 160, consider alternative actions, as appropriate, that could reduce adverse impacts (e.g. Alternative Sites, Modifications or Mitigation).

**Part VII:** In computing the "Total Site Assessment Points" where a State or local site assessment is used and the total maximum number of points is other than 160, convert the site assessment points to a base of 160.

Example: if the Site Assessment maximum is 200 points, and the alternative Site "A" is rated 180 points:

$$\frac{\text{Total points assigned Site A}}{\text{Maximum points possible}} = \frac{180}{200} \times 160 = 144 \text{ points for Site A}$$

For assistance in completing this form or FPPA process, contact the local NRCS Field Office or USDA Service Center.

NRCS employees, consult the FPPA Manual and/or policy for additional instructions to complete the AD-1006 form.

5. Reason For Selection:  
**Overall score for Corridor A within Onondaga County is 116.2, indicating it did not approach the score that would require consideration of alternative corridors.**

Signature of Person Completing this Part: *David Frenkel* DATE: **1/8/25**

NOTE: Complete a form for each segment with more than one Alternate Corridor

## CORRIDOR - TYPE SITE ASSESSMENT CRITERIA

The following criteria are to be used for projects that have a linear or corridor - type site configuration connecting two distant points, and crossing several different tracts of land. These include utility lines, highways, railroads, stream improvements, and flood control systems. Federal agencies are to assess the suitability of each corridor - type site or design alternative for protection as farmland along with the land evaluation information.

(1) How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?

More than 90 percent - 15 points  
90 to 20 percent - 14 to 1 point(s)  
Less than 20 percent - 0 points

(2) How much of the perimeter of the site borders on land in nonurban use?

More than 90 percent - 10 points  
90 to 20 percent - 9 to 1 point(s)  
Less than 20 percent - 0 points

(3) How much of the site has been farmed (managed for a scheduled harvest or timber activity) more than five of the last 10 years?

More than 90 percent - 20 points  
90 to 20 percent - 19 to 1 point(s)  
Less than 20 percent - 0 points

(4) Is the site subject to state or unit of local government policies or programs to protect farmland or covered by private programs to protect farmland?

Site is protected - 20 points  
Site is not protected - 0 points

(5) Is the farm unit(s) containing the site (before the project) as large as the average - size farming unit in the County ?

(Average farm sizes in each county are available from the NRCS field offices in each state. Data are from the latest available Census of Agriculture, Acreage or Farm Units in Operation with \$1,000 or more in sales.)  
As large or larger - 10 points  
Below average - deduct 1 point for each 5 percent below the average, down to 0 points if 50 percent or more below average - 9 to 0 points

(6) If the site is chosen for the project, how much of the remaining land on the farm will become non-farmable because of interference with land patterns?

Acreage equal to more than 25 percent of acres directly converted by the project - 25 points  
Acreage equal to between 25 and 5 percent of the acres directly converted by the project - 1 to 24 point(s)  
Acreage equal to less than 5 percent of the acres directly converted by the project - 0 points

(7) Does the site have available adequate supply of farm support services and markets, i.e., farm suppliers, equipment dealers, processing and storage facilities and farmer's markets?

All required services are available - 5 points  
Some required services are available - 4 to 1 point(s)  
No required services are available - 0 points

(8) Does the site have substantial and well-maintained on-farm investments such as barns, other storage building, fruit trees and vines, field terraces, drainage, irrigation, waterways, or other soil and water conservation measures?

High amount of on-farm investment - 20 points  
Moderate amount of on-farm investment - 19 to 1 point(s)  
No on-farm investment - 0 points

(9) Would the project at this site, by converting farmland to nonagricultural use, reduce the demand for farm support services so as to jeopardize the continued existence of these support services and thus, the viability of the farms remaining in the area?

Substantial reduction in demand for support services if the site is converted - 25 points  
Some reduction in demand for support services if the site is converted - 1 to 24 point(s)  
No significant reduction in demand for support services if the site is converted - 0 points

(10) Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of surrounding farmland to nonagricultural use?

Proposed project is incompatible to existing agricultural use of surrounding farmland - 10 points  
Proposed project is tolerable to existing agricultural use of surrounding farmland - 9 to 1 point(s)  
Proposed project is fully compatible with existing agricultural use of surrounding farmland - 0 points

---

5. Reason For Selection:

**Overall score for Corridor A within Oswego County is 89, indicating it did not approach the score that would require consideration of alternative corridors.**

Signature of Person Completing this Part: David Frenkel DATE: **1/8/25**

NOTE: Complete a form for each segment with more than one Alternate Corridor

## CORRIDOR - TYPE SITE ASSESSMENT CRITERIA

The following criteria are to be used for projects that have a linear or corridor - type site configuration connecting two distant points, and crossing several different tracts of land. These include utility lines, highways, railroads, stream improvements, and flood control systems. Federal agencies are to assess the suitability of each corridor - type site or design alternative for protection as farmland along with the land evaluation information.

(1) How much land is in nonurban use within a radius of 1.0 mile from where the project is intended?

More than 90 percent - 15 points  
90 to 20 percent - 14 to 1 point(s)  
Less than 20 percent - 0 points

(2) How much of the perimeter of the site borders on land in nonurban use?

More than 90 percent - 10 points  
90 to 20 percent - 9 to 1 point(s)  
Less than 20 percent - 0 points

(3) How much of the site has been farmed (managed for a scheduled harvest or timber activity) more than five of the last 10 years?

More than 90 percent - 20 points  
90 to 20 percent - 19 to 1 point(s)  
Less than 20 percent - 0 points

(4) Is the site subject to state or unit of local government policies or programs to protect farmland or covered by private programs to protect farmland?

Site is protected - 20 points  
Site is not protected - 0 points

(5) Is the farm unit(s) containing the site (before the project) as large as the average - size farming unit in the County ?

(Average farm sizes in each county are available from the NRCS field offices in each state. Data are from the latest available Census of Agriculture, Acreage or Farm Units in Operation with \$1,000 or more in sales.)  
As large or larger - 10 points  
Below average - deduct 1 point for each 5 percent below the average, down to 0 points if 50 percent or more below average - 9 to 0 points

(6) If the site is chosen for the project, how much of the remaining land on the farm will become non-farmable because of interference with land patterns?

Acreage equal to more than 25 percent of acres directly converted by the project - 25 points  
Acreage equal to between 25 and 5 percent of the acres directly converted by the project - 1 to 24 point(s)  
Acreage equal to less than 5 percent of the acres directly converted by the project - 0 points

(7) Does the site have available adequate supply of farm support services and markets, i.e., farm suppliers, equipment dealers, processing and storage facilities and farmer's markets?

All required services are available - 5 points  
Some required services are available - 4 to 1 point(s)  
No required services are available - 0 points

(8) Does the site have substantial and well-maintained on-farm investments such as barns, other storage building, fruit trees and vines, field terraces, drainage, irrigation, waterways, or other soil and water conservation measures?

High amount of on-farm investment - 20 points  
Moderate amount of on-farm investment - 19 to 1 point(s)  
No on-farm investment - 0 points

(9) Would the project at this site, by converting farmland to nonagricultural use, reduce the demand for farm support services so as to jeopardize the continued existence of these support services and thus, the viability of the farms remaining in the area?

Substantial reduction in demand for support services if the site is converted - 25 points  
Some reduction in demand for support services if the site is converted - 1 to 24 point(s)  
No significant reduction in demand for support services if the site is converted - 0 points

(10) Is the kind and intensity of the proposed use of the site sufficiently incompatible with agriculture that it is likely to contribute to the eventual conversion of surrounding farmland to nonagricultural use?

Proposed project is incompatible to existing agricultural use of surrounding farmland - 10 points  
Proposed project is tolerable to existing agricultural use of surrounding farmland - 9 to 1 point(s)  
Proposed project is fully compatible with existing agricultural use of surrounding farmland - 0 points

**RE: NRCS FPPA Review – Micron Clay Fab Facility, Onondaga and Oswego Counties, NY**

Ms. Sivirichi,

The Natural Resources Conservation Service (NRCS) under Part 523 of the Farmland Protection Policy Act (FPPA) has reviewed the proposed project described above. This review was conducted with respect to the effect(s) that the proposal may have on prime, statewide, and/or unique farmland. The project has several components within the overall design, some of which are limited to linear utility corridors. As such, the project is being reviewed with two separate forms. The following listed components have been submitted as part of the project with specific descriptions, extent, and areas of impact provided:

1. Micron Campus
2. Childcare Site
3. Rail Spur
4. Clay Substation Expansion
5. Oak Orchard WWTP
6. Existing Raw Water Pump Station
7. OCWA Terminal Campus
8. OCWA Burt Point Property
9. OCWA Lake Ontario Water Treatment Plant
10. Gas Regulator Station
11. Natural Gas Line
12. Fiberoptic Line
13. OCWA Line
14. Industrial Wastewater Conveyance

Project components 11 through 14 (as listed above) are associated with linear utility installations and were evaluated with the Farmland Conversion Impact Rating For Corridor Type Projects (NRCS-CPA-106). As the proposed OCWA line (component 13) crosses from Onondaga into Oswego counties, two separate NRCS-CPA-106 forms were used to capture county level land evaluation information. The remaining project areas (1 through 10 in the list above) were evaluated using a single Farmland Conversion Impact Rating form (AD-1006) as most proposed actions will take place within Onondaga County. Those non-corridor related activities occurring within Oswego County as currently proposed fall under existing exemptions and are not subject to FPPA provisions.

Several listed project components as proposed in part or as a whole would be exempt from FPPA provisions for several reasons. Subpart B of Part 523 of the Farmland Protection Policy Act states that ‘Lands identified as “urbanized area” (UA) on the Census Bureau maps’ are not covered by the act. The OCWA Terminal Campus, and OCWA Burt Point Property (components 7 and 8 on the above list)

1 | Page

extents as currently proposed and presented are entirely within UA on the 2020 Census Bureau Reference Maps and would therefore be exempt from FPPA provisions. In addition, portions of components 1 and 13 are also located within UA areas as proposed, and those acreages were not included within the AD-1006 or NRCS-CPA-106 evaluations. Other areas of components 3, 5, 9, and 10 that are part of the project were described as either already converted (i.e., currently paved, standing buildings, etc.) or fall outside the area of proposed disturbance. Additionally, project area 9, the OCWA Lake Ontario Water Treatment Plant improvements proposed are located within an area not mapped as prime, unique, or farmland of statewide importance, and/or are already converted, therefore would not fall under the FPPA provisions. If the scope of the project changes, then further review for FPPA might be needed.

FPPA provisions outlined in 440-V-CPM Amendment 12 Part 523.11 C, describes if construction is within an existing right-of-way (ROW), the activity is not subject to provisions of FPPA. As currently proposed and provided, portions of components 11, 14, and all of 12 (Fiberoptic line) occur within existing road ROW's, and therefore those acreages would be exempt. Please note that Part 523.11 E, lists another exemption that might be applicable for corridor portions of the project. FPPA provisions lists corridor subsurface project (such as buried water, sewage, and/or electrical lines) exempt if the proposal includes development of a soil disturbance/removal and reconstruction plan (as defined in 30 CFR823.12 and 30 CFR823.14) for all agricultural land uses. If a project area is currently in cropland, as defined by USDA-NRCS, 30 CFR823.15 applies, and a soil disturbance/removal and reconstruction plan will be developed for the exemption to apply.

For areas of the project proposal that do not fall under an existing exemption, and will impact prime farmland soils, or farmland soils of statewide importance, the enclosed AD-1006 and NRCS-CPA-106 forms need to be completed to rate the land being converted. If the Total Points in part VII (Relative Value from Part V plus the Total Site Assessment from Part VI) is greater than or equal to 160 (on either form AD-1006 or NRCS-CPA-106), an alternative site or adjustment to project extent should be considered that will limit impacts to prime farmland soils and soils of statewide importance. If no alternative for the project is practical, the Reason for Selection block at the bottom of the form should state the reasoning. Upon completion of Parts VI and VII of the forms provided, a copy is requested to be sent to the address below or e-mail to [daniel.ufnar@usda.gov](mailto:daniel.ufnar@usda.gov).
