SCOPING SUMMARY, SCOPING COMMENTS, KEY DOCUMENTS,
NOTICES, AND PUBLIC COMMENT DOCUMENTS

Appendix A-1

CPO Purpose and Need Factors

A-1 CPO Purpose and Need Factors

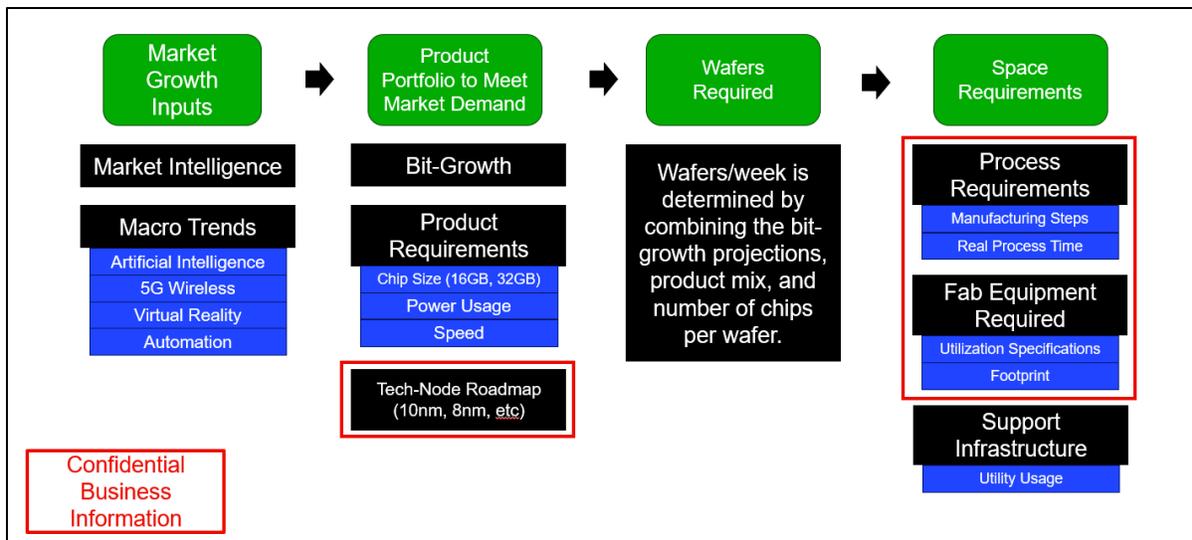

As described in Section 1.1.1, the Department of Commerce’s funding award for a semiconductor memory facility is based on two factors: (1) the amount of cleanroom space that would be required to achieve an economically viable domestic memory chip output sufficient to meet U.S. economic and national security objectives, based on economic modeling; and (2) by extension, the amount of total building area and site configuration that would be required to support that cleanroom space, accounting for technological, logistical, and cost considerations.

A-1.1 Cleanroom Space

Based on the economic modeling that Micron submitted in support of its CHIPS application, the Department of Commerce determined that Micron would need to construct 2.4 million sq. ft. of cleanroom space capable of producing an average of 52,000 wafers per week over the life of the project to achieve the level of domestic memory chip output sufficient to meet U.S. economic and national security objectives.

This output and associated cleanroom space requirement is based on Micron’s sources and uses information submitted in support of its CHIPS application, including economic modeling and estimates that Micron prepares as part of its annual long-range SNOP process. Micron uses its SNOP process to forecast overall memory sector market growth based on market intelligence, macro trends from new technologies such as AI, virtual reality, 5G wireless proliferation, and many other factors. Based on its product mixes and technological capabilities, such as the number of bits it can manufacture per wafer, Micron then determines how many wafers would be required to meet DRAM market demand, which in turn determines the cleanroom space required to meet that demand. Figure A-1 illustrates the SNOP process.

Figure A-1 Micron Long Range SNOP Process

Source: Micron Technology.

The economic modeling in Micron’s SNOP process analyzes key market trends. In the semiconductor industry, one key trend is the continuous effort to develop chips based on increasingly smaller (e.g., nanoscale) “technology nodes” enabled by advancements in semiconductor manufacturing technology.¹ As technology nodes become smaller typically every 18 to 24 months, more processing steps are required per wafer due to increased manufacturing complexity. This results in both longer processing times per wafer and the need for additional, highly complex, space-consuming, and expensive semiconductor manufacturing equipment or “tools,” which in turn require more cleanroom space.

Therefore, as reflected in historic data and information from the research and development processes of Micron and other manufacturers, as technology advances, the number of wafers that can be produced per square foot of cleanroom space declines, necessitating more cleanroom space. Micron’s modeling also considers that, as technology advances and technology nodes become smaller, the amount of data stored per wafer (measured in bits) increases, which further drives longer processing times per wafer, manufacturing complexity, the need for additional tools, and requirements for more cleanroom space.

Micron’s ability to achieve a target DRAM wafer output and successfully align its investment planning and product optimization with that output thus depends on the ability to effectively model and forecast memory chip demand based on the above technical considerations. The economic and commercial viability of Micron’s planned facilities depends in part on Micron’s ability to analyze how trends in declining wafer production per square foot of cleanroom space and increasing data storage per wafer affect overall operational capacity and efficiency, so that Micron can align its production capacity with future market growth and competition.

Micron gathers market intelligence from a variety of sources, including industry publications and engagement with customers. The Boston Consulting Group (BCG) and the Semiconductor Industry Association (SIA) estimate that the United States accounts for 25 percent of global memory chip demand, and that 9 percent of the global memory chip output is consumed by applications that are critical to U.S. economic and national security (Varas et al., 2021), including defense, aerospace, telecommunications, energy, medical equipment, and other applications. As noted in Section 1.1.1, because Micron currently manufactures all DRAM produced in the United States, but that output is less than one percent of global DRAM production, the United States memory chip supply chain is largely dependent on production in East Asia, which leaves the United States exposed to geopolitical tensions and large-scale supply interruptions, which could impair access to suppliers or customers.

To expand domestic DRAM production, Micron has first looked to expansion and modernization of their existing domestic facilities. The expansion at the Virginia site is focused on the automotive, aerospace, defense and industrial markets, and does not offset any of the DRAM and HBM chips planned to be manufactured in New York. The ongoing expansion at Micron’s HQ and R&D facility in Idaho to include high volume DRAM production will satisfy the short-term domestic needs for DRAM chips but will be inadequate to satisfy projected growth leaving

¹ A technology node is the smallest manufacturable feature size on a chip, typically measured by transistor gate length, often in nanometers (nm). As the technology node size shrinks, more transistors can be packed into a given area, improving performance.

the United States again dependent on production in East Asia over the next decade. The expansion of HVM in Idaho is also possible due to colocation benefits with R&D.

The 2.4 million sq. ft. of additional cleanroom space that would be needed to achieve the level of domestic memory chip output sufficient to meet U.S. economic and national security objectives described above is based on historical investment data showing that DRAM memory chip manufacturing requires, on average, approximately 2.05 times the capital intensity of logic chip manufacturing (Yoon, 2021), which drives memory cleanroom size. In general, an economically viable logic operation requires approximately 300,000 sq. ft. of cleanroom space, and the typical memory operation requires approximately 600,000 sq. ft. of cleanroom space. Based on these factors and technical constraints relating to bit-growth per wafer and step-growth per wafer from new technology nodes, achieving the necessary level of DRAM output requires a total of 2.4 million sq. ft. of cleanroom space.

In addition, growth trends in logic fabs also drive growth trends in memory fabs. In their 2021 report, “Strengthening the Global Semiconductor Value Chain,” BCG and SIA specifically noted that “covering the expected domestic consumption of advanced logic chips for critical infrastructure applications by 2030 would require building . . . 2-3 new state-of-the-art [logic] fabs in the U.S.” (Varas et al., 2021). The Department of Commerce factored in this domestic need for logic chip production in the context of a separate CPO award to TSMC Arizona Corporation to construct three leading-edge logic fabs in Arizona with 900,000 sq. ft. of cleanroom space.² Because on-shoring of logic chip production is anticipated to drive domestic growth of products requiring logic chips that also will require memory chips,³ 2.4 million sq. ft. of cleanroom space is in keeping with the projected capital intensity needed to on-shore memory chip production at pace with logic chip production.

A-1.2 Co-Location at Sufficient Scale

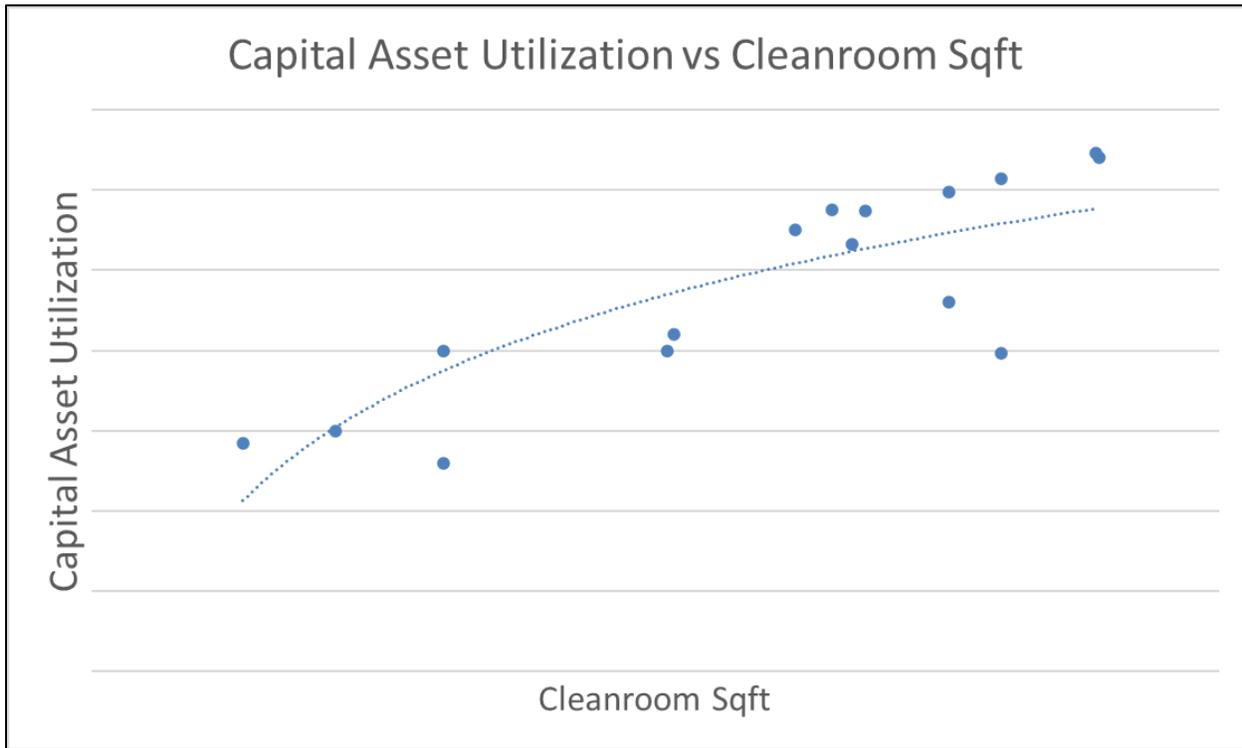

As noted above, cleanroom space is the primary driver of semiconductor facility size requirements. However, a key related requirement is the need to accommodate such large amounts of cleanroom space with sufficient supporting infrastructure and utilities, accounting for technological, logistical, and cost considerations. As noted in Section 1.1.1, to be economically viable, large-scale semiconductor facilities need to be simultaneously: (a) large enough to achieve a utilization rate of their expensive facility infrastructure capable of justifying their capital expenditures, known as the CAU rate; and (b) compact enough with buildings efficiently designed to meet precise sizing, engineering, and interoperability specifications while minimizing overall building, utility, and equipment costs.

² See U.S. Department of Commerce, “Biden-Harris Administration Announces CHIPS Incentives Award with TSMC Arizona to Secure U.S. Leadership in Advanced Semiconductor Technology” (Nov. 15, 2024), <https://www.commerce.gov/news/press-releases/2024/11/biden-harris-administration-announces-chips-incentives-award-tsmc>; See also Arizona Commerce Authority, “President Trump, TSMC Announce \$100 Billion Investment in Arizona” (Mar. 3, 2025), <https://www.azcommerce.com/news-events/news/2025/3/president-trump-tsmc-announce-100-billion-investment-in-arizona/>

³ Logic chips are primarily designed to perform complex logical operations and execute instructions for programmable devices that rely on them; memory chips are primarily responsible for storing and retrieving data for such devices.

Although it would not cost more money, narrowly construed, to build only two or three fabs as opposed to four, a campus limited to two or three fabs would have a higher *per wafer cost* due to lower scale and production efficiencies. The incremental wafer cost would be higher at a 2-fab facility than a 4-fab facility. Put differently, to avoid a higher per wafer cost, semiconductor facilities must take advantage of larger economies of scale. The CAU rate is one measurement of this requirement and reflects the utilization rate of advanced semiconductor manufacturing equipment, weighted by cost. (For example, the average privately owned car is used only at certain times, to drive to work, the store, etc., whereas a taxi, which operates more continuously, has a much higher utilization rate.) In semiconductor manufacturing, the CAU rate increases with cleanroom square footage, as larger fabs enable more efficient equipment use (see Figure A-2).

Figure A-2 Capital Asset Utilization vs. Cleanroom Square Footage

Source: Micron Technology.

Micron estimates that with only two fabs instead of four, its CAU rate would be approximately 6.7 percent lower. This lower utilization rate would reflect the less efficient use of resources from operating fewer fabs with the same expensive equipment, which would result in a higher production cost per wafer. Specifically, Micron estimates that an additional up-front investment of approximately \$3.3 billion would be necessary to achieve the same output needed to meet the Department of Commerce’s goals with fewer fabs, due to the less efficient economies

of scale and lower CAU rate that approach would create.⁴

Building a large campus with four fabs would require co-locating the fabs in a precise site configuration to ensure adequate cost controls for economic viability. Memory is a commodity that is built to precise standards (such as the Joint Electron Device Engineering Council (JEDEC) standards) and is designed to be pin-compatible, enabling customers to easily substitute one supplier's product for another. This high level of interchangeability creates a highly competitive market. When combined with the cyclical nature of the semiconductor industry, which includes periods of operating at a loss, this combination reinforces the principle that controlling cost is paramount. Strict cost control is therefore essential for long-term viability. Co-locating cleanroom space in multiple fabs on a single site to reduce both the fixed cost per wafer produced and the average operating cost per wafer has become a demonstrated cost control strategy in the industry. In the context of the Proposed Project, and as shown in Table A-1 below, co-locating four fabs on a single site is necessary to avoid cost impacts that could prevent the campus from achieving economic viability.

⁴ This calculation is not applicable to the Virginia or Idaho expansions. The Virginia expansions is occurring within an already built clean room space that is underutilized. The Idaho facility is collocated with Micron's existing HQ and R&D facility and can share existing assets, making the expansion costs more favorable than the cost identified in Table A-1.

Table A-1 Cost Impacts of Building Fewer Than Four Fabs

Requirement	Description	Est. Cost Impact
Electrical Infrastructure	Each fab would use approximately 400 MW of electricity, which would require very large copper cables from the Clay Substation to the fabs. This cost is projected to remain high as the world electrifies transportation and builds out renewable energy solutions. By locating all four fabs at the WPCP across the road from the Clay Substation, Micron would be able to control these high transmission costs.	\$50 million (approx. \$5,000 per linear foot)
Lighting Strike Protection	One of the most damaging events to a semiconductor operation is the loss of power, even a short loss measured in seconds. ⁵ The Clay Substation has invested \$150 million to install lightning protection over the past five years. If Micron built some of the fabs elsewhere, Micron would need to invest \$150 million to ensure adequate lightning protection.	\$150 million
Water	By locating all four fabs at the WPCP, and with installation of the proposed OCWA water supply system upgrades discussed in this EIS, Micron would be able to ensure an adequate water supply for Fabs 1 and 2 using as much existing infrastructure as possible.	Estimate not available
Capital Equipment	As described above, Micron estimates that achieving the required memory chip output with a lower CAU rate from operating fewer fabs with the same expensive semiconductor manufacturing equipment would require \$3.3 billion in additional capital investment.	\$3.3 billion
Transportation	The WPCP is conveniently located near a major highway and is a short drive (20 minutes) from Syracuse. In comparison, STAMP is two times farther from I-90 and twice as far from a major metro area (Buffalo).	Estimate not available
Total Estimated Impact: \$3.5 billion (approx.)		

Source: Micron Technology

⁵ In 2019, a major semiconductor manufacturer in Japan experienced a 13-minute power outage due to a lightning strike on its electrical infrastructure. The outage impacted approximately 25 percent of the company’s output for the quarter, a material event financially for the company resulting in an estimated loss of \$250 million.

1 Introduction

Micron New York Semiconductor Manufacturing LLC (Micron), a Delaware limited liability company (LLC) and wholly owned subsidiary of Micron Technology, Inc., is proposing to construct a semiconductor manufacturing campus (the “Micron Campus”) in the Town of Clay, New York, at the White Pine Commerce Park (WPCP), an approximately 1,400-acre industrial park controlled by the Onondaga County Industrial Development Agency (OCIDA). The Micron Campus, together with ancillary development on nearby properties (described below), are referred to collectively as the “Proposed Project.”

After receipt of an Application for Financial Assistance from Micron, OCIDA circulated a notice of intent to serve as State Environmental Quality Review Act (SEQRA) (6 NYCRR Part 617) (New York Environmental Conservation Law §§8-0101 et seq.) Lead Agency on July 28, 2023. No objections to that notice were received during the 30-day period commencing on that date. At its regular meeting of September 14, 2023, OCIDA issued a Positive Declaration, indicating the need for an Environmental Impact Statement (EIS), and scheduled a public scoping meeting held on October 11, 2023.

Micron, as the Project Sponsor, will prepare a draft Environmental Impact Statement (DEIS) pursuant to SEQRA. Since Micron is seeking federal funding under the “Creating Helpful Incentives to Produce Semiconductors and Science Act of 2022 (the “CHIPS Act”) and the Proposed Project will require certain federal permits and approvals that require federal environmental review, including, but not limited to, federal wetlands permits pursuant to Section 404 of the Clean Water Act, the SEQRA DEIS will also contain information to support the National Environmental Policy Act (NEPA) of 1969 (42 United States Code (U.S.C.) § 4321 et seq.) review.

This document is the Final SEQRA Scope for the proposed DEIS. It was prepared pursuant to 6 NYCRR Part 617.8 and provides: (1) a brief description of the Proposed Project; (2) an identification of potentially significant adverse impacts from the SEQRA Environmental Assessment Form and through consultation with Federal, State, and local agencies; (3) the extent and quality of information needed to adequately address each impact; (4) an initial identification of mitigation measures; and (5) the reasonable alternatives to be considered.

1.1 PROPOSED PROJECT OVERVIEW AND DESCRIPTION

Micron is a world leader in innovative memory solutions that transform how the world uses information. For over 40 years, the company has been instrumental to the world's most significant technology advancements, delivering optimal memory and storage systems for a broad range of applications. Memory is at the leading edge of semiconductor manufacturing and fuels everything from feature-rich 5G smartphones to the AI-enabled cloud. Micron's leadership in both

DRAM and NAND technologies provides the market-based confidence to invest up to \$100 billion to affirm the company's industry-leading memory innovation and deliver differentiated products to its customers.

Micron's proposed semiconductor manufacturing facility campus ("Micron Campus") in the Town of Clay, Onondaga County, New York will be built-out over an approximate 20-year period, and will consist of the construction of four (4) Memory Fabrication facilities (Fabs). Micron expects that the Fabs will be built in sequence, with construction of each Fab starting as the preceding Fab is being fit-out with manufacturing equipment and operations begun (the DEIS will analyze two interim analysis years as well as a final year of completion). This process will result in continuous construction activities on the site over the approximate 20-year period, with a significant portion of that construction occurring inside previously-constructed Fab buildings. Micron intends to start construction of the Micron Campus in 2024 with Fabs 1 and 2 operational by 2032. Fabs 3 and 4 would be operational by 2041.

1.1.1 Proposed Project Location

The proposed Micron Campus is an approximately 1,400-acre assemblage of land located at the White Pine Commerce Park (WPCP) in the Town of Clay bordered by NYS Route 31 to the south, Caughdenoy Road to the west, a series of National Grid overhead power lines to the north (although the Micron Campus extends approximately 100 feet beyond the power lines), and the Town of Clay/Town of Cicero boundary line to the east. Most of the Micron Campus is contained within the Town of Clay, Onondaga County, New York and is accessible from I-81 via an interchange with NYS Route 31. Figure 1 identifies the broader vicinity within which the Micron Campus would be located. Figure 2 identifies the Micron Campus in relation to surrounding roadways.

1.1.2 Project Background

OCIDA completed a Generic Environmental Impact Statement (GEIS) in 2013 and a Supplemental GEIS (SGEIS) in 2021 on potential development of WPCP with manufacturing use. See Section 3.2 for additional information on the project background and OCIDA's efforts to prepare a shovel-ready site for manufacturing use, with a particular focus on the semiconductor industry.

FIGURE 1 VICINITY MAP

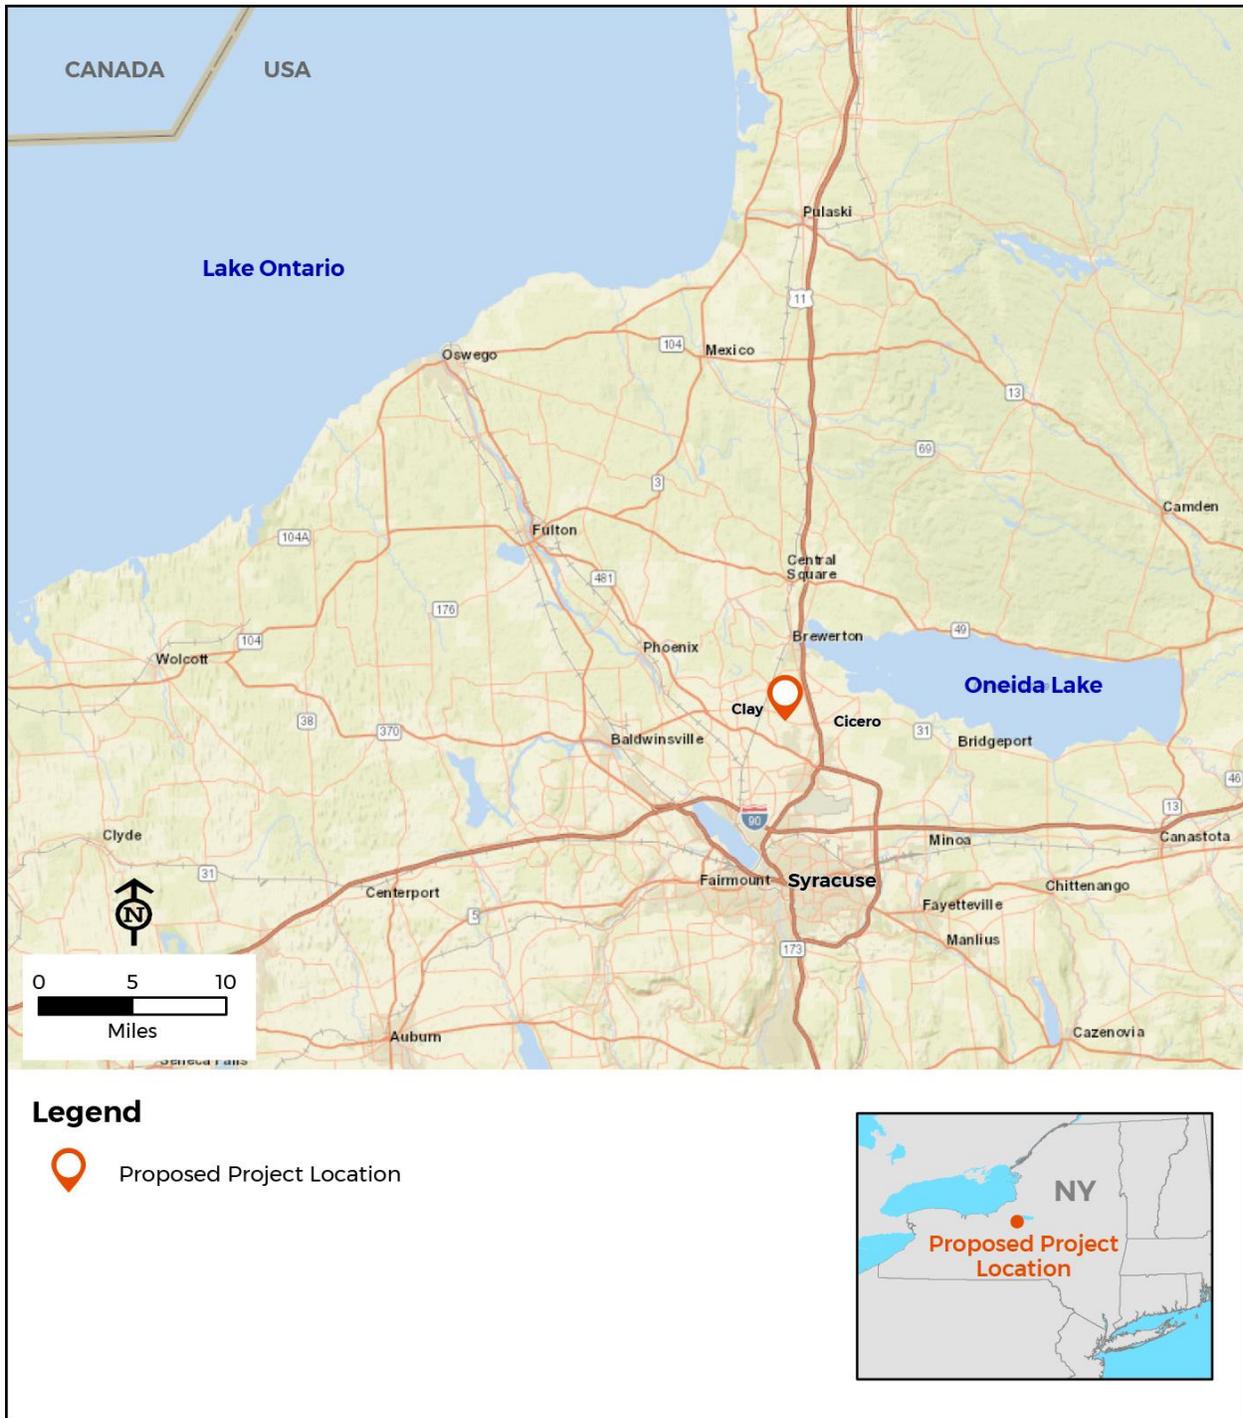

FIGURE 2 LOCATION OF PROPOSED PROJECT

1.1.3 Project Description

1.1.3.1 Micron Campus

The Micron Campus would comprise approximately 1,400 acres, consisting of the enlarged WPCP parcel studied in the 2021 SGEIS along with additional contiguous acreage acquired or to be acquired by OCIDA or Micron. Each Fab is expected to cover approximately 1.2 million sf of land and contain approximately 600,000 sf of cleanroom space¹, 290,000 sf of cleanroom support space², and 250,000 sf of administrative space. Each set of two Fabs will be supported by approximately 470,000 sf of central utility buildings³, 200,000 sf of warehouse space, and 200,000 sf of product testing space⁴ housed in separate buildings. The Micron Campus will also have ancillary on-site electrical substations, as well as facilities for water and wastewater treatment and storage, along with industrial gas storage. See Figure 3 for a preliminary site plan of the proposed Micron Campus.

Two (2) additional properties will be developed with uses ancillary to the Micron Campus (see Figure 4):

- An approximately 30.2-acre parcel on the north side of Caughdenoy Road (Town of Clay tax parcel 042.-01-13.0, 9100 Caughdenoy Road) (the "Childcare Site") on which Micron will construct an employee health care center and childcare center; and
- An approximately 1-acre parcel on the northwest side of the WPCP (048.-01-02.1) ("jack and bore site") which will be used for utility line conveyance.

The Micron Campus, with four (4) Fabs and all ancillary support facilities, driveways, and parking; the jack and bore site; and the Childcare Site comprise the "Proposed Project." The DEIS will include additional description of each element of the Proposed Project as well as a high-level description of key Micron systems to provide an understanding of Micron's proposed use and management of water, chemicals, and energy serving the site (including provisions for renewable energy sources). The DEIS will also describe Micron's generation and management of various waste streams and how best management practices will be implemented to limit energy consumption, water consumption, air pollutants, and generation of waste.

¹ Cleanroom: This part of the campus is where the thousands of advanced pieces of equipment are housed that are used to take raw silicon wafers and build the chips. It is called a cleanroom because there are strict requirements on particles in the air that can impact the functionality of the chips. The chips are built up in layers of metals and insulators, similar to how a building is constructed floor-by-floor.

² Cleanroom support: This part of the campus includes functions such as workshops to refurbish parts, labs to complete incoming chemical tests, surface analysis of what is on the wafers, and analysis of cross-sections of the wafer to validate the structure of the chips meets requirements.

³ Central utility building: These buildings house the systems required for delivering the utilities necessary to produce the chips. These utilities include systems such as HVAC, electrical transmission equipment, water purification and recycling, and chemical/specialty gas delivery systems.

⁴ Product testing space: This space is used to house advanced equipment that takes finished wafers and performs electrical testing that validates the chips function to required specifications before the wafers are shipped out for assembly into products and further testing.

FIGURE 3 PROPOSED SITE PLAN FOR MICRON CAMPUS

1.1.3.2 Off-Site Improvements

Off-site energy (natural gas and electricity), telecommunications, water, wastewater utility, and rail spur improvements also will be required and will be identified as "off-site improvements" necessary for the Proposed Project (see Figure 4). The DEIS will assess impacts of the Proposed Project and off-site improvements. National Grid will complete a separate Article 7 regulatory process before the New York Public Service Commission with regard to the electric transmission lines needed for the Proposed Project. The following off-site improvements have been identified:

Energy

- Extension of a 16-inch diameter natural gas line from National Grid's Gas Regulator Station (GRS) 147 at 4459 NYS Route 31 to the Micron Campus (approximately 3.15 miles) and construction of GRS 147A at the same address as the existing GRS;
- Construction of eight (two per Fab) underground electrical transmission duct bank connections from the existing National Grid sub-station west of Caughdenoy Road.

Telecommunications

- Extension of existing fiber-optic lines located along NYS Route 31 to the Micron Campus and from the existing fiber-optic lines located along Caughdenoy Road.

Water Supply

Onondaga County Water Authority (OCWA) has capacity within its water supply system to service Micron's initial water demand for construction and operations of Fab 1 (approximately 11.5 million gallons per day (MGD)). A new Clear Water Pumping Station at OCWA's Lake Ontario Water Treatment Plant (LOWTP) would be required. This new Clear Water Pumping Station will be designed to accommodate anticipated water demand for Micron's Fab 2, Fab 3, and Fab 4. Potable water for initial construction would be provided to the Micron Campus through existing buried water mains located within the Caughdenoy Road and Burnet Road rights-of-way. Potable water for Fab 1 operations would be provided to the Micron Campus through construction of a new connection from OCWA's existing Eastern Branch Transmission Main south of NYS Route 31 via a new service connection within a 99-foot-wide easement within the Micron Campus along Caughdenoy Road.

To serve the anticipated future demand of approximately 48 MGD, OCWA would have to make the following water supply infrastructure improvements:

- Construction of a new Raw Water Tunnel and Raw Water Pumping Station at OCWA's existing Burt Point property on Lake Ontario (City of Oswego);
- Construction of a new Raw Water Transmission Main from Burt Point to OCWA's Lake Ontario Water Treatment Plant (LOWTP) using an easement that OCWA obtained for such purposes in the 1990s;

- Modification to the LOWTP with addition of two (2) new filters, one (1) contact basin, and one (1) new clearwell as well as additional chemical storage space and residual handling facilities;
- Expansion of OCWA's Clear Water Transmission Main from LOWTP to OCWA's Terminal Campus with one (1) additional 54-inch diameter line parallel to the existing 54-inch diameter line;
- Construction of one (1) 15 million gallon water storage tank at OCWA's Terminal Campus;
- Upgrading of existing pumps at OCWA's Farrell Pumping Station at Terminal Campus and construction of a parallel pumping station;
- Expansion of OCWA's Eastern Branch Transmission Main south of NYS Route 31 from one (1) 54-inch diameter water main with up to three (3) additional 54-inch diameter water mains depending on evaluations of Micron's initial water re-use and reclamation performance; and
- Relocation of a portion of the existing OCWA Eastern Branch Transmission Line crossing the Micron Campus to allow for Micron Fab 3 and Fab 4 construction.

Wastewater

Onondaga County Department of Water Environment Protection (OCDWEP) will be able to convey sanitary wastewater from the Micron Campus during initial construction through a previously planned and separately studied extension of municipal sanitary wastewater force mains to a portion of the Oak Orchard Wastewater Treatment Plant (WWTP) service area that has not previously been served by municipal infrastructure. Operation of Micron's Fabs 1-4 will require additional industrial wastewater infrastructure and improvements to the Oak Orchard WWTP in addition to planned industrial wastewater pre-treatment facilities that Micron will construct on the Micron Campus. The following OCDWEP infrastructure improvements are required prior to operation of Micron's Fab 1:

- Construction of OCDWEP industrial wastewater service conveyance to the Oak Orchard wastewater treatment plant (WWTP) from a new industrial wastewater pumping station to be constructed on the Micron Campus. Conveyance infrastructure would comprise four (4) 30-inch force mains for industrial wastewater; and one (1) 36-inch force main for reclaimed water supply; and
- Expansion of the Oak Orchard WWTP to treat industrial wastewater (with pre-treatment required by Micron at the Micron Campus).

Rail Spur Site

Micron has proposed to construct a rail spur on an approximately 37-acre area on the west side of Caughdenoy Road (including Town of Clay tax parcel 046.-02-03.2) (the "rail spur site"). The rail spur will be used to deliver construction aggregate to the Micron Campus to reduce construction vehicle impacts on the local community from construction of the Proposed Project, which will

facilitate the avoidance, minimization and mitigation of traffic, air, climate change and community character impacts. The rail spur is a separate but related action that would require advanced construction to achieve the intended benefit of reduced construction vehicle impacts from the Proposed Project. Although it will be addressed separately under SEQRA so that it is in place at the commencement of groundbreaking in order to maximize mitigation measures for the Proposed Project, it will also be analyzed in the SEQRA DEIS.

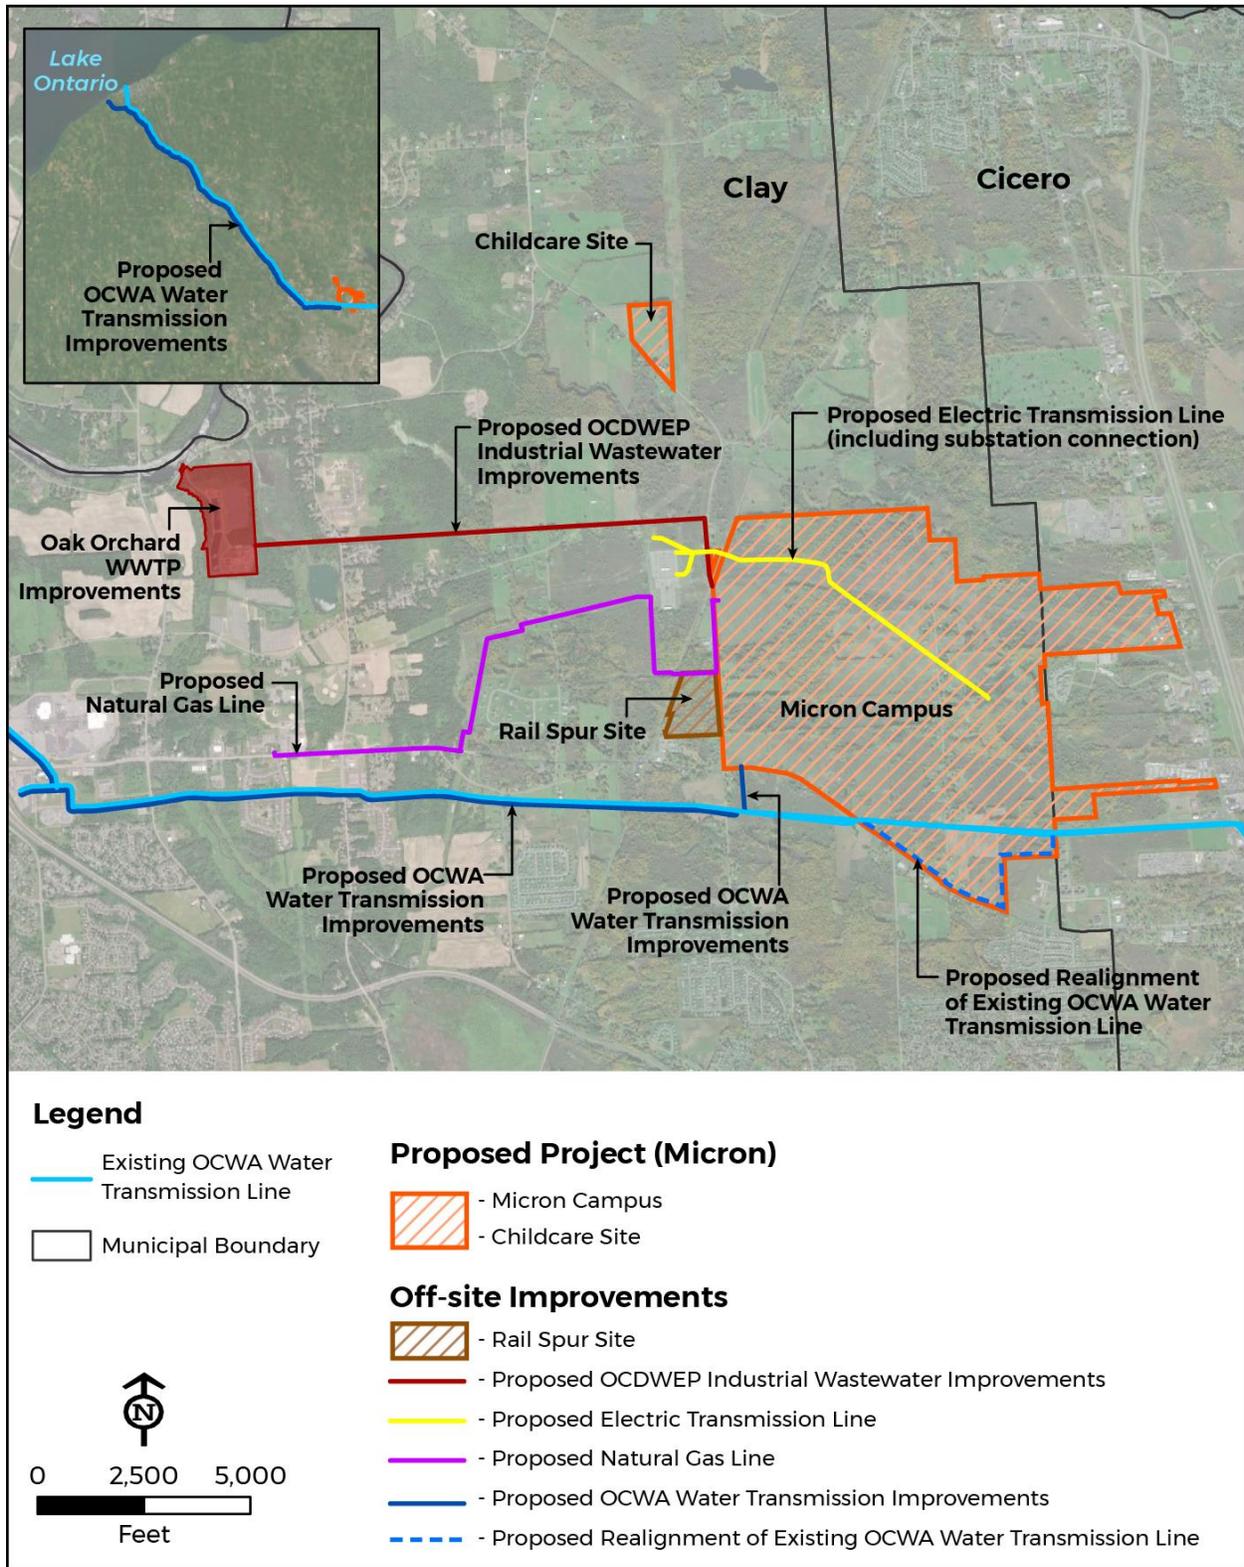

1.1.3.3 Proposed Project Employment

Micron will create approximately 9,000 high-paying jobs by 2045 to support the Micron Campus when operating at full capacity and about 40,000 community jobs over a 20-plus year period to include suppliers, contractors, and other supporting roles. Micron has begun efforts to attract a diverse and multi-talented workforce to Central New York. Using its existing labor models for high-volume fabs around the globe, Micron has estimated that 90% of its workers will be dedicated to manufacturing, and the remaining 10% will provide support services, including IT, security, quality, procurement, supply chain, smart manufacturing technology, finance, people, and legal services.

The bulk of manufacturing headcount will comprise three major job categories, each with a mix of specific jobs and skillsets. In the category of leadership (~10%), there are directors, managers, and supervisors. Typical qualifications for managers are a B.A. or B.S. degree or equivalent training and experience and five years of leadership experience. For supervisors, these are an A.A. or A.S. degree or Production Operations Management Certificate or equivalent training and experience. For directors, a B.A. or B.S. degree or equivalent training and experience, and eight years of leadership experience is required. In the category of Engineering & Professional (~44%), the bulk of needed roles are equipment engineers and process engineers. Engineering roles require a B.S. in Engineering or a B.S. in a relevant discipline, and Micron provides specific on-the-job training for the role's function. In the category of Technicians (~36%), the bulk of needed roles are equipment technicians and process technicians. Technician roles require the same minimum qualifications, and Micron provides specific on-the-job training for the role's function. The qualifications are an A.A or A.S. degree or completion of a Micron Apprenticeship Program or, other approved certification, or a combination of certifications under development with Micron community college partners or equivalent training and experience.

Micron will operate three (3) shifts over a 24-hour day. Day and night shifts will be utilized to sustain 24-hour manufacturing activities as well as a maintenance shift.

FIGURE 4 PROPOSED PROJECT AND OFF-SITE IMPROVEMENTS

2 The Scoping Process and Agency Coordination

Scoping provides an opportunity for the public to learn more about the Proposed Project and to provide valuable input as Micron and OCIDA prepare the SEQRA Draft EIS (DEIS). A SEQRA Positive Declaration and notice of public scoping meeting was published in the *Environmental Notice Bulletin* on September 20, 2023. Notice of the public scoping meeting was placed in The Post Standard (Syracuse.com) – a newspaper of general circulation serving the broader Clay, New York area on September 19, 2023.

Project information and this final SEQRA Scope was also posted on OCIDA's website (www.ongovd.com).

OCIDA, as SEQRA Lead Agency, invited the public and agencies to be involved in the environmental review process. During the SEQRA scoping process, comments were encouraged on the draft purpose and need, potential alternatives, and environmental issues of concern. A list of the Federal, State, and local agencies with which OCIDA is coordinating is provided in Section 6.

Public Comment Period and Community Meetings

- The comment period for the scoping process was extended beyond the minimum required 30 days from September 20, 2023, to October 31, 2023. During this period, OCIDA held a public scoping meeting on October 11, 2023, at 6:30 PM to obtain input from the public. Everyone who registered or asked to speak was given the opportunity to submit a verbal comment.

The scoping meeting provided simultaneous Spanish and American Sign Language interpretation. No additional language translation services or special needs assistance were requested.

How Comments Were Received

Comments were accepted during the scoping period via:

- Public comment at the public scoping meeting on October 11, 2023;
- E-mails to micron@ongov.net; and
- Mail to Attn: Micron Project, Office of Economic Development, Onondaga County, 335 Montgomery Street, 2nd Floor, Syracuse, NY 13202

All comments received, no matter their format, were considered equally. In total, 39 individuals, organizations, or agencies provided comments during the public comment period including written comment letters from the United States Fish & Wildlife Service and the New York State Department of Environmental Conservation.

How Comments Were Used

After the end of the comment period on October 31, 2023, OCIDA, with assistance as needed from Micron, collected, reviewed, and summarized the comments received and prepared this final SEQRA Scope with attached Response to Comments found in Appendix B. The comments received during the scoping period were considered by OCIDA to define this final scope of the DEIS and to inform the related technical analyses and environmental resources to be evaluated.

OCIDA has made the final SEQRA Scope available to all interested and involved agencies as well as on its website (www.ongovcd.com/ocida) and to everyone that commented during the public comment period. This final SEQRA Scope will be used to prepare the DEIS.

3 Purpose and Need

3.1 PURPOSE AND NEED

The purpose of the Proposed Project is to further the United States goal to expand domestic memory chip manufacturing capacity and restore U.S. leadership in semiconductor manufacturing as embodied in the "Creating Helpful Incentives to Produce Semiconductors and Science Act of 2022" (the "CHIPS Act"). For Micron, the purpose is to advance its leading-edge position in the development and manufacturing of DRAM memory chips.

The purpose of the CHIPS Act and the need for the Proposed Project is to reduce U.S. reliance on foreign production of both leading edge and older generation microelectronics. Semiconductors were invented in America, and the U.S. semiconductor industry has historically dominated many parts of the international semiconductor supply chain, such as R&D, chip design and manufacturing. Yet the U.S. position within the semiconductor industry has been declining. According to the Semiconductor Industry Association, U.S. production of the world's microchips has fallen from 37% in 1990 to 12% in 2020. The need for the Proposed Project is to reduce economic and national security risks by building domestic capacity, to establish a dynamic and collaborative network for semiconductor research and innovation centers, and to improve competitiveness and strengthen regional supply chain industries. Micron provides a unique and essential role in domestic production of leading-edge memory chips that are essential and high-volume components of the semiconductor industry.

Micron's investment in the Proposed Project will also advance the goals of the State of New York and OCIDA to enhance job growth in Central New York by promoting advanced manufacturing in the region. The Proposed Project is anticipated to generate nearly 50,000 jobs in Central New York over more than a 20-year period, including 9,000 good-paying Micron jobs directly generated by the Proposed Project and over 40,000 additional jobs with suppliers, contractors and other businesses supporting the proposed chip manufacturing facility. To this end, Micron and the State of New York have announced a historic \$500 million investment in community and workforce development over a more than 20-year period. Micron will further invest \$250 million in line with its commitment to the Green CHIPS Community Investment Fund. An additional \$250 million is expected to be invested, with \$100 million from New York, and \$150 million from local, other state and national partners. This fund is intended to expand and train the workforce in the region, including providing support for disadvantaged populations.

3.2 PROJECT BACKGROUND

Central New York as well as other regions of New York State have experienced a reduction in manufacturing jobs over several decades. In 1991, OCIDA and the City of Syracuse Chamber of

Commerce commissioned an Industrial Park Feasibility Study to identify potential candidate sites for locating industrial businesses in Onondaga County (the "County"). The study identified two sites for large scale industrial uses, with the White Pine Commerce Park (WPCP) ultimately selected as the preferred site for purchase due to its proximity to National Grid's Clay electric substation, highway access, and Industrial zoning designation. Between 1991 and 1999, the County purchased seven properties to form the original approximately 340-acre WPCP (previously referred to as Clay Business Park).

OCIDA's intent in acquiring the lands, was further justified in 1998 with the advent of the SEMI-NY program (as discussed below), resulted in the accumulation of the original 340-acre footprint of the WPCP. The SEMI-NY program was a New York State initiative initiated in 1998 to attract the semiconductor industry to the state by identifying and advancing "qualified" sites that were consistent with conceptual semiconductor industry profiles. OCIDA's objective was to further the County's economic development agenda by providing a site that met the SEMI-NY criteria and could be presented as a qualified site for a semiconductor manufacturing facility under the SEMI-NY program. To support OCIDA's efforts to obtain the SEMI-NY "qualified" site designation for its site, OCIDA prepared a SEQRA Generic Environmental Impact Statement (GEIS) to assess potential environmental and socio-economic impacts associated with full build-out of the 300-acres by a yet to be determined semiconductor company.

From 2017 to the present, OCIDA has made significant investments to advance and market the WPCP, with the semiconductor industry targeted as the site's highest and best use. In the ensuing years following the initial creation and focused marketing of the WPCP, the semiconductor industry, for several commercial reasons, has transitioned toward the construction and use of a Fab complex, which typically consists of two to four fabrication facilities operating at a single site; a trend introduced in Asia and Europe and now replicated in the United States. The semiconductor industry of today focuses on economies of scale; the need to build fewer, larger Fabs; and the managerial and economic benefits regarding workforce and reducing operational downtimes during expansions. This has resulted in the need for 1000-acre sites.

As a result, over the past six years, OCIDA decided to purchase adjacent land to enlarge the WPCP to accommodate this new industry model. The WPCP is now over 1,400 contiguous acres. This size makes it considerably larger than most available sites in New York. Considering other critical additional project needs beyond sheer size (e.g., proximity to a sufficient supply of electricity and water, wastewater treatment, and natural gas) further diminishes the number of available sites that can accommodate modern semiconductor manufacturing. Overlaying the acreage and infrastructure needs with access to multi-modal transportation and labor needs is often a point of failure for most other sites, which might otherwise meet the acreage need. Accordingly, sites that substantially meet Micron's site selection criteria are not commonly available, which further supports Micron's selection of the WPCP for the proposed Micron Campus.

OCIDA utilized the development of a GEIS (2013) and the follow-up Supplemental Generic Environmental Impact Statement (SGEIS), completed in 2021, to evaluate potential locations throughout Onondaga County for development of a site suitable to attract semiconductor manufacturing. OCIDA, in 2013, and again in 2021, selected the WPCP as its preferred site to attract private industrial and commercial development because of its size, potential for industrial zoning, access to transportation, proximity of utilities, as well as a history of Town of Clay efforts to facilitate industrial development at the property.

The 2013 GEIS considered several other potential sites in addition to WPCP:

- Radisson Corporate Park – 950 acres in the Town of Lysander;
- Hancock Air Park – 200 acres adjacent to the Syracuse Hancock Airport;
- Collamer Crossings Business Park – 200 acres in the Town of Dewitt located near NYS Route 298, I-90, I-481; and
- Syracuse Research Park – 99-acre site adjacent to Syracuse University.

OCIDA deemed the Radisson Corporate Park as an unviable choice because it lacked sufficient room and it did not offer the location specific advantages such as the proximity to I-81 and I-481/NY 481 that the WPCP did. Neither the Hancock Air Park nor the Collamer Crossing Business Park were deemed viable options because the available lots were small and could not accommodate large industrial uses. The Syracuse Research Park was available for light industrial use, but OCIDA concluded that it could not easily accommodate large-scale industrial uses.

The 2013 GEIS evaluated three (3) different site layouts for the WPCP: 1) a layout that provided 1 million sf of development while avoiding all State-mapped wetlands; 2) a layout that provided 1.5 million sf of development that balanced approximately 4.2 acres of wetland impacts against the additional benefits from the larger size of development; and 3) a layout that provided over 2 million sf balanced against additional impacts to wetlands. OCIDA identified the third alternative as the “preferred alternative” in the 2013 GEIS based on the overall economic returns versus the degree of environmental impacts. The 2013 GEIS also included a 2012 engineering report evaluating three (3) options for extending sanitary sewer service to the WPCP: 1) use of Verplank Road north of NYS Route 31; 2) use of the NYS Route 31 right-of-way; and 3) use of the Metropolitan Water Board (now OCWA) right-of-way south of NYS Route 31. The 2012 engineering report built from a 2003 feasibility study, the *Semi-NY Sewer Route Feasibility Study*, which evaluated five (5) sanitary sewer line routing options. OCIDA selected the third option for extension of sanitary sewer service to the WPCP as the preferred alternative.

The 2021 SGEIS revisited the question of whether the WPCP was the preferred alternative to attract industrial and commercial development to Onondaga County. The SGEIS compared WPCP to the

same alternative candidate sites that the 2013² GEIS assessed, again concluding that “[n]one of the previously considered alternative locations would be able to accommodate the large-scale industrial use that the [White Pine Commerce] Park is promoting due to size limitations and proximity to services and necessary infrastructure.”

The 2021 SGEIS concluded that significant expansion of the WPCP was feasible and more likely to attract leading edge manufacturing, such as semiconductor manufacturing. The alternative locations considered in the 2021 SGEIS were rejected as much too small to accommodate semiconductor manufacturing. The 2021 SGEIS assessed the additional potential significant adverse impacts from a larger facility and the creation of a shovel-ready WPCP by increasing the size of the development parcel to approximately 1,250 acres (later expanded to the current approximately 1,400 acres). OCIDA indicated in the SEQRA Findings Statement that “consistent with social, economic and other essential considerations from among the reasonable alternatives available, the action is the one that avoids or minimizes adverse impacts to the maximum extent practicable, and that adverse impacts will be avoided or minimized to the maximum extent practicable by incorporating as conditions to the decision those mitigation measures that were identified as practicable.”

On August 9, 2022, President Biden signed into law the CHIPS Act making over \$50 billion available “to strengthen American manufacturing, supply chains, and national security, and invest in research and development, science and technology, and the workforce of the future to keep the United States the leader in the industries of tomorrow, including nanotechnology, clean energy, quantum computing, and artificial intelligence.”⁵

On August 11, 2022, New York State Governor Kathy Hochul signed into law the Green CHIPS Act, which provides up to \$10 billion in economic incentives for environmentally friendly semiconductor manufacturing and supply chain projects (Ch. 494, L. 2022). The Green CHIPS legislation was passed to align with the provisions of the Federal CHIPS Act for the purpose of attracting domestic semiconductor manufacturing and related activities to New York State.

On October 4, 2022, Micron announced plans to invest up to \$100 billion over the next 20-plus years to develop a new leading edge semiconductor manufacturing facility at what is now known as the WPCP in Clay, New York, with a first-tier investment of \$20 billion planned by the end of this decade. Micron intends to apply for funding from both the CHIPS Act and the Green CHIPS Act to assist in the financing of the Proposed Project. Micron and Empire State Development (ESD), the umbrella organization of New York State’s two principal economic development public-benefit corporations, established a framework, known as the Community Investment Framework, outlining the shared investments to be made by Micron and the State of New York. This framework

⁵ FACT SHEET: CHIPS and Science Act will Lower Costs, Create Jobs, Strengthen Supply Chains, and Counter China, August 9, 2022, The White House. <https://www.whitehouse.gov/briefing-room/statements-releases/2022/08/09/fact-sheet-chips-and-science-act-will-lower-costs-create-jobs-strengthen-supply-chains-and-counter-china/>

will allow for the strengthening of the existing regional workforce and to create new growth and expansion of the workforce overall.

Micron's Proposed Project is the long-anticipated fulfillment of OCIDA's original goal to attract a state-of-the-art manufacturing facility to generate high-paying employment opportunities in Onondaga County. Micron's investment also furthers recent United States and New York State policies and programs to incentivize domestic semiconductor manufacturing.

4 Project Alternatives

4.1 INTRODUCTION

SEQRA requires the evaluation of alternatives to the Proposed Project, including either alternative sites or alternative designs, as well as a No Action Alternative. The evaluation of alternative site locations to be presented in the DEIS for the Proposed Project will be based upon the prior evaluation of alternative sites reflected in the earlier SEQRA analyses prepared by OCIDA as well as work completed by the New York State Economic Development Council (Project Rhino). See Table 1 for a summary of the various alternatives considered previously in the establishment of WPCP and those that will be carried into the DEIS for consideration.

4.2 DISCUSSION OF ALTERNATIVE PROJECT LOCATIONS

4.2.1 Alternative Sites in New York State

The DEIS will include a discussion of project location needs for semiconductor manufacturing in general and Micron in particular. The DEIS will also discuss the process previously undertaken by New York State to identify candidate sites for semiconductor manufacturing over recent years. That process identified four (4) sites throughout New York State as “shovel ready” sites for semiconductor manufacturing: STAMP in Genesee County, WPCP in Onondaga County, Marcy Nanocenter in Oneida County, and Luther Forest Technology Campus in Saratoga County. The DEIS will discuss the three alternative shovel ready sites and detail why they are not suitable alternative locations for the Proposed Project. For example, since 2012, GlobalFoundries U.S., Inc. has operated a semiconductor manufacturing facility at the Luther Forest Technology Campus in Saratoga County. Marcy Nanocenter Parcel #1 was previously developed into a manufacturing facility for Wolfspeed. The remaining parcel at Marcy Nanocenter is only 438 acres, too small for the proposed project. Some development has already occurred at STAMP and the remaining available acreage at that site also is too small to accommodate the Proposed Project.

In 2018 the New York State Economic Development Council (NYSEDC) prepared a “Competitive Site Location Benchmarking for Semiconductor Manufacturing” study (also known as “Project Rhino”). The purpose of the benchmarking study was to assess and compare four (4) sites in New York State, including WPCP, for their readiness to support semiconductor manufacturing; benchmark those four (4) sites against six (6) other sites located throughout the United States; and identify other industrial sectors that might be attracted to New York State to support semiconductor manufacturing. The study was based upon a hypothetical semiconductor manufacturing facility and evaluated each of the sites against a number of quality, cost, and economic incentive factors.

The qualitative assessment evaluated the sites against five categories, each of which had several factors included: site quality and suitability; workforce and community alignment; utilities capacity, quality, and reliability; economic development and regulatory context; and incentive capacity and capability. WPCP ranked second nationally for access to utilities and readiness of those utilities to serve the site. It was noted that all four New York State sites ranked first through fourth for the degree to which tax and non-tax incentives have been made available from the State and local governments. Lastly, three of the New York sites, including WPCP, ranked in the top five for economic development and regulatory support.

While all four New York State sites were among the most expensive in terms of construction costs, personnel, water and wastewater, and real estate and personal income taxes, the New York State sites had a competitive advantage on electricity and natural gas costs. On balance, the study concluded that New York State led all competitors in terms of the capacity, capability, and probability of delivering a meaningful incentives package.

The DEIS will include a summary of the prior New York State site selection process and detail why alternative semiconductor locations in New York State cannot accommodate the Proposed Project.

4.2.2 Alternative Sites and Design Options in Onondaga County

As previously noted, as part of its effort to develop a “shovel-ready” industrial park in Onondaga County, OCIDA evaluated a number of potential locations throughout the county. OCIDA ultimately selected WPCP as its preferred site to attract private industrial and commercial development because of its size, potential for industrial zoning, access to transportation, proximity of utilities, as well as a history of Town of Clay efforts to facilitate industrial development at the property.

The 2012 DGEIS prepared by OCIDA evaluated three (3) different site layouts for WPCP: 1) a layout that provided 1 million sf of development while avoiding all State-mapped wetlands; 2) a layout that provided 1.5 million sf of development that balanced approximately 4.2 acres of wetland impacts against the additional benefits from the larger size of development; and 3) a layout that provided over 2 million sf balanced against additional impacts to wetlands. OCIDA identified the **third alternative as the “preferred alternative” in the 2012 DGEIS** based on the overall economic returns versus the degree of environmental impacts. The DGEIS also included a 2012 engineering report evaluating three (3) options for extending sanitary sewer service to WPCP: 1) use of Verplank Road north of NYS Route 31; 2) use of the NYS Route 31 right-of-way; and 3) use of the Metropolitan Water Board (now OCWA) right-of-way south of NYS Route 31. The 2012 engineering report built from a 2003 feasibility study, the *Semi-NY Sewer Route Feasibility Study*, that evaluated five (5) sanitary sewer line routing options. OCIDA selected the third option for extension of sanitary sewer service to WPCP as the preferred alternative.

The 2021 Final SGEIS prepared by OCIDA revisited the question of whether WPCP was the preferred alternative to attract industrial and commercial development to Onondaga County, and compared it to the same alternative candidate sites that were assessed in the 2012 DGEIS, concluding that “[n]one of the previously considered alternative locations would be able to accommodate the large-scale industrial use that the [White Pine Commerce] Park is promoting due to size limitations and proximity to services and necessary infrastructure.” The 2021 Final SGEIS further concluded that significant expansion of WPCP was feasible and more likely to attract leading edge manufacturing, such as semiconductor manufacturing. The 2021 SGEIS assessed the additional potential significant adverse impacts from a larger facility (up to 4 million sf of manufacturing space) and increase in size of the development parcel to approximately 1,250 acres. OCIDA indicated in the SEQRA Findings Statement that “consistent with social, economic and other essential considerations from among the reasonable alternatives available, the action is the one that avoids or minimizes adverse impacts to the maximum extent practicable, and that adverse impacts will be avoided or minimized to the maximum extent practicable by incorporating as conditions to the decision those mitigation measures that were identified as practicable.”

The DEIS will include a summary of the prior Onondaga County site selection process, but will not include detailed impact assessment of any of the candidate sites included in that prior process.

4.2.3 Other Alternatives Considered but Determined Not Feasible

The DEIS will include a summary of other alternatives previously considered but determined not to be feasible, including an alternative that relies exclusively on alternative sources of energy (beyond use of renewable energy for purchased electricity).

The DEIS will also summarize previous Onondaga County Water Authority studies evaluating potential alternative sources of water.

4.3 ALTERNATIVES TO BE CONSIDERED IN THE DEIS

4.3.1 No Action Alternative

Under the No Action Alternative, WPCP would **delay OCIDA's long-standing** efforts to develop the WPCP, with a particular focus on development that will bring high-tech facilities and high paying jobs to Onondaga County. OCIDA's 2021 Final SGEIS concluded that development of up to 4 million sf of manufacturing space would avoid, minimize, or mitigate adverse environmental impacts to the maximum extent practicable. The WPCP would therefore remain vacant land until such time as OCIDA identified another development proposal for the WPCP.

4.3.2 The Proposed Project

Micron intends to build a semiconductor manufacturing facility campus (the “Micron Campus”) at the expanded WPCP, which will be built-out over an approximately 20-year period with four

Fabs. It is expected that Fabs will be continuously fit-out and construction on the next Fab will be in sequence as the prior Fab finishes fit-out. The DEIS will analyze an interim analysis year of 2031 with Fab 1 in operation and Fab 2 under construction and anticipated completion of major off-site transportation improvements,⁶ 2037 with Fab 1 and Fab 2 operating and construction of Fab 3 underway, as well as a final analysis year of 2041 with all four Fabs in operation with on-going fit-out of Fab 4).

4.3.3 The Proposed Project with No Access from US Route 11

Micron intends to build a site access road from US Route 11 in the Town of Cicero to facilitate construction and operation access to the Proposed Project once construction of Fab 3 commences. The DEIS will analyze an alternative access scenario that eliminates this site access road from the Micron Campus to US Route 11. In this alternative, all access to the Micron Campus would be from NYS Route 31 and Caughdenoy Road.

4.3.4 Alternative Internal Configurations of the Proposed Project

Consistent with the requirements of the Clean Water Act (Section 404(b)(1)), which governs the filling of wetlands, Micron must demonstrate that the Proposed Project is the least environmentally damaging practicable alternative (“LEDPA”). In accordance with USEPA “Guidelines for Specification of Disposal Sites for Dredged or Fill Material (40 CFR Part 230), Micron has developed an alternative analysis to evaluate the reasonableness and practicableness of several on-site layout alternatives. The DEIS will consider these on-site layout alternatives.

4.3.5 Reduced Scale Proposed Project

The DEIS will consider an alternative development site plan reflecting a reduced scale of the Proposed Project, which would comprise only the first two Fabs, as described above. All of the same off-site improvements would be considered as part of the Reduced Scale Proposed Project and while the improvements would be scaled to the requirements of the smaller project, the areal extent of disturbance to construct those conveyances would be substantially similar to that required for the Proposed Project while only realizing half of the economic and social benefits from the Proposed Project.

The purpose of this alternative is to assess significant adverse effects from a reduced scale project and compare such effects to the Proposed Project.

⁶ The 2031 interim year analysis will evaluate any traffic, air quality, noise, and construction impacts for what is projected to be a peak of operations and construction employment. For other areas of impact analysis, the 2037 analysis year representing completion of Fab 1 and Fab 2 will be used to reflect the larger amount of project completion at that time.

TABLE 1 SUMMARY OF ALTERNATIVES CONSIDERED OR TO BE CONSIDERED

Alternatives Considered	Status of Alternative
Alternative Sites Considered in New York State	
STAMP in Genesee County	Withdrawn from further consideration because some development has already occurred, and the remaining parcel is too small for the proposed project.
Marcy Nanocenter in Oneida County	Withdrawn from further consideration because the site was previously developed into a manufacturing facility for Wolfspeed.
Luther Forest Technology Campus in Saratoga County	Withdrawn from further consideration because, since 2012, GlobalFoundries has operated a semiconductor manufacturing facility on this site.
Previous Alternatives Considered in OCIDA 2013 Generic EIS (GEIS) for White Pine Commerce Park	
Radisson Corporate Park	Withdrawn from further consideration because it lacked room and did not offer the location specific advantages such as proximity to Interstate 81.
Hancock Air Park	Withdrawn from consideration because it could not easily accommodate large-scale industrial uses.
Collamer Crossings Business Park	
Syracuse Research Park	
Concept 1: 1 million square foot development – no wetland impacts	
Concept 2: 1.5 million square foot development – 4.2 acres of wetland impacts	Withdrawn from consideration because it could not easily accommodate large-scale industrial uses.
Concept 3: 2 million square foot development – additional wetlands impacts	
Concept 3: 2 million square foot development – additional wetlands impacts	
Previous Alternatives Considered in OCIDA 2021 Supplemental GEIS for White Pine Commerce Park	
Alternative 1: Retain site as open space	Withdrawn from consideration because it could not easily accommodate large-scale industrial uses.
Alternative 2: Same as Concept 3 in OCIDA’s 2013 GEIS	Withdrawn from consideration because it could not easily accommodate large-scale industrial uses.
Alternative 3: Comparable to Alternative 2 but at smaller scale	
Preferred Alternative: 4 million square feet development – additional wetlands impacts	OCIDA identified this alternative as the preferred alternative in the Supplemental GEIS based on the overall economic returns versus the degree of environmental impacts.
Other Alternatives Considered but Determined to be Not Feasible	
Alternative Energy Sources	The DEIS will describe how Micron’s Proposed Project could not rely exclusively on alternative energy sources (beyond use of renewable energy for purchased electricity) before reliable energy sources are identified and developed.
Alternatives to be Considered in the Draft EIS for the Micron Semiconductor Fabrication Project	
No Action	These alternatives will be considered in the DEIS for the Micron Semiconductor Fabrication Project in Clay, NY.
Proposed Project (4 fabs)	
Proposed Project No Access from US Route 11	
Proposed Project Alternative Internal Configurations* – Options 2, 3, 4, 5, 6 and 7	
Reduced Scale Proposed Project (2 fabs)**	

* Note: Proposed Project– Alternative Internal Configuration Option 1 is the Proposed Project (4 fabs).

** This alternative is similar to the Preferred Alternative: 4 million square feet development identified in the OCIDA 2021 SGEIS.

5 Analysis Framework

This section outlines the analytical framework that will be used to complete the DEIS. It describes the reasoning behind the chosen analysis year(s) and study area(s) and outlines the methodology used to establish baseline conditions from which the environmental effects will be analyzed.

5.1 ORGANIZATION OF THE ENVIRONMENTAL IMPACT STATEMENT

Preparation of the DEIS will conform to 6 NYCRR Part 617.9(b). The Proposed Project will be evaluated for potential significant adverse effects to the Project Site⁷ and applicable study areas for all relevant environmental technical categories in accordance with applicable SEQRA requirements. The DEIS will consider short-term (construction) and long-term (operational) effects (including direct and indirect effects) of the Proposed Project. Cumulative impacts will also be addressed, as applicable. The DEIS will identify proposed mitigation for any significant adverse environmental impacts. The DEIS shall include a list of all Involved and Interested Agencies to which copies of the DEIS and supporting material will be distributed. See Table 2, "Preliminary List of SEQRA Lead, Involved, and Interested Agencies," and Table 3, "Preliminary List of Federal Agencies," in Section 6.

Consistent with those regulations, the DEIS technical chapters are proposed as shown below. Appendices of the DEIS will contain any detailed technical studies used to complete the DEIS.

- Cover Sheet (see below)
- Table of Contents
- Executive Summary
- Chapter 1 – Purpose and Need
- Chapter 2 – Project Alternatives and Description of the Proposed Project
- Chapter 3 – Land Use, Zoning, and Public Policy
- Chapter 4 – Community Facilities, Open Space and Recreation
- Chapter 5 – Socioeconomic Conditions
- Chapter 6 – Environmental Justice
- Chapter 7 – Historic and Cultural Resources
- Chapter 8 – Visual Impacts and Community Character
- Chapter 9 – Geology, Soils, and Topography
- Chapter 10 – Water Resources
- Chapter 11 – Ecological Communities and Wildlife
- Chapter 12 – Solid Waste
- Chapter 13 – Hazardous Materials

⁷ References to the "Project Site" refer to any location where elements of the Proposed Project or off-site improvements will be constructed.

- Chapter 14 – Transportation
- Chapter 15 – Air Quality
- Chapter 16 – Greenhouse Gas Emissions and Climate Change
- Chapter 17 – Noise and Vibration
- Chapter 18 – Utilities and Infrastructure
- Chapter 19 – Use and Conservation of Energy
- Chapter 20 – Construction
- Chapter 21 – Permits
- Chapter 22 –Cumulative Impacts
- Chapter 23 – Unavoidable Adverse Impacts
- Chapter 24 – Growth Inducing Aspects
- Chapter 25 – Irreversible and Irrecoverable Commitment of Resources
- Chapter 26 – Mitigation
- Appendices

Consistent with 6 NYCRR Part 617.9(b)(3), the DEIS Cover Sheet shall:

- (i) identify the document as a DEIS;
- (ii) identify the name of the Proposed Project;
- (iii) identify the location of the Proposed Project;
- (iv) identify the name and address of the Lead Agency and the contact information of a person at the agency who can provide further information;
- (v) identify the names of individuals and organizations that prepared any portion of the DEIS;
- (vi) identify the date the DEIS was accepted as complete with respect to the Final Scope by the Lead Agency; and
- (vii) identify the date of the DEIS Public Hearing and the closing of the Public Comment Period.

5.2 ANALYSIS YEARS

The following analysis years (build years) will be included in the DEIS for the Proposed Project. Selection of analysis years is based on Micron's projected operations and construction employment and peak levels of activities:

- 2031 — Interim analysis year with Fab 1 in operation and Fab 2 under construction and anticipated completion of major off-site transportation improvements⁸;

⁸ The 2031 interim year analysis will evaluate any traffic, air quality, noise, and construction impacts for what is projected to be a peak of operations and construction employment. For other areas of impact analysis, the 2037 analysis year representing completion of Fab 1 and Fab 2 will be used to reflect the larger amount of project completion at that time.

- 2037 — Interim analysis year with Fab 1 and Fab 2 operating and construction of Fab 3 underway; and
- 2041 — All four Fabs in operation with on-going fit out of Fab 4.

Specific study areas for technical evaluations will be established and described in each chapter as appropriate (i.e., traffic intersections for analysis).

5.3 METHODOLOGIES FOR TECHNICAL ANALYSES

5.3.1 Technical Studies

The environmental review will include site-specific evaluations and studies of the full range of technical areas needed to comply with SEQRA. The following bullets identify the key environmental topics that could result in potential adverse impacts that will be studied. If environmental analysis reveals any significant adverse impacts, the document will identify any reasonable measures to minimize or mitigate those impacts. To the extent applicable, prior studies completed by OCIDA as part of its generic environmental impact statements will be referenced in the site-specific assessments completed as part of the current environmental impact statement.

- **LAND USE, ZONING, AND PUBLIC POLICY:** This analysis will assess land use, zoning, and public policy, including relevant New York State policy related to Green CHIPS. Zoning compliance of the Proposed Project will be assessed where project elements are proposed. The study area for the land use assessment will be one mile from the Micron Campus as well as, where relevant, any other areas where off-site development is proposed to occur. Public policy assessments will cover the Town of Clay, Town of Cicero, and Onondaga County, as appropriate. This analysis will also identify reasonably foreseeable development projects (projects known or likely to be built within the time horizon of the Proposed Project in the study area) based on information obtained from the Town of Clay, Town of Cicero, and Onondaga County. Changes in land use and/or zoning that may result from the Proposed Project, either directly or indirectly, will be described and evaluated. Consistency with any applicable local or regional policies, including the SMTC 2050 Long Range Transportation Plan, Onondaga County Comprehensive Plan, Onondaga County Climate Action Plan, Town of Clay Comprehensive Plan (if available; draft anticipated in March 2024), Town of Clay Northern Land Use Study, Town of Clay Local Waterfront Revitalization Program (LWRP) (for proposed modifications to the Oak Orchard WWTP), Town of Cicero Comprehensive Plan (if available; draft anticipated in April 2024), and City of Oswego LWRP (for proposed improvements to water supply infrastructure) will be evaluated.
- **COMMUNITY FACILITIES/OPEN SPACE AND RECREATION:** The police, fire, emergency, and community service providers within the Town of Clay and the Town of Cicero, and school district(s) that serve the Proposed Project will be identified and the impacts to each service will be analyzed with potential mitigation identified where significant adverse impacts are identified. The relevant Town of Clay and Town of Cicero departments will be consulted regarding the

existing staffing of emergency services; planned changes to staffing levels, service levels, equipment and/or facilities; and how those departments would respond to emergency situations at the site. The DEIS will assess potential impacts of the Proposed Project on staffing levels, service levels, equipment and/or facilities on- and off-site. The chapter will discuss separation distance between buildings, proposed fire access, and construction in accordance with applicable building and fire codes. The chapter will also describe and map existing parks and recreational resources on-site and within one mile of the Micron Campus, including walking paths and trails. Using information made available by the State/County/Town parks agencies, the assessment will include a discussion of planned changes to existing parks and recreational resources, and/or development of new parks and recreational resources anticipated to occur in the future without the Proposed Project. Potential direct and indirect impacts of the Proposed Project on parks and recreational facilities will be assessed. Operations of the Proposed Project may result in new residential populations that may generate additional school children. The DEIS will identify enrollment trends for the following school districts and will identify whether any of these school districts may require capacity enhancements: North Syracuse Central School District (CSD), Baldwinsville CSD, Liverpool CSD, Central Square CSD, and Phoenix CSD.

- **SOCIOECONOMIC CONDITIONS:** This analysis will examine the potential direct and indirect effects of the Proposed Project on population, housing, and economic activities within local and regional study areas. The local study area will be the Town of Clay, and the regional study area will include Onondaga County and surrounding counties in the Central New York region (the area from which most Micron employees would reside). The analysis will use a variety of data sources including the U.S. Census Bureau, New York State Department of Labor, Syracuse Metropolitan Transportation Council (SMTC), OCIDA, Empire State Development (ESD), and study area municipalities to present: existing demographic and workforce characteristics; changes that are expected to occur in the future independent of the Proposed Project; and the potential impacts of the Proposed Project. The impact assessment will consider changes in demographics and housing costs, property taxes, changes in labor supply and effects on existing businesses, and municipal costs generated by the Proposed Project. In addition to considering potential adverse effects, the analysis will describe anticipated social and economic benefits such as jobs, economic and workforce development opportunities, and municipal and state tax revenues. **The DEIS will also describe Micron's efforts to work with community leaders through the Community Engagement Committee (CEC) (an entity convened by the Governor's Office, Micron, and local elected officials) to consider how project benefits can be distributed throughout the affected communities, including to communities of color or low-income communities. This is necessary to issue findings where agencies must balance social and economic considerations against environmental impacts that cannot be avoided or mitigated.**
- **ENVIRONMENTAL JUSTICE:** The environmental justice study area will include all census block groups that are within or intersect a 10-mile radius of the Proposed Project as well as the area that

could be affected by changes in traffic patterns resulting from the Proposed Project. The environmental justice study area also encompasses the areas that would be affected by the off-site improvements. Pursuant to the Laws of New York (2022) ECL § 8-0113(2)(b), this analysis will consider the direct or indirect impacts of the Proposed Project on any identified low-income, minority, or “disadvantaged communities” (as defined in ECL § 75-0101(5)), including whether the Proposed Project may cause or increase a disproportionate pollution burden on those communities. This analysis will also follow Executive Order 12898 on Environmental Justice, “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,” Executive Order 14008, “Tackling the Climate Crisis at Home and Abroad,” and Executive Order 14096, “Revitalizing our Nation’s Commitment to Environmental Justice for All,” to determine whether the Proposed Project will result in any disproportionate and adverse impacts on minority or low-income populations (in anticipation of consistency with federal guidelines as part of federal NEPA review or permitting for the Proposed Project). This analysis will also describe the public outreach undertaken to inform and involve minority and low-income populations who may be affected by the Proposed Project.

- **HISTORIC AND CULTURAL RESOURCES:** This analysis will document the Proposed Project’s impact on historic and cultural resources consistent with Section 14.09 of the New York State Historic Preservation Act, and NYSDEC Commissioner Policy 42, “Contact, Cooperation, and Consultation with Indian Nations.” An Area of Potential Effects (APE) (study area) will be defined for potential direct effects covering any location where construction would occur as well as a ¼-mile study area for potential indirect effects where construction activities would result in permanent above-ground features that could have the potential to indirectly affect historic architectural resources. The New York State Office of Parks, Recreation, and Historic Preservation (OPRHP) Cultural Resources Information System (CRIS) will be consulted to identify if there are any known listed or eligible structures within the APE. Additionally, any previously unidentified historic resources in the APE will be identified and evaluated. The evaluation will assess the potential of the Proposed Project to affect historic and cultural resources in the APE including buried archaeological resources through consultation with the New York State Historic Preservation Office (SHPO). It is anticipated that Section 106 of the National Historic Preservation Act compliance would be completed by a Federal agency as part of federal permitting for the Proposed Project.
- **VISUAL IMPACTS AND COMMUNITY CHARACTER:** This analysis will evaluate the Proposed Project for potential visual and community character impacts within a five-mile radius of the Micron Campus and ¼-mile from the Childcare Site and rail spur site (which are included within the five-mile radius of the Micron Campus) and ¼-mile from above-ground structures associated with the off-site improvements. This section of the DEIS will detail the existing aesthetic characteristics of the WPCP and surrounding area through descriptive text and representative photographs including a description of prevalent landforms and vegetative cover. Potential changes in views of the Proposed Project and its surroundings will be evaluated through comparisons of post-development conditions to the existing conditions and to the established

aesthetic character of the surrounding area. The analysis will identify and describe significant views into the existing WPCP from a range of representative publicly accessible vantage points and aesthetic resources and the preservation of existing vegetative buffers. The visual and architectural character of the Proposed Project, with special attention to the site lighting and off-site visibility of buildings and structures will be assessed. Assessment of impacts shall be based on the NYSDEC Program Policy document "Assessing and Mitigating Visual and Aesthetic Impacts" last revised December 13, 2019.

- **GEOLOGY, SOILS, AND TOPOGRAPHY:** This analysis will identify the major geologic and soil conditions within areas where construction of the Proposed Project and off-site improvements would occur, focusing on suitability of the property for development and stormwater management purposes, as applicable. The analysis will use information readily available from the United States Department of Agriculture's Natural Resources Conservation Service (e.g., soil survey) as well as the geotechnical investigation of the Micron Campus to complete this chapter. Any soils classified as prime agricultural soils will be identified. The assessment will also include a slope map and discussion of proposed modifications to site topography including categories of 0-10%, 10-15%, 15-25% and 25% or greater. A summary of the geotechnical investigation and cut and fill analysis for the Micron Campus will also be included.
- **WATER RESOURCES:** This analysis will address the potential impacts to water resources present on the Project Site or in any area impacted by off-site improvements, including groundwater, streams and wetlands. Groundwater levels will be described from geotechnical investigations. Wetlands will be delineated using the three-part standard outlined in the 1987 U.S. Army Corps of Engineers delineation manual, with the boundaries verified through the Jurisdictional Determination process. New York State regulated wetlands will also be delineated pursuant to the standards set forth at Article 24 of the Environmental Conservation Law and NYSDEC's freshwater wetlands regulations set forth at 6 NYCRR Part 663. Any water resources will be characterized and any potential adverse impacts to them will be assessed and potential mitigation identified. The DEIS will include an assessment of wetland functions and services. A physical and chemical characterization of Youngs Creek will be presented in the DEIS based on site reconnaissance. The Proposed Project's location with respect to any floodplain would also be documented. A Stormwater Pollution Prevention Plan (SWPPP) prepared pursuant to the NYSDEC *Stormwater Management Design Manual* will be prepared for the Proposed Project and included as an appendix to the DEIS. Potential impacts of stormwater generated by the Proposed Project on streams and wetlands will be described in the DEIS. While specific impacts and mitigation measures are not known at this time, impacts to streams and wetlands from the Proposed Project are likely. Stream and wetland mitigation could include on-site or off-site stream or wetland creation, restoration, or enhancements approved by USACE and NYSDEC. The wetland delineation report and draft conceptual compensatory mitigation plan will be included as an appendix to the DEIS.
- **ECOLOGICAL COMMUNITIES AND WILDLIFE:** This analysis will address the potential impacts to ecological communities (terrestrial and aquatic) and wildlife. The U.S. Fish & Wildlife Service

(USFWS) Information, Planning, and Consultation System (IPaC) and New York State Natural Heritage Program database will be queried for any known or potential threatened or endangered species within the study area, which includes the Project Site as well as any areas where off-site improvements would be constructed. This will include an assessment for the presence of, and potential impacts to, threatened and endangered species for all linear utility construction projects, new infrastructure, and the expansion of existing infrastructure (e.g., Oak Orchard Wastewater Treatment Plant and the Lake Ontario water filtration plant). Consultation with NYSDEC and USFWS to develop protocol for assessing presence of habitat for any identified species and protocol for assessing potential impacts to any identified species will be undertaken. Summaries of field studies will be included as an appendix to the DEIS. The DEIS will include characterization of wildlife within the Project Site based on literature review and field observations collected seasonally, including winter and migration seasons. Field studies will identify existing plant species that are invasive, non-native, or both invasive and non-native. Field studies will also include characterization of aquatic wildlife (biology) within Youngs Creek. Potential impacts to wildlife that will be considered in the DEIS include, but are not limited to, habitat fragmentation, noise, lighting, pollution, human activity and traffic. The DEIS will include a commitment to prepare and implement an invasive species management plan as a condition of site plan approval.

- **SOLID WASTE:** This analysis will describe the proposed generation of solid waste by the Proposed Project and how that material will be handled, stored, and transported. This analysis will describe Micron's proposed measures to reduce generation of solid waste through reuse or recycling. This analysis will describe Onondaga County's Solid Waste Management Plan and how the Proposed Project would comply. The analysis will consider the capacity of the existing waste management network and the ability to accept increased volumes generated by the Proposed Project as well as the anticipated population growth in the study area. Approximate timing of expansion of waste or recycling facilities, if needed, will be discussed.
- **HAZARDOUS MATERIALS:** The assessment of hazardous materials will include Phase I environmental site assessments compatible with American Society for Testing and Materials (ASTM) standards (E1527-21) to identify potential areas of concern within areas where construction of the Proposed Project would occur. All pertinent environmental databases will be reviewed for each off-site improvement area and site inspections will be conducted where feasible. Phase II environmental sampling would be conducted as needed and to the extent practicable. Any warranted remedial approaches for addressing identified or potential contaminated materials would be described. The chapter will identify any hazardous materials (including any chemical or petroleum bulk or other storage) that would be used, stored, transported, or generated by the Proposed Project and measures to protect against releases to the environment and impacts to human health, including worker safety. Hazardous wastes as identified in 6 NYCRR Part 371.4 that the Proposed Project may generate will be described, including the type of hazardous waste anticipated to be generated, estimated volumes, storage methods, disposal options, and how the facility will comply with hazardous waste

regulations at 6 NYCRR Part 370-373. Potential mitigation measures to be considered include an evaluation of methods to reduce generation of hazardous waste.

- **TRANSPORTATION:** Construction and operation of the Proposed Project can be expected to generate a substantial number of new vehicular trips on the local and regional highway network including local roads and I-81 and NYS Route 481. The DEIS will describe the existing transportation network, project conditions in the future with and without the Proposed Project and will assess potential impacts associated with the Proposed Project, such as changes to intersection and roadway capacity and Levels of Service as well as access to existing and anticipated uses along key highway corridors serving the Project Site. In consultation with NYSDOT, New York State Thruway Authority, and Onondaga County Department of Transportation, automatic traffic recorder (ATR), turning movement counts (TMC), and vehicle classification counts (VCC) will be conducted. See Appendix A for additional information on the locations of proposed traffic data collection. Analysis will consider the effects of Proposed Project operations and construction, including during times when both operations and construction overlap. The DEIS will also describe the site driveways, internal circulation roadways, and parking facilities that will be part of the Proposed Project and designed to accommodate peak employee demand and on-going construction activity. The regional travel demand model developed by the Syracuse Metropolitan Transportation Council (SMTC), the designated Metropolitan Planning Organization (MPO) for the area serving the Project Site, will be used to identify existing and projected travel patterns on area roadways throughout the region. A sub-area section of SMTC's model will be used to provide the analysis foundation for a Visum transportation planning model to assign routing through the regional study area. Micro-simulation modeling of roadways and intersections within the study area will be conducted with either Vissim or Synchro traffic analysis modeling tools to analyze potential impacts of the Proposed Project in coordination with NYSDOT. Additional evaluations of existing crash patterns related to addressing safety, signal functionality, signing and striping, roadway lighting, and ITS systems will be completed to propose future improvements designed to increase safety and service in the area. While specific impacts and mitigation measures are not known at this time, impacts to area roadways due to additional traffic (during construction and during operations) from the Proposed Project are likely. Traffic mitigation may include improvements to area roadways or construction of new roadways. The DEIS will identify any proposed traffic improvements and a timetable for their implementation.

The Transportation assessment will also include an identification of, and assessment of potential impacts from the Proposed Project and off-site improvements to, transit systems operating within Onondaga County as well as the CSX freight rail operations using the railroad line adjacent to the Micron Campus.

- **AIR QUALITY:** This analysis will assess mobile source and stationary source air emissions from the Proposed Project, including air emissions from operation of the fabs as well as the increased vehicular traffic on the local and regional roads and highways. The mobile source air quality analyses will be performed in accordance with the procedures found in the NYSDOT *The*

Environmental Manual (TEM), the USEPA guidance on project-level analyses, and the FHWA's current guidance on Mobile Source Air Toxic (MSAT) analysis. Potential air quality effects associated with construction activities will also be assessed. Overall, transportation conformity is not applicable to projects in Onondaga County. Consistent with the Clean Air Act and the Final Transportation Conformity Rule, the assessment will determine whether any regional or localized impacts to air quality (beneficial or detrimental) will result from the Proposed Project, including whether the Proposed Project would cause or contribute to any new violation of any National Ambient Air Quality Standards (NAAQS) in any area or increase the frequency or severity of any existing violation of any NAAQS in any area, or delay timely attainment of any NAAQS or any required interim emission reductions or other milestones in any area.

The Proposed Project will require a stationary source air pollution control permit for the new manufacturing facilities. The air pollution control permit application will include evaluation of pollutants subject to NAAQS, New York air toxic control and ambient air requirements, and a Climate Leadership and Community Protection Act (CLCPA) greenhouse gas evaluation. The DEIS will summarize these detailed air quality modeling and impact assessment analyses that will be prepared to support the air pollution control permitting process and address potential impacts to human health from project related air emissions.

- **GREENHOUSE GAS AND CLIMATE CHANGE:** This analysis will estimate greenhouse gas (GHG) emissions from embodied carbon (carbon embodied in building materials) and construction activities and will describe anticipated facility design features that will minimize energy consumption and GHG emissions. This analysis will use the Motor Vehicle Emission Simulator (MOVES). Following the rule of reason (*Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews*), MOVES can be used for calculation of mobile source GHG emissions as inputs are available from use in the NAAQS related analysis. The GHG assessment will also follow applicable standards or guidance from the New York State CLCPA.
- **NOISE AND VIBRATION:** The Proposed Project will have the potential to increase noise levels based on construction activities and operation of the proposed facility. The increase in vehicular traffic is also likely to result increase in noise levels both on- and off-site. Noise standards as available from applicable local, state, and federal will be reviewed and used to establish impact thresholds and criteria. Traffic noise measurement and modeling methodology will use the NYSDOT TEM, Section 4.4.18, "Noise Analysis Policy and Procedures" (or "NYSDOT Noise Policy") and will use FHWA Traffic Noise Model (TNM) 2.5 to perform the traffic noise analyses. The assessment of potential noise impacts will also be conducted following the NYSDEC guidance document, "Assessing and Mitigating Noise Impacts" (DEP-00-1, Revised February 2, 2001).
- **UTILITIES AND INFRASTRUCTURE:** As noted in the Proposed Project description, there are substantial off-site infrastructure improvements that will be required to support the Proposed Project. The DEIS will identify and describe these required improvements and assess if the Proposed Project, with improvements (and acknowledging any measures that Micron can take to reduce

consumption of energy or water or generation of wastewater), has the potential to adversely affect the larger community in terms of potential impacts to water from operational usage, as well as sanitary sewer and industrial wastewater discharges. The analysis will also note connections to energy (electrical and natural gas) and telecommunications infrastructure, and capacity of those systems, as applicable.

- **USE AND CONSERVATION OF ENERGY:** This analysis will describe the Proposed Project's use and conservation of energy and measures that Micron intends to pursue to reduce energy consumption and use of renewable sources.
- **CONSTRUCTION IMPACTS:** This analysis will address impacts arising from the primary construction activities for the Proposed Project and off-site improvements, such as construction traffic on surrounding streets, noise and vibration, air quality (e.g., emissions from construction equipment), effects on adjacent historic structures, dewatering activities, and any hazardous materials that may be disturbed by construction activities. This assessment will also qualitatively discuss potential impacts associated with noise, air quality, water quality, and traffic impacts from construction of the Proposed Project.
- **CUMULATIVE IMPACTS:** The DEIS will consider any significant adverse impacts resulting from the incremental impact of the Proposed Project when added to other past, present, and reasonably foreseeable future actions. This chapter will identify the other projects or actions included in the assessment and summarize the cumulative impacts of the Proposed Project contained in each of the technical areas of evaluation.
- **UNAVOIDABLE ADVERSE IMPACTS:** This chapter will identify any impacts that are unavoidable and that cannot be reasonably mitigated.
- **GROWTH INDUCING ASPECTS OF THE PROPOSED PROJECT:** This chapter will focus on whether the Proposed Project will have the potential to induce new development within the surrounding area, including, but not limited to, White Pine South, an approximately 105-acre parcel south of the Micron Campus and NYS Route 31. As noted, one of the purposes of the Proposed Project will be to create both direct and indirect employment opportunities in Central New York. The DEIS will evaluate the environmental impacts that arise from such economic enhancements and new development.
- **IRREVERSIBLE AND IRRETRIEVABLE COMMITMENT OF RESOURCES:** This chapter will include a discussion of any irreversible or irretrievable commitments of resources.
- **MITIGATION:** This chapter will summarize any mitigation measures required to avoid, minimize or mitigate identified significant adverse effects. Mitigation measures will be described in detail in the technical analyses. While specific impacts and mitigation measures are not known at this time, impacts to wetlands and area roadways due to additional traffic (during construction and during operations) from the Proposed Project are likely. Wetland mitigation could include on-site or off-site wetland enhancements approved by USACE and NYSDEC. Traffic mitigation could include physical enhancements to area roadways, railways, and/or

signal timing changes approved by the Federal Highway Administration (FHWA), NYSDOT or Onondaga County.

6 Agency and Public Coordination

Agency and public coordination are an integral component at all stages of planning and project development, including in this SEQRA scoping process.

6.1 AGENCY COORDINATION ACTIVITIES

The agency coordination process will include coordination with various Federal, State, and local agencies (see Table 2, "Preliminary List of SEQRA Lead, Involved, and Interested Agencies" and Table 3, "Preliminary List of Federal Agencies").

OCIDA, as the lead agency for the Proposed Project, has coordinated with Micron to identify Involved and Interested Agencies to be informed and involved throughout the environmental review.

An "Involved Agency" means "an agency that has jurisdiction by law to fund, approve or directly undertake an action. If an agency will ultimately make a discretionary decision to fund, approve or undertake an action, then it is an 'involved agency' notwithstanding that it has not received an application for funding or approval at the time the SEQR process is commenced. The lead agency is also an 'involved agency'" (6 NYCRR 617.2(f)).

An "Interested Agency" means "an agency that lacks the jurisdiction to fund, approve or directly undertake an action but wishes to participate in the review process because of its specific expertise or concern about the proposed action. An 'interested agency' has the same ability to participate in the review process as a member of the public" (6 NYCRR 617.2(u)).

TABLE 2 PRELIMINARY LIST OF SEQRA LEAD, INVOLVED, AND INTERESTED AGENCIES

Agency	Potential Role	Responsibilities
Lead Agency		
Onondaga County Industrial Development Agency (State environmental review lead)	Lead Agency	SEQRA leadership and coordination, establishing final entitlement of White Pine Industrial Park and coordination of land development agreements. Sale of OCIDA property to Micron. Potential property condemnation pursuant to New York Eminent Domain Procedure Law.
Involved and Interested Agencies		
New York State Department of Environmental Conservation	Involved Agency	Title V air quality permitting, wetlands jurisdictional determination and permitting, consultation related to threatened & endangered species, SWPPP permits for on-site and off-site land disturbance, modification to existing SPDES discharge for Oak Orchard WWTP, Section 401 water quality certification, hazardous petroleum and chemical bulk storage, and SPDES Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity.
New York State Empire State Development	Involved Agency	Approval of Excelsior Jobs Program Green Chips Project Application.
New York State Office of Parks, Recreation and Historic Preservation (OPRHP)	Involved Agency	Consultation related to potential impact to historic and cultural resources. OPRHP serves as the New York SHPO.
New York State Department of Transportation	Involved Agency	Consultation in traffic impact evaluation and mitigation measures to address adverse transportation impacts on state routes and interstate highways. Potential property condemnation pursuant to New York Eminent Domain Procedure Law.
Syracuse Metropolitan Transportation Council (SMTC)	Interested Agency	General consultation and approval actions to add to official regional transportation plans.
Onondaga County Department of Planning	Interested Agency	General consultation.
Onondaga County Dept. of Transportation (OCDOT)	Involved Agency	Consultation in traffic impact evaluation and mitigation on county routes. Potential property condemnation pursuant to New York Eminent Domain Procedure Law.
Town of Clay Planning Board	Involved Agency	Site Plan/Subdivision (re-subdivision of multiple parcels) approvals including MS4/SWPPP approval.
Town of Cicero Town Board	Interested Agency	Referral per General Municipal Law.
Town of Cicero Planning Board	Involved Agency	Subdivision Approval.
City of Syracuse	Interested Agency	General consultation.
New York Power Authority	Involved Agency	Proving high-load factor energy allocation and ReCharge expansion energy allocation.
New York State Energy Research Development Authority	Interested Agency	Collaborating on Excelsior Jobs Program Green Chips Project Application..
Onondaga County Department of Water Environment Protection	Involved Agency	Enlarging wastewater treatment capacity and extending sewer lines to the Micron Campus; Modification of OCDWEP's SPDES Permit by NYSDEC; issuance of an Industrial Wastewater Discharge Permit from OCDWEP to Micron Campus.
Onondaga County Water Authority	Involved Agency	Extending potable water lines to the Micron Campus.

TABLE 3 PRELIMINARY LIST OF FEDERAL AGENCIES

Federal Agencies	
US Dept. of Commerce	Approval of CHIPS Act funding application.
US Army Corps of Engineers (USACE)	Issue 404 Wetlands permit.
Federal Highway Administration	Consultation on the need and design of alterations to the national highway system and the interstate highway system to mitigate identified adverse traffic impacts.
U.S. Environmental Protection Agency	NEPA advisory role (i.e., Environmental Justice) and consultation related to the issuance of federally-delegated Clean Air Act and Clean Water Act permits to be issued by New York State Department of Environmental Conservation.
U.S. Department of Interior, Office of Environmental Policy and Compliance	Consultation related to Section 4(f) of the U.S. Dept. of Transportation Act.
U.S. Fish & Wildlife Service	Consultation on federal Endangered Species Act compliance.

Appendix A

TRAFFIC STUDY AREA

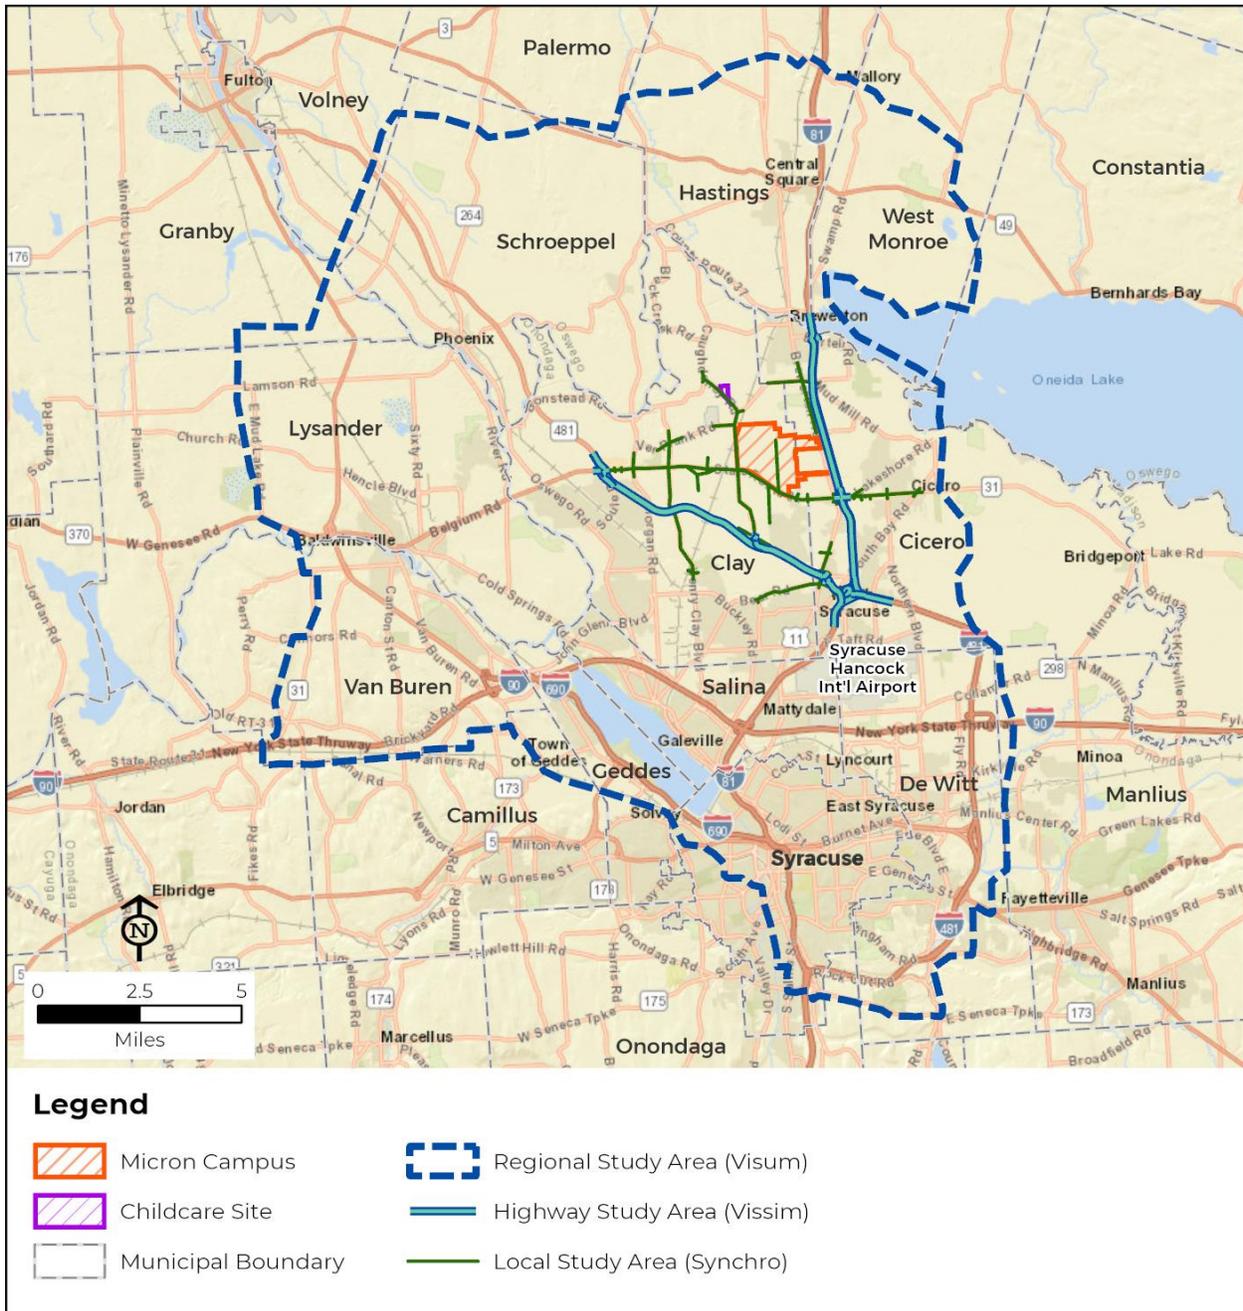

It is expected that traffic due to the Proposed Project, which includes construction workers, Micron employees, and community jobs induced by the Proposed Project, will be distributed throughout Onondaga County and beyond. The DEIS will focus on the immediate area around the Proposed Project and will examine potentially impacted traffic areas through regional, highway, and local analyses. The regional analysis will focus on the broader transportation network links within a roughly 30-minute driving commute of the proposed Micron Campus because this is the area that is expected to experience the largest increases in traffic volume. Within this area, all major highways in the greater Syracuse area are represented, and it is expected that trips coming from a greater distance to the Micron Campus, including from the City of Syracuse would be captured along these major access roadways. Additionally, the area allows other major projects in the area, such as the modifications to Interstate 81 (I-81) to be considered in the analysis.

The highway and local analyses will focus on the major highways, interstates, and intersections within a five-mile radius of the proposed Micron Campus. A 5-mile radius was chosen as this captures the locations most likely to be impacted by the Proposed Project.

The analyzed highway area includes sections of New York State Route 481/Interstate 481 (NY 481/I-481) and I-81. The analyzed local area will include 42 intersections along NY 31, United States Route 11 (US 11), Caughdenoy Road, Verplank Road, and other local streets.

The study area extents of the regional, highway and local study areas described above are shown in Figure A-1.

FIGURE A-1 TRAFFIC STUDY AREA

AUTOMATIC TRAFFIC RECORDER (ATR) COUNTS

Continuous 24-hour, two-way Automatic Traffic Recorder (ATR) counts will be collected at 190 locations within the New York State Department of Transportation (NYSDOT) jurisdiction, collected at 65 locations within the Onondaga County Department of Transportation (OC DOT), and collected at 36 locations within the New York State Thruway Authority (NYSTA) jurisdiction, each for a total of 7 days. The ATR counts will be collected by a third-party vendor using traffic data collection cameras or pneumatic tubes. ATR volume data summaries will be summarized in 15-minute intervals by location. The proposed ATR count locations, for each jurisdiction, are shown in Figure A-2.

TURNING MOVEMENT COUNTS (TMC)

Turning Movement Counts (TMCs) will be collected at 25 signalized and 7 unsignalized intersections within the NYSDOT jurisdiction and at 3 signalized and 6 unsignalized intersections within the OC DOT jurisdiction. A high-resolution video technology will be used to record vehicle classification TMC counts and crosswalk pedestrian volumes for two 5-hour time periods. The classified TMC counts will be compiled on two representative mid-weekdays (Tuesday, Wednesday, or Thursday) during the ATR count period nearest their location. The time periods chosen for reduction will be subject to the ATR results but is currently anticipated to be 5AM to 10AM and 3PM to 8PM. The number of conflicting pedestrians and bicyclists will be counted simultaneously with vehicle turning movement counts. Traffic recorded in the TMCs will be sorted into four classifications: Autos, Buses (including non-articulated buses, articulated buses and jitneys), Medium Trucks, and Heavy Trucks. The proposed TMC count locations are provided in Figure A-3.

VEHICLE CLASSIFICATION COUNTS (VCC)

29 ATR locations have been identified within the NYSDOT jurisdiction and 4 ATR locations have been identified within the NYSTA jurisdiction for Vehicle Classification Counts (VCCs). VCC shall be collected to provide detailed vehicle classification data over a 24-hour period during one of the three representative mid-weekdays (Tuesday, Wednesday, or Thursday). The VCC volume data summary will be summarized by location in 15-minute intervals. Traffic recorded for the VCCs will be sorted into four vehicle classifications: Autos, Buses (which would include non-articulated buses, articulated buses and jitneys), Medium Trucks, and Heavy Trucks. The proposed VCC ATR count locations are provided in Figure A-4.

A. Introduction

Micron New York Semiconductor Manufacturing LLC (Micron), a Delaware limited liability company (LLC) and wholly owned subsidiary of Micron Technology, Inc., is proposing to construct a semiconductor manufacturing campus (the “Micron Campus”) in the Town of Clay, New York, at the White Pine Commerce Park (WPCP), an approximately 1,400-acre industrial park controlled by the Onondaga County Industrial Development Agency (OCIDA). The Micron Campus, together with ancillary development on nearby properties, are referred to collectively as the “Proposed Project.” Off-site energy (natural gas and electricity), telecommunications, water, and wastewater utility improvements also will be required and are referred to as “off-site improvements” necessary for the Proposed Project. Rail spur improvements adjacent to the site are also considered off-site improvements.

After receipt of an Application for Financial Assistance from Micron, OCIDA circulated a notice of intent to serve as State Environmental Quality Review Act (SEQRA) (6 NYCRR Part 617) (New York Environmental Conservation Law §§8-0101 et seq.) Lead Agency on July 28, 2023. No objections to that notice were received during the 30-day period commencing on that date. At its regular meeting of September 14, 2023, OCIDA issued a Positive Declaration, indicating the need for an Environmental Impact Statement (EIS), and scheduled a public scoping meeting held on October 11, 2023. The Positive Declaration and notice of public scoping meeting was published in the Environmental Notice Bulletin on September 20, 2023. Notice of the public scoping meeting was placed in The Post Standard (Syracuse.com) – a newspaper of general circulation serving the broader Clay, New York area. Project information and a Draft SEQRA Scope were posted on OCIDA’s website (www.ongoved.com).

This document is an addendum to the Final SEQRA Scope. It identifies comments received through a public scoping process that ran from September 20, 2023, through October 31, 2023, including an in-person scoping meeting on October 11, 2023, at North Syracuse Junior High School.

Additional information on the Proposed Project and off-site improvements is contained in the Final SEQRA Scope.

B. Commenters on SEQRA Scope of Work

Individuals, elected officials, agencies, and organizations (“commenters”) were able to submit comments during the SEQRA scoping process in a variety of ways:

- Oral testimony was received during a public scoping meeting on October 11, 2023; and
- Written comments were received via mail and e-mail through October 31, 2023.

The list below identifies all commenters who submitted comments during the comment period. In some instances, commenters used more than one method for submitting comments.

All comment submittals (written and oral) were reviewed and substantive comments were allocated to comment categories. This document provides responses by comment category. When multiple commenters submitted similar comments, the similar comments were paraphrased and summarized in the respective comment categories, with effort taken to retain the substance and tone of the comments received. Each comment response includes a numbered cross-reference to the corresponding comment submittal(s). Attachment 1 is the full transcript of the public scoping meeting. Attachment 2 contains all written comments received during the public comment period.

AGENCY COMMENTS

- A. New York State Department of Environmental Conservation (NYSDEC) Region 7
- B. United States Fish & Wildlife (USFWS)
- C. Onondaga County Legislator Charles Garland
- D. Town of Clay Supervisor Damien Ulatowski

ORAL TESTIMONY AT PUBLIC SCOPING MEETING

1. Frank Sciortino
2. Jay Riordan | Cicero Democratic Committee and candidate for Town Council
3. Donald Hughes | Sierra Club
4. John Przepiora | Greening USA, Inc.
5. Mary Scanlon
6. Diana Elliott
7. Jim Nistico
8. Denise Androvette | Sierra Club member
9. Debra DeSocio | Sierra Club member
10. Peter Wirth | Climate Change Awareness and Action
11. Brian Heffron

WRITTEN PUBLIC COMMENTS

12. Frank Sciortino

13. Debra DeSocio | Central and Northern NY Sierra Club
14. Steve Erwin | Trucking Association of New York
15. Nathan Gunn
16. Minchin G Lewis
17. Audrey Fletcher
18. Paul Goldsman
19. Onondaga Audubon
20. Peter Wirth
21. Jill Shultz
22. Mary Lou Bender
23. Craig Polhamus
24. Richard Ellenbogen | Allied Converters, Inc.
25. Roger Caiazza
26. Michelle Fanelli
27. Brian Cocca
28. Center for Public Environmental Oversight
29. Sara Pieklik
30. CNY Sustainability Coalition
31. Sierra Club
32. Michael Wolfson
33. Frank Fowler
34. Jim Baker
35. Steve Strauss | Empire State Passengers Association¹

¹ Although this comment was received late, it was still considered by OCIDA and addressed in this Response to Comments.

C. Response to Agency Comments

New York State Department of Environmental Conservation (NYSDEC)

NYSDEC Comment 1: The DEIS should include a separate chapter addressing stormwater management which should include an evaluation of stormwater runoff (industrial and construction) and water quality. This section should identify the current requirements of NYSDEC's State Pollutant Discharge Elimination System (SPDES) Permits, including the Construction General Permit (GP-0-20-001) and Multi-Sector General Permit (GP-0-23-001), and also evaluate how these requirements will be met. Sufficient information should be developed to identify the approximate size and location of necessary stormwater management measures and outfalls during and after construction.

Response: Although stormwater impacts and management will be evaluated in the DEIS, it will not be in a separate chapter but will be included in the water resources chapter as part of the assessment of the Proposed Project's impact on surface waters. The Scope indicates that a Stormwater Pollution Prevention Plan (SWPPP) will be prepared for the Proposed Project and described in the DEIS (it will also be included as an appendix).

NYSDEC Comment 2: Due to the scale of the project and the anticipated need to have large areas of soil exposed at any given time, the DEIS should evaluate the soil characteristics that may cause or contribute to erosion on site. A reference should be developed to identify any supporting information or reports that will be included as an appendix. The Stormwater Pollution Prevention Plan (SWPPP) needs to address hydraulic changes pre- and post-construction, and all changes to hydrology from filling in any wetlands, streams, and drainage ways on site. It is important to note that while NYSDEC's Region 7 Division of Water and the Town of Clay will jointly evaluate the required SWPPP prepared by the Applicant, responsibility for the approval of the SWPPP lies with the Town of Clay as per the municipal separate stormwater sewer systems (MS4) General Permit (currently GP 0-15-003).

Response: The SWPPP will be prepared pursuant to the New York State Stormwater Management Design Manual (SMDM) and included in Micron's site plan application to the Town of Clay. Any soil characteristics that may cause or contribute to erosion will be identified in the SWPPP. Measures to protect against erosion during construction will also be identified in the SWPPP.

NYSDEC Comment 3: Stormwater management should pay particular attention to Chapter 3 of the New York State Stormwater Management Design Manual (SMDM) and its focus on Stormwater Management Planning. The SMDM requires a specific planning process when addressing stormwater management on a project site and guides the planner through steps to maintain pre-development natural hydrologic conditions of the site by application of environmentally sound development principles, such as green infrastructure, as well as treatment and control of runoff discharges from the site.

Response: Comment noted.

NYSDEC Comment 4: Identify additional potential development alternatives considering design and configuration changes to avoid or minimize potential impacts to wetlands, streams, and other sensitive natural resources. The area east of Burnett [sic] Road contains a large, forested wetland complex and portions of Youngs Creek; additional consideration should be given to avoiding development in this area.

Response: The Scope has been revised to indicate that the DEIS will consider two additional alternatives: 1) an alternative that evaluates the Proposed Project without access to and from US Route 11; and 2) an alternative that evaluates different internal configurations of Micron's proposed Fabs to determine to what extent impacts to wetlands, streams, and other natural resources on the Micron Campus can be avoided or minimized.

NYSDEC Comment 5: The DEIS should include a discussion of potential alternatives and mitigation that could reduce energy and fuel demands during construction and the long-term operation of the facility, including renewable energy sources.

Response: The Scope has been revised to indicate that the DEIS will include a summary of other alternatives previously considered but determined not to be feasible, including an alternative that relies exclusively on alternative sources of energy (beyond use of renewable energy for purchased electricity). The DEIS will also assess the proposed use and conservation of energy (including provisions for renewable energy sources). The DEIS will include an evaluation of energy impacts from construction and long-term operation of the facility, along with potential mitigation of those impacts.

NYSDEC Comment 6: Natural resource impacts associated with off-site infrastructure improvements (linear utility construction projects, pump stations, water intake and associated improvements, wastewater plant) should be evaluated and described in the DEIS, including the presence of, and impacts to, wetlands, waterbodies, and threatened and endangered species for. Horizontal drilling should be discussed and considered.

Response: The Scope has been revised to clarify that the DEIS will include an assessment of off-site improvements in each of the relevant subject areas, including natural resources. Proposed mitigation methods will be discussed.

NYSDEC Comment 7: The DEIS should include a table summarizing the amounts and types of wetlands, streams, and other waterbodies on the Proposed Project site, and those associated with the previous comment. The table should also quantify the impacts on these resources for phases 1 and 2, and the cumulative of both phases.

Response: Comment noted.

NYSDEC Comment 8: The DEIS should include a complete discussion on the avoidance and minimization of wetlands impacts, which are the first two analyses required prior to considering

wetland mitigation under implementing regulatory programs for Section 404 of the Clean Water Act and Article 24 of the New York State Environmental Conservation Law.

Response: The Scope has been revised to indicate that the DEIS will consider an alternative that evaluates different internal configurations of Micron's proposed Fabs to determine to what extent impacts to wetlands, streams, and other natural resources on the Micron Campus can be avoided or minimized.

NYSDEC Comment 9: The DEIS should include and discuss wetland creation and restoration prior to consideration of enhancement. Please see attachment B, which discusses DEC wetland mitigation requirements. This information should be discussed in the DEIS.

Response: The Scope has been revised to note that creation and restoration of wetlands would be considered prior to consideration of enhancement.

NYSDEC Comment 10: The DEIS should include the Proposed Project's onsite wetland delineation and compensatory mitigation package being developed by Micron and its consultants.

Response: The Scope has been revised to indicate that the wetland delineation report and draft conceptual compensatory mitigation plan will be included as an appendix to the DEIS.

NYSDEC Comment 11: The DEIS should address and discuss stream mitigation that will be completed to offset impacts to waterbodies on the Proposed Project site.

Response: The Scope has been revised to clarify that potential impacts (and any required mitigation) to streams will be assessed as part of the water resources assessment.

NYSDEC Comment 12: The DEIS should include an assessment of the functions and benefits of all the streams and wetlands on the Proposed Project site.

Response: The Scope has been revised to indicate that the DEIS will include an assessment of wetland functions and services.

NYSDEC Comment 13: The Acoustic Bat Survey Report and the Grassland Breeding Bird Survey Report, prepared for Micron New York by AKRF Inc. should be discussed and appended to the DEIS. The DEIS should reference Grass Land Bird Mitigation Requirements (attachment to comment letter)

Response: The Scope has been revised to indicate that the field reports for work conducted in Spring 2023 on bat habitat and grassland birds will be included as appendices to the DEIS.

NYSDEC Comment 14: The natural resource analysis of the Proposed Project should also include details on wildlife that likely use the site based on habitat types and any ancillary observations made by on-site natural resource consultants. The DEIS should discuss the impacts on the species associated with converting these habitats to an industrial site.

Response: The Scope indicates that the DEIS will include discussion of natural resources, including wildlife habitats, potential impacts and proposed mitigation.

NYSDEC Comment 15: The C-Class Youngs Creek (Water Index Number ONT-66-11-14), located east of Burnett [sic] Road, is continuously connected to the Oneida River (Water Index Number ONT-66-11) with no known impassable barrier. The site plan OCIDA included with the draft scope shows portions of the Proposed Project filling Youngs Creek. The DEIS should include information on any portions of Youngs Creek being filled or "culverted" and discuss how water in the stream will be managed.

Response: The Scope has been revised to note that field studies describing physical, biological, and chemical characteristics of Youngs Creek will be conducted as part of the DEIS.

NYSDEC Comment 16: A biological survey of Youngs Creek on the Proposed Project site should be completed to assess fish species composition in this stream and detail the effects on these species associated with any impact on the stream. The analysis should consider upstream and downstream impacts, and evaluate upstream and downstream instream habitat enhancement projects to mitigate potential onsite impacts.

Response: The Scope has been revised to include a requirement for field studies to characterize aquatic wildlife within Youngs Creek.

NYSDEC Comment 17: The DEIS should include further details to identify how surface and subsurface water resources will be evaluated. It should address potential on-site and off-site flooding and impacts to surface and groundwater, and an evaluation of impacts on surface water volume, including streams, wetlands, and drainage ways, and groundwater elevations during and after construction. Impacts to groundwater levels, quantity, and quality from filling wetlands should be assessed, including a groundwater hydrologic and hydraulic analysis of the impacts of placing fill in watersheds contributing to the project area. Special consideration should be given to filling wetlands, drainage areas, Youngs Creek, and its tributaries, including unmapped streams, and evaluate how fill may affect the surface and subsurface water flow and drainage patterns in the area and surrounding properties. Consider factors such as increased surface runoff, potential water flow redirection, and impacts on nearby waterbodies or stormwater management systems. Portions of this information are also needed as part of the SWPPP review. Points for consideration in the hydrologic/hydraulic analysis were identified.

Response: The Scope has been revised to clarify that the DEIS will identify both surface and subsurface water resources and impacts to those resources, including from construction, and potential mitigation of those impacts. See also Responses to NYSDEC Comments 1, 15, 16.

NYSDEC Comment 18: The DEIS should discuss how drainage will be maintained and how potential flooding would be mitigated.

Response: The DEIS will include the requested discussion.

NYSDEC Comment 19: NYSDEC supports documenting floodplains and recommends re-evaluating and updating floodplain mapping for any significant grade changes.

Response: Comment noted.

NYSDEC Comment 20: Dewatering of groundwater during construction should be discussed including best management practices that may be employed to avoid and mitigate impacts to the resource.

Response: The DEIS will include the requested discussion.

NYSDEC Comment 21: Evaluate the impact potential population growth associated with this development will have on the management of solid waste and recyclables, as well as the anticipated amount of waste and recyclable material generated by Micron. Onondaga County law requires that waste generated within the County be disposed of at the Onondaga County Resource Recovery Waste to Energy Facility. Consider the existing waste management network's capacity, and ability to accept increased volumes associated with the Proposed Project, and the potential for population growth. If the evaluation includes an expansion of any waste or recycling facilities or the use of the Onondaga County landfill, approximate dates of the expansion(s) should be included that correspond with Micron's expected buildout.

Response: The Scope has been revised to indicate that the DEIS will address issues of solid waste generation from the Proposed Project, as well as plans by Onondaga County to manage solid waste and recyclables as a result of economic development related to the Proposed Project. The Scope has been revised to provide additional detail on how the capacity of the existing waste management network would be affected by the Proposed Project.

NYSDEC Comment 22: The DEIS should include a discussion of hazardous waste, listed in 6 NYCRR Part 371.4, that the Proposed Project may generate, including type of hazardous waste anticipated to be generated, approximate volumes, storage methods, disposal options, and how the facility will operate following hazardous waste regulations found at 6 NYCRR Part 370-373.

Response: The Scope has been revised to clarify that the DEIS will include a description of the generation, storage, and disposal of hazardous wastes identified in 6 NYCRR Part 371.4.

NYSDEC Comment 23: Mitigation considerations for solid waste should include an evaluation of processing methods and chemicals used in the manufacturing process to determine if alternative methods could reduce the generation of hazardous waste.

Response: See Responses to NYSDEC Comments 21 and 22.

NYSDEC Comment 24: The air quality modeling included in the DEIS should include an air quality impact evaluation or dispersion modeling analysis for a variety of emission sources including major sources, air toxic sources, and any sources that appear likely to contravene an applicable ambient air quality standard. NYSDEC developed the DAR-10 guidance document, NYSDEC Guidelines on Dispersion Modeling Procedures for Air Quality Impact Analysis. The applicant should submit a modeling protocol to DEC for approval prior to performing any dispersion modeling analyses.

Response: The Scope notes that a stationary source air pollution control permit for the new manufacturing facilities will be required. The air pollution control permit application will include evaluation of pollutants subject to the National Ambient Air Quality Standards (NAAQS), New York air toxic control and ambient air requirements, and a Climate Leadership and Community Protection Act (CLCPA) greenhouse gas evaluation. The Scope indicates that the DEIS will summarize these detailed air quality modeling and impact assessment analyses that will be prepared to support the air pollution control permitting process.

NYSDEC Comment 25: If the impact assessment includes a private, pre-construction, on-site air quality monitoring network, the plan will need prior NYSDEC approval. Guidance for the establishment, maintenance, and reporting requirements of private air monitoring networks can be found in DAR-2, 6 NYCRR Part 231-12.3 and Appendix B to 40 CFR Part 58.

Response: Comment noted.

NYSDEC Comment 26: If one or more applicable requirements or proposed compliance certification sections require the use of a continuous emissions monitoring (CEM) system, the analysis should develop and include a continuous emissions monitoring plan. The analysis should include applicable RACT/BACT/LAER demonstrations, as well as appropriate Emission Reduction Credit (ERCs) demonstrations and analysis.

Response: See Response to NYSDEC Comment 24.

NYSDEC Comment 27: The analysis should include, as applicable, a Toxic Impact Assessment and Environmental Rating Demonstration pursuant to the requirements of 6 NYCRR Part 212. DEC developed DAR-1: Guidelines for the Evaluation and Control of Ambient Air Contaminants Under Part 212.

Response: See Response to NYSDEC Comment 24.

NYSDEC Comment 28: NYSDEC recommends that a copy of the Air Title V permit application and supporting information be appended to the DEIS to the extent it is available.

Response: Information supporting the Air Title V permit application will be provided as an appendix to the DEIS.

NYSDEC Comment 29: The Proposed Project is subject to the mandates of the Climate Leadership and Community Protection Act (CLCPA) and therefore requires an analysis pursuant to Section 7(2) of CLCPA. Please see DEC Program Policy DAR-21 for guidance on preparing the CLCPA analysis.

Response: The DEIS will include an assessment of GHG emissions associated with the Proposed Project and will assess compliance with Section 7(2) of the CLCPA.

NYSDEC Comment 30: NYSDEC recommends evaluating and quantifying GHG and co-pollutants of mobile emissions sources during construction and when the plant is in operation. Additionally, alternatives and mitigation that reduce GHG and co-pollutants from mobile emission sources must be considered.

Response: The Scope indicates that the DEIS will assess the Proposed Project's potential emission of GHGs and the measures proposed to avoid, minimize, and mitigate any impacts.

NYSDEC Comment 31: Among other CLCPA requirements, the Proposed Project will result in an actual increase in greenhouse gas (GHG) emissions, including both direct and indirect GHG emissions. Therefore, the DEIS should include a discussion of the justification for the Proposed Project, along with the technical and economic feasibility of any alternatives or GHG mitigation measures to address the increase. Any such mitigation should take place at the New York facility or in the immediate area, rather than in other cities or out of state. NYSDEC offered examples of potential alternatives and mitigation measures.

Response: The Scope indicates that the DEIS will include an assessment of GHG emissions associated with the Proposed Project and will assess compliance with Section 7(2) of the CLCPA.

NYSDEC Comment 32: The discussion of natural resource impacts for constructing utility connections, such as clean water, wastewater, electric, gas, telecommunications, and roadway expansions should be referenced in the Utilities and Infrastructure section of the DEIS.

Response: The Scope has been revised to clarify that the DEIS will include assessment of all off-site improvements (water, wastewater, electricity, natural gas, telecommunications) in each of the relevant subject areas, including natural resources.

NYSDEC Comment 33: NYSDEC recommends developing a phasing plan, which coincides with Micron's incremental expansion, for the buildout and expansion of all utility upgrades required to meet the Proposed Project's anticipated demands. The phasing plan should include sewer extensions, pumping systems, new clean water source(s) and distribution systems, wastewater plant upgrades, and gas and electricity distribution infrastructure.

Response: The Scope indicates that the DEIS will describe the proposed phasing plan of off-site improvements required to meet the Proposed Project's anticipated demand.

NYSDEC Comment 34: The DEIS should also provide adequate information to demonstrate that all utility upgrades will be constructed, operational, and sufficient to accept waste from or provide service to the Proposed Project. Please see Attachment D, which lists the typical details DEC reviews for a sewer extension and force main approvals.

Response: See Response to NYSDEC Comment 33.

NYSDEC Comment 35: Provide adequate details on the Proposed Project's wastewater loading, flow, and discuss the on-site wastewater pretreatments.

Response: The Scope has been revised to indicate that the Project Description chapter of the DEIS will include additional description of Micron's proposed use and management of water and chemicals (including on-site pretreatment) and Micron's proposed generation and management of various waste streams and how best management practices will be implemented.

NYSDEC Comment 36: The DEIS should provide details on the design specification of the new lake water intake structure and intake screening and assess potential fish impingement mortality and entrainment, and additional measures, including specific equipment, to avoid and minimize fish impingement and entrainment.

Response: The DEIS will identify and describe required infrastructure improvements, including, to the extent known, information on the design, and potential impacts to environmental resources from construction of those improvements.

NYSDEC Comment 37: The DEIS should consider and include details and a summary of water conservation and reuse practices to mitigate water demands.

Response: The Scope has been revised to indicate that the Project Description chapter of the DEIS will include additional description of Micron's proposed use and management of water (including on-site pretreatment) and how best management practices will be implemented to conserve water usage.

NYSDEC Comment 38: The DEIS should include a summary of any investigated and considered alternative water sources.

Response: The Scope has been revised to indicate that the DEIS will describe any previous studies conducted by Onondaga County Water Authority on alternative sources of water.

NYSDEC Comment 39: Water withdrawals within the Great Lakes Basin are subject to the requirement and provisions of the Great Lakes-St. Lawrence River Basin Water Resource Compact. The DEIS should discuss and address how the proposed water withdrawal and use is consistent with the Compact and all state, local, and federal laws.

Response: In accordance with NYSDEC rules and guidance there is an exception for public water supply systems from the Great Lakes-St. Lawrence River Basin Water Resources Compact as enacted in ECL Article 21 Title 10. The DEIS will include discussion regarding water withdrawal, including applicable permits and regulations.

NYSDEC Comment 40: NYSDEC recommends renaming the DEIS chapter as “Use and Conservation of Energy.”

Response: The Scope has been revised to indicate that the chapter will be named “Use and Conservation of Energy.”

NYSDEC Comment 41: The DEIS should contain a description of energy sources to be used during both construction and operational phases of a project, including accurate estimates of demand or consumption. Discuss alternatives and mitigation that could reduce energy and fuel demands during construction and long-term operation.

Response: The DEIS will assess the Proposed Project’s energy requirements and will include a discussion of the use of alternative energy sources and energy conservation. If significant adverse impacts with regard to energy resources are identified, mitigation of such impacts will be identified.

NYSDEC Comment 42: The 2018 amendments to SEQR regulations require all New York State agencies to evaluate such GHG impacts in a new section specifically dedicated to climate change and its impacts. Proposed energy conservation measures that go beyond the minimum requirements of the State Energy Conservation Construction Code (9 NYCRR Parts 7810 through 7816) should be specifically identified, such as LEED or Energy Star. Please refer to Chapter 5, Section C, Item 44 on page 123 in the SEQR Handbook. The information and energy conservation measures discussed in this section may be applicable and cross-referenced to the Greenhouse Gas Emissions and Climate Change chapter.

Response: Comment noted.

United States Fish & Wildlife Services (USFWS)

USFWS Comment 1: Section five of the Scope provides general topics and specific technical studies proposed to inform the DEIS. We note that while the list of resources includes wetlands, floodplains, and vegetated habitat, there is no mention of an analysis of the project’s effects on wildlife. The Scope should be amended to include literature review and field observations of wildlife using the site at all times of the year, including winter and migration seasons. Potential impacts to wildlife that should be considered in the DEIS include, but are not limited to, noise, lighting, pollution, human activity and traffic. Potential loss of habitat and fragmentation appear to be substantial and will negatively affect many species. This information should be included in the Scope and documented in the DEIS.

Response: The Scope has been revised to divide the “Natural Resources” chapter into separate “Water Resources” and “Ecological Communities & Wildlife” chapters to

provide clarity regarding how water resources (groundwater, streams, and wetlands) and habitat for wildlife will be assessed in the DEIS. The DEIS will assess potential impacts on wildlife, including where appropriate, literature review and field observations collected seasonally, including winter and migration seasons. This assessment will evaluate potential impacts associated with noise, lighting, pollution, human activity and traffic as well as from the potential loss of habitat and fragmentation.

USFWS Comment 2: Regarding site vegetation, the Scope should include mapping of vegetation communities, surveys to document endemic plants and identification of rare species and communities as well as invasive plant species. Information should also be provided on the present and future threats of spreading invasive plants to and from the site. An invasive species management plan should be developed for the site in consultation with NYSDEC.

Response: The Scope has been revised to enhance the description of how the DEIS will address ecological communities and potential impacts of the Proposed Project. The DEIS will include mapping of vegetation communities, surveys to document endemic plants and identification of rare species and communities as well as invasive plant species. The DEIS will also assess present and future threats of spreading invasive plants to and from the site.

USFWS Comment 3: The information gathered using the Service's Information, Planning and Consultation (IPaC) system should be included in the DEIS along with a description of studies completed thus far. For example, the Service and the Micron team, along with staff from the NYSDEC, have discussed studies of two endangered bat species believed to be using the site.

Based on information in IPaC, the project is within the range of the federally listed endangered Indiana bat (*Myotis sodalis*) and the federally listed endangered northern long-eared bat (*Myotis septentrionalis*). Accordingly, Micron initiated acoustic surveys of these species at sample locations on the site. A summary of the survey results should be included in the DEIS. The documented call locations should be analyzed in regard to tree removal and habitat modification. This information should inform what the potential effects to these listed species may be and what, if any, measures could be implemented to mitigate adverse effects. The Service will continue to work with Micron and other partners in evaluating the project's effects on federally listed species. Since federal agencies will be funding, permitting and/or approving aspects of the project, section 7 consultation under the ESA will be required.

Response: The Scope has been revised to indicate that summaries of field studies will be included as an appendix to the DEIS. The Scope indicates that the USFWS IPaC system will be queried.

USFWS Comment 4: The Scope indicates that wetlands will be identified and delineated in consultation with the US Army Corps of Engineers. We understand that most of that field work has been completed. However, the Scope does not indicate if or how wetland functions and services will be evaluated and reported. This information is important in understanding the habitat and social values (flood flow attenuation, sediment and nutrient retention, pollution abatement, etc.) these

areas provide. Documentation in the DEIS is also important to understand what is being potentially lost from the project and what mitigation is required of Micron to replace these functions and services. In line with section 404 of the Clean Water Act, the project design must avoid, minimize, and mitigate potential impacts to aquatic resources to the greatest extent practicable. This review approach should be added to the Scope.

Response: The discussion of wetlands has been revised in the Scope to make clear that a discussion of wetland function and services will be included in the DEIS along with a discussion of Section 404 permitting factors.

USFWS Comment 5: Wetland mitigation is mentioned in the Scope as potentially occurring on and off site. While the extent of potential wetland impacts is not yet known, it appears to be a substantial amount based upon the extent of wetlands found on the 1400-acre site. Mitigation for unavoidable impacts should occur within the same watershed (as defined by the 8-digit hydrologic code) and be as close to the impacted wetlands as practicable. Micron has inquired about mitigation options including the purchase of credits at third party wetland mitigation banks or in-lieu fee sites. The Service does not support the complete purchase of available credits for the Micron project as that reduces the effectiveness of the mitigation program.

Response: Comment noted.

Onondaga County Legislator Garland

Comment 1: "I want to be sure that our collective efforts ensure a pathway out of poverty for all of the residents I represent."

Response: Comment noted.

Comment 2: Raised concerns about the potential for increased traffic on highways and roads in and around the project due to population growth and workforce commutes.

Response: In coordination with the New York State Department of Transportation (NYSDOT), Onondaga County, the Town of Clay, and the Town of Cicero, and as indicated in the Scope, the DEIS will include an assessment of traffic conditions at the regional and local levels. Input from the Syracuse Metropolitan Transportation Council (SMTC) is also being provided. The Scope has been revised to include additional detail on how the traffic and transportation study area has been defined through consultation with NYSDOT and SMTC and in recognition of modifications to I-81.

Comment 3: Raised safety concerns relative to increased traffic and questioned what improvements would be made.

Response: See Response to Legislator Garland Comment 2.

Comment 4: Questioned the study area for traffic and whether additional areas to the south should be included.

Response: See Response to Transportation Comments 1-2.

Comment 5: "How is traffic going to be addressed as the scoping of the project goes further and further and brings not only Micron employees to our -- to our boundaries, but also those support industries that are so vital to that operation and will be instrumental in the growth of our community."

Response: See Response to Growth Inducing Impacts 2.

Town of Clay

Comment 1: The DEIS should include the reason or purpose for the chimneys or stacks (163 ± ft), and the emissions associates with those stacks.

Response: The Scope indicates that the DEIS will include analysis of impacts associated with construction and operation of the facility, including visual impacts and air emissions impacts.

Comment 2: Safeguards should be established for the discharges into the rivers, including testing, to confirm the discharges are safe and not contaminating the receiving waters.

Response: Comment noted.

Comment 3: Assurances should be made regarding the safe conveyance of wastewater from the facility to the Oak Orchard treatment plant.

Response: Comment noted.

Comment 4: The DEIS should address not only the traffic impacts to the Town from Micron employees but also those from the support industries.

Response: The DEIS will include a full analysis of traffic impacts, including growth-inducing impacts.

D. Response to Public Comments

Purpose and Need

Comment 1: Many commenters expressed overall support of the Proposed Project and noted the many positive impacts, including economic impacts, it will have in the Town, County, region and State. (1, 14, 15 16, 17, 33, 34, 35)

Response: Comment noted.

Project Alternatives and Description of the Proposed Project

Comment 1: One commenter stated that “Micron, DEIS needs to greatly expand its range of alternatives.” (30)

Response: See Responses to NYSDEC Comments 4-5.

Comment 2: Comments asked why Micron needs to site the Proposed Project in Clay. (26)

Response: See Response to NYSDEC Comment 4. The Scope indicates that the DEIS section on alternatives will detail the analyses previously performed for the proposed location of the Proposed Project and other locations in New York State and Onondaga County.

Comment 3: Commenters suggest that the Draft Environmental Impact Statement should include an alternative to add a Combined Cycle generating plant on the Micron Property. (24, 25)

Response: See Response to NYSDEC Comment 5.

Comment 4: Comments requested a consideration of alternative energy sources, including the use of renewable energy. (3, 10, 13, 20, 21, 26, 29, 30, 31,)

Response: See Response to NYSDEC Comment 5.

Comment 5: “Careful attention must be paid to ensuring the energy at the plant will be fossil free.” (10)

Response: As outlined in the Scope, the DEIS will assess the Proposed Project’s energy needs, including its potential use of fossil free energy.

Land Use, Zoning, & Public Policy

Comment 1: The Sierra Club and CNY Sustainability Coalition commented “Why isn’t the city of Syracuse explicitly included here? Seems to be a major omission.” (30, 31)

Response: While changes to land use, zoning, and public policy within the City of Syracuse will be unlikely given the distance between the City of Syracuse and WPCP, the Scope indicates that the DEIS will address regional issues of economic activity and how that might affect land use within the surrounding area, including the City of Syracuse. See also response to *Other* Comment 11.

Community Facilities, Open Space & Recreation

Comment 1: A number of comments note that open space and the enjoyment of outdoor activities (e.g., birding) was important and should be preserved. Numerous studies have demonstrated the benefit to humans of having green spaces nearby. (19, 26, 29)

Response: The Scope indicates that the DEIS will consider potential direct and indirect impacts of the Proposed Project on parks and recreational resources as well as open space.

Comment 2: The Sierra Club and CNY Sustainability Coalition commented that "This section is poorly organized and deserves to be rewritten to define more clearly what are the parameters to be studied and analyzed relevant to police, fire and other emergency services; schools; parks and rec facilities. Absent from the community facilities most notably is the health care and hospital system." (30, 31)

Response: The Scope has been revised to provide greater clarity on the study areas that will be used for each of the technical areas of analysis, including for community facilities and services and parks and recreational resources. Because the technical areas are related to variable conditions, there will necessarily be a variety of study areas defined for each area. Note, however, that an assessment of impact on health care and the hospital system is not contemplated as it is beyond the scope of the environmental review of the Proposed Project.

Comment 3: "Onondaga County health care facilities, in particular our hospitals, were short-staffed even before the Coronavirus pandemic. Waiting times and bed shortages were unfortunately highlighted by Covid-19 cases and have continued. What improvements in the healthcare system are proposed to remedy these shortcomings in view of the expectation of potentially thousands of new residents to work at and/or serve the Micron plant." (32)

Response: See Response to Community Facilities, Open Space & Recreation Comment 2.

Socioeconomic Conditions

Comment 1: The public comments raised questions about the future workforce. (16, 26)

Response: Micron has been engaged in an extensive discussion with the Community Engagement Committee (CEC) (an entity convened by the Governor's Office, Micron, and local elected officials) on how the economic benefits of Micron's Proposed Project will be experienced within the broader community, including, but not limited to, the City of Syracuse. Micron has been working with regional stakeholders to identify and enhance workforce development programs in anticipation of the thousands of jobs that the Proposed Project will generate. The draft Scope included estimates of projected Micron employment and the general qualifications required for different categories of jobs. The Scope has been revised to include a new sub-heading for this text: "Proposed Project Employment."

Comment 2: Some comments requested a discussion of the anticipated impacts on property taxes. (1, 3, 5, 26,)

Response: SEQRA does not require consideration of purely economic impacts. Notwithstanding, the Scope indicates that the DEIS will consider changes in demographics and housing costs, changes in labor supply and effects on existing businesses, and municipal costs generated by the Proposed Project. As part of

this, anticipated impacts to municipal tax levies (the amount of the municipal budget derived from property taxes) will be qualitatively discussed.

Comment 3: How will the increase in this infrastructure expansion be covered financially? Will the local community be impacted financially due to the building of the pipeline to carry the water? How is the expense being covered? How much money will it take to pay for the whole building?" (26)

Response: This comment is outside the scope of SEQRA. Notwithstanding, the Scope indicates that the DEIS will consider changes in demographics and housing costs, changes in labor supply and effects on existing businesses, and municipal costs generated by the Proposed Project.

Comment 4: "What are the projected benefits for the local community? What does Micron have to offer the local community as they plan their environmental impact? How will the negative effects of this infrastructure affect me economically in the beginning and through to the future?" (26)

Response: The Scope indicates that the DEIS will describe Micron's projected benefits to the community as well as its efforts to work with community leaders through the CEC to consider how project benefits can be distributed throughout the affected communities, including to communities of color or low-income communities.

Comment 5: The benefits and adverse impacts of socioeconomics need to be considered together and the DEIS should specify the analytical standards, tools and techniques employed. (32, 35)

Response: The Scope indicates that potential adverse socioeconomic impacts will be assessed in the DEIS.

Environmental Justice

Comment 1: Comments raised concern that project-related traffic could potentially affect environmental justice areas and suggested that traffic data be collected from an expansive geographic, especially since the southwest side of the city which has been a concentration of historically disadvantaged populations. (16)

Response: The Scope indicates that the DEIS will include analysis of potential impacts on environmental justice communities and disadvantaged communities. See Response to Transportation Comment 1.

Comment 2: "There is a draft permitting requirement that should be considered in the Technical Studies section of the DEIS. The New York State Department of Environmental Conservation (DEC) recently proposed a new policy that will require an analysis of impacts on disadvantaged communities (DACs) as part of most environmental permitting actions." (25)

Response: Comment noted. Micron will consider applicable guidance in the DEIS.

Historic and Cultural Resources

Comment 1: One commenter noted the existence of properties located on Burnet Road and other parts of the White Pine site, some of which are eligible or potentially eligible for listing on the NY State Register of Historic Places and commented that these properties were supposed to be surveyed/assessed in conjunction with the NY State Historic Preservation Office. (18) One commenter suggested preservation of a house on the corner of Burnet and Route 31, and also preservation of a barn on the south side of Route 31. (34)

Response: The properties located on Burnet Road were studied as part of the SGEIS for the WPCP prepared in 2021 to establish a shovel ready commerce park. Any demolition of those properties is not part of the Proposed Project and was completed earlier this year for public safety purposes. The Scope indicates that coordination with the New York State Historic Preservation Office (SHPO) would be required for any additional properties not previously evaluated. In coordination with SHPO, and as indicated in the Scope, the DEIS will identify potential eligible or listed historic resources at WPCP or the surrounding area.

Visual Impacts & Community Character

Comment 1: Commenters raised concerns about visual impacts, including impacts associated with lighting. (19, 22)

Response: The Scope indicates that a visual impact assessment will be conducted consistent with NYSDEC Program Policy "Assessing and Mitigating Visual Impacts."

Comment 2: Concerns were raised about the Proposed Project's impact on community character and quality of life. (4, 24)

Response: The Scope indicates that potential impacts to community character will be addressed in the DEIS.

Comment 3: The Sierra Club and CNY Sustainability Coalition commented that "This project has the potential to significantly alter the character of the community—not only the locale surrounding the immediate project location, but the wider Syracuse and Onondaga County as well as portions of Oswego County as population growth and housing development is induced." (30, 31)

Response: See Response to Visual Impacts & Community Character Comment 2.

Geology, Soils, & Topography

Comment 1: "Reference is made to 'property survey' as a data source but later the 'geotechnical investigation' is mentioned but not included in the sentence describing the analysis. Is this an oversight that should be corrected? Certainly the geotechnical survey will provide valuable information to confirm or modify the USGS soil survey data." (30, 31)

Response: The Scope has been revised to clarify the information to be used in the geology, soils, and topography DEIS chapter.

Water Resources

Comment 1: Public comments related to consumption of water, water infrastructure, wastewater, and water quality. (2, 3, 5, 17, 26, 27, 28, 30, 32)

Response: The Scope has been revised to indicate that the DEIS will include additional description of Micron's proposed consumption of water and generation of wastewater and how those volumes will be minimized as well as managed and coordinated with County infrastructure.

Comment 2: The DEIS must describe the types and amounts of pollutants that will be discharged into the water. (27)

Response: See Response to Water Resources Comment 1.

Comment 3: The DEIS should evaluate ways in which water consumption can be minimized including options for recycling. (3, 32)

Response: See Response to Water Resources Comment 1.

Comment 4: The volume of water and the contents of wastewater including, but not limited to known hazardous waste products/chemicals must be identified, including, the various expected contents of the water must be specified, including hazardous materials, even if the weights and the volumes are not known. (27, 28, 32)

Response: See Response to Water Resources Comment 1.

Comment 5: Questions were raised about the industrial wastewater, including how it will be treated and monitored. (5, 28, 30, 31)

Response: See Response to Water Resources Comment 1.

Comment 6: Concerns were raised about the massive use of water and potential impacts to water resources. (2, 3, 26, 30, 31, 32)

Response: The Scope indicates that the DEIS will evaluate potential impacts to water resources.

Comment 7: The public must be assured that the public water drinking supply will never be compromised to accommodate water use by the Micron plant. (32)

Response: Comment noted.

Comment 8: Questions were posed regarding safeguards and monitoring for wastewater leaving the Micron facility. (5, 27, 28, 30, 31)

Response: The Scope indicates that the DEIS will discuss applicable permitting, monitoring, and reporting obligations associated with wastewater.

Ecological Communities and Wildlife

Comment 1: Public comments raised concerns of the potentials impacts to wildlife and habitat on and around the site, specifically to birds, butterflies and other animals native to the site. (19, 21, 22, 23, 26, 28, 29, 30, 31)

Response: The Scope indicates that potential adverse impacts to these natural resources will be addressed in the DEIS.

Comment 2: Native plants should be considered as part of mitigation plans instead of typical ornamentals. (19)

Response: The Scope indicates that the DEIS will consider use of native plants as mitigation where necessary and if appropriate.

Solid Waste

Comment 1: Public comments submitted raised questions about solid waste and the amount of materials that would be used at the site, and what the process would be to dispose of the waste. (3, 26, 28, 32,)

Response: The Scope indicates that the DEIS will evaluate solid waste generation from the Proposed Project, including proposed management, impacts to resources, as well as proposed mitigation strategies, including recycling to reduce waste stream volumes.

Hazardous Materials & Hazardous Waste

Comment 1: Public comments raised concerns about hazardous materials being transported to and from the site, along with how Micron plans to dispose of such materials. Comments mentioned the use of PFAS as it relates to the semiconductor industry more broadly. Comments requested more information about the use of PFAS and the potential effect on communities and the environment. Comments also expressed interest in further analysis as it relates to the materials that will be used at the site and how risks will be avoided or mitigated with respect to those materials. (3, 4, 9, 23, 26, 28, 32)

Response: See Response to NYSDEC Comment 22.

Comment 2: Comments requested that the DEIS identify any hazardous materials, including chemical or petroleum bulk storage that would be used towards transport or generated by the proposed project and measures to protect against releases to the environment. (4, 30, 31)

Response: See Response to NYSDEC Comment 22. The Scope has been revised to indicate that the Project Description in the DEIS must further illustrate Micron's intended use, management, and conservation of water, chemicals, and energy.

Transportation

Comment 1: A commenter provided that "The importance of I-81 is recognized for its impact in the draft scoping document. The majority of the Micron Campus is contained within the Town of Clay, Onondaga County, New York and is accessible from I-81 from an interchange with NYS Route 31 (see Figure 1). OCIDA deemed the Radisson Corporate Park as an unviable choice because it lacked . . . specific advantages such as the proximity to Interstates 81 and 481. The draft scoping document notes that the lack of "access to multi-modal transportation" is often a point of failure for most other sites. Changes to I-81 should be evaluated for potential adverse impacts on the Micron Development." (16)

Response: The Scope indicates that the DEIS, in coordination with the New York State Department of Transportation (NYSDOT), will evaluate regional and local traffic conditions. The assessment of potential future traffic conditions will include potential I-81 modifications. The Scope has been revised to include additional detail on how the traffic and transportation study area has been defined through consultation with NYSDOT and SMTC and in recognition of modifications to I-81.

Comment 2: Several additional public comments raised concerns about the potential for increased traffic on highways and roads in and around the project due to population growth and workforce commutes. Many commenters are concerned about impact to residents and listed areas directly around the Project Site, while others raised concerns about the regional traffic impact. (1, 2, 5, 7, 14, 15, 16, 17, 22, 26, 32)

Response: In coordination with NYSDOT, Onondaga County, the Town of Clay, and the Town of Cicero, and as indicated in the Scope, the DEIS will include an assessment of traffic conditions at the regional and local levels. Input from the Syracuse Metropolitan Transportation Council (SMTC) is also being provided. The Scope has been revised to include additional detail on how the traffic and transportation study area has been defined through consultation with NYSDOT and SMTC and in recognition of modifications to I-81. See also response to Legislator Garland Comment 2.

Comment 3: Many commenters requested that the DEIS analyze and provide details for the proposed traffic improvements. As part of this, certain potential traffic improvements were proposed to help alleviate the traffic of the current roads that exist now. (2, 8)

Response: The Scope indicates that the DEIS will identify proposed transportation improvements and provide a schedule for when the improvements would be required.

Comment 4: Comments raised safety concerns and questions about what improvements would be made. Many commenters are concerned about impact to residents and listed areas directly around

the Project Site, while others raised concerns about the regional traffic impact. (3, 5, 13, 15, 16, 17, 20, 28, 29, 30)

Response: See Response to Transportation Comments 1-3.

Comment 5: Traffic must be evaluated in the context of existing and proposed infrastructure. (16)

Response: See Response to Transportation Comments 1-3.

Comment 6: "Significant adverse impacts could result in the assessment of environmental impacts from traffic if Automatic Traffic Recorder (ATR) counts and Vehicle Classification Counts (VCC) data sites are not added to collect data from sites in the City of Syracuse." (16)

Response: See Response to Transportation Comments 1-2.

Comment 7: A question was raised regarding the proposed number of entrances to the campus as well as the traffic flow and routes for delivery trucks. (2, 5)

Response: Details of proposed access points and circulation routes for employee vehicles and delivery vehicles will be described in the DEIS.

Comment 8: Certain comments questioned the study area for traffic and whether additional areas to the south should be included. "There [are] no traffic counters utilized on I-481 at the NY Route 92/5 exchange nor in the City of Syracuse." (15, 16)

Response: See Response to Transportation Comments 1-2. The Scope has been revised to include additional detail on how the traffic and transportation study area has been defined through consultation with NYSDOT and SMTC and in recognition of modifications to I-81. The interchange of I-481 and NY Route 92/5 is included in the regional study area.

Comment 9: The Trucking Association of New York commented that "[w]hile the Micron project itself may not have a negative impact on our industry, the additional vehicle traffic will. Put that increased vehicular traffic on a poorly designed interstate, and the results will be disastrous for our industry." As additional context, the Trucking Association of New York attached its October 2021 comments on the I-81 Viaduct Project DEIS. (14)

Response: See Response to Transportation Comment 1.

Air Quality

Comment 1: Public comments mentioned air quality as it relates to operations at the Proposed Project Site along with the air quality implications due to increased traffic and potential hazardous material. These comments requested additional detail on proposed air emissions, including mobile source emissions, and requested that air quality impacts be evaluated in the context of the existing

and proposed infrastructure” and, “Air quality should be monitored at all the traffic locations.” (16, 17, 32, 36)

Response: See Response to NYSDEC Comment 24. The Scope indicates that the DEIS will include assessment of mobile source and stationary source emissions from the Proposed Project. Mobile source emissions are primarily generated from additional vehicular traffic during both construction and operations. Stationary source emissions are generated from operation of the proposed Fabs. The Scope notes that a stationary source air pollution control permit for the new manufacturing facilities will be required. The air pollution control permit application will include evaluation of pollutants subject to the National Ambient Air Quality Standards (NAAQS), New York air toxic control and ambient air requirements, and a Climate Leadership and Community Protection Act (CLCPA) greenhouse gas evaluation. The Scope indicates that the DEIS will summarize these detailed air quality modeling and impact assessment analyses that will be prepared to support the air pollution control permitting process.

Comment 2: The public must be informed now regarding the amounts and types of air pollutants released by current Micron industrial facilities and expected to be released/emitted by the proposed Clay plant. (32)

Response: See Response to NYSDEC Comment 24.

Comment 3: Micron should identify plans to notify first responders and public of any toxic air releases, and first responders should be provided in advance with training and equipment to respond safely to such releases. (28)

Response: Comment Noted.

Comment 4: Employees should be warned about the toxicity of gases used by the industry and trained to protect themselves from potential releases, both at low levels associated with chronic toxicity as well as higher levels with acute toxicity.” (28)

Response: Comment noted.

Greenhouse Gas Emissions and Climate Change

Comment 1: Public comments noted that the use of natural gas seems inconsistent with New York State’s Climate Leadership and Community Protection Act (CLPCA) greenhouse gas (GHG) reduction goals. (10, 20, 23)

Response: See Responses to NYSDEC Comments 29-31.

Comment 2: Members of the public provided comments about GHGs. (10, 20, 35)

Response: The Scope indicates that the DEIS will assess the Proposed Project's potential emission of GHGs and the measures proposed to avoid, minimize and mitigate any impacts.

Comment 3: "Semiconductors have a carbon problem. The public should be informed about the plan to prevent fluorocarbons from being introduced to our local air." (9)

Response: See Response to Greenhouse Gas and Climate Change Comments 1 and 2.

Comment 4: "Interested to learn about the impact of embodied carbon as well as operational carbon in both the Micron plant and the associated growth." (6)

Response: See Response to Greenhouse Gas and Climate Change Comments 1 and 2.

Comment 5: Methane is a much more potent greenhouse gas than CO2. (10)

Response: Comment noted.

Comment 6: "The current plans for powering the Micron facility in Clay, NY, while looking good on paper, will in fact increase emissions on energy used to supply the Micron facility... The reality is that Micron is going to be powered by Fossil Fuel Generation that is transmitted over long distances, very likely from out of state in Pennsylvania or Ohio that have generation carbon footprints far higher than those in NY State. As GHG emissions are not cognizant of political boundaries on a map, those emissions will end up affecting NY State residents." (14)

Response: Comment noted.

Comment 7: "There are also possibilities for using the CO2 emissions of the generating facility for agricultural purposes, further reducing the carbon footprint of the plant." (14)

Response: Comment noted.

Noise & Vibration

Comment 1: Several public comments referred to concerns about noise & vibration from construction and operation, including noise from increased traffic. (8, 19, 29)

Response: The Scope indicates that the DEIS will include assessment of noise and vibration generated by construction and operations of the Proposed Project, including from increased vehicular traffic.

Utilities and Infrastructure

Comment 1: One comment requests that the process for wastewater be described.

Response: The Scope indicates that the DEIS will describe the manner in which wastewater will be treated.

Comment 2: There needs to be better definition of the assessment of potential impacts on infrastructure (water, stormwater, sanitary sewer, electrical and telecommunications) will be assessed.

Response: The Scope indicates that the DEIS will include an assessment of potential adverse impacts on utilities and infrastructure due to demand associated with the Proposed Project.

Comment 3: The release of toxic contaminants through water pathways is one of the most serious threats of semiconductor productions. Releases of certain contaminants in wastewater could compromise the operations of the Oak Orchard Wastewater Treatment Plant, even undermining compliance with its discharge permit.

Response: The Scope indicates that the DEIS will include an assessment of impacts from wastewater discharges from the Proposed Project.

Comment 4: Industrial pre-treatment must be described in the DEIS and should include identification of identify ways to pre-treat hazardous chemicals, perhaps even reusing some, before comingling with other wastes. This is particularly important for PFAS, because in the future more PFAS compounds are likely to be subjected to enforceable environmental standards, many at very low concentrations." (18)

Response: The Scope indicates that the DEIS will include an assessment of impacts from wastewater discharges from the Proposed Project, and will include a description of industrial pretreatment at the Proposed Project.

Comment 5: The DEIS needs to address parameters such as system capacity, level of service changes, fiscal implications for the community and impacts on water bodies. (16)

Response: The Scope has been revised to indicate that the DEIS will include additional description of Micron's proposed consumption of water and generation of wastewater and how those volumes will be managed and coordinated with County infrastructure.

Comment 6: Impacts associated with the "natural gas main" that will be extended to the plant must be included in the DEIS. (30, 31)

Response: The Scope has been revised to clarify that the DEIS will include assessment of all off-site improvements (water, wastewater, electricity, natural gas, telecommunications) in each of the relevant subject areas.

Anticipated Use & Conservation of Energy

Comment 1: "It is imperative to reduce emissions through clean energy usage initiatives and energy conservation projects." (2,36)

Response: Comment noted.

Comment 2: One comment questioned the impact of the Proposed Project on their energy bill and whether the Proposed Project will strain the grid and cause blackouts. (16)

Response: The Scope has been revised to indicate that the DEIS will include additional description on Micron's proposed use and conservation of energy (including provisions for renewable energy sources).

Comment 3: Additional detail was requested on the anticipated energy needs of this project which were noted to be enormous. (20,23)

Response: The DEIS will describe the Proposed Project's energy needs.

Comment 4: "Electrical consumption is anticipated to be 16 billion kilowatt-hours of electricity per year, when fully built. (Phase 2, Envir. Assessment Form, Part 1, Section K) To put this in perspective, this is equivalent to all of the electricity consumed by the states of New Hampshire and Vermont, combined. The entire state of New York used 143 billion kWh of energy in 2022. Micron will increase demand in NY by 11%." (20,23)

Response: Comment noted.

Comment 5: Questions were raised regarding the type and source of energy to be used by the Proposed Project. (10, 11, 16, 22)

Response: See Response to Anticipated Use and Conservation of Energy Comment 2.

Comment 6: Commenters requested consideration of various sources of electricity, including those that are currently available, and whose which may become available as the plant is constructed.

Response: See Response to NYSDEC Comment 5; Response to Anticipated Use and Conservation of Energy Comment 2.

Comment 7: The DEIS must evaluate the ability of current power lines owned and operated by National Grid to deliver the required power. (30)

Response: See Response to Anticipated Use and Conservation of Energy Comment 2.

Comment 8: One commenter questioned whether Micron stated its goal "to achieve 100% renewable energy for existing U.S. operations by the end of 2025" applies to the proposed facility. (10)

Response: See Response to Anticipated Use and Conservation of Energy Comment 2.

Construction

Comment 1: Several public comments referred to concerns about construction, specifically the use of heavy duty equipment and expected constructed related vehicular trips. (1, 13, 24)

Response: The Scope indicates that the DEIS will include evaluation of traffic conditions and potential adverse impacts during the construction of the Proposed Project. Specific analysis of traffic and traffic-related air quality and noise during construction will be identified and assessed in the DEIS, including potential mitigation options to address any adverse impacts.

Permits

Comment 1: "The SEQRA review should list all anticipated permitting processes, with the anticipated schedule of public comment periods, and it should require public notification to interested parties of each permit application as it is submitted." (18)

Response: Section 6 of the Scope lists the Federal, State, and local agencies with which Micron would coordinate on the Proposed Project and a preliminary list of anticipated permits that would be required to construct and operate the Proposed Project. The status, and contents, of draft permit applications would be made available, as applicable, as appendices to the DEIS. When OCIDA releases the DEIS for public review, it will announce the schedule for public comment and notifications will be distributed in accordance with applicable rules and regulations.

A forecasted date for the commencement of construction will be included in the DEIS.

Cumulative Impacts

Comment 1: "The use of the word 'summarize' to describe the scope of this Chapter is insufficient. This Chapter must assess indirect and cumulative impacts of the proposed project for each of the technical areas included in the DEIS. If these effects are included elsewhere it may be appropriate to summarize them here. Let's be clear about exactly what is required to be included in the DEIS." (20, 23)

Response: The Scope has been revised to indicate that the "Cumulative Impacts" chapter will consider any significant adverse impacts resulting from the incremental impact of the Proposed Project when added to other past, present, and reasonably foreseeable future actions. Each of the technical areas of the DEIS will address direct and indirect effects of the Proposed Project and off-site improvements.

Growth Inducing Aspects

Comment 1: Onondaga Audubon commented on Housing & Development that "the region outside of the project's direct footprint will be modified in order to support influx of as many as 100,000 new residents. Zoning maps have already been changed to increase the amount of land available to be developed for housing." (21)

Response: Comment noted.

Comment 2: The DEIS should include an analysis of the potential for growth-induced changes in the community that this project will induce." (32, 35)

Response: The Scope indicates that the DEIS will include an assessment of potential growth-inducing effects of the Proposed Project. This assessment will evaluate projected growth in traffic as a result of new residential development and any noise or air quality impacts associated with that increase in traffic.

Comment 3: Commenters note that the Proposed Project will cause an increase in demand for new housing and questioned the necessary capacity as well as the potential environmental impacts. (19)

Response: The location of any development of new housing within the Central New York region in response to any demand generated by Micron employment is unknown at this time and outside of Micron's control. It is therefore beyond the scope of this environmental review. Notwithstanding, any such new development would be subject to local comprehensive planning policies and zoning laws and regulations and require separate approvals pursuant to those local laws, regulations, and policies. The Scope indicates that the DEIS will evaluate projected growth in traffic as a result of new residential development and any noise or air quality impacts associated with that increase in traffic. The Scope also indicates that the DEIS will evaluate potential indirect impacts to community facilities and services as a result of projected residential population growth (see above).

Comment 4: "This is going to affect the housing market, are there any plans in order to ease this transition or combat this? (28)

Response: See Response to Growth Inducing Comment 3.

Comment 5: "With new jobs and housing comes increased traffic and therefore noise and air pollution. What impact will this have on residents' health and how will it be mitigated?" (19, 27)

Response: See Response to Growth Inducing Comment 2.

Other

Comment 1: Many commenters asserted that the NYSDOT's environmental review of the I-81 project was inadequate and that similar mistakes should not be made for the Proposed Project. (14, 15, 16, 33)

Response: Comment noted. The I-81 project is a separate and distinct project.

Comment 2: "Onondaga County health care facilities, in particular our hospitals, were short-staffed even before the Coronavirus pandemic. Waiting times and bed shortages were unfortunately highlighted by Covid-19 cases and have continued. What improvements in the healthcare system are proposed to remedy these shortcomings in view of the expectation of potentially thousands of new residents to work at and/or serve the Micron plant." (36)

Response: An assessment of impact on health care and the hospital system is beyond the scope of the environmental review of the Proposed Project.

Comment 3: "Demand new housing have walkable community parks that exceed the WHO recommendation of green space per person, and demand current brownfield sites be the priority sites of new development." (29, 31)

Response: The specific development of new housing within the Central New York region in response to any demand generated by Micron employment is unknown at this time and outside of Micron's control. The Scope indicates that impacts from induced demand will be considered in the DEIS. .

Comment 4: "It just brought, and I sort of a thought to myself to make sure that the scope does consider and focus and put ample attention towards the rail line. I'm not sure if the current CSX line that is moving across 31 is a part of what would be an increase in that rail traffic because of -- if that movement happened with that grant and that played out in (unintelligible). But I just want to, you know, make sure that the scope looks at the rail lines and the impact of the rail service and of an increase in that surface as we move forward here in the future generation. Thank you." (12)

Response: The Scope has been revised to indicate that the DEIS will address the existing CSX rail line adjacent to WPCP and its potential use to support construction of the Proposed Project and reduce construction truck traffic. Potential air quality and noise impacts of additional rail traffic along the CSX rail line would also be considered in the DEIS.

Comment 5: The use of rail was encouraged to mitigate transportation impacts. (35)

Response: Comment noted.

Comment 6: Several comments raised concerns about transit options in the area and how those options would be addressed for workers and commuters who will be working at the site. Commenters also encouraged prioritizing bike, and pedestrian access to the site. (29, 31, 32)

Response: The Scope has been revised to indicate that the DEIS, in coordination with the Central New York Regional Transportation Authority (Centro), will identify potential adverse impacts to transit service caused by the Proposed Project and modifications and expansion to transit service that may be required to address those impact and address the need for such services caused by the Proposed Project.

Comment 7: "The only mitigation measures mentioned in this section are improvements to roadways. It is imperative that the utilization of public transportation, including mass transit by bus and light rail, be considered." (32)

Response: See Response to Other Comment 6.

Comment 8: It should be noted that the Community Grid Plan is subject to a court order requiring the need for additional diligence related to the Micron development among other factors." (17)

Response: See Response to Other Comment 1.

Comment 9: Some comments questioned the use of the terminology "100 percent renewable energy." (10, 11, 22)

Response: Comment noted.

Comment 10: News reports have indicated that Micron has not committed to the huge expense of building a second water supply system from Lake Ontario in order to serve its industrial needs. The taxpayers of Onondaga County should not pay for this water supply system. This new system amounts to a dedicated supply for the Clay Micron plant." (36)

Response: Comment noted.

Comment 11: The City of Syracuse should be considered an interested agency. (31, 32)

Response: The Scope has been revised to include the City of Syracuse as an interested agency.

Comment 12: The DEIS should include a chapter for Wastewater and Stormwater.

Response: See Response to NYSDEC Comment 1.

Comment 13: A detailed assessment of the expected numbers of cancers and other pollutant-related illnesses based on air emissions, water discharge, and hazardous solid waste from the plant must be identified as part of the DEIS. (24)

Response: The Scope has been revised to indicate that the DEIS will include an assessment of potential adverse health impacts associated with air emissions and the use and disposal of hazardous waste from the facility.

Comment 14: "Micron is to be commended for committing itself to a large degree of sustainability, but what is actually achievable?" (3)

Response: The Scope indicates that the DEIS will discuss sustainability measures that Micron intends to implement at its facility.

Appendix A-3
Summary of NEPA Scoping Comments

A-3 Summary of NEPA Scoping Comments

As noted in Section 1.3.2, a NEPA scoping period was held from March 5 to April 5, 2024, and a public scoping meeting was held on March 19, 2024. Commenters at the scoping meeting included Federal, State, and local agencies, non-government organizations, and members of the public. Overall, 113 commenters, including 102 individuals, provided input during the scoping period. As shown in Table A-2, a total of 438 individual comments were received across various categories. This section summarizes the comments received by category.

Table A-2 Summary of Scoping Comments by Category

Category	Comments
NEPA Process Generally	73
Land Use, Zoning, and Public Policy	9
Geology, Soils, and Topography	13
Water Resources	99
Biological Resources	43
Historic and Cultural Resources	7
Air Quality	21
Greenhouse Gases and Climate Change	12
Solid Waste, Hazardous Waste, and Hazardous Materials	21
Human Health and Safety	14
Utilities and Supporting Infrastructure	22
Transportation and Traffic	36
Noise and Vibration	8
Socioeconomic Conditions	32
Environmental Justice	2
Miscellaneous	26
Total	438

NEPA Process Generally

Seventy-three commenters provided comments on the NEPA process. USEPA suggested the use of the NEPAAssist tool to facilitate the environmental review process. Most commenters in this category requested that the EIS analyze all potential environmental effects. Some commenters requested additional consultation with local indigenous communities and nearby municipalities. Some commenters expressed concern about the lack of transparency in the semiconductor industry in general. One commenter stated that the current environmental process is sufficient. One commenter highlighted the importance of fully applying the guidance in CPO’s Programmatic Environmental Assessment for Modernization and Internal Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program.

Three commenters provided comments on indirect and cumulative effects. USEPA recommended consideration of direct, indirect, and cumulative effects, analysis of effects of both the Proposed Project and other announced or planned projects in the area, analysis of effects on communities that may be experiencing existing pollution or health burdens.

Other commenters noted the existence of other projects within the vicinity of the Proposed Project, such as the Interstate 81 urban corridor redevelopment project, which required lengthy analysis of traffic modeling. These commenters suggested that the EIS include updated regional traffic and air pollution models, with detailed analysis of the Proposed Project's effects on traffic in Syracuse. Commenters also recommended the consideration of cumulative effects on sewers, water usage, power, emergency services, schools, roads, air quality, and water quality.

Seven commenters provided comments relating to alternatives to the Proposed Project. Some commenters suggested siting the proposed Micron Campus elsewhere to decrease potential environmental, community, and traffic impacts; one commenter recommended siting the Micron Campus in downtown Syracuse or at one of several unused remediated industrial sites with existing utilities and infrastructure. Some commenters suggested that the Micron Campus and alternatives include features such as permeable parking lots and ecological landscaping techniques to reduce potential effects on wildlife. One commenter suggested that alternatives only be partially implemented to reduce potential effects.

Twenty-seven commenters provided comments on mitigation measures and monitoring. These commenters highlighted the need for a comprehensive and transparent discussion on mitigation and monitoring measures in the EIS, particularly regarding potential effects relating to wetlands and traffic. Many commenters expressed concern that wetland mitigation measures may not be sufficient or could lead to adverse effects. Commenters stated that the scope of current plans for wetland mitigation should be expanded to include wetlands outside the immediate project area and that there is a potential for the wetland mitigation measures to adversely affect nearby landowners due to displaced water.

Many commenters requested that the government agencies reviewing the Proposed Project ensure that stated mitigation measures are fully planned and implemented prior to the commencement of construction. Some commenters stated there should be permitting and monitoring efforts to reduce the potential effects of environmental releases.

Three commenters requested accessible public meetings that members of the public could reasonably attend after normal working hours, accommodations for non-English speakers, and virtual attendance methods. Commenters requested assurances that Micron would fulfill commitments to provide financial assistance to the City of Syracuse to address poverty. Commenters also stated that agencies should recognize the public's right to know about Proposed Project effects, the permits it would require, and how and when comments could be made on the EIS. The commenters recommended that agencies publish a schedule of opportunities for public participation for permit processes associated with the Proposed Project.

Land Use, Zoning, and Public Policy

Nine commenters provided comments on land use. Some commenters expressed concerns that the Proposed Project area contains prime agricultural land and historic properties that would

be permanently impacted if the Proposed Project is implemented. Others indicated concern over the planned development of the land based on the potential environmental effects of filling wetlands and streams. Some commenters suggested increasing the amount of green space on the proposed Micron campus, while others suggested that Micron purchase land elsewhere that could be converted to green space as a land exchange. Some commenters also expressed concerns about potential effects on residentially zoned areas adjacent to the project area.

Geology, Soils, and Topography

Seven commenters provided comments on geology, topography, and soils. Commenters were generally concerned over potential pollution of the soil as a result of facility construction and operation, particularly related to heavy metals, PFAS, and other chemical contamination. One commenter expressed concerns about potential soil impacts due to excavation.

Six commenters provided comments on construction methods and impacts. Commenters recommended utilizing green construction practices whenever possible, including recycling of construction materials for both use and disposal, environmentally friendly landscaping, green infrastructure, and incorporation of energy-efficient technologies. Commenters requested that green construction include permeable pavement on all hardened surfaces because the facility would be built in a wetland area. Commenters further inquired if Micron would seek a SITES certification for sustainable landscapes, which would entail the creation of landscapes to help reduce water demand, conserve or restore natural resources, provide wildlife habitat, reduce energy consumption, and promote human health and wellbeing.

Commenters also expressed concern relating to the effects of construction processes and equipment on the site. Commenters stated that significant volumes of concrete may affect the water table, and that the drainage of the site should be considered. Commenters stated that there should be a construction plan to mitigate the potential effects of construction fill on the site's water table and drainage, and of construction vehicle traffic on surrounding residential areas.

Water Resources

Fifty-seven commenters provided comments on water resources, water quality, and flooding in and near the Proposed Project area. Commenters were broadly concerned with the potential for negative effects from facility wastewater, stormwater runoff, and potential leaks or spills on the water quality of water resources, including Oneida Lake, nearby streams, and other water bodies. Commenters expressed concerns about potential flooding due to water displaced by the facility from the filling of water bodies and runoff from impervious surfaces, such as parking lots. Commenters also expressed concerns about short- and long-term adverse effects on nearby residences, businesses, and agriculture from potential Proposed Project-induced flooding, including sedimentation, increased turbidity, and introduction of pollutants via runoff. Some commenters expressed concerns that filling of water bodies would potentially cause floodwater to enter their properties and damage their lands or structures, and some of those commenters provided personal or historical anecdotes of flooding on their properties.

Forty-two commenters submitted comments relating to wetlands in or near the Proposed Project area. Most of these commenters expressed general concern about and opposition to the filling of wetlands, particularly related to potential flooding of nearby properties, and the loss of

wildlife habitat, including for threatened and endangered species and migratory birds. Many commenters stated that wetlands are essentially irreplaceable and expressed concerns that compensatory mitigation for filled wetlands would not sufficiently replace them or the habitat and ecosystem services they provide. Many commenters also expressed concerns about the potential for pollutants to leach into wetlands outside of the Proposed Project area. Some commenters requested that the EIS analyze wetlands outside of the immediate vicinity of the Proposed Project area. One commenter indicated that USACE should not permit Micron to fill the proposed acreage of wetlands and should instead consider permitting fill of a substantially smaller acreage of wetlands.

Biological Resources

Forty-three commenters provided comments relating to biological resources, including threatened and endangered species, other terrestrial wildlife, migratory birds, and vegetation and habitat in and near the Proposed Project area. Many commenters expressed concerns about potential adverse effects on wildlife from noise and light pollution from construction and operation of the proposed Micron Campus. Several commenters expressed opposition to the amount of vegetation and wildlife habitat that would be cleared for construction.

A majority of these 43 commenters expressed concerns about potential effects on Indiana and northern long-eared bats from habitat loss that would be expected to occur within the Proposed Project area and vicinity. Some commenters expressed concerns about proposals to relocate bat populations. Additional commenters raised concerns about potential effects on protected bird species in the area. Other commenters expressed concerns that planned habitat mitigation measures would not be sufficient to protect threatened and endangered species or concerns with an overall lack of mitigation planning in general.

Commenters in this category generally also commented on potential effects on wildlife from the loss of wetland and grassland habitat. Commenters expressed concern that Micron's plan to minimize the effects on habitat would be inadequate and suggested that there should be a mitigation program to analyze the effects of construction in wetlands, including on adjacent uplands. Commenters also stated that Micron should engage in wildlife relocation efforts. Commenters stated that the loss of grassland habitat would affect the 11 species of grassland birds in New York State that require grasslands for breeding and wintering. One commenter noted that historic habitat degradation has had little impact on New York State's wildlife and expects the Proposed Project to have no significant effects on wildlife.

Additional comments related to other potential Proposed Project effects on wildlife from construction activities, noise and light pollution, wastewater, and water use. One commenter requested the preparation of studies of these effects, and effects from loss of open space and increased human activity within the proposed Micron Campus, on wildlife. Commenters also requested disclosure of effects of wastewater discharges and water intakes on shoreline vegetation, aquatic organisms, fish, and other lake-dependent wildlife.

Five comments expressed concerns about potential effects of wetlands and grasslands habitat removal on migratory birds. The commenters stated that wetlands and grasslands play a vital role in supporting birds during migration and expressed concerns about potential effects on migratory birds from facility light pollution and the risk of bird strikes once the buildings are

completed.

Historic and Cultural Resources

Seven commenters expressed concerns relating to potential effects on properties considered to have historic importance at or near the Proposed Project site, including a cemetery, older residences, and potential indigenous burial sites. Other commenters expressed concerns about potential effects on local indigenous communities, particularly the Onondaga Nation and the Oneida Indian Nation, from potential pollution of Onondaga Lake and other culturally significant water bodies in and near the Proposed Project area. Some commenters also expressed concern that the Onondaga Nation and the Oneida Indian Nation did not attend the public scoping meeting and requested that Micron invite their views and input on the Proposed Project.

Air Quality

Twenty-one commenters expressed concerns about potential air pollution from facility chemical use (including PFAS) and incineration, and from increased traffic. Commenters stated that there should be careful monitoring and regulation of air emissions associated with the Proposed Project. Commenters requested the use of modeling to estimate potential air emissions from the proposed Micron Campus and from Proposed Project-related traffic, and that these estimates be made publicly available. One commenter requested that USACE develop a more comprehensive action plan to mitigate air pollution.

Greenhouse Gases and Climate Change

Twelve commenters provided comments on GHGs and climate change. Some commenters expressed general concerns about potential individual and cumulative effects from the Proposed Project on climate change. Commenters expressed concerns about potential effects on climate change from chemical and gas releases and a large projected water consumption rate. Some commenters stated that there should be more discussion of the GHG emissions mitigation technology that Micron plans to use, including for fluorinated gases. Several commenters requested that Micron implement green energy solutions to mitigate the Proposed Project's potential contributions to climate change, such as on-site renewable energy generation by solar or geothermal power.

Solid Waste, Hazardous Waste, and Hazardous Materials

Twenty-one commenters provided comments on chemicals, contaminants, toxics, and hazardous materials, including comments relating to PFAS. Commenters expressed concerns about potential environmental pollution from facility releases of chemicals from normal operation, hazardous waste, and waste disposal by incineration and wastewater. Commenters expressed concerns about regulatory oversight of the semiconductor industry given the range of toxic chemicals it uses. Some commenters stated that there should be a comprehensive waste management plan addressing potential worker or public chemical exposure. One commenter requested assurances that herbicides or insecticides would not be used on the proposed Micron Campus. One commenter suggested that municipalities included in the traffic study should be notified of vehicles that would transport hazardous chemicals or waste within their boundaries.

Some commenters expressed concerns about the potential use of PFAS on the proposed Micron Campus, including concerns that potential release routes for PFAS could include accidental spills during transport or handling of PFAS-containing products, incomplete combustion of PFAS during process controls on gaseous emissions, or inadequate wastewater treatment. Commenters expressed concerns that current wastewater treatment technologies would not adequately remove all PFAS, particularly short-chain compounds used in semiconductor production. The commenters requested that the EIS identify potential mitigation measures or research objectives relating to industrial wastewater. These commenters also expressed concern that current State and Federal regulations only cover two types of PFAS that have been phased out by the semiconductor industry. Other comments expressed general concerns about the longevity of PFAS once they are released to the environment and their potential adverse effects on the human and natural environment.

Human Health and Safety

Fourteen commenters provided comments on public and worker health and safety. Commenters expressed concerns about the potential for public and worker exposure to toxic chemicals, including PFAS, via air, water, and soil pollution and short- and long-term health effects from potential chemical exposure, including at a nearby school. Some commenters also expressed concerns about fair labor practices in the context of potential worker exposure to hazardous chemicals. Some commenters expressed concerns about potential terrorist acts on the Micron Campus based on its national value and proximity to New York City and stated that these factors could pose risks to public safety. Commenters suggested that employees should be trained in the potential toxicity of gases and management of potential releases. Commenters stated that additional risk management should include the planned use and storage of hazardous substances based on proximity and wind direction. One commenter recommended that Micron create Risk Management Plans for the notification of the public and first responders.

Utilities

Twenty-two commenters provided comments on utilities. Many commenters expressed concerns about the funding sources or use of tax dollars for new utility connections for the proposed Micron Campus. Commenters also expressed concerns about the size of the proposed Micron Campus and its projected electricity and water demands, and the ability of the existing utility system to prevent potential blackouts and water shortages. One commenter inquired about the potential incorporation of combined heat and power into Micron Campus building designs.

Transportation and Traffic

Thirty-six commenters provided comments on transportation and traffic in and surrounding the Proposed Project area. Commenters generally expressed concerns about the potential for increased traffic congestion as a result of the Proposed Project and additional residential and commercial development. Some commenters stated that increased traffic could result in potential air quality and noise effects. Some commenters requested the completion of additional traffic studies, particularly relating to air quality or the delivery of construction material to the Proposed Project site. One commenter expressed concern about the ability of emergency vehicles (e.g., fire engines) to travel efficiently along Caughdenoy Road in the event of potential traffic congestion from the Proposed Project. Another commenter suggested that the EIS should thoroughly discuss

specific traffic mitigation measures. One commenter submitted an illustration proposing new road construction.

Noise and Vibration

Eight commenters provided comments on noise (as well as other potential nuisances such as olfactory irritation and light pollution). Commenters expressed concerns about potential quality of life effects (e.g., sleep, traffic flow) and effects on wildlife (e.g., birds) from noise pollution from operation of the proposed Micron Campus. One commenter expressed concerns about potential noise pollution from lawncare equipment and recommended the implementation of ecological landscape techniques to reduce the amount of necessary lawncare. One commenter requested construction of a traffic noise barrier. One commenter stated that the current wastewater treatment plant has an extremely unpleasant odor. Another commenter expressed concerns about potential unpleasant odors from the completed Micron facility due to chemical releases. Two commenters expressed concerns that the Micron Campus would generate light pollution during operation and from associated traffic and stated that light pollution could also have adverse effects on the quality of human life.

Socioeconomic Conditions

Thirty-two commenters provided comments relating to socioeconomic conditions. Several commenters expressed support for the Proposed Project due to the projected boost to the local economy. Many commenters expressed concerns regarding housing affordability and availability in the areas surrounding the Proposed Project due to the projected influx of Micron employees and supporting staff. Some commenters expressed concerns about effects on quality of life in the areas surrounding the proposed Micron Campus relating to potential chemical, noise, and light pollution from the construction and operation of the facility. Some commenters expressed concerns about potential effects on the local economy from the construction of supporting facilities and residences. One commenter expressed concern that products manufactured at the Micron Campus would not be used in the United States, but would be shipped overseas, and that the Proposed Project would not result in the creation of jobs for existing local residents. One commenter suggested that Micron seek employees for the new facility from within the local area, particularly the City of Syracuse, based on the city's high rate of poverty and unemployment, particularly among minority groups. One commenter suggested that the EIS discuss potential effects on property taxes.

Two commenters expressed opposition to removal of residences and potential effects on properties considered to have historic importance. One commenter expressed concerns about where homeowners who would be asked to relocate would go and who would be responsible for providing new housing. One commenter described a personal experience with losing a historical property to eminent domain.

Environmental Justice

USEPA stated that communities with environmental justice concerns should be afforded the opportunity to provide input on the NEPA process, including proposed mitigation, and encouraged the use of the EJScreen tool to identify such communities. One commenter stated that the EIS must provide an unbiased and rigorous analysis of environmental effects, including effects relating to environmental justice, and encouraged the agencies to evaluate potential air quality,

climate change, water quality, and socioeconomic effects on communities with environmental justice concerns.

Miscellaneous

Twenty-six commenters raised other miscellaneous concerns:

- **Aesthetics and visual resources.** Commenters expressed concerns relating to potential effects on area aesthetics from facility construction and perceived undesirable visual elements, such as large sizes of buildings and supporting infrastructure on the proposed Micron Campus.
- **Recreation.** Three commenters stated that the EIS should consider potential effects on recreational resources in Upstate New York and the outdoor opportunities they provide. One commenter mentioned the value of Oneida Lake to fishermen and enthusiasts of boating, kayaking, sailing, swimming, and sightseeing, noting that these activities generate more than \$140 million in spending and additional tax revenue.
- **Comment deadline extension requests.** Four commenters requested an extension of the public scoping comment deadline to give the public more time to provide input.
- **Support for public scoping meeting.** One commenter expressed appreciation for USACE and Micron staff based on the public scoping meeting.
- **Education and community benefits.** One commenter expressed support for the Proposed Project based on projected education and community benefits, particularly as would be provided by the proposed Childcare Center.
- **Employment interest.** One commenter expressed support for the Proposed Project and interest in future employment at the Micron Campus.
- **Information requests.** Two commenters requested copies of public scoping meeting materials.
- **Mailing list requests.** Five commenters requested to be added to the EIS mailing list to receive updates on the NEPA process.
- **Media interview requests.** One commenter requested an interview with Micron regarding the Proposed Project.
- **Project longevity.** Several commenters expressed concerns about the longevity of the Micron fabs, and associated facilities based on potential further technology advancement during the Proposed Project's 16-year construction period.
- **Independent review.** Several commenters requested that government agencies conduct independent and thorough reviews of documents associated with the Proposed Project, including the EIS, traffic and air studies, and Proposed Project facility emergency and disaster management plans.

- **Sovereign Nations.** One commenter requested that the EIS describe the process and outcomes of consultation with sovereign nations and recommended that the EIS evaluate potential downstream effects on sovereign nations, sacred sites, and areas of religious or cultural significance. The commenter stated that CPO should ensure that the Proposed Project avoids or includes plans to mitigate effects on such sacred sites.

Compliance with Executive Order 14008. One commenter inquired about compliance with Section 216 of E.O. 14008, Tackling the Climate Crisis at Home and Abroad, which requires Federal agencies to recommend steps to achieve the goal of conserving at least 30 percent of U.S. lands and waters by 2030.

Regulatory Branch

**SUBJECT: Public Scoping for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198**

Mr. Robert M. Davies
Director, Office of Statewide Engineering
Federal Highway Administration
New York Division Office
11A Clinton Avenue, Suite 719
Albany, New York 12207

Dear Mr. Davies:

The U.S. Army Corps of Engineers (USACE), Buffalo District, has received an application for a Department of the Army (DA) permit (USACE number LRB–2000–02198) from Micron New York Semiconductor Manufacturing LLC (Micron), a wholly owned subsidiary of Micron Technology, Inc., to construct a semiconductor manufacturing facility for leading-edge manufacturing of dynamic random-access memory (DRAM) chips. The USACE, as the lead federal agency under the National Environmental Policy Act (NEPA), has determined the proposed project may significantly affect the quality of the human environment and filed a Notice of Intent to prepare an environmental impact statement (EIS) on March 5, 2024.

Micron is proposing to acquire the approximately 1400-acre White Pine Commerce Park site, located at 5171 Route 31, Clay, NY 13041, from the Onondaga County Industrial Development Agency (OCIDA), and to construct the semiconductor manufacturing facility over a continuous 20-year period. The Proposed Project consists of (1) construction of the Micron Campus, which will include four individual memory fabrication units (fabs), ancillary support facilities, driveways, and parking; (2) construction of a childcare and health care center located at 9100 Caughdenoy Road, Brewerton, NY; (3) construction of a connection to the National Grid substation, adjacent to the Micron Campus, and (4) a rail spur on the west side of Caughdenoy Road adjacent to the proposed facility. Micron intends to start construction of the Micron Campus in 2025, with two fabs (Fabs 1 and 2) becoming operational by 2029. Two more fabs (Fabs 3 and 4) would be operational by 2041. Separately, Onondaga County plans to improve the water supply and wastewater infrastructure to support operations of the manufacturing plant. The National Grid utility company plans to upgrade the energy infrastructure to support the Proposed Project. The Proposed Project is anticipated to involve placement of fill into a total of approximately 226 acres of federally regulated wetlands on the proposed Micron Campus, 18 acres on the Rail Spur property west of the proposed campus, and 7,523 linear feet of federally regulated streams and ditches. The applicant proposes to develop a compensatory wetland mitigation plan to offset permanent losses of waters of the United States from the Proposed Project.

Regulatory Branch

SUBJECT: Scoping Letter for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198

The National Institute of Standards and Technology's (NIST) CHIPS Program Office (CPO), the Federal Highway Administration (FHWA), and the U.S. Environmental Protection Agency (EPA) have agreed to participate as Cooperating Agencies pursuant to 40 CFR 1501.8.

One public scoping meeting on the Proposed Project will be conducted. The purpose of the meeting is to provide information regarding the Proposed Project, answer questions, and accept comments regarding the potential environmental impacts and effects to historic properties that may result from construction and operation of the Proposed Project. The public scoping meeting will be held on Tuesday March 19, 2024, 7 p.m. Eastern Time at the Town of Clay, Town Hall Board Room; 4401 Route 31; Clay, NY 13041. Agencies, organizations, and members of the general public are invited to present comments or suggestions with regard to the range of actions, alternatives, and potential impacts to be considered in the EIS.

The scoping period will continue for 30 days from the date of the Notice of Intent and will close on April 4, 2024. During the scoping period, the USACE invites federal, state, and local agencies, Tribal Nations, other interested parties, and the general public to participate in the scoping process. The purpose of the scoping process is to provide information to the public, serve as a mechanism to solicit agency and public input on alternatives, identify significant issues to be analyzed in the EIS, and ensure full and open participation in scoping for the draft EIS. USACE anticipates that potential impacts to land use; socioeconomic conditions; environmental justice communities; historic and cultural resources; visual impacts; geology, soils, and topography; water resources; biological resources; solid waste; hazardous materials; health and safety; transportation; air quality; greenhouse gas emissions and climate change; noise; and utilities and infrastructure will be analyzed in the EIS. All comments must include the USACE number LRB-2000-02198. In order to be accepted, email comments must originate from the author's email account. All comments received will become part of the administrative record and are subject to public release under the Freedom of Information Act, including any personally identifiable information such as names, phone numbers, and addresses.

Written comments regarding the proposed EIS scope should be submitted to: U.S. Army Corps of Engineers, Buffalo District, Attn: Ms. Margaret Crawford, 7413 County House Road, New York 13021. Individuals who would like to provide comments electronically should submit comments by email to: celrb-micron.public.comments@usace.army.mil.

Sincerely,

**SUBJECT: Public Scoping for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198**

Mr. Mark Austin
Environmental Review Team Lead
US Environmental Protection Agency
Region 2
290 Broadway Mail Code: 19TH FL
New York, New York 10007

Dear Mr. Austin:

The U.S. Army Corps of Engineers (USACE), Buffalo District, has received an application for a Department of the Army (DA) permit (USACE number LRB–2000–02198) from Micron New York Semiconductor Manufacturing LLC (Micron), a wholly owned subsidiary of Micron Technology, Inc., to construct a semiconductor manufacturing facility for leading-edge manufacturing of dynamic random-access memory (DRAM) chips. The USACE, as the lead federal agency under the National Environmental Policy Act (NEPA), has determined the proposed project may significantly affect the quality of the human environment and filed a Notice of Intent to prepare an environmental impact statement (EIS) on March 5, 2024.

Micron is proposing to acquire the approximately 1400-acre White Pine Commerce Park site, located at 5171 Route 31, Clay, NY 13041, from the Onondaga County Industrial Development Agency (OCIDA), and to construct the semiconductor manufacturing facility over a continuous 20-year period. The Proposed Project consists of (1) construction of the Micron Campus, which will include four individual memory fabrication units (fabs), ancillary support facilities, driveways, and parking; (2) construction of a childcare and health care center located at 9100 Caughdenoy Road, Brewerton, NY; (3) construction of a connection to the National Grid substation, adjacent to the Micron Campus, and (4) a rail spur on the west side of Caughdenoy Road adjacent to the proposed facility. Micron intends to start construction of the Micron Campus in 2025, with two fabs (Fabs 1 and 2) becoming operational by 2029. Two more fabs (Fabs 3 and 4) would be operational by 2041. Separately, Onondaga County plans to improve the water supply and wastewater infrastructure to support operations of the manufacturing plant. The National Grid utility company plans to upgrade the energy infrastructure to support the Proposed Project. The Proposed Project is anticipated to involve placement of fill into a total of approximately 226 acres of federally regulated wetlands on the proposed Micron Campus, 18 acres on the Rail Spur property west of the proposed campus, and 7,523 linear feet of federally regulated streams and ditches. The applicant proposes to develop a compensatory wetland mitigation plan to offset permanent losses of waters of the United States from the Proposed Project.

SUBJECT: Scoping Letter for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198

The National Institute of Standards and Technology's (NIST) CHIPS Program Office (CPO), the Federal Highway Administration (FHWA), and the U.S. Environmental Protection Agency (EPA) have agreed to participate as Cooperating Agencies pursuant to 40 CFR 1501.8.

One public scoping meeting on the Proposed Project will be conducted. The purpose of the meeting is to provide information regarding the Proposed Project, answer questions, and accept comments regarding the potential environmental impacts and effects to historic properties that may result from construction and operation of the Proposed Project. The public scoping meeting will be held on Tuesday March 19, 2024, 7 p.m. Eastern Time at the Town of Clay, Town Hall Board Room; 4401 Route 31; Clay, NY 13041. Agencies, organizations, and members of the general public are invited to present comments or suggestions with regard to the range of actions, alternatives, and potential impacts to be considered in the EIS.

The scoping period will continue for 30 days from the date of the Notice of Intent and will close on April 4, 2024. During the scoping period, the USACE invites federal, state, and local agencies, Tribal Nations, other interested parties, and the general public to participate in the scoping process. The purpose of the scoping process is to provide information to the public, serve as a mechanism to solicit agency and public input on alternatives, identify significant issues to be analyzed in the EIS, and ensure full and open participation in scoping for the draft EIS. USACE anticipates that potential impacts to land use; socioeconomic conditions; environmental justice communities; historic and cultural resources; visual impacts; geology, soils, and topography; water resources; biological resources; solid waste; hazardous materials; health and safety; transportation; air quality; greenhouse gas emissions and climate change; noise; and utilities and infrastructure will be analyzed in the EIS. All comments must include the USACE number LRB-2000-02198. In order to be accepted, email comments must originate from the author's email account. All comments received will become part of the administrative record and are subject to public release under the Freedom of Information Act, including any personally identifiable information such as names, phone numbers, and addresses.

Written comments regarding the proposed EIS scope should be submitted to: U.S. Army Corps of Engineers, Buffalo District, Attn: Ms. Margaret Crawford, 7413 County House Road, New York 13021. Individuals who would like to provide comments electronically should submit comments by email to: celrb-micron.public.comments@usace.army.mil.

Sincerely,

**SUBJECT: Public Scoping for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198**

Mr. David Warrington
Regional Administrator
Department of Homeland Security
Federal Emergency Management Agency Region 2
Suite 1337, 26 Federal Plaza
New York, New York 10278

Dear Mr. Warrington:

The U.S. Army Corps of Engineers (USACE), Buffalo District, has received an application for a Department of the Army (DA) permit (USACE number LRB-2000-02198) from Micron New York Semiconductor Manufacturing LLC (Micron), a wholly owned subsidiary of Micron Technology, Inc., to construct a semiconductor manufacturing facility for leading-edge manufacturing of dynamic random-access memory (DRAM) chips. The USACE, as the lead federal agency under the National Environmental Policy Act (NEPA), has determined the proposed project may significantly affect the quality of the human environment and filed a Notice of Intent to prepare an environmental impact statement (EIS) on March 5, 2024.

Micron is proposing to acquire the approximately 1400-acre White Pine Commerce Park site, located at 5171 Route 31, Clay, NY 13041, from the Onondaga County Industrial Development Agency (OCIDA), and to construct the semiconductor manufacturing facility over a continuous 20-year period. The Proposed Project consists of (1) construction of the Micron Campus, which will include four individual memory fabrication units (fabs), ancillary support facilities, driveways, and parking; (2) construction of a childcare and health care center located at 9100 Caughdenoy Road, Brewerton, NY; (3) construction of a connection to the National Grid substation, adjacent to the Micron Campus, and (4) a rail spur on the west side of Caughdenoy Road adjacent to the proposed facility. Micron intends to start construction of the Micron Campus in 2025, with two fabs (Fabs 1 and 2) becoming operational by 2029. Two more fabs (Fabs 3 and 4) would be operational by 2041. Separately, Onondaga County plans to improve the water supply and wastewater infrastructure to support operations of the manufacturing plant. The National Grid utility company plans to upgrade the energy infrastructure to support the Proposed Project. The Proposed Project is anticipated to involve placement of fill into a total of approximately 226 acres of federally regulated wetlands on the proposed Micron Campus, 18 acres on the Rail Spur property west of the proposed campus, and 7,523 linear feet of federally regulated streams and ditches. The applicant proposes to develop a compensatory wetland mitigation plan to offset permanent losses of waters of the United States from the Proposed Project.

Regulatory Branch

SUBJECT: Scoping Letter for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198

The National Institute of Standards and Technology's (NIST) CHIPS Program Office (CPO), the Federal Highway Administration (FHWA), and the U.S. Environmental Protection Agency (EPA) have agreed to participate as Cooperating Agencies pursuant to 40 CFR 1501.8.

One public scoping meeting on the Proposed Project will be conducted. The purpose of the meeting is to provide information regarding the Proposed Project, answer questions, and accept comments regarding the potential environmental impacts and effects to historic properties that may result from construction and operation of the Proposed Project. The public scoping meeting will be held on Tuesday March 19, 2024, 7 p.m. Eastern Time at the Town of Clay, Town Hall Board Room; 4401 Route 31; Clay, NY 13041. Agencies, organizations, and members of the general public are invited to present comments or suggestions with regard to the range of actions, alternatives, and potential impacts to be considered in the EIS.

The scoping period will continue for 30 days from the date of the Notice of Intent and will close on April 4, 2024. During the scoping period, the USACE invites federal, state, and local agencies, Tribal Nations, other interested parties, and the general public to participate in the scoping process. The purpose of the scoping process is to provide information to the public, serve as a mechanism to solicit agency and public input on alternatives, identify significant issues to be analyzed in the EIS, and ensure full and open participation in scoping for the draft EIS. USACE anticipates that potential impacts to land use; socioeconomic conditions; environmental justice communities; historic and cultural resources; visual impacts; geology, soils, and topography; water resources; biological resources; solid waste; hazardous materials; health and safety; transportation; air quality; greenhouse gas emissions and climate change; noise; and utilities and infrastructure will be analyzed in the EIS. All comments must include the USACE number LRB-2000-02198. In order to be accepted, email comments must originate from the author's email account. All comments received will become part of the administrative record and are subject to public release under the Freedom of Information Act, including any personally identifiable information such as names, phone numbers, and addresses.

Written comments regarding the proposed EIS scope should be submitted to: U.S. Army Corps of Engineers, Buffalo District, Attn: Ms. Margaret Crawford, 7413 County House Road, New York 13021. Individuals who would like to provide comments electronically should submit comments by email to: celrb-micron.public.comments@usace.army.mil.

**SUBJECT: Public Scoping for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198**

Ms. Gay Vietzke
Regional Director
Department of Interior
National Park Service Region 1
1234 Market Street 20th Floor
Philadelphia, PA 19107

Dear Ms. Vietzke:

The U.S. Army Corps of Engineers (USACE), Buffalo District, has received an application for a Department of the Army (DA) permit (USACE number LRB-2000-02198) from Micron New York Semiconductor Manufacturing LLC (Micron), a wholly owned subsidiary of Micron Technology, Inc., to construct a semiconductor manufacturing facility for leading-edge manufacturing of dynamic random-access memory (DRAM) chips. The USACE, as the lead federal agency under the National Environmental Policy Act (NEPA), has determined the proposed project may significantly affect the quality of the human environment and filed a Notice of Intent to prepare an environmental impact statement (EIS) on March 5, 2024.

Micron is proposing to acquire the approximately 1400-acre White Pine Commerce Park site, located at 5171 Route 31, Clay, NY 13041, from the Onondaga County Industrial Development Agency (OCIDA), and to construct the semiconductor manufacturing facility over a continuous 20-year period. The Proposed Project consists of (1) construction of the Micron Campus, which will include four individual memory fabrication units (fabs), ancillary support facilities, driveways, and parking; (2) construction of a childcare and health care center located at 9100 Caughdenoy Road, Brewerton, NY; (3) construction of a connection to the National Grid substation, adjacent to the Micron Campus, and (4) a rail spur on the west side of Caughdenoy Road adjacent to the proposed facility. Micron intends to start construction of the Micron Campus in 2025, with two fabs (Fabs 1 and 2) becoming operational by 2029. Two more fabs (Fabs 3 and 4) would be operational by 2041. Separately, Onondaga County plans to improve the water supply and wastewater infrastructure to support operations of the manufacturing plant. The National Grid utility company plans to upgrade the energy infrastructure to support the Proposed Project. The Proposed Project is anticipated to involve placement of fill into a total of approximately 226 acres of federally regulated wetlands on the proposed Micron Campus, 18 acres on the Rail Spur property west of the proposed campus, and 7,523 linear feet of federally regulated streams and ditches. The applicant proposes to develop a compensatory wetland mitigation plan to offset permanent losses of waters of the United States from the Proposed Project.

The National Institute of Standards and Technology's (NIST) CHIPS Program Office (CPO), the Federal Highway Administration (FHWA), and the U.S. Environmental Protection Agency (EPA) have agreed to participate as Cooperating Agencies pursuant to 40 CFR 1501.8.

One public scoping meeting on the Proposed Project will be conducted. The purpose of the meeting is to provide information regarding the Proposed Project, answer questions, and accept comments regarding the potential environmental impacts and effects to historic properties that may result from construction and operation of the Proposed Project. The public scoping meeting will be held on Tuesday March 19, 2024, 7 p.m. Eastern Time at the Town of Clay, Town Hall Board Room; 4401 Route 31; Clay, NY 13041. Agencies, organizations, and members of the general public are invited to present comments or suggestions with regard to the range of actions, alternatives, and potential impacts to be considered in the EIS.

The scoping period will continue for 30 days from the date of the Notice of Intent and will close on April 4, 2024. During the scoping period, the USACE invites federal, state, and local agencies, Tribal Nations, other interested parties, and the general public to participate in the scoping process. The purpose of the scoping process is to provide information to the public, serve as a mechanism to solicit agency and public input on alternatives, identify significant issues to be analyzed in the EIS, and ensure full and open participation in scoping for the draft EIS. USACE anticipates that potential impacts to land use; socioeconomic conditions; environmental justice communities; historic and cultural resources; visual impacts; geology, soils, and topography; water resources; biological resources; solid waste; hazardous materials; health and safety; transportation; air quality; greenhouse gas emissions and climate change; noise; and utilities and infrastructure will be analyzed in the EIS. All comments must include the USACE number LRB-2000-02198. In order to be accepted, email comments must originate from the author's email account. All comments received will become part of the administrative record and are subject to public release under the Freedom of Information Act, including any personally identifiable information such as names, phone numbers, and addresses.

Written comments regarding the proposed EIS scope should be submitted to: U.S. Army Corps of Engineers, Buffalo District, Attn: Ms. Margaret Crawford, 7413 County House Road, New York 13021. Individuals who would like to provide comments electronically should submit comments by email to: celrb-micron.public.comments@usace.army.mil.

Sincerely,

**SUBJECT: Public Scoping for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198**

Ms. Deborah Broderson
Attorney Advisor
Federal Communications Commission
Office of General Counsel
45 L Street NE
Washington, DC 20554

Dear Ms. Broderson:

The U.S. Army Corps of Engineers (USACE), Buffalo District, has received an application for a Department of the Army (DA) permit (USACE number LRB-2000-02198) from Micron New York Semiconductor Manufacturing LLC (Micron), a wholly owned subsidiary of Micron Technology, Inc., to construct a semiconductor manufacturing facility for leading-edge manufacturing of dynamic random-access memory (DRAM) chips. The USACE, as the lead federal agency under the National Environmental Policy Act (NEPA), has determined the proposed project may significantly affect the quality of the human environment and filed a Notice of Intent to prepare an environmental impact statement (EIS) on March 5, 2024.

Micron is proposing to acquire the approximately 1400-acre White Pine Commerce Park site, located at 5171 Route 31, Clay, NY 13041, from the Onondaga County Industrial Development Agency (OCIDA), and to construct the semiconductor manufacturing facility over a continuous 20-year period. The Proposed Project consists of (1) construction of the Micron Campus, which will include four individual memory fabrication units (fabs), ancillary support facilities, driveways, and parking; (2) construction of a childcare and health care center located at 9100 Caughdenoy Road, Brewerton, NY; (3) construction of a connection to the National Grid substation, adjacent to the Micron Campus, and (4) a rail spur on the west side of Caughdenoy Road adjacent to the proposed facility. Micron intends to start construction of the Micron Campus in 2025, with two fabs (Fabs 1 and 2) becoming operational by 2029. Two more fabs (Fabs 3 and 4) would be operational by 2041. Separately, Onondaga County plans to improve the water supply and wastewater infrastructure to support operations of the manufacturing plant. The National Grid utility company plans to upgrade the energy infrastructure to support the Proposed Project. The Proposed Project is anticipated to involve placement of fill into a total of approximately 226 acres of federally regulated wetlands on the proposed Micron Campus, 18 acres on the Rail Spur property west of the proposed campus, and 7,523 linear feet of federally regulated streams and ditches. The applicant proposes to develop a compensatory wetland mitigation plan to offset permanent losses of waters of the United States from the Proposed Project.

Regulatory Branch

SUBJECT: Scoping Letter for the Proposed Micron Semiconductor Fabrication Facility;
Department of Army No. LRB-2000-02198

The National Institute of Standards and Technology's (NIST) CHIPS Program Office (CPO), the Federal Highway Administration (FHWA), and the U.S. Environmental Protection Agency (EPA) have agreed to participate as Cooperating Agencies pursuant to 40 CFR 1501.8.

One public scoping meeting on the Proposed Project will be conducted. The purpose of the meeting is to provide information regarding the Proposed Project, answer questions, and accept comments regarding the potential environmental impacts and effects to historic properties that may result from construction and operation of the Proposed Project. The public scoping meeting will be held on Tuesday March 19, 2024, 7 p.m. Eastern Time at the Town of Clay, Town Hall Board Room; 4401 Route 31; Clay, NY 13041. Agencies, organizations, and members of the general public are invited to present comments or suggestions with regard to the range of actions, alternatives, and potential impacts to be considered in the EIS.

The scoping period will continue for 30 days from the date of the Notice of Intent and will close on April 4, 2024. During the scoping period, the USACE invites federal, state, and local agencies, Tribal Nations, other interested parties, and the general public to participate in the scoping process. The purpose of the scoping process is to provide information to the public, serve as a mechanism to solicit agency and public input on alternatives, identify significant issues to be analyzed in the EIS, and ensure full and open participation in scoping for the draft EIS. USACE anticipates that potential impacts to land use; socioeconomic conditions; environmental justice communities; historic and cultural resources; visual impacts; geology, soils, and topography; water resources; biological resources; solid waste; hazardous materials; health and safety; transportation; air quality; greenhouse gas emissions and climate change; noise; and utilities and infrastructure will be analyzed in the EIS. All comments must include the USACE number LRB-2000-02198. In order to be accepted, email comments must originate from the author's email account. All comments received will become part of the administrative record and are subject to public release under the Freedom of Information Act, including any personally identifiable information such as names, phone numbers, and addresses.

Written comments regarding the proposed EIS scope should be submitted to: U.S. Army Corps of Engineers, Buffalo District, Attn: Ms. Margaret Crawford, 7413 County House Road, New York 13021. Individuals who would like to provide comments electronically should submit comments by email to: celrb-micron.public.comments@usace.army.mil.

Micron Semiconductor Manufacturing Facility Project, Clay, NY

June 27, 2025

Michael Martucci, Regional Administrator
U.S. Environmental Protection Agency Region 2
290 Broadway
New York, New York 10007-1866

Dear Mr. Martucci:

On June 27, 2025, the Creating Helpful Incentives to Produce Semiconductors (CHIPS) Program Office (CPO) within the U.S. Department of Commerce, as joint lead agency with the Onondaga County Industrial Development Agency (OCIDA), published the Draft Environmental Impact Statement (Draft EIS) for the proposed Micron New York Semiconductor Manufacturing Project. CPO and OCIDA jointly prepared this Draft EIS to evaluate the potential environmental effects of the project as required under the National Environmental Policy Act and the New York State Environmental Quality Review Act. A link to the Draft EIS and all appendices is included here <https://www.nist.gov/chips/chips-incentives-funding-opportunities/environmental-division/national-environmental-policy>.

Copies of these documents may also be viewed at the following library during normal business hours:

Onondaga County Public Library
447 South Salina St.
Syracuse, NY 13202

A public hearing will be held on Thursday, July 24, 2025, with public comment sessions from 10 am – 1 pm; 2 pm – 5 pm; and 6 pm – 9 pm, to gather unsworn, public comment on the Draft EIS. The hearing will take place at the Liverpool High School Auditorium, 4338 Wetzell Road, Liverpool, New York, 13090.

Written comments on the Draft EIS will be accepted by mail or e-mail to chipsnepa@chips.gov until **August 11, 2025**. Because this is a joint Federal and State Draft EIS, all comments submitted to either CPO or OCIDA will be considered by both agencies. Comments do not need to be submitted to both agencies to be considered.

STATE ENVIRONMENTAL QUALITY REVIEW ACT

NOTICE OF COMPLETION AND PUBLIC HEARING DRAFT ENVIRONMENTAL IMPACT STATEMENT

MICRON NEW YORK SEMICONDUCTOR MANUFACTURING PROJECT

This notice is issued pursuant to Part 617 of the implementing regulations pertaining to Article 8, State Environmental Quality Review Act (SEQRA) of the New York State Environmental Conservation Law and the regulations adopted pursuant thereto (6 NYCRR Part 617). The Onondaga County Industrial Development Agency (OCIDA), as joint lead agency with the Creating Helpful Incentives to Produce Semiconductors (CHIPS) Program Office (CPO) created by the U.S. Department of Commerce, has accepted for public review and comment the Draft Environmental Impact Statement (Draft EIS) for the proposed Micron New York Semiconductor Manufacturing Project. CPO and OCIDA jointly prepared this Draft EIS to evaluate the potential environmental effects of the Proposed Project as required under the National Environmental Policy Act (NEPA) and SEQRA. A copy of the Draft EIS may be viewed on OCIDA's webpage at: <https://ongoved.com/microndeis2025/>.

A paper copy may also be viewed at the office of OCIDA during normal business hours by appointment by using the phone number below. Copies of these documents may also be viewed at the Town of Clay Town Hall and Town of Cicero Municipal Offices as well as the following library during normal business hours:

Onondaga County Public Library
447 South Salina St.
Syracuse, NY 13202

Public comment sessions will be held from 10 am – 1 pm; 2 pm – 5 pm; and 6 pm – 9 pm on Thursday, July 24, 2025, pursuant to 6 NYCRR Part 617, to gather unsworn, public comment on the Draft EIS. The meeting will take place at the Liverpool High School Auditorium, 4338 Wetzel Road, Liverpool, New York, 13090. All persons, organizations, corporations, or government agencies that may be affected by the proposed project are invited to attend the meeting and to submit oral or written comments. Lengthy statements should be in writing and summarized for oral presentation. Reasonable time limits may be set for each speaker to afford everyone an opportunity to be heard. Equal weight will be given to both oral and written statements. The public comment session will have simultaneous Spanish and American Sign Language interpretation. To request additional language translation services or special needs assistance, at no charge, please contact OCIDA by 5:00 p.m. **July 14, 2025**, using the contact information listed below.

Written comments on the Draft EIS will be accepted by OCIDA and must be submitted by mail or e-mail to the contact listed below until **August 11, 2025**. Because this is a joint Federal and State Draft EIS, all comments submitted to either OCIDA or CPO will be considered by both agencies.

Comments do not need to be submitted to both agencies to be considered. There will be no extension of the comment period.

Micron New York Semiconductor Manufacturing LLC (Micron), a wholly owned subsidiary of Micron Technology, Inc., proposes to construct and operate a semiconductor manufacturing facility with four semiconductor fabrication buildings (fabs) on an approximately 1,377-acre site consisting primarily of the White Pine Commerce Park (WPCP), principally located at 5171 Route 31, Town of Clay, New York. In total, the Proposed Project would consist of: construction of the Micron Campus at the WPCP, including the four fabs, ancillary support facilities, ingress and egress roads, driveways, and parking; construction of a rail spur and construction material conveyance facility to support construction of the Micron Campus (Rail Spur Site); construction of a childcare center, healthcare center, and recreational center (Childcare Site); and leasing of existing warehouse space in an industrially zoned area at a location to be determined within 20 miles of the Micron Campus (Warehouse Site). The Proposed Project will also require utility and infrastructure improvements to meet its electricity, natural gas, water supply, wastewater, and telecommunications needs (Connected Actions).

Construction and operation of the Proposed Project and Connected Actions requires action from several Federal, State, and local agencies. Micron is also seeking federal funding under the Creating Helpful Incentives to Produce Semiconductors for America Act (the “CHIPS Act”), as amended by the CHIPS Act of 2022, and has submitted applications and requests for certain Federal permits and approvals that require Federal environmental review, including, but not limited to, Federal wetlands permits pursuant to Section 404 of the Clean Water Act. New York State is considering providing financial support and tax incentives to Micron under the New York Green CHIPS Program and the Green CHIPS Excelsior Jobs Tax Credit Program to support construction and operation of the Proposed Project within New York State. In addition, OCIDA is considering Micron’s application for a grant of financial assistance to construct the Proposed Project and the use of its condemnation authority pursuant to the New York Eminent Domain Procedure Law. OCIDA is also considering whether to lease, and ultimately sell to Micron, the WPCP where the Proposed Project will be located. Other Federal, State and local land use decisions, permits, authorizations and approvals are also under consideration by relevant agencies and authorities.

The Draft EIS analyzed the following areas of potential environmental impacts from the No Action Alternative and the Proposed Action Alternatives: Land Use, Zoning and Public Policy; Geology, Soils and Topography; Water Resources; Biological Resources; Historic and Cultural Resources; Air Quality; Greenhouse Gas and Climate Change; Solid Waste and Hazardous Materials; Human Health and Safety; Utilities and Infrastructure; Transportation; Noise and Vibration; Visual Impacts and Community Character; Community Facilities, Open Space and Recreation; Socioeconomics; and Environmental Justice.

ENB PUBLISH DATE: 06/25/2025

Town of Clay - Micron New York Semiconductor Manufacturing Project

Notice of Acceptance of Draft EIS and Public Hearing

Onondaga County - The Onondaga County Industrial Development Agency (OCIDA), as joint lead agency with the Creating Helpful Incentives to Produce Semiconductors (CHIPS) Program Office (CPO) created by the United States Department of Commerce, has accepted for public review and comment the Draft Environmental Impact Statement (Draft EIS) for the proposed Micron New York Semiconductor Manufacturing Project. CPO and OCIDA jointly prepared this Draft EIS to evaluate the potential environmental effects of the Proposed Project as required under the National Environmental Policy Act (NEPA) and SEQRA. A copy of the Draft EIS may be viewed on OCIDA's webpage at: <https://ongoved.com/microndeis2025/>.

A paper copy may also be viewed at the office of OCIDA during normal business hours by appointment by using the phone number below. Copies of these documents may also be viewed at the Town of Clay Town Hall and Town of Cicero Municipal Offices as well as the following library during normal business hours:

Onondaga County Public Library
447 South Salina St.
Syracuse, NY 13202

Public comment sessions will be held from 10:00 a.m. to 1:00 p.m.; 2:00 p.m. to 5:00 p.m.; and 6:00 p.m. to 9:00 p.m. on Thursday, July 24, 2025 at the Liverpool High School Auditorium, 4338 Wetzel Road, Liverpool, NY, 13090. Reasonable time limits may be set for each speaker to afford everyone an opportunity to be heard. Equal weight will be given to both oral and written statements. The public comment session will have simultaneous Spanish and American Sign Language interpretation. **To request additional language translation services or special needs assistance, at no charge, please contact OCIDA by 5:00 p.m. July 14, 2025, using the contact information listed below.**

Written comments on the Draft EIS will be accepted by OCIDA and must be submitted by mail or e-mail to the contact listed below until August 11, 2025. Because this is a joint Federal and State Draft EIS, all comments submitted to either OCIDA or CPO will be considered by both agencies. Comments do not need to be submitted to both agencies to be considered. There will be no extension of the comment period.

Micron New York Semiconductor Manufacturing LLC (Micron), a wholly owned subsidiary of Micron Technology, Inc., proposes to construct and operate a semiconductor manufacturing facility with four semiconductor fabrication buildings ("fabs") on an approximately 1,377-acre site consisting primarily of the White Pine Commerce Park (WPCP), principally located at 5171 Route 31, Town of Clay, New York. In total, the Proposed Project would consist of: construction of the Micron Campus at the WPCP, including the four fabs, ancillary support facilities, ingress and egress roads, driveways, and parking; construction of a rail spur and construction material conveyance facility to support construction of the Micron Campus (Rail Spur Site); construction of a childcare center, healthcare center, and recreational center (Childcare Site); and leasing of existing warehouse space in an industrially zoned area at a location to be determined within 20

miles of the Micron Campus (Warehouse Site). The Proposed Project also will require utility and infrastructure improvements to meet its electricity, natural gas, water supply, wastewater, and telecommunications needs (Connected Actions).

The project is located at 5171 Route 31 in the Town of Clay, New York

Appendix A-5 Response to Comments

Agency Comments

United States Environmental Protection Agency

USEPA Comment 1:

The United States Environmental Protection Agency (“USEPA”) recommended that the Executive Summary should clearly state the purpose and need for the Project, as that information is critical in describing the validity of alternatives.

Response: Chapter 1 sets out the purpose and need for the Proposed Project, which has been further detailed in the FEIS. See FEIS Section 1.1. The Executive Summary also has been updated to further describe the Proposed Project’s purpose and need. See FEIS Section 0.1.

USEPA Comment 2:

USEPA recommended that the criteria by which the commercial viability of the Project is evaluated should be defined in the Introduction of the EIS.

Response: Deciding which applicants may merit funding under the mandates of the CHIPS Act is discretionary with CPO, and is not subject to public review under NEPA.

USEPA Comment 3:

USEPA suggested that the Final EIS identify the anticipated timeline for the additional regulatory requirements including permits and environmental reviews that will be required for the Project and connected actions.

Response: Section 1.4 of the FEIS identifies the permits and other approvals that are anticipated to be needed for the Proposed Project and Connected Actions. The lead agencies, however, cannot predetermine the timeline for permit issuance or other approvals required for the Proposed Project. Notwithstanding, Micron seeks to have all necessary permits and approvals required to start construction during the 2025-2026 tree clearing window.

USEPA Comment 4:

USEPA requested that the alternatives analysis briefly discuss the criteria for the weighing effects of one resource area against another resource and how this weighting was incorporated into impact determinations for the resource areas.

Response: The FEIS’s alternatives analysis did not weigh effects against each other. Language was updated in the FEIS to clarify that when comparing the effects between alternatives, the lead agencies compared the degree of effects on each resource. See FEIS Section 2.2.

USEPA Comment 5:

USEPA requested that the Final EIS provide clear definitions for impact level classifications or criteria used to assess significance of potential impacts for each resource area.

Response: The FEIS has not been revised in response to this comment. Clear definitions are already found in Chapter 3.0 of the FEIS and specific resource chapters under “Summary of Effects.” The FEIS explains the impact criteria for each resource in the discussion of each resource. For example, the Summary of Effects in the Land Use section explains that the development of the Proposed Project and Connected Actions is consistent with applicable zoning and public policies, which is the criteria that was used to identify any significant adverse effects. See also the Summary of Effects in Air Quality, which explains whether the Proposed Project would contribute to the exceedance of any applicable air quality standard established to protect human health; this is the criteria used to establish significant effects within the five-county region. These criteria are specific to each resource area and cannot be effectively defined independently or summarized absent the narrative discussion that precedes the Summary of Effects for each resource area.

USEPA Comment 6:

USEPA recommended creating a section that lists all mitigation measures considered in the Final EIS.

Response: Each resource area includes a summary of all mitigation measures considered by the lead agencies. In addition, Table 3.17-1 details those areas where mitigation measures have been identified and directs the reader, by resource area, to the specific reference in the FEIS.

USEPA Comment 7:

USEPA requested that the information in Table 3.6-1 be revised to reflect a revised annual sulfur dioxide (SO₂) NAAQS standard of 10 ppb.

Response: Table 3.6-1 has been revised in the FEIS.

USEPA Comment 8:

For Mobile Sources, USEPA requested that the Final EIS incorporate a more explicit explanation of the intersections that fail hot spot analyses and what that signifies in Appendix I-3.

Response: There are no intersections that fail the hot spot analyses. See FEIS Table 3.6-16.

USEPA Comment 9:

USEPA suggested the best management practices (BMPs)/mitigation measures for construction equipment include best available control technology as feasible into contract specifications to reduce emissions during construction.

Response: Micron and its third-party contractors will be required to comply with BMPs and permitting requirements. As appropriate, contract specifications will include requirements to comply with applicable BMPs and permitting requirements. The lead agencies will monitor compliance with all construction BMPs/mitigation measures.

USEPA Comment 10:

USEPA recommended including a map of surface hydrology connecting on-site aquatic resources to downstream traditionally navigable waters.

Response: A map depicting the surface hydrology connection between onsite aquatic resources to downstream traditionally navigable waters is include in the FEIS at Figure 3.3-3.

United States Fish and Wildlife Service**USFWS Comment 1:**

The United States Fish and Wildlife Service (“USFWS”) commented that there seems to be a discrepancy between the text in Section 3.3.3.1 of the Draft EIS and Table 3.3-5 (pg. 3-65), which says there are 422.20 federal wetlands on Campus.

Response: The comment is correct that there is a discrepancy because of references to jurisdictional wetlands and a more general reference to total wetlands. For example, FEIS Section 3.3.3.1 refers to 408.61 acres of *delineated federal jurisdictional wetlands* on the Micron Campus that fall under U.S. Army Corps of Engineers (USACE) federal jurisdiction, as verified through Preliminary Jurisdictional Determinations (PJDs) issued in February and October 2024. The 422.20-acre total shown in Table 3.3-5 represents the entire wetland area on the Micron Campus. This total includes:

- 408.61 acres of federal jurisdictional wetlands
- 13.14 acres of non-jurisdictional wetlands
- 0.45 acres of state-jurisdictional wetlands that do not overlap with the federally jurisdictional wetlands

This breakdown clarifies the distinction between federal, state, and non-jurisdictional wetlands and explains how the total acreage was calculated.

USFWS Comment 2:

USFWS recommended that Section 3.4.4, Table 3.4-8 be revised to add a project commitment that forested areas that will remain undisturbed: reference to construction monitor who would monitor invasive plant establishment, if this will be part of the monitor’s scope of work; and under altered composition: consider changing “where feasible” to the “maximum extent practicable.” Native plants should be the default choice.

Response: The commitment and revisions requested in the comment will be included as part of the Landscape Management Plan described in the FEIS Table 3.4-8. Table 3.4-8 has been updated in the FEIS to reflect these requested changes.

USFWS Comment 3:

Regarding the pages 3-118 and 3-120 of the Draft EIS, the USFWS requested that consideration be given to the carrying capacity of the adjacent or nearby habitat these animals might relocate to and give context as to how much habitat is available.

Response: FEIS Section 3.4.4.2 acknowledged the likelihood that some mammals, birds, reptiles, and amphibians will be unable to relocate to suitable alternative habitat and thus may experience reduced fitness and possibly reduced survival. These sections have been revised in the FEIS to reiterate this point and make it clearer that displaced wildlife will be challenged to find habitat elsewhere, particularly in areas that may already be at carrying capacity for their species.

USFWS Comment 4:

USFWS acknowledged that the No Effect determination for the tricolored bat will be revised in the Biological Assessment (BA).

Response: CPO revised the final BA to make a preliminary Endangered Species Act effect determination of “not likely to jeopardize; may affect, likely to adversely affect” for the tricolored bat, and is requesting a conference opinion for the tricolored bat.

USFWS Comment 5:

USFWS requested that the tree clearing commitment on page 3-123 of the Draft EIS be revised to state that “all tree clearing...shall only occur within the winter hibernation window from November 1 through March 31.”

Response: The requested change has been made in the FEIS.

USFWS Comment 6:

USFWS commented that the loss of acreage identified in the Draft EIS for roosting habitat does not align with the BA, which says a total of 727 acres would be lost (which includes all actions; 467 acres for the campus and rail spur site). These acreages should be consistent across all documents. Discuss the remaining 307 acres of forested habitat.

Response: FEIS Section 3.4.4.2 stated that 335 acres of roosting habitat would be lost on the Micron Campus and Rail Spur Site. That figure was incorrect and should be 467 acres, as reported in the BA. The FEIS has been revised accordingly. The forest that will remain outside the Micron Campus LOD and be protected is discussed in the BA (Appendix G-4).

USFWS Comment 7:

USFWS recommended the inclusion of a table similar to Table 11 in the BA.

Response: A table similar to Table 11 in the BA has been added to the FEIS (FEIS Table 3.4-10).

USFWS Comment 8:

USFWS commented that Table 3.4-10 regarding the operational effects on bats was unclear and appears to be inconsistent with the forested (roosting habitat) loss in Table 14 of the BA.

Response: The acreages in FEIS Table 3.4-11 (DEIS Table 3.4-10) do not match Table 14 of the BA because: (1) the BA table combines four categories of forest while the EIS table treats them individually; and (2) the BA table presents the Proposed Project separately from the Connected Actions and transportation improvements, while the EIS table is a combination of the Proposed Project and Connected Actions, and does not include transportation improvements.

USFWS Comment 9:

USFWS requested that Table 3.4-11 be updated with the correct acreages (307 acres of forested habitat will remain) and to reflect the project commitments of the Biological Opinion (BO). USFWS further noted that for BMPs the use of native species should be the default choice.

Response: Comment noted. FEIS Table 3.4-12 (DEIS Table 3.4-11) presents the number of acres of forested habitat that will remain on the Micron Campus (272 acres). The 307 acres referenced in the comment represents the total acreage to remain across the Proposed Project and Connected Actions. Therefore, the table has not been revised in the FEIS.

USFWS Comment 10:

USFWS requested that Table 3.4-12 be updated to be consistent with the BA.

Response: FEIS Table 3.4-13 (DEIS Table 3.4-12) has been revised in the FEIS to be consistent with the BA.

USFWS Comment 11:

USFWS requested that the Draft EIS should acknowledge that, on a regional basis, cumulative impacts to wetlands from the projects listed in Table 4.2-1 are likely to be substantial on downgradient functions and services, despite BMPs and mitigation measures.

Response: FEIS Section 4.3.3 (Cumulative Impacts, Water Resources) evaluates the reasonably foreseeable cumulative impacts from the projects listed in Table 4.2-1 and determined that the proposed transportation upgrades and reasonably foreseeable actions are predicted to result in additional adverse effects on existing wetlands, above and beyond the effects of the Proposed Project and Connected Actions. This evaluation considered if the projects are planned within the same nine sub-watersheds and if construction activities occur at the same time as construction of the Proposed Project and Connected Actions. However, based on the avoidance, minimization, and mitigation measures that would be required as part of the permitting process, jurisdictional wetland losses would be compensated through enhancement, establishment, and/or restoration of

wetlands elsewhere within the watersheds and the protection of existing wetlands would be maximized.

USEFWS Comment 12:

USFWS commented that the increased human activity, noise and light expected from these projects on a regional basis will cumulatively decrease suitable habitat for listed bat species and wildlife overall.

Response: The measures identified in the DEIS and Biological Assessment, that Micron would be required to implement, would avoid, minimize, and mitigate the loss of habitat through a combination of on-site impact avoidance and off-site mitigation. FEIS Section 3.4.5.1 describes Best Management Practices (BMPs) to reduce impacts to biological resources, including retention of onsite roosting and foraging habitat (380 acres that includes approximately 272 acres of nearly contiguous forested roosting and foraging habitat) and use of lighting that minimizes light spillage or trespass beyond intended areas of illumination. Micron will also fund the purchase and installation of 10 roost boxes of appropriate styles and designs selected by USFWS and NYSDEC for Indiana, northern long-eared, and tricolored bats in undisturbed portions of the Micron Campus.

Lighting will be designed to minimize backlight, uplight, and glare, consistent with the Illuminating Engineering Society's BUG rating system and the Town of Clay's lighting code (§140). Construction lighting will be limited to active work areas—unsuitable for bats—and will be directed inward to minimize light trespass into adjacent areas. Construction will end by 10 p.m., further limiting nighttime lighting and noise exposure.

With respect to operational noise, the Micron Campus and Childcare Site would employ noise mitigation measures (e.g., sound attenuators, acoustical louvers, sound walls) to reduce noises generated by outdoor equipment such as rooftop air handlers and cooling fans. Operation of the Rail Spur conveyor would include equipment upgrades to reduce noise, including upgraded pulleys and return idlers, and 1-inch rubber flashing on the hoppers.

Offsite Mitigation Plans proposed by Micron to address the loss of wetlands, surface waters, and associated biological communities, are detailed in Appendix F and Appendix G of the FEIS. The *Off-site Compensatory Mitigation Plan* (Appendix F-7 of the FEIS, Appendix N, Attachment B), implemented through The Wetland Trust, Inc. ("TWT"), will permanently conserve approximately 1,340 acres of upland and wetland habitat across six sites within the Oneida River watershed, including the enhancement, establishment and restoration of 422.14 acres of wetlands and 14,030 linear feet of streams.

Micron has also developed Mitigation Plans to address impacts to biological communities on the Proposed Project site, as detailed in FEIS Appendix G. This includes the purchase and permanent protection of two acres of suitable bat roosting habitat for every one acre of forested area lost due to construction of the Proposed Project and Connected Actions. Based on current estimates, a minimum of approximately 1,182 acres of protected roosting habitat offsite in addition to the approximately 272 undisturbed acres of roosting habitat that will be protected via conservation

easement on the Micron Campus following full buildout, resulting in a total of at least 1,454 permanently protected acres of roosting habitat for Indiana, northern long-eared, and tricolored bats.

Micron and TWT have also proposed to purchase 650 acres of sufficiently high-quality grassland bird habitat for permanent protection and to restore and manage the habitat as grassland for 15 years (in 3-year cycles) to achieve a net conservation benefit.

Micron will sponsor research and monitoring projects recommended by and designed in consultation with USFWS and the NYSDEC, to help improve science-based management and conservation of the Indiana, northern long-eared, and tricolored bat in New York. They include studies of the movement, summer ranges, and distribution of bats on the Syracuse-area landscape, the sensitivity of bats to noise and light, and the response of bats to the Micron Campus' development over time.

New York State Department of Environmental Conservation

NYSDEC Comment 1:

The New York State Department of Environmental Conservation (“NYSDEC”) noted that, in addition to the SEQR-NEPA environmental impact review detailed in the Draft EIS, NYSDEC is evaluating potential environmental impacts through a concurrent review of application materials submitted by the applicants for permits under the Environmental Conservation Law (ECL) which are required for construction and operation of the Micron Project and the Connected Actions.

Response: Comment noted.

NYSDEC Comment 2:

Because the Draft EIS states that bed rock removal may require blasting operations NYSDEC recommended that (1) permanent blasting lines are kept clear of conductive materials such as power circuits, pipes, rails, etc., and ideally maintained at least 20 feet away from power lines; (2) the NYS licensed blaster must follow standard state and federal guidelines, including air blast limits and safe ground vibration levels, which shall be protective for the surrounding structures and residences; and (3) all blasts are monitored by a seismograph.

Response: The blasting plan has been revised. See FEIS Appendix E-5, Micron Blasting Plan, Sections 7.1, 7.2, and 7.6. Should blasting be required as a last resort, Micron will comply with NYSDEC's recommendations.

NYSDEC Comment 3:

Because Micron's wetlands mitigation plans included in the Draft EIS continued to be refined with agency input, NYSDEC recommended that the Final EIS contain the final wetland mitigation plans if there are updates or site plan adjustments.

Response: As of the date of the FEIS, the wetlands mitigation plans are not yet final. The final wetlands mitigation plan will be made public once adopted as part of the USACE and NYSDEC permitting for the Proposed Project.

NYSDEC Comment 4:

NYSDEC noted that Micron and the Rail Spur operator are required to gain coverage under NYSDEC's Construction General Stormwater Permit, GP-0-25-001 (CGP), which requires developing a Stormwater Pollution Preventions Plan (SWPPP) that includes the implementation of practices to protect water quality and to reduce future flooding risks associated with the Project.

Response: Micron and the Rail Spur operator will be required to obtain coverage under NYSDEC's Construction General Stormwater Permit, GP-0-25-001 (CGP), which includes the development and implementation of SWPPPs.

NYSDEC Comment 5:

NYSDEC commented that it and the Town of Clay will be completing a joint review to ensure that the SWPPP meets NYSDEC technical standards and the requirements of the CGP. NYSDEC also recommended that the Micron and Rail Spur SWPPP be appended to the final EIS, if available at the time of publication.

Response: As of the date of the FEIS, the SWPPPs for the Rail Spur Site and Micron Campus are not yet final. To provide additional disclosure, a draft version of the SWPPP document for the first phase of the Micron Campus as submitted to NYSDEC and the Town of Clay has been included as Appendix F-8 of the FEIS. Both the final SWPPPs for the Micron Campus and the Rail Spur Site will be made public as part of the NYSDEC and Town of Clay's review.

NYSDEC Comment 6:

NYSDEC confirmed that it will be completing routine site inspections to ensure CGP permit compliance during project construction.

Response: Comment noted.

NYSDEC Comment 7:

NYSDEC noted that, to accommodate the increase in the flowrate and the associated organic/inorganic loadings to the existing Oak Orchard Waste Water Treatment Plant ("OOWWTP"), Onondaga County will submit an NY-2A application to NYSDEC for modification of the current OOWWTP State Pollution Discharge Elimination System (SPDES) permit, which will include a chemical characterization of the wastewater from all existing and new sources that the expanded facility is expected to receive and treat. NYSDEC further notes that the wastewater characterization will include the mixture of any emerging contaminants that are assumed to be contained within the discharge from new industrial sources.

Response: Comment noted.

NYSDEC Comment 8:

NYSDEC will continue to work closely with Onondaga County and Micron in the development and review of the SPDES permit modification to maintain New York State's high water quality standards.

Response: The lead agencies recognize NYSDEC's jurisdiction to review OOWWTP's application for a SPDES permit modification and acknowledge that the required permit review and modification will be granted based on the OOWWTP meeting applicable New York State water quality standards.

NYSDEC Comment 9:

NYSDEC recommends including any updates to the OOWWTP upgrade plans to the FEIS, as necessary and if available.

Response: The layout and plans for the OOWWTP are still being designed within the limits of disturbance as shown on Figure 2.1-16. The limits of disturbance have not changed for the IWWTP. Review of the municipal upgrades and associated plans is covered under separate SEQRA review.

NYSDEC Comment 10:

NYSDEC commented that the Draft EIS was published prior to the publication of Micron's Climate Leadership and Community Protection Act (CLCPA) Analysis, which NYSDEC publicly noticed as part of its permitting process, and noted that a finer level of detail was included in the CLCPA Analysis than is presently in the Draft EIS.

Response: See Response to Climate Change/GHG Comment 14. The lead agencies acknowledge the timing and note that the analysis required under the Climate Leadership and Community Protection Act (CLCPA) will contain greater detail than the discussion of the CLCPA in the FEIS given the differences between SEQRA and the CLCPA. Notwithstanding, the FEIS comprehensively reviews and assesses the Proposed Project's reasonably foreseeable GHG impacts. Any difference in detail between the FEIS and the CLCPA Analysis would not materially alter the extent of the Proposed Project's GHG impacts. See also FEIS Section 3.7.3.2.

NYSDEC Comment 11:

NYSDEC recommended that the FEIS incorporate the latest greenhouse gas emissions data and information available to ensure consistency amongst the permitting documents and related CLCPA Analysis.

Response: See Response to NYSDEC Comment 10 and Climate Change/GHG Comment 14. The FEIS provides a thorough and comprehensive review of environmental effects, including greenhouse gas emissions. Pursuant to Section 7(2) of the CLCPA, and as discussed in FEIS Section 3.7.1.3, NYSDEC will review Micron's CLCPA analysis as part of its processing of

NYSDEC permits and determine whether the Proposed Project would be inconsistent with or interfere with the attainment of the statewide GHG emission limits in ECL Article 75, and if it determines that it would, whether it is otherwise justified and determine feasible mitigation measures to be required

The lead agencies have appended the current draft CLCPA Analysis to the FEIS as Appendix J-2. It is anticipated that this document remains subject to change as part of the NYSDEC permitting process.

NYSDEC Comment 12:

NYSDEC noted that the scope and complexity of the potential impacts associated with the Micron Project require a thorough and comprehensive review of environmental, social, and economic factors.

Response: The FEIS evaluates the reasonably foreseeable environmental impacts of the Proposed Project and Connected Actions and considers mitigation measures that would reduce or avoid otherwise significant impacts as required by NEPA and SEQRA. The FEIS satisfies the legal standards under all applicable regulatory regimes.

NYSDEC Comment 13:

NYSDEC stated that it will continue to work with the applicants and the other local, state, and federal agencies as necessary to further address potential environmental impacts of construction and operation of the Micron Project throughout the permitting process.

Response: Comment noted.

New York State Department of Transportation

NYSDOT Comment 1:

The New York State Department of Transportation (NYSDOT) acknowledged the assessment of potential transportation improvements on state-owned roadways and the transportation recommendations identified in the Draft EIS.

Response: Comment noted.

NYSDOT Comment 2:

NYSDOT noted that, as part of a separate environmental review and in coordination with FHWA, it will further study the improvements that are needed to the state transportation network and that the improvements studied in this separate review may differ from what is presented in the Micron DEIS.

Response: The lead agencies acknowledge that the NYSDOT, in coordination with FHWA, will conduct its own study of potential transportation improvements on state-owned roadways.

NYSDOT and the other agencies with jurisdiction over authorization of transportation improvements, which do not include CPO or OCIDA, will fully assess potential transportation improvements to ensure that the traffic impacts of the Preferred Action Alternative are mitigated to the maximum extent practicable. As part of this, NYSDOT will also consider the environmental impacts that may be associated with the transportation improvements NYSDOT would be considering approving or implementing.

As noted in the comment, for purposes of the FEIS, the lead agencies included recommended mitigation measures that, if implemented, would substantially mitigate the significant adverse traffic impacts of the Preferred Action Alternative. See FEIS Section 3.11.5.

NYSDOT Comment 3:

NYSDOT expressed its appreciation for the coordination and noted that it will continue to work with OCIDA as the Micron Project progresses.

Response: Comment noted.

Empire State Development

Empire State Development Comment 1:

The Empire State Development (ESD) noted that Micron's \$100 billion investment in Central New York will bring transformative growth to the region and has the potential to reshape the economic trajectory of the entire state. This unprecedented investment was made possible by New York's Green CHIPS Program, championed and signed into law by Governor Hochul and overseen by ESD.

Response: Comment noted.

Empire State Development Comment 2:

ESD noted that Micron and Governor Hochul signed a Community Investment Framework in October 2022. In the agreement, Micron and New York State made strong commitments to community and sustainability, including: (1) establishment of a \$500 million Community Investment Fund (CIF) and the creation of a Community Engagement Committee made up of local stakeholders working with Micron to support ongoing community engagement, help to recommend community investment grants to be made from Micron's contribution to the Green CHIPS CIF, and support implementation framework and monitoring of the overall and subsequent Green CHIPS Community Plan between Micron and ESD; (2) a commitment to volunteering and giving in Central New York communities; and (3) Micron agreed to set diverse hiring and contracting goals, sustainability requirements, and other community investments.

Response: Comment noted.

Empire State Development Comment 3:

ESD provided information on the extensive public engagement by the CEC with Central New Yorkers for development of its Community Priorities Document published in June 2024. The Community Priorities Document represents a critical strategic framework to help guide the \$500 million Green CHIPS CIF towards the community's most pressing needs and aspirations and is designed to be spent over the course of the next two decades.

Response: Appendix R, Environmental Justice, of the FEIS has been edited to reflect this information.

Empire State Development Comment 4:

ESD provided information on the diverse contracting goals set in the CIF agreed to by Micron and New York State, as well as diverse hiring and workforce development.

Response: Appendix R, Environmental Justice, of the FEIS has been edited to reflect this information.

Empire State Development Comment 5:

ESD provided information on the recent efforts by New York State and ESD to ensure that the region can sustain induced growth from the Micron project while preserving its most

Response: Appendix R, Environmental Justice, of the FEIS has been edited to reflect this information.

County of Oswego

Oswego Comment 1:

Oswego County supports investment in Central New York and the attendant economic drivers, jobs and opportunities investment can bring to the region.

Response: Comment noted.

Oswego Comment 2:

Oswego County commented that it and its local jurisdictions in proximity to the project were not listed as interested or involved agencies. Oswego County commented that the Draft EIS process was cloaked in secrecy and that information to, and input from, Oswego County was required.

Response: The lead agencies are not aware of any necessary approvals by Oswego County or any local jurisdiction within Oswego County required for the Proposed Project or any Connected

Action. As such, Oswego County and its local jurisdictions are neither an interested agency nor an involved agency. *See* 6 NYCRR 617.2(t), (u).

The FEIS process has not been cloaked in secrecy. See Responses to Public Review Comments 2 and 3 (detailing the extensive opportunities provided over the years for input into the WPCP and Proposed Project decision making process, including comment on the DIES). Oswego County has been able to submit its comments during the public comment period.

Oswego Comment 3:

No agencies are listed as needing to provide permits, approvals, or consultations for the identified mitigation measures including wetland/habitat construction, roadway reconstruction, etc.

Response: The comment does not accurately reflect the FEIS. For example, the FEIS appropriately identifies the NYSDOT as the agency with jurisdiction over the necessary traffic mitigation. To the extent that the comment suggests that Oswego County or one of its jurisdictions have approval jurisdiction over the wetland mitigation or habitat construction, the comment is incorrect. The proposed mitigation does not require any local approvals.

Oswego Comment 4:

There has been insufficient review of the impacts of the proposed wetlands mitigation as it concerns Oswego County and that there has been insufficient notice to and/or involvement of impacted jurisdictions within Oswego County.

Response: Landowners associated with the proposed mitigation plans have been notified of the planned wetland restoration activities and have agreed to the long-term protection measures and legal obligations related to these resources. Micron has been required to develop mitigation plans to address the anticipated loss of wetlands and surface waters (see FEIS Appendix F), as well as the associated biological communities (FEIS Appendix G). The lead agencies note that these plans comply with all applicable regulations under the Clean Water Act and Article 24 of the New York State Environmental Conservation Law, ensuring mitigation for both federal and state jurisdictional wetlands and surface waters. Additionally, all impacts to biological resources will be mitigated in consultation with the U.S. Fish and Wildlife Service (USFWS) and in accordance with the Endangered Species Act (ESA).

See also Response to Oswego Comment 2. Notwithstanding, Micron will be required to continue to engage with Oswego County and local municipalities within Oswego County, where appropriate. This will include direct outreach to relevant government stakeholders to address questions and concerns.

Oswego Comment 5:

The removal of viable agricultural lands from production, and their conversion into permanent wetlands, harms the agriculture sector in Oswego County.

Response: The proposed mitigation sites are located on privately held lands for which the landowners have agreed to transfer ownership of the lands and thus no longer use the land for agriculture. Furthermore, many of these areas were historically wetlands prior to colonial development in the 1700s. Over thousands of years, these landscapes accumulated rich organic soils and siltation from periodic flooding, making them highly productive for agriculture once they were converted from wetlands. The restoration of these lands to their original ecological function not only supports long-term environmental resilience but also aligns with broader conservation goals.

In FEIS Section 3.1.3, the lead agencies considered the Proposed Project's and the Connected Actions' (including components in Oswego County) anticipated effects on farmland conversion. See also FEIS Appendix D, Land Use, Zoning, and Public Policy. As stated in the FEIS, the NRCS conducted a land evaluation and site assessment and determined that several Proposed Project and Connected Action components would be exempt from FPPA provisions because they would occur in existing urbanized areas, utility corridors, rights-of-way, or already converted areas. NRCS rating forms document scores below 160 for all sites – no further action under FPPA is necessary. See FEIS Section 3.1.3.2, Operational Effects, Appendix D-4. The FEIS also states that Micron and the agencies responsible for the Connected Actions would be required to follow applicable requirements and notification procedures per Article 25-AA of the New York State Agricultural and Markets Law.

As noted in FEIS Section 3.1.2.2 Existing Utility Property and FEIS Section 3.1.2.3 Protected Farmland, Connected Actions associated with the Proposed Project within Oswego County may occur on lands classified by the NRCS as farmland and, in some instances, may necessitate easements on these lands. However, these easements are limited in scope: most infrastructure involved is underground, minimizing long-term impacts on farming activities. FEIS Section 3.4.3, Affected Environment further notes that, while Connected Actions may temporarily disturb a mix of land cover types, including approximately 26 acres of active cropland, most of the construction disturbance would take place in previously developed or disturbed areas. Any temporary impacts to cropland or other land cover types would be mitigated through regrading and revegetation following construction, ensuring that the long-term viability of farmland is preserved to the greatest extent practicable. See also Response to Oswego Comment 13.

Oswego Comment 6:

The proposed wetlands mitigation also hinders any possible future development of these lands for housing or other uses and would remove acreage from the taxable portion of the rolls. There are no plans in the Draft EIS regarding host community benefits in Oswego County for the potential losses.

Response: See Response to Oswego Comment 5. The proposed mitigation is consistent with the conservation objectives outlined in the Oswego County Comprehensive Plan and supported by the

Oswego County Soil and Water Conservation District. These objectives emphasize the protection of ecological zones, enhancement of water quality, and restoration of natural habitats—including wetlands—as part of a broader strategy for environmental sustainability and climate resilience.

While concerns have been raised regarding the potential loss of future development opportunities and taxable acreage, it is important to note that purely economic impacts are beyond the scope of NEPA and SEQRA. Removing lands from the taxable base is at the sole discretion of the private landowners through the voluntary placement of conservation easements on these mitigation sites. These easements are intended to preserve the restored wetlands in perpetuity, ensuring long-term ecological benefits while balancing the need for future land development.

While the mitigation sites are not part of the primary development footprint, Micron will continue to coordinate with regional stakeholders and explore opportunities to support broader community benefits, which may include environmental education, conservation partnerships, and potential ecosystem service valuation efforts that may help offset perceived losses.

Oswego Comment 7:

The Draft EIS should have employed wetland mitigation measures and considered reasonable alternatives within Onondaga County, and within the same watershed, for the Project instead of pursuing them in other areas.

Response: The FEIS evaluated the scope of impacts associated with the Proposed Project, whether such impacts could be avoided or required mitigation and, whether mitigation was feasible. As discussed in FEIS Section 3.3.5 and Appendix F-7, Micron will undertake mitigation across six mitigation sites located within a 9-mile distance of the WPCP. This approach is consistent with federal and state regulatory guidance and reflects a deliberate effort to prioritize proximity and ecological relevance. Additionally, mitigation sites were selected to preserve and restore lands that were likely historically wetlands prior to agricultural conversion, aligning with Oswego County's conservation goals.

The FEIS also recognizes the extent of mitigation required to offset the unavoidable impacts to wetlands, and acknowledges that the USACE and NYSDEC, using their technical expertise and jurisdiction, evaluated reasonable wetland mitigation, including the location of such mitigation, and have tentatively determined the nature, extent, and location of appropriate mitigation.

The mitigation sites are all located within the same watershed as the Proposed Project (see Appendix F-7, Figure 1-1) and were selected based on ecological suitability and regulatory criteria outlined in Section 2.1 of the Mitigation Plan (FEIS Appendix F). Key factors included hydrologic conditions, watershed-scale features, compatibility with adjacent land uses, and alignment with watershed management plans, as required under 33 CFR 332.2(d). The site selection process began within the 12-digit Hydrologic Unit Code (HUC 041402020905) containing the proposed Micron Campus, then expanded to the 10-digit HUC (0414020209), followed by four Onondaga County townships—Clay, Cicero, Lysander, and Van Buren—and finally into the southern portion of Oswego County. Ultimately, all mitigation sites were secured within the 12- or 10-digit HUC, ensuring they remain within the same watershed as the Project (see FEIS Appendix F-7, Figure 1-1).

Prior to final selection, all sites were pre-screened by regulatory agencies to ensure suitability. Sites were prioritized that could provide a net wetland gain—defined by the USACE as established or re-established wetlands, and by NYSDEC as restored wetlands. The Wetland Trust (TWT) was able to meet these criteria, with 94 percent of the compensation developed as re-established/restored wetlands and the remaining 6 percent as rehabilitation/enhancement. Mitigation sites were chosen to replicate the frequency and types of wetlands impacted by the Project, using classification systems from Cowardin et al. (1979) and Edinger et al. (2014). The goal was to match physical, chemical, and biological functions between the impacted and restored ecosystems, with final wetland credit targets determined by regulatory agencies.

Sites also offer sufficient stream restoration potential to meet agency compensation needs and allow for integrated stream-wetland restoration within functioning ecological complexes. Each site was analyzed for existing wetlands to be avoided, soil characteristics conducive to wetland development (e.g., soil moisture, depth to groundwater), and topography.

Priority was given to sites closer to the Micron Campus, within the same watershed, and to larger parcels capable of supporting similar ecological functions—such as flood attenuation, groundwater recharge, stormwater infiltration, wildlife habitat, habitat connectivity, carbon sequestration, and long-term sustainability.

Oswego Comment 8:

The Draft EIS review is inadequate to the extent the Project relies upon other counties for solid waste disposal. Any reliance on Oswego County's solid waste system is misplaced.

Response: The FEIS first ensures that appropriate waste avoidance and minimization measures have been considered and employed where feasible. It then evaluates capacity for the disposal of solid waste associated with the Proposed Project. The FEIS does not rely upon disposal of municipal solid waste outside Onondaga County for the Micron Project. As outlined in FEIS Section 3.8, Onondaga County requires all municipal solid waste to be sent to the Onondaga County Resource Recovery Agency (OCRRA). However, as part of the FEIS analysis of induced growth and specifically household growth and impacts on municipal solid waste, the FEIS projects household growth in neighboring counties including Oswego County and the capacity of landfills in neighboring counties to address the projected increase in municipal solid waste within each county.

Oswego Comment 9:

The Draft EIS lacks information regarding potential impacts upon rivers within Oswego County as the discharge from new wastewater facilities in Onondaga County ultimately will end up in waterways in Oswego County.

Response: The FEIS concludes that discharge from wastewater facilities in Onondaga County are not anticipated to have any significant environmental effects in Onondaga County. See FEIS Sections 3.3 and 3.3.5; Figure F-2. The same would be true for Oswego County such that the lead agencies do not anticipate that any discharge from wastewater facilities in Onondaga County would have a significant environmental impact on the Oswego River.

Discharge of chemical constituents from industrial activities is strictly regulated through OCDWEP's EPA-approved Industrial Pretreatment Project, industrial wastewater discharge permits, and New York State's SPDES permitting process. Wastewater generated at the Micron Campus will first be treated onsite at a preliminary wastewater treatment plant. As described in FEIS Section 3.3.4.2, industrial wastewater not reused onsite will be conveyed to the Industrial Wastewater Treatment Plant (IWWTP) at the Oak Orchard site for further treatment.

Oswego Comment 10:

Many migratory waterfowl stop in Oswego County and this county believes that further study of the potential impacts of the Project within Oswego County is warranted to ensure there are no adverse impacts on rare or state-listed avian species and fish stocks.

Response: Oswego County's concern regarding potential impacts to migratory waterfowl, rare or state-listed avian species, and fish stocks is acknowledged. FEIS Section 3.4.5.1 outlines BMPs to protect threatened and endangered species, including timing restrictions for tree clearing, retention of roosting and foraging habitat, and coordination with the U.S. Fish and Wildlife Service under the Endangered Species Act (ESA). See FEIS Table 3.4-11. For example, the "Lighting Reduction" activity states that all nighttime exterior lighting at the Micron Campus would be designed to minimize light spillage or trespass beyond intended areas of illumination. Lighting fixtures will be designed, where feasible, to meet the highest LEED standards for minimizing backlight, uplight, and glare—with a focus on achieving near-zero uplighting. This includes the use of warm white LEDs and cut-off optics to reduce light pollution, which can disrupt migratory patterns and behavior of nocturnal and sensitive bird species.

The lead agencies will also require Micron to engage in ongoing consultation with regulatory agencies and regional stakeholders to ensure that sensitive ecological resources—including migratory birds and aquatic species—are considered and protected throughout the development process.

Oswego Comment 11:

Oswego County is concerned about potential increases in contaminants from the Micron Project such as PFAS, increases in water temperatures and decreases in overall water quality.

Response: As detailed in FEIS Section 3.3.4.2, Micron, National Grid, OCWA, and OCDWEP would implement stormwater BMPs during construction of the Proposed Project and Connected Actions. These BMPs are specifically designed to reduce stormwater runoff rates, minimize erosion and sedimentation, and prevent contamination of surface waters.

To address concerns about water quality and degradation of aquatic ecosystems—stormwater management areas would be designed in accordance with the New York State Stormwater Management Design Manual (NYSDEC, 2024) and the New York State Standards and Specifications for Erosion and Sediment Control (NYSDEC, 2016). These standards are intended

to protect waters of the State from adverse impacts associated with construction runoff and ensure no downgradient increases in stormwater quantity or pollutant loading occur.

All BMPs will be documented in site-specific Stormwater Pollution Prevention Plans (SWPPPs) and subject to regulatory oversight. See Appendix F-8 Draft Micron Campus Phase 1a SWPPP. Additionally, Micron will continue to work with relevant agencies to ensure that water quality protections remain effective and responsive to emerging concerns, including those raised by Oswego County.

Information concerning PFAS is ever evolving. Notwithstanding, the FEIS provides a robust discussion of the identification, use and management of PFAS associated with the Proposed Project. The FEIS also addresses, to the extent known today, the potential risks and procedural controls in place to manage the risk associated with chemicals that will be used. A new appendix L-1 has been included in the FEIS which further discusses PFAS and related concerns about these chemicals.

Micron will be required to obtain a discharge permit from OCDWEP which will establish specific PFAS limits on the discharge of wastewater to the IWWTP. To meet these limits, Micron will segregate and pretreat PFAS on site prior to any discharge to the IWWTP. FEIS Section 3.8.3.2 and Appendix L-1 discuss PFAS wastewater treatment technologies that exist and that are in the process of development. Because of the evolving nature of PFAS and treatment technologies, Micron will continue to assess emerging PFAS wastewater technologies capable of addressing PFAS at the ppt levels found in semiconductor fabrication wastewater and that will meet limits specified in the Micron Campus's wastewater discharge permit.

In addition, PFAS will be addressed cumulatively by the other regulatory controls, including appropriate storage and handling of chemicals, and spill prevention planning, as discussed in the FEIS. Micron will also be required to comply with all existing PFAS regulatory requirements as well as all future regulations as applicable to its handling, use and disposal of PFAS. Finally, Micron will continue to evaluate feasible alternatives to the use of PFAS based on market availability and consistent with operational safety needs and other considerations, as well as new and emerging detection and pretreatment methods as they become available.

Oswego Comment 12:

Oswego County questioned whether OCIDA undertook the required hard look at all reasonable alternatives to the Project.

Response: Building upon its development of the WPCP related environmental reviews, OCIDA considered and evaluated the reasonable alternatives that are feasible, considering the objectives and capabilities of Micron as well as the "no action" alternative. See FEIS Section 2.2. Further, because the FEIS was prepared in accordance with NEPA in addition to SEQRA, the alternatives review went farther than required under SEQRA by considering other alternatives.

Oswego Comment 13:

Oswego County commented that the Draft EIS failed to consider the impacts to farmland in Oswego County.

Response: See Response to Oswego Comment 5. The FEIS fully considers the impacts to farmland where the Proposed Project would directly or indirectly convert prime farmland and farmland of statewide importance to industrial and commercial uses. The FEIS found that, because the Proposed Project and Connected Actions would have limited to no effect on any existing or likely future agricultural uses on the properties where they would be built, farmland conversion under the Preferred Action Alternative would not result in any significant adverse direct effects on agricultural land uses. See FEIS Section 3.1.3.2.

Indirect effects, including potential growth-induced effects on farmland, are expected to be subject to local planning, discretionary approvals, and applicable measures to avoid or minimize adverse development effects, and therefore are not expected to result in significant adverse impacts to farmland.

Oswego Comment 14:

Oswego County commented that the TIS failed to address traffic impacts in Oswego County or consider necessary traffic mitigation.

Response: The transportation evaluation area was established in consultation with NYSDOT. The geographic extent of analysis was defined by where the Proposed Project has the potential to result in a significant adverse transportation impact. This approximately 5-mile radius boundary was supported by detailed corridor capacity analysis and assessments, and anticipated changes in projected traffic patterns, connectivity, and land use. NYS Route 481 and I-81 freeway operations were considered just south of Oswego County's southern boundary. See FEIS Appendix M.

Oswego Comment 15:

The Draft EIS does not discuss the environmental impacts of the proposed traffic mitigation measures. It does not reference the adverse impact on local authorities who must mitigate local roads for the increased traffic and differing traffic patterns.

Response: The recommended traffic mitigation measures identified in the FEIS are subject to the jurisdiction of federal and state agencies other than the lead agencies, and those measures will be further studied by those agencies. It is anticipated that an environmental analysis will be prepared by those agencies. As part of this review by those agencies, the reasonably foreseeable adverse environmental impacts associated with the traffic mitigation measures selected will be evaluated. Notwithstanding, to the extent reasonably foreseeable, the potential adverse environmental impacts of the proposed traffic mitigation are identified and evaluated in FEIS Chapter 4.0.

Oswego Comment 16:

The impacts on community character from induced growth, both near the proposed site and in Oswego County are not addressed.

Response: In FEIS Section 3.13.4.2, the lead agencies evaluated how growth induced by the Preferred Action Alternative would gradually bring substantial changes to local communities and the wider five-county region, including Oswego County. The FEIS anticipates that population increases, and higher-density residential, commercial, and industrial development could change community character over time. See FEIS Appendix C. The FEIS acknowledges that the precise nature and exact location of future development from induced growth is not yet known. The FEIS further notes that all new developments and any changes in community character would require discretionary approvals from appropriate government authorities, and occur in accordance with local land use regulations, polices, and plans. See FEIS Section 3.13.4.

Oswego Comment 17:

The study area for induced job growth includes Oswego, Onondaga, Cayuga, Madison and Cortland Counties, but failed to include Oneida County. Growth inducing effects in Oneida County should be examined, as it is less than a 30 minute drive from Micron, is rural in nature and has room for residential growth.

Response: The 2022 ESD sponsored study prepared by Regional Economic Models, Inc. (REMI) (the “REMI Study”) is included as FEIS Appendix C-2. As described in the Methodology section, the REMI Study uses ESD’s multi-region, 70-industry Tax-PI v2.5 model of New York. As described in Appendix C-1 (Growth Inducing Effects), according to the REMI Study, 85 percent of induced job growth and 90 percent of induced residential growth from Micron establishing a four-fab semiconductor manufacturing facility in Onondaga County would occur within the five-county region. Therefore, this five-county region was selected as the study area for analyzing growth inducing effects in this FEIS. Appendix C-1 also notes that, in general, although locations beyond the five-county region could experience some induced growth, such growth would likely be more limited in nature than that in the five-county region and would not occur at a scale that would be anticipated to result in significant adverse environmental effects.

Oswego Comment 18:

The Draft EIS fails to consider the changes in density patterns and resulting environmental impacts associated with induced growth.

Response: The FEIS considers the reasonably foreseeable impacts of induced growth as part of every resource area chapter. The FEIS also evaluates reasonably foreseeable population growth and workforce in-migration in the local and regional study areas. Predicting the exact locations where Micron workers may reside and resulting population densities is inherently speculative and beyond the scope of the FEIS. FEIS Appendix C presents the Growth Inducing Effects study area, methodology, and evaluation methods, including induced growth projections by town, city, and county. As explained there, the specific locations or density patterns of induced development cannot be predicted at this time with any degree of reasonable certainty due to local zoning, site plan approvals, and other discretionary actions. Notwithstanding, the FEIS provides reasonable

assumptions regarding worker residence patterns to inform assessments of housing demand, infrastructure capacity, and community services, ensuring a sufficient basis for evaluating reasonably foreseeable environmental and socioeconomic effects.

Oswego Comment 19:

The Draft EIS does not speak to the potential water and wastewater impacts of the Connected Actions or growth inducing effects.

Response: FEIS Section 3.3 evaluates reasonably foreseeable water and wastewater impacts associated with both the Proposed Project and Connected Actions under the Preferred Action Alternative, including those related to growth inducing effects. Under the Preferred Action Alternative, construction of the Proposed Project and Connected Actions would result in significant adverse effects on wetlands and surface water but would not result in significant adverse effects from stormwater, or on groundwater, floodplains, or coastal resources. The Preferred Action Alternative could have growth inducing effects on wetlands and surface water in the five-county region over time; however, these changes would be gradual and would require independent discretionary approvals and analysis from relevant authorities.

Oswego Comment 20:

Oswego County questioned why Micron has proposed a sewage leach field at the Childcare site given the assumption that the site would be connected to public wastewater utilities.

Response: The Childcare Site would not connect to public wastewater utilities because such services are not available at the site. Adding a connection to the public wastewater utility lines would have required running an additional line and there is space on the childcare site for septic while minimizing adverse impacts to any wetland or habitat impact. As stated in FEIS Section 2.1.3, each building at the Childcare Site would be equipped with its own septic tank and pump station, with sanitary wastewater directed via piping to a sewage disposal system and leaching field.

Oswego Comment 21:

Oswego County commented that the land use study area was too small and failed to adequately analyze growth inducing impacts on land use.

Response: The study area was identified in the Draft Scope, which was made publicly available for comment. Oswego County did not question the sufficiency of the study area during that time. See 6 NYCRR §§ 617.8(f), (g).

The land use study area for analyzing growth-inducing effects was selected based on the 2022 REMI Study, which indicates that most of the induced growth resulting due to the Preferred Action Alternative would occur within the five-county region. See FEIS Appendix C-2. Based on this analysis, the five-county region provides sufficient study area for assessing reasonably foreseeable growth-inducing effects on land use. While some growth could occur beyond this region, it would

likely be limited in scale and not expected to result in significant adverse environmental effects. See also FEIS Appendix D-1.

The study area for the Proposed Project includes the Micron Campus, the Rail Spur Site, and the Childcare Site, as well as the area within a one-mile radius surrounding the Micron Campus and the Rail Spur Site and a ¼-mile radius surrounding the Childcare Site, as shown in Figure 3.1-1. These study area limits represent a conservative estimate of the broader area potentially susceptible to land use changes from the Proposed Project. The build-out of the Micron Campus and the Rail Spur Site would create industrial uses in an area generally surrounded by vacant land, residential uses, and agricultural land. Therefore, the 1-mile radius around the Micron Campus and the Rail Spur Site represents the area that would be most likely to experience potential adverse effects from the manufacturing and industrial activities on those sites, such as noise and vibration effects from construction activities and the effects of increased traffic.

The Childcare Site would include childcare, medical, and recreational uses more common in residential and commercial areas with more limited potential to disturb adjacent properties. Therefore, the ¼-mile radius was selected based on the lower likelihood of potential adverse effects from that site to extend beyond that distance. The land use study area also encompasses the Connected Actions (electricity, natural gas, telecommunications, water, wastewater, and utility improvements; see FEIS Table 3.1-3. The Connected Actions would include upgrades to existing utility properties and certain linear infrastructure located primarily in existing rights-of-way and easements that would be unlikely to generate noticeable post-construction effects beyond the utility boundaries. Therefore, the study area for the Connected Actions is limited to the extent of the new utilities and improvements upon build-out but considers any potential effects on surrounding properties, including privately owned parcels along utility easement areas.

Oswego Comment 22:

Oswego County questioned why the 2022 REMI Study found that 85% of induced job growth and 90% of induced residential growth will occur in the 5-county region including Oswego.

Response: The 2022 REMI Study and its findings are located in FEIS Appendix C-2. As noted in the Methodology section (REMI Study, p. 9), REMI uses Empire State Development's multi-region, 70-industry Tax-PI v2.5 model of New York. Oswego County is in the Central New York five-county model region. The study presents that 85% of induced job growth and 90% of induced residential growth reflect growth projected within this predefined model region, which defines the geographic scope of the analysis. See also Response to Oswego County Comment 17.

Oswego Comment 23:

Oswego County commented that the anticipated population growth is not consistent with the REMI report.

Response: FEIS Appendix C-1 explains that, to provide a more granular analysis of growth inducing effects at the community level, local planning data compiled by the Syracuse Metropolitan Transportation Authority (SMTA) was used to develop a model of induced

household growth at the town, city, and county levels. This analysis, presented in the appendix, aligns with values presented in FEIS Section 3.1.

Oswego Comment 24:

The Draft EIS should address substantial housing impacts upon local municipalities, including in Oswego County. The Project will cause short-term challenges in the local and regional housing markets and, in turn, will require additional municipal investment in infrastructure which will outpace existing municipal plans, budgets/capital projects for repaving, bridge replacement, etc.

Response: Section 3.15.3.2 of the FEIS projects induced household growth for municipalities in Oswego County and considers whether such growth could lead to significant adverse impacts due to increased housing costs and/or increases in the cost of municipal services. The analysis finds that the potential for significant adverse impacts due to increased housing costs would be limited to the primary study area (i.e., within the Towns of Clay and Cicero) and would be short-term in duration. While there would be rent pressures attributable to the Proposed Project's induced growth in markets beyond the local study area, the projected growth within regional communities is more dispersed, and in larger part attributable to non-Micron induced growth that would gradually occur, allowing time for regional markets to respond to the increased demand through new housing production.

While some municipalities and school districts could experience increases in costs associated with the Proposed Project's induced growth, new property taxes and other revenues generated by induced growth would avoid shortfalls in budgets that require significant increases in tax rates and/or the diminishment of public services. The REMI Study projects that construction and operations of a 4-fab facility would generate nearly \$500 million annually in local government revenues for municipalities within the region. See FEIS Appendix C-2, Table 2.6a; see also response to Oswego Comment 25.

Oswego Comment 25:

The increased demand for housing and increased rent is not a temporary impact.

Response: Although the Proposed Project is large enough to alter market conditions in the regional study area, housing demand and resulting changes in rents are influenced by broad market dynamics. Market movements cannot be predicted with certainty. However, an increase in housing demand does not necessarily mean that increased rents are permanent within a geography. For certain geographies, an increase in demand can result in more housing units being brought online or newly constructed housing, leading to controlled increases in rent, if not comparable rental rates once market absorption has taken place. Areas which are highly desirable to the incoming populations may see larger rent and home price increases; different communities may experience these increases at different temporal scales, although the property market should be expected to react to the new demand within approximately four years. According to the United States Census Bureau (USCB) Residential Construction Survey (Northeastern region) data and an affordability assessment conducted in November of 2023 by JP Morgan, four years is a conservative estimate

for a market reaction and an effective decrease in housing prices. Tertiary factors may accelerate or decelerate this market reaction.

As detailed in FEIS Appendix Q, the real estate market in the Central New York region has stagnated in recent years with vacancies outpacing unit construction. According to American Community Survey (ACS) 2019-2023 5-Year Estimates, Oswego County has 7,565 vacant housing units. As discussed in FEIS Section 3.15.3.2, certain real estate markets throughout the region have struggled with deferred maintenance spurred on by low housing demand, which has resulted in low rents. Oswego County rental rates saw an inflation adjusted 1 percent increase in median gross rents since 2010 (see Appendix Q, Table Q-38). The presence of higher housing demand would be likely to bring online a portion of the over 7,500 vacant housing units in Oswego County.

Oswego Comment 26:

Oswego County questioned the housing estimates associated with growth inducing development and whether the associated environmental impacts were properly assessed.

Response: The environmental impacts associated with growth inducing development were assessed using standard SEQRA methodology and were based on data from a variety of sources including the 2022 REMI that was sponsored by ESD (see FEIS Appendix C for more information on data sources and methodological approach for growth inducing development). See response to Oswego Comment 25.

Oswego Comment 27:

The Draft EIS does not address impacts associated with the in-migration of construction workers or support the assumptions regarding the number of construction jobs that will be filled by a local work force.

Response: Section 3.15.3.2 of the FEIS evaluates impacts associated with the in-migration of construction workers as part of the in-migrating population induced by the Proposed Project.

The FEIS also evaluates the availability of the local workforce relative to the anticipated employment needs, indicating that a portion of the workforce can be met by local labor, supplemented by workers commuting from outside the immediate area. See FEIS Section 2.1.1.6. Labor Force. As evaluated there, construction of the Micron Campus would require approximately 4,200 construction workers on-site daily during peak construction periods lasting roughly six months for each fab. Information on the local labor market suggests that approximately 2,000 local workers may be available for each phase of the Micron Campus construction, which could help reduce the number of construction crews traveling to the area from other geographical locations.

Oswego Comment 28:

The Draft EIS does not identify the environmental impacts of the project on the construction and materials availability in Central New York, as well as the impact on costs of construction materials, or analyze whether there is sufficient workforce to support the necessary construction.

Response: The FEIS evaluates the reasonably foreseeable significant adverse environmental impacts of the Proposed Project and proposes mitigation measures for those impacts. Though construction and materials availability and prices in Central New York are not significant environmental impacts under NEPA, pursuant to SEQRA, the FEIS includes a discussion of environmental resources that would be irreversibly and irretrievably committed to the Preferred Action Alternative. This includes the building materials needed to construct and operate the Proposed Project. See FEIS Section 5.2.

The analysis in the FEIS found that the Preferred Action Alternative would not have any reasonably foreseeable significant adverse socioeconomic effects. As described in the FEIS, construction of the Micron Campus will employ approximately 4,200 construction workers, which exceeds the amount available locally by approximately 1,500. See FEIS Section 3.15.3.2. As explained in the FEIS, Micron therefore likely will have to hire from outside the local area because Micron will have already employed all available local workers. Much of the analysis in the FEIS is concerned with the environmental and economic effects of anticipated induced regional growth that would result from the influx of Micron workers into the five-county area.

Oswego Comment 29:

There will be delays in new development caused by the need for new infrastructure and the need to fund same.

Response: The anticipated schedule for implementing the Preferred Action Alternative is described in the FEIS although, as acknowledged in Section 2.3, it could be modified. See, e.g., FEIS Figure 2.1-3; Appendix B-5. The comment does not explain why particular delays should be expected. The full buildout of the Preferred Action Alternative will take many years, allowing time for local and regional long-term planning for infrastructure, including budgeting, and source funding for anticipated new development.

Oswego Comment 30:

Oswego County commented that anticipated growth and the tax revenue generated from the same could not exceed the new and additional costs to be incurred by Oswego County and its local governments because of the Project and no funding is earmarked for Oswego County. Current residents will likely be burdened with additional taxes/fees to fund infrastructure improvements.

Response: FEIS Section 3.14 considers public services and concludes that the construction and operation of the Proposed Project are not anticipated to significantly increase demand on public services. The FEIS also explains that induced growth associated with the Preferred Action Alternative would only result in a potentially significant increase in demand for local voluntary firefighting services and not anywhere else in the five-county region. See FEIS Section 3.14.3.2.

Any nonsignificant increase in demand for public services associated with induced growth in any of the five counties is anticipated to be funded via an increased tax base and other revenue associated with the induced growth itself. See FEIS Section 3.14.3.2. Further, as population and tax base grow, local governments and service providers have the capacity to allocate additional

resources to public services, such as the police, to keep pace with demand. Purely economic impacts are also beyond the scope of NEPA and SEQRA.

Oswego Comment 31:

Oswego County commented that the assessment of impacts to community facilities was incomplete as the proposed project and its anticipated induced growth will increase the demand for police services, EMS, teachers and related educational services, healthcare workers, and fire services.

Response: The lead agencies considered the reasonably foreseeable impacts to community facilities, including police services, EMS, schools, healthcare workers, and fire services. FEIS Section 3.14.3.2 concludes that the construction and operation of the Proposed Project are not anticipated to significantly increase demand on public services, either locally or regionally, except for potentially significant effects on the Town of Clay's volunteer firefighting services due to induced growth. To address the potentially significant effect Clay Fire and the Town of Clay's fire response capacity, Micron will be required to pay for and support ongoing training efforts with Clay Fire and other local fire departments. See FEIS 3.14.4. Similarly, Micron will be required to work with Clay Fire to determine any future need for the development of a full-time professional fire service.

Oswego Comment 32:

There is no mention of the Caughdenoy Fire Department, Central Square Fire Department, or Hastings Fire Department, which are all located within 5-miles of the Proposed Project and will likely be first responders in the case of an emergency and will also need training and potentially specialized equipment to respond to needs at the Proposed Project Site.

Response: As discussed in FEIS Section 3.14.4, BMPs and Mitigation Measures "[t]o address the potential significant adverse effect on volunteer fire services as a result of induced growth associated with the Proposed Project, including on Clay Fire and the Town of Clay's fire response capacity, as a mitigation measure, Micron would commit to pay for and support ongoing Micron-related training efforts with Clay Fire and *other local fire departments.*" (emphasis added).

Oswego Comment 33:

Oswego County commented that the Draft EIS is inconsistent since it states that local utilities would not need to conduct any utility improvements (including water and sewer) under the No Action Alternative then later stating that these utilities have identified improvements that would be conducted regardless of the proposed project.

Response: Should the Proposed Project not proceed (No Action Alternative), water and wastewater utility owners would still implement the infrastructure improvements that are already planned and funded. These upgrades are scheduled independently of the Proposed Project and would move forward regardless of its development.

Oswego Comment 34:

The Draft EIS does not consider potential utility upgrades necessary to support the growth inducing effects on other smaller municipal utilities, including those in Oswego County or in areas without public infrastructure.

Response: The FEIS primarily evaluates utility impacts associated with the Proposed Project and planned infrastructure within the immediate area of the Proposed Project. The FEIS acknowledges that induced growth from the Proposed Project could increase demand on regional utilities over time. See FEIS Section 3.10. However, specific upgrades or expansions to smaller municipal utilities beyond the area of the Proposed Project, particularly in localities lacking public infrastructure, are inherently speculative at this stage. Any such improvements would depend on the nature, timing, and location of future development, which are beyond the scope of the FEIS and control of the Lead Agencies.

Should future growth occur in these areas, local utility owners and municipalities would be responsible for assessing their infrastructure needs and planning appropriate upgrades or extensions. These processes are typically governed by local and regional planning efforts and subject to state and federal environmental review. Further, should induced growth occur in Oswego County, it would be subject to environmental review that would be required to analyze the impacts of any such project(s) on municipal utilities.

Where feasible, utility-related infrastructure construction associated with the Proposed Project would be coordinated with local agencies to support comprehensive utility planning.

Oswego Comment 35:

The Draft EIS does not identify/mention the potential growth inducing impacts on historical architectural properties and archaeological resources or threatened and endangered species due to the clearing of land and trees for the continued development of the 5-county region.

Response: The FEIS acknowledges how induced growth associated with the Proposed Project could potentially affect historic properties (see Section 3.5.2.3) and biological resources (see Section 3.4.4.2 (Preferred Action Alternative, Operational Effects, Ecological Communities) across the broader five-county region. Although specific future development outside the Study Area is speculative and cannot be reasonably determined at this time, any future induced growth development would be subject to local land use regulations and environmental review under SEQRA, which includes consideration of impacts to historic properties, archaeological resources, and threatened and endangered species. This ensures that protections remain in place even as regional growth evolves independently of the Micron Project.

Oswego Comment 36:

The Draft EIS does not consider the environmental impacts on the areas where the grassland/habitat mitigation is occurring (e.g, loss of land use, potential rezoning of the land, loss of potential future tax revenue or use for residential housing).

Response: As described in the FEIS, the environmental impacts related to grassland and habitat mitigation are anticipated to be predominantly positive. Mitigation sites were selected due to existing characteristics and the ability to meet the needs of the identified mitigation such as current or former agricultural fields, forested parcels, and adjacent to existing streams, wetlands or forests. See FEIS Appendix F and Appendix G. Overall, restoration, re-establishment, or rehabilitation activities targeting stream, wetland, and grassland habitats are expected to enhance the biological and ecological diversity of the mitigation sites. See Response to Oswego Comment 6.

Oswego Comment 37:

It is stated that the wetland mitigation will be in the same watershed, but this does not appear to be the case.

Response: The planned wetland mitigation will be within the same HUC10 or HUC12 watershed. The entirety of the Proposed Project and mitigation sites are located within the HUC10 Oneida River watershed (HUC 0414020209). The entirety of the Proposed Project and two of the six proposed mitigation sites are also within the HUC12 Oneida River sub-watershed (HUC 041402020905). Figure F-24 in FEIS Appendix F identifies the locations of the proposed mitigation sites in relation to the Proposed Project and the watersheds.

Oswego Comment 38:

The Draft EIS did not solicit information about, nor does it consider, the impact upon public health in Oswego County as concerns the creation of new wetlands connected to the Project and mosquito-vectored diseases.

Response: The properties that The Wetlands Trust (TWT) would develop for the mitigation sites are located in the vicinity of existing wetlands and wet areas, so the establishment and enhancement of wetlands on the properties would not cause a substantial alteration to current conditions in the area. The intent of the mitigation plan is to establish and enhance wetlands at those sites that will develop into a mature, balanced wetland ecosystems that include multiple predator species that eat mosquitoes. The mitigation plan does not include developing any artificial standing water such as cisterns or gutters where mosquitoes are unfettered by predation. The natural wetlands considered for wetlands development have cooler water compared to artificial containers (e.g., gutters, old tires, buckets) that can harbor disease carrying mosquitoes.

Oswego Comment 39:

No consideration in the Draft EIS was given to the potential increased costs which could be incurred by Oswego County in mosquito surveillance and spraying programs in connection with the additional 400 acres of wetlands to be created and along with adjoining acreage.

Response: Because the wetland mitigation sites are not anticipated to increase the need for mosquito surveillance and spraying programs (see Response to Oswego Comment 38), no increased costs are anticipated.

Oswego Comment 40:

Low-income areas have not fully been reviewed as only Onondaga County is considered. Oswego County has low-income areas in proximity to the Project.

Response: All low-income areas in the study area were evaluated. See FEIS 3.16.2.2 (Environmental Justice, Low-Income Communities in Study Area). This specifically included areas in Oswego County.

Oswego Comment 41:

Oswego County commented that the Summary of Effects (Table 3.17-1) should have also considered water and sewer.

Response: Within FEIS Table 3.17-1, water and sewer are listed under the Utilities and Support Infrastructure Resource Area as “Other Utilities.”

Oswego Comment 42:

There are no mitigation measures for direct and ancillary Project impacts in Oswego County.

Response: NEPA and SEQRA require agencies to consider mitigation measures for reasonably foreseeable significant environmental impacts. Because the FEIS does not identify any significant environmental impacts associated with the Preferred Action Alternative in Oswego County, no mitigation measures in Oswego County were deemed necessary or required.

Oswego Comment 43:

Oswego County should be further considered with regard to the growth inducing impacts.

Response: Growth inducing impacts were evaluated as part of each resource area in the FEIS. Because, in many cases, the nature, timing, and location of induced growth was speculative and not reasonably foreseeable, the anticipated impacts were addressed generically. Notwithstanding, to the extent that growth inducing impacts reasonably included Oswego County, they were evaluated to the extent feasible. See, e.g., FEIS Table 3.4-11, Projected Land Cover Loss Due to Induced Growth by 2041; Table 3.8-12, Induced Growth Incremental MSW Projections; Table 3.15-5, Induced Household Growth Projections Exceeding 10 Percent of Existing Household Estimates.

Oswego Comment 44:

The Draft EIS does not take proposed commute times and current commute time patterns into account when projecting the areas that would be impacted the most.

Response: The traffic analysis approach relied on FHWA recommended calibration criteria and measures for Vissim analysis calibration and validation. See FEIS Appendix M, Section 2.4.3.1.

To set up the traffic analysis, the process involved a detailed examination of actual travel times through various road sections, using speed and travel time data. Travel times were checked against real measurements from 2023, including GPS records and speed runs. This ensured that the computer models matched real-life driving conditions. By comparing actual travel times to the model's predictions, the analysis was confirmed to be realistic, with adjustments made when necessary to fit the roadway and ramp conditions.

Oswego Comment 45:

Oswego County commented that the chapter on Irreversible or Irretrievable Commitments of Environmental Resources was inadequate and failed to discuss the lands that will be irretrievably lost because they will be used as part of the mitigation efforts and will be turned into wetlands or habitat sites and will no longer be available for development, the tax monies which will be irretrievably lost to those municipalities (including Oswego County, townships, and schools) because those sites will never be used for a development purpose, residential, commercial or otherwise, as well as the loss of lands due to traffic mitigation measures that propose the widening of roads.

Response: SERQA's requirement to consider irreversible and irretrievable commitment of natural resources to an action does not encompass economic loss from loss of the potential prospect for future development. Notwithstanding, FEIS Section 5.2 has been revised to include in the loss of lands for use as wetland mitigation sites. See also Response to Oswego Comment 36.

Oswego Comment 46:

Oswego County commented that the potential environmental impacts of leasing warehouse space was not considered.

Response: Leasing existing warehouse space does not require new construction or disturbance of land, so it is not expected to have direct environmental impacts. Further, Micron intends to lease existing warehouse space in an industrially zoned area and will not store hazardous materials within the warehouse space, therefore there are no reasonably foreseeable significant environmental impacts associated with Micron's leasing of existing warehouse space. See also FEIS Section 2.1.4, Warehouse Site.

Town of Clay

Clay Comment 1:

The Town of Clay noted that it was proud to serve as the host community as well as its deep appreciation to the leadership demonstrated by Micron, New York State, Onondaga County, and OCIDA in bringing this investment to Central New York. The promise of this project is transformational, and the Town of Clay stands ready to be a full and responsible partner in ensuring its success.

Response: Comment noted.

Clay Comment 2:

The cost of accommodating this project shall not be placed on our current taxpayers or local businesses. We expect Micron, New York State, Onondaga County, and OCIDA to provide the Town of Clay with the resources, coordination, and authority necessary to proactively mitigate and manage the impacts described in the Draft EIS.

Response: Comment noted.

Clay Comment 3:

The Town of Clay is not seeking permanent subsidies because, over time, a growing tax base will restore fiscal self-sufficiency. However, to responsibly meet the early demands of this project, the Town expresses its request for a significant upfront investment to expand capacity in parallel with Micron's development. The Town of Clay requests that funding be committed prior to key construction milestones, with clear sources, disbursement schedules, and scope aligned to the actual service demand and facility impacts and must come through grants and direct appropriations from Micron, New York State, Onondaga County, or OCIDA.

Response: This comment relates to economic issues that are beyond the scope of NEPA and SEQRA. Notwithstanding, Micron has entered into a funding agreement with the Town of Clay to support the technical review of Micron's site plan and other local approvals in advance of construction. Additionally, Micron and the Town of Clay have had preliminary discussions regarding financial support needed to oversee the early construction of the Proposed Project. Micron will continue to engage with the Town of Clay on potential funding opportunities, including seeking funding from county and state sources. The FEIS also provides a fiscal assessment in Section 3.15.3.2. See *Funding for Local Governments and Taxing Districts* in the Growth Inducing Effects. Accordingly, fiscal self-sufficiency was assessed, and no significant adverse impacts were found. See also Response to Clay Comment 4.

Clay Comment 4:

The Town of Clay requested targeted regulatory relief that balances environmental protection with the flexibility required to meet both local and state housing objectives. This relief should be paired with coordinated transportation and infrastructure planning to ensure that available parcels are accessible, serviceable, and compatible with community character. Without such action, the Town maintains that it will be unable to provide sufficient housing to support Micron's workforce needs while maintaining the quality of life expected by our residents.

Response: The lead agencies recognize that the Town's call for coordinated infrastructure and transportation planning is essential to sustainable development and to maintain community standards. As the Proposed Project advances, the lead agencies will require Micron to collaborate with the Town of Clay, New York State, Onondaga County, and other stakeholders to explore avenues for regulatory relief that uphold environmental standards while facilitating responsible,

community-oriented growth. This collaborative approach will help ensure that housing needs are met efficiently and that infrastructure improvements are strategically implemented.

Further, the State of New York has made housing and affordability a top priority and has enacted several programs aimed at increasing the production of housing, including \$650 million in state funding for Pro-Housing communities and \$100 million in capital funding to assist with infrastructure to build new housing. Additionally, housing was identified as an immediate priority by the Community Engagement Committee and will be a central focus of the \$500 million CIF in Central New York. New housing supply—inclusive of affordable housing—would serve to control rent increases and is a critical component of meeting existing and future community demand for housing at lower income levels.

Clay Comment 5:

The Town maintains that the noise study underrepresents the full extent of the impact, noting that the cumulative effect of employee commuting, freight movement, construction activity, and regional development linked to the Micron campus will raise baseline noise levels across much of the Town.

Response: The noise analysis in the FEIS included and assessed the potential increase in noise levels due to increased project-related traffic. The FEIS's noise analysis presents a detailed comprehensive analysis and addresses the multiple sources and types of noise and vibration generated by the Proposed Project, including construction, operations, and transportation-related activities, inclusive of truck trips. It used industry-accepted modeling techniques to predict future sound conditions, providing a robust assessment of potential impacts. See FEIS Section 3.12.3 Noise and Vibration Assessment Methodology. The FEIS integrates the consideration of cumulative effects, analyzing combined impacts from all relevant activities—construction, operation, and traffic. See FEIS Section 3.12.5, Environmental Consequences.

Clay Comment 6:

The Town commented that traffic pattern changes outlined in the Draft EIS will amplify the cumulative effect of noise in the Town. Specifically, the Town states that new interchanges, access road reconfigurations, and raised medians will redirect traffic flows in ways that may concentrate noise along certain corridors and at key residential interfaces; shifts that have not been fully modeled to show their long-term noise implications.

Response: The noise analysis presented in FEIS Section 3.12, Noise and Vibration includes an assessment of the Proposed Project's traffic noise impacts. Further in FEIS Section 4.3.12 traffic noise impacts associated with the recommended traffic mitigations are fully disclosed. Finally, any future changes in traffic patterns, the resulting noise impacts, and determining how these effects would be addressed in association with the implementation of the recommended traffic mitigation improvements will be evaluated by NYSDOT (or the responsible agency for the roadway) who will be performing the detailed planning and design for any roadway improvements within the area.

Clay Comment 7:

The Town requests that noise mitigation go beyond the limited commitments currently described in the Draft EIS and suggest that permanent sound barriers be installed in all feasible locations, including residential areas near Barcaldine Drive, Route 31, Route 11, Caughdenoy Road, and the neighborhoods surrounding the I-481/Route 31 interchange.

Response: The FEIS describes Micron's commitment to installing ground level noise barriers and rooftop equipment enclosures on its property where significant adverse construction and operational noise effects are identified, as outlined in the FEIS. Consultations with property owners will specifically address aesthetic considerations, such as landscaping, to integrate these barriers with existing community character, as detailed in FEIS Figures 3.12-15, 3.12-16, and 3.12-17. Further, noise mitigation measures will be reviewed by the Town of Clay as part of the site plan approval process and ongoing refinements to noise mitigations will be implemented based on a requirement for ongoing noise compliance monitoring, See Clay Comment 10.

Permanent ground-level noise barriers to address traffic noise impacts are generally not feasible along main corridors because many properties require driveway access, which would break the continuity and reduce the effectiveness of the barriers. However, at locations where residences do not have direct driveway access onto the main roads, such as near Barcaldine Drive, installation of permanent noise barriers to effectively mitigate traffic noise is feasible. For most impacted properties, continuous noise mitigation is not feasible.

Because the final selection of traffic mitigation measures falls within the jurisdiction of the FHWA and NYSDOT, the noise impacts resulting from specific mitigation measures for the traffic improvements ultimately selected by the agencies will be analyzed in the NYSDOT and FHWA environmental review.

Clay Comment 8:

Where right-of-way or design constraints prevent noise barrier installation, the Town recommends the use of alternative methods such as vegetated berms, low-noise pavement surfaces, or building façade improvements should be deployed.

Response: Comment noted.

Clay Comment 9:

The Town requests that noise mitigation also address construction-phase noise, which will occur over many years and could involve pile-driving, heavy vehicle traffic, and large-scale material handling. The Town recommends the use of best practices, including the use of properly muffled and acoustically insulated equipment, restrictions on nighttime activities, and selection of lower-impact construction methods where feasible.

Response: FEIS Section 3.12.6 provides a list of construction BMPs intended to minimize noise, as well as structural mitigation measures such as temporary and permanent barriers for effective construction noise screening. Further, the FEIS provides that construction hours would be required to comply with the Town of Clay Code, which prohibits noise associated with demolition and construction between 7 PM and 7 AM on weekdays, before 8 AM and after 5 PM on Saturday and any time on Sunday. Ongoing refinements to noise mitigations will be implemented based on a requirement for ongoing noise compliance monitoring, See Clay Comment 10.

Clay Comment 10:

To protect public health and maintain accountability, the Town expects continuous noise monitoring at representative receptor locations during both construction and operation, with results made publicly available. The monitoring network should also be integrated with the Town's broader communication strategy, enabling residents to access up-to-date information on noise conditions in their neighborhoods.

Response: The lead agencies will require Micron to install noise monitoring at receptors to continuously monitor noise from the Proposed Project and adapt noise mitigation measures as necessary to reduce impacts.

Clay Comment 11:

The Town requests that noise monitoring be paired with adaptive mitigation measures so that if monitored noise exceeds modeled levels, additional controls will be deployed.

Response: See Response to Clay Comment 10.

Clay Comment 12:

The Town commented that the Micron Project's duration and scale make noise impact a permanent quality-of-life issue for the Town and that addressing it equitably from the start will require full funding for both physical infrastructure and ongoing operational controls, not temporary or piecemeal measures.

Response: The FEIS details BMPs, noise reduction strategies, and specific mitigation measures, including permanent features such as noise barriers and louvers, that will be implemented at the appropriate times to control noise levels. See FEIS Section 3.12.6. The locations of the proposed permanent noise barriers are shown in Figures 3.12-15 through 3.12-17, with additional details provided in Table 13.12-15. See also Response to Clay Comment 10.

Clay Comment 13:

While noting the comprehensive set of Best Management Practices (BMPs) intended to protect public health, safety, and the environment during the construction and operation of the Micron campus detailed in the Draft EIS, the Town notes that there are essential, several critical gaps and clarifications needed to ensure they are effective, enforceable, and fully funded.

Response: The BMPs identified in the FEIS for each resource area have been determined to be sufficient and their implementation will be enforced by the lead agencies. Notwithstanding, Micron will continue to engage with the Town of Clay to address concerns related to the effectiveness of its BMPs.

Clay Comment 14:

The Town requests that Micron's Spill Prevention, Containment, and Countermeasure (SPCC) Plan, Spill Prevention Report (SPR), and Risk Management Plan (RMP) detail storage vessel specifications, operational safeguards, worst-case release scenarios, employee training, and emergency response protocols and include provisions for adequate on-site containment materials, such as manhole covers, absorbents, and temporary dikes. The Town also requests that the plans be reviewed by NYSDEC and USEPA.

Response: The cited plans will be reviewed and approved by the applicable regulatory agencies. See also responses under Health & Human Safety, Community Facilities, and Solid Waste & Hazardous Materials relative to employee training, emergency response and RMP.

Clay Comment 15:

The Town expects confirmation that Micron will maintain on-call contracts with trained private spill-response contractors capable of mobilizing quickly for on-site or off-site incidents.

Response: Micron will be required to maintain an on-site ERT for deployment, when needed, to assess, manage, and respond to spills and emergency situations. Further, Micron maintains on-call contracts with trained professionals to support Micron ERT, as needed or requested. For off-site response, Micron would contract with carriers and shippers of hazardous materials that maintain 24/7 emergency response support in the event of hazardous materials spills prior to and during transit, and appropriate incident reporting protocols. See FEIS Section 3.8.3.2 and 3.8.4. See also Response to Community Facilities Comment 12 and Solid Waste and Hazardous Materials Comment 57.

Spills that occur during transportation are the responsibility of the transporter, per USDOT regulations. Typically, both the NYSDOT and the carrier retain on-call emergency response professionals that are immediately called when a chemical spill occurs during transportation. Initial response times vary based on the contract and the location of the spill.

Clay Comment 16:

The Town commented that Micron may be required to prepare and submit a Facility Response Plan to USEPA if all petroleum storage vessels are not equipped with secondary containment.

Response: Comment noted.

Clay Comment 17:

The Town commented that local fire departments will require additional specialized training and equipment to respond effectively to chemical emergencies. The receipt, handling, and storage of large volumes of hazardous chemicals and petroleum products will necessitate specialized planning, training, and equipment at the local level.

Response: See Responses to Community Facilities Comment 1 and 2. Calls to the local fire department are anticipated to be minimal. Micron would implement its ERMS and deploy its ERT beginning with construction, and they would also be in place and govern emergency response throughout continuous Proposed Project operations. Micron's ERT would act as the initial line of response to any fire alarms on the Micron Campus and would be equipped to handle smaller fires and hazardous material spills. Micron would adhere to applicable requirements to report fires, spills, or other accidents to government agencies such as NYSDEC or USEPA. See FEIS Section 3.8, Solid Waste, Hazardous Waste, and Hazardous Materials. In the event of a structural fire or a hazardous material spill requiring outside assistance, the ERT would notify Clay Fire via 911.

As part of construction planning, Micron would engage closely and collaboratively with local fire departments, including Clay Fire and Cicero Fire, to familiarize local fire service personnel with any potential Proposed Project construction hazards such as construction site fuel and chemical storage, jointly prepare to implement best management practices for construction fire safety, and ensure compliance with applicable fire protection code requirements.

Prior to operations, Micron, Clay Fire, and the Syracuse Fire Department would establish a joint protocol for when the Syracuse Fire Department's hazardous material response unit would be brought in to address a relevant incident. Onondaga County DEM also would alert and deploy Cicero Fire as needed.

Clay Comment 18:

The Town comments that stormwater and wastewater management systems be designed, constructed, and operated to ensure that all discharges meet or exceed applicable federal and state water quality standards.

Response: Micron will be required to ensure that all discharges meet applicable federal and state water quality standards.

Clay Comment 19:

The Town comments that the upgrades required at the OOWWTP to handle wastewater from Micron's operations be fully funded by Micron and its partners to prevent any financial or service impacts on existing customers and to safeguard downstream water quality.

Response: Onondaga County will establish policy and guidelines for appropriate user rates for the IWWTP to support Micron's operations in Clay. The IWWTP is not part of the OOWWTP system that provides wastewater service to residential and commercial users. See Utilities Comment 2.

Clay Comment 20:

The Town commented that winter maintenance of all roadways serving the Micron campus and surrounding neighborhoods be developed and implemented in a coordinated, science-based strategy that reduces environmental impacts. The recommendations of the 2024 Adirondack Road Salt Reduction Task Force Report should be included such as brine and pre-wetting technologies, calibrated spreaders, alternative deicers, and comprehensive operator training to minimize salt use. This salt reduction strategy should be incorporated into and measured against the Draft EIS-proposed water quality monitoring program to ensure that its effectiveness is documented, and corrective actions are taken when necessary.

Response: Micron would be required to implement BMPs and post-construction SMPs as a condition of its SPDES permit, which would be designed to accommodate, slow, and hold stormwater runoff and to filter out the pollutants (e.g., salt) it would carry from the impervious surfaces. Those BMPs may also include suggestions such as such as brine and pre-wetting technologies, calibrated spreaders, alternative deicers, and comprehensive operator training to minimize salt use. Micron intends to work with local, County, and State Departments of Transportation to review their best practices in order to provide consistency within the watershed.

Clay Comment 21:

The Town requested clarification on the land use, speed and conceptual locations considered in the TIS. The Town of Clay's future land use needs are not specified in the Traffic Impact Study (TIS), and recommended Three Rivers along Maider Road, the Complex along Morgan Road, and the Historic Clay Center at Willer Canning Road be included as locations.

Response: Only approved developments with quantified trip generation are included in the SMTC Regional Model and the Traffic Impact Study (TIS) for background traffic volumes. Projects still in planning or conceptual stages are excluded. Final traffic improvements for approved projects will be evaluated by FHWA and NYSDOT, with implementation planning led by NYSDOT or the agency responsible for coordination with affected municipalities. The Town of Clay is encouraged to share its recommendations during future environmental review processes for proposed traffic improvements. See FEIS Section 3.11.3.4, Analysis of Recommended Mitigations and FEIS Section 3.11.5 Recommend Mitigations.

Clay Comment 22:

The Town commented that the TIS fails to contain content on impacts to emergency services. Clarification was requested whether impacts to response times were considered as well as coordination during construction for impacts to emergency services and their facilities and whether there would be impacts to the fire department building at US 11.

Response: The TIS evaluated significant adverse impacts on overall intersection operations and freeway facilities and identified potential mitigations. For the purposes of the FEIS, significant impacts on the transportation network were defined in Table 3.11-4 (typically a degradation LOS D or better from the No Action Alternative to LOS E or LOS F in the Preferred Action Alternative).

The goal of Section 3.11 was to identify potential mitigation measures that would bring LOS back to acceptable limits. Although emergency response times were not specifically investigated, the recommended traffic mitigation measures identified would potentially improve emergency response times in some cases.

As described in FEIS Section 3.11.3.4, Analysis of Recommended Mitigations, recommended traffic mitigation measures within the jurisdiction of federal, state, and local transportation agencies, and thus the detailed design and implementation of recommended mitigation measures, such as the widening of Route 31, are subject to the discretion of those agencies and would be subject to further review and approval by NYSDOT, FHWA, and other jurisdictional agencies, including additional environmental review. Coordination with emergency services would be completed as part of the planning and design stages of the roadway improvements by the agencies responsible. The impacts to emergency services will be included as part of the NYSDOT project evaluation.

As detailed in FEIS Appendix L-3, Micron's Emergency Response Management System (ERMS) is intended to minimize potential calls to local emergency services, although Micron would call them in cases of certain emergencies that would warrant assistance from first responders, such as active fires, confined space rescues, loss of consciousness, loss of life, potential loss of limb or sight, chest pain, or other situations that the on-site Occupational Medical Director determines. Micron's response capabilities would include CPR and AED use, emergency medical trauma care, medication administration, confined space and high-angle rescue, initial chemical and hazmat response, and limited fire response. Micron has an existing mutual aid agreement with Clay Fire and has engaged with the Clay and Syracuse fire departments, as well as NAVAC and NOVA for EMS. The latter two organizations anticipate having adequate capacity to respond to incidents at the Micron Campus.

Clay Comment 23:

The Town commented that the TIS did not include traffic data results for the proposed traffic improvements at Verplank Road.

Response: The need for the Verplank Road interchange will be determined by NYSDOT as part of its evaluation and determination of the final traffic improvements. Initial traffic forecasting revealed minimal traffic volumes would be anticipated associated with the Preferred Action Alternative to utilize the interchange compared to the NYS Route 481 and NYS Route 31 interchange.

Clay Comment 24:

The Town commented in support of the proposed new Verplank interchange.

Response: See Response to Clay Comment 23.

Clay Comment 25:

The Town requests that transportation BMPs go beyond current Draft EIS commitments.

Response: The final traffic improvements will ultimately be chosen and fully evaluated by the FHWA and NYSDOT.

Clay Comment 26:

The Town recommended the use of traffic signal coordination, particularly along Route 31 from Oswego Road to I-481, to improve peak-hour flow and reduce congestion.

Response: The traffic analysis contained in the FEIS and TIS assumed signal timings and coordination would be optimized. The implementation of optimized signal programming or systems would be the responsibility of the agencies who are responsible for the signals (e.g. local municipalities or NYSDOT). The final traffic improvements will ultimately be chosen and fully evaluated by the FHWA and NYSDOT.

Clay Comment 27:

The Town commented that adaptive signal control should be deployed both during construction and permanently and that preemption systems should be installed to prioritize emergency and transit vehicles.

Response: See Response to Clay Comment 26.

Clay Comment 28:

The Town commented that transportation demand management (TDM) measures, such as employee shuttle programs, carpool incentives, and parking management, be implemented early to reduce single-occupancy vehicle trips.

Response: See Responses to Transportation Comments 17 and 19. The lead agencies recommend that Micron incorporate such measures, to the extent feasible and practicable.

Clay Comment 29:

The Town requested that side street pedestrian and bicycle connections, bus pull-off bays, and improved lighting at intersections be added to ensure safe and efficient multimodal travel. Additional information is requested regarding where lighting is expected to be placed.

Response: NYSDOT (or the responsible agency for the roadway) will be performing the detailed planning and design for any roadway improvements within the area tied to the Preferred Action Alternative recommended mitigations, which will consider multi-modal improvements, transit upgrades, and safety improvements such as lighting installation. See FEIS Section 3.11.3.4, Analysis of Recommended Mitigations.

Clay Comment 30:

The Town requests that construction staging and sequencing be planned to minimize disruptions to local businesses, residents, and emergency service access.

Response: Staging and sequencing construction of a project of this magnitude is a complex, multi-decade effort. The staging and sequencing have been designed to realistically meet the needs of the Proposed Project, the region, and the nation, as well as the local community. As currently proposed, the Preferred Action Alternative may have some reasonably foreseeable significant effects on the local community, including on local fire services, traffic, and noise associated with traffic. See FEIS Section 3.17 (Summary of Effects).

Some of the impacts noted in the FEIS will be mitigated below significance (e.g., fire services), some will be substantially mitigated through future mitigation implemented by other agencies (e.g., traffic improvements approved and implemented by FHWA and NYSDOT), while others will be significant despite mitigation implementation (e.g., noise associated with traffic). The construction staging and sequencing is explained in the FEIS and will be followed by Micron, which will remain cognizant of the needs of the local community and be careful to minimize impacts to the local community throughout the 16 years of Proposed Project construction.

Clay Comment 31:

The Town requests that traffic improvements be evaluated for their impact on fire department response times and neighborhood connectivity before implementation. Where negative impacts are identified, alternative designs or mitigation measures must be adopted.

Response: The TIS evaluated significant adverse impacts on overall intersection operations and freeway facilities and identified potential mitigations. Although emergency response times were not specifically investigated, the mitigations identified would potentially improve emergency response times in some cases. Final traffic improvements will ultimately be chosen and fully evaluated by the FHWA and NYSDOT. This is anticipated to include an assessment of potential impacts on response times and neighborhood connectivity.

Clay Comment 32:

The Town requested additional information of where roadway lighting is planned and recommended that it be considered for intersections at location to enhance safety for pedestrians and bicyclists.

Response: See Response to Clay Comment 29.

Clay Comment 33:

The Town commented that most of the proposed roadway improvements are focused on State Roads and that additional work should be considered for side streets, County Roads, and those at a local level. Route 31 concepts also do not appropriately factor in

u-turns for emergency services. Improvements show a standard sidewalk and a wide shared use path along NYS Route 31, but not along side streets.

Response: As part of NYSDOT's design of the NYS Route 31 widening and other roadway improvements, NYSDOT would coordinate with emergency services. Pedestrian and bicycle accommodations would be integrated into the overall transportation and land-use planning framework as described in Section 3.11.3.5. Sidewalks and shared use improvements would be developed as part of their comprehensive master planning process, ensuring that side streets provide safe, accessible, and continuous links between the proposed concept improvements on state roads and residential neighborhoods and commercial areas.

Clay Comment 34:

The Town provided various comments and recommendations regarding the proposed traffic improvements.

Response: Future planning and detailed design for the implementation of recommended mitigation measures will be completed by NYSDOT (or the agency responsible for the roadway facility) who would coordinate with the local municipalities impacted by the project(s). Section FEIS Section 3.11.3.4, Analysis of Recommended Mitigations, and FEIS Section 3.11.5 Recommend Mitigations. The Town is encouraged to provide their recommendations to the agencies with jurisdiction over traffic and road infrastructure during the environmental review of the proposed traffic improvements by FHWA and NYSDOT.

Clay Comment 35:

The Town requested that the proposed utility work be described and the associated impacts to roads, residences and businesses.

Response: Proposed utility work is addressed in the FEIS as Connected Actions. Any additional utility work that may be necessitated by induced growth cannot be specifically evaluated at this time as the nature, extent, timing and location of induced growth is currently too speculative.

Clay Comment 36:

The Town commented that EV charging facilities should be considered.

Response: Micron is planning on providing EV charging stations as part of its campus development. See FEIS Table 3.7-13.

Clay Comment 37:

The Town comments that funding and technical support to train, equip, and maintain the readiness of the Town's volunteer fire departments, police, and code enforcement staff must be provided to allow the Town to ensure compliance with BMPs throughout the life of the project.

Response: See Responses to Community Facilities Comment 1, 2, and 15. See also Response to Clay Comment 17.

Clay Comment 38:

The Town comments that BMPs for the Micron Project be treated as binding commitments, backed by enforceable agreements and sufficient funding.

Response: The lead agencies will require Micron to implement the BMPs described through the FEIS and coordinate with the Town regarding funding and enforceability.

Clay Comment 39:

The Town requests that Micron establish and maintain a formal community outreach and engagement program to serve as a direct and permanent channel between the company, its public partners, and the people of Clay. This program should include regular project updates on construction progress, operational changes, and anticipated impacts, public reporting on compliance with key mitigation measures clear and accessible channels for residents to raise concerns, receive timely responses, and track resolution of issues.

Response: Micron has agreed to continue its current bi-weekly meetings with a cross-functional team of representatives from the Town of Clay and is supportive of continuing this regular engagement with Town officials to address questions and issues as the Proposed Project progresses.

Town of Cicero

Cicero Comment 1:

The Town of Cicero commented that it would be prudent for the proposed improvements to Lakeshore Road and the Lakeshore Road Spur as well as the connection to the new I-81 interchange from Route 11 and Sneller Road to include a Shared Use Path or sidewalk given that adding safe pedestrian connections is very important to the community.

Response: FHWA and NYSDOT will determine the final design of traffic improvements that are necessary and feasible. See FEIS Section 3.11.5 (Recommended Mitigations). The Town is encouraged to provide recommendations to these agencies during the environmental review of the proposed traffic improvements. The FEIS identified the provision of shared-use paths and sidewalks along NYS Route 31 and US Route 11 as well as connecting paths and sidewalks along existing corridors, and the provision of crosswalks and other safety improvements at intersections and interchanges. See FEIS Section 3.11.3.5 Bicycle & Pedestrian Facilities. NYSDOT will be developing a more detailed design that will implement the proposed improvements along NYS Route 31 at the I-81 interchange and Lakeshore Road intersection.

City of Syracuse

Syracuse Comment 1:

The socioeconomic effects of the Preferred Action Alternative would be significant and beneficial.

Response: Comment noted.

Syracuse Comment 2:

The Proposed Project's construction and operational activities would generate off-site economic activity and additional jobs and labor income within industries supporting Micron's construction, and within governments and businesses supporting workers' day-to-day spending.

Response: Comment noted.

Syracuse Comment 3:

The City commented that new Micron related jobs will attract young professionals to the area. If 5% to 10% of those young professionals choose to live in the City, that would conservatively translate to 2,000 to 4,000 new households in the City, over the next two decades from this project alone.

Response: Comment noted.

Syracuse Comment 4:

The City stated that it has led regional collaboration on workforce development and career training programs in industries essential to a success semiconductor industry: building and construction trades and technology and advanced manufacturing.

Response: Comment noted.

Syracuse Comment 5:

The City supported the Draft EIS's conclusion that, "the Preferred Action Alternative would not result in any significant adverse effects with respect to zoning or public policies, and it would likely result in beneficial effects by fulfilling economic development policy goals."

Response: Comment noted.

Syracuse Comment 6:

The City noted that although the Preferred Action Alternative would result in significant adverse effects on transportation and traffic in the surrounding areas during certain periods of construction and operation, many of these effects would be addressed through

mitigation measures developed with input from agencies with jurisdiction to implement such measures.

Response: Comment noted.

Syracuse Comment 7:

The City commented that, even though the transportation impacts are generally limited to the project study area, which would not directly affect the City, it is supportive of the recommended mitigations identified in the Draft EIS to mitigate the adverse traffic impacts.

Response: Comment noted.

Syracuse Comment 8:

The City recommended that Micron work in close coordination with Centro to provide robust public transportation service from the City of Syracuse directly to the project site and that this service should be aligned with the anticipated Bus Rapid Transit system to make it possible for City residents to easily get to project related jobs with minimal harmful impact to transportation.

Response: Comment noted.

Syracuse Comment 9:

The City noted that while the displacement of the wetlands in the proposed project area is not beneficial to the regional environment, the proposed replacement and restoration of new wetlands at a 2:1 ratio is valuable.

Response: Comment noted.

Syracuse Comment 10:

The City encouraged Micron to meet or preferably exceed the 2:1 ratio and provide critical wetlands to support ecosystems affected by the proposed development.

Response: The lead agencies agree with USACE and NYSDEC that a 2.2:1 ratio is sufficient and appropriate.

Syracuse Comment 11:

The City commented on Micron's commitment to purchase 100% carbon-free electricity utilizing power purchase agreements and renewable energy credits (RECs) as well as Micron's proposals to decrease the project's impact on climate change and support renewable energy locally, noting that these were things that the City is supporting through the Sustainable Syracuse Initiative.

Response: Comment noted.

Syracuse Comment 12:

The City noted that although there will be a significant water impacts in the region, proposed system upgrades are planned by Onondaga County Water Authority. Specifically, OCWA is designing its planned infrastructure improvements with redundancy measures, including redundant parallel pipelines, and these features enhance infrastructure resilience, minimizing risks to service reliability during maintenance or emergencies.

Response: Comment noted.

Syracuse Comment 13:

The City noted that it is encouraged by much of the Draft EIS, specifically the expected economic growth, investment in the region, and positive impacts on jobs. These economic benefits are anticipated to help many communities work toward greater fiscal sustainability, including the City.

Response: Comment noted.

Syracuse Comment 14:

The City commented that the Micron Project will launch the region into exponential growth in a variety of areas, and it will create a historic economic boost that will extend throughout Central New York.

Response: Comment noted.

Syracuse Metropolitan Transportation Council

SMTC Comment 1:

The Syracuse Metropolitan Transportation Council (“SMTC”) commented, with reference to Section 2.1.7.1 of the Draft EIS, that its planning area no longer includes “a small portion of the Granby.”

Response: The comment appears to reference Section 2.1.7.1 of the TIS, not the DEIS. The commenter is correct that the SMTC planning area no longer includes a small portion of the Granby.

SMTC Comment 2:

SMTC commented that Table 3-1 of the Draft EIS should be updated to correct roadway jurisdictions.

Response: The comment appears to reference Table 3.1 in the TIS, not the DEIS. The referenced table was intended to refer to roadway ownership, rather than roadway maintenance jurisdictions. Despite the table headings, the table accurately reflects roadway ownership as intended,

SMTC Comment 3:

SMTC commented that it would be helpful to have a map/graphic summarizing the trip distribution in Section 3.4 of Appendix M of the Draft EIS.

Response: Appendix M of the DEIS is the TIS. SMTC's regional travel model is larger than the Transportation Evaluation Area established in the TIS. Illustrating the travel patterns extrapolated from the SMTC regional model would introduce confusion with respect to the TIS boundaries. Accordingly, the supplemental graphic was not added; the written description in the TIS of the relationship between regional model and the TIS boundaries is sufficient to show how the regional model was relevant background for development of the model network.

SMTC Comment 4:

SMTC questioned the crash reduction statistics that were identified in Section 4.3 of the Draft EIS and requested the source of that analysis.

Response: The section referenced in the comment relates to the TIS (Appendix M of the DEIS). The safety analysis was based on crash data from the NYSDOT Accident Location System (ALIS) and Crash Location and Engineering Analysis and Reporting (CLEAR). The expected crash reduction analysis used the Safety Investigation Procedures Manual, also known as the Yellow Book (NYSDOT, 2023b). See TIS Section 4. The safety analysis was conducted by a Professional Engineer with Professional Traffic Operations Engineer and Roadway Safety Professional (level 1) certifications.

SMTC Comment 5:

SMTC asked whether the reference in Section 6.1.4 of the Draft EIS to the North, South, East, West Interconnect project is referring to the City of Syracuse's signal interconnect and, if so, why is that project relevant given that it would not include any intersections in the Transportation Evaluation Area.

Response: The comment appears to reference Section 6.1.4 of the TIS, not the DEIS. The TIS Section 6.1.4 - Excluded Developments and Transportation Evaluation Area Roadway Network Changes, categorizes the North, South, East, West Interconnect project as an "excluded project" precisely because this project does not impact the TIS/Transportation Evaluation Area.

SMTC Comment 6:

SMTC questioned the statement that "[t]he addition of the ramp from southbound Caughdenoy Road to southbound NYS Route 481 provides a more direct exit from the campus to the southeast." SMTC commented that a more likely explanation is that residents of the areas around Stearns Rd and Caughdenoy Road would utilize this new 481SB on-ramp.

Response: Once the ramp is constructed, Micron traffic and residential traffic would both be able to utilize the new ramp.

SMTC Comment 7:

SMTC commented that it would be fairer to compare the incremental value of each mitigation scenario to the prior (less intensive) scenario.

Response: The TIS and FEIS evaluated the number and locations of significant adverse impacts from the Preferred Action Alternative within the Transportation Evaluation Area, defined as the roadway network within a 5-mile radius of the Proposed Project, and the ability for each Mitigation Scenario to address those impacts. The comparison of No Action Alternative to Preferred Action Alternative identifies the significant impacts while the comparison of Preferred Action Alternative to each Mitigation Scenario captures the number of significant impacts mitigated. Each scenario was meant to be evaluated independently of the other scenario. This approach allows for a clearer understanding of how each scenario performs on its own merits.

SMTC Comment 8:

SMTC questioned the differences between Mitigation Scenario C and Mitigation Scenario B and whether there was a material difference.

Response: The main distinction between Mitigation Scenarios B and C is that Scenario C includes an added interchange ramp from Caughdenoy Road to eastbound NYS Route 481. This ramp decreases the traffic volume on the New Access Road and its new interchange with NYS Route 481.

SMTC Comment 9:

SMTC commented on sheet plans shown in Chapter 10 and inquired whether all existing unsignalized side streets and driveways will still have full access to Route 31. It also questioned why some unsignalized intersections were shown in detail on the plan sheets, while others are not.

Response: The existing recommended mitigation measures shown in Figure 10-1 – Concept Schematic Plan serve as guidance and placed a representative typical roadway section and access controls. Final decisions regarding access management and intersection treatments will be subject to further evaluation and approval by the responsible transportation agency, such as NYSDOT, during the development of detailed design plans.

SMTC Comment 10:

Regarding the proposed widening to three travel lanes in each direction (plus additional turn lanes at major intersections) on Route 31 west of NY 481, SMTC asked for the justification for widening west of NY 481 and also why there were no turn restrictions at the remaining unsignalized driveways.

Response: The widening is proposed in response to reduced traffic operations in the areas affected by the Preferred Action Alternative. All of the mitigation measures described in DEIS Section 3.11.3.4 – Analysis of Recommended Mitigations were developed collaboratively with NYSDOT,

and will be further studied and analyzed by FHWA and NYSDOT as well as other relevant agencies prior to any potential implementation.

SMTC Comment 11:

SMTC requested consideration of a future connection to Sutcliffe Drive in the design of the Carling Road extension, which would allow residents of the Pine Gate area better access to Route 31 while reducing trips on Soule Road. SMTC requested that coordination with the Town of Clay occur and that traffic calming measures be incorporated on Sutcliffe Drive to alleviate any potential concerns about through traffic.

Response: The comment falls under the jurisdiction of local agencies to improve circulation and should be addressed through their future planning processes.

SMTC Comment 12:

SMTC inquired whether it is necessary to move the bike path to the south side of Route 31 in the segment between the NY 481 interchange and the westernmost Great Northern Mall driveway.

Response: NYSDOT, as the roadway agency responsible for the intersection, will determine how to support the path through this area with their future planning and design processes. SMTC is encouraged to provide its recommendations to these agencies during the environmental review of the proposed traffic improvements.

SMTC Comment 13:

SMTC asked whether alternative designs were considered that would use less land than the proposed NY 481 Verplank Road interchange.

Response: NYSDOT, as the roadway agency responsible for the interchange, will make a final determination as to the need and configuration of the interchange. SMTC is encouraged to provide its recommendations to these agencies during the environmental review of the proposed traffic improvements.

SMTC Comment 14:

SMTC recommended the use of other design tools to encourage traffic to/from the Micron facility to utilize the new access road, while maintaining connectivity of Caughdenoy Road (i.e. traffic calming on Caughdenoy Road, perhaps limiting to right-in/right-out access at Route 31).

Response: Within the recommended traffic mitigations included in the DEIS, the south leg of Caughdenoy Road at NYS Route 31 was converted to a cul-de-sac to reduce Micron-related traffic through residential communities directly adjacent to Caughdenoy Road and to improve traffic flow at local signalized intersections. This design directs vehicles traveling to and from the Micron Campus via NYS Route 481 to utilize the New Access Road, rather than the existing and planned ramps at the Caughdenoy Road and NYS Route 481 interchange.

SMTC Comment 15:

SMTC suggested continuing the share-use path along the access road into the site along the Micron entrance road.

Response: The nature and extent of necessary and appropriate traffic improvements will be determined by the FHWA and NYSDOT. SMTC is encouraged to provide its recommendations to these agencies with jurisdiction during the environmental review of the proposed traffic improvements.

SMTC Comment 16:

SMTC requested clarification of the intent for the Connector Road/Micron Access Road and suggested adding a bicycle facility to this road.

Response: The New Access Road will be developed by the owning jurisdiction as part of their plans, and included in the applicable environmental review, by NYSDOT and FHWA. The inclusion of pedestrian facilities along this road could be viewed as a first step to providing a more continuous pedestrian network. The nature and extent of necessary and appropriate traffic improvements will be determined by appropriate roadway owner (Town of Clay, Onondaga County, or NYSDOT). SMTC is encouraged to provide its recommendations to these agencies with jurisdiction during the environmental review of the proposed traffic improvements.

SMTC Comment 17:

SMTC recommends coordination with the Town of Clay and Onondaga County Planning Department on a comprehensive vision for land use and transportation development for the area.

Response: Comment noted.

SMTC Comment 18:

SMTC inquired what alternatives were considered for widening at Route 31/Route 11 and noted that on-road bike lanes should be removed and separated bike facilities used instead.

Response: A roundabout was found not to provide adequate traffic operations at this location based on the projected demand. The nature and extent of necessary and appropriate traffic improvements will be determined by the FHWA and NYSDOT. SMTC is encouraged to provide its recommendations to these agencies with jurisdiction during the environmental review of the proposed traffic improvements.

SMTC Comment 19:

SMTC commented that the existing designated snowmobile trail along Route 31 through the I-81 interchange area was not incorporated into the designs and consideration should be given to relocating it to Sneller Road to cross I-81.

Response: NYSDOT, as the responsible state transportation agency, would coordinate future easement agreements, if able, and develop the final design plans for this area. The comments will be made available to NYSDOT. See also Response to Community Facilities Comment 27.

SMTC Comment 20:

SMTC commented that the new site entrance road on Route 11 should be labeled on Sheet 6a and inquired whether any consideration was given to a roundabout instead of a new signal at this location.

Response: The new entrance from Route 11 to the Micron Campus is clearly delineated on Sheet 6a, and its relationship to the Micron Campus and other Proposed-Project related improvements is illustrated in the “Key Map” in the lower right hand of the page. According to the map legend, the dotted yellow line around the depicted site entrance clearly “denotes designates future site plan or construction,” and no additional labeling is necessary. For the most reliable map rendering, maps should be opened in their native format, as some map details may not render fully in all browsers or when insufficient memory has been allocated for file viewing.

The ultimate traffic control and signing approach of the new site entrance and Route 11 will be determined by NYSDOT, as the state transportation agency responsible, in coordination with Micron. The comments will be made available to NYSDOT for their consideration when developing the final design plans. Notwithstanding, the nature and extent of necessary and appropriate traffic improvements will be determined by NYSDOT. SMTC is encouraged to provide its recommendations to these agencies with jurisdiction during the environmental review of the proposed traffic improvements.

SMTC Comment 21:

SMTC suggested continuing the shared-use path along Sneller Rd through the proposed interchange with I-81.

Response: The nature and extent of necessary and appropriate traffic improvements will be determined by the FHWA and NYSDOT. Final design plans for this area, including determining the logical termini for the shared-use path along US Route 11 and Sneller Road, if warranted. SMTC is encouraged to provide its recommendations to these agencies during the environmental review of the proposed traffic improvements.

Cortland County Industrial Development Agency

Cortland IDA Comment 1:

The Cortland County Industrial Development Agency (“Cortland IDA”) offered its strong support for the Micron Project, noting that the project represents a historic opportunity for the region and state.

Response: Comment noted.

Cortland IDA Comment 2:

Cortland IDA commented that the Micron Project is poised to generate tens of thousands of direct and indirect jobs, including a significant number of high-paying positions in semiconductor manufacturing. The ripple effects of this investment will reach far beyond the Onondaga county, offering surrounding communities like Cortland the opportunity to contribute to, and benefit from, the project's long-term success.

Response: Comment noted.

Cortland IDA Comment 3:

Cortland IDA stated that it is actively engaged in supporting workforce development with two higher education institutions and a growing network of vocational training programs, which will enable Cortland County to be well-positioned to supply talent in construction, electrical work, HVAC, precision machining, and other trades critical to the project's development phases.

Response: Comment noted.

Cortland IDA Comment 4:

Cortland IDA commented that Cortland County businesses and contractors stand ready to support the project's induced growth, and that it is committed to facilitating connections between local businesses and the Micron supply chain.

Response: Comment noted.

Onondaga Nation

Nation Comment 1:

The Onondaga Nation ("Nation") supported the community request for a 120-day public comment period.

Response: See Response to Public Review Comment 3. As a participating entity in the development of the DEIS, the Nation was given significantly more time to review and comment on the DEIS during its development and as acknowledged in the Nation's comments, many of the Nation's concerns were addressed prior to public release of the DEIS.

Nation Comment 2:

The Nation noted that both SEQRA and NEPA require that the public have the opportunity for meaningful and effective engagement with the DEIS.

Response: See Response to Public Review Comments 3 and 4. The public had a full opportunity for meaningful and effective engagement with the DEIS.

Nation Comment 3:

The Nation supported requests for multiple public hearings at locations across the affected area.

Response: See Response to Public Review Comments 4.

Nation Comment 4:

The Nation commented about its special role in environmental matters in this Region and stated that the “affected area” for the Micron Project, as it is defined in the Draft EIS, falls entirely within the Nation’s traditional territory. The Nation’s unique relationship with this land was recognized under the 1794 Treaty of Canandaigua, in which the United States recognized this connection and guaranteed the Nation’s “free use and enjoyment” of its original territories.

Response: Comment noted.

Nation Comment 5:

The area directly affected by the proposed Micron project and its connected actions is of particular cultural and historical significance to the Nation.

Response: The lead agencies recognize the Nation’s cultural and historic connection to the areas where the Proposed Project and Connected Actions are located. The Department of Commerce has initiated Section 106 Consultation under the National Historic Preservation Act of 1966 on the Proposed Project and Connected Actions.

Nation Comment 6:

The Draft EIS does not consider a sufficient range of alternatives because the overarching purpose and need for the Micron Project was translated into an extremely narrow production goal, which was never properly explained or justified, and the Draft EIS failed to consider recent changes in the domestic chip production landscape that may affect the way that the overall project purpose and need is translated into an on-the-ground production goal.

Response: To the extent that this comment relates to CPO’s purpose and need (see FEIS 1.0.1 and 1.1.1), as stated in FEIS Section 2.2, CPO considered a reasonable range of alternatives to its Proposed Action (the disbursement of direct funding to Micron for the Proposed Project): the Preferred Action Alternative; the No Action Alternative; a Reduced Scale Manufacturing Alternative; a U.S. Route 11 Access Elimination Alternative; and six Micron Campus Site Layout Alternatives. As required under NEPA, CPO assessed whether each alternative would be technically and economically feasible and meet the purpose and need of the Proposed Action. See 42 U.S.C. § 4332(2)(C)(iii). CPO did not carry forward any of the alternatives besides the Preferred Action Alternative and the No Action Alternative for detailed analysis in the FEIS because CPO determined that each of the other alternatives would be technically or economically infeasible and/or would not meet CPO’s purpose and need. CPO conducted this assessment of reasonable

alternatives under NEPA based on its technical and economic expertise in evaluating conditions in the semiconductor manufacturing industry, the particular context surrounding DRAM and the high-bandwidth memory sector, and the Department of Commerce’s policy objectives in incentivizing domestic semiconductor manufacturing under the CHIPS Act. As noted in FEIS Section 2.2, in the context of the CHIPS Incentives Program, which CPO is responsible for administering, there is an inherent degree of overlap between consideration of an alternative’s ability to meet CPO’s purpose and need and its technical and economic feasibility and practicability, because an alternative that is not technically or economically feasible or practicable would likely result in Micron pursuing a memory campus in a lower-cost geography outside of the United States.

FEIS Section 1.1.1 (CPO Purpose and Need) provides an in-depth discussion of the context for CPO’s assessment of feasible alternatives in the EIS. This assessment is based on the Department of Commerce’s determination that a four-fab memory campus with an efficient layout at a single location would be required to ensure an economically and commercially viable operation that would meet the Department of Commerce’s economic and national security responsibilities under the CHIPS Act. As explained in FEIS Section 1.1.1, the primary driver of the need for a four-fab configuration is the need for at least 2.4 million sq. ft. of cleanroom space to manufacture increasingly complex semiconductor products at an economy of scale sufficient to compete with expanding memory campuses in East Asia. FEIS Appendix A-1 provides further in-depth information on the factors that drive this need.

Nation Comment 6a:

First, the DEIS asserts that, to be competitive and take advantage of economies of scale, Micron must build a four-fab alternative. In support, the DEIS provides data on the size of similar facilities in the United States and around the world operated by Micron and two of its competitors. According to this data, one competitor has a single facility larger than the proposed Micron project (more than 2,500,000 square feet of cleanroom) and the other has a facility comparable to the proposed Micron project (approximately 2,100,000 square feet of cleanroom). DEIS, p. 1-10, Fig. 1-1.2. The other five competitor-owned facilities shown in this figure are at or below 2,000,000 square feet of cleanroom space. Most of the facilities listed are well below this scale. While the DEIS notes proposals for additional large-scale production facilities in South Korea, no information about the stage of the proposal or the likelihood of approval is provided. DEIS, p. 1-7, fn. 7.

Response: Figure 1-1.2 in the FEIS has been revised to add bars representing the additional large-scale memory campuses in South Korea that were noted in Draft EIS p. 1-7, n. 7: SK hynix’s proposed four-fab DRAM cluster in Yongin, and Samsung’s proposed six-fab DRAM and advanced logic cluster, also in Yongin. Construction of the SK hynix four-fab memory campus is now underway.¹ The Samsung six-fab campus has received expedited government approval.² CPO

¹ “SK hynix starts fab construction in Yongin chip cluster,” *The Korea Herald* (Feb. 25, 2025), <https://www.koreaherald.com/article/10428310> (“The chipmaker plans to build four fabs to produce next-generation chips and a chip cooperation complex with more than 50 small local companies.”).

² “Yongin Semiconductor Industrial Complex Plan Receives Early Approval by Three Months,” *Power Electronics News* (Jan. 7, 2025), <https://www.powerelectronicsnews.com/yongin-semiconductor-industrial-complex-plan->

has tracked these developments and concluded that these projects have or are likely to receive continued government approvals. CPO's analysis of publicly available information on the projects' projected sizes indicates that the SK hynix campus in Yongin will include 3.6 million sq. ft. of cleanroom space³ and the Samsung campus in Yongin will include 4.8 million sq. ft. of cleanroom space,⁴ both much larger than the Proposed Project's 2.4 million sq. ft. of cleanroom space.

Samsung, SK hynix, and Micron are the three main competitors dominating the global DRAM market. As explained in Section 1.1.1, South Korea currently has a 44 percent share of the global memory chip market, whereas Micron manufactures all DRAM produced in the United States (less than one percent of global DRAM production). The x-axis in Figure 1-1.2 shows an increasing trend toward campuses that are now crossing the four-fab threshold (2.4 million sq. ft. or more of cleanroom space), reflected in the developments described above, the competitors also are continuing to add capacity to existing campuses over time. These global developments underscore the need to expand, or "onshore," domestic memory manufacturing capacity to enhance the resilience of the U.S. semiconductor supply chain to potential global disruptions. The fact that major new memory campus projects are building four or more fabs on single sites supports the need for a domestic memory campus cluster of at least four fabs to ensure an economically and commercially viable operation that would meet the Department of Commerce's economic and national security responsibilities under the CHIPS Act.

Nation Comment 6b:

The DEIS also argues that the per wafer production costs in smaller two- or three-fab facilities would be much higher, making a smaller project economically infeasible for Micron. This analysis is based on a capital asset utilization (CAU) rate as calculated for various cleanroom space represented in Appendix A, Figure A-2. Micron asserts that the CAU rate for a two-fab alternative would be 6.7% lower than for a four-fab alternative and that it would have to invest \$3.3 billion more in equipment costs to achieve the same production levels as the proposed four-fab alternative. DEIS, App. A, p. A-6.

The graph provided as Figure A-2 plots CAU against square feet of clean room space. However, neither axis has numeric markers, meaning that there is no way to determine the CAU for any particular amount of clean room space or whether a two-fab or four-fab alternative is even represented on the graph as included. In addition, the graph appears to be a flattening parabola, meaning that the incremental CAU per additional square foot of cleanroom space will approach zero at some point. Without numeric markers on either axis, it's impossible to determine at what point that might happen. It

[receives-early-approval-by-three-months/](#) ("To expedite progress, the government has accelerated the construction start date by three years and six months to December 2026, supported by fast-tracked land compensation starting in 2025. Infrastructure upgrades, including roads, water, and power, are also planned to enable the first semiconductor production plant to begin operations by 2030.").

³ See "SK hynix Board Approves Yongin Semiconductor Cluster Investment Plan," *SK hynix Newsroom* (July 26, 2024), <https://news.skhynix.com/sk-hynix-board-approves-yongin-semiconductor-cluster-plan/>.

⁴ See "Yongin Semiconductor Cluster General Industrial Complex: Set to Rise as a Global Semiconductor Leader," *Invest Korea* (May 5, 2025), https://www.investkorea.org/ik-en/bbs/i-5045/detail.do?ntt_sn=490808.

is completely impossible to evaluate the asserted 6.7 reduction in CAU rates for a two-versus four-fab alternative.

Response: The figure included in the DEIS Appendix A, Figure A-2, is intended to be illustrative of the general correlation of CAU and cleanroom space, and is not intended to be utilized as a tool for assessing the specific CAU reduction for the Micron Clay location. As a result, including the numerical values for the axis are not necessary to demonstrate the correlation. In addition to the general correlation between CAU and cleanroom space, final CAU estimates require a multifactorial analysis, which are dependent on variables such as fab location, tool mix, and numerous other considerations. The estimates included in the DEIS and confirmed in the FEIS of a CAU reduction of 6.7 percent are based on Micron confidential multifactorial analysis.

Nation Comment 6c:

The DEIS sets a domestic DRAM wafer production goal of 12% of global DRAM manufacturing capacity, which translates into a weekly production rate of 13,000 DRAM wafers by 2028 and 52,000 by 2045. DEIS, p. 1-8. However, the only data cited that ties DRAM wafer use to critical economic and national security interests is a single estimate by the Boston Consulting Group, which the DEIS characterizes as asserting that 11% of the global memory chip output is used by “applications that are critical to U.S. economic and national security” interests. DEIS, App. A, p. A-4. This characterization does not appear to be supported by the cited report.

In reviewing the cited report, the reported 11% figure is not apparent. The report includes an exhibit labeled “Example: How the US could establish a minimum viable capacity to address its critical strategic risk in advanced logic manufacturing,” which asserts that 9% of US semiconductor consumption in 2019 was consumed by “critical infrastructure.” (Varas et al, 2021, p. 48, Exh. 22.) This critical infrastructure is defined to include defense and aerospace; telecom networks; energy, security and medical equipment; and data centers of government and essential sectors. (Id.) Our review did not find any obvious economic or defense uses of microchips that should be added to the 9% figure or any discussion of critical strategic needs at the DEIS-reported 11% level.

Response: The statement citing the Boston Consulting Group/Semiconductor Industry Association (BCG/SIA) report in FEIS Appendix A-1 has been corrected to state that 9 percent of the global memory chip output is consumed by applications that are critical to U.S. economic and national security. However, the relevant section of the BCG/SIA report found that two to three logic fabs would need to be built in the United States to cover expected domestic consumption of advanced logic chips for critical infrastructure applications by 2030. Due to the comparatively greater capital intensity of memory fabs, this translates to the need for four to six memory fabs in the same timeframe.

As explained in FEIS Appendix A-1, historical investment data was analyzed showing that DRAM memory chip manufacturing requires, on average, approximately 2.05 times the capital intensity of logic chip manufacturing (Yoon, 2021), which drives memory cleanroom size. In general, an economically viable logic operation requires approximately 300,000 sq. ft. of cleanroom space, whereas the typical memory operation requires approximately 600,000 sq. ft. of cleanroom space.

As further noted in FEIS Appendix A-1, the BCG/SIA report made the following specific estimate in 2021, as stated at p. 48 of that report: “We estimate that covering the expected domestic consumption of advanced logic chips for critical infrastructure applications by 2030 would require building just 2-3 new state-of-the-art [logic] fabs in the US” (Varas et al., 2021). The Department of Commerce considered the BCG/SIA estimated need for domestic logic chip production in the context of a separate CPO award to TSMC Arizona Corporation to construct three leading-edge logic fabs in Arizona with 900,000 sq. ft. of cleanroom space. Given the need for memory chips to support critical infrastructure running on logic chips, and that memory chip manufacturing requires, on average, approximately double the capital intensity compared to logic chip manufacturing, the domestic need for three logic fabs to supply critical infrastructure applications (900,000 sq. ft. of cleanroom space) translates to the need for six memory fabs to support those same applications (3.6 million sq. ft. of cleanroom space). As FEIS Appendix A-1 noted, 2.4 million sq. ft. of cleanroom space is in keeping with the projected capital intensity needed to onshore memory chip production at pace consistent with logic chip production. This is why, as noted in Section 1.1.1, although the Department of Commerce’s final award to Micron only includes direct funding to support Fabs 1 and 2, the Department of Commerce based its award decision on Micron’s proposal to establish a full four-fab cluster in New York (the Proposed Project).

Nation Comment 6d:

Further, for either goal, the production is described as Micron’s nation-wide goal. Micron has recently announced plans to build a second fab at its Idaho facility and a new plant on its Virginia site . . . Given this significant expansion of Micron’s domestic chip production, the 52,000 wafer per week production goal may be met in other ways, allowing for Micron to consider a scaled-down version of its Clay facility.

Response: Micron’s recently announced plans to build a second fab at its Boise, ID location and expand production in its existing fab in Manassas, VA do not negate the need for a four-fab facility in Clay, NY. The need for those additional facilities is based on increasing economic demand for memory chip production. In this context, the need for a four-fab domestic memory campus has only grown, not diminished, even with Micron’s announcements relating to its ID and VA locations.

CPO continues to evaluate memory market trends facing Micron and its competitors. The BCG/SIA analysis, which was released in 2021, assumed a seven percent compound annual growth rate (CAGR). This forecast was made before generative AI products, such as ChatGPT, were well understood by the market. Since that time, the semiconductor industry has revised its forecast to nine percent CAGR in 2024 and 2025.⁵ The Yole Group, a market research, technology consulting, and financial advisory firm that provides strategic analysis and forecasts for the semiconductor, photonics, and electronics industries, projects that the memory industry will grow at a 10 percent CAGR from 2024 to 2030.⁶ This projection is higher than the seven percent CAGR assumption in

⁵ “Global Semiconductor Fab Capacity Projected to Expand 6% in 2024 and 7% in 2025, SEMI Reports,” *SEMI* (June 18, 2024), <https://www.semi.org/en/news-media-press-releases/semi-press-releases/global-semiconductor-fab-capacity-projected-to-expand-6%25-in-2024-and-7%25-in-2025-semi-reports>.

⁶ “Memory industry at a crossroads: why 2025 marks a defining year,” *Yole Group* (June 30, 2025), <https://www.yolegroup.com/strategy-insights/memory-industry-at-a-crossroads-why-2025-marks-a-defining-year/>

the 2021 BCG/SIA analysis and reflects increased growth from AI technology innovation. Another more recent analysis performed by McKinsey in 2024 concluded that, by 2030, “the generative AI boom globally will require . . . an additional six to 18 new memory fabs.”⁷ Based on the projection from McKinsey, an average of two new memory fabs will need to come online in the United States every five years to meet the most critical needs. Tesla is sourcing \$16.5 billion of AI logic chips,⁸ which will need to be paired with HBM products. NVIDIA, the industry leading provider of AI hardware solutions, recently announced revenue of \$44.1 billion, up 12 percent from Q4 and up 69 percent from a year ago, for Q1-26 results, showing continued growth in AI demand.⁹ NVIDIA’s hardware solutions use Micron memory.¹⁰

AI workloads require HBM chips, which take more steps to produce than traditional DRAM chips, such as double-data rate (DDR) 4 and DDR 5 products. HBM products require more manufacturing steps due to their speed requirements, the need to stack HBM chips into modules using Through-Silicon-Via technology, and other performance requirements. See also FEIS Section 1.1.1. Each AI module (i.e., an AI product containing a logic chip plus memory chips) requires dozens of HBM chips.¹¹

(“DRAM continues to lead in both scale and growth potential, with High-Bandwidth Memory (HBM) becoming the centerpiece of this transformation”).

⁷ “More new logic fabs needed to fill the looming supply shortage in AI chips by 2030: McKinsey – Memory chips are also likely to face supply woes,” *Manufacturing Asia* (2024), <https://manufacturing.asia/manufacturing/in-focus/more-new-logic-fabs-needed-fill-looming-supply-shortage-in-ai-chips-2030-mckinsey>.

Micron plans to manufacture a mix of these products in New York, and the HBM requirements for these products are anticipated to create upward pressure on the amount of cleanroom space required to meet growing market demand, which is why Micron has announced an additional fab in Idaho. The announced expansion of production of the fab in Virginia contains a different product mix than the planned New York fab. The Virginia fab produces legacy nodes, instead of the leading-edge DRAM and HBM chips planned for New York.

In sum, based on CPO's technical and economic expertise in evaluating conditions in the semiconductor manufacturing industry, the particular context surrounding the DRAM and high-bandwidth memory sector, and the Department of Commerce's policy purposes in incentivizing domestic semiconductor manufacturing under the CHIPS Act, CPO disagrees with the assertion that the memory chip production need analyzed in the FEIS may be met through a reduced-scale alternative for the Proposed Project, which is why CPO did not carry forward that alternative for detailed analysis in the FEIS. The need for a four-fab memory campus for U.S. national and economic security purposes has not changed following Micron's ID and VA announcement.

Nation Comment 7:

The Nation asserts that the Draft EIS improperly relies on compliance with applicable laws and regulations to find that environmental impacts are not significant. The Draft EIS should be amended to eliminate all claims that legal compliance translates into an absence of significant adverse impacts. Instead, the Draft EIS should incorporate quantitative or qualitative estimates of the contaminants that may be discharged into air or water or that may be released from solid and hazardous wastes or hazardous materials and then discuss the likely environmental and public health impacts of exposure to those contaminant levels.

Response: The lead agencies have taken a hard look at the reasonably foreseeable impacts of the Proposed Project on air, water and human health. While the DEIS properly acknowledges and considers the various permitting that will be required, which, in many instances, is proceeding on a simultaneous path, the lead agencies have not determined that compliance with permitting requirements necessarily translates into non-significance. In many instances, it is the specific permitting regime, with required minimization and mitigation measures, coupled with the nature of the impact summarized in the DEIS and Micron's commitments to BMPs, that were used to determine whether significant impacts remain. Where compliance with applicable law and permits provides support for a conclusion of no significant impact, it is appropriate to reference such obligations. Where significant impacts remain, the lead agencies have required implementation of additional mitigation as identified in the FEIS beyond compliance with applicable laws and regulations. See FEIS Table 3.17-1.

Nation Comment 8:

PFAS, which is recognized as an emerging contaminant with the potential to cause significant harm to human health and the environment at very low levels of exposure, is not well understood or properly regulated. Although the Draft EIS discusses the evolving legal standards for PFAS at both the state and federal level, it fails to plainly state that the vast majority of PFAS compounds are unregulated.

Response: The lead agencies fully recognize the evolving nature of the PFAS regulatory regime as more and more technical information becomes known and alternatives and detection and control measures are discovered. Appendix L-1 further addresses this concern. This Appendix describes the various PFAS definitions, analytical techniques for measuring the presence of PFAS, the current regulatory framework for managing PFAS, intended uses of PFAS at the Proposed Project, wastewater treatments under evaluation, air emissions controls, recycling and disposal frameworks, and overall chemical management practices for responsible use of these critical substances at the Micron Campus.

Recognizing that the regulatory requirements for PFAS are continuing to develop and subject to change, the DEIS identifies and discusses the laws and regulations to which the Proposed Project will be subject, including air emission permitting, wastewater permitting and accompanying monitoring, required spill prevention protocols, and the reporting regimes that accompany federal, state and local regulatory programs. These programs include regulation of PFAS, as discussed in FEIS Section 3.8.3.2. and Appendix L-1. These sections also discuss the review of PFAS treatment options that go beyond what is currently legally mandated. The options under review are not limited to treatment of only those PFAS that are currently regulated or for which approved analytical methods exist. PFAS also would be addressed cumulatively by the other regulatory controls, including appropriate storage and handling of chemicals, and spill prevention planning, as discussed in the FEIS. NYSDEC also requires PFAS monitoring as provisions in its wastewater permits, including quarterly sampling for approximately 40 compounds using EPA Method 1633/1633A and leveraging state guidance values (e.g., 10 ppt for PFOA/PFOS).¹² Any potential future regulation of PFAS is speculative and beyond the scope of the FEIS, though Micron must continue to comply with all applicable law and will explore technological innovation to reduce or eliminate PFAS from semiconductor manufacturing, where feasible.

Nation Comment 9:

The representative nature of air quality data from Rochester should be verified with some local monitoring data.

Response: See also Response to Air Quality Comment 4. No verification is necessary. Compliance with the NAAQS thresholds are determined by USEPA based on ambient air monitoring. DEIS Section 3.6.3.2 demonstrates compliances with NAAQS thresholds for regulated criteria pollutants under a conservative approach based on preliminary design information assuming all four fabs are operational, although initially construction and operation of only Fabs 1 and 2 is expected. As further discussed in FEIS Section 3.6 and Appendix I, the proposed Micron Campus is located in a more rural area compared to the location of the air monitors in Rochester and Syracuse, and, therefore, the ambient background air quality in the Rochester and Syracuse monitoring locations is a conservative representation of background concentrations in the area of the Proposed Project area.

¹² See <https://dec.ny.gov/environmental-protection/water/emerging-contaminants>.

Nation Comment 10:

The Nation commented that, other than an assessment of combined stationary and mobile source impacts on particulate matter, the air quality assessment does not seem to consider the potential for localized air quality impacts from facility operations alone or from the combination of facility and traffic emissions.

Response: FEIS Chapter 3.6 provides a comprehensive analysis of emissions associated with both the construction and operational phases of the Proposed Project. This includes evaluation of criteria pollutants (e.g., volatile organic compounds (VOCs), particulate matter (PM), hazardous air pollutants (HAPs)) and regulated non-criteria pollutants from both stationary and mobile sources. These analyses were conducted in the context of Clean Air Act thresholds and regulatory guidance concentrations designed to protect human health. The FEIS demonstrates that all projected emissions remain below applicable health-based regulatory thresholds and guidance concentrations throughout both phases of the Proposed Project. Therefore, the Proposed Project is not expected to result in significant adverse impacts to air quality in the surrounding community. As concluded in FEIS Section 3.6.5, Summary of Effects:

Construction activities associated with the Proposed Project components would result in temporary adverse, direct impacts to air quality. In addition, based on the regulatory requirements for preconstruction and operational air quality permitting and compliance, the emissions controls inherent to the Proposed Project operations, and the confirmation through atmospheric dispersion modeling that stationary sources associated with the Proposed Project would not cause or contribute to an exceedance of any applicable NAAQS, AGC or SGC, the stationary and mobile source emissions from construction and long-term operation of the Proposed Project would not have a significant adverse effect on air quality. The potential effects on air quality from induced growth anticipated from the Proposed Project would not cause a significant adverse effect within the five-county region.

Nation Comment 11:

The Nation commented that there is no mention of air modeling for PFAS or contaminants specifically identified as PFAS byproduct.

Response: As discussed in FEIS Chapters 3.6. and 3.7, the Micron Campus will be a stationary source of air pollutants and will be subject to rigorous permitting and emissions controls. Although there are no specific federal or state standards for PFAS air emissions individually or as a group, air pollutants (including PFAS) have been evaluated. The Micron Campus will use highly segregated exhaust systems to manage emissions from various processes routed to source specific control devices, such as point-of-use (POU) abatement, process equipment exhaust conditioners (PEECs), to manage emissions directly at the source. These exhausts may contain unreacted input

materials and reaction byproducts, such as PFAS byproducts formed during semiconductor fabrication. All process emissions will be routed to control systems with built-in redundancy to ensure safety and compliance.

The Micron Campus is expected to be classified as a major source under the Prevention of Significant Deterioration (PSD) Program, requiring the implementation of Best Available Control Technology (BACT) for pollutants like carbon monoxide, nitrogen oxides, and fluorinated greenhouse gases (F-GHGs), some of which may be considered PFAS. These pollutants will be treated using controls like regenerative catalytic systems or POU thermal oxidizers with up to 99% destruction efficiency. FEIS Section 3.7.3.2 discusses potential emissions and emissions controls for F-GHGs, including certain PFAS. Air dispersion modeling for individual fluorinated compounds is presented in Appendix I, which confirms compliance with regulatory guidance concentrations for all applicable compounds. As discussed in FEIS Appendix L-1, New York's air toxics program regulates non-criteria pollutants, including PFAS, using annual (AGC) and short-term guideline (SGC) concentrations developed based on best available science. Micron also plans to minimize fugitive emissions from heat transfer fluids and refrigerants through efficient design, monitoring, and maintenance. The Proposed Project will undergo a Climate Leadership and Community Protection Act (CLCPA) Analysis by the NYSDEC including F-GHGs that may be considered PFAS to ensure alignment with state climate goals. A copy of the CLCPA analysis is included as Appendix J-2 of the FEIS. Additionally, the semiconductor industry is actively developing technologies to reduce PFAS emissions, including alternative chemistries, process optimization, and recycling systems, which will be reflected in the Micron Campus's air permit.

Nation Comment 12:

The Nation commented that the Draft EIS does not consider the risk of upset, exceedance, or other violations of air emission permits. According to the Nation, no equipment works perfectly and exceedances of permit terms are fairly common during start-up, shutdown, or maintenance procedures.

Response: NYSDEC air permitting requirements include mandatory emissions reporting, certification, and compliance monitoring to ensure that emissions remain within permitted thresholds and regulatory limits. Through this regulatory framework, the Proposed Project is subject to oversight designed to prevent, detect, and mitigate any adverse air quality impacts, thereby protecting public health and the environment.

Nation Comment 13:

The Nation urged the lead agencies to mandate on-going, local air monitoring to provide confirmation that the Micron project is not creating regional or local air quality impacts.

Response: There are numerous federal, state and local entities permitting and monitoring Micron facilities during both construction and operation of the Proposed Project. For example, the Clean Air Act and New York state laws and regulations require USEPA monitoring, assessment, and reporting of ambient air quality and compliance with the NAAQS. NYSDEC air permitting

requirements include emissions reporting and certification to ensure compliance with permit thresholds and regulatory limits. Site specific monitoring, recordkeeping, and reporting requirements will also be included in an Title V air permit issued by NYSDEC and will require air emission monitoring reports and certifications to be submitted to NYSDEC to ensure compliance with permit and regulatory thresholds and limits. USEPA and NYSDEC maintain ongoing authority to monitor and ensure compliance with all air permit and applicable air quality requirements and compliance with the NAAQS, and deviations from permit requirements must be reported to NYSDEC. See also Response to Air Quality Comment 12.

Nation Comment 14:

The Nation commented that the Draft EIS provides very limited information on the specific types and quantity of hazardous materials, including PFAS, that may be used within the Micron project, the types and quantity of hazardous wastes that are likely to be generated, or the final fate of these wastes.

Response: FEIS Table 3.8-10 lists the quantities and storage methods for specific types of liquid and gaseous chemicals that would be stored on-site. Table 3.8-9 lists the types of hazardous materials that would be used in the manufacturing process at the Micron Campus, the potential hazards associated with each part of the process, and the controls that would be used to protect worker and public health and safety. Future permitting or reporting may identify additional chemicals to be used. See also Responses to Solid and Hazardous Materials Comments 9 and 10.

FEIS Table 3.8-8 shows the various types of hazardous and universal waste material the Micron Campus would generate and anticipated management or disposal methods and locations. Micron would manage hazardous and universal materials through its or reduce, reuse, and recycle RRR Program to the greatest extent practicable to reduce the volume of material that would need to be managed as hazardous waste for disposal.

FEIS Section 3.8.3.2 and new Appendix L-1 describe the types and instances where PFAS compounds generally will be used in the semiconductor manufacturing process. Some forms or types of PFAS to be used or discharged are not provided due to the highly proprietary nature of this information or are not yet confirmed at this point in the Project development process. Regulatory agencies with permitting authority will have confidential access to specific PFAS compounds used at the Micron Campus and thus would have the ability to assess whether the treatment technology used for the Proposed Project is sufficient to achieve compliance with applicable laws and regulations.

Permitted private hazardous waste haulers would collect hazardous waste generated by the Proposed Project and bring it to facilities authorized by NYSDEC or analogous out-of-state regulatory agencies for the disposal of hazardous waste in accordance with RCRA regulations. Micron would use a variety of local, regional, and national waste disposal and materials reuse vendors to appropriately manage hazardous waste and other materials. Micron anticipates that hazardous waste would be sent out-of-state for disposal. Micron would be responsible for selecting specific vendors and disposal facilities as the Proposed Project progresses.

Certain waste streams such as lab waste, cylinders, expired materials, glues, resins, a subset of solvents, and certain acids would likely need to be incinerated at permitted off-site disposal facilities in other states. Micron anticipates using Veolia as its primary RRR materials and waste disposal vendor, but Micron would be responsible for selecting all waste and RRR vendors as needed during operations.

Nation Comment 15:

Recognizing that Micron may not be able to project the full list of materials or the specific quantities of each to be used in for the project, it commented that data on the typical materials used and wastes generated by similar chip manufacturing facilities – either from industry-wide reporting or from prior Micron experience in the field – must be available and should be provided and analyzed.

Response: See Response to Solid Waste and Hazardous Materials Comment 9.

Nation Comment 16:

The Draft EIS must review specific data on the likely types and quantities of PFAS compounds that will be used and discharged or disposed of by the Micron Project.

Response: See Response to Solid Waste and Hazardous Materials Comment 9. Descriptions of the types of chemicals used onsite, including the types of PFAS used in semiconductor fabrication, have been provided in FEIS Section 3.8.3.2 and Appendix L-1. Appendix L-1, which has been added to the FEIS in response to comments, provides further detail on where PFAS are used in semiconductor fabrication, the types of PFAS used in such processes, the functionality of PFAS in these processes, the categories of PFAS that may be found in wastewater, the review of wastewater treatment technologies, and the management and disposal framework that will be applied at the Proposed Project. The identity of specific PFAS compounds used in the semiconductor manufacturing process are not provided due to the highly proprietary nature of this information. Also, specific chemicals to be used at the Micron Campus are not yet confirmed at this point in the Proposed Project development process. However, the identities of specific PFAS compounds are not required to assess reasonably foreseeable significant adverse impacts of the Proposed Project. Sufficient information has been provided to identify PFAS use and management, and to address the potential risks and procedural controls in place to manage the risk associated with using these materials. Additional information on PFAS substances used in semiconductor manufacturing is available on the Semiconductor PFAS Consortium website at www.semiconductors.org/pfas, including “Background on Semiconductor Manufacturing and PFAS” (May 17, 2023).

Nation Comment 17:

The potential for PFAS in on-site IWWTP sludge and need for IWWTP sludge to require special handling should be addressed.

Response: Micron’s industrial wastewater discharge permit (IWDWP) to the IWWTP will include specific pretreatment permit limits for PFAS that limits discharge of these compounds to the IWWTP. To comply with these limits, Micron will be required to manage and pretreat wastewater

at the Micron Campus before discharge to the IWWTP. Sludge generated at the IWWTP will be managed and disposed of in accordance with all applicable laws and regulations.

FEIS Sections 3.3.4.2 and 3.8.3.2, as well as the new Appendix L-1, identify and discuss a range of wastewater treatment technologies and materials management and disposal options that Micron is considering for the different types of materials that may be generated at the Proposed Project, which may include PFAS-containing sludge or other materials. USEPA's current "Interim Guidance on the Destruction and Disposal of Perfluoroalkyl and Polyfluoroalkyl Substances and Materials Containing Perfluoroalkyl and Polyfluoroalkyl Substances" ([Interim Guidance on the Destruction and Disposal of Perfluoroalkyl and Polyfluoroalkyl Substances and Materials Containing Perfluoroalkyl and Polyfluoroalkyl Substances--2024](#)) describes the agency's latest assessment of available methods for treatment and management of PFAS-containing materials. Micron will use this and other guidance to assess suitable methods for disposal and management of PFAS-containing material and will comply with applicable law for the safe and proper disposal of any generated solid and hazardous waste.

Nation Comment 18:

The Nation commented that the Draft EIS improperly dismisses the potential impacts of industrial pollution on groundwater and connected surface water, particularly given the potential for karst structures in the area. The Draft EIS discusses the potential for ground or surface water contamination from spills, uncontrolled discharges, or stormwater runoff on the project site in a fairly superficial way and improperly minimizes the potential for broad groundwater contamination from plant operations.

Response: The FEIS documents and analyses the potential impacts of industrial pollution on groundwater and connected surface water in Section 3.3.4.2. There are no karst features found in the WPCP. The FEIS did not identify any broad groundwater contamination from the Proposed Project activities; the only potential for surface or groundwater contamination would come from spills, accidents, and improperly managed stormwater at the WPCP. These concerns are addressed by the SWPPP and discussed in the FEIS Section 3.3.4.2 and Appendix F-8. Further, as discussed in FEIS Section 3.3.4.2, Micron has installed groundwater monitoring wells to ensure that assumptions regarding subsurface are the same as expected. See also Response to Geology and Soils Comment 1.

Nation Comment 19:

The Draft EIS should be revised to address the potential presence of karst features in the project area or the potential for "karstification" over time.

Response: As noted in FEIS Section 3.2.2.1, geophysical testing completed within the WPCP, including seismic refraction surveying and MASW testing, did not suggest the presence of karst features. See also Response to Nation Comment 18; Geology and Soils Comment 1.

Nation Comment 20:

Data on spills, violations, upsets, and exceedances within the domestic semiconductor industry as a whole or within Micron facilities generally be reviewed to create a more grounded and fact-based assessment of water pollution risks.

Response: See Response to Water Resources Comment 40, 41 and 47. In addition, see Response to Solid Waste and Hazardous Materials Comment 48. Historic data from Micron manufacturing facilities were used to develop a detailed understanding of potential water pollution risks, as well as required processes for managing chemicals used at the Micron Campus.

NYSDEC, via the SPDES permitting process, will determine the discharge permit effluent limit specifications for Oak Orchard WWTP in accordance with federal, state, and local guidelines to protect surface waters. The OCDWEP IWDP for Micron, established through its Industrial Pretreatment Program, will include limits for PFAS and other pollutants prior to discharge by Micron to the Oak Orchard IWWTP. This discharge will be closely and routinely monitored to ensure compliance with the Pretreatment Limits set forth in the OCDWEP issued IWDP to Micron in order to protect Oak Orchard IWWTP Treatment Processes and ensure compliance with NYSDEC established SPDES permit discharge limits.

Nation Comment 21:

The Draft EIS fails to provide specific mitigation plans or to properly consider harm related to loss of habitat connectivity or the potential impacts of off-site project-related effects, such as increased traffic or open-space development for new commercial spaces or housing.

Response: See Response to Biological Resources Comment 9. A detailed Wetlands Mitigation Plan is attached as Appendix N to Micron's CWA Sec. 404 permit, and has been included as Appendix F-7-1 to the FEIS. The goal of the Mitigation Plan is to describe how Micron will fully replace the suite of lost functions and services the on-site wetlands provide that would be impacted by construction of the Micron Campus.

The Mitigation Plan adheres to all applicable federal and State wetland mitigation regulations. USACE and the NYSDEC have evaluated each distinct wetland on the WPCP for its current cover type and condition to determine the number of credits/acres that would be needed to offset the impact. In general, mitigation will be designed to improve the wetland and stream functions and services over those lost, increasing both the quantity and quality of wetlands and streams within the larger watershed as a result of implementing the Proposed Project. As part of the Mitigation Plan, the Wetland Trust will also be required to implement comprehensive wetland monitoring techniques and to meet stringent wetland development criteria.

Regarding habitat connectivity, the Proposed Project incorporates design and mitigation strategies intended to reduce impacts on habitat connectivity. These include maintaining and enhancing buffer zones, implementing a Landscape Management Plan using native species where feasible,

preserving key habitat corridors where feasible, and implementing off-site conservation measures to support regional ecological integrity. See FEIS Table 3.4-8.

Nation Comment 22:

Additional analysis of the adequacy of the proposed wetlands mitigation is necessary.

Response: No additional analysis is required. See Response to Water Resources Comment 6. The Wetlands Trust Stream/Wetland Mitigation Plan, which is attachment B to Appendix N to Micron's CWA Sec. 404 permit, and has been included in Appendix F-7 of the FEIS. Section 4.1 of the Mitigation Plan describes the selection and design criteria that have been used to identify mitigation sites in accordance with the 2008 United States Army Corps of Engineers Compensatory Mitigation Rule. Environmental due diligence and historical investigations of each of the mitigation sites have been performed as required by the 2008 Compensatory Mitigation Rule that governs compensatory mitigation requirements for unavoidable impacts. The mitigation sites have been selected based upon proximity to the unavoidable impacts and within similar HUC-8 watershed, specifically the Oneida River watershed. As required by the 2008 United States Army Corps of Engineers Mitigation Rule, site selection of potential mitigation sites undergoes significant scrutiny by the regulatory agency and is required to meet certain site selection criteria to be an eligible mitigation site for compensatory mitigation requirements.

Nation Comment 23:

Several issues should be more explicitly addressed as the Draft EIS makes no effort to quantify the ecological value of these developing wetlands over time, compare them to the value of an established wetland forest, or determine when the ecological value of the developing wetlands will reach the value of the existing wetlands.

Response: See Response to Water Resources Comment 10. The factors associated with diversity of wetland systems and composition of wetlands communities have been taken into consideration as part of the proposed Mitigation Plan. See FEIS Appendix F. The Mitigation Plan takes temporal considerations associated with a mature and developing wetland system into account in determining the required compensatory mitigation.

Nation Comment 24:

The DEIS also pays limited attention to how the remaining wetlands on the Micron Project site will be affected by the overall project.

Response: See Response to Water Resources Comment 18. As described in FEIS Sections 3.3.4.2 and 3.4.4.2, the Wetland Adaptive Management Plan will be designed specifically for the Micron Campus to ensure that the remaining wetlands are actively monitored and protected throughout the life of the project. This plan includes comprehensive monitoring of both groundwater and surface water levels in the surrounding area before, during, and after construction. The data collected will inform Micron of any necessary adaptive management strategies to address potential long-term adverse impacts on wetland hydrology and ecological function.

In addition to monitoring, the plan will guide the implementation of stormwater management BMPs designed to minimize post-construction runoff impacts. These BMPs will be developed and maintained in accordance with the New York State Stormwater Management Design Manual, ensuring compliance with state standards and protection of wetland resources.

By integrating adaptive management and regulatory compliance into the project's design and operations, Micron aims to proactively address potential impacts to the remaining wetlands and support their long-term ecological integrity.

Nation Comment 25:

The Draft EIS fails to consider that disruptions to ground and surface water flow on the Micron Project site will almost certainly affect groundwater recharge to the remaining wetlands on site and even to adjacent wetlands.

Response: See Response to Nation Comment 24.

Nation Comment 26:

The DEIS also gives short shrift to the analysis of the flood-related or other impacts of wetland loss, increase in impervious surfaces, artificial stormwater flow under a stormwater management plan, and other related surface and groundwater flow changes on adjacent properties.

Response: The FEIS acknowledges the importance of thoroughly evaluating the reasonably foreseeable hydrologic impacts of wetland loss, increased impervious surfaces, and changes in surface and groundwater flow resulting from the Proposed Project. The FEIS addresses these concerns through a comprehensive stormwater management and wetland protection strategy, as outlined in Chapter 3.3 and Appendix F.

Stormwater design and permitting will comply with NYSDEC requirements in effect at the time of permit submittal for each project phase. Stormwater Management Practices (SMPs) will be implemented to:

- Preserve existing drainage patterns to the greatest extent practicable;
- Maintain conveyance of upland watershed runoff;
- Control increases in stormwater volume;
- Prevent soil erosion and sedimentation;
- Reduce runoff through green infrastructure where feasible.

To mitigate downstream flood risks, wet extended detention ponds and bioretention filtration areas will be incorporated to reduce stormwater runoff volumes and peak flows. These measures also support water quality protection by maintaining the integrity of stormwater systems and reducing pollutant loads.

Wetlands permitting will follow applicable NYSDEC and USACE requirements. The larger wetland complexes W34 and W35 were identified as having a primary function of floodflow alteration—defined by USACE as the ability to attenuate floodwaters for prolonged periods following precipitation events. See FEIS Appendix F-3.1.1; see also FEIS Table 3.3-5.

To preserve these critical hydrologic functions, the proposed project layout has been designed to avoid impacts to W34 and W35 to the greatest extent possible. Specifically, the project will avoid disturbances to:

- 33.35 acres of federal jurisdictional wetlands and 33.37 acres of state jurisdictional wetlands in W34;
- 157.36 acres of federal and state jurisdictional wetlands in W35.

While the FEIS provides a foundational analysis of hydrologic impacts, additional detailed modeling and site-specific evaluations will be conducted during final design and permitting phases. These will include assessments of floodplain dynamics, groundwater recharge, and downstream flow conditions to ensure that adjacent properties and ecosystems are not adversely affected.

Micron remains committed to implementing adaptive management strategies and coordinating with regulatory agencies to ensure that stormwater and wetland impacts are effectively mitigated and monitored throughout the life of the project.

Nation Comment 27:

The Draft EIS does not assess the availability of suitable habitat within the migratory range of affected mammals or birds. It also fails to consider the effects of other changes in the area on wildlife.

Response: See Response to Biological Resources Comment 40. FEIS Section 3.4.4.2 acknowledges the impacts of construction of the Proposed Project.

To mitigate these effects, Micron will implement several measures, including maintaining vegetated buffer habitats near sensitive ecological communities (e.g., remaining wetlands and surface waters) where feasible. See FEIS Table 3.4-8. These buffers are intended to support habitat connectivity and reduce edge effects. Micron has also committed to BMPs for biological resources that include the retention of approximately 380 acres on the Micron Campus, including approximately 272 nearly contiguous acres of forested habitat. See FEIS Section 3.4.5.1.

Nation Comment 28:

The proposed mitigation measures to reduce “unavoidable significant adverse effects” on bats and birds lack sufficient information to assess the likely effectiveness of the mitigation proposals. Additional details on the mitigation proposals and an analysis of

their likely effectiveness is necessary to support the assertion that the proposals will sufficiently reduce unavoidable significant and adverse impacts of the Micron project.

Response: See Response to Biological Resources Comment 17. The lead agencies acknowledge the concerns regarding unavoidable adverse effects from construction activities and lighting on bat species, particularly the federally listed Indiana bat and Northern long-eared bat. To address these concerns, Micron has been required to develop detailed Mitigation Plans, as outlined in Appendix F and Appendix G of the FEIS, to minimize and offset impacts.

All biological resource impacts will be mitigated in accordance with consultation with the USFWS and the Endangered Species Act (ESA). FEIS Section 3.4.5.1 describes BMPs to reduce impacts to threatened and endangered species, including:

- Retention of on-site roosting and foraging habitat where feasible,
- Noise and lighting reduction to reduce the potential for disturbance of bats in adjacent areas of habitat,
- Water quality protection,
- Biological monitoring to oversee implementation of BMPs.

The Draft Biological Assessment (Appendix G-4) assumes light-averse behavior for the Indiana bat, northern long-eared bat, and tri-colored bat, and evaluates lighting impacts accordingly. Additional mitigation measures described in FEIS Section 3.4.5.2 include:

- Off-site habitat protection at a 2:1 ratio, conserving approximately 1,182 acres of bat roosting habitat,
- Artificial roost site installation following best practices,
- Research and monitoring projects developed in consultation with USFWS and NYSDEC,
- Micron-funded conservation grant program to support long-term bat conservation,
- Gating of hibernacula to prevent human disturbance,
- Acoustic bat monitoring to track species activity and presence.

These measures are designed to minimize disruption to bat foraging and roosting behavior and to support long-term conservation of bat populations in the region. Micron will be required to implement these strategies in coordination with USFWS and NYSDEC to ensure compliance and ecological stewardship.

Nation Comment 29:

The DEIS should be revised and expanded to consider the state-wide impacts of Micron's massive electricity demands, the actual shortfall in power likely in the future given increasing electricity demands and limited increases in electricity supply in the region and state-wide, and the potential expansion of nuclear power generation in upstate New York to meet the power demands of the Micron Project.

Response: See Response to Utilities Comment 1. FEIS Section 3.10 discusses the planning process that ensures adequate utility capacity to meet energy demand in New York State. That process, governed by the New York Independent System Operator (NYISO), ensures that there is adequate capacity to meet existing and projected demand so there is not a tradeoff between the Proposed Project and the demand for other users in the community. See also FEIS Section 3.10.4.

Given the robustness of statewide and utility-level planning processes, it is anticipated that future electricity needs—both for Micron’s project and broader statewide growth—will be adequately addressed. See FEIS Section 3.10.3.2.

Nation Comment 30:

The Three Rivers Area just west and south of the proposed Micron project and a stone’s throw from the connected actions at Oak Orchard Wastewater Treatment Plant, was an historic meeting place for Onondaga Nation citizens scattered across the Nation’s traditional territory and for meetings of the larger Confederacy. For all of these reasons, the Nation holds this area to be sacred. Any development that might disturb historic sites or cause damage to the natural world here is of particular concern.

Response: Ongoing consultation with the Onondaga Nation as a Section 106 Consulting Party for the Proposed Project and Connected Actions will continue throughout the Section 106 process.

Nation Comment 31:

The Draft EIS should require Micron to make detailed information about the hazardous or potentially hazardous materials used on or generated by the site for the life of the project.

Response: See Response to Solid Waste and Hazardous Materials Comment 4, 9. Micron’s implementation of the Proposed Project would be subject to multiple federal and State regulations (RCRA, HMTA, EPCRA, CAA, TSCA, NYCRR Part 360, etc.) and extensive plans and procedures (e.g., RMP, CWMP, Waste Management Plan, SMMP, SPCC Plan/SPR, SWPPP, etc.) developed pursuant to those programs to prevent environmental exposure to chemicals used for the Project. See FEIS Chapter 3.8, Table 3.8-1.

Nation Comment 32:

Micron should be required to conduct routine and on-going monitoring of the environmental impacts of this project to ensure that the assumptions about impact significance or insignificance can be verified over time.

Response: During construction, Micron will obtain a third-party environmental monitor to ensure compliance with all applicable laws, regulations, and project commitments. During operations, Micron is required to obtain and comply with all applicable environmental permits in order to operate (e.g., a State Pollution Elimination Discharge permit (SPDES) for offsite water discharge, and regular real-time monitoring of Micron’s air emissions through its Title V PSD permit).

Nation Comment 33:

Micron should be required to develop a construction mitigation plan focused on options such as fencing, appropriately timed construction, and even relocation efforts to reduce the mass mortality of reptiles, amphibians, and small mammals with limited mobility.

Response: See Response to Biological Resources Comment 8. Impacts to species associated with construction activities and the timing of those construction activities have been thoroughly evaluated in the FEIS. As described in FEIS Section 3.4.4.2, Micron would implement stormwater BMPs to help minimize the effect of the Proposed Project on biological resources. These BMPs are categorized in FEIS Table 3.4-12. These measures are designed to avoid direct harm to wildlife during sensitive periods and to preserve critical habitat features.

Nation Comment 34:

Micron should be required to generate or subsidize the generation of sufficient renewable energy to offset its power demands.

Response: The lead agencies are satisfied with Micron's commitment to purchase 100% carbon-free electricity via power purchase agreements and renewable energy credits (RECs) for the Proposed Project. See FEIS Section 0-4. As described in FEIS Chapter 2, Table 2.1-3, Micron also plans to install approximately 4 MW of solar panels on the rooftops of the parking garages and administrative buildings as part of its efforts to offset carbon emissions associated with the Proposed Project.

Though these on-site energy generation facilities would not themselves substantially offset the total grid demand associated with the Micron Campus, they do maximize efficient use of the Micron Campus for carbon-free energy generation. Micron has additionally committed to working with State entities including NYPA, ESD, and NYSERDA to identify reasonably feasible opportunities to procure new renewable or carbon-free electricity projects in New York and is also reviewing opportunities for 24/7 and/or time-matching-based renewable energy sources related to storage.

Nation Comment 35:

Micron should be required to create and support a community advisory and oversight committee which can help with on-going monitoring, environmental impacts assessment and response, and community engagement. This committee should be composed of both community members and local experts who can provide grounded information for use in and review of any continuing assessment and adaptive management at the site as well as a direct line of communication with the affected public.

Response: Micron and ESD formed the Community Engagement Committee (CEC) to solicit and identify community priorities and create a framework for directing investments in the region. Additionally, Micron intends to provide the community with milestone updates, such as construction milestones, or notifications regarding construction events or related improvements.

Nation Comment 36:

Given that the 9,000 on-site workers will not all work at the same time, there is no need to have 11,600 parking spaces. Eliminating even 1,600 spaces could reduce the impermeable surfaces on site by 9 to 15 acres, which could have important benefits for wetlands and habitat preservation.

Response: FEIS Appendix B-4 provides the rationale for why 11,600 parking spaces are needed to accommodate the anticipated peak headcount for full-time employees, construction workers, general visitors, visitors to large on-site events, and adequate snow storage capacity. A reduction in the number of parking spaces would not meet the operational needs of the campus.

1.0 Purpose and Need**Purpose and Need Comment 1:**

The DEIS incorrectly relies on the assumption that the Micron project in Clay must independently meet the DRAM production goals set by the U.S. Department of Commerce “necessary to offset potential disruptions to the U.S. economic and national security.” The DEIS does not properly justify the stated production goal, meaning that the public simply has to trust that the Commerce’s assessment is reasonable. Even if we assume that this overall domestic production goal is appropriate, recently announced expansions at other Micron facilities may affect production goals for the Clay facility.

Response: See Response to Nation Comments 6d.

Purpose and Need Comment 2:

General Statements were made that the project is not needed. General concerns were raised that the long-term consequences outweigh the project's benefits.

Response: The lead agencies have determined that there is a need for the Proposed Project. See Response to Nation Comments 6d; FEIS Sections 1.1 and 2.1.1. The Proposed Project is expected to stimulate economic revitalization, specifically in Onondaga County, driven by the creation of high-paying jobs, substantial capital investment, and a measurable increase in regional economic activity. See FEIS Sections 1.1, 2.0.1, and 2.0.2.

Purpose and Need Comment 3:

General comments were raised that the community does not want the project. Micron’s arrival is not what the people want.

Response: The lead agencies recognize that there is opposition to the Proposed Project. All of the concerns that were raised during the comment period have been thoroughly considered, evaluated and addressed in this responsiveness summary.

While certain members of the public expressed their opposition to the Proposed Project, a significant number of commenters expressed support for the Proposed Project. See, e.g., Purpose and Need Comment 7, General Comments 2, 3, 5, 6, 9-13.

Purpose and Need Comment 4:

Commenters expressed concerns that due to changing technologies, the project or the chips that will be manufactured will be obsolete or phased out by the time it is built. The technologies will render the project out of date. Companies that make hardware are not long-lived. Manufacturing will be shipped overseas.

Response: The key role of memory chips and the stated federal policy of supporting domestic semiconductor manufacturing, through the passage of the CHIPS Act, support the feasibility and resiliency of the Micron Project. The Proposed Project will support the production of leading edge dynamic random-access memory (“DRAM”). The Proposed Project is core to the strategic objectives of the CHIPS program and aligns with a key pillar of the Department of Commerce’s “Vision for Success” for CHIPS investments in commercial fabrication facilities, which envisages high-volume domestic DRAM production on economically competitive terms. Although the United States was once a leader in memory production, cost competition and market consolidation led most U.S. companies to exit the memory business in the 1980s and 1990s. Investments in leading-edge memory production in the United States will advance American technology leadership and geographically diversify global supply.

Memory chips are a critical component of all computational systems, ranging from supercomputers to smartphones, and they account for a significant portion of the overall global semiconductor market. DRAM is a type of memory that provides high speed temporary storage that enables fast processing and computation of that data by logic chips. DRAM chips typically constitute approximately 50% of total product costs in high performance computing platforms. Memory comprises approximately one-quarter of semiconductor industry revenue, is growing faster than the overall market, and drives more capital expense investment than any other segment.

Finally, building in the United States affords some benefits to Micron. For example, the United States is cost-competitive in some categories like power, which serves to mitigate partially the cost disadvantage in the United States. Additionally, Micron may experience benefits from being closer geographically to U.S. customers. Such benefits increase the likelihood that Micron will remain committed to the timely completion of the Proposed Project.

Purpose and Need Comment 5:

Commenters expressed concerns that the political climate will change. Others expressed comments regarding political issues or are political in nature and not related to the DEIS.

Response: The comments are outside the scope of required review under NEPA and SEQRA.

Purpose and Need Comment 6:

The DEIS has insufficient justification for why there must be 4 fabs. Commenter suggested an incremental phasing approval process.

Response: As stated in FEIS Sections 1.3 and 2.1, the U.S. Department of Commerce determined that a 4-fab memory campus with an efficient layout at a single location would be required to ensure an economically and commercially viable operation that would meet the Department of Commerce's economic and national security responsibilities under the CHIPS Act. See Response to Nation Comments 6 and 6a; Response to Purpose and Need Comment 2.

Purpose and Need Comment 7:

As global demand for semiconductors grows, the question is no longer if facilities like this will be built, but where. The proposed development carries significant opportunities including well-paying jobs, strengthened national security and long-term economic growth.

Response: Comment noted.

Purpose and Need Comment 8:

The NAACP recognizes the project's stated purpose to revitalize the US semiconductor manufacturing industry, accelerate domestic production of cutting-edge logic and memory chips, and catalyze long-term economically sustainable growth, supporting U.S. economic and national security. The NAACP acknowledges the commitment to attracting new semiconductor manufacturing projects to New York, including through measures like the New York Green CHIPS Program which aims to create thousands of jobs and attached billions of dollars.

Response: Comment noted.

Purpose and Need Comment 9:

Syracuse does not need this big of a facility anywhere near it.

Response: The City of Syracuse is likely to benefit from development of the Proposed Project. Job growth will be enhanced in Central New York, including Syracuse, through the promotion of advanced manufacturing. Similarly, the Central New York Community Engagement Committee (CEC) is investing in regional educational and workforce training programs. Other benefits include, but are not limited to, new household income for thousands of existing residents within the local and regional study areas and substantial new economic activity in the five-county region, facilitating the growth of industries and commercial and residential development. See FEIS Section 3.15.3.2. See also Syracuse Comments 1-3, 13, 14.

Purpose and Need Comment 10:

When its fourth fab is complete, Micron employees in Clay, along with other fabs in the Northeast, will produce one in every four chips made in America. The DEIS notes that the scale of production at all four fabs is crucial to the financial viability of this project and U.S. economic and national security needs.

Response: Comment noted.

Purpose and Need Comment 11:

Upon completion, the Project would be the largest domestic producer of dynamic random-access memory (DRAM) chips, which have crucial applications in military equipment, cybersecurity technology, the aerospace industry, artificial intelligence (AI), and other cutting-edge uses, as well as more common areas of the domestic consumer economy. The EPA recognizes the importance of the Project in supporting the national goal of strengthening domestic supply chains for semiconductors necessary for the national security, manufacturing, critical infrastructure, and technology leadership of the U.S.

Response: Comment noted.

2.0 Project Description and Alternatives**Project Description/Alternatives Comment 1:**

The DEIS is insufficient with respect to analysis and consideration of reduced-scale alternatives or those more protective and consistent with federal and state environmental law and policy.

Response: See Response to Nation Comments 6 and 6a; Responses to Purpose and Need Comments 2 and 6; FEIS Sections 1.1.1 and 2.2.2.

Project Description/Alternatives Comment 2:

General comments were made that the Project should be located elsewhere.

Response: Both OCIDA and New York State have considered the WPCP as an appropriate site for semiconductor manufacturing for decades. As outlined in Section 2.2 of the FEIS, in 1997, New York State initiated the CHIP FAB 98/SEMI-NY Program to promote growth of the State's semiconductor manufacturing industry, which began by identifying suitable sites. By 2000, three sites—Luther Forest (in Malta, NY, in Saratoga County), Marcy Nanocenter (in Marcy, NY, in Oneida County), and WPCP were identified as “shovel ready,” i.e., they had completed certain pre-permitting requirements applicable at that time. In 2017, NYSEDC updated the criteria (evaluation of 108 criteria points) for semiconductor site location, and WPCP was again considered in the top four potentially viable sites, including the Marcy Nanocenter, Western NY Science & Technology & Advanced Manufacturing Park (STAMP), Luther Forest, and WPCP.

Substantial portions of the Marcy Nanocenter, the STAMP site, and the Luther Forest site are developed, and each no longer contains enough undeveloped acres to site the Proposed Project.

In 1991, OCIDA and the City of Syracuse Chamber of Commerce initiated an Industrial Park Feasibility Study to identify potential locations for industrial businesses in Onondaga County. Among the two sites identified, WPCP emerged as the preferred choice due to its proximity to National Grid's Caughdenoy electric substation, excellent highway access, and ability to be rezoned for Industrial use. Onondaga County completed a Generic Environmental Impact Statement (GEIS) that identified and screened various alternatives to WPCP within Onondaga County. The analysis concluded that WPCP was the only viable option to meet the semiconductor industry's needs, as it meets specific project prerequisites, including a large, contiguous parcel of land controlled by a single owner, and access to significant, redundant, and resilient transportation and utility infrastructure. Given the competitiveness and cost sensitivity of the DRAM market, Micron sought to meet its production goals by constructing its fabs and supporting infrastructure on a single site of sufficient size to accommodate all such infrastructure, rather than attempt to develop disparate parcels with duplicative infrastructure and supply chain needs. Therefore, only the WPCP contains the minimum 1,000 acres necessary for the co-location of multiple fabs that can support the extensive infrastructure needs of Micron for economically efficient large-scale semiconductor manufacturing (OCIDA 2013). See also Response to Nation Comment 6d.

Furthermore, the regional area is expected to reap substantial economic benefits if the project is built, as proposed, at the WPCP. See FEIS Section 3.15 and Appx. C-2. As OCIDA determined in its Findings Statement for the SGEIS and restated in the FEIS, high-tech advanced manufacturing holds the promise of transforming the Onondaga County economy through new high-paying jobs, significant financial investment, and increased economic activity, including: (1) the creation of thousands of construction jobs and up to approximately 50,000 permanent jobs; (2) a robust supply chain of companies that will service a high-tech advanced manufacturing organization; (3) a reduction in poverty; and (4) secondary benefits such as increased local small business activity, growth in community civic and cultural organizations, and increased county and municipal investment. This is why Onondaga County and the State of New York have committed to attracting semiconductor manufacturing. See FEIS Sections 1.0.1 and 1.1.

Project Description/Alternatives Comment 3:

The DEIS incorrectly relied upon the alternatives assessed in the 2021 SEQRA Findings Statement for the site.

Response: The FEIS does not rely on the alternatives assessed in the 2021 SEQRA Findings Statement. As required by SEQRA, the FEIS describes and evaluates "the range of reasonable alternatives to the action that are feasible, considering the objectives and capabilities of the project sponsor." 6 NYCRR 617.9(b)(5)(v). This included the No-Action Alternative.

Moreover, because the FEIS was also prepared under NEPA, the FEIS looked at a broader range of alternatives using specific evaluation criteria. See 42 U.S.C. 4332(C)(iii) (requiring the lead agency to consider a "reasonable range of alternatives to the proposed action, including an analysis of any negative environmental impacts of not implementing the proposed action in the case of a no action alternative, that are technically and economically feasible, and meet the purpose and

need of the proposal.”). These alternatives, including the potential for other available sites across the State of New York, a reduced scale project, and alternative configurations, were all evaluated against the detailed evaluation criteria presented in the FEIS. Except for the No Action Alternative, if an alternative would not meet CPO’s purpose and need under NEPA or Micron’s purpose and need under SEQRA (see FEIS Section 1.1) or would not be technically and economically feasible and practicable, CPO and OCIDA determined not to carry that alternative forward for detailed analysis in the FEIS, regardless of how it would compare against the fourth criterion. See FEIS Sections 2.2.2 and 2.2.3; FEIS Appendix B-3 (providing an analysis of the Micron Campus layout alternatives); FEIS Section B-1 (providing Micron Campus selection background).

Thus, while the 2021 Findings Statement was reviewed for consideration of alternatives, it was not dispositive of the issue and a full evaluation of alternatives for the proposed action under SEQRA and NEPA was conducted in the FEIS. See also Responses to Nation Comments 6 and 6a-d; FEIS Appendix B; Responses to NYSDEC Comments 4-5, 8 (noting instances where the Draft Scope was revised to include consideration of various alternatives).

Project Description/Alternatives Comment 4:

The White Pine Commerce Park (WPCP) offers a unique set of infrastructure assets, with requisite power, water and geology. Combined with strategic property acquisition over the past few years, the WPCP is one of a handful of sites in the nation large enough to attract such a semiconductor megaproject, an increasingly important industry for consumers, businesses and U.S. national security. Micron, one of the world's leading computer chip manufacturers, was attracted by the site's amenities, and saw promise in the region's workforce and commitment to further building a skilled talent pipeline.

Response: Comment noted.

Project Description/Alternatives Comment 5:

Comments indicated that the Project should ideally be relocated to avoid destruction of wetlands.

Response: See Responses to Project Description/Alternatives Comments 2 and 3; FEIS Section B-1 (providing Micron Campus selection background). The Preferred Action Alternative site was selected and designed to minimize impacts to wetlands, homes, and other sensitive resources to the greatest extent practicable. The Preferred Action Alternative avoids direct impacts to wetlands to the maximum extent practicable consistent with its purpose and need; however, due to the size and unique infrastructure requirements of a semiconductor manufacturing campus, alternative siting options are extremely limited. As a result, the Preferred Action Alternative site configuration represents the only feasible option to accommodate the Proposed Project while balancing environmental, community, and operational considerations. See also Response to Water Resources Comment 5.

Project Description/Alternatives Comment 6:

Micron should have proposed alternative locations for consideration, with a summary of impacts for each, i.e., why restoration of wetlands would not be as beneficial at an alternative location.

Response: Alternative locations were evaluated in the FEIS, but none could accommodate a campus that met the purpose and need of the Proposed Project. See FEIS Sections 1.0.1, 1.1, and 2.2.

Project Description/Alternatives Comment 7:

A commenter indicated that the US Fish and Wildlife Service criticized Micron for not presenting alternative site plans to better avoid wetlands.

Response: USFWS agreed to act as a participating agency in the preparation of the FEIS based on its special expertise in evaluating effects on aquatic and terrestrial wildlife and their habitats. See FEIS Section 1.2.2.2. Pursuant to the ESA Section 7 consultation process, CPO is consulting with USFWS to ensure that the Proposed Action is not likely to jeopardize the continued existence of any Federally listed threatened or endangered species or destroy or adversely modify designated critical habitat. While USFWS has provided comments and recommendations to the SEQRA Scope of Work and Draft EIS, those comments did not specifically reference the need to provide further alternatives to better avoid wetlands. See Responses to USFWS Comments 1-12; FEIS Appendix B-1 (describing the Micron campus site selection background and providing responses to USFWS Comments 1-5). As discussed in the Response to Project Description/Alternatives Comment 2, the FEIS provides a thorough analysis of alternatives for the proposed action in compliance with the requirements of SEQRA and NEPA.

Project Description/Alternatives Comment 8:

The DEIS fails to provide details with respect to alternative road layouts and design, particularly to avoid wetlands and other impacts.

Response: As discussed in the Response to Project Description/Alternatives Comment 3, the FEIS provides a thorough analysis of alternatives for the proposed action in accordance with the requirements of SEQRA and NEPA. Moreover, the Preferred Action Alternative site was selected and designed to minimize impacts to wetlands, homes, and other sensitive resources to the greatest extent practicable. The Preferred Action Alternative avoids direct impacts to the vast majority of surrounding residential areas; however, due to the size and unique infrastructure requirements of a semiconductor manufacturing campus, alternative siting options are extremely limited. As a result, the Preferred Action Alternative site configuration represents the only feasible option to accommodate the Project while balancing environmental, community, and operational considerations. See Response to Water Resources Comment 5.

With respect to traffic mitigation, the FEIS presents recommended traffic improvements that would mitigate the effects of the Preferred Action Alternative on transportation. Alternative road layouts and final designs would be developed and further evaluated by the NYSDOT and FHWA,

the agencies with direct jurisdiction over the recommended, and any other, traffic improvements. See Response to NYSDOT Comment 2; FEIS Section 3.11.5.

Project Description/Alternatives Comment 9:

There was no alternative to the Project that does not impede attainment of CLCPA emissions goals.

Response: While NEPA and SEQRA require CPO and OCIDA to consider a reasonable range of alternatives to a proposed action, a determination of compliance with the goals of the Climate Leadership and Community Protection Act (CLCPA) is the responsibility of the NYSDEC and other state agencies. As discussed in FEIS Section 3.7.1.3, NYSDEC will review Micron's CLCPA analysis as part of its processing of NYSDEC permits and determine whether the Proposed Project would be inconsistent with or interfere with the attainment of the statewide GHG emission limits in ECL Article 75, and if it determines that it would, whether it is otherwise justified and determine feasible mitigation measures to be required. See Response to Climate Change/GHG Comment 14.

Project Description/Alternatives Comment 10:

The Preferred alternative lacks a comprehensive cost benefit analysis and fails to account for the social cost of GHG emissions.

Response: See Response to Project Description/Alternatives Comment 2 and FEIS Sections 1.0, 1.1, and 2.2, which provide the evaluation criteria under SEQRA/NEPA used by CPO and OCIDA to consider proposed alternatives. The requested cost/benefits analysis is not required by NEPA or SEQRA.

Moreover, although NYSDEC has issued a guidance document, *Establishing a Value of Carbon*, associated with the social cost of carbon, as noted in the guidance, it is not appropriate or useful in all situations. The guidance specifically states that it does not establish a requirement on any public or private entity and is therefore voluntary. Any social cost of carbon analysis or guidance is subject to a host of variables, and any attempt at defining the variables and calculating methods is difficult and can be miscalculated and/or lead to erroneous results. In addition, the NYSDEC social cost of carbon guidance is primarily based on federal guidance, models, and values, which are no longer used by federal agencies. See also Response to Climate Change/GHG Comment 60.

Project Description/Alternatives Comment 11:

The DEIS should be expanded to include a 3-fab alternative. Micron is building and/or expanding its semiconductor operations in other states. This allows for Micron to consider a scaled-down version of its Clay facility. Even a slightly smaller three- fab alternative in Clay might eliminate significant environmental impacts by avoiding wetlands clustered east of Burnett Road, decreasing traffic disruptions, fewer parking spaces, and fewer utility upgrades.

Response: See Response to Project Description/Alternatives Comment 1; Response to Nation Comment 6d; FEIS Section 2.2.2.

Project Description/Alternatives Comment 12:

The project should be constructed in smaller components, with infrastructure that can be adapted for other uses if the building is no longer used. Commenter also suggests using spaces that are already industrial.

Response: The Micron Campus cannot be constructed in smaller components. See Response to Project Description/Alternatives Comment 1. See also Response to Nation Comments 6, 6a, and 6b.

Project Description/Alternatives Comment 13:

The 2-fab alternative option should include analysis of the capacity of other Micron semiconductor facilities expected to be constructed in the future.

Response: See Response to Project Description/Alternatives Comment 1; Response to Nation Comment 6d.

Project Description/Alternatives Comment 14:

A smaller footprint would better fit the objectives of SEQRA, e.g., fewer environmental impacts, project will still produce wafers, and project still feasible with less profits.

Response: See Response to Project Description/Alternatives Comment 1; Response to Nation Comment 6a and 6b.

Project Description/Alternatives Comment 15:

As a global concern, each time the DEIS cites a condition of the project that is expected to have a material environmental impact, it is assumed that there is no feasible alternative, offset, or obligation to maintain a standard of best available technology throughout the project's lifecycle. Is there such an obligation and if not, why not?

Response: The Proposed Project has been designed to avoid or minimize significant adverse impacts where feasible. The FEIS evaluates the reasonably foreseeable environmental impacts of the Proposed Project and Connected Actions and considers mitigation measures that would reduce or avoid otherwise significant impacts as required by NEPA and SEQRA. Although NEPA/SEQRA do not contain a broad “best available technology” standard for project implementation, the FEIS identifies BMPs—many of which are technology-based—that will be required of Micron to minimize environmental impacts, regardless of whether the impacts are anticipated to be significant.

Where significant adverse impacts to a resource area are expected to occur, mitigation measures have been proposed for implementation. However, not all impacts can be mitigated below the level of significance. The impact of the Preferred Action Alternative on some resources will remain significant despite the implementation of BMPs and all available mitigation measures. These unavoidable significant impacts are identified and discussed in FEIS Section 5.1, Unavoidable

Significant Adverse Effects, and are considered unavoidable consequences of selecting the Preferred Action Alternative, regardless of any practicable mitigation measure or BMP.

All BMPs and mitigation measures that are committed to in the FEIS will become obligations of the affected party, though the FEIS cannot bind the actions of other agencies that are not parties to the FEIS.

Project Description/Alternatives Comment 15:

In DEIS Section 0.3, subsection addressing elimination of Rt. 11 Access, commenter agreed that having multiple access points is good for mitigating traffic impacts to the community. In addition, it would provide additional means for egress in emergencies and additional access for emergency vehicles. Commenter stated that employees will like the increased convenience as well.

Response: Comment noted.

3.0 Resources

3.1 Land Use Zoning and Public Policy

Land Use/Zoning Comment 1:

General concerns were raised over the loss of land and greenspace. The area cannot support more people living here without ruining greenspace.

Response: As discussed in FEIS Section 3.1.3.2 and Appendix D-3, the vast majority of the WPCP is zoned Industrial (I-2) and its development is consistent with the local and regional planning policies and fulfills several of the planning policies goals relating to economic development and industrial use of the WPCP. Further, as stated in FEIS Section 3.1.3.2 Preferred Action Alternative, “the growth inducing effects of the Preferred Action Alternative would result in significant changes to land use. However, these changes would continue to be subject to local discretionary approvals and planning policies, including applicable measures to avoid or minimize adverse development effects and preserve community and regional character.” See also Response to Land Use/Zoning Comment 4 and 6.

Land Use/Zoning Comment 2:

Micron is trying to push people out of their homes when they do not want to leave. Why can't they change plans and work around homes and land. The Kings on Caughdenoy Road have been there a long time and are pillars of the community.

Response: OCIDA acquired all the lands at WPCP through negotiated purchase and sale agreements. OCIDA owns all the land at WPCP including the property and residential home at 8700 Caughdenoy Road. The resident of 8700 Caughdenoy Road occupies the home under a license agreement with OCIDA.

The Proposed Project site was selected and designed to minimize impacts to wetlands, homes, and other sensitive resources to the greatest extent practicable. See FEIS Section 2.2, Alternatives. The Proposed Project avoids direct impacts to the vast majority of surrounding residential areas; however, due to the size and unique infrastructure requirements of a semiconductor manufacturing campus, alternative siting options are extremely limited. As a result, the current site configuration represents the only feasible option to accommodate the Proposed Project while balancing environmental, community, and operational considerations. See FEIS Section 2.2.4, Micron Campus Site Layout Alternatives.

Land Use/Zoning Comment 3:

Will more land need to be acquired for the Project?

Response: The Proposed Project is not expected to require additional land. However, certain required mitigation, such as the proposed traffic mitigation, may require acquisition of additional land. FEIS Section 2.1 describes the land necessary for the Proposed Project and Connected Actions.

Land Use/Zoning Comment 4:

In the Land Use Changes subsection, there is reference to two remaining properties that Micron does not have access to, and that OCIDA may need to go through eminent domain to obtain access. Given the time and effort associated with the eminent domain process, the EIS should note this (along with all the other approvals needed) as potential schedule impacts so the public is aware.

Response: The potential use of eminent domain is identified in the FEIS. To the extent that it is required, there would be sufficient time to acquire the parcels so that no schedule impacts are anticipated.

See FEIS Section 3.1.3.2, Preferred Action Alternative, Operational Effects, Land Use Changes. See also Response to Land Use/Zoning Comment 2.

Land Use/Zoning Comment 5:

In DEIS Figure 3.1-4: There is a symbol for Industrial wastewater conveyance (brown line type), but the commenter could not find any such linework in the figure. Please review and adjust if needed. This same comment applies to DEIS Figure 3.1-7 on page 3-16.

Response: Figures 3.1-4 and 3.1-7 have been revised in the FEIS accordingly.

Land Use/Zoning Comment 6:

Concerns were raised regarding the large loss of farmland given its importance to the area in providing food and its economic role in the region. More investment should be made to ensure more farmland is protected in the Central New York Area. It is unclear

whether converting prime agricultural land requires mitigation, like land grants to maintain agricultural property in perpetuity.

Response: See Responses to Oswego Comments 5 and 13. With or without the Proposed Project, the WPCP, which is zoned for industrial use, will be developed by OCIDA in accordance with its 2021 SGEIS, which already considered the effects on land use. Regardless, the WPCP is not currently being used for farmland and there is no expectation that it would ever be used as such.

See FEIS Section 3.1.2.1 and Section 3.1.3.2. Because the Proposed Project and Connected Actions would have limited to no effect on any existing or likely future agricultural uses on the properties where they would be built, farmland conversion under the Preferred Action Alternative would not result in any significant adverse direct effects on agricultural land uses. The growth-inducing effects of the Preferred Action Alternative would result in significant changes to land use. However, these changes would continue to be subject to local discretionary approvals and planning policies, including applicable measures to avoid or minimize adverse development effects and preserve community and regional character. See FEIS Section 3.1.3.2, Preferred Action Alternative, Growth Inducing Effects.

Micron has also complied with existing federal and state regulatory requirements with respect to farmlands. FEIS Section 3.1.1 recognizes the legal and regulatory framework of Farmland Protection Policy Act (FPPA), 7 U.S.C. § 4201 et seq. and New York State Agriculture and Markets Law. Section 3.1.3.2 Preferred Action Alternative discusses Micron's compliance and filing of conversion impact rating forms to NRCS. Appendix D-4 includes copies of the farmland conversion impact rating forms and the NRCS letter.

NRCS conducted a land evaluation and site assessment and determined by letter dated December 5, 2024, that several Proposed Project and Connected Action components would be exempt from FPPA provisions because they would occur in existing urbanized areas, utility corridors, rights-of-way, or already converted areas. Following the NRCS assessment, CPO completed the rating forms, which resulted in scores below 160 for all sites. As a result, the Preferred Action Alternative would not require consideration of alternative sites or project adjustments, and no further action under the FPPA would be necessary.

Land Use/Zoning Comment 7:

General concerns were raised about how proposed land use changes could affect nearby residential agricultural, or public parcels, including those with historic resources.

Response: See Response to Land Use/Zoning Comment 6. FEIS Section 3.5.2.3 outlines the identification of historic properties within the Area of Potential Effect (APE) for the Proposed Project and Connected Actions and presents the results of those investigations as part of the Section 106 process. See Response to Historical/Cultural Resources Comment 1. The APE is the geographic area within which the Proposed Project may directly or indirectly alter the character or use of historic properties. APEs were assessed as part of the Section 106 process. The FEIS acknowledges that induced growth associated with the Proposed Project could potentially affect

historic resources (see FEIS Section 3.5.3, Growth Inducing Effects) and community character (see FEIS Section 3.13.4.2, Growth Inducing Effects) across the broader five-county region. As described in these sections, any future development outside the Study Area is speculative and beyond Micron's control. Such development would be subject to local land use regulations and environmental review under SEQRA, which includes consideration of impacts to historic properties, archaeological resources, and the community. This ensures that protections remain in place even as regional growth evolves independently of the Proposed Project.

Land Use/Zoning Comment 8:

Several commenters advocated for comprehensive planning to ensure the site does not become a brownfield.

Response: See Response to Land Use/Zoning Comment 10, for discussion of consistency with comprehensive planning. See also Responses to Solid Waste and Hazardous Materials Comments 4, 42 and 51.

Micron's implementation of the Proposed Project would be subject to several Federal and State regulatory programs and extensive plans and procedures developed pursuant to those programs (see Response to Solid Waste and Hazardous Materials Comment 4). As part of or in addition to those plans, Micron also would be required to implement several BMPs, as shown in FEIS Table 3.8-13, to address solid and hazardous waste generation and the use of hazardous materials over time and minimize the amount of waste that is generated and requires disposal.

Land Use/Zoning Comment 9:

Concern was raised that improvements by OCDWEP, OCWA, and National Grid could bypass local zoning requirements under the Monroe balancing test or the NYS Public Service Law, reducing community input and local control.

Response: FEIS Section 3.1.3.2, Operational Effects, Zoning Changes, states, "[p]ublic utility projects in New York State are generally exempt from local zoning regulations under a legal doctrine known as the Monroe balancing test, which considers the public interest in such projects. Therefore, the Connected Actions that would be undertaken by OCDWEP and OCWA (see FEIS Table 3.1-1) may be exempt from some or all local zoning requirements. In addition, the Connected Actions that would be undertaken by National Grid may be exempt from local zoning requirements through provisions in the New York State Public Service Law (PSL). To the extent the improvements would be subject to any zoning requirements, OCDWEP, OCWA, and National Grid would apply for any necessary local approvals and would work with the municipalities to ensure the proposed improvements comply with the zoning requirements."

Land Use/Zoning Comment 10:

General concerns were raised that the Project is inconsistent with the Onondaga County Comprehensive Plan or the Town of Clay Northern Land Use Study.

Response: The comment references discrepancies with the Clay Northern Land Use Study (NLUS), which are also documented in the FEIS. See FEIS Appendix D-3, Section D-3.3.1. Although the NLUS was developed before a project of this scale was envisioned, FEIS Section 3.1.3.2 Preferred Action Alternative cites the analysis in Appendix D-3, which evaluates the relationship between the Proposed Project and the Onondaga County Comprehensive Plan, the SMTC 2050 Long Range Transportation Plan 2020 Update, the NLUS, the draft Town of Cicero Comprehensive Plan, and the New York Green CHIPS Program and concludes that the Proposed Project would be consistent with each of these policies and would fulfill several of their goals relating to economic development and industrial use of the WPCP. The Preferred Action Alternative would not result in any significant adverse effects with respect to these policies and would likely result in beneficial effects by fulfilling economic development policy goals. Appendix D further details local and regional plan goals, including those of the Onondaga County Comprehensive Plan and the NLUS.

Land Use/Zoning Comment 11:

Concerns were raised that the Project forecloses future land uses aligned with sustainable development or regenerative ecological restoration, in conflict with the NYS Smart Growth Public Infrastructure Policy Act.

Response: It is expected that induced growth associated with the Proposed Project would be undertaken with climate resiliency in mind, and that the growth would not significantly negatively affect the current climate resiliency of the region. As stated in the FEIS Section 3.7.5, Growth Inducing Effects, “[a]lthough induced growth from the Proposed Project may stress the resiliency of the region to climate impacts, any future development would be conducted under applicable State and local policies and programs, including the Smart Growth Public Infrastructure Policy Act, CLCPA, and CRRA, which establish 11 smart-growth criteria for use by state and local agencies to help ensure that future planning and implementation of transportation, sewer and water treatment, water, education, housing, and publicly supported infrastructure, among other things, is resilient to a changing climate.”

Land Use/Zoning Comment 12:

Suggestion was made that Micron support and fund local municipal training and incentive programs for conservation and mitigation measures, including zoning for conservation housing relying upon native plants building native habitat for bee pollinators, bats, and other displaced species.

Response: The FEIS evaluates and discloses the potential environmental effects of the Proposed Project and Connected Actions and requires training (e.g. fire departments) and conservation and

mitigation measures as described below. Initiatives that are not tied to mitigation for significant adverse effects from the Proposed Project, as suggested by the commentor, are outside the scope of the FEIS for the Proposed Project.

In regard to general conservation and mitigation measures, Micron, in consultation with the USACE, the USFWS, and NYSDEC, considered all protected and non-protected species in the evaluation of onsite impacts and the development of mitigation projects. FEIS Section 3.4, Biological Resources, and Appendix G both discuss upland and wetland communities and species that have been observed and are likely to utilize those communities. The proposed preservation of protected bat and grassland bird species habitat and the proposed wetland mitigation areas will preserve, create and enhance habitat for other non-endangered native plant and animal species that will be impacted by site development.

The mitigation proposed for protected species and wetland habitats also inherently considers protection for protected and non-protected species that currently utilize those site habitats. FEIS Section 3.4.5.1 describes the BMPs the project will implement to minimize impacts to threatened and endangered species. These include, but are not limited to, wintertime tree clearing, tree marking, retention of onsite roosting and foraging habitat where feasible, and limited nighttime construction. As stated in Table 3.4-8, Micron would also implement a Landscape Management Plan to incorporate landscaped areas in the vicinity of new buildings, parking lots, and stormwater management areas with the completion of each fab, and at the Childcare Site. The LMP prioritizes planting and replanting of native species. Micron has also proposed planting native vegetated buffers along the perimeter of the Micron Campus where it is feasible and where allowed under applicable municipal zoning codes, particularly in areas near sensitive habitats, including wetlands, to develop a transition zone between developed and undeveloped habitats. See FEIS Table 3.4-12.

Micron has also developed Mitigation Plans to address the loss of wetlands and surface waters (FEIS Appendix F), as well as the associated biological communities (FEIS Appendix G). The Proposed Project will follow all relevant regulations under the Clean Water Act and Article 24 of the Environmental Conservation Law to address the proposed losses of federal and State jurisdictional wetlands and surface waters. Additionally, all biological resource impacts would be mitigated in accordance with consultation with USFWS and the Endangered Species Act (ESA).

Land Use/Zoning Comment 13:

Concern that the impacts of an estimated 27,000 new households aren't properly considered by the DEIS, and that the assumption that such housing is consistent with the Onondaga County Comprehensive Plan or smart growth is insufficient. DEIS should consider the additional roads, water lines, sewers, and land that will be developed for housing as a result of the Project. The DEIS does not provide a comprehensive study of whether increases in housing developments comply with local and regional comprehensive plans.

Response: See Responses to Land Use/Zoning Comments 10 and 11. As noted throughout the FEIS, the Proposed Project will be constructed over approximately 16 years. In-migration associated with the Proposed Project is anticipated to be spread over the construction period. FEIS Section 3.15.3.2 Environmental Consequences, Preferred Action Alternative, is intended to demonstrate that the Proposed Project will enable growth of populations associated with relatively high paying jobs, using a skilled workforce that will be offered training opportunities to support the available jobs. It is difficult to assess precisely where populations will settle. Several local and regional plans referenced in FEIS Section 3.15.3.2 are already aligned with the potential development of housing, ancillary support businesses, and community services needed for successfully implementing the Proposed Project. In these communities, the desire for industrial manufacturing, such as what Micron would bring to the area, is precisely what has been sought and planned for. Mechanisms have been identified for updating other local comprehensive plans that may not yet fully align with the anticipated growth of the area. Once the Proposed Project is initiated, it is expected that construction of other needed community infrastructure and housing will become incentivized by the influx of revenues generated from the Proposed Project and other project funding.

FEIS Section 3.11, Transportation and Traffic, describes the impacts to transportation facilities based on the vehicles anticipated to travel to and from the site as well as other developments anticipated to be constructed near the proposed site. A summary of the infrastructure expansion required to support the induced growth is discussed in FEIS Section 3.10, Utilities and Supporting Infrastructure. See also Response to Land Use/Zoning Comment 6, for discussion of induced effects to land use.

It is acknowledged in FEIS Section 3.15.3.2, Preferred Action Alternative, Real Property and Housing that the Proposed Project's induced growth would lead to increased housing demand. As the project sponsor, Micron is not required to provide housing, housing strategies, or detailed consideration regarding additional roads, water lines, sewers, etc. that would not be required for the Proposed Project itself to be completed. The location of potential future housing developments is unknown but will be required to comply with federal, state, and local laws, rules and regulations, as well as local and regional planning standards. See also Response to Socioeconomic Comment 19.

Land Use/Zoning Comment 14:

General concerns were raised that growth inducing effects are not properly considered, and that statements that any proposed BMPs and mitigation measures are not required based on future discretionary approvals at the local level are insufficient to demonstrate conformity with local land use planning. There is a lack of clarity surrounding what the expectation is of municipalities to conform to future discretionary land use and zoning actions by Onondaga County.

Response: See Responses to Land Use/Zoning Comments 10 and 12. Land use planning and zoning decisions are the responsibility of local governments, which are carried out through

established discretionary approval processes, including comprehensive plans, zoning codes, subdivision regulations, and site plan review procedures. These processes are designed to ensure that future development is evaluated and approved in accordance with each municipality's adopted policies, regulatory framework, and community priorities. The FEIS identifies potential growth-inducing effects and acknowledges that local governments will continue to guide land use and zoning decisions to address such effects as they arise. See FEIS Section 3.1.3.2, Growth Inducing Effects.

Land Use/Zoning Comment 15:

The DEIS fails to explain how the influx of additional labor force will mitigate the existing housing crisis in lieu of exacerbating it through displacement, etc.

Response: See Response to Socioeconomic Comment 19. As noted throughout the FEIS, the Proposed Project would be constructed over approximately 16 years. The effects of population growth from construction and operation of the Proposed Project over that time on housing demand, property values and housing costs are fully addressed in FEIS Section 3.15.3.2. In-migration associated with the Proposed Project is anticipated to be spread over the construction period. Once the Proposed Project is initiated, it is expected that construction of other needed community infrastructure, and specifically housing, will expand within the pace of in-migration supported by the influx of revenues generated by project workers and other project funding identified to support the community (e.g., the Community Investment Fund).

Land Use/Zoning Comment 16:

The land use impact analysis ignores the fact that the Micron Campus will spur additional commercial and industrial development, which should be addressed.

Response: FEIS Section 3.1.3.2, Growth Inducing Effects, analyzes the effects on land use, zoning and public policy from the induced growth from both the commercial and industrial businesses that will support Micron, in addition to the effects due to the increased demand for housing and business services. The FEIS acknowledges that induced growth will result in noticeable land use changes associated with the new commercial and housing development as well as development supporting Micron's supply chain. The developments will be subject to municipal zoning, and discretionary land use approvals, which would require measures to avoid, minimize or mitigate impacts from the development.

Land Use/Zoning Comment 17:

Widespread land use changes and these impacts on historic resources and local community identity are unaddressed by the DEIS.

Response: The FEIS acknowledges that induced growth associated with the Proposed Project could potentially affect historic resources (see Section 3.5.2.3, Identification of Historic Properties) and community character (see Section 3.13.4.2, Growth Inducing Effects) across the broader five-county region. As described in these sections, any future development outside the

Study Area due to induced growth is speculative at this time. Such development, however, would be subject to local land use regulations and environmental review, which includes consideration of impacts to historic properties, archaeological resources, and the community. This ensures that protections remain in place even as regional growth evolves independently of the Proposed Project. Notwithstanding, land use changes because of the construction and operation of the Proposed Project would be consistent with community character as expressed in local land use regulations, policies and plans.

Land Use/Zoning Comment 18:

Concerns were raised relating to zoning for additional housing required.

Response: See Responses to Land Use/Zoning Comments 15 and 17.

3.2 Geology, Soils and Topography

Geology/Soils Comment 1:

The Micron site is located on an area of geology known as a Karst, and contamination from the Project will be able to move fast and far through this type of aquifer. The DEIS fails to acknowledge the presence of karst-like conditions at the Site and is therefore insufficient to assess the impacts of highly variable subsurface conditions on site preparation and development. Initiation of construction activities such as the excavation and removal of soil or bedrock at the Site is not recommended at this time based on the documented occurrence of soluble bedrock with evidence of dissolution and highly variable subsurface conditions at the Site that could lead to fast, turbulent subsurface water flow and further dissolution of soluble bedrock.

Response: Karst features (e.g., sinkholes, depressions, solution cavities, caves, escarpments, ridges, etc.) were not observed within the WPCP either at the surface or within boreholes performed by Langan (see FEIS Appendix E-4). Previous reporting by CME indicates consistent observations. Similarly, geophysical testing completed within the site, including seismic refraction surveying and MASW testing, did not suggest the presence of karst features. Where tested, recovered bedrock samples were generally reported to show low reactivity to dilute HCl further reducing the potential for development of karst features. Furthermore, the geotechnical investigations of the WPCP did not encounter soils vulnerable to liquefaction, sudden collapse, or failure under seismic loading conditions.

In general, site grading is largely being raised using engineered fill and is not expected to result significant changes to groundwater flow, The native soils will typically remain, and such soils tend to demonstrate low permeability. In addition, the site will largely be built over with impervious cover and engineering controls will be used to manage stormwater and mitigate infiltration during precipitation events.

Impacts on local aquifers resulting from construction are not expected as the vertical extents of excavations tend to be modest and exposure and penetration into the rock mass is limited. Where

the rock mass is exposed, it will be covered or infilled with concrete and engineering controls will be in place during construction to mitigate the potential for impacts.

The Proposed Project will implement a comprehensive suite of BMPs and preventative and responsive measures specifically designed to preclude contamination from project activities with the intent of protecting resources, including groundwater. See FEIS Section 3.2.4, BMPs and Mitigation Measures. As part of the construction design phase, Micron will conduct additional subsurface investigations, including geotechnical borings and groundwater monitoring, to further characterize site conditions. See FEIS Section 3.2.3.2, Construction Effects. These investigations will inform engineering design decisions aimed at mitigating any potential impacts associated with construction and operational activities and identify any karst-like conditions.

These safeguards are applicable throughout all phases of the project, including construction, and are intended to address the potential for rapid groundwater movement associated with karst aquifers. Measures include erosion and sediment control, stormwater management, groundwater monitoring and adaptive management, and hazardous materials handling. See FEIS Section 3.2.4, BMPs and Mitigation Measures. The FEIS also notes that horizontal directional drilling and other low-impact construction techniques will be used to avoid aquifer disturbance.

The table below summarizes these BMPs.

Summary of BMPs for Groundwater Protection

Topic	BMP Description	FEIS Reference
Stormwater Management	Use of stone check dams, slope stabilization, perimeter dikes/swales, rock outlet protection, silt fencing, compost filter socks, sediment traps, stabilized construction accesses. All BMPs follow NYSDEC standards and are documented in stormwater pollution prevention plans (SWPPPs).	Section 3.3.4.2, Stormwater
Adaptive Management	42 groundwater monitoring wells installed; 17 used for adaptive stormwater management. Data from wells and piezometers inform BMP adjustments.	Section 3.3.4.2, Stormwater, Wetland Adaptive Management Plan
Groundwater Recharge Protection	Minimize vegetation removal and soil disturbance; use erosion and sediment control BMPs to maintain infiltration and recharge.	Section 3.3.4.2, Groundwater
Hazardous Materials Handling	Spill prevention and countermeasure plans, secondary containment, release response procedures, on-site emergency response team (ERT), secure chemical storage, automated delivery systems, and leak sensors.	Table 3.14-8, BMPs for Emergency Response; Table 3.8-13, BMPs for Hazardous Waste
Construction Techniques	Use of horizontal directional drilling, timber mats, and other low-impact methods to avoid aquifer disturbance.	Section 3.3.4.2

Cumulative Risk Mitigation	Standardized chemical storage, BMPs to trap or prevent infiltration of contaminated stormwater, and erosion control to reduce cumulative groundwater contamination risks.	Section 4.3, Cumulative Effects
-----------------------------------	---	---------------------------------

See also Response to Nation Comment 18.

Geology/Soils Comment 2:

General statements were made relating to the source of fill, its quality, and whether fill material is stable, clean, and suitable for construction. General concerns were also raised about the transport, storage, and placement of the 9 million CY of imported material.

Response: The sourcing and quality of fill material are addressed in FEIS Section 3.2.3.2, Construction Effects, Micron Campus. This section specifies that imported fill material will be obtained from NYSDOT and NYSDEC approved virgin quarry sources. These sources are selected to ensure a known origin and consistent quality of materials used for construction. The FEIS further notes that fill material will be subject to strict placement controls, particularly in areas with sensitive soils, to ensure stability and prevent loss into voids. Additionally, Micron will be required to implement a SWPPP and obtain a SPDES permit for construction activities, which includes sediment and erosion control measures to further protect soil and groundwater quality during fill placement. See FEIS Appendix F-8 for the draft SWPPP.

Geology/Soils Comment 3:

The DEIS indicates that construction of the facility will result in temporary alteration of land type and soil type, but it will permanently change the land type and soil type as all overburden soils are being replaced with aggregate, and the land type will be industrial rather than vacant. The DEIS should be revised accordingly.

Response: FEIS Section 3.2.3.2 acknowledges that construction of the Micron Campus will result in substantial permanent changes to the existing geology, soil conditions, and topography of the WPCP. These changes include the removal of overburden soils, bedrock excavation, pier drilling, and the placement of imported fill material to achieve final site grading. FEIS Section 3.1.3.2 acknowledges that these activities will permanently alter the landform, and the site will transition from its current vacant and limited residential uses to industrial and commercial land use.

Geology/Soils Comment 4:

General statements were made that blasting, grading, or excavation could affect groundwater or mobilize pollutants.

Response: Blasting, if required, will be completed by a licensed blaster in accordance with proper blast design pursuant to the Blasting Plan presented in FEIS Appendix E-5. Grading and excavation activities will likewise adhere to the BMPs identified in FEIS Section 3.2.4, which includes a groundwater monitoring component to confirm that no hydrogeologic changes result

from site construction activities. A Phase I Environmental Site Assessment has been completed for the Proposed Project and a Soils and Materials Management Plan (FEIS Appendix K-7) has been developed to address handling of any contaminated materials encountered during excavation and grading activities and prevent mobilization of any potential contamination.

Geology/Soils Comment 5:

Comments were made about how cutting into glacial tills or bedrock aquifers might change water table levels or cause contamination. Several commenters called for weekly, independent soil testing for toxic chemicals.

Response: The potential for hydrogeologic flow change with the removal of native soils and bedrock exists. However, the geotechnical investigations performed to date suggest that groundwater tends to be perched atop bedrock within the glacial till soils. As the majority of the site work is comprised of filling to raise grades, the proposed construction is not expected to greatly impact local groundwater levels or groundwater flow. Areas of higher existing surface grade are generally limited to areas containing drumlins. Cuts to facilitate construction in these areas will largely reduce mounding of perched water. The coarser grained materials used to replace them for building requirements will be largely covered with impervious structures. Additionally, a groundwater monitoring program will be implemented to verify that excavation and grading activities do not adversely affect local hydrogeology. See also Response to Solid Waste and Hazardous Materials Comment 17; FEIS Section 3.3.3.4, Groundwater.

Geology/Soils Comment 6:

Several comments questioned whether borings and geotechnical tests fully address local soil variability. No borings were conducted east of Burnett Road and should be reflected as such in the site characterization and the DEIS should indicate additional borings will be collected at a later date.

Response: Geotechnical borings have been completed in the areas proposed for the initial phases of construction, including the locations of Fabs 1 and 2, as documented in FEIS Appendix E. These investigations were conducted in Spring and Fall 2023 and Spring 2024, and included test borings, cone penetration testing, test pits, groundwater monitoring wells, and laboratory testing (Appendix E-4).

As noted in FEIS Section 3.2.2.1, bedrock was core-sampled at 13 test boring locations and verified to be sedimentary interbedded shale and dolostone, which is nonreactive to only slightly reactive to dilute hydrochloric acid. Borings were not advanced directly beneath Fab 3 or Fab 4 during the geotechnical investigations included in FEIS Appendix E-4. However, the exploration included multiple locations and is considered representative of site conditions. Further, before construction begins on Fabs 3 and 4, additional borings would be collected. See FEIS Appendix E-4, Geotechnical Reports. This phased approach is consistent with standard engineering practice for large-scale, multi-phase projects and ensures that site-specific soil variability is fully evaluated prior to construction in each area.

The Soil and Materials Management Plan and the SWPPP will also be updated as new data becomes available, ensuring that construction practices remain protective of environmental and structural integrity. See also Response to Geology/Soils Comment 11.

Geology/Soils Comment 7:

In section 3.2.2.1 and Figure 3.2-1, there is a discrepancy or inconsistency in the references to glacial till depth and description of the shallowness of bedrock.

Response: No discrepancy regarding bedrock depths in the Micron Campus and Rail Spur Site locations are noted. The referenced Section and Figure correlate properly.

Geology/Soils Comment 8:

The commenter warned that 2012 study suggests biogeochemical function is not fully restored based on soil carbon storage where wetlands are restored or created and requested additional documentation to support Micron's statements that BMPs/SMPs will mitigate temporary soil erosion.

Response: While full restoration of soil carbon storage may not be immediate, the mitigation plan integrates BMPs/SMPs and ecological design principles to promote long-term recovery of biogeochemical functions. See FEIS Section 3.2.4, BMPs and Mitigation Measures. The Proposed Project's phased implementation, monitoring, and adaptive management framework provide a robust response to the concerns raised in the 2012 study and ensures compliance with regulatory requirements.

Specifically, Micron's migration strategy below, which incorporates both scientific understanding of soil recovery and regulatory best practices, is designed to address these challenges.

1. Soil Function and Restoration Limitations

The Oneida River mitigation site has a documented history of agricultural use and logging, resulting in compacted soils, altered hydrology, and degraded biogeochemical conditions. The plan recognizes that soil carbon dynamics and microbial functions may take years to reestablish. See FEIS Appendix F-7-7. However, the restoration design intentionally incorporates features that promote soil recovery, including:

- Microtopography restoration (e.g., pit-and-mound structures) to enhance water retention and organic matter accumulation.
- Use of native hydrophytic vegetation with deep and diverse root systems to support microbial activity and carbon sequestration.
- Uncompacted soil placement to allow natural settling and aeration.

2. Erosion Control and BMPs/SMPs

To mitigate temporary soil erosion during construction and early establishment phases, the project includes a comprehensive suite of BMPs and SMPs that are outlined in the draft SWPPP for Phase 1a of the Micron Campus (See FEIS Appendix F-8). These include:

- Pre-construction erosion controls, such as silt fencing and marked disturbance boundaries.
- Spoil deposition protocols to prevent sediment transport into wetlands and waterways.
- Post-construction stabilization, including mulching, seeding, and planting with erosion-resistant native species.
- Monitoring and maintenance of erosion control structures for up to three growing seasons or until full stabilization is achieved.

3. Long-Term Monitoring and Adaptive Management

The mitigation plan includes a 15-year monitoring program with performance standards for hydrology, vegetation, and invasive species control. See FEIS Section 3.4.5.2 and Appendix F-7-(3-8). Soil development and vegetative cover will be tracked annually, and adaptive management measures—such as regrading, replanting, or hydrologic adjustments—will be implemented if performance goals are not met.

Geology/Soils Comment 9:

A comment noted that stumps and root wads are generally not available from typical commercial logging based on soil disturbance, and thus those made available from tree clearing and grubbing operations should be utilized.

Response: Micron and The Wetland Trust are actively working with the USACE and NYSDEC to evaluate the feasibility of using the cleared and grubbed woody debris from the Micron Campus, including for use in the wetland mitigation sites, while adhering to the provision set forth in the Invasive Species Management Plan (FEIS Appendix G-9) and the Soil and Materials Management Plan (see FEIS Section 3.8, Solid Waste, Hazardous Waste and Hazardous Materials and Appendix K-7). Ultimately, the determination on reuse of this material will be up to the permitting agencies.

Geology/Soils Comment 10:

Comments sought clarification whether Micron would participate in the NYS Beneficial Use Program (BUD) with respect to reuse of excavated material. It is optimistic to assume all soils will be recyclable. Uncontaminated excavated soil ineligible for beneficial use could be used as landfill cover at solid waste facilities. A commenter recommended backup for the estimated quantities of eligible soils be provided in the Appendix.

Response: Micron intends to participate in the NYSDEC BUD program for the reuse of excavated materials, as described in FEIS Section 3.8.3.2. The FEIS specifies that excavated materials will be evaluated for BUD eligibility and, where appropriate, reused or recycled in accordance with NYSDEC regulations. This includes potential reuse as structural fill, road base, or other engineered applications.

Not all excavated soils will be suitable for reuse under the BUD program. Soils that are uncontaminated but ineligible for beneficial use may be directed to solid waste facilities for use as landfill cover, consistent with NYSDEC guidance and waste management protocols.

To support this approach, FEIS Appendix E provides extensive geotechnical data characterizing the physical properties of native and excavated soils, including:

- Grain size distribution and Atterberg limits for classification.
- Moisture-density relationships and California Bearing Ratio (CBR) testing for compaction and load-bearing suitability.
- Visual soil classifications from over 200 test borings and 17 test pits, which inform estimates of material reuse potential.

These data form the basis for estimating the quantities of excavated soils likely to meet BUD criteria, and for identifying materials suitable for alternative uses such as landfill cover. While exact quantities are subject to refinement during construction, the FEIS and Appendix E provide a robust framework for evaluating and managing excavated materials in compliance with state regulations.

Geology/Soils Comment 11:

The project is being built on a wetland and an area of a high water table, which means the possibility of soil liquefaction exists. The soil may not support the weight of the fabs.

Response: See Responses to Geology/Soils Comments 1, 2, and 6. As noted in FEIS Section 3.2.2.1, there is generally a low risk of geologic hazards within the study area. A comprehensive geotechnical investigation was conducted for the Proposed Project, with full results presented in FEIS Appendix E-4 and summarized in FEIS Section 3.2.3.2. These investigations included over 200 test borings, laboratory testing, infiltration studies, and installation of groundwater monitoring wells to characterize subsurface conditions across the site.

The Proposed Project site is located in an area with wetlands and a high-water table, and the FEIS acknowledges these conditions (see Appendix E-4 Geotechnical Reports). However, the geotechnical data does not indicate a significant risk of soil liquefaction. Laboratory testing—including one-dimensional consolidation tests, moisture-density relationships, and California Bearing Ratio (CBR) evaluations—demonstrate that the native soils exhibit sufficient strength and stability under anticipated loading conditions. For example, and as discussed:

- Dry unit weights ranged from 107 to 112 per cubic foot (pcf), with low void ratios and moderate compression indices.
- Soils were classified primarily as grey silts with little clay and trace sand, which are not typically prone to liquefaction.
- Coefficients of consolidation were high, indicating rapid dissipation of pore pressures under load.

Bedrock was core-sampled at 13 test boring locations and verified to be sedimentary interbedded shale and dolostone, which is nonreactive to only slightly reactive to dilute hydrochloric acid. Karst topography (known for higher incidences of sinkholes) was not noted at the site. While borings were not advanced directly beneath Fab 3 or Fab 4 during the geotechnical investigations included in FEIS Appendix E-4, the exploration included multiple locations and is considered representative of site conditions. Steep slope and soil conditions at greater risk of landslides also were not identified at the WPCP. Furthermore, the geotechnical investigations of the WPCP did not encounter soils vulnerable to liquefaction, sudden collapse, or failure under seismic loading conditions.

Additionally, it should be noted, the 2019 Onondaga County Multi-Jurisdictional Hazard Mitigation Plan Update, the Towns of Clay and Cicero are located in areas with moderate susceptibility to landsliding but a low incidence of occurrence; only one small area in the center of the southern portion of Onondaga County has a moderate incidence of landslide occurrence.

Furthermore, Micron's design drawings will specify the use of structural fill materials that meet NYSDOT standards. See FEIS Section 3.2.3.2, Preferred Action Alternative. These materials will be placed and compacted in engineered lifts, and their use will be subject to review and approval during the building permit process. The FEIS also notes that ground improvement techniques may be employed where necessary to ensure long-term stability.

Geology/Soils Comment 12:

Comments sought clarification of soil stability and permeability, and associated flood risks from extreme weather events.

As discussed in the FEIS Section 3.2.2.1 and Appendix E, soil conditions at the WPCP are stable and not vulnerable to seismic or collapse-related risks. The mitigation design incorporates site-specific soil permeability characteristics and includes comprehensive flood resilience measures. These strategies collectively ensure that the project can withstand extreme weather events while maintaining ecological and structural integrity. Specifically:

1. Soil Stability and Seismic Risk

As stated in the FEIS (Section 3.2.2.1 Geology): "The geotechnical investigations of the WPCP conducted in 2023 did not encounter soils vulnerable to liquefaction, sudden collapse, or failure under seismic loading conditions, based on a computational analysis using CME's Subsurface Exploration data, which included Standard Penetration Testing (SPT), Cone Penetration Testing (CPT), and Multichannel Analysis of Surface Waves (MASW). No sinkholes were identified on the WPCP."

This confirms that the soils underlying the Project site and associated infrastructure are structurally stable and not prone to collapse or seismic failure. These findings are based on industry-standard geotechnical methods and provide assurance that the site is not at risk of subsurface instability.

2. Soil Permeability and Hydrologic Management

FEIS Appendix F-7-(3-8) (Section 3.2 and 3.3 of the Wetland Mitigation Plans) provides detailed soil mapping and hydrologic assessments across the mitigation sites. Key findings include:

- The Oneida River site is dominated by high clay-content soils, which naturally retain water and slow infiltration (Appendix F-7-7, Table 3-1).
- Aquitard-like layers were identified in some areas, further limiting permeability and enhancing surface saturation (Appendix F-7-(3-8), Section 3.3).
- These characteristics are accounted for in the wetland design through:
 - Grading and microtopography restoration to manage water retention and flow (Appendix F-7-(3-8), Section 5.2).
 - Disabling of drainage tiles and construction of berms to restore natural hydrology (Appendix F-7-(3-8), Figures 5-2 and 5-3).
 - Installation of monitoring wells and staff gauges to track groundwater and surface water dynamics (Appendix F-7-(3-8), Table 3-3 and Figure 3-5).

3. Flood Risk and Climate Resilience

FEIS Appendix F-7-(3-8) (Section 10) outlines adaptive management strategies to address flood risks and extreme weather events:

- Sediment and erosion control measures are implemented before, during, and after construction, including silt fencing, spoil deposition protocols, and stabilization practices (Appendix F-7-(3-8), Section 5.6).
- Stormwater Best Management Practices (BMPs) and Site Management Practices (SMPs) are incorporated to handle varying infiltration rates and runoff volumes and are detailed in the draft SWPPP for Phase 1a of the Micron Campus (See FEIS Appendix F-8).
- The plan includes contingency measures for flooding events, such as replanting, soil stabilization, and reconstruction of berms or ditch plugs if damaged (Appendix F-7-(3-8), Section 10).

Geology/Soils Comment 13:

Comments sought clarification as to a preliminary estimate of soil to be reused onsite and whether excavated wetland soils could be used in wetland restoration. A commenter suggested coordination with wetlands experts to determine whether soil and muck removed from existing wetlands could be utilized as part of the wetlands mitigation plan.

Response: FEIS Section 3.8.3.2 contemplates the use of excavated materials, including re-use and recycling. See Response to Geology/Soils Comment 9 and Water Resources Comment 13.

Geology/Soils Comment 14:

Comments sought clarification of basis for bedrock removal for underground utilities and whether shallow groundwater is an anticipated construction concern.

Response: Underground utilities will need to maintain specific burial depths from source area to end-use location connections. On the Proposed Project site, bedrock removal for building foundations will be required to attain design construction depths; however, onsite utilities will primarily be located within areas of fill. Industry-standard best management practices (BMPs) will be observed during all construction phases to address any encountered groundwater. These BMPs—including dewatering plans, SWPPP, spill prevention and control plans (SPCC/SPR), and soil stabilization techniques—are outlined in FEIS Section 3.2.4, BMPs and Mitigation Measures. These practices are designed to prevent contamination, promote groundwater recharge, and ensure immediate containment and cleanup of any accidental releases during construction.

Geology/Soils Comment 15:

General statements were made indicating that soil types must be assessed to consider negative impacts of habitat loss.

Response: The FEIS provides a robust foundation for understanding the implications of soil disturbance on habitat integrity and supports the development of appropriate mitigation measures. As discussed in FEIS Section 3.2.4, BMPs and Mitigation Measures, soil types were evaluated in order to inform environmental mitigation strategies and construction planning. The geotechnical data in FEIS Appendix E supports the identification of soil characteristics that influence erosion potential, foundation stability, and suitability for vegetation and habitat restoration. More specifically, Appendix E includes the geology, soils, and topography methodology; a list of soil type descriptions; and geotechnical reports prepared for the Proposed Project. Habitat loss is discussed in Section 3.4.3.1, Ecological Communities and Section 3.1.2.3, Protected Farmland discusses the potential impacts of the conversion of prime farmland soils, which can also be associated with habitat loss. See also Response to Geology/Soils Comment 4.

Geology/Soils Comment 16:

A commenter sought clarification of measures to eliminate acid runoff reaching limestone and causing degradation.

Response: Site-specific stormwater modeling and design will be conducted during the permitting phase. Stormwater design and permitting will follow current NYSDEC requirements at the time of permit submittal for each phase of the project. Stormwater Management Practices (SMPs) will be implemented to preserve existing drainage patterns to the greatest extent practicable, maintain conveyance of upland watershed runoff, control increases in stormwater volume, prevent soil erosion and sedimentation, and reduce runoff through the use of green infrastructure where feasible. These measures are outlined in FEIS Section 3.3.4.2, Table 3.3-11 and Appendix F and collectively mitigate downstream flood risks, protect water quality, and prevent chemical interactions that could degrade limestone or other vulnerable substrates.

Geology/Soils Comment 17:

Karst topography and steep slope and soil conditions of the Proposed Project and Connected Action sites provide a greater risk of landslides and sinkholes.

Response: See Response to Geology/Soils Comment 1. Potential geologic hazards are addressed in FEIS Section 3.2.2.1, Geology, which concludes that “[t]here is generally a low risk of geologic hazards within the study area.” The geotechnical investigations conducted in 2023 at the White Pine Commerce Park (WPCP) included Standard Penetration Testing (SPT), Cone Penetration Testing (CPT), and Multichannel Analysis of Surface Waves (MASW). The potential for geologic hazards is considered low with the area experiencing reasonably low seismicity. These investigations found no evidence of soils vulnerable to liquefaction, sudden collapse, or failure under seismic loading conditions, as the site soils are not considered to be prone to liquefaction, landslides, or lateral spreading impacts.

Further, karst topography, which is typically associated with increased risk of sinkholes due to the presence of soluble rock such as limestone, was not noted at the Proposed Project site. FEIS Section 3.2.2.1, Geology.

Additionally, steep slope and soil conditions that could elevate the risk of landslides were not identified at the Micron Campus. According to the 2019 Onondaga County Multi-Jurisdictional Hazard Mitigation Plan Update, the Towns of Clay and Cicero are located in areas with moderate susceptibility but low incidence of landsliding; only a small area in the southern portion of Onondaga County shows moderate incidence of landslide occurrence. See FEIS Section 3.2.2.1, Geology.

As discussed in the FEIS, geologic conditions at the proposed Rail Spur and Childcare Sites, as well as existing utility properties, are substantially similar to those at the Micron Campus. Therefore, the risk of seismic activity, sinkholes, and landslides at these locations is also considered low. See FEIS Section 3.2.2.1, Geology.

Notwithstanding, as part of the construction design phase, Micron will conduct additional subsurface investigations, including geotechnical borings and groundwater monitoring, to further characterize site conditions. These investigations will inform engineering design decisions aimed to mitigate any potential impacts associated with construction and operation activities and identify any karst-like conditions. See also Response to Geology/Soils Comments 1 and 6.

Geology/Soils Comment 18:

A commenter raised concerns that not all bedrock intended to be built upon was evaluated.

Response: See Response to Geology/Soils Comment 6.

Geology/Soils Comment 19:

Surface and subsurface conditions which are consistent with karst geology/features and can pose significant risks to human health, built structures, water quality, and the environment through the formation of unwanted and damaging land subsidence, flooding, slope movements, and/or contaminant migration.

Response: See Response to Geology/Soils Comment 1 and 17.

Geology/Soils Comment 20:

Review of the DEIS uncovered significant data and information gaps regarding the Site's geology, soils, topography, and water resources, including but not limited to recent nearby use of a productive bedrock aquifer for local water supply. Additional investigation and characterization of the Site's geology, hydrology, and local groundwater use are required to inform the public and to assist owners, operators, design professionals, plan reviewers, public works officials, and jurisdictional regulators in making informed decisions on Site development and management.

Response: See Responses to Geology/Soils Comments 1 and 12.

Geology/Soils Comment 21:

The 10-foot contour interval used in topographic maps presented in Section 3.2 of the Draft EIS is inadequate to identify topographic features with less than 10 feet of relief. Field experience has shown that many topographic features associated with the dissolution of soluble bedrock (i.e., karst) in central New York have less than 10 feet of topographic relief. Karst is a landscape formed by the dissolution of soluble bedrock and is characterized by a variety of distinctive features including solution-enlarged fractures, rock pinnacles, closed topographic depressions, sinking streams, and others, and also by the dominance of subsurface drainage over surface drainage. The use of smaller topographic contour intervals (e.g., a 2-foot contour interval) in mapping is better suited for assessments of potential karst areas in central New York, particularly in relatively flat areas.

Response: While the topographic maps presented in FEIS Section 3.2 utilize 10-foot contour intervals, more detailed topographic conditions were collected by the surveyor, which documented the topography at 1-foot contour intervals. The 1-foot contour interval survey is referenced in the Geotechnical Report included in FEIS Appendix E-4. See also Responses to Geology/Soils Comments 1 and 17.

Geology/Soils Comment 22:

Review of Figures E-2 and E-3 of the EIS show areas of steeper slopes at the Site. Close examination of these two figures show numerous locations with generally circular or elliptical areas of connected (closed) steeper slopes. Some (possibly many) of these areas

likely represent closed circular or elliptical topographic depressions, which are a common, distinctive landform that occurs in areas of karst geology and hydrology.

Response: While Figures E-2 and E-3 do show localized slope variations, this does not necessarily indicate karst conditions. Potential geologic hazards are addressed in FEIS Section 3.2.2.1 Geology, which concludes that “[t]here is generally a low risk of geologic hazards within the study area.” Further, the topography of the Proposed Project site is generally flat to gently sloping, and the circular or elliptical slope features observed in the figures could also reflect natural surface depressions or historic land use patterns, rather than active karst processes. See FEIS Section 3.2.2.3, Topography and Table 3.2-3. Karst topography (known for higher incidences of sinkholes) was not noted at the Proposed Project site. Regardless, as part of the construction design phase, Micron will conduct additional subsurface investigations, including geotechnical borings and groundwater monitoring, to further characterize site conditions. These investigations will inform engineering design decisions aimed at mitigating any potential impacts associated with construction and operational activities and identify any karst-like conditions. See also Responses to Geology/Soils Comments 1 and 17.

Geology/Soils Comment 23:

Topographic contours in the vicinity of the proposed Micron Campus and surrounding areas published by the New York State Department of Transportation shows many water-filled closed topographic depressions on and near the proposed Micron Campus, which are a common landform that occurs in areas of karst geology and hydrology.

Response: See Responses to Geology/Soils Comments 1, 17, and 22.

Geology/Soils Comment 24:

Review of the Onondaga County Multi-Jurisdiction Hazardous Mitigation Plan Update indicates that the proposed Micron Campus and Rail Spur are located fully within a geological hazard area consisting of dolostone bedrock which is a soluble carbonate rock that is susceptible to dissolution and the resulting formation of karst features such as solution-enlarged fractures and sinkholes, and the associated hazards of land subsidence, floods, and slope movements.

Response: Potential geologic hazards and geotechnical considerations are discussed in FEIS Section 3.2.2.1, Geology, finding that “[t]here is generally a low risk of geologic hazards within the study area.” The FEIS states further, “The geotechnical investigations of the WPCP conducted in 2023 did not encounter soils vulnerable to liquefaction, sudden collapse, or failure under seismic loading conditions, based on a computational analysis using CME’s Subsurface Exploration data, which included Standard Penetration Testing (SPT), Cone Penetration Testing (CPT), and Multichannel Analysis of Surface Waves (MASW). No sinkholes were identified on the WPCP.” Karst topography was not noted at the Proposed Project site. See also Response to Geology/Soils Comments 1, 17, and 22.

Geology/Soils Comment 25:

Micron is proposing to remove a very large volume of relatively impermeable soil and replace it with more permeable fill materials, which will increase infiltration into the subsurface and likely exacerbate the dissolution of soluble bedrock and the formation and development of karst features. Removal of significant amounts of soil or other cover over karst features may also accelerate or trigger the development of sinkholes or other karst features through a variety of processes.

Response: FEIS Section 3.2.3.2 identifies the quantities of soil and bedrock removal required for site preparation. It further explains that excavated soils deemed unsuitable for structural use will be reused elsewhere on the property where appropriate, helping to minimize off-site disposal and maintain site stability.

Imported coarser materials will be used primarily in foundation zones and beneath paved surfaces, such as roads and parking areas, where structural support and drainage performance are critical. These areas will be covered by impermeable surfaces—including buildings, concrete pads, and asphalt—which significantly reduce direct groundwater infiltration into the subsurface.

It should also be noted that as part of the construction design phase, Micron will conduct additional subsurface investigations, including geotechnical borings and groundwater monitoring, to further characterize site conditions. These investigations will inform engineering design decisions aimed at mitigating any potential impacts associated with construction and operational activities and will identify any karst-like conditions. See also Responses to Geology/Soils Comments 1, 2, and 24.

Geology/Soils Comment 26:

The Micron campus is located on Lockport Group bedrock formation which are susceptible to formation of karst features. Development of some karst features including sinkholes have been documented on the Lockport Group.

Response: See Response to Geology/Soils Comment 1.

Geology/Soils Comment 27:

Another bedrock formation nearby is the Camillus Shale, which has been reported that small solutional conduits drained into these mines and some land-surface subsidence has occurred.

Response: See Response to Geology/Soils Comment 1.

Geology/Soils Comment 28:

Another bedrock formation in the vicinity of the site and the connected actions known as the Vernon Formation, is identified in the list of karst aquifers published by the USGS.

Response: See Response to Geology/Soils Comment 1.

The Vernon Formation is present beneath some of the Connected Action sites, but it does not underlie the Micron Campus. In the areas where it is present, the Vernon rock unit consists primarily of shale, which is a non-carbonate sedimentary rock. Unlike carbonate rocks such as limestone or dolostone, shale is not highly susceptible to dissolution. See FEIS Section 3.2.2.1, Geology.

Geology/Soils Comment 29:

The DEIS indicates bedrock is encountered at shallow depths, which is very close to bedrock encountered at greater depths. Variable depth to bedrock is a common condition in areas of karst geology and may indicate a zone of epikarst, which typically contains significant amounts of stored water.

Response: See Response to Geology/Soils Comment 1.

Geology/Soils Comment 30:

Appendix E-4 of the EIS contains photos and boring data, further evidencing features associated with dissolution of soluble bedrock.

Response: See Response to Geology/Soils Comment 1.

Geology/Soils Comment 31:

The commenter indicates that the statement in Section 3.2.2.1 of the Draft EIS that karst topography was not noted at the Site does not eliminate the presence of karst conditions at, beneath, or near the proposed limits of disturbance at the Site.

Response: See Response to Geology/Soils Comment 1.

Geology/Soils Comment 32:

The structural attitude of Site bedrock likely consists predominantly of sub-horizontal bedding that strikes generally east-west and dips gently towards the south. Several sets of regional joints or fractures occur in area bedrock with predominant structural trends striking generally northwest and generally east-northeast. These regional joint and fracture sets commonly act as preferential pathways for water migration and the development of solution-enlarged joints and fractures in soluble carbonate or evaporite bedrock formations, such as those that occur at and near the Site.

Response: See Response to Geology/Soils Comment 1.

Geology/Soils Comment 33:

The Site's physical setting, geology, and hydrology indicate the proposed Micron Campus and Rail Spur Site are located directly over a productive soluble bedrock aquifer with features consistent with a karst aquifer. This aquifer is likely used by some property

owners in the area for water supply, and these are highly susceptible to contamination, moving long distances, quickly without attenuation.

Response: See Response to Geology/Soils Comment 1. The comment presumes sources of contamination, which are precluded by excavation and operational BMPs and prevention and response measures detailed throughout the FEIS. See FEIS Section 3.3.5, BMPs and Mitigation Measures.

Geology/Soils Comment 34:

The DEIS does not include groundwater contour maps, groundwater potentiometric maps, geologic cross sections, bedrock surface contour maps, or similar maps and data for overburden groundwater and bedrock groundwater.

Response: See Response to Water Resources Comment 76. Bedrock depths are shown in FEIS Figure 3.2-1. Figure 3.2-1 has been updated to include additional boring locations.

Geology/Soils Comment 35:

A commenter suggests performing a surface geophysical investigation using one or more methods discussed in ASTM (2020) tailored for subsurface fracture detection and void or sinkhole detection and installing monitoring wells at coupled overburden and bedrock monitoring wells.

Response: The geotechnical investigation methods and results, including geophysical surveys, are detailed in FEIS Appendix E. These investigations included Standard Penetration Testing (SPT), Cone Penetration Testing (CPT), and Multichannel Analysis of Surface Waves (MASW), which are consistent with industry standards and appropriate for evaluating subsurface conditions.

3.3 Water Resources

Water Resources Comment 1:

A commenter stated that it is unclear from the discussion in the DEIS whether the identification and delineation of wetlands, and the mitigation on which it is based, accounts for and complies with the 2022 amendments to the New York State Wetlands Law and its implementing regulations that went into effect on January 1, 2025, because some of the delineation happened before the freshwater wetlands legislative amendments were enacted and all of the delineations and site visits happened before the language of the final regulations and the revised wetlands classification system was made public in December of 2024.

Response: All wetlands within the Proposed Project area were identified and delineated by Micron's consultant based on technical criteria (soils, plants, and hydrology as described in the Updated Wetlands Delineation Report, Appendix H of the Joint Permit Application) and were reviewed after the passage of the 2022 amendments to the New York State Wetlands Law or are under review by NYSDEC now. See also FEIS Appendix F. As discussed in FEIS Section 3.3.3.1

and Appendix F-3.1, Micron’s consultant delineated all wetlands within the boundaries of the Micron Campus, Rail Spur Site, and Childcare Site. NYSDEC evaluated the delineations and issued a Jurisdictional Determination (JD) for the Micron Campus in February 2024 based on connections to existing jurisdictional Class II and Class III wetlands, and, after the 2022 amendments, including the criteria for wetlands of unusual importance, were enacted. No state wetlands were identified at the Rail Spur Site, and a JD is still pending for the Childcare Site where wetlands are being avoided. The delineations also included wetlands that were evaluated and ultimately determined by NYSDEC (and USACE) not to be jurisdictional. A listing of the JDs prepared for the Micron Campus, the Rail Spur Site, and the Childcare Site can be found in Appendix F-6. Copies of the individual JD letters can be found in Appendix H of the 404 Permit Application.

NYSDEC will apply the current standards set forth in the NYS Wetlands Law (Environmental Conservation Law Article 24) and its implementing regulations at 6 NYCRR § 664 when evaluating Micron’s pending state wetlands permit application, and, if a permit is issued, will enforce its terms. NYSDEC is also an involved agency in the SEQRA process, provided input on the development of the DEIS, and made numerous field visits to confirm Micron’s wetland delineation. Any other jurisdictional determination after January 2025, for example, for the Connected Actions, will be in accordance with the new state wetlands regulations.

Water Resources Comment 2:

A commenter stated that all wetlands should be analyzed and wetlands larger than 7.4 acres should be considered state jurisdictional and come with commensurate buffers, protections and mitigations associated with their permitting because construction will continue to occur when the jurisdictional threshold is reduced to 7.4 acres.

Response: See Response to Water Resources Comment 1. All wetlands within the Proposed Project area were identified and delineated by Micron’s consultants and reviewed by NYSDEC in accordance with current regulations. NYSDEC is reviewing Micron’s wetland permit application, which covers construction of the entire Proposed Project, under current NYSDEC regulations, and utilizing the delineated federal and state wetlands identified in FEIS Appendix F. The NYSDEC regulations that will expand NYSDEC jurisdiction to all wetlands of at least 7.4 acres will not take effect until January 1, 2028, and will not apply to Micron’s wetland permitting process, which will be completed before that time.

Water Resources Comment 3:

Commenters stated that wetlands should be evaluated for jurisdictional criteria for “local importance.”

Response: See Responses to Water Resources Comments 1 and 2.

Water Resources Comment 4:

A commenter stated that the DEIS does not assess wetland impacts from traffic improvements, including the new 481 interchange at the CSX crossing.

Response: The NYS Route 31/NYS Route 481 Interchange is a separate planned infrastructure project and is not part of the Proposed Project. Therefore, potential impacts—such as those to wetlands—associated with that interchange will be evaluated through a separate environmental review and permitting process specific to that project.

Water Resources Comment 5:

Commenters stated that the Micron Campus should be designed to protect wetlands and incorporate onsite mitigation wetlands.

Response: The Proposed Project was designed to avoid and minimize impacts to wetlands to the greatest extent practicable while maintaining an operable design for manufacturing operations. Overall, the Proposed Project layout will avoid disturbances to 33.35 acres of federal jurisdictional wetlands and 33.37 acres of state jurisdictional wetlands in W34, and 157.36 acres of federal and state jurisdictional wetlands in W35. The Proposed Project also avoids 8.36 acres of jurisdictional wetlands on the Rail Spur Site and all jurisdictional wetlands on the Childcare Site. See FEIS Section 3.3.4.2, Construction Effects, Wetlands. Mitigation requirements necessitate a suitable large area for offsite mitigation to create continuous wetlands that will replace lost wetland services, which cannot be accomplished on the Micron Campus. See also Response to Water Resources Comment 6.

As part of its application for a Clean Water Act (CWA) Section 404 dredge and fill permit from U.S. Army Corps of Engineers (USACE), and a Freshwater Wetlands Permit (ECL Article 24, Title 7) from the New York State Department of Environmental Conservation (NYSDEC), Micron has proposed a compensatory mitigation plan to offset losses of wetlands. The permitting process with USACE and NYSDEC, including the development of appropriate mitigation measures, is ongoing. Mitigation for the other Connected Actions is also under development and remains the responsibility of each respective Connected Action proponent. As described in FEIS Sections 3.3.5 and 3.4.5, Micron would also implement a range of best management practices (BMPs) to avoid and, where impacts are unavoidable, reduce indirect adverse impacts from construction and operation of the Proposed Project. BMPs include stormwater controls to prevent runoff pollution and promote infiltration, and measures to manage lighting, noise, and other disturbances that could affect wetland functions and wildlife.

Water Resources Comment 6:

A commenter stated that the DEIS should provide the basis for the selection of the wetland mitigation sites. The suitability of the wetland mitigation sites, including the degree of connectedness between the sites, distance from the Micron Campus and the potential for residual pesticides and herbicides in soils from use as croplands, was questioned. Commenters noted the land was previously used for soybean production that could have resulted in herbicide/pesticide contamination.

Response: Mitigation site selection is a complex process that considers proximity to project, availability, suitability, and size, depending on the mitigation required and species need. Selection of the mitigation sites was subject to extensive due diligence and regulatory review and scrutiny by the USACE. Environmental due diligence and historical investigations of each of the mitigation

sites was performed as required by the 2008 Compensatory Mitigation Rule that governs compensatory mitigation requirements for unavoidable impacts and requires that certain site selection criteria be met. See FEIS Appendix F-7, Appendix N, Section 3, Mitigation Site Selection Process.

The mitigation sites were selected, in part, based upon proximity to the unavoidable impacts. Two of the proposed mitigation sites are located within the same HUC-12 watershed as the Proposed Project, and the remaining four are located within the same HUC-10 watershed. The largest possible sites that meet the criteria were considered as part of the U.S. Army Corps of Engineers and NYS Department of Environmental Conservation permit review process. For many of the mitigation sites, multiple property parcels were acquired to create a consolidated mitigation parcel.

The basis for selection of the wetland mitigation sites is described in Section 4.1 of the *Offsite Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B), which enumerates the following reasons for selection of the mitigation sites:

1. The immediate work areas contain few, if any, existing wetlands, which allows for focus on re-establishment and are near or adjacent to existing NYSDEC wetlands. Delineated wetlands will be subsumed into the work area and will be either registered as rehabilitation if the area is marginal, which is usually the case, or will otherwise be subtracted from the total acreage built and corresponding credits generated. The agencies decide which option is selected;
2. The sites are in active soybean production and will stay in active agriculture until construction commences, which helps prevent invasive species and incompatible land uses;
3. Most of the six mitigation sites contain large expanses of fields with slopes of 2 percent or less;
4. NRCS soil maps show poorly drained soils such as clay or silt loam-textured soils. This was field-verified;
5. Evidence of historic wetland drainage is visible in historic and recent orthoimagery, which was verified on the ground by examining each site closely to identify signs of hydrologic alteration, including ditches, stream diversions, stream channeling, sloping, filling, surface inlets, or buried drainage structures (e.g., drainage tiles). These landscape components are key for re-establishing wetlands by disabling and reversing historic drainage practices;
6. Some ditches on the property can be filled to restore wetlands without flooding neighboring property or roads;
7. The land adjoins other properties with similar characteristics that present an opportunity to expand the site;
8. There is potential for stream restoration and the creation of a stream wetland complex.

Mitigation sites were chosen to replicate the frequency and types of wetlands impacted by the Project, using classification systems from Cowardin et al. (1979) and Edinger et al. (2014). The goal was to match physical, chemical, and biological functions between the impacted and restored ecosystems, with final wetland credit targets determined by regulatory agencies.

Sites also offer sufficient stream restoration potential to meet agency compensation needs and allow for integrated stream-wetland restoration within functioning ecological complexes. Each site was analyzed for existing wetlands to be avoided, soil characteristics conducive to wetland development (e.g., soil moisture, depth to groundwater), and topography. See FEIS Section 3.3.5.

Water Resources Comment 7:

Commenters also stated that the proposed mitigation is not close enough to the Proposed Project or downstream from the Micron Campus and should be within the same watershed.

Response: See Response to Water Resources Comment 6; Response to Oswego County Comment 7. Mitigation sites were selected based on ecological suitability and regulatory criteria outlined in Section 2.1 of the *Off-site Compensatory Mitigation Plan*. See FEIS Appendix F-7, Appendix N, Attachment B. Key factors included hydrologic conditions, watershed-scale features, compatibility with adjacent land uses, and alignment with watershed management plans, as required under 33 C.F.R. 332.2(d). Site availability was also considered. The mitigation plan includes a list of sites that were investigated within the watershed(s) (see FEIS Appendix F-7, Appendix N, Table 3.2 and Table 3.3).

Two of the proposed mitigation sites are located within the same HUC-12 watershed as the Proposed Project, and the remaining four are located within the same HUC-10 watershed. This approach is consistent with federal and state regulatory guidance and reflects a deliberate effort to prioritize proximity and ecological relevance. Additionally, mitigation sites were selected to preserve and restore lands that were likely historically wetlands prior to agricultural conversion.

The land just north of the proposed Micron Campus was explored as a potential mitigation site but the site was sold to a competing bidder. The site is being used as mitigation for another project entailing wetland impacts not associated with the Proposed Project.

Prior to final selection, all sites were pre-screened by regulatory agencies to ensure suitability. Sites were prioritized that could provide a net wetland gain—defined by the U.S. Army Corps of Engineers (USACE) as established or re-established wetlands, and by NYSDEC as restored wetlands. The Wetland Trust, Inc. (TWT) was able to meet these criteria, with 94% of the compensation developed as re-established/restored wetlands and the remaining 6% as rehabilitation/enhancement.

Priority was given to sites closer to the Micron Campus, within the same watershed, and to larger parcels capable of supporting similar ecological functions—such as flood attenuation, groundwater recharge, stormwater infiltration, wildlife habitat, habitat connectivity, carbon sequestration, and long-term sustainability.

Water Resources Comment 8:

A commenter stated that the wetland mitigation plan should include replacement of 154 acres of palustrine forested wetlands.

Response: The agencies have evaluated each distinct wetland on the WPCP for its current cover type and condition to determine the number of credits/acres that would be needed to offset the impact. In general, the mitigation will be designed to compensate the wetland and stream functions and services lost, increasing both the quantity and quality of wetlands and streams within the larger watershed because of implementing the Preferred Action Alternative

As discussed in FEIS Section 3.3.4.2, Construction Effects, Wetlands, Micron has proposed a compensatory mitigation plan to offset permanent wetland losses. The *Off-site Compensatory Mitigation Plan* (provided in FEIS Appendix F-7, Appendix N, Attachment B) describes how approximately 220.8 acres of palustrine forest (PFO) wetlands will be re-established/restored as part of the mitigation plan, including 153.1 acres of red maple-hardwood swamp, 10.1 acres of hemlock-hardwood swamp, and 57.6 acres of floodplain forest. In addition, 67.2 acres of existing PFO wetlands will be rehabilitated.

As discussed in FEIS Section 3.3.5, BMPS and Mitigation Measures, the ultimate goal of the Mitigation Plan (included in Appendix F-7) is to fully replace the suite of lost functions and services the on-site wetlands provide that would be impacted by construction of the Micron Campus. The Mitigation Plan adheres to federal and state wetland mitigation regulations with approval from USACE and NYSDEC, which determine the appropriate amount of mitigation/wetland replacement that will be required.

Water Resources Comment 9:

Commenters raised concerns about the adequacy of the proposed mitigation ratio and the ability of mitigation sites to replicate wetland services such as water quality, flood control, and ecological resources and diversity. Several commenters stated that the Proposed Project should have a greater wetland mitigation ratio because mitigation sites rarely replicate the services of undisturbed natural wetlands and there is a loss of ecological services during the time mitigation wetlands are becoming established.

Response: Micron has committed to mitigation of water resources and biological communities in coordination with the applicable resource agencies. The purpose of the mitigation plans developed by Micron is to replace lost services and ecological resources using established scientific methods and at a ratio that is on average twice the amount of wetland area being lost. As described in the *Off-site Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B), and required as a condition of Micron's wetlands permits, Micron will offset impacted wetlands at a 2.2:1 rate on average. The mitigation rates for each type of wetlands can be found in Section 3.3.5 of the FEIS. These ratios are dependent upon the wetland to be impacted, cover type, and primary functions and services. For example, the proposed ratio for mitigating forested wetland losses are higher (3:1) than emergent wetland losses (1.5:1) due to the amount of time that it takes to develop a forested wetland.

Implementation of the compensatory mitigation project shall be, to the maximum extent practicable, in advance of or concurrent with the activity causing the authorized impacts. For example, all of the mitigation sites for Phase 2 impacts will be developed prior to filling wetlands. This approach will allow the opportunity to add additional wetland acres if necessary, on a realistic, adaptive timeline, thus minimizing the temporal loss of functions and services and providing compensation that tracks construction.

In addition, the proposed mitigation sites will be protected in perpetuity via a conservation easement, which will preserve the 422.2 acres required to perform the necessary wetland and stream mitigation as well as an additional 918.8 acres of existing wetlands and upland buffer. This will ensure that the mitigation sites result in large wetland / stream / upland complexes that compensate for the proposed impacts.

The mitigation sites will be monitored for 15 years following the year of completion to ensure the successful establishment of wetland vegetation and ecological function. Various vegetative performance standards have been set that will ensure the wetland mitigation sites meet or exceed ecological performance and diversity levels within the first 10 years. These goal standards include:

- Native Species Establishment: Eighty five percent (85%) relative cover of wetland re-establishment areas by native hydrophytes (FAC, FACW, or OBL).
- Forested Habitat: The areas meeting PSS criteria will have at least 400 shrubs/trees per acre, and those stems will display normal and healthy growth, free of disease and pests. At least half of the stems growing will be shrub species. For all forested wetland mitigation areas, it can be demonstrated that a minimum of 400 native, live, and healthy (disease and pest free) woody plants are growing per acre. At least half of the stems growing will be tree species.
- Invasive Species: Wetland acreage will have less than 5% relative cover of all non-*Typha* invasive plant species such as, but not limited to: purple loosestrife, common reed, and Japanese knotweed. Due to the difficulty of distinguishing the three species of cattails, as well as the likelihood that at least one of these will be present in many types of New York wetlands, the total relative cover of all invasive species, including cattails, will be less than 10%.
- Due to the propensity of reed canarygrass to colonize a farm field where farming has recently halted, the total relative cover of reed canarygrass will be less than 10%.
- VIBI: The vegetation index of biotic integrity “floristic quality” (VIBI-FQ) of the rehabilitated and re-established wetlands will be equal to or greater than 40.

Performance standards for stream mitigation have also been set and include the following for perennial reaches:

- Less than 15% increase in cross sectional area of stream reaches caused by erosion.
- A bank height ratio (BHR) less than 1.2 at riffle cross-sections.
- Entrenchment ratio (ER) greater than 1.4 at riffle cross-sections.
- Stream reach meets a Natural Resource Conservation Service (NRCS) Stream Visual Assessment Protocol Version 2 (SVAP 2) average of 7. The SVAP 2 evaluates the physical and biological parameters of restored reaches qualitatively and quantitatively. This evaluation tool provides an indication of the health of a stream and its associated riparian

area and of the functions and services they perform in the landscape. This is achieved by scoring and averaging up to 16 different stream attributes, or “elements” to derive an overall stream health score.

Ultimately, USACE and NYSDEC will determine the required mitigation ratio based on the agencies’ assessment of what would be needed to avoid wetland loss over time due to Proposed Project activities. Mitigation for the other Connected Actions is also under development and remains the responsibility of each respective Connected Action proponent and USACE and NYSDEC, as appropriate.

Micron has also developed Mitigation Plans to address the loss of biological communities associated with wetlands (FEIS Appendix G), which will be implemented in consultation with the USFWS. See also Responses to Water Resources Comment 7 and 10.

With respect to concerns about the potential for downstream flooding, such impacts would be addressed by Stormwater Management Practices (SMPs). Stormwater design and permitting will follow NYSDEC requirements at the time of permit submittal for each phase of the Proposed Project. SMPs would be implemented to preserve existing drainage patterns to the greatest extent practicable, maintain the conveyance of upland watershed runoff, control increases in stormwater volume, prevent soil erosion and sedimentation, and reduce runoff using green infrastructure where feasible. Additionally, wet extended detention ponds and bioretention filtration areas would help mitigate downstream flood risks by reducing stormwater runoff volumes. These measures also support the protection of water quality by maintaining the integrity of stormwater systems. A detailed discussion of the SMPs and overall stormwater management approach is provided in Section 3.3 and Appendix F of the FEIS. See also Response to Water Resources Comment 27.

Water Resources Comment 10:

Commenters stated that the DEIS and proposed mitigation plan fails to address long term ecological losses because it will take decades for mitigation sites to provide similar ecological services to the present wetlands, if at all. Another commenter stated that the DEIS does not quantify the ecological value over time of existing forested wetlands that will be impacted compared with mitigation wetlands which will take many years to become established. A commenter stated that the DEIS should describe the value lost by wetland impacts and the value provided by mitigation.

Response: See Response to Water Resources Comment 9. As discussed in FEIS Section 3.3.4.2, Construction Effects, Wetlands, the goal of the Mitigation Plan (included in Appendix F-7) is to fully replace the suite of lost functions and services the on-site wetlands provide that would be impacted by construction of the Micron Campus. Although the establishment, re-establishment, and rehabilitation of offsite wetlands can take years to become fully functional, implementation of the compensatory mitigation shall be, to the maximum extent practicable, in advance of or concurrent with the activity causing the authorized impacts. For example, the project proposes to develop all of the mitigation sites for Phase 2 impacts prior to filling wetlands. This approach will help minimize the temporal loss of functions and services.

Mitigation ratios have also been proposed that are designed to overcompensate for the losses based on cover type and primary functions and services. For example, the proposed ratio for mitigating forested wetland losses are higher (3:1) than emergent wetland losses (1.5:1) due to the amount of time that it takes to develop a forested wetland. In general, the mitigation would be designed to compensate for and improve the wetland and stream functions and services over those lost with minimal loss of function over time and to increase both the quantity and quality of wetlands and streams within the larger watershed compared with current conditions within the first 10 years of establishment. Mitigation sites will be monitored based on the set of ecological performance standards established for wetlands and streams. Adjustments will be made by TWT to ensure these standards are met or exceeded so that the anticipated functions/services are sustainable for the future.

The proposed mitigation sites will also be protected in perpetuity via a conservation easement, which will preserve an additional 918.8 acres of existing wetlands and upland buffer. This will ensure that the mitigation sites result in large wetland / stream / upland complexes that compensate for the proposed impacts.

The mitigation plan adheres to federal and state wetland mitigation regulations and guidance with approval from all resource agencies involved. Each distinct wetland on the Micron Campus has been evaluated for its current cover type and condition to determine the number of credits/acres that will be needed to replace the impact. The permitting process with USACE and NYSDEC is ongoing and mitigation will be a condition of Micron's permits. Mitigation for the other Connected Actions is under development and remains the responsibility of each respective Connected Action proponent. See also Response to Water Resources Comment 9.

Water Resources Comment 11:

A commenter stated that Micron should be required to purchase existing wetlands to be protected in perpetuity.

Response: Micron's mitigation plan developed in coordination with the applicable resource agencies, will establish new mitigation wetlands using a 2:1 ratio of mitigation wetlands credits to lost wetland acres.. The mitigation plan includes wetland establishment, re-establishment and rehabilitation, and the number of mitigation credits given to each of these mitigation types will be determined by USACE and NYSDEC.

As stated in the *Off-site Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B): "The objective of this plan is to secure, preserve, and protect in perpetuity through conservation easements approximately 1,340 acres of upland and aquatic resources" including the rehabilitations of "113.9 acres of existing wetland, including 11.2 acres of [palustrine emergent marsh], 35.5 acres of [palustrine scrub shrub], and 67.2 acres of [palustrine forest]." Conservation easements for the mitigation sites will be held and managed by The Wetland Trust, Inc.

Water Resources Comment 12:

A commenter stated that mitigation sites should be protected in perpetuity by conservation easements or similar legal instruments.

Response: See Response to Water Resources Comment 11.

Water Resources Comment 13:

Commenters stated that excavated wetland soils, muck, and downed trees and woody debris from existing wetlands at the WPCP, which contains plant seeds, spores, and microorganisms, could be used for the establishment of new wetlands as part of the wetlands mitigation plan to accelerate the establishment of new wetlands.

Response: FEIS Section 3.8.3.2 contemplates the possible use of excavated materials, including re-use and recycling. Once construction begins, Micron will coordinate with The Wetland Trust, Inc. to assess the feasibility and practicality of moving wetland soil from the campus to the mitigation sites. However, a decision to reuse soils would have to consider the potential that the seed bank contains invasive or undesirable plant species, which could then result in the introduction and spread of invasive species at the mitigation sites. If implemented, the reuse will adhere to the provisions of the Invasive Species Management Plan (see FEIS Appendix G-9) and the Soil and Materials Management Plan (see FEIS Appendix K-7) and occur in coordination with and with approval from USACE and NYSDEC. See also Response to Geology/Soils Comment 9.

Water Resources Comment 14:

A commenter added that Micron should coordinate with the Wetland Trust and other wetland experts about reuse of wetland materials.

Response: See Response to Water Resources Comment 13.

Water Resources Comment 15:

Commenters stated that the wetland mitigation sites should be monitored long-term, under supervision of NYSDEC, to maximize functions and maintain values consistent with those wetlands that will be removed on the Micron site. Another commenter stated that water quality should be monitored to evaluate the effectiveness of all mitigation efforts with active involvement from the affected communities, including Indigenous Nations, in the oversight process.

Response: The objective of the mitigation plan is to establish, at a 2.2:1 ratio, wetlands with characteristics that are similar to or have greater value than the wetlands impacted. Micron's mitigation plan requires long-term monitoring to ensure mitigation site success. Each off-site mitigation sites will be monitored for 15 years following the year of completion to validate the successful establishment of wetland functions and ecological values. Section 7 of Micron's *Off-site Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B) states that "monitoring reports will be submitted by December 31st of the monitoring year to describe

conditions in the growing season” to USACE and NYSDEC. These monitoring reports will be submitted on a schedule described in Table 8 of Section 7, including a total of 11 reports over the course of 15 years, ranging from a post-construction report at year 0 to the final report at year 15 that covers the fifteenth full year of vegetative growth. Long-term management plans will be developed and submitted with each of the individual mitigation plans for USACE and NYSDEC review and will be subject to amendments as needed as the sites develop and mature. Monitoring reports submitted to USACE and NYSDEC will be available to the public upon request.

Water Resources Comment 16:

A commenter stated that the wetland mitigation sites should be monitored for invasive species that would overwhelm desired vegetation and result in loss of wetland value and function.

Response: Performance conditions will include invasive species management which will begin before construction and continue during the entire 15-year monitoring period. The *Off-site Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B) states that prior to the initiation of earthwork at the mitigation sites, invasive vegetative species management will target non-native, invasive plants identified at each site (see the Invasive Species Management Plan (ISMP) for of each individual mitigation plan in FEIS Appendix F-7, Appendix N, Attachment B) that are within the restoration work area, and any area within The Wetland Trust, Inc. ownership boundary that may present a current or future problem. Control methods may include mechanical removal, such as hand-pulling or mowing, and chemical treatments using targeted herbicide treatments or both. These actions will be timed during the appropriate season of the target species to maximize effectiveness. Invasive species control will be completed in a manner that avoids soil disturbance, reduces seed dispersal, and limits impacts on local resources. All treated areas will be monitored to ensure the effectiveness of the control measures, and follow-up treatments will be applied as necessary.

Water Resources Comment 17:

A commenter that lives near the proposed mitigation sites on Buxton Creek expressed concerns about monitoring of mosquito populations at the mitigation sites as well as herbicides used at the sites that drain into the Oneida River. Another commenter expressed concern about the selection of wetland mitigation sites in connection with endemic mosquito-borne diseases in the area and any minimization measures planned to limit mosquito populations and monitoring of same.

Response: The properties that The Wetlands Trust (TWT) would develop for the mitigation sites are located in the vicinity of existing wetlands and wet areas, so the establishment and enhancement of wetlands on the properties would not cause a substantial alteration to current conditions in the area. The intent of the mitigation plan is to establish and enhance wetlands at those sites that will develop into mature, balanced wetland ecosystems that include multiple predator species that eat mosquitoes. The mitigation plan does not include developing any artificial standing water such as cisterns or gutters where mosquitoes are unfettered by predation. The natural wetlands being considered for development have cooler water compared to artificial containers (e.g., gutters, old tires, buckets) that can harbor disease carrying mosquitoes.

With respect to invasive species control measures, such controls will be completed in a manner that avoids soil disturbance, reduces seed dispersal, and limits impacts on local resources. See the Invasive Species Management Plan (ISMP) for each individual mitigation plan in FEIS Appendix F-7, Appendix N, Attachment B.

See Responses to Oswego County Comments 38 and 39. See also Response to Water Resources Comment 16 regarding invasive species management.

Water Resources Comment 18:

A commenter stated that Micron should be required to monitor the health of remaining wetlands onsite.

Response: See Response to Water Resources Comment 27. Micron (and the proponents of the Connected Actions) will evaluate monitoring well and surface water data to identify the need for modifications to the Proposed Project or Connected Actions to avoid or minimize effects from stormwater runoff on remaining wetlands. Micron will monitor groundwater and surface water levels within the adjacent surface waters and wetlands prior to, during, and after construction to inform Micron of any adaptive management strategies that need to be implemented to maintain the health of the remaining wetlands. Any adaptive management measures will be included in a Wetland Adaptive Management Plan. In addition, as discussed in FEIS Sections 3.3.4.2 and 3.4.4.2 Micron will be required to minimize indirect effects on remaining wetlands from stormwater flows and runoff through the implementation of stormwater BMPs and by maintaining vegetative buffers. Local municipalities will be responsible for overseeing the implementation of stormwater BMPs and adaptive management measures.

Water Resources Comment 19:

Commenters expressed concern that the DEIS does not evaluate the effect of the Proposed Project's impacts on ground and surface water flows that will impact groundwater recharge on remaining and adjacent wetlands.

Response: See Responses to Water Resources Comments 18 and 27. The FEIS acknowledges that the Proposed Project has the potential to affect remaining and adjacent wetlands due to changes in hydrology from stormwater runoff and groundwater recharge. Micron will be required to implement stormwater BMPs and SMPs to reduce runoff rates, reduce erosion, and protect remaining and adjacent wetlands from contamination (FEIS Section 3.3.4.2). Additionally, groundwater and surface water monitoring wells have been installed to evaluate pre-project, during construction, and post-project groundwater and surface water conditions. Adaptive management measures will be identified in a Wetland Assessment and Monitoring Plan (Appendix O to the Micron JPA application), and may include, but are not limited to, the following:

- Adjust onsite structures (such as retrofitting culverts and risers) that contribute surface water to the offsite aquatic resources to optimize water levels and maintain existing hydrologic conditions to the extent practicable.

- Inspect condition of storm drainage infrastructure inlets/outlets and remove accumulated debris and sediment as needed to maintain functionality and minimize flow disruption to wetland areas.
- Address erosion and sedimentation issues.
- Monitor impacts/damage from mammals (e.g., beaver, muskrat) and employ control techniques (e.g., trapping and removal) as necessary.
- Modify or supplement hydrologic inputs, including temporary irrigation or rerouting clean stormwater, in response to prolonged deviations from baseline groundwater or surface water conditions, to prevent degradation of hydric soil characteristics.
- Revise and adjust subsequent design phases in response to monitoring data results that indicate adverse impacts to wetland conditions.
- Employ control measures (e.g., manual removal) to reduce invasive species aerial coverage.
- Incorporate annual adaptive management review cycles to review monitoring data results, assess management effectiveness, and implement strategies as needed.

Water Resources Comment 20:

A commenter stated that the DEIS does not adequately assess the cumulative and downstream impacts of filling ephemeral and intermittent streams.

Response: Section 3.3.4.2 of the FEIS acknowledges and evaluates the impacts to ephemeral and intermittent streams from the construction of the Proposed Project, including downgradient river and stream channels (FEIS Table 3.3-10). These effects will be minimized through the required implementation of stormwater BMPs and Stormwater Management Practices (SMPs).

Micron's construction activities would be subject to SPDES General Permit requirements, and a detailed evaluation of stormwater management and specific mitigation would be documented in Micron's SWPPP prior to operation. Micron will also be providing an analysis with the SWPPP under the NYS Community Risk and Resiliency Act (CRRA) to assess climate change, and flooding stormwater design and permitting will follow NYSDEC requirements at the time of permit submittal for each phase of the project. SMPs would be implemented to preserve existing drainage patterns to the greatest extent practicable, maintain the conveyance of upland watershed runoff, control increases in stormwater volume, prevent soil erosion and sedimentation, and reduce runoff through the use of green infrastructure where feasible. BMPs to reduce erosion, sedimentation, and sediment transport would include silt fencing, stone outlet sediment traps, compost filter socks, compost filter bag sediment traps, temporary gravel roads, and stabilized construction access (see FEIS Section 3.3.4.2, Stormwater). Additionally, wet extended detention ponds and bioretention filtration areas would help mitigate downstream flood risks by reducing stormwater runoff volumes. These measures also support the protection of water quality by maintaining the integrity of stormwater systems. A detailed discussion of the SMPs and overall stormwater management approach is provided in FEIS Section 3.3 and Appendix F.

Additionally, impacts to surface water features and floodplains due to induced residential and commercial growth, or due to other projects in the study area, would be reviewed on case-by-case basis and be subject to USACE and/or NYSDEC jurisdiction and federal, State, or local permit programs, which may require avoidance, minimization, or mitigation measures.

Water Resources Comment 21:

A commenter stated that further study of the potential impacts of the Proposed Project discharges on water quality in Oswego County is needed, including PFAS and increases in temperature.

Response: NYSDEC includes specific monitoring parameters, such as biochemical oxygen demand (BOD), total suspended solids (TSS), and flow rate, detailed in each individual wastewater discharge permit. The agency's requirements depend on the facility's design and permit type and mandate compliance with both state and federal water quality standards. The permit issued by NYSDEC will detail the specific pollutants to be monitored, the required frequency of sampling (e.g., daily, monthly, semi-annually), the concentration limits, and the approved analytical methods to be used. NYSDEC also requires PFAS monitoring provisions in its SPDES permits, including sampling for approximately 40 compounds using EPA Method 1633/1633A and leveraging state guidance values. NYSDEC may also require that the IWWTP include monitoring parameters for temperature if the agency determines that such parameters are necessary to protect aquatic resources. No further study would be required.

See Response to Oswego County Comment 11.

Water Resources Comment 22:

A commenter questioned whether chemical information will be available under the TRI reporting rule, and if so, why not disclose it now?

Response: See Response to Solid Waste and Hazardous Materials Comment 9 and 29.

For additional information regarding PFAS, see FEIS Appendix L-1.

Water Resources Comment 23:

A commenter stated that the evaluation of PFAS must use a definition of PFAS that encompasses the full PFAS class.

Response: As discussed in FEIS Section 3.8.3.2 and FEIS Appendix L-1, definitions of PFAS vary by agency and continue to evolve with regulation. USEPA and the Organization of Economic Cooperation and Development (OECD) provide detailed definitions and publish lists of materials, while New York state uses a different definition but does not publish a list of substances that meet the definition. These definitional frameworks are also discussed in NIST's "Final Programmatic Environmental Assessment for Modernization and Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program" (2024). For purposes of the FEIS, the

agencies did not exclude consideration of any PFAS based on these definitions, taking a broad view to review potential impacts of the Proposed Project.

Water Resources Comment 24:

Commenters stated that a baseline for PFAS in current water withdrawals, upstream from the proposed discharge point, and current wastewater discharges should be measured to compare with future monitoring of Micron's wastewater discharges, and that monitoring should be coordinated among the State, County, and Micron and made publicly available.

Response: Discharges of wastewater will have to meet NYSDEC established SPDES permit standards. Micron's wastewater discharges will require an Industrial Wastewater Discharge Permit (IWDP) issued by OCDWEP in accordance with its EPA-approved Industrial Pretreatment Program. Micron will be required to comply with OCDWEP-issued IWDP permit and any other federal or state pretreatment requirements. As discussed in FEIS Section 3.8.3.2 and Appendix L-1, Micron will apply to OCDWEP for an IWDP, which will specify limits for discharges to the IWWTP, as well as monitoring and reporting requirements, including for PFAS. OCDWEP's upgraded and expanded OOWWTP (both industrial and municipal wastewater treatment plants) will require a modified SPDES permit from NYSDEC for discharge of treated wastewater to the Oneida River. NYSDEC also requires PFAS monitoring provisions in its SPDES permits, including sampling for approximately 40 compounds using EPA Method 1633/1633A and leveraging state guidance values. Specific details of monitoring plans will be determined at the time of permitting and final designs and permits are pending.

Water Resources Comment 25:

Commenters expressed concern that PFAS cannot be reliably measured because the most up-to-date methods can only detect 40 PFAS substances.

Response: The FEIS evaluation of potential impacts from wastewater containing PFAS considers the current state of technology for monitoring and treatment. As discussed in FEIS Section 3.8.3.2 and Appendix L-1, analytical techniques for measuring PFAS in various media are evolving. Government and industry groups, including semiconductor trade groups in which Micron actively participates, are working to advance the development of validated methods for accurately identifying and quantifying PFAS in various matrices, including wastewater. Presently, EPA Method 1633A is the only standardized validated method for analyzing approximately 40 PFAS in industrial wastewater. NYSDEC requires PFAS monitoring as provisions in its permits, including periodic sampling for approximately 40 compounds, using EPA Method 1633/1633A and leveraging state guidance values. Micron will be required to comply with the discharge limits for PFAS set in its IWDP from OCDWEP, employing technology that will meet those pretreatment limits on the Micron Campus prior to discharge to the IWWTP.

Water Resources Comment 26:

A commenter asked if Micron will monitor PFAS, what will be monitored, what frequency, and will the information be shared with the County. A commenter stated that

a comprehensive monitoring program for PFAS in groundwater, surface water, and effluent should be implemented with public reporting of results.

Response: See Response to Water Resources Comment 24 regarding monitoring of wastewater. The lead agencies recognize that OCDWEP will establish that monitoring of PFAS in wastewater for Micron that will occur no less than quarterly pursuant to an IWDP issued by OCDWEP and will be reported to OCDWEP. No groundwater discharges of wastewater are anticipated; accordingly, no monitoring of groundwater for PFAS is planned.

NYSDEC is responsible for monitoring NYS surface waters and does so through its Statewide Ambient Water Quality Monitoring Program (SWMP), which includes the Rotating Integrated Basin Studies (RIBS) program. RIBS is a comprehensive water quality assessment of the state's major river and stream basins on a 5-year rotating cycle. NYSDEC has included PFAS in the RIBS program.

Water Resources Comment 27:

Concerns were raised regarding water displacement runoff to adjacent properties and surrounding towns from the removal of wetlands.

Response: FEIS Section 3.3.4.2 acknowledges the potential impacts of flooding from increased surface water runoff due to the loss of water retention capacity from wetlands and surface waters. However, Micron has employed a comprehensive hydrologic modeling program as part of the development of a Wetlands Assessment and Monitoring Program. The modeling was performed under the guidance of the NYSDEC and the USGS. The results of the modeling indicate that the Micron construction would not result in significant adverse effects from stormwater or significant adverse effects on floodplains. See FEIS Section 3.3.4.2.

Further, Micron will be required to implement Stormwater Best Management Practices, or BMPs, as well as post-construction Stormwater Management Practices, or SMPs, in the final design of the Proposed Project. These BMPs and SMPs would serve to reduce stormwater runoff rates and avoid exacerbating flooding during large rain events.

Specific BMPs will include:

- Runoff rate reduction: stone check dams, slope stabilization with turf matting, perimeter dikes or swales, and rock outlet protection.
- Temporary stabilization and reduction of erosion and sedimentation: silt fencing, stone outlet sediment traps, compost filter socks, and compost filter bag sediment traps.
- Prevention of sediment transport: temporary gravel roads and stabilized construction accesses.

Proposed SMPs include wet extended detention ponds, filtration bioretention areas, stormwater planters with underdrains, dry swales, rainwater harvesting systems, green roofs, rooftop disconnections, and porous pavement. The SMPs would be designed to maintain existing drainage patterns to the greatest extent practicable, convey upland watershed runoff, control stormwater runoff, prevent soil erosion and sedimentation, and provide runoff reduction.

All BMPs and SMPs will be documented in site-specific SWPPPs and subject to regulatory oversight. Additionally, Micron is committed to ongoing coordination with relevant agencies to ensure that water quality protections remain effective.

Additionally, of the 42 groundwater monitoring wells installed as part of pre-design activities, 17 would provide a basis for developing adaptive stormwater management measures. Information gathered from the remaining 25 monitoring wells, the additional 15 surface water monitoring points (7-culvert and 8-channel), and the 5 piezometer wells proposed to be installed within wetlands around the WPCP, would be periodically assessed to determine if any alterations would need to be made to the stormwater management measures. These monitoring wells will allow for the tracking of direction of flow of groundwater as well as the height of the water table. Details can be found in Section 3.3, Water Resources, and Appendix F of the FEIS.

Water Resources Comment 28:

Commenters proposed different types of monitoring for PFAS and other chemicals. A commenter stated that monitoring should be required for all fluorinated compounds in wastewater. Another commenter suggested that Micron test wastewater using analytical methods that include the whole range of PFAS such as TOPS and total adsorbable fluorine and/or total fluorine. Another commenter stated that Micron should use methods that detect total organic fluorine and limited fluorinated compounds all together. Another commenter recommended testing for total organic fluorine and total oxidizable precursors and all of the chemicals listed in Appendices C and D of the CHIPS Program Office Final Programmatic Environmental Assessment, dated June 28, 2024.

Response: See Responses to Water Resources Comments 24 and 25. FEIS Appendix L-1 also discusses the evolution of PFAS analytical methods and the limitations of these evolving technologies. As discussed in FEIS Appendix L-1, Micron's IWDP and OCDWEP's SPDES permit will include periodic monitoring and reporting requirements for PFAS. As analytical methods evolve, such requirements will be updated appropriately.

Water Resources Comment 29:

A commenter stated that Micron must commit to measures that avoid and minimize the significant adverse effects from the Project's use and release of PFAS, including periodic surface water, groundwater, and fish monitoring; periodic monitoring of drinking water wells; monitoring of pretreatment wastewater before and after pretreatment; funding of monitoring at Oak Orchard; evaluating PFAS to be used and seek alternatives; and establishing a research fund for developing alternatives to PFAS.

Response: Government and industry groups, including semiconductor trade groups in which Micron actively participates, are working to advance the development of validated methods for accurately identifying and quantifying PFAS in various matrices, including wastewater. As discussed in FEIS Section 3.8.3.2 and Appendix L-1, Micron is evaluating potential non-PFAS containing alternatives to the chemistries, equipment, and materials used in semiconductor fabrication. This includes partnering with several suppliers to explore non-PFAS alternatives, as well as engagement with the broader semiconductor industry through groups like the World

Semiconductor Council (WSC), the Semiconductor Industry Association's PFAS Consortium, SEMI, and the National Science Foundation/ Semiconductor Research Corporation, as further discussed in Micron Technology's 2025 Sustainability Report (chemical management). Presently, there are no known, drop-in substitutes for many critical PFAS uses in semiconductor fabrication, and substitutions will require fundamental changes in the design of processes, materials, and facilities in ways that are currently unknown.

Micron will be subject to monitoring and reporting requirements as part of its IWDP issued by OCDWEP in accordance with its EPA-Approved Pretreatment Program. NYSDEC also requires PFAS monitoring in SPDES discharge permits, which would be required for both the Oak Orchard IWWTP and OOWWTP (collectively the IWWTP and municipal WWTP). See also Response to Solid and Hazardous Waste Comment 48 regarding protective measures from releases and spills. See also Response to Water Resources Comment 24, 28 and 40.

Water Resources Comment 30:

A commenter stated that Micron should monitor wastewater using GIS or remote sensing over traditional grab sampling.

Response: The lead agencies will require only that Micron comply with the monitoring requirements specified in its permits. Any additional or different monitoring may be considered by Micron in coordination with the applicable resource agencies and in accordance with applicable regulatory requirements.

Water Resources Comment 31:

A commenter stated that the effectiveness of the treatment of hazardous substances in wastewater should be confirmed by independent monitoring.

Response: Micron's wastewater discharges will require an IWDP issued by OCDWEP in accordance with its EPA-approved Pretreatment Program. Monitoring and reporting of PFAS in wastewater will be required of Micron under its IWDP. OCDWEP's discharges are covered by a SPDES permit issued by NYSDEC, which is currently being modified. SPDES permits establish effluent limitations and monitoring requirements for the OOWWTP to ensure compliance with established SPDES limits. Specifically, with respect to the IWWTP, "OCDWEP would be responsible for ensuring that operation of the IWWTP complies with SPDES [collectively the IWWTP and municipal treatment plant] permit conditions, including effluent limitations and water quality standards under ECL Article 17 and 6 NYCRR Part 703...OCDWEP would coordinate with NYSDEC to perform regular analytical testing of effluent sampling and surface water samples and would comply with ongoing monitoring, reporting and sampling requirements." See FEIS Section 3.4.4.2, Connected Actions.

NYSDEC requires that wastewater samples be collected and then analyzed by certified laboratories. The results are then routinely reported to NYSDEC. Laboratories are certified by the New York State Department of Health (NYSDOH), which operates the Environmental Laboratory Approval Program (ELAP) program. As part of the ELAP program, NYSDOH audits these laboratories periodically.

Water Resources Comment 32:

A commenter stated that Micron is working under a faulty assumption that the transformation of PFAS into “shorter chain PFAS” makes the PFAS safer.

Response: As discussed in FEIS Sections 3.3.4.2 and 3.8.3.2 and Appendix L-1, Micron continues to assess emerging PFAS wastewater technologies capable of addressing PFAS, including technologies capable of removing both long- and short-chain PFAS at the Micron Campus. It is anticipated that Micron’s IWDP issued by OCDWEP will include limits and monitoring requirements for PFAS. The FEIS and Appendix L-1 also address multiple approaches to providing for the proper management of PFAS substances by Micron. See also Response to Water Resources Comment 29.

Water Resources Comment 33:

A commenter questioned whether the technologies listed in the DEIS are capable of treating PFAS in semiconductor waste to the ppt level?

Response: As discussed in FEIS Sections 3.3.4.2 and 3.8.3.2. and Appendix L-1, Micron will be required to comply with the discharge limits established by OCDWEP in its IWDP, employing technology on the Micron Campus that will meet those limits. Micron continues to assess emerging PFAS wastewater technologies capable of addressing PFAS at the part per trillion levels found in semiconductor fabrication wastewater prior to treatment and that will meet limits specified in the Micron Campus’s IWDP. This includes review of available literature that has identified a suite of candidate technologies for potential inclusion in the Proposed Project, including technologies identified as best available technology under 40 CFR 141.61(d), Table 3. This assessment includes segregation and destruction capabilities, removal or destruction efficacy of various chain lengths, effectiveness of technologies alone or in combination, and management options for PFAS-containing waste generated during treatment.

Micron is also working with various semiconductor industry groups to pursue PFAS pollution prevention and treatment options, as discussed in Micron Technology’s 2025 Sustainability Report. Early evaluations suggest that the most effective wastewater treatment solution for the Proposed Project will involve installation of PFAS segregation technology targeted to the relevant process wastewater streams.

Water Resources Comment 34:

A commenter requested a commitment from Micron to use the best available treatment technology to remove PFAS to the ppt level onsite, include PFAS in continuous effluent monitoring requirements, and allocate funding for third party verification.

Response: See Responses to Water Resources Comments 24, 31, and 33.

Water Resources Comment 35:

Commenters stated that Micron should ensure that wastewater is free from chemicals before releasing it through the use of state-of-the-art treatment technology, such as reverse osmosis, advanced oxidation or surface plasma treatment, at the Micron Campus or paid for by Micron at the wastewater treatment plant. Another commenter expressed a similar concern about the treatment of PFAS by Micron before wastewater leaves the plant and investment in PFAS treatment processes as they become available over time. Another commenter stated that strict pretreatment standards should be enforced.

Response: See Responses to Water Resources Comments 24, 33 and 34. OCDWEP will establish PFAS limits in Micron's IWDP. To meet these discharge limits, Micron will employ on-site pretreatment prior to discharge to the IWWTP.

Water Resources Comment 36:

Micron should provide additional detail on the PFAS treatment systems proposed for its on-site Industrial WWTP, including an assessment of where PFAS removed from the process wastewater will end up. Unless Micron can show that PFAS will fall out elsewhere in the treatment process, the sludge from the on-site industrial WWTP should be considered hazardous and not suitable for land application as fertilizer or soil enhancer.

Response: Additional details on PFAS pretreatment systems are included in FEIS Appendix L-1. As summarized in Exhibit C of this Appendix, there is a suite of candidate technologies available for potential inclusion in the Proposed Project that require further evaluation to determine their suitability, scalability, and configuration within semiconductor fabrication facility wastewater systems. Promising developments include technologies that may break the carbon-fluorine bonds, thereby reducing cost and risk associated with secondary waste streams. Such technologies may be used in tandem with other proprietary technologies that Micron similarly is scrutinizing for appropriateness. Detailed, site-specific design will determine the technology or technologies selected based on factors such as the candidate technologies' capabilities, the commercial viability of the treatment vendors, the feasibility of any necessary pretreatment, and their operational characteristics, but the existence of effective treatment and destruction technologies is not currently in doubt.

Regardless of the final technologies selected, Micron will be required to meet discharge limits that OCDWEP will impose in Micron's IWDP, employing onsite PFAS wastewater treatment necessary to meet discharge limits. See also Responses to Water Resources Comments 33 and 34 and Nation Comment 17.

Solids/sludge will be disposed of according to applicable regulations and the materials management framework discussed in FEIS Appendix L-1.

Water Resources Comment 37:

A commenter stated that Micron, not OCDWEP, should be responsible for the treatment of PFAS in wastewater from Micron's operations.

Response: See Responses to Water Resources Comments 25, 33, and 34. Micron will be required to meet discharge limits specified in the IDWP issued by OCDWEP and will employ onsite PFAS wastewater pretreatment necessary to meet the discharge limits. See FEIS Appendix L-1.

Water Resources Comment 38:

Commenters generally stated that current legal standards for PFAS are insufficient. One commenter stated that there are no monitoring requirements on water permits. Other commenters stated that compliance with permit terms does not mean that there will be no significant environmental effects because there are not federal or state drinking water standards for all types of PFAS (only two types have drinking water standards in NY and six currently under federal law).

Response: The lead agencies acknowledge that the regulatory standards for PFAS are evolving. With this backdrop, the FEIS evaluates the potential environmental effects of PFAS and the avoidance and mitigation measures to address such effects based on the information that is currently available and the current state of monitoring and treatment technologies. The FEIS also acknowledges that government and industry groups, including semiconductor trade groups in which Micron actively participates, are working to advance the development of validated methods for accurately identifying and quantifying PFAS in various matrices, including wastewater, and that regulatory standards may change over time.

Limits and controls established for specific PFAS prioritized for regulation would reasonably be expected to provide benefits and adequate levels of protection for other PFAS as well. PFAS also would be addressed cumulatively by the other regulatory controls, including appropriate storage and handling of chemicals, and spill prevention planning, as discussed in the FEIS. See Response to Solid and Hazardous Waste Comment 48. Further, review of available technologies is not limited to those effective on only currently-regulated PFAS or to any subset of PFAS for which approved analytical methods in wastewater exist. Micron is also working with various semiconductor industry groups to pursue PFAS pollution prevention and treatment options, as discussed in Micron Technology's 2025 Sustainability Report.

Water Resources Comment 39:

A commenter stated that a "mixing zone" downstream from the water treatment plant will not ameliorate impacts from PFAS, because PFAS are persistent in the environment and there are no water quality criteria or acute toxicity values for the majority of the PFAS that Micron would discharge.

Response: See Response to Water Resources Comment 38. Treatment of PFAS in the FEIS does not rely on dilution in a mixing zone to meet compliance requirements. Industrial wastewater generated on the Micron Campus that is not treated at the campus for reuse would be treated on

the Micron Campus to levels necessary to meet discharge limitations (including for PFAS) contained in an IWDP issued to Micron by OCDWEP prior to being sent to the IWWTP at the Oak Orchard Site. Micron's IWDP would be based on a USEPA-approved Industrial Pretreatment Program and the individual SPDES permit issued by NYSDEC to OCDWEP pursuant to ECL Article 17 (6 NYCRR Part 750) to authorize discharge of treated industrial wastewater from the IWWTP into surface waters of the Oneida River.

Water Resources Comment 40:

Commenters stated that reliance on future wastewater permits and descriptions of the types of pollution control technologies Micron intends to use (without any commitment), are insufficient to assess the environmental risk of wastewater discharges. Another commenter stated that permits and the plans on which those permits will rely have not been finalized.

Response: See Responses to Water Resources Comments 31 and 38. Pretreatment limits will be met by Micron for discharge to the Oak Orchard IWWTP, and the IWWTP treatment performance will be validated to meet SPDES discharge limits. As discussed in FEIS Section 3.8.3.2 and Appendix L-1, OCDWEP will issue an IWDP to Micron that will include PFAS wastewater discharge limits. Micron will implement wastewater pretreatment to meet these limits. The OCDWEP IWWTP/OOWWTP discharges are subject to the SPDES permitting program, which includes public participation, technical review, and enforceable conditions that ensure environmental protection. As such, while specific technologies may evolve, the regulatory oversight and performance standards remain robust and enforceable.

During the permitting process, regulatory agencies establish effluent discharge limits designed to protect public health, safety, and welfare. These limits are based on applicable federal and state regulations and are informed by the anticipated characteristics of the wastewater and the capabilities of the treatment technologies. SPDES permits require that effluent samples be collected regularly and analyzed by certified laboratories. The results of these analyses are then routinely submitted to NYSDEC to demonstrate compliance with permit conditions. Effluent limitations are determined using two main approaches:

1. Technology-Based Effluent Limitations (TBELs):

These are based on the capabilities of current treatment technologies and reflect the best practicable control methods available. TBELs are often standardized across industries.

2. Water Quality-Based Effluent Limitations (WQBELs):

These are customized to ensure that discharges do not violate water quality standards in the receiving water body.

Once these limits are established, Micron and OCDWEP will be required to conduct regular sampling and analysis of the treated effluent using NYSDEC-approved methods.

Typical monitoring requirements include:

- Numerical limits for specific pollutants
- Action levels and response protocols
- Reporting schedules and data submissions to NYSDEC

These safeguards ensure that any discharge from the Micron Campus meets strict environmental standards and does not compromise water quality.

While final plans and permits are still under development, the regulatory framework ensures that effluent limits will be protective of water quality and public health. These limits are subject to revision during permit renewals, often becoming more stringent as treatment technologies and analytical methods improve. Since issuance of the notice of DEIS, OCDWEP has submitted an application to the NYSDEC for modification of the current SPDES permit.

Water Resources Comment 41:

A commenter stated that a Pretreatment Program should be implemented and that no discharges of any wastewater with PFAS should be discharged to the wastewater treatment plant. A commenter stated that Micron should be required to use methods that destroy, rather than remove, PFAS, such as supercritical water oxidation.

Response: See Responses to Water Resources Comments 33, 34, and 38. NYSDEC will determine the SPDES permit effluent limit specifications in accordance with federal, state, and local guidelines for the Oak Orchard IWWTP to protect surface waters, groundwater, and aquifers. OCDWEP's EPA-approved Industrial Pretreatment Program will impose wastewater discharge limits for PFAS and other pollutants by Micron prior to discharge to the Oak Orchard IWWTP. This discharge will be closely monitored to ensure compliance with Micron's IWDP limits set by OCDWEP and any other applicable federal or state pretreatment requirements in order to protect Oak Orchard IWWTP treatment processes and ensure the IWWTP's compliance with NYSDEC-established discharge limits. Micron will comply with anticipated discharge limits, employing technology that will meet those limits. NYSDEC will determine the SPDES permit effluent limit specifications for the Oak Orchard OOWWTP (both the IWWTP and municipal wastewater treatment plant) to protect surface waters, groundwater, and aquifers.

Micron continues to review evolving wastewater treatment technologies, including both segregation and destruction technologies, capable of meeting anticipated discharge limits to the IWWTP. Currently available information suggests that localized application of segregation and concentration technologies are the most effective treatment for Micron's operations. If additional treatment is needed to meet discharge limits, Micron will evaluate such additional treatments.

Water Resources Comment 42:

A commenter stated that Micron should be prevented from operating until the wastewater treatment plant upgrade is complete and has demonstrated the ability to treat PFAS waste without any "pass through."

Response: The regulatory definition of "pass through" in 40 CFR §403.3(p) refers to a "[d]ischarge which exits the POTW into waters of the United States in quantities or concentrations which, alone

or in conjunction with a discharge or discharges from other sources, is a cause of a violation of any requirement of the POTW's NPDES permit (including an increase in the magnitude or duration of a violation).” Micron would be required to comply with discharge limits and applicable pretreatment standards under its IWDP prior to discharge to the IWWTP that are protective of the OOWWTP SPDES permit limitations.

OCDWEP’s new wastewater treatment systems will be carefully tested during start up to make sure effluent is within the compliance parameters set forth by the NYSDEC for discharge to the Oneida River.

Water Resources Comment 43:

A commenter stated that permits issued to Micron and the wastewater treatment plant should include effluent limitations and/or new source performance standards for all PFAS that Micron knows or foresees will be discharged. The permit should also include best management practices to control or abate discharges and prohibit land application of biosolids.

Response: See Responses to Water Resources Comments 38 and 42 and Nation Comment 17. Any land application of biosolids would occur only in compliance with applicable legal requirements. No PFAS new source performance standards exist for semiconductor wastewater discharging to a POTW. FEIS Appendix L-1 provides further detail on the framework for management of PFAS-containing materials that will comply with applicable legal requirements and be consistent with USEPA’s guidance on treatment and disposal of PFAS-containing materials.

Water Resources Comment 44:

Commenters stated that the DEIS does not address the treatment of discharges during construction and initial operations before the wastewater treatment plant upgrade.

Response: FEIS Sections 2.1.8 and 3.10.3.2 address construction and initial operations while the wastewater treatment plant is being upgraded. As described in FEIS Section 3.10.3.2, Preferred Action Alternative, under Wastewater Treatment and Discharge Capacity, the Oak Orchard Wastewater Treatment Plant (OOWWTP) will receive both sanitary wastewater and startup industrial wastewater from the Micron Campus.

The Onondaga County Department of Water Environment Protection (OCDWEP) has determined that it can handle Micron’s initial flow (Years 1-4) with its current facilities. During this interim period OCDWEP will also be constructing its IWWTP. The staged approach ensures that wastewater discharges are managed responsibly throughout all phases of development. Once Micron begins production, all operational industrial wastewater flows from Micron will be directed to the IWWTP in compliance with Micron’s IWDP.

See also Response to Water Resources Comment 37 regarding water reclamation and reuse.

Water Resources Comment 45:

Commenters stated that Micron should be required to evaluate PFAS alternatives to reduce or eliminate their use. Another commenter stated that these efforts should be reviewed by the Involved Agencies and compared with baseline data at Micron's expense. Another commenter stated that PFAS alternatives already exist and could be implemented.

Response: Micron's ongoing efforts to evaluate PFAS alternatives is discussed in FEIS Appendix L-1.

Water Resources Comment 46:

Commenters asked about the location of the wastewater discharges and if holding ponds will be used onsite.

Response: Wastewater will be discharged through a new outfall, located in the same general vicinity as the existing outfall in the Oneida River. Once the Oak Orchard sanitary WWTP upgrade is complete (a project independent of the Preferred Action Alternative), it will not require the existing lagoons, which will be removed from the site.

Holding ponds related to industrial wastewater discharges are not anticipated.

Water Resources Comment 47:

Commenters expressed concerns that the Proposed Project discharges will impact other water bodies, including Onondaga Lake, the Seneca River, and the Upper St. Lawrence River.

Response: Onondaga Lake and the Seneca River upstream of the Three Rivers Junction are not downstream of the Oak Orchard outfall and would not be impacted. Surface water bodies significantly downstream of the Oak Orchard WWTP outfall such as Lake Ontario and Upper St. Lawrence River are not expected to be impacted by wastewater from the Proposed Project.

The existing NYSDEC SPDES permitting process is protective of water quality standards for downstream water bodies.

See also Responses to Water Resources Comments 31, 37, 39, 40, and 44.

Water Resources Comment 48:

Commenters raised concerns about the impact of spills and wastewater discharges on drinking water, including municipal water intakes.

Response: See Response to Water Resources Comment 47; Response to Solid Waste and Hazardous Materials Comment 48. The reclamation, reuse, pre-treatment, and treatment of industrial wastewater discharges in conformance with permitting requirements, as well as the

immediate response to any spills as directed under various spill plans described in these Responses and the FEIS, will avoid impacts to drinking water, including municipal water intakes.

Water Resources Comment 49:

A commenter raised concerns about chemicals polluting farms.

Response: See Response to Water Resources Comment 48. Treated wastewater effluent will not be discharged to farms. Solids will be disposed of according to applicable regulations.

Water Resources Comment 50:

A commenter stated that the DEIS does not consider the impact from the need for additional water and wastewater treatment and upgrades in other jurisdictions, including Oswego County, due to induced growth effect or Connected Actions.

Response: See Response to Oswego County Comment 34.

Water Resources Comment 51:

A commenter stated that the DEIS did not consider the risk of leachate discharges from landfills that accept wastewater treatment sludge containing PFAS from the wastewater treatment plant treating Micron's wastewater discharges.

Response: FEIS Section 3.8.3.2 and the Appendix L-1 identify and discuss a range of wastewater treatment technologies and disposal options for different types of generated waste at the proposed Micron Campus.

USEPA's current interim guidance on PFAS destruction and disposal describes the agency's latest assessment of the available methods for treatment and management of the PFAS-containing waste. Micron will use this and other guidance to assess suitable methods for disposal and management of PFAS-containing waste and will comply with applicable laws for the safe and proper disposal of any generated solid and hazardous waste.

OCDWEP will comply with NYSDEC solid waste disposal regulations and policies for disposal of biosolids generated from the Oak Orchard IWWTP treatment process.

Water Resources Comment 52:

Commenters are concerned that contamination from the Micron site would end up in the water supply intake in Lake Ontario and in the Oneida River (and other surface waters).

Response: See Responses to Water Resources Comments 40, 47, and 48.

Water Resources Comment 53:

Commenters raised general concerns about the nature, impacts, ability to treat, and monitoring of wastewater from Micron's manufacturing processes, including concerns about the presence of "forever chemicals," and how wetlands, water resources, and drinking water will be protected.

Response: See Responses to Water Resources Comments 24, 25, 33, 34, 37, 40, 47, and 48. Untreated wastewater will not be discharged into any waterbody. FEIS Section 3.3.4.2 discusses the management and treatment of wastewater at the Micron Campus prior to discharge.

Water Resources Comment 54:

The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.

Response: The FEIS, which has been reviewed by the federal and state agencies with regulatory authority and expertise in water quality and protection of ecological resources, fully addresses reasonably foreseeable impacts to hydrological and ecological resources in Section 3.2 (Geology, Soils, and Topography), Section 3.3 (Water Resources), and Section 3.4 (Biological Resources). These sections evaluate the Proposed Project's reasonably foreseeable effects on wetlands, water quality, groundwater, surface water, and ecological communities. Relative to surface water and groundwater, Micron is implementing a Wetlands Assessment and Monitoring Plan (Appendix O to the Micron JPA application) to monitor groundwater and surface water flow as a means of assessing the potential for impacts to onsite and downstream wetlands that might occur as a result of construction and operational activities at the site. Should impacts be identified, adaptive management measures would be implemented to ensure the continued success of these wetlands. Where significant impacts to wetlands and surface water streams may occur, the avoidance, minimization, and mitigation measures described in Sections 3.3.4.2 and 3.3.5 of the FEIS, and as required by federal and state law, would be implemented.

As part of its application for a Clean Water Act (CWA) Section 404 permit from U.S. Army Corps of Engineers (USACE), and a Freshwater Wetlands Permit (ECL Article 24, Title 7) from New York State Department of Environmental Conservation (NYSDEC), Micron has proposed a comprehensive Offsite Compensatory Wetland and Stream Mitigation Plan (CWSMP) to offset wetland losses. The CWSMP details very specific measures that will be utilized to compensate for onsite losses of wetlands and jurisdictional streams from onsite construction activities. FEIS Section 3.3.4.2, Table 3.3-10 identifies the indirect long-term effects on downgradient river and stream channels and their water quality conditions, including sediment transport, nutrient loading, and water quality impacts. The USACE and NYSDEC have oversight and approval authority of the CWSMP and are working with Micron to ensure the adequacy of the plan.

Additionally, ecological features, soil types, and other related elements have been considered in Section 3.4.4.2 of the FEIS (evaluation of ecological communities), the Biological Assessment (BA) (FEIS Appendix G-4), and the State Incidental Take Permit application (Appendix Q of the Micron JPA application). The permitting process with USACE and NYSDEC, including the development of appropriate mitigation measures, is ongoing and provides another avenue for regulatory oversight by agencies with jurisdiction and expertise in these areas. Section 3.4.5 of the FEIS describes BMPs and mitigation measures that would be implemented for the protection of ecological communities and specific species. See also Response to Water Resources Comment 6 and Water Resources Comment 19.

Water Resources Comment 55:

Commenters expressed concerns about increased stormwater runoff and flooding risks downstream of the Proposed Project (including Fulton, Phoenix, and near Stearns Road) from severe weather events, loss of streams and wetlands, excavation, and increased impervious surfaces.

Response: See Responses to Water Resources Comments 20 and 27. As discussed in FEIS Section 3.3.4.2, construction activities would be subject to NYSDEC SPDES Construction General Permit requirements. Stormwater design and permitting will follow NYSDEC requirements at the time of permit submittal for each phase of the project. Stormwater BMPs would be designed to meet performance criteria in the New York State Standards and Specifications for Erosion and Sediment Control Manual and would be appropriately documented in relevant SWPPPs. Stormwater management areas would be designed to meet New York State Stormwater Management Design Manual requirements to ensure waters of the State are protected from adverse impacts of construction stormwater runoff and no downgradient increases in stormwater quantity would occur. These evaluations would be completed with plan documentation in Micron's SWPPP development prior to operation in accordance with NYS stormwater permitting requirements. With these measures in place the FEIS properly concludes that stormwater discharge from the Micron Campus would not result in adverse impacts.

During operations, SMPs would be implemented to preserve existing drainage patterns to the greatest extent practicable, maintain the conveyance of upland watershed runoff, control increases in stormwater volume, prevent soil erosion and sedimentation, and reduce runoff through the use of green infrastructure where feasible. Additionally, wet extended detention ponds and bioretention filtration areas would help mitigate downstream flood risks by reducing stormwater runoff volumes. These measures also support the protection of water quality by maintaining the integrity of stormwater systems. These operational SMPs would be documented in the SWPPP required under the Multi-Sector General Permit (MSGP) and would include monitoring conditions. The SMPs would be adaptively managed and refined over time, as appropriate, based on ongoing water level and flow monitoring. A detailed discussion of the SMPs and overall stormwater management approach is provided in FEIS Section 3.3.4.2 and Appendix F.

Water Resources Comment 56:

Commenters expressed concerns about flooding risks downstream of the Proposed Project from increased discharges of wastewater to the Oneida River.

Response: See Responses to Water Resources Comments 20, 27, and 55 regarding stormwater discharges. With respect to wastewater, wastewater discharges attributable to the Proposed Project will gradually increase over a 15-year timeframe. Regardless, the discharge from the OOWWTP treatment systems is a minor component of the flow in the Oneida River. Statistically, for the period of record for the Oneida River (going back to 1996), average flow of the Oneida River at the closest monitoring location (Euclid) is 3000 cfs and the maximum flow is 10,600 cfs. For reference the Oak Orchard WWTP discharge at 20MGD is 31 cfs. Peak flows from Oak Orchard IWWTP combined with peak flows from sanitary from the Oak Orchard municipal WWTP would be up to 59 MGD (4 Fabs at 34 MGD plus sanitary at 25 MGD) would be less than 2% of average flow and less than 1% of maximum flow.

Water Resources Comment 57:

Commenters expressed specific concerns regarding displaced wetlands causing flooding on properties immediately adjacent to the Proposed Project (north of the campus on Mud Mill Road; and on Caughdenoy Road).

Response: Mud Mill Road and that portion of Caughdenoy Road that runs north of the Micron Campus are located at a minimum of approximately 0.32 miles away from the campus footprint. In addition, most of the wetland displacement occurs in the southern portion of the campus site. Finally, these roads and the Micron Campus are not currently within FEMA designated floodplains. With the proposed BMPs, together with the measures that will be included in the SWPPP, and the adaptive management of stormwater and groundwater levels in the vicinity, there is no risk of flooding conditions changing north of the Micron Campus. See FEIS Appendix F-8 for the draft SWPPP of Phase 1a of the Micron Campus.

See also Responses to Water Resources Comments 20, 27, and 55.

Water Resources Comment 58:

Commenters expressed concerns that increased runoff will flood basements and impact septic systems downstream.

Response: See Responses to Water Resources Comments 27 and 55. As described in FEIS Section 3.3.4.2, Micron would develop stormwater designs that comply with the *New York State Stormwater Management Design Manual* and are approved by the NYSDEC and the appropriate local authority to maintain water quality and quantity volumes as compared to pre-construction conditions.

Water Resources Comment 59:

Commenters expressed concerns about whether the construction of a sewer system for the Project will affect the water table, causing more flooding.

Response: The Proposed Project relies on water withdrawn and returned to Lake Ontario following treatment. Construction of the sewer system will not affect the water table or cause more flooding. See also Responses to Water Resources Comments 27 and 55. The construction of Connected

Actions will be subject to NYSDEC's permitting requirements and associated Stormwater BMPs to prevent increased stormwater runoff during construction. See also Response to Water Resources Comment 86.

Water Resources Comment 60:

Commenters stated that there is insufficient information to assess whether stormwater management and wetland restoration measures will address flooding impacts. Other commenters stated that more analysis is needed regarding stormwater retention to address flood risk and runoff pollution, including hydrologic modeling and engineered mitigation plans.

Response: See Responses to Water Resources Comments 20, 27, 55 and 62. A detailed discussion of the SMPs and overall stormwater management approach is provided in FEIS Section 3.3 and Appendix F.

Water Resources Comment 61:

A commenter stated that the DEIS does not evaluate potential flood risk from increased paved surfaces due to additional roads that will be built.

Response: See Responses to Water Resources Comments 27 and 55. Site-specific stormwater modeling and design will be conducted during the permitting phase to ensure runoff from all new impervious surfaces, including roads, are properly managed. The measures identified in FEIS Section 3.3.4.2, Table 3.3-11 (Proposed SMPs) would reduce stormwater runoff and help minimize potential flood risks.

Water Resources Comment 62:

Commenters stated that the DEIS does not provide a detailed stormwater management plan to mitigate downstream flooding or calculations for stormwater runoff. Another commenter stated that Micron must provide detailed stormwater modeling and management plans as part of its Environmental Impact Statement. Independent experts should review this modeling and downstream communities should be included in the decision-making process around acceptable levels of flood risk.

Response: See Responses to Water Resources Comments 27 and 55. Micron has conducted comprehensive stormwater/hydrologic monitoring in coordination with NYSDEC and USGS to assess the potential for flooding to occur downstream once construction has been completed. As discussed in the FEIS, construction of the Proposed Project would not result in significant adverse effects from stormwater or significant adverse effects on floodplains. See FEIS Section 3.3.4.2. Micron's construction activities would be subject to SPDES Construction General Permit requirements, and a detailed evaluation of stormwater management and specific mitigation would be documented in Micron's SWPPP prior to operation. NYSDEC will be involved in the review of stormwater calculations and design in connection with the preparation of a SWPPP under

NYSDEC's Construction General Permit and post-construction SMPs. The draft SWPPP is included in FEIS Appendix F-8.

Micron will also be required to implement a Monitoring Plan for surface water, groundwater, and vegetation, that is integral to understanding baseline conditions, thereby enabling analysis of potential hydrologic changes resulting from construction activities and placement of buildings. The findings will help inform adaptive management measures to address groundwater and surface water flow. The Monitoring Plan is built around data collected from 42 installed groundwater monitoring wells, 15 surface water monitoring stations, and infield vegetative monitoring plots that will be coupled with high resolution imagery. Baseline monitoring is ongoing.

Water Resources Comment 63:

A commenter stated that the DEIS lacks a stormwater modeling and management plan that accounts for climate change, regional development, and volume of wastewater discharges to mitigate downstream flooding risk.

Response: See also Responses to Water Resources Comments 27, 55, and 62.

Water Resources Comment 64:

A commenter stated that the Final EIS should specify that the permanent stormwater design will meet the New York State Stormwater Design Manual requirements in effect at the time of the design of each phase of permanent stormwater features.

Response: The FEIS includes updates to clarify that the stormwater design will meet the requirements of the New York State Stormwater Management Design Manual that is in effect at the time of approval. See FEIS Section 3.3.4.2, Stormwater.

Water Resources Comment 65:

A commenter stated that water quality impacts from stormwater from the Rail Spur, Childcare Site, and wastewater treatment plant expansion are not addressed.

Response: BMPs and SMPs related to construction and operations for these sites are discussed in FEIS Section 3.3.4.2. These SMPs include green infrastructure, wet extended detention ponds, and bioretention filtration areas, which are intended to reduce pollutant loads and manage runoff volumes effectively. Each project component, including the Rail Spur and Childcare Site, will be subject to site-specific stormwater design and permitting in accordance with NYSDEC requirements at the time of permit submittal.

As required, the IWWTP construction design at the Oak Orchard site will follow NYSDEC stormwater management plans and requirements for construction activities. Once constructed, OCDWEP will follow the requirements of the NYSDEC's Multisector General Permit for Stormwater Discharges (GP-0-23-001) Sector T – Treatment Works. These stormwater permitting requirements are designed to protect water quality.

See also Responses to Water Resources Comments 27 and 55.

Water Resources Comment 66:

A commenter stated that the DEIS does not analyze sediment transport, nutrient loading, or water quality impacts from the construction of the Micron Campus and construction of utilities.

Response: FEIS Section 3.3.4.2, Table 3.3-10 identifies the indirect long-term effects on downgradient river and stream channels and their water quality conditions, including sediment transport, nutrient loading, and water quality impacts. To minimize these indirect effects, Micron, National Grid, OCWA, and OCDWEP would implement various stormwater BMPs to reduce stormwater runoff rates, reduce erosion of disturbed land and downgradient sedimentation, and protect stormwater from contamination before and during Proposed Project and Connected Action construction activities. BMPs to reduce runoff rates would include stone check dams, slope stabilization with turf matting, perimeter dikes or swales, and rock outlet protection. BMPs to provide temporary stabilization and reduce erosion and sedimentation would include silt fencing, stone outlet sediment traps, compost filter socks, and compost filter bag sediment traps. BMPs to prevent sediment transport would include temporary gravel roads and stabilized construction accesses. All BMPs would be designed to meet the performance criteria in the New York State Standards and Specifications for Erosion and Sediment Control (NYSDEC, 2016) manual and would be appropriately documented in relevant SWPPPs. Stormwater management areas would be designed to meet New York State Stormwater Management Design Manual requirements in effect at the time of approval to ensure waters of the State are protected from adverse impacts of construction stormwater runoff and no downgradient increases in stormwater quantity would occur.

Water Resources Comment 67:

A commenter stated that sufficient information has not been provided to take a hard look at stormwater runoff and make a reasoned judgement justifying that the proposed 66.6 acres stormwater management and wetland restoration plans fully mitigate the water quantity and quality of increased runoff and loss of wetlands on the site.

Response: See Responses to Water Resources Comments 9, 20, 27, and 55.

Water Resources Comment 68:

A commenter stated that additional details are needed on Micron's use of temporary sediment erosion controls.

Response: FEIS Section 3.3.4.2 identifies construction-related BMPs to prevent or minimize potential soil erosion, including silt fencing, stone outlet sediment traps, compost filter socks, compost filter bag sediment traps, temporary gravel roads and stabilized construction accesses. See also Responses to Water Resources Comments 27, 55, and 66.

Water Resources Comment 69:

A commenter stated that the SWPPP and site grading plans should be publicly available.

Response: Preliminary SWPPP information and site grading plans for the Micron Campus and the Rail Spur were included with the Clean Water Act Section 401 Water Quality Certification (WQC) application submitted to the NYSDEC and are available to the public. A draft SWPPP was provided to NYSDEC and the Town of Clay and is included in FEIS Appendix F-8.

Water Resources Comment 70:

A commenter requested specific plans for retention ponds. Another commenter stated that containment systems are needed in the event of a spill that will prevent contamination from reaching stormwater conveyance systems.

Response: See Response to Water Resources Comment 55, which states, in part, that site-specific stormwater modeling and design will be conducted during the permitting for each phase of the Proposed Project. Additionally, secondary containment is required for all tanks that contain hazardous chemicals and most tanks that contain petroleum. The volume of the secondary containment is required to be at least 110% of the volume of the largest tank within it. The SPCC and SPR will include a summary of the tanks and their respective volumes, contents, secondary containment, leak detection, and safety equipment. See FEIS Section 3.8.3.2.

Water Resources Comment 71:

Commenters stated that Micron should design larger stormwater detention ponds and open water portions of mitigation wetlands where space allows to accommodate runoff from larger storm events.

Response: This suggestion will be considered during the final stormwater design. As described in FEIS Section 3.3.4.2, Micron would develop stormwater designs that comply with the New York State Stormwater Management Design Manual and are approved by the NYSDEC and the appropriate local authority. Stormwater retention/detention ponds and infrastructure would be adequately sized to maintain water quality and quantity volumes as compared to pre-construction conditions. Additionally, where feasible, stormwater management practices summarized in FEIS Table 3.3-11 would be implemented to reduce stormwater runoff and enhance resilience to storm events.

Water Resources Comment 72:

Commenters stated that the DEIS should evaluate porous paving surfaces, green roofs, and bioswales to reduce runoff and potential flooding. Micron should commit to green infrastructure best practices when feasible.

Response: The SMPs mentioned in the comment, which include green infrastructure practices to the greatest extent practicable, are being considered and are discussed in FEIS Section 3.3.4.2.

Water Resources Comment 73:

A commenter suggested that stormwater management BMPs be designed to meet the 1,000-year 24-hour event to provide a buffer for large intense storm events.

Response: Stormwater design and permitting will follow NYSDEC requirements at the time of approval.

Water Resources Comment 74:

Commenter suggested amending language to meet design standards approved at the time of construction due to duration of project over the next 20 years.

Response: See Response to Water Resources Comment 64. Stormwater design and permitting will follow NYSDEC requirements at the time of approval.

Water Resources Comment 75:

Concerns were raised that the expanded impermeable surface for parking facilities will increase flood risks.

Response: See Responses to Water Resources Comments 27 and 55.

Water Resources Comment 76:

A commenter stated that the DEIS does not include necessary information to evaluate groundwater and groundwater-surface water interactions, including contour mapping of groundwater and bedrock, geologic cross sections, groundwater potentiometric maps, surface water elevations, or groundwater monitoring well data from wells installed in the productive bedrock.

Response: Micron is proposing the implementation of a Monitoring Plan for surface water, groundwater, and vegetation, that is integral to understanding baseline conditions, thereby enabling analysis of potential hydrologic changes resulting from construction activities and placement of buildings. The findings will help inform the assessment of onsite wetlands and monitoring efforts. The Monitoring Plan is built around data collected from 42 installed groundwater monitoring wells, 15 surface water monitoring stations, and infield vegetative monitoring plots that will be coupled with high resolution imagery. Baseline data is not available yet.

Additionally, with respect to the evaluation, avoidance, and minimization of effects on groundwater and surface water from the Proposed Project, Micron would implement several stormwater BMPs as integral elements of Proposed Project design and operations. Micron also would be required to obtain a SPDES permit from NYSDEC, which would require Micron to implement post-construction SMPs as operating permit conditions. The stormwater BMPs and SMPs would serve to increase infiltration of stormwater runoff from impervious surfaces to promote groundwater recharge, filtration, infiltration, and storage. As part of its SPDES permit,

Micron also would be required to implement SWPPP and SPCC/SPR Plan measures to reduce the risk of accidental releases, leaks, or spills during facility operations and provide for immediate containment and cleanup of any release. SMPs would be adaptively managed and refined over time, as appropriate, based on ongoing water level and flow monitoring performed at 42 groundwater monitoring lls, 15 surface water monitoring points (7 culverts and 8 channel points), and 5 piezometer monitoring wells.

National Grid, OCWA, and OCDWEP would operate their respective Connected Actions in accordance with all applicable SPDES permit requirements, including by implementing any required post-construction SMPs, as well as any required SWPPP and SPC/SPR Plan measures to reduce the risk of spills and provide for immediate containment and cleanup of any release.

Water Resources Comment 77:

Commenters expressed general concerns about the depletion of groundwater generally and resulting from loss of wetlands.

Response: See Response to Water Resources Comment 27 and 76, which discuss BMPs and SMPs to promote infiltration of stormwater runoff to promote groundwater recharge in connection with the Proposed Project and Connected Actions.

As discussed in FEIS Section 3.3.4.2, if required based on the need for construction dewatering activities, Micron will apply for a water withdrawal permit and prepare and implement a dewatering plan.

Water Resources Comment 78:

Commenters expressed concerns or stated that the DEIS did not evaluate the potential for chemicals (e.g., PFAS, heavy metals) to contaminate groundwater in private wells or the two unconsolidated aquifers overlain by the wastewater treatment plant and wastewater conveyance.

Response: The FEIS evaluated the presence of private wells and aquifers, acknowledges the risk of spills from the Proposed Project and Connected Actions, and describes the measures that will be implemented to avoid and minimize potential adverse impacts. Also, FEIS Section 3.8.3.2. and Appendix L-1 discuss federal and state standards for specific PFAS in drinking water. All public drinking water for the area is sourced from surface water resources and is distributed by OCWA. Based on New York State GIS data, only nine private domestic wells are located within one mile of the Micron Campus.

FEIS Appendix F-3.4 states that the IWWTP and wastewater conveyance lines would overlay two unconsolidated aquifers on the western edge of the Shaver Creek watershed, but these are not currently used as public drinking water sources. Pertaining to the IWWTP and conveyances at Oak Orchard, OCDWEP, if required, would obtain SPDES stormwater permit and develop SWPPPs and SPCC/SPR Plans to reduce the risk of accidental releases, leaks, or spills during construction activities and provide instructions for immediate containment and cleanup of any release. See also Responses to Solid Waste and Hazardous Materials Comments 42 and 48.

Discharges of treated wastewater would be to the Oneida River and not to groundwater. See Response to Water Resources Comment 47.

Water Resources Comment 79:

A commenter stated that the DEIS does not address, in any substantive way, the potential for spills, leaks and infiltration from the operations at the Micron facility to contaminate the local groundwater, and for that groundwater to transport contaminants long distances, particularly with the potential for karst features in the subsurface.

Response: See Response to Geology/Soils Comments 1 and 2; Response to Solid Waste and Hazardous Materials Comment 48. The FEIS acknowledges the risk of spills from the Proposed Project and describes the measures that will be implemented to avoid and minimize potential impacts. As part of its SPDES permit from NYSDEC, Micron will be required to implement a SWPPP, as well as SPCC/SPR Plan measures to reduce the risk of accidental releases, leaks, or spills during facility operations and provide for immediate containment and cleanup of any release. Micron will also be subject to various fuel and chemical storage requirements under federal law and the NYSDEC Petroleum and Chemical Bulk Storage and Major Oil Storage Facility (MOSF) Programs.

The SPCC plan will incorporate appropriate bulk storage tank and container registration and licensing, spill prevention, contingency planning, incident reporting, emergency response coordination, and recordkeeping procedures in accordance with Federal and State requirements. Secondary containment is also required for all tanks that contain hazardous chemicals and most tanks that contain petroleum. The volume of the secondary containment is required to be at least 110% of the volume of the largest tank within it. See FEIS Section 3.8.3.2. The SPCC and SPR will include a summary of the tanks and their respective volumes, contents, secondary containment, leak detection, and safety equipment. These and other required measures are expected to avoid and minimize the occurrence and impacts of accidental releases, leaks, or spills.

Water Resources Comment 80:

A commenter stated that the removal of epikarst for construction and replacement of relatively impermeable soils with permeable fill materials without further characterization and engineering measures could cause or exacerbate flooding and contaminant migration.

Response: See Responses to Geology/Soils Comments 1 and 2. As part of the construction design phase, Micron would conduct additional subsurface investigations, including geotechnical borings and groundwater monitoring, to further characterize site conditions. These investigations will inform engineering design decisions aimed to mitigate any potential impacts associated with construction activities. Micron would also use information from the 42 monitoring wells to inform adaptive management measures to avoid and minimize effects from the Proposed Project on groundwater and to refine SMPs designed to maintain existing drainage patterns to the greatest extent practicable, continue the conveyance of upland watershed runoff, control increases in stormwater runoff, prevent soil erosion and sedimentation, and provide runoff reduction.

Water Resources Comment 81:

A commenter stated that a karst survey and hydrogeologic characterization should be performed.

Response: See Response to Geology/Soils Comments 1 and 2. Sections 3.3.3 and 3.3.4.2 and Appendix F of the FEIS provide a description of hydrologic conditions and protective measures for surface and groundwater. Additionally, Micron is proposing the implementation of a Monitoring Plan for surface water, groundwater, and vegetation, that is integral to understanding baseline conditions, thereby enabling analysis of potential hydrologic changes resulting from construction activities and placement of buildings. The findings will help inform the assessment of onsite wetlands and monitoring efforts. The Monitoring Plan is built around data collected from 42 installed groundwater monitoring wells, 15 surface water monitoring stations, and infield vegetative monitoring plots that will be coupled with high resolution imagery.

Water Resources Comment 82:

A commenter stated that the DEIS does not evaluate the potential hydraulic connections between soluble bedrock at the Micron Campus and the Rail Spur Site, the confined aquifer that was identified, or the Baldwinsville Primary Aquifer.

Response: The analysis described in the comment is not necessary for the evaluation of existing groundwater conditions to assess whether the Proposed Project will have a significant effect on groundwater. FEIS Sections 3.3.3 and 3.3.4.2 and Appendix F provide a description of hydrologic conditions and protective measures for surface and groundwater. These measures are also summarized in Responses to Geology/Soils Comment 1, Water Resources Comments 27 and 40, and Solid Waste and Hazardous Materials Comment 48.

Water Resources Comment 83:

Commenters expressed concern about the Proposed Project's impact on drinking water wells in the area. Commenters stated that a private well survey is needed that would identify wells installed prior to NYS well construction reporting requirements. Another commenter stated that the DEIS inaccurately identifies wells on or near the Micron Campus that are actually located in Oswego County.

Response: The FEIS evaluated the presence of groundwater wells and aquifers, and describes the measures that will be implemented to avoid and minimize potential impacts. FEIS Section 3.3.4.2 states that no primary or principal aquifers or SSAs have been identified beneath the Proposed Project portion of the study area, but confined and unconsolidated aquifers exist on the western edge of the Shaver Creek watershed (see Figure F-37). These aquifers are not currently used as public drinking water sources. Instead, all public drinking water for the area is sourced from surface water resources and is distributed by OCWA. In addition, there are only nine private domestic wells within approximately one mile of the WPCP based on publicly available data.

Micron will be required to implement a Monitoring Plan for surface water, groundwater, and vegetation, that is integral to understanding baseline conditions, thereby enabling analysis of

potential hydrologic changes resulting from construction activities and placement of buildings. The findings will help inform the assessment of onsite wetlands and monitoring efforts. The Monitoring Plan is built around data collected from 42 installed groundwater monitoring wells, 15 surface water monitoring stations, and infield vegetative monitoring plots that will be coupled with high resolution imagery. Information gathered from these monitoring wells would be periodically assessed for changes that would warrant alterations to Proposed Project design and construction, as well as to inform adaptive management measures to avoid and minimize effects on groundwater.

As part of its SPDES Construction General Permit and to avoid and minimize potential effects on groundwater, Micron will be required to implement a SWPPP and SPCC/SPR Plan to reduce the risk of accidental releases, leaks, or spills of materials such as concrete, oil, fuel, lubricants, or hydraulic fluids during construction and provide for immediate containment and cleanup of any release. Micron also will be required to obtain a SPDES permit from NYSDEC, which would require Micron to implement post-construction SMPs as operating permit conditions. The stormwater BMPs and SMPs would serve to increase infiltration of stormwater runoff from impervious surfaces to promote groundwater recharge, filtration, infiltration, and storage. As part of its SPDES permit, Micron also will be required to implement SWPPP and SPCC/SPR Plan measures to reduce the risk of accidental releases, leaks, or spills during facility operations and provide for immediate containment and cleanup of any release.

Water well data was obtained through the publicly available NYSDEC GIS database (See FEIS Section 3.3.3.4). Any discrepancies among the well data, in this case identifying wells that are further from the Micron Campus (in Oswego County), would be attributable to inaccuracies in the publicly available dataset.

Water Resources Comment 84:

A commenter identified a well designated OD2031 that is approximately 600 feet from the eastern boundary of the Micron Campus with a high yield exclusively from shallow groundwater. The commenter stated that further study is needed of private wells that use this productive bedrock aquifer.

Response: See Response to Water Resources Comment 83 regarding evaluation of groundwater and wells and protective measures for groundwater. As stated in Section F-3.4 of Appendix F, the NYSDEC Division of Water protects the quality of groundwater used for public drinking water supplies in unconfined aquifers determined to be highly vulnerable to contamination and highly productive for use by public water supply systems by categorizing them as either primary aquifers or principal aquifers. Primary aquifers are those that are highly productive and are utilized as sources of water by major municipal water supply systems; principal aquifers are those that are known to be highly productive or whose geology suggests the potential for an abundant water supply, but which are not intensively used as water supply sources (NYSDEC, 1990). There are no primary or principal aquifers on or adjacent to the Micron Campus, including the area associated with well OD2031.

In addition, of the 42 groundwater monitoring wells installed, several are installed along the eastern boundary of the Micron Campus and are positioned to be representative of groundwater conditions near well OD2031, which lies further to the east. The monitoring of these wells, and

the use of adaptive management strategies, would be used to ensure that current groundwater hydrologic conditions (e.g., depths to groundwater, yields) would not change because of project development. As a result, no private well testing is necessary.

Water Resources Comment 85:

A commenter stated that monitoring well data from existing monitoring wells should be provided.

Response: Micron will be required to implement a Monitoring Plan for surface water, groundwater, and vegetation, that is integral to understanding baseline conditions, thereby enabling analysis of potential hydrologic changes resulting from construction activities and placement of buildings. Information from initial groundwater monitoring events is included in the Monitoring Work Plan that is included as Appendix O to the Clean Water Act Section 404 Joint Permit Application. See also Response to Water Resources Comment 83.

Water Resources Comment 86:

A commenter stated that Micron should disclose when, where, and how long it will dewater the site for construction, which commenter states will lower the groundwater table and potentially drain nearby wetlands, streams, and wells, and how Micron will mitigate impacts.

Response: A plan for de-watering, and the details of same, will be developed on an as-needed basis. As discussed in FEIS Section 3.3.4.2, if required, Micron would obtain a Water Withdrawal permit for dewatering activities related to construction and would develop and implement a dewatering plan. Any dewatering would occur periodically over the entire 16-year construction schedule. Fab construction is phased over time so dewatering will not be consistent over the build out phase period. Micron would implement BMPs and SMPs in connection with its NYSDEC-issued SPDES permits to promote groundwater recharge, filtration, infiltration, and storage. Additionally, based on data obtained from 42 groundwater monitoring wells installed at the Micron Campus, Micron would employ adaptive management strategies, as needed, such as managed aquifer recharge, integrated water resource management, or investing in natural infrastructure to promote groundwater recharge, filtration, infiltration, and storage.

Water Resources Comment 87:

A commenter asked about the impact on wetlands and surface waters from utilities and related transportation projects. Another commenter stated that wetland impacts from Connected Actions must be evaluated before construction begins and tracked over time.

Response: FEIS Sections 3.3.3 and 3.3.4 and Appendices F-3 and F-4 discuss the affected environment and protective measures related to the Connected Actions. Potential effects—such as those to wetlands and surface waters—associated with those Connected Actions will be further reviewed during the permitting process specific to each project. Final jurisdictional determinations have not been made for all Connected Actions at this time given when they are anticipated to move forward. Table 3.3-5 in Section 3.3.3.1 of the EIS currently lists all acreages of Federal, State, and

non-jurisdictional wetlands across the Micron Campus and Connected Actions. These projects cannot proceed until permits are issued.

To minimize indirect effects on remaining wetlands, National Grid, OCWA, and OCDWEP would implement stormwater BMPs similar to those that Micron would implement for the Proposed Project to reduce runoff rates, reduce erosion of disturbed land and downgradient sedimentation, and protect stormwater from contamination before and during Connected Action construction activities.

Future transportation projects will also be subject to similar environmental review and permitting requirements as those described herein.

Water Resources Comment 88:

Commenters were generally concerned about the analysis in the DEIS of water resources, including water quality, ground water, surface water impacts, and wetlands.

Response: The FEIS, which has been reviewed by the federal and state agencies with regulatory authority and expertise in water quality, fully addresses reasonably foreseeable impacts to hydrological resources in Section 3.2 (Geology, Soils, and Topography) and Section 3.3 (Water Resources). These sections evaluate the Proposed Project's potential adverse effects on wetlands, water quality, groundwater, surface water, and ecological communities. Where significant impacts may occur, avoidance and mitigation measures will be required, including BMPs and SMPs. As part of its application for a Clean Water Act (CWA) Section 404 permit from the USACE, and a Freshwater Wetlands permit (ECL Article 24, Title 7) from the NYSDEC, Micron has proposed a compensatory mitigation plan to offset wetland and surface water losses. The permitting process with USACE and NYSDEC, including the development of appropriate mitigation measures, is ongoing and provides another avenue for regulatory oversight by agencies with jurisdiction and expertise in these areas. See also Responses to Water Resources Comments 6, 7, 9, 10, 20, 27, 40, 55, and 76.

Water Resources Comment 89:

Commenters raised general concerns regarding the Project's impact on and removal of wetlands and streams.

Response: The lead agencies acknowledge the concern but note that Micron will be required to implement necessary and appropriate mitigation. See Responses to Water Resources Comments 20, 27, and 55. Section 3.3.3 of the FEIS describes the affected environment for the Proposed Project, including permanent impacts on wetlands and streams. Section 3.3.5 and Appendix F describe Micron's proposed mitigation plan for unavoidable impacts to surface waters and wetlands. As described in the *Off-site Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B), and required as a condition of Micron's wetlands permits, Micron will offset impacts to wetlands at a 2.2:1 rate on average. The mitigation rates for each type of wetlands can be found in FEIS Section 3.3.5. Under the Mitigation Plan, Micron will be required to enhance, establish, or restore a total of 422.14 acres of wetlands and restore a total of 14,030 LF of streams through permittee-responsible mitigation at the mitigation sites. The mitigation sites

will be monitored for 15 years following the year of completion to ensure the successful establishment of wetland vegetation and ecological function.

Water Resources Comment 90:

Commenters raised general concerns about the efficacy of the proposed wetland mitigation.

Response: The lead agencies acknowledge the concern but have reviewed the mitigation in coordination with the USACE and NYSDEC and find that it is appropriate. See Responses to Water Resources Comments 6, 7, 9, and 10.

Water Resources Comment 91:

Commenters stated that removal of wetlands is contrary to NYS wetland protection laws and the Clean Water Act.

Response: The removal of wetlands is not prohibited by the federal Clean Water Act (CWA) or the New York State Environmental Conservation Law (ECL). Section 404 of the CWA (33 U.S.C. § 1344) and its attendant regulations prohibit the discharge of dredge or fill materials into Waters of the U.S. without a permit and establish a permitting process that includes mitigation of permanent impacts by permitted projects. Article 24 of the ECL and its attendant regulations establish a similar permitting and mitigation process for regulated activities within state-jurisdictional wetlands.

As part of its application for a CWA Section 404 permit from U.S. Army Corps of Engineers (USACE), and a Freshwater Wetlands permit (ECL Article 24, Title 7) from the New York State Department of Environmental Conservation (NYSDEC), Micron has proposed a compensatory mitigation plan to offset wetland losses. The permitting process with USACE and NYSDEC, including the development of appropriate mitigation measures, is ongoing. The *Off-site Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B) will require that Micron enhance, establish, or restore a total of 422.14 acres of wetlands and restore a total of 14,030 LF of streams through permittee-responsible mitigation at the mitigation sites. See also Response to Water Resources Comment 6.

Water Resources Comment 92:

Commenters stated that the DEIS analysis cannot rely on legal compliance or future permitting for the conclusion that impacts are not significant.

Response: The conclusions in the FEIS do not rely solely on legal compliance with applicable law, regulations, and permits for determinations of impact significance. The FEIS reflects a thorough analysis of the affected environment, and where impacts have been identified, the protective measures described therein to avoid, minimize, or mitigate effects. The FEIS, which has been reviewed by the federal and state agencies with regulatory authority and expertise in water quality, fully addresses reasonably foreseeable impacts to hydrological resources in Section 3.2 (Geology, Soils, and Topography) and Section 3.3 (Water Resources). These sections evaluate the Proposed

Project's reasonably foreseeable effects on wetlands, water quality, groundwater, surface water, and ecological communities. Where significant impacts may occur, mitigation measures are proposed.

Additionally, as part of its application for a Clean Water Act (CWA) Section 404 permit from the USACE, and a Freshwater Wetlands permit (ECL Article 24, Title 7) from the NYSDEC, Micron has proposed a compensatory mitigation plan to offset wetland and surface water losses. The permitting process with USACE and NYSDEC, including the development of appropriate mitigation measures, is ongoing and provides another avenue for regulatory oversight by agencies with jurisdiction and expertise in these areas. See also Response to Nation Comment 7.

Water Resources Comment 93

A commenter stated that the recent changes in the wetlands law have added over 1 million acres to the wetlands maps such that development of 200 acres of wetlands is non-consequential.

Response: Comment noted.

Water Resources Comment 94:

Commenters stated that the DEIS does not provide details regarding alternative building and roadway layouts to avoid impacts to water resources. A commenter suggested building no more than 3 fabs.

Response: See Response to Project Description/Alternatives Comment 1. See also Response to Water Resources Comment 5 regarding the Micron Campus layout and avoidance of wetlands. Additionally, the Section 404(b)(1) analysis included as a component of the JPA provides a detailed assessment in Section 3.3 of the various alternatives that Micron considered and the rationale for why the 4-fab alternative was selected.

The JPA states that Micron compressed the construction footprint to avoid substantial development in the more extensive wetland complex areas within and north of the National Grid transmission right-of-way. Micron also designed the Micron Campus to avoid impacts to perennial streams.

Water Resources Comment 95:

A commenter stated that a salt reduction strategy should be included in the DEIS-proposed water quality monitoring program and water quality monitoring data should be publicly available. Concerns were expressed about the impacts on water resources from the increased salt usage on roads and parking lots as a result of the Project.

Response: Micron will be required to implement BMPs and post-construction SMPs as a condition of its SPDES permit, which would be designed to accommodate, slow, and hold stormwater runoff and to filter out the pollutants (e.g., salt) it would carry from the impervious surfaces. Also, NYSDEC jurisdictional wetlands are given a 100' protective buffer, which helps protect wetlands from runoff and allows for the filtration of pollutants.

Water Resources Comment 96:

A commenter stated that Micron should commit to a review process that would incorporate a partnership similar to that for the Onondaga Lake cleanup.

Response: The Onondaga Lake cleanup, which concerned the cleanup of a Superfund site, is not comparable. The Proposed Project is subject to agency and public review and scrutiny through the NEPA and SEQRA processes, as well as permit applications before the resource agencies. Micron has committed to transparency and regulatory compliance throughout the environmental review, construction, and operations.

Water Resources Comment 97:

A commenter asked whether the County will impose limits on chemicals not regulated by the state or federal government.

Response: Any decision by the County to regulate chemicals within the County is in the discretion of the Onondaga County Legislature and not within the scope of environmental review.

Water Resources Comment 98:

A commenter asked whether Micron is exempt from liability for chemical emissions.

Response: Micron will be subject to and is required to comply with all applicable federal, state, and local regulations. FEIS Section 1.4, Table 1.4-1 identifies the major permits, approvals, and consultations required for the Proposed Project.

Water Resources Comment 99:

A commenter asked whether the Proposed Project will impact international waters.

Response: See Response to Water Resources Comment 40 and 47.

Water Resources Comment 100:

Section 5.1 Water Resources – Unfortunately, large projects such as this invariably severely impact valuable water and other resources, often by paving them over. Historically, these resources were lost forever. However, laws and regulations over the past half-century have required mitigation of these impacts. Large projects like this require large mitigations which create opportunities for large contiguous area mitigations that are simply not possible for small projects. Mitigations in Appendix F are generally large contiguous areas for either permanent protection or construction of mitigation features.

Response: Comment noted.

Water Resources Comment 101:

The DEIS fails to adequately assess the cumulative and downstream impacts of filling streams. Micron should conduct a comprehensive assessment of the cumulative and downstream impacts of filling ephemeral and intermittent streams, and ensure their protection through first avoidance, second minimization, and only then robust mitigation measures.

Response: The FEIS addresses cumulative effects to the extent they are reasonably foreseeable in Section 4.3.3. All projects in which rivers and streams would be impacted would require applicable Federal and State permitting (e.g., CWA Section 404, Rivers and Harbors Act Section 10, and state Article 15 permitting) to ensure protection of surface water features. Permit applications would require the development and implementation of plans to avoid impacts to rivers and streams whenever and wherever possible and the implementation of SMPs, BMPs (e.g., using horizontal directional drilling, silt fences, compost filter socks, timber mats), erosion and sediment control, stormwater pollution prevention, and/or spill prevention control, as necessary to minimize impacts on remaining surface water features and water quality conditions. All regulated stream channel losses would be subject to mitigation as required by the CWA. Compliance with these relevant laws and regulations would reduce the potential for cumulative impacts on remaining surface water features and water quality conditions within the analysis area to the maximum extent practicable.

The Wetlands Assessment and Monitoring Plan (Wetlands Assessment and Monitoring Plan (Appendix O to the Micron JPA application) describes a long-term monitoring program implemented by Micron to assess groundwater and surface water (including at locations downstream of Micron in Youngs Creek) to verify that construction and operational activities have not impacted onsite or downstream wetlands and surface waters and to inform any necessary adaptive management measures. For the Micron Campus, avoidance and minimization efforts were employed to limit onsite impacts to only those which were unavoidable. Additionally, 14,030 linear feet of streams are being restored/created as part of the offsite mitigation process. See Responses to Water Resources Comments 20, 27, 55, and 89 regarding surface water avoidance and mitigation.

Water Resources Comment 102:

Sufficient information has not been provided to take a hard look at cumulative flooding impacts and make a reasoned judgement justifying that the proposed stormwater management and wetland restoration is enough mitigation to address all of these impacts and claim no significant adverse effects.

Response: See Responses to Water Resources Comments 6, 7, 9, 10, 20, and 27. As noted in Section 4.4.3 of the FEIS, cumulative impacts to floodplains resulting from changes in stormwater flows—both from the Proposed Action and other developments within floodplain boundaries—cannot be reasonably quantified or predicted. This is due to the wide variability and uncertainty in project-specific conditions associated with each individual action. While cumulative changes in stormwater flows have the potential to significantly affect floodplains within the relevant hydrologic system, existing local, state, and federal regulations and permitting requirements are

designed to prevent and minimize direct impacts from development within floodplain areas, as well as downstream stormwater effects.

Stormwater design and permitting for each phase of the project will comply with current NYSDEC requirements at the time of permit submittal. Stormwater Management Practices (SMPs) will be implemented to preserve existing drainage patterns to the extent practicable, maintain upland watershed runoff conveyance, control increases in stormwater volume, prevent soil erosion and sedimentation, and reduce runoff through the use of green infrastructure where feasible. Additionally, wet extended detention ponds and bioretention filtration areas will help mitigate downstream flood risks by reducing stormwater runoff volumes. These measures also contribute to water quality protection by maintaining the integrity of stormwater systems. Additionally, the Final SWPPP for the Micron Campus will identify additional measures, if any, to address upstream and downstream flooding per the requirements of the Climate Risk and Resiliency Act.

A detailed discussion of the SMPs and the overall stormwater management strategy is provided in Section 3.3.4.2 and Appendix F of the FEIS.

3.4 Biological Resources

Biological Resources Comment 1:

A commenter suggests that the Record of Decision be delayed until formal consultation with US Fish and Wildlife Service is completed, and the Biological Opinion is made public and that approval of the Proposed Project should be denied if the Biological Opinion finds likely jeopardy. Another commenter stated that the Final EIS needs to discuss whether construction will be delayed until consultation is completed.

Response: Formal consultation with USFWS concluded on October 6, 2025. It is anticipated that the Biological Opinion will be issued before the Record of Decision. Assuming all other approvals are secured, no delays to construction are anticipated. The lead agencies will take all relevant environmental information into account when deciding whether to take action on the Proposed Project, which will be reflected in their decisional documents.

Biological Resources Comment 2:

A commenter stated that the DEIS catalogues the protected and endangered species affected by the loss of wetlands; however, no inventory or census is provided for other native plant and animal species, and how those will be preserved and protected. Is it Micron's position that only legally protected species are to be considered?

Response: All non-listed species were analyzed collectively in taxonomic groups of birds, mammals, reptiles, and amphibians. While regulatory frameworks prioritize legally protected species, Micron's proposed mitigation approach is designed to support broader biodiversity and ecosystem health. Micron has developed comprehensive Mitigation Plans to address the loss of wetlands and surface waters (FEIS Appendix F), as well as the associated biological communities (FEIS Appendix G). These plans are designed to comply with all applicable regulations under the Clean Water Act, the Endangered Species Act, and Articles 11 and 24 of the Environmental

Conservation Law, ensuring that both federal and State jurisdictional wetlands, surface waters, and wildlife resources are appropriately protected and impacts are avoided, minimized, or mitigated.

In response to concerns about the protection of native species beyond those with legal status, it is important to note that while the Biological Assessment (FEIS Appendix G-4) focuses on federally protected species—such as the Indiana bat—the mitigation measures developed for these species, and for other state-protected species, are expected to benefit a broader range of flora and fauna. For example, the purchase and permanent protection of at least 1,182 acres of off-site bat roosting habitat and 650 acres of grassland bird habitat will support many other species that inhabit or could inhabit these ecosystems.

Appendix G-3 of the FEIS provides a detailed inventory of biological resources, including observed plant species and terrestrial and avian wildlife, as well as species with the potential to occur on-site. While the FEIS emphasizes species with protected status due to regulatory requirements, the broader ecological benefits of the mitigation strategy—such as restoring 14,030 linear feet of stream channel and over 400 acres of various wetland types—will enhance habitat quality for a wide array of other native species. Additionally, Micron would implement numerous BMPs to minimize the effects of the Proposed Project on all biological resources (see FEIS Section 3.4.5.1).

Biological Resources Comment 3:

A commenter stated that additional study / bioassay should be conducted along the Oneida River for four miles starting at the Peter Scott Swamp to establish an ecological baseline.

Response: Comprehensive assessments have been conducted, including delineations of wetlands and aquatic resources, and Best Management Practices (BMPs) are in place to minimize biological impacts, as outlined in FEIS Sections 3.4.5.1 and 3.4.5.2. Regulatory agencies such as the U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, and the New York State Department of Environmental Conservation have concurred with the findings. During the permitting process, regulatory agencies establish effluent discharge limits designed to protect public health, public enjoyment of the resource, protection and propagation of fish and wildlife, and industrial development in the state. SPDES permits require that effluent samples be collected regularly and analyzed by certified laboratories. The results of these analyses are then routinely submitted to NYSDEC to demonstrate compliance with permit conditions. No further studies are warranted. See also Response to Water Resources Comment 40 with respect to discharges into the Oneida River.

Furthermore, establishing an ecological baseline for Peter Scott Swamp would not yield useful data for evaluating potential impacts of the Micron Campus on that location because the Peter Scott Swamp lies downstream of many possible discharge points, which would make it inherently difficult to identify the specific cause of any contamination identified in a bioassay.

Biological Resources Comment 4:

A commenter stated that further study of the potential impacts of the Proposed Project discharges on rare or state-listed avian species and fish stocks in Oswego County is needed.

Response: No additional studies are warranted. See Response to Oswego County Comment 10. See also Response to Biological Resources Comment 26 and Response to Water Resources Comment 47, regarding the limited area of effect in the Oneida River from wastewater discharges. The FEIS acknowledges potential impacts to migratory waterfowl, rare or state-listed avian species, and fish stocks. FEIS Sections 3.4.5.1 and 3.4.5.2 outline BMPs and mitigation measures to protect wildlife, including avian species. See FEIS Table 3.4-12.

Consultation is ongoing with regulatory agencies and regional stakeholders to ensure that sensitive ecological resources—including migratory birds and aquatic species—are considered and protected throughout the development process. Should future studies or coordination with Oswego County identify additional concerns, Micron is open to evaluating further mitigation measures to ensure regional ecological integrity is maintained.

Biological Resources Comment 5:

The DEIS acknowledges that adaptation of relocated protected and endangered species to scattered-site wetlands will happen slowly. Why wasn't consideration given to the impact of relocation of these species to a consolidated site, or a consideration of what larger alternative sites might be available?

Response: See Response to Biological Resources Comment 2. Mitigation site selection is a complex process that considers proximity to project, availability, suitability, and size, depending on the mitigation required and species needs. The largest possible sites that meet these needs were considered by the USACE and NYSDEC, and in consultation with the USFWS, and often multiple property parcels were acquired to create a consolidated mitigation parcel. See also Response to Water Resources Comment 6.

Biological Resources Comment 6:

Commenters were generally concerned about the loss of biodiversity and impacts to species (including reptiles and amphibians) from noise, light, vibrations and changes in water quality caused by the Proposed Project.

Response: See Response to Biological Resources Comment 2. Micron will be required to implement its Mitigation Plans to address the loss of wetlands and surface waters (FEIS Appendix F), as well as the associated biological communities (FEIS Sections 3.4.5.1 and 3.4.5.2 and Appendix G).

All non-listed species were analyzed collectively in taxonomic groups of birds, mammals, reptiles, and amphibians, and biological resource impacts would be mitigated in consultation with

USACE/USFWS and NYSDEC. FEIS Section 3.4.5.1 describes the BMPs Micron will be required to implement to minimize impacts to biological resources. These include, but are not limited to, retention of onsite habitat, planting native species where feasible, noise mitigation measures, minimization of light spillage from nighttime exterior lighting, avoidance of dyes, pesticides, or fertilizers near wetlands or surface waters, wintertime tree clearing, tree marking, retention of onsite roosting and foraging habitat where feasible, and limited nighttime construction. See FEIS Section 3.4.5.1, Table 3.4-12.

Additionally, Table 3.3-12 in Section 3.3.5 of the FEIS discusses, “BMPs for the Protection of Water Resources,” which will protect aquatic habitat for reptiles and amphibians. These include the following: groundwater monitoring; increasing and maximizing water recycling; managing, controlling, and monitoring wastewater flows; and implementing and maintaining BMPs identified in the applicable SWPPP and SPCC/SPR Plan.

Biological Resources Comment 7:

Commenters were generally concerned about impacts to the endangered species that reside on the Proposed Project site. A commenter added that construction workers should be educated about threatened and endangered species.

Response: The *Off-site Compensatory Mitigation Plan* (FEIS Appendix F-7, Appendix N, Attachment B), implemented through The Wetland Trust, Inc., will permanently conserve approximately 1,340 acres across six sites within the Oneida River watershed as mitigation for significant adverse impacts at the Micron Campus. These efforts are designed not only to meet regulatory obligations but also to support long-term ecological integrity. The protected areas will be maintained and monitored in coordination with USFWS and NYSDEC, ensuring that both legally protected and other native species benefit from restored and preserved habitats.

Micron will be required to implement its Mitigation Plans to address impacts to biological communities located on the Micron Campus, as detailed in Appendix G of the FEIS. All biological resource impacts will be minimized in consultation with the USFWS and NYSDEC. FEIS Section 3.4.5.1 outlines the BMPs that will be implemented to minimize impacts to threatened and endangered (T&E) species. These include wintertime tree clearing, tree marking, retention of on-site roosting and foraging habitat where feasible, and limiting nighttime construction activities. Micron would also employ a biological monitor to oversee implementation of BMPs and other measures intended to minimize effects on biological resources.

Appendix G-4 of the FEIS contains the Biological Assessment, which further details avoidance, minimization and mitigation measures developed in coordination with USFWS and NYSDEC. These include:

- Permanent off-site habitat protection through conservation easements managed by The Wetland Trust, Inc.

- Installation of artificial roost sites following guidance from the Wildlife Conservation Society Canada, and of appropriate styles and designs selected by USFWS and NYSDEC for Indiana, northern long-eared, and tricolored bats in undisturbed portions of the Micron Campus.
- Sponsorship of four research and monitoring projects designed in consultation with USFWS and NYSDEC.
- Funding a grant program administered by a non-governmental conservation organization or university to support conservation of the Indiana bat, northern long-eared bat, and tricolored bat, and to help offset cumulative impacts from regional economic growth.
- Financial contributions toward the fabrication and installation of gates to protect the Glen Park bat hibernaculum or another site selected by USFWS and NYSDEC.

To mitigate unavoidable significant adverse effects, NYSDEC would require that either three acres of new or improved habitat be protected for every acre lost due to Proposed Project construction, or one acre of new or improved habitat be protected for every one acre lost along with a commitment to manage that habitat in a grassland state for 15 years. As described in the Net Conservation Benefit Plan this mitigation would be carried out within 5-year cycles. Micron and The Wetland Trust, Inc., a 501(c)(3) nonprofit organization, have proposed to purchase 650 acres of sufficiently high-quality habitat for permanent protection and to restore and manage the habitat as grassland for 15 years (in 3-year cycles) to achieve the required net conservation benefit.

In response to concerns about construction worker awareness, Micron will be required to educate all construction personnel working on the site about the presence of T&E species and the importance of compliance with mitigation measures. Worker training programs will include information on species identification, habitat sensitivity, and protocols for avoiding and reporting potential impacts.

The measures identified in the FEIS and committed to by Micron will protect both legally protected species and the broader ecological integrity of the project area.

Biological Resources Comment 8:

Commenters stated that the DEIS does not adequately address the mass mortality of animals due to construction or mitigation measures.

Response: See Responses to Biological Resources Comments 2, 6 and 7. In response to concerns about mass mortality of animals due to construction or mitigation activities, Micron will be required to implement BMPs to help minimize the effects of the Proposed Project on biological resources, which are summarized in FEIS Table 3.4-12. These measures are designed to avoid direct harm to wildlife during sensitive periods and to preserve critical habitat features. These BMPs are discussed in Section 3.4.5.1 of the FEIS and include the following:

- Retention of on-site roosting and foraging habitat where feasible.

- Implementation of a Landscape Management Plan (LMP) on the Micron Campus and Childcare Site using native plant species where feasible.
- Noise reduction and mitigation measures such as sound attenuators and acoustical louvers to reduce noises generated by outdoor equipment.
- Lighting reduction measures to minimize light spillage.
- Water quality protection including avoiding the use of dyes, pesticides and fertilizers near any wetlands and surface waters.
- Employment of a biological monitor to oversee implementation of BMPs.

In addition to BMPs, Micron's required biological, wetland, and surface water mitigation will offset unavoidable significant adverse effects on biological resources, including from construction activities. As discussed in FEIS Section 3.4.5.2, Micron's mitigation efforts are designed not only to meet regulatory obligations but also to support long-term ecological integrity. See FEIS Appendix G; Off-site Compensatory Mitigation Plan (FEIS Appendix F-7, Appendix N, Attachment B).

Biological Resources Comment 9:

Commenters were generally concerned about impacts on habitat connectivity and fragmentation and avoiding and preserving existing natural habitats.

Response: A detailed alternatives analysis is provided in Section 2.2 of the FEIS. While the Preferred and No-Build Alternatives were evaluated in terms of environmental impacts, other alternatives were not carried forward because they did not meet CPO's purpose and need under NEPA, Micron's purpose and need under SEQRA, or the technical and economic feasibility of the project. See Response to Purpose and Public Need Comment 2; Project Description/Alternatives Comment 6.

Notwithstanding, the Proposed Project incorporates design and mitigation strategies intended to reduce impacts on habitat connectivity. These include maintaining and enhancing buffer zones, implementing a Landscape Management Plan using native species where feasible, preserving key habitat corridors where feasible, and implementing off-site conservation measures to support regional ecological integrity. These efforts are intended to balance project feasibility with environmental stewardship and address concerns raised by commenters regarding the protection of natural habitats. See FEIS Sections 3.4.5.1, 3.4.5.2 and Table 3.4-8.

Biological Resources Comment 10:

A commenter stated that the Proposed Project will eliminate potential habitat for American Hart's-Tongue Fern and Bog Turtle even if individuals are not currently present.

Response: See Response to Biological Resources 2, 6, 7, and 9. The FEIS considers only the habitat of species that is impacted by the Proposed Project. Though the species identified in the comment do not occur in the area that would be affected by the Proposed Project, measures such as off-site conservation easements, habitat restoration, and long-term monitoring are designed to preserve

and enhance suitable habitat conditions for a wide range of species, including potentially those identified in the comment. See also FEIS Sections 3.4.5.1 and 3.4.5.2.

Biological Resources Comment 11:

Commenters were generally concerned about potential impacts of the Proposed Project on existing habitat and ecological communities and dominant vegetation communities, including successional old fields, floodplain forests, shrublands, marshes, and red maple-hardwood swamps, which provide habitat and ecological services.

Response: See Responses to Biological Resources 2, 6, and 9. FEIS Section 3.4.3.1 describes the affected environment and biological resource types present on the Proposed Project site. Table 3.4-1 provides a detailed inventory of existing ecological communities and dominant vegetation. Anticipated impacts to these communities are discussed in Section 3.4.4, with Table 3.4-6 outlining the current extent of each community, the area expected to be impacted by each project component (Micron Campus, Rail Spur Site, and Childcare Site), and the areas that would remain post-construction.

Additional tables provide further detail: Table 3.4-7 breaks down affected areas by construction stage on the Micron Campus; Table 3.4-8 outlines proposed impact minimization measures, including preservation of habitat patches, buffer zones, and restoration efforts.

The measures identified in the FEIS and committed to by Micron, including required mitigation, are designed to reduce habitat fragmentation and preserve ecological function where feasible, in alignment with state and federal environmental regulations. These efforts include BMPs and other mitigation measures in Sections 3.4.5.1 and 3.4.5.2 such as the protection of at least 1,182 acres of bat roosting habitat (in addition to the 272 undisturbed acres on the Micron Campus) and 650 acres of grassland bird habitat, as well as protection and mitigation measures described for water resources in Section 3.3 of the FEIS.

Biological Resources Comment 12:

Commenters were generally concerned about the project and that the growth associated with the project will displace or eliminate wildlife and greenspace.

Response: See Response to Biological Resources Comments 6, 7, 9, and 11. The measures identified in the FEIS and committed to by Micron would minimize the displacement of wildlife and loss of greenspace through a combination of on-site impact avoidance, off-site habitat conservation, and long-term ecological stewardship. Mitigation Plans to address the loss of wetlands, surface waters, and associated biological communities, are detailed in Appendix F and Appendix G of the FEIS. All biological resource impacts will be mitigated in consultation with the USFWS and NYSDEC.

To address concerns about broader ecological impacts and greenspace loss, an Off-site Compensatory Mitigation Plan (FEIS Attachment F-7, Appendix N, Attachment B), will be implemented through The Wetland Trust, Inc., which will permanently secure and protect

approximately 1,340 acres of upland and aquatic resources across six wetland mitigation sites within the Oneida River watershed. This plan includes:

- Restoration of 14,030 linear feet of stream channel,
- Re-establishment/restoration of over 390 acres of wetland types (emergent marsh, scrub-shrub, and forested),
- Rehabilitation of 113.9 acres of existing wetland and preservation of 96.5 acres of existing wetlands, and
- Protection of approximately 380 acres of buffer habitat.

These mitigation efforts are designed not only to comply with the Clean Water Act and Article 24 of the Environmental Conservation Law, but also to preserve ecological function and support regional biodiversity. FEIS Table 3.3-12 in Section 3.3.5 outlines additional BMPs for water resource protection, including groundwater monitoring, maximizing water recycling, managing wastewater flows, and implementing stormwater and spill prevention plans.

Biological Resources Comment 13:

Appendix F-7 Compensatory Mitigation Plan - Considering that many of the large contiguous areas requiring mitigation within the Micron site are impacted by invasive species, this project provides a rare opportunity to generate high quality large contiguous areas focused on specific wildlife species that are generally not accommodated by smaller mitigations. In particular, grasslands in this region tend to undergo succession to woodlands in the absence of a wildfire cycle. Maintaining some areas as large contiguous grasslands (>50 acres in size) and preventing woodland succession will be valuable for species that require large grassland plots to maintain breeding populations.

Response: See Responses to Biological Resources Comments 2, 5, 7, and 12. As outlined in Appendix F-7-1, Section 3.2 Mitigation Area Selection, mitigation site selection is a complex process that considers proximity to project, availability, suitability, and size, depending on the mitigation required and species need. The largest possible sites that meet these needs were considered by the USACE and NYSDEC, and often multiple property parcels were acquired to create a consolidated mitigation parcel.

To meet NYSDEC mitigation requirements for the state-listed short-eared owl and northern harrier, the offsite grassland parcels that have been approved by NYSDEC, acquired, and will soon be placed in conservation easements, will be managed (i.e., mowed) on a 3-year rotation for 15 years to maintain them in a grassland state.

Biological Resources Comment 14:

Commenters generally were concerned about impacts on Indiana bat, Long-eared bat, tri-colored bat, and other bat species. One commenter suggested placing bat boxes on site.

Response: As outlined in FEIS Section 3.4.4.2, Indiana bat, northern long-eared bat, and tri-colored bat, are all documented at the Micron Campus site. To avoid direct take of these bats, all proposed tree clearing would only occur within the winter hibernation window from November 1 through March 31. To minimize impacts to bats, FEIS Section 3.4.5.1 outlines BMPs, that will be required of Micron, such as wintertime tree clearing, tree marking, retention of on-site roosting and foraging habitat where feasible, and limited nighttime construction. FEIS Section 3.4.5.2 and the Biological Assessment (Appendix G-4) further describe targeted mitigation measures for bat species. See also Response to Biological Resources Comment 7.

The off-site bat roosting habitat will be protected at a 2:1 ratio, resulting in the conservation of a minimum of approximately 1,182 acres, in addition to 272 undisturbed acres of roosting habitat that will remain protected on-site.

Micron will also fund the purchase and installation of 10 roost boxes of appropriate styles and designs selected by USFWS and NYSDEC for Indiana, northern long-eared, and tricolored bats in undisturbed portions of the Micron Campus. The boxes will be installed prior to the completion of Fab 1. Occupancy of the boxes will be monitored once per maternity season for the first five years following their installation, along with annual cleaning and maintenance procedures that follow manufacturer recommendations and best management practices as noted in FEIS Section 3.4.5.2 and Appendix G-4.

Biological Resources Comment 15:

A commenter stated that the DEIS draws on limited and geographically inconsistent research in the analysis of noise sensitivity in bats that may not accurately reflect the needs of endangered species in New York.

Response: Section 5.2 of Appendix G of the FEIS provides a detailed overview of the current scientific understanding of noise sensitivity in bats, drawing primarily from peer-reviewed studies and articles focused on North American species, including the Indiana bat, northern long-eared bat, and tri-colored bat. These species are of particular relevance to the Proposed Project and its geographic context in New York State. The section also includes analysis of anticipated noise levels from both construction and operational phases of the project, with specific attention to road noise, which is pertinent to other species. The FEIS prioritizes studies most applicable to the species and environmental conditions present in the project area.

Biological Resources Comment 16:

A commenter stated that the DEIS does not define seasonal clearing restrictions, tree survey protocols, bat presence verification, a Habitat Conservation Plan, or Section 7 consultation results despite the presence of potential summer roosting habitat.

Response: See Response to Biological Resources Comment 14. The Draft Biological Assessment (BA), included in the DEIS as Appendix G-4, has been finalized, and is included as Appendix G-4 of the FEIS. As outlined in FEIS Section 3.4.2, USFWS' Biological Opinion (BO) (see Appendix G-4) will be included in the Record of Decision and will address the potential incidental take of

federally listed species associated with the Proposed Project and include reasonable and prudent measures necessary or appropriate to minimize the impacts of any incidental take. A draft Habitat Conservation Plan (HCP) was submitted by The Wetland Trust, Inc. to USFWS in August 2025 for review.

While the final results of the Section 7 consultation are pending, FEIS Section 3.4.5.1 outlines several mitigation strategies and protocols to protect bat species and their habitats. FEIS Section 3.4.5.2 and Appendix G-4 further detail mitigation measures developed in coordination with USFWS and NYSDEC, including off-site habitat protection, artificial roost site installation, acoustic bat monitoring, and funding for conservation research and habitat protection.

Biological Resources Comment 17:

Commenters expressed concerns regarding the unavoidable adverse effects from construction-related habitat destruction and lighting on Indiana and northern long-eared bats, both federally listed species, which will disrupt foraging and roosting.

Response: See Response to Biological Resources Comment 14. The FEIS acknowledges concerns regarding unavoidable adverse effects from construction activities and lighting on bat species, particularly the federally listed Indiana bat and northern long-eared bat. To address these concerns, Micron has committed to Mitigation Plans, as outlined in Appendix F and Appendix G of the FEIS, to minimize and offset impacts.

All biological resource impacts will be mitigated in accordance with consultation with the USFWS and the Endangered Species Act (ESA). Section 3.4.5.1 of the FEIS describes BMPs to reduce impacts to threatened and endangered species, including retention of onsite roosting and foraging habitat (380 acres that includes approximately 272 acres of nearly contiguous forested roosting and foraging habitat) and use of lighting that minimizes light spillage or trespass beyond intended areas of illumination.

Section 5.3 of Appendix G-4 also specifically addresses the potential effects of lighting on bats. The FEIS notes that all construction and operational lighting on the Micron Campus will strive to meet the U.S. Green Building Council's LEED light pollution reduction credit (SS6) for LZ1 land-use zones. Lighting will be designed to minimize backlight, uplight, and glare, consistent with the Illuminating Engineering Society's BUG rating system and the Town of Clay's lighting code (§140). Construction lighting will be limited to active work areas—unsuitable for bats—and will be directed inward to minimize light trespass into adjacent areas. Construction will end by 10 p.m., further limiting nighttime lighting exposure.

The Biological Assessment (Appendix G-4) assumes light-averse behavior for the Indiana bat, northern long-eared bat, and tri-colored bat, and evaluates lighting impacts accordingly. Additional mitigation measures are described in FEIS Section 3.4.5.2 and include:

- Off-site habitat protection at a 2:1 ratio, conserving a minimum of approximately 1,182 acres of bat roosting habitat,
- Artificial roost site installation following best practices,
- Research and monitoring projects developed in consultation with USFWS and NYSDEC,

- Micron-funded conservation grant program to support long-term bat conservation,
- Gating of hibernacula to prevent human disturbance, and
- Acoustic bat monitoring to track species activity and presence.

These measures are designed to minimize disruption to bat foraging and roosting behavior and to support long-term conservation of bat populations in the region.

Biological Resources Comment 18:

A commenter stated that more mitigation for bats is needed such as the construction of roosting sites nearby. Another commenter stated that the effectiveness of artificial roosts should be further examined before implementation.

Response: See Response to Biological Resources Comment 14. As described in Table 3.4-13 of Section 3.4 of the FEIS, Micron would fund the purchase and installation of 10 artificial roost boxes designed specifically for Indiana bat, northern long-eared bat, and tri-colored bat. These boxes would be placed in undisturbed portions of the Micron Campus and monitored once per maternity season for five years following installation to assess occupancy and effectiveness.

The design and placement of these roost boxes will follow best practices outlined by the USFWS and guidance from the Wildlife Conservation Society Canada, with a focus on providing suitable summer habitat. Micron would evaluate the performance of these artificial roosts and adjusting strategies as needed based on monitoring results and consultation with the USFWS and NYSDEC.

Biological Resources Comment 19:

A commenter questioned whether bats will successfully find other roosting sites given roosting fidelity and the likelihood that bats will return to their original roost sites.

Response: See Response to Biological Resources Comment 14 regarding the installation of roost boxes and other mitigation measures. While roosting fidelity is a known trait among bat species, the preservation of undisturbed habitat and implementation of targeted mitigation measures are intended to reduce disruption and support long-term habitat continuity. Micron will be required to continue to work closely with USFWS and NYSDEC to ensure that mitigation strategies are responsive to species-specific behaviors and ecological needs.

As described in FEIS Section 3.4.5.1, Micron will be required to implement BMPs to help minimize effects on biological resources, including bats. One BMP outlined is the retention of on-site roosting and foraging habitat. As stated in FEIS Table 3.4-12, “the Micron Campus site plan has been designed to economize space and reduce the manufacturing facility LOD to the maximum extent practicable. Based on the site plan, construction of the campus would leave approximately 380 acres on the site undisturbed, including approximately 272 nearly contiguous acres of forested roosting habitat, approximately 84 acres of former cropland shrubland), and approximately 11 acres of non-forested wetlands. These avoidance measures will reduce the scale of habitat loss from the Proposed Project and preserve some suitable on-site roosting and foraging habitat for Indiana bats, northern long-eared bats, and tricolored bats, which would also be connected to adjacent habitat areas off-site.” The 272 acres of undisturbed roosting habitat on-site are protected

for bats through permanent conservation easements and are intended to support the continued presence of bat populations and facilitate their return to existing roost sites.

Outside of BMPs, Micron is also required to implement Mitigation Plans, as outlined in FEIS Appendix F and Appendix G, to minimize and offset impacts. The Mitigation Plans also include off-site habitat protection, artificial roost installation, acoustic monitoring, and other measures designed to support bat behavior and habitat use.

Further, as described in Section 3.4.2 of the FEIS, the Draft Biological Assessment (BA), included as Appendix G-4 in the DEIS, has been finalized, and is included as FEIS Appendix G-4. USFWS's Biological Opinion (BO) will be included in the Record of Decision and will address the potential incidental take of federally listed species, including the Indiana bat and northern long-eared bat, and include reasonable and prudent measures necessary or appropriate to minimize the impacts of any incidental take. See FEIS Section 3.4.2. A draft Habitat Conservation Plan has been submitted to USFWS for review and a detailed mitigation plan is being developed as part of this ongoing consultation.

Biological Resources Comment 20:

A commenter stated that the DEIS lacks detail regarding Micron's proposed mitigation for bats and grassland birds, including the company's "mitigation masterplan," and the likely effectiveness of mitigation that considers the quality and availability of habitat (e.g., maternity roost trees).

Response: See Responses to Biological Resources Comments 6, 14, 16, 19, and 22.

Biological Resources Comment 21:

A commenter stated that the Project will result in the removal of bats from the local area which help to reduce the infectious mosquito population.

Response: See Responses to Biological Resources Comments 6, 14, 16, and 19. Micron would implement BMPs to minimize impacts to bat populations, as well as a comprehensive suite of measures aimed at preserving and enhancing bat habitat both on-site and off-site. Key mitigation actions include:

- Off-site habitat protection at a 2:1 ratio, conserving a minimum of approximately 1,182 acres of bat roosting habitat through permanent conservation easements.
- On-site preservation of 272 acres of undisturbed roosting habitat to support continued bat presence within the project area.
- Installation of artificial roost sites designed according to best practices to provide alternative summer habitat for species such as the Indiana bat, northern long-eared bat, and tri-colored bat.
- Research and monitoring projects developed in consultation with USFWS and NYSDEC to evaluate bat activity, habitat use, and the effectiveness of mitigation measures.
- Micron-funded conservation grant program to support long-term bat conservation and offset cumulative regional impacts.

- Gating of hibernacula to prevent human disturbance at critical overwintering sites.
- Acoustic bat monitoring to track species presence and behavior over time.

These measures are designed not only to comply with federal and state regulations but also to support the ecological functions bats provide, including natural pest control.

Biological Resources Comment 22:

Commenters were generally concerned about impacts to avian species, including endangered species, grassland birds and species of greatest conservation need (e.g., Eastern Meadowlark, Brown Thrasher, Bobolink, Sedge Wren) and their habitat.

Response: See Response to Biological Resources Comment 2. In addition to the BMPs summarized in Section 3.4.5.1 of the FEIS, Section 3.4.5.2 describes mandatory mitigation measures Micron would implement that provide a net conservation benefit, specifically for identified grassland bird species and their habitats.

To offset the adverse impact due to loss of grassland habitat from construction of the Proposed Project, the NYSDEC requires that either three acres of new or improved habitat be protected for every acre lost, or one acre of new or improved habitat be protected for every one acre lost along with a commitment to manage that habitat in a grassland state for 15 years. In response, Micron, in partnership with The Wetland Trust, Inc., a 501(c)(3) nonprofit organization, has proposed the permanent protection and 15-year management of approximately 650 acres of high-quality grassland habitat. These lands will be restored and maintained as grassland for a minimum of 15 years, in three-year management cycles, across seven properties located in Oswego, Chenango, Yates, Cortland, Broome, Tompkins, and Tioga Counties—ranging from 10 to 60 miles from the Micron Campus. Each restored field will exceed 25 contiguous acres to ensure ecological viability.

A final Grassland Protection Plan will be developed in coordination with NYSDEC and will be subject to agency review and approval. This plan will incorporate technologically, economically, and biologically practicable measures to support listed grassland birds, including northern harriers and short-eared owls, while also benefiting a broader range of avian species such as Eastern Meadowlarks, Brown Thrashers, Bobolinks and Sedge Wrens, and ecological communities.

Biological Resources Comment 23:

Commenters were generally concerned about impacts on the Northern harrier.

Response: See Responses to Biological Resources Comments 22 and 26.

Biological Resources Comment 24:

Commenters were generally concerned about impacts on the Short-eared owl.

Response: See Responses to Biological Resources Comments 22 and 26.

Biological Resources Comment 25:

A commenter stated that the Proposed Project will eliminate a heron rookery.

Response: Winter tree/vegetation clearing will minimize direct impacts to the rookery as it will occur after the herons have migrated offsite. Upon return, herons would be expected to establish a rookery in suitable habitat elsewhere onsite or offsite. The proposed wetland mitigation areas will also preserve and create/enhance habitat for non-endangered animal species, including herons.

Biological Resources Comment 26:

A commenter stated that the DEIS fails to evaluate migratory bird stopover use. Commenters expressed concerns about the negative impact of lighting for the Proposed Project on bird migration and asked whether Micron will support the “lights out” initiative to protect migratory birds. A commenter stated that the lighting plan needs to be redesigned to avoid impacts to birds.

Response: See Response to Oswego County Comment 10. The Micron Campus would operate 24 hours a day, seven days a week. As such, exterior lighting will be necessary for safety and operational reasons. The FEIS analyzes the potential adverse impacts that lighting associated with implementation of the Preferred Action Alternative—which includes the lighting strategies and measures discussed above—would have on avian species, including migratory bird species such as the Northern Harrier and Short-eared Owl. See, e.g., FEIS Sections 3.4.4.2 (effects of construction lighting on species) and 3.4.4.2 (effects of operational lighting on species).

However, the FEIS discusses numerous measures to minimize or mitigate the potential impacts from lighting on biological resources. Exterior lighting would be downward directional, shielded, warm white LED lights to reduce the potential impacts to aerial animals and insects. All nighttime exterior lighting at the Micron Campus would be designed to minimize light spillage or “trespass” beyond intended areas of illumination. See FEIS Table 2.1-5, Table 3.4-12, Section 3.13.5.

The Micron Campus lighting would be designed to meet the highest U.S. Green Building Council LEED standards for minimizing backlight, uplight, and glare, with a focus on achieving near-zero uplighting. This includes the aforementioned minimization measures as well as the use of cut-off optics to reduce uplight and trespass. Where feasible, Micron would use lights with high-quality optic controls on shorter poles to control lighting effects as needed. Additionally, office lights are planned to have motion sensors to automatically turn off when not in use.

The FEIS discusses placement and use of temporary construction lighting within construction and staging areas at the Micron Campus and Rail Spur Site to allow for work at night during authorized construction windows and to support site security. See FEIS Section 3.13.4.2, Construction Effects. The lighting would include approximately 20-to-30-foot-high portable light towers with multiple adjustable fixture heads on single poles. Micron would require its contractors to use lighting that conforms to the Town of Clay lighting code (section 140 of the Town Code) and, where feasible, lighting eligible for the LEED light pollution reduction credit for LZ1 land use zones. Construction of the Childcare Site would not take place at night and would only require minor safety and security lighting in limited areas. See FEIS Section 3.13.4.2, Childcare Site.

Biological Resources Comment 27:

A commenter stated that fall and spring migration surveys should have been conducted.

Response: Surveys during spring and fall would not have further informed the assessment of potential impacts to birds because all migratory bird species associated with the habitat types on the Micron Campus and native to the eastern U.S. would have the potential to occur during migration stopovers. Therefore, conducting surveys would not provide information that is not already known or could be assumed. Moreover, stopover habitat is not a limiting factor in this region. Potential impacts to birds from the Proposed Project are greatest for breeding birds, which are evaluated in the FEIS.

Accordingly, additional surveys were not necessary to evaluate the potential impacts on avian species or for the development of the BMPs and mitigation measures that are described in the FEIS, and that will be required for permitting, including the achievement of a net conservation benefit for state-listed species. See Response to Biological Resources Comment 22.

Biological Resources Comment 28:

A commenter stated that mitigation strategies should be developed and implemented for all bird species, including financial support and habitat creation and restoration near the Micron Campus.

Response: See Response to Biological Resources Comment 2, 6, and 22.

Biological Resources Comment 29:

A commenter stated that at least 75 contiguous acres should be the baseline for grassland bird habitat mitigation. A commenter asked what it means that mitigation will be carried out in five-year cycles and about the management of the mitigation sites.

Response: See Responses to Biological Resources Comments 2, 6, 22, and 31. To offset the loss of grassland habitat due to the Proposed Project, the NYSDEC requires that either three acres of new or improved habitat be protected for every acre lost, or one acre of new or improved habitat be protected for every one acre lost along with a commitment to manage that habitat in a grassland state for 15 years. See FEIS Section 3.4.5.2. In response, Micron, in partnership with The Wetland Trust Inc., a 501(c)(3) nonprofit organization, has proposed the permanent protection and active management of approximately 650 acres of high-quality grassland habitat. These lands will be restored and maintained as grassland for a minimum of 15 years, in three-year management cycles, across seven properties located in Oswego, Chenango, Yates, Cortland, Broome, Tompkins, and Tioga Counties—ranging from 10 to 60 miles from the Micron Campus. Each restored field will exceed 25 contiguous acres to ensure ecological viability. See FEIS Section 3.4.5.2.

Mitigation sites follow a general path that includes construction, monitoring, and long-term management. A 5-year cycle entails that a constructed mitigation site will be monitored for 5 years, at which time if 80% or more of the planted vegetation has established itself and continues to grow, the site can be deemed successful. If less than 80% of the vegetation is established, it is up to the

regulatory agency to determine the next steps, and it can potentially result in additional plantings and another 5-year monitoring period.

Biological Resources Comment 30:

A commenter stated that grassland habitat mitigation should be a 5:1 ratio to provide a net conservation benefit that accounts for the Proposed Project and induced growth effects.

Response: See Responses to Biological Resources Comment 2, 6, 22, 29, and 31. The mitigation ratios followed were determined based on consultation with USACE and NYSDEC to mitigate impacts from the Proposed Project, and for state-protected species, to achieve a net conservation benefit.

Biological Resources Comment 31:

A commenter stated that additional details on the mitigation parcels proposed is necessary to determine the adequacy of the proposed mitigation, including the shape of the parcels limiting edge areas and whether there is adjacent suitable habitat to the mitigation sites sufficient to establish habitat areas of at least 100 acres for each site. Another commenter stated that there are no detailed mitigation plans and that the mitigation plans must address long-term management responsibilities.

Response: See Response to Biological Resources Comments 5, 22, 29, and 30. The mitigation ratios used for the Proposed Project— such as 2:1 for bat roosting habitat and 3:1 for grassland bird habitat—are determined through consultation with the USACE, USFWS and NYSDEC, based on regulatory requirements and ecological best practices. See FEIS Section 3.4.5.2. Each grassland bird site exceeds the minimum size thresholds necessary to support viable habitat blocks, with restored fields designed to exceed 25 contiguous acres and, where feasible, to be part of larger habitat complexes of 100 acres or more.

As outlined in FEIS Appendix F-7 Compensatory Wetlands/Stream Mitigation Plan, the Off-site Compensatory Mitigation Plan includes the permanent protection of approximately 1,340 acres across six separate sites within the Oneida River watershed. These parcels were selected based on habitat quality, landscape connectivity, and their ability to support long-term ecological function.

Micron and The Wetland Trust, Inc., a 501(c)(3) nonprofit conservation organization, will oversee the acquisition, restoration, and long-term management of these parcels. Management responsibilities include habitat restoration, invasive species control, monitoring, and reporting, all conducted in accordance with approved conservation easements and subject to review by USACE, NYSDEC, and USFWS. These measures are designed to ensure that the mitigation sites remain ecologically functional and protected in perpetuity.

Biological Resources Comment 32:

A commenter stated that tree clearing should not occur until August 15 through November 1 to accommodate late-breeding birds or species that have multiple broods.

Response: As discussed in FEIS Section 3.4.4.2, tree clearing would not occur during the primary breeding season for most bird species (April through July). Therefore, construction would avoid direct effects on actively breeding woodland birds protected under the Migratory Bird Treaty Act. Micron will continue to coordinate with regulatory agencies to ensure that tree clearing and other construction activities are conducted in a manner that supports regional biodiversity and complies with applicable environmental protections. See FEIS Section 3.4.4.2 Preferred Action Alternative. Further, Micron has committed to BMPs for biological resources that include the retention of approximately 380 acres on the Micron Campus, including approximately 272 nearly contiguous acres of forested habitat. See FEIS Section 3.4.5.1.

Biological Resources Comment 33:

A commenter stated that Micron should use bird friendly glass in the buildings to mitigate loss of birds.

Response: Comment noted.

Biological Resources Comment 34:

A commenter stated that vegetation clearing required for the Project can result in increased water temperatures of nearby streams beyond the tolerance of cold-water fish and macroinvertebrates.

Response: As described in Appendix F-7, biological sampling conducted in June 2024 along Youngs Creek and its tributaries found aquatic communities dominated by tolerant species such as brook stickleback and central mudminnow—species adapted to low-oxygen, warm, lentic (still water) conditions. The perennial portion of Youngs Creek, which supports more sensitive species such as juvenile northern pike and green sunfish, is outside the Limits of Disturbance and will remain unimpacted by the Proposed Project. Further, Micron would implement BMPs for biological resources, including a Landscape Management Plan that would use native species where feasible to offset losses to habitat and native vegetated buffers, particularly in areas near sensitive habitats, to develop a transition zone and protect undeveloped habitats. See FEIS Section 3.4.5.1.

For surface waters within the Limits of Disturbance, FEIS Section 3.3.4.2 states that Micron, National Grid, OCWA, and OCDWEP will implement stormwater BMPs during construction of the Proposed Project and Connected Actions. These BMPs are specifically designed to reduce runoff rates, minimize erosion and sedimentation, and prevent contamination of surface waters—including thermal pollution. Stormwater management areas will be designed in accordance with the *New York State Stormwater Management Design Manual* (NYSDEC, 2024) and the *New York State Standards and Specifications for Erosion and Sediment Control* (NYSDEC, 2016). As outlined in FEIS Section 3.3.4.2 specific BMPs include:

- Runoff rate reduction: stone check dams, slope stabilization with turf matting, perimeter dikes or swales, and rock outlet protection.
- Erosion and sediment control: silt fencing, stone outlet sediment traps, compost filter socks, and compost filter bag sediment traps.

- Sediment transport prevention: temporary gravel roads and stabilized construction accesses.

All BMPs will be documented in site-specific Stormwater Pollution Prevention Plans (SWPPPs) and will be subject to regulatory oversight. Stream impacts are addressed in the Stream Mitigation Plans detailed in Appendix F of the FEIS.

Biological Resources Comment 35:

A commenter stated that wetland and stream loss will alter sediment, nutrient, and organic matter flows and may harm cold-water fish and macroinvertebrates.

Response: See Response to Biological Resources Comment 34 and Response to Water Resources Comment 27.

Biological Resources Comment 36:

A commenter stated that the DEIS does not adequately address impacts, or identify mitigation measures, related to soil erosion and runoff that will occur from the disturbed land and can cause harmful algal blooms, release toxins, deplete oxygen in the water, kill fish, and allow invasive species to spread.

Response: See Response to Biological Resources Comment 34 and Response to Water Resources Comment 27.

Biological Resources Comment 37:

A commenter expressed concern about the impact of PFAS on fish and the fishing industry.

Response: Based on presently known information, no impact to fish or fishing from PFAS is anticipated. See Responses to Water Resources Comments 31, 33, 34, 38, and 40 regarding the permitting of wastewater discharges to surface waters and treatment of PFAS. See also FEIS Appendix L-1. USEPA has developed recommended PFOS and PFOA criteria to protect aquatic life designated uses for freshwater and saltwater, as well as acute freshwater aquatic life benchmarks for eight PFAS (i.e., PFBA, PFHxS, PFNA, PFDA, PFBS, PFHxA, 8:22 FTUCA, and 7:3 FTCA), 89 Fed. Reg. 81077 (Oct. 7, 2024). NYSDEC has set final guidance values for PFOS in surface water sources at 160 parts per billion (ppb) for chronic risk in fresh water, 710 ppb for acute risk in fresh water, 41 ppb for chronic risk in saline water, and 190 ppb for acute risk in saline water. NYSDEC has determined that guidance values for PFOA in surface waters sources are not applicable for protection of aquatic life. These are the known standards to protect aquatic species at this time. To the extent that the regulatory requirements evolve, Micron will be required to meet them.

Biological Resources Comment 38:

A commenter stated the Proposed Project should avoid and minimize stream impacts to the greatest extent possible before relying on mitigation because filling in streams impacts Oneida Lake fisheries and endangered lake sturgeon.

Response: As described in the FEIS Section 3.3.4.2, the Proposed Project avoids impacts to the perennial extents of the Youngs Creek stream system located on the Micron Campus. These perennial reaches, which support more sensitive aquatic communities, are outside the Limits of Disturbance (LOD) and will remain unaffected by construction activities. See also Responses to Water Resources Comments 5 and 55.

Where stream impacts are unavoidable—primarily involving intermittent or ephemeral reaches—Micron has developed a Mitigation Plan (FEIS Appendix F) in coordination with the USACE and NYSDEC. This plan includes restoration of stream channels, wetland re-establishment, and long-term ecological monitoring to offset losses and maintain watershed function.

Biological Resources Comment 39:

A commenter stated that additional protections should extend to creek habitats supporting mussels, fisheries such as sturgeon, and floodplain forests.

Response: See Responses to Biological Resources Comment 34 and 38 and FEIS Sections 3.3.5 and 3.4.5, which discuss BMPs and Mitigation Measures.

Biological Resources Comment 40:

A commenter stated that the DEIS includes an assumption that mobile species will move to remaining suitable habitat but does not consider the availability of suitable habitat within the range of affected mammals and birds or the potential for increased traffic to harm wildlife by cutting off migration routes or increasing the number of wildlife fatalities.

Response: The lead agencies acknowledge the impacts of construction of the Proposed Project, even on mobile species in FEIS Section 3.4.4.2. However, as shown in Figure 3.4-1 and Table 3.4-1, the dominant ecological communities at the proposed Micron Campus location are best characterized as successional old field, floodplain forest, and successional shrubland, followed by deep emergent marsh, red maple-hardwood swamp, shallow emergent marsh, and mowed lawn with trees. These types of ecological communities are common to Onondaga County and the surrounding five-county region (Cornell 2024, SOCPA 2022, USGS NLCD 2023).

Notwithstanding, the Proposed Project incorporates required design and mitigation strategies intended to reduce impacts on habitat connectivity. These include maintaining and enhancing buffer zones, implementing a Landscape Management Plan using native species where feasible, preserving key habitat corridors where feasible, and implementing off-site conservation measures to support regional ecological integrity. See FEIS Table 3.4-8. These buffers are intended to support habitat connectivity and reduce edge effects. Further, Micron has committed to BMPs for

biological resources that include the retention of approximately 380 acres on the Micron Campus, including approximately 272 nearly contiguous acres of forested habitat (see FEIS Section 3.4.5.1).

Biological Resources Comment 41:

Commenters discussed avoidance and minimization measures for species impacts such as scheduling construction outside of breeding and migration periods and using exclusion fencing and wildlife crossings.

Response: See Responses to Biological Resources Comments 9 and 40. FEIS Section 3.4.5.1 describes the BMPs the project will be required to implement to minimize impacts to T&E species. These include wintertime tree clearing, tree marking, retention of onsite roosting and foraging habitat where feasible, and limited nighttime construction. As discussed in Section 3.4.4.2 of the FEIS “tree clearing would not occur during the primary breeding season for most bird species (April through July). Therefore, construction would avoid direct effects on actively breeding woodland birds protected under the Migratory Bird Treaty Act. Consistent with NYSDEC guidance, to avoid effects on grassland birds, construction in open fields would be limited to late summer and early fall, after the breeding period but before the wintering period.”

Biological Resources Comment 42:

A commenter stated that the DEIS should consider or evaluate installation of horizontal passageways or structures for migrating animals, road crossings, and vernal pool protections.

Response: See Responses to Biological Resources Comments 9, 40, and 41. Micron has designed areas of hydrological connectivity, such as bottomless culverts, to allow for the movement of species.

Biological Resources Comment 43:

A commenter stated that Micron should commit to wildlife corridors and habitat connectivity, not just buffer zones.

Response: See Response to Biological Resources Comment 9, 40, 41, and 42.

Biological Resources Comment 44:

A commenter asked for a description of any efforts to relocate plant and animal species.

Response: There are no plans to physically relocate any plant or animal species. Site development has been designed to avoid and minimize impacts to natural resources to the extent practicable. As discussed in FEIS Section 3.4.4.2 Ecological Communities, many species, including beavers, white-tailed deer, and various birds would most likely attempt to relocate to undisturbed portions of the site or to other habitats not at carrying capacity. Although no plant relocation is planned, as stated in FEIS Table 3.4-8, Construction Effects on Ecological Communities (Micron Campus),

Micron would implement a Landscape Management Plan (LMP) to incorporate landscaped areas in the vicinity of new buildings, parking lots, and stormwater management areas with the completion of each fab (and at the Childcare Site), prioritizing native species in this LMP. See FEIS Section 3.4. Micron also would plant native vegetated buffers along the perimeter of the campus where feasible, particularly in areas near sensitive habitats (including wetlands), to develop a transition zone between developed and undeveloped habitats. Preliminary landscape drawings can be found in Appendix G-10 of the FEIS.

Further, the Proposed Project will be required to comply with all local, state, and federal regulations regarding the protection of plant and animal species, as well as any measures determined during the Section 7 USFWS and NYSDEC consultations. Mitigation and Net Conservation Benefit plans will further provide protection to plant and animal species.

Biological Resources Comment 45:

A commenter stated that construction should be slowed to provide time for wildlife species to exit the area while tree clearing occurs and that removed trees should be sold and the funds used for habit restoration and reforestation.

Response: See Responses to Biological Resources Comments 40 and 44. As discussed in FEIS Section 3.4.4.2 Ecological Communities, the Proposed Project will be developed in phases, which will result in a more gradual transformation of the site and provides opportunities for wildlife to relocate from active construction zones to surrounding habitat. The impacts from construction of the Proposed Project will be minimized through the implementation of BMPs discussed in FEIS Section 3.4.5.1. For example, where feasible, vegetated buffers and undisturbed habitat (including approximately 272 nearly contiguous acres of forest on the Micron Campus site) will be retained to support wildlife movement and reduce fragmentation. As discussed in FEIS Section 3.4.4.2, part of the construction phased approach includes timing restrictions for tree clearing—developed in consultation with the USFWS. The timing restrictions will be followed to avoid sensitive periods for threatened and endangered species but will likely benefit other species as well.

FEIS Section 3.8.3.2 provides that forestry material “would be processed (e.g., mulched) on-site and reused as cover material to reduce erosion, help establish vegetation, or serve other construction purposes and thereby reduce the need for off-site hauling. Any remaining tree debris not reused on-site would be recycled at local sawmills and mulch processing, compost and topsoil, pallet manufacturing, and biomass power generating facilities.

Biological Resources Comment 46:

A commenter stated that the DEIS should evaluate the possibility of constructing around areas of mature trees and wetlands to save those areas.

Response: The Alternative Analysis in FEIS Section 2.2 evaluated different site configurations. See FEIS Appendix B-3. However, none of the site layout alternatives besides the Preferred Action Alternative would be technically or economically feasible or practicable because each would create inefficiencies that would prevent the Micron Campus from achieving the semiconductor wafer output necessary to achieve commercial viability. In addition, all of the site layout

alternatives besides the Preferred Action Alternative would result in either the same amount of permanent losses of Federal jurisdictional wetlands or the permanent loss of approximately 16-20 additional acres of Federal jurisdictional wetlands. See FEIS Section 2.2.4.

See Responses to Water Resources Comment 5 and Biological Resources Comment 2, 6 and 9. The project incorporates impact minimization strategies where feasible and mitigation strategies. As outlined in FEIS Section 3.4.5.1. and 3.4.5.2., these minimization and mitigation strategies include the following:

- Retention of approximately 380 acres on the Micron Campus site, including approximately 272 nearly contiguous acres of forested roosting habitat, approximately 84 acres of former cropland (mostly successional old field and shrubland), and approximately 11 acres of non-forested wetlands;
- Avoidance of high-value ecological areas, such as the perennial portions of Youngs Creek;
- Retention of vegetated buffers near sensitive habitats;
- Phased construction to reduce immediate disturbance; and
- Ongoing coordination with regulatory agencies to refine mitigation and avoidance measures.

Biological Resources Comment 47:

A commenter stated that the DEIS fails to provide binding mitigation measures that satisfy the no-jeopardy requirement under Section 7 of the Endangered Species Act.

Response: See Response to Biological Resources Comment 16. The BA has been approved by USFWS and is included in Appendix G-4 of the FEIS. USFWS' BO will be included in the Record of Decision and will address the potential incidental take of federally listed species associated with the Proposed Project. All disturbances related to threatened and endangered species will follow all applicable and relevant USFWS and NYSDEC regulations. The Proposed Project will follow all determinations issued because of the Section 7 process.

Biological Resources Comment 48:

A commenter stated that mitigation efforts should have independent oversight.

Response: See Response to Biological Resources Comment 16 and 47. All mitigation plans implemented through The Wetland Trust, Inc. will be monitored by the USACE, Regulatory Branch, Auburn Office and NYSDEC Region 7 Headquarters in Syracuse, as discussed in Section 7 of the Off-site Compensatory Mitigation Plan (FEIS Appendix F-7, Appendix N, Attachment B). This regulatory agency monitoring will continue for 10 years, unless additional monitoring is required by either agency to ensure performance standards are being met. Current monitoring schedules include at minimum a post construction report that details the year of completing plantings and 10 monitoring reports over the course of 15 years of vegetative growth. The overview in Appendix F of the FEIS includes detailed anticipated monitoring schedules, and the type of content to be included in the monitoring reports.

Section 3.4.5.2 of the FEIS includes multiple mitigation measures for bats, including the purchase and permanent protection of twice the amount of roosting habitat that would be lost due to Proposed Project and Connected Action construction, and funding for research and monitoring efforts to benefit science-based bat species conservation and management programs in New York State. Micron will be responsible for developing a mitigation plan in coordination with USFWS and NYSDEC. See also Response to Biological Resources Comment 7.

For grassland birds, Micron and The Wetland Trust, Inc., a 501(c)(3) nonprofit organization, have proposed to purchase 650 acres of sufficiently high-quality habitat for permanent protection and to restore and manage the habitat as grassland for 15 years (in 3-year cycles) to achieve the required net conservation benefit. A final grassland protection plan would be developed in coordination with NYSDEC to achieve a net conservation benefit for listed grassland birds, including northern harriers and short-eared owls, based on technologically, economically, and biologically practicable measures, and would be subject to NYSDEC review and approval.

Biological Resources Comment 49:

A commenter asked about long-term measures to protect remaining habitat and conservation easements.

Response: See Responses to Water Resources Comment 11 and Biological Resources Comment 48. The Wetland Trust will protect via conservative easements bat roosting habitat, grassland bird habitat, and the wetland mitigation sites. Approximately 272 undisturbed acres of forested roosting habitat on the Micron Campus will be protected via conservation easement.

Biological Resources Comment 50:

A commenter stated that biological and botanical experts should oversee the construction and long-term curation of repurposed properties used as mitigation.

Response: See Response to Biological Resources 16 and 48. All off-site mitigation will be coordinated with and approved by USACE and NYSDEC and conducted through The Wetland Trust, Inc., a 501(c)(3), a New York based company that owns and manages conservation easements. The Wetland Trust, Inc., along with monitoring and regulation by USACE and NYSDEC will serve as expert oversight of the construction and long-term management of the mitigation sites. See also FEIS Appendix F-7, Appendix N, Attachment B).

Biological Resources Comment 51:

A commenter suggested that given the habitat value and carbon sequestration capabilities of the trees that will be removed, Micron should provide funds to Onondaga Earth Corps, Onondaga Audubon, CNY Land Trust or equivalent NFPs so that an equivalent number of trees are planted within Onondaga or Oswego County to make up for the trees that are removed. Another commenter suggested that Micron plant trees that could provide habitat for endangered species and provide trees to local residents to plant.

Response: See Responses to Biological Resources Comments 6, 7, 8, 9, and 61.

Biological Resources Comment 52:

A commenter stated that wildlife mitigation should involve restoration of habitat.

Response: In addition to the BMPs described in FEIS Section 3.4.5.1 to minimize impacts to wildlife, Section 3.4.5.2 describes mitigation measures for bats and grassland birds, including grants for projects to benefit bat species, hibernaculum gating, installation of roost boxes, and management and stewardship of offsite bat mitigation sites. Micron and The Wetland Trust, Inc. have proposed to purchase 650 acres of sufficiently high-quality habitat for permanent protection and to restore and manage the habitat as grassland. Also, as described in the Off-site Compensatory Mitigation Plan (FEIS Appendix F-7, Appendix N, Attachment B), and required as a condition of Micron's wetlands permits, Micron will offset impacts to wetlands at a 2.2:1 rate on average. The mitigation rates for each type of wetlands can be found in FEIS Section 3.3.5. Under the Mitigation Plan, Micron would be required to enhance, establish, or restore a total of 422.14 acres of wetlands and restore a total of 14,030 LF of streams through permittee-responsible mitigation at the mitigation sites. See also Responses to Biological Resources Comments 7, 12, and 48.

Biological Resources Comment 53:

A commenter stated that the DEIS does not provide specific mitigation or consider harm related to loss of habitat connectivity or off-site effects such as increased traffic and noise or development of commercial space or housing.

Response: As outlined in FEIS Section 3.4.4.2, Growth Inducing Effects, "[t]he loss of at least some additional biological habitat would be expected within the five-county region due to site excavation, filling, and grading activities that would be required for construction of other residential or commercial development, including expansion of semiconductor supply chain business in the region." However, "[b]ecause these projected losses of forestland and grassland habitats due to induced growth are contingent on the specific locations, extent, and nature of future development, it is not feasible to project specific future losses of forest- and grassland-dependent wildlife, including protected bats or grassland birds. Although the projected habitat losses described above may serve as proximate indications of future species losses, the projected net habitat losses are relatively low, and may be offset by land cover ecological succession rates. Therefore, the Preferred Action Alternative has low potential to result in significant growth inducing effects on biological resources."

As discussed in FEIS Section 3.4.5.1, Micron will also be required to implement BMPs to minimize the effects of the Proposed Project on biological resources. These measures are summarized in Table 3.4-12 and include maintaining and enhancing buffer zones, implementing a Landscape Management Plan using native species where feasible, preserving key habitat corridors where feasible, and implementing off-site conservation measures to support regional ecological integrity. Specific noise mitigation measures include:

- Installation of sound attenuators, acoustical louvers, and sound walls at the Micron Campus and Childcare Site to reduce operational noise from rooftop air handlers and cooling fans.
- Upgrades to Rail Spur conveyor equipment, including improved pulleys, return idlers, and rubber flashing on hoppers, to reduce noise and minimize disturbance to adjacent bat habitat.

Biological Resources Comment 54:

A commenter stated that Micron should be required to develop a construction mitigation plan to reduce the impact to reptiles, amphibians, and small mammals with limited mobility.

Response: See Response to Biological Resources Comment 2, 6, and 45. As discussed in FEIS Section 3.4.4.2, Construction Effects, the Proposed Project will be developed in phases, which provides an opportunity for wildlife to relocate from active construction zones. Further minimization measures will also be employed during construction to reduce impacts including employing a biological monitor to oversee implementation of BMPs and other measures intended to minimize effects on biological resources. See FEIS Section 3.4.5.1.

As described in FEIS Section 3.3 (Water Resources), Micron would also be required to implement stormwater BMPs and would be required to undertake SMPs that would be documented in a SWPPP as part of its NYSDEC SPDES Construction General Permit to protect water quality of remaining wetlands and surface waters, and establish suitable habitat, for reptiles and amphibians. See FEIS Appendix F-8 for the draft SWPPP. See also Response to Water Resources Comment 27.

Biological Resources Comment 55:

A commenter stated that Micron should create a dedicated conservation area with comparable ecological features to lost wetlands and partner with environmental organizations to protect and restore the land as habitat for impacted species.

Response: See Responses to Water Resources Comments 6, 7, and 9. The basis for selection of mitigation sites was to match physical, chemical, and biological functions between the impacted and restored ecosystems. See also Biological Resources Comments 7, 12, 48 and 50; FEIS Appendix F-7, Appendix N, Attachment B. All off-site mitigation will be conducted through The Wetland Trust, Inc., a 501(c)(3), New York based company that owns and manages conservation easements. The Wetland Trust, Inc., along with monitoring and regulation via USACE and NYSDEC will serve as the experts overseeing the construction and long-term management of the

mitigation sites. These conservation easements would protect the wetland and stream habitat areas in perpetuity.

Biological Resources Comment 56:

A commenter stated that stormwater retention features could be designed to provide beneficial habitat.

Response: FEIS Section 3.3.4.2 (and Table 3.3-11) discusses Proposed Stormwater Management Practices including wet extended detention ponds, filtration bioretention areas, stormwater planters, and green roofs. The Childcare Site would include stormwater management areas, a pollinator garden, vegetative screenings, a tree island, and shade trees. These features can support native vegetation, improve habitat connectivity, and offer refuge for low-mobility and moisture-dependent species.

Biological Resources Comment 57:

A commenter suggested restoring disturbed areas and enhancing green spaces and landscaped buffers with native plants, bird boxes, amphibian ponds, and stormwater systems that mimic natural hydrology.

Response: See Responses to Biological Resources Comments 9, 12, and 56. As stated in FEIS Table 3.4-8, *Construction Effects on Ecological Communities (Micron Campus)* in Section 3.4, Micron would implement a Landscape Management Plan (LMP) to incorporate landscaped areas that prioritize native species in the vicinity of new buildings, parking lots, and stormwater management areas with the completion of each fab (and at the Childcare Site). Nesting boxes can be considered in the Landscape Management Plan. Micron also would plant native vegetated buffers along the perimeter of the Micron Campus where feasible, particularly in areas near sensitive habitats (including wetlands), to develop a transition zone between developed and undeveloped habitats and offer a degree of protection to the undeveloped habitats from the effects of fragmentation and invasive species. Preliminary landscape drawings can be found in FEIS Appendix G-10. Additionally, SMPs would be implemented to preserve existing drainage patterns to the greatest extent practicable, maintain the conveyance of upland watershed runoff, control increases in stormwater volume, prevent soil erosion and sedimentation, and reduce runoff through the use of green infrastructure where feasible. See also Response to Water Resources Comment 20.

Biological Resources Comment 58:

A commenter stated that Micron should plant thrice as many trees as they intend to destroy, and to continue to plant trees throughout our county to offset the carbon footprint. Other commenters supported planting trees as mitigation or funding not-for-profit groups to plant trees.

Response: See Responses to Biological Resources Comments 6, 7, 8, and 9. As described in FEIS Table 3.3-13, the anticipated mitigation ratio for federal palustrine forested wetlands and the various state forested wetlands (re maple hardwood swamp, hemlock hardwood swamp, and

floodplain forest) is 3 to 1. This means that for every one acre of forested wetlands impacted, three acres will be protected, rehabilitated, reestablished, and/or restored as part of the Mitigation Plan (FEIS Appendix F). See also Responses to Climate Change/GHG Comments 38 and 39.

Biological Resources Comment 59:

A commenter stated that Micron should use native plants and include shagbark hickory in the Compensatory Mitigation Plan for Red Maple Hardwood swamps.

Response: The lead agencies will require Micron to consider this comment in consultation with the applicable regulatory agencies and requirements.

Biological Resources Comment 60:

A commenter stated that native conservation plantings should be established following ideas of Homegrown National Park (<https://homegrownnationalpark.org>).

Response: Micron will consider this suggestion in consultation with the applicable regulatory agencies. See also Responses to Biological Resources Comments 57 and 58 and Table 3.4-8, *Construction Effects on Ecological Communities (Micron Campus)*, in FEIS Section 3.4, which highlights Micron's implementation of a Landscape Management Plan.

Biological Resources Comment 61:

A commenter stated that Micron should support and fund local municipalities and nonprofit organizations to build training programs that promote conservation of habitat.

Response: As described in FEIS Section 3.4.5.2, Micron proposes to establish a conservation grant fund to support the long-term protection and management of bat species, including the Indiana bat, northern long-eared bat, and tricolored bat. To help offset potential regional impacts associated with growth induced by the Proposed Project, Micron would provide up to \$100,000 annually for 10 years in grant funding for projects that directly benefit these species.

Biological Resources Comment 62:

A commenter expressed concern about the impacts of PFAS releases on wildlife and states that the DEIS fails to take a hard look at the potential impacts on species and ecosystems.

Response: See Responses to Biological Resources Comment 37 and Water Resources Comments 31, 33, 34, 38, and 40. Potential releases of PFAS are addressed in the FEIS, based on the information that is currently available and the current state of monitoring and treatment technologies. The FEIS specifically identifies PFAS use and presence in wastewater and discusses current regulatory approaches. As discussed in FEIS Section 3.8.3.2 and Appendix L-1, Micron will be required to secure an IDWP from OCDWEP that will require Micron to meet discharge limits for PFAS, employing onsite to wastewater pretreatment to meet those limits.

PFAS also would be addressed by the other regulatory controls, including appropriate storage and handling of chemicals, and spill prevention planning, which are discussed in the FEIS.

Biological Resources Comment 63:

Commenters were generally concerned about the spread of invasive species from disturbances caused by the Proposed Project.

Response: See Responses to Biological Resources Comments 31 and 63; Response to Water Resources Comment 16. As described in FEIS Table 3.4-8 *Construction Effects on Ecological Communities (Micron Campus)*, because invasive species have the potential to compromise the integrity of the remaining ecological communities during construction, Micron will be required to implement an Invasive Species Management Plan (ISMP) that “govern[s] each construction phase, including measures to manage soil and debris to reduce invasive species transport on-site. Biological surveys would be conducted in coordination with construction contractors prior to commencing each phase. Efforts to eliminate invasive species would continue throughout the construction period as needed and the ISMP would be amended to address site-specific invasive species and other issues as they arise.” See FEIS Appendix G-9 (draft plan).

Micron will also be required to implement a Landscape Management Plan to incorporate native species in landscaped areas near the new buildings, as well as plant native vegetative buffers along the Micron Campus perimeter, where feasible, with a focus on areas near any remaining sensitive habitats to build up a transition zone between developed and undeveloped areas. Preliminary landscape drawings can be found in FEIS Appendix G-10.

3.5 Historic and Cultural Resources

Historic/Cultural Resources Comment 1:

General concern was raised that the influx of population and new builds will lead to the demolition, neglect or irreversible alteration of historic buildings, landscapes and districts.

Response: Through ongoing consultation, regulatory compliance, and mitigation planning, the project seeks to ensure that historic properties are identified, evaluated, and protected throughout the development process. The FEIS and associated Section 106 studies were prepared in coordination with the New York State Historic Preservation Officer (NYSHPO), Tribal Historic Preservation Officers (THPOs), and other consulting parties. These consultations informed the definition of the Area of Potential Effect (APE)—the geographic area within which the proposed project may directly or indirectly alter the character or use of historic properties, as defined in 36 CFR 800.16. The Section 106 process includes:

- Initiating consultation with relevant parties
- Identifying historic properties within the APE
- Assessing potential adverse effects
- Resolving adverse effects through avoidance, minimization, or mitigation

These efforts also establish compliance with Section 14.09 of the New York State Historic Preservation Act (NYSHPA), which addresses impacts to resources listed or eligible for listing in the State Register.

FEIS Section 3.5, along with completed and ongoing studies conducted under Section 106 of the National Historic Preservation Act of 1966 (as amended), evaluates potential impacts on properties listed in or eligible for listing in the National Register of Historic Places. FEIS Section 3.5.2.3 outlines the identification of historic properties within the APE for the Micron Campus and Connected Actions and presents the results of those investigations. Appendix H-2 provides a summary of Section 106 consultation conducted to date.

Induced growth throughout the five-county region has the potential to affect historic architectural properties and archaeological resources. Although it cannot be predicted exactly when, or to what degree, induced growth would affect historic architectural properties, any future development requiring discretionary approvals would also be required to comply with Section 106 of the NHPA or Section 14.09 of the NYSHPA. See FEIS Section 3.5.2.3. Similarly, new development would still be subject to local land use regulations, such as setbacks, height restrictions, and landscaping and lighting requirements. See FEIS Section 3.13.4.2, Growth Inducing Effects. Other large projects also would be subject to site plan approvals and may be subject to the SEQRA process, which may include consideration, as here, of visual effects or aesthetic impacts on designated aesthetic resources. If future growth is concentrated in “centers,” and does not occur on contiguous farmland, it would be consistent with Plan Onondaga’s goal to encourage compact development to avoid sprawl and maintain rural character. See also Response to Historical/Cultural Resources Comment 7.

Historic/Cultural Resources Comment 2:

Describe what the public review process is for the ongoing study on historic and cultural resources. Add any new findings from those studies in the Final EIS and describe the most current schedule for completion of these studies as they could affect the start of construction.

Response: See Response to Historical/Cultural Resources Comment 1, discussing the Section 106 review process. CPO is serving as the lead Federal agency for Section 106 consultation for the Proposed Project and Connected Actions. See FEIS Section 3.5.1. As discussed in Section 3.5.4, “[t]o ensure that CPO’s responsibilities under the NHPA and its implementing regulations are met, Micron will not be authorized to begin construction of the Proposed Project or commence use of staging, storage, or temporary work areas or new or to-be-improved access roads until the Section 106 obligations have been met as defined under the PA, even if Micron receives funding and all other permits are obtained.”

This process ensures that any necessary mitigation measures can be developed and implemented in advance, minimizing potential impacts to historic and cultural resources. Currently, all conditions outlined above have been met for project components/portions of project components that are scheduled to begin construction in early 2026, following all necessary project approvals/permits. Field investigations for future project components will be completed prior to the scheduled construction start dates for those components. CPO is in the process of preparing a Programmatic Agreement (PA) for the Proposed Project and Connected Actions that will

implement a phased identification process to defer the final identification and evaluation of archaeological resources. See Response to Historic/Cultural Resources Comment 3. Section 106 consultation will continue throughout the process, and updates will be shared with consulting parties and the public, as appropriate. The results of ongoing archaeological and cultural resource studies will be documented and made available to the public in accordance with the SEQRA, Section 106 of the NHPA, and Section 14.09 of the NYSHPA. See also 36 C.F.R. 800.2(d). While sensitive information—such as the precise locations of archaeological sites—will be withheld to protect these resources, all other findings are included in the FEIS, where available.

Historic/Cultural Resources Comment 3:

The text on page 3-145 indicates that the Phase 1B investigations will be completed as well as all consultations completed prior to any intrusive construction in 2025. The Final EIS should provide a realistic schedule for these efforts so that the public is aware of any construction schedule delays.

Response: See Response to Historic/Cultural Resources Comment 2. Phase 1B workplans have been completed. As noted in FEIS Section 3.5.2.2, Phase 1B archaeological testing in the APEs for the Micron Campus (Phase 1A construction area), Rail Spur Site, Childcare Site, Industrial Wastewater Treatment Plant, Industrial Wastewater Conveyance, Natural Gas Line, and Electric Service has been completed. Phase 1B archaeological testing is ongoing for the Water Supply Connected Action and Micron Campus Phase 1B, 2A, and 2B construction areas. There will be no change to the construction schedule for the Proposed Project based on the status of the Phase 1B investigations.

Historic/Cultural Resources Comment 4:

A commenter asked whether there will be funding for stabilization of historic neighborhoods in Syracuse and other legacy cities.

Response: Decisions regarding local housing approvals and funding fall under the authority of relevant federal, state, and local agencies. See Response to Socioeconomic Comment 19, discussing funding for regional housing initiatives under the Green CHIPS Community Investment Fund.

Historic/Cultural Resources Comment 5:

The DEIS provides only limited analysis of how such widespread land use change could affect historic resources—particularly in rural, agricultural, or historically residential areas where unregulated growth may alter historic context, fabric, and community identity.

Response: Section 106 of the National Historic Preservation Act (NHPA) (54 U.S.C. § 306108; 36 C.F.R. Part 800) and Section 14.09 of the New York State Historic Preservation Act (NYSHPA), codified in the NYS Parks, Recreation and Historic Preservation Law, provide the federal and state regulatory framework under which the Lead Agencies must consider the effects of the Project on historic properties. Compliance with the requirements of these programs is

thoroughly discussed in FEIS Section 3.5 and remains ongoing. See Responses to Historical/Cultural Resources Comments 1 and 3.

Historic/Cultural Resources Comment 6:

The DEIS assumes that the open space and agricultural land that are referred to as “vacant” or “underutilized” are available for transformation and there is little attention given to their historic significance or community value. If consumed by speculative subdivisions or generic corporate parks, the region risks losing elements of its distinct identity.

Response: See Response to Historic/Cultural Resources Comment 1. FEIS Section 3.5.3 acknowledges that induced growth could potentially impact historic properties, including those in rural, agricultural, or historically residential areas. While the FEIS may refer to certain lands as “vacant” or “underutilized,” it does not assume these areas lack historic or cultural value. Rather, the FEIS recognizes that such areas may contribute to the region’s historic context and community identity. Any future development requiring discretionary approvals must comply with both the NHPA and NYSHPA, ensuring that historic significance is considered before transformation occurs.

Historic/Cultural Resources Comment 7:

The DEIS should include a comprehensive review of historic resources in areas likely to experience induced growth.

Response: See Response to Historical/Cultural Resources Comment 1. FEIS Section 3.5.3 acknowledges that induced growth has the potential to affect historic properties, but such impacts cannot be predicted at the individual property level. The section notes that any future development requiring discretionary approvals must comply with NHPA and NYSHPA. In accordance with SEQRA, Section 106, and Section 14.09, an analysis of the direct areas of potential effect (APE) must be conducted to the extent that it can be reasonably foreseen. These APEs are subject to review and approval by SHPOs, THPOs, and other consulting parties.

Because areas of induced growth cannot be accurately predicted, their potential impacts on historic resources cannot be studied in advance. FEIS Section 4.2 discusses reasonably foreseeable future actions, with Table 4.2-1 identifying the distance of these actions from the Micron Campus and the associated resources. These actions are also likely to require discretionary approvals, triggering compliance with NHPA, NYSHPA, and/or SEQRA.

Historic/Cultural Resources Comment 8:

Micron should provide incentives for historic housing rehabilitation.

Response: See Response to Historical/Cultural Resources Comment 4.

Historic/Cultural Resources Comment 9:

Concerns were raised regarding the widening of Route 31 and the potential impact it has on historic properties and places of worship, including the Immanuel Lutheran Church.

Response: See Response to Visual/CC Comment 3. Proposed right-of-way limits for specific roadway widenings are typically determined during roadway design development, at which time discussions between the NYSDOT and adjacent property owners would occur.

The effects on the status of historic structures within the area of impact are discussed in FEIS Section 3.5 and Appendix H. While not discussed in the FEIS, the Immanuel Lutheran Church was evaluated for listing in the National Register of Historic Places (NRHP) as part of the Section 106 Consultation Process, adhering to the National Historic Preservation Act of 1966, as amended. The structures on the church parcel were surveyed in the Architectural Resources Survey Report (AKRF 2024:20) which recommended the church as not eligible for listing in the NRHP as a result of alterations to the original church structure over time. Based on its review of the Architectural Resources Survey Report, SHPO opined that the Immanuel Lutheran Church is not eligible for listing in the NRHP in a letter dated December 13, 2024.

Historic/Cultural Resources Comment 10:

A commenter stated that there are no historical and archeological sites located within the area where the Micron plant is to be constructed. However, the commenter mentioned the following nearby sites, raising concern that these areas will not be fully explored with their information and locations being preserved before they are completely destroyed by related development: (1) the early Onondaga encampment located at Three-Rivers on the Clay side of the river; (2) on the Schroepfel side of the river is the location of an early fort as well as the encampment of 10,000 troops. This area also is the location of where early Circle Mounds were located; (4) the location of the Great Stone Bowl makers at Horseshoe Island; (5) the Oak Orchard area contains many sites including three native burial grounds, camping and fishing sites. This also was the location of the Paleo Indians and the Greenland Eskimos. Oak Orchard is also the site of an early massacre; (6) The Great Flint Rock was located near Caughdenoy Road. There is also at least one booklet on the burials from there to Brewerton; and (7) the Town of Schroepfel on the other side of the river also has many sites (specific sites not provided). A lot of work needs to be done to save this historic information, perhaps by New York college students.

Response: See Responses to Historical/Cultural Resources Comment 1, 2 and 7. As discussed, FEIS Section 3.5.3 acknowledges that induced growth has the potential to affect historic properties, but such impacts cannot be predicted at the individual property level. The section notes that any future development requiring discretionary approvals must comply with NHPA and NYSHPA. In accordance with SEQRA, Section 106, and Section 14.09, an analysis of the direct APE must be conducted to the extent that it can be reasonably foreseen. These APEs are subject to review and approval by SHPOs, THPOs, and other consulting parties. See also Response to Nation Comment 30.

The results of ongoing archaeological and cultural resource studies will be documented and made available to the public in accordance with the SEQRA, Section 106 of the NHPA, and Section 14.09 of the NYSHPA. See also 36 C.F.R. 800.2(d). Archaeological work plans for all parts of this project have been completed and archaeological Phase IB investigations, including excavations to identify unknown archaeological sites, will be completed in a phased approach throughout the construction process.

3.6 Air Quality

Air Quality Comment 1:

General comments or concerns were raised that the Project will have a negative impact on air quality in the community.

Response: FEIS Chapter 3.6 provides a comprehensive analysis of air emissions associated with stationary and mobile sources from both the construction and operational phases of the Proposed Project. This includes evaluation of criteria pollutants and their precursors (e.g., volatile organic compounds (VOCs), particulate matter (PM), nitrogen oxides (NO_x), hazardous air pollutants (HAPs) and regulated non-criteria pollutants from both stationary and mobile sources associated with the Proposed Project.

These analyses, including air dispersion modeling of the maximum emissions generating scenario detailed in FEIS Chapter 3.6 and Appendix I, were conducted in the context of Clean Air Act and New York state thresholds and regulatory guideline concentrations designed to protect human health and the environment. FEIS Chapter 3.6 and Appendix I demonstrate that the Project will not cause or contribute to an exceedance of any National Ambient Air Quality Standard (NAAQS) health-based regulatory threshold for criteria pollutants, non-criteria pollutant annual guideline concentrations (AGCs) or short-term guideline concentrations (SGCs) throughout both the construction and operational phases of the Proposed Project.

Air Quality Comment 2:

The DEIS lacks clear modeling of emissions related to fab operations, diesel construction fleets, and chemical deliveries.

Response: FEIS Chapter 3.6 presents a thorough and comprehensive analyses of project-associated emissions for both construction and operation phases, including for criteria pollutants and precursors (e.g., VOCs, particulates), HAPs and regulated non-criteria pollutants, for both stationary and mobile sources, which includes facility operations and truck traffic in the context of Clean Air Act and New York state thresholds and regulatory guidelines protective of human health. Appendix I of the FEIS provides an assessment of the air modeling conducted, including modeling performed for mobile and stationary sources, including criteria pollutants and non-criteria pollutants associated with the Project.

The modeling was performed in accordance with USEPA and NYSDEC requirements and guidelines, including: (1) the USEPA user guides for the EPA Regulatory AERMOD Modeling System available from USEPA's Support Center for Regulatory Atmospheric Modeling website,

(2) the USEPA's Guideline on Air Quality Models (40 CFR Part 51 - Appendix W), (3) DAR-10: NYSDEC Guidelines on Dispersion Modeling Procedures for Air Quality Impact Analysis, and (4) DAR-1: Guidelines for the Evaluation and Control of Ambient Air Contaminants under 6 NYCRR Part 212.

Air Quality Comment 3:

The DEIS lacks clear modeling of volatile organic compounds (VOCs), particulate matter, and other emissions related to fab operations, diesel construction fleets, and chemical deliveries.

Response: See Response to Air Quality Comment 2. FEIS Chapter 3.6 presents analyses of project-associated emissions for both construction and operation phases, including for criteria pollutants (e.g., VOCs, particulates, HAPS) and regulated non-criteria pollutants, for both stationary and mobile sources, in the context of Clean Air Act thresholds and regulatory guidance concentrations protective of human health.

Air Quality Comment 4:

Micron should have to provide more support for using Rochester air quality monitoring or do actual monitoring to demonstrate no NAAQS exceedances. Conditions in Rochester may be expected to be similar, but Micron should at least be required to demonstrate—with actual local monitoring data—that they are before relying on these figures to demonstrate that the facility will not have any significant environmental impacts.

Response: See Response to Nation Comment 9. FEIS Section 3.6.3.2 demonstrates compliance with NAAQS thresholds for regulated criteria pollutants under a conservative approach based on preliminary design information assuming all four fabs are operational, although initially construction and operation of only Fabs 1 and 2 is expected. As further discussed in FEIS Chapter 3.6 and Appendix I, the proposed Micron Campus is located in a more rural area compared to the location of the air monitors in Rochester and Syracuse, and therefore the ambient background air quality in the Rochester and Syracuse monitoring locations is a conservative representation of background concentrations in the Proposed Project area.

Air Quality Comment 5:

The DEIS should incorporate a more explicit explanation of the intersections that fail hot spot analyses and what that signifies.

Response: As discussed in FEIS Section 3.6.3.2, no intersections failed the PM Hot-Spot Analysis, and there are no associated potentially significant adverse impacts to local air quality anticipated.

Air Quality Comment 6:

Assuming that the DEIS NAAQS compliance analysis is correct, modeled levels of both NOx and PM2.5 are very close to NAAQS limits. Given the uncertainty inherent in

modeling data, Micron should be required to keep a closer eye on the regional levels of these pollutants during construction and operation.

Response: USEPA monitors and reports regional ambient air quality and compliance with the NAAQS on an ongoing basis. The Title V air permit for the Proposed Project will also include emission limits to ensure that the Proposed Project will not cause or contribute to exceedances of the NAAQS in the region. In accordance with the requirements of its air permit, Micron will be required to monitor and report its emissions and compliance with the emission limits and requirements of its air permit. See also Responses to Air Quality Comments 1 and 4.

Air Quality Comment 7:

The DEIS must discuss Micron's PFAS air emissions, including those associated with F-gasses. The DEIS acknowledges that Micron will use and release fluorinated gasses (F-gasses), with almost 2.5 tons of projected "fluorides" emissions from fabs 1 and 2 alone. But the DEIS overlooks the fact that many F-gasses are themselves PFAS or PFAS-precursors, the adverse impacts of which extend far beyond their contribution to climate change.

Response: FEIS Chapters 3.6 and 3.7 detail the Proposed Project's anticipated emissions, proposed emission control measures, and applicable permitting requirements. To minimize and avoid impacts to air quality during operations, FEIS Section 3.6.6 details the best management practices, air pollution control devices and other measures that will be implemented to minimize and avoid potential impacts to air quality. Air permits issued by the NYSDEC will ensure that emissions are properly managed and do not pose a risk to public health.

Although there are no specific federal or state air quality standards for PFAS individually or as a group, all air pollutants (including PFAS) have been evaluated. Additionally, the Micron Campus is expected to be classified as a major source under the Prevention of Significant Deterioration (PSD) Program, requiring the implementation of Best Available Control Technology (BACT) for pollutants like carbon monoxide, nitrogen oxides, and fluorinated greenhouse gases (F-GHGs), some of which may be considered PFAS. These pollutants will be treated using controls like regenerative catalytic systems or POU thermal oxidizers with up to 99% destruction efficiency. FEIS Section 3.7.3.2 discusses potential emissions and emissions controls for fluorinated GHGs, including certain PFAS.

New York's air toxics program regulates non-criteria pollutants, including PFAS, using annual and short-term guideline concentrations developed based on best available science. Micron also plans to minimize fugitive emissions from heat transfer fluids and refrigerants through efficient design, monitoring, and maintenance. Additionally, the semiconductor industry is actively developing technologies to reduce PFAS emissions, including alternative chemistries, process optimization, and recycling systems. See FEIS Appendix L-1.

Air Quality Comment 8:

In the environment, most F-gasses degrade into trifluoroacetic acid (TFA), which is associated with developmental toxicity and liver and thyroid harm, and extremely difficult to control. DEIS fails to mention TFA.

Response: See Responses to Air Quality Comments 7 and 13. Emissions modeling for applicable individual fluorinated compounds (including directly-emitted F-GHGs and combustion byproducts) are presented in FEIS Appendix I-1 and demonstrate compliance with applicable federal and state requirements. Also, by implementing Best Available Control Technology (BACT) for GHGs, including F-GHGs (F-gases), Micron will minimize the amount of F-GHGs released into the atmosphere.

Air Quality Comment 9:

Micron must review the environmental impacts of incineration and consider the use of alternative technologies within the DEIS.

Response: As discussed in Micron's Air Permit Application, it is preferable to combust F-GHGs with natural gas rather than to release them directly to the atmosphere because: (1) PEECS are necessary to mitigate safety concerns (e.g. reactive and pyrophoric gases) associated with exhaust streams from thin films process tools, such that any CO₂ or CH₄ emissions are a necessary result of achieving important safety goals; and (2) the formation of CO₂ in POU control devices and RCS is a desirable outcome, because the GWP of CO₂ is significantly less than typical F-GHGs used in etching. Further, RCS and POU control devices can be used to treat F-GHGs at up to 99% destruction and removal efficiency for most compounds, according to the 2019 IPCC. See 2019 Refinement to the 2006 IPCC Guidelines for National Greenhouse Gas Inventories, V. 3 Industrial Processes and Product Use, Ch. 6 Electronics Industry Emissions (Rev. Nov. 2023).¹³ Incomplete oxidation of process chemicals are accounted for in the emissions estimates in the FEIS. As part of the NYSDEC permitting, alternatives and identified combustion-based control technologies have been addressed and identified in Micron's air permit application (as required through Best Available Control Technology (BACT) and Lowest Achievable Emission Rate (LAER) analyses). See also FEIS Appendix J-2. See also Response to Air Quality Comment 10.

Air Quality Comment 10:

Incineration of process gases with wet scrubbing is not 100% effective, making the DEIS estimate of GHGs too low; and it produces toxic products of incomplete combustion, and hydrogen fluoride. This causes toxic gases of unknown composition to be emitted into the community. The DEIS needs to be revised to assess the danger and health effects to humans and animals. Mitigation of these health risks could be accomplished by either replacing fluorinated gases with non-toxic degradable compounds or use an alternative control technology like wet oxidation.

¹³ https://www.ipcc-nggip.iges.or.jp/public/2019rf/pdf/3_Volume3/19R_V3_Ch06_Electronics.pdf.

Response: Devices that control air emissions have been evaluated in the FEIS and as part of the air permitting process. An analysis of the benefits and impacts of various control technologies, including centralized rotor concentrator thermal oxidizers (RCTOs) that achieve at least a 97% reduction of the VOC emissions, is included in FEIS Section 3.6. As discussed, thermal oxidation in point of use control devices and the use of a wet scrubbing system and process equipment exhaust conditioners (PEECs) are also used to control air emissions from semiconductor manufacturing facilities.

Information on products of incomplete combustion (PICs) are included in the FEIS as well as in Micron's air permit application. As indicated in FEIS Section 3.7.3.2, "emission chemicals [which may include products of incomplete combustion] may be generated in PEECs which manage exhaust from process tools for protection of equipment and personnel. In addition, POU control devices installed for removal of F-GHGs and centralized RCTOs installed for removal of volatile organic compounds (VOC) can generate emission chemicals. When these reactions occur, use of the primary chemical results in emissions of one or more emission chemicals that are not the primary chemical itself." Further, the control devices described above are designed specifically to target fluorinated chemicals in addition to particulates and acid gases, as opposed to control devices used in other manufacturing sectors designed only for particulate and/or acid gas control. The identified control technologies for fluorinated greenhouse gases are consistent with BACT. See response to Air Quality Comment 7 for further discussion on controls of PFAS-containing air emissions. See also Response to Air Quality Comment 9 on assessment of alternatives and air emissions controls.

Air Quality Comment 11:

Micron should be required to install air quality monitors for NAAQS pollutants and selected hazardous air pollutants (including HF, NF3, and total fluorides) in the airshed directly affected by the Micron facility.

Response: See Response to Onondaga Nation Comment 9. See also Responses to Air Quality Comments 1, 4, and 12. USEPA monitors and reports regional ambient air quality and compliance with the NAAQS thresholds. Micron will also be required to monitor and report facility emissions, including HAPs, criteria and non-criteria pollutants as part of its air permit to be issued by NYSDEC.

Air Quality Comment 12:

Commenters suggested that an independent, third-party natural resource monitor be employed for the site and vicinity to assess impacts on natural resources, including air quality. Long-term monitors should report to NYSDEC or Onondaga County.

Response: The Clean Air Act and New York State laws and regulations already require USEPA monitoring, assessment and reporting of ambient air quality and compliance with the NAAQS. NYSDEC air permitting requirements include emissions reporting and certification to ensure compliance with permit thresholds and regulatory limits. Site specific monitoring, recordkeeping, and reporting requirements will also be included in an air Title V permit to be issued by NYSDEC and will require air emission monitoring reports and certifications to be submitted to NYSDEC to ensure compliance with permit and regulatory thresholds and limits. USEPA and NYSDEC

maintain ongoing authority to monitor and ensure compliance with all air permit and applicable air quality requirements and compliance with the NAAQS, and deviations from permit requirements must be reported to NYSDEC.

Air Quality Comment 13:

Micron must contain and treat any chemicals their processes release into the air, including PFAS and greenhouse gases.

Response: FEIS Chapters 3.6 and 3.7 detail the Project's anticipated emissions, proposed emission control measures, and applicable permitting requirements. Air permits issued by the NYSDEC will ensure that emissions are properly managed and do not pose a risk to public health. As part of the permitting process, NYSDEC will also evaluate the Project's greenhouse gas emissions and include requirements for controls. FEIS Section 3.6.3.2 discusses proposed control technologies (e.g. thermal oxidation systems, various types of scrubbers). Details of the applicable control technologies, including monitoring, maintenance, and reporting requirements, will be detailed and included in an air Title V permit. The Title V permit review and issuance process will include maintenance, monitoring, reporting, and compliance requirements to ensure regulatory compliance and protection of human health.

Although there are no specific federal and state air quality standards for PFAS individually or as a group, all air pollutants (including PFAS) have been evaluated for the Proposed Project. See Responses to Nation Comment 11; Air Quality Comment 7; FEIS Appendix L-1. All process emissions will be routed to control systems with built-in redundancy to ensure safety and compliance. The Micron Campus is expected to be classified as a major source under the Prevention of Significant Deterioration (PSD) Program, requiring the implementation of Best Available Control Technology (BACT) for pollutants like carbon monoxide, nitrogen oxides, and fluorinated greenhouse gases (F-GHGs), some of which may be considered PFAS. These pollutants will be treated using controls like regenerative catalytic systems or POU thermal oxidizers with up to 99% destruction efficiency.

FEIS Section 3.7.3.2 discusses potential emissions and emissions controls for fluorinated GHGs, including certain PFAS. Air dispersion modeling for individual fluorinated compounds is presented in Appendix I, which confirms compliance with regulatory guidance concentrations for all applicable compounds. As discussed in FEIS Appendix L-1, New York's air toxics program regulates non-criteria pollutants, including PFAS, using annual and/or short-term guideline concentrations developed based on best available science. Micron also plans to minimize fugitive emissions from heat transfer fluids and refrigerants through efficient design, monitoring, and maintenance. Additionally, the semiconductor industry is actively developing technologies to reduce PFAS emissions, including alternative chemistries, process optimization, and recycling systems, which will be reflected in the Micron Campus's air permit.

Air Quality Comment 14:

The Air Quality section needs to add in discussions regarding the adverse effects and environmental impact on air of emissions exceedances, violations, upset conditions and other inadvertent releases to the atmosphere.

Response: NYSDEC air permitting requirements include mandatory emissions reporting, certification, and compliance monitoring to ensure that emissions remain within permitted thresholds and regulatory limits. Through this regulatory framework, the Proposed Project is subject to oversight designed to prevent, detect, and mitigate any adverse air quality impacts, thereby protecting public health and the environment.

Air Quality Comment 15:

What specific technologies and protocols will be implemented to monitor and control air emissions, especially hazardous air pollutants, from the manufacturing process and supporting facilities (e.g., bulk gas yards)?

Response: FEIS Section 3.6.3.2 discusses proposed air pollution control technologies (e.g., thermal oxidation systems, various types of scrubbers) that will control emissions from the manufacturing process and the facility. Details of the applicable control technologies, and their operation, including monitoring, maintenance, and reporting requirements, will be established by NYSDEC in the Title V permit.

Air Quality Comment 16:

How will Micron ensure air emission control measures are consistently effective in protecting local air quality. Micron should be required to monitor the regional levels of pollutants in the air during construction and operation.

Response: See Response to Onondaga Nation Comment 9. See also Responses to Air Quality Comments 1, 11, and 17. FEIS Section 3.6.3.2 discusses proposed control technologies (e.g., thermal oxidation systems, various types of scrubbers). Details of the applicable control technologies, including monitoring, maintenance, and reporting requirements, will be established by NYSDEC and included in the Title V permit to ensure compliance with regulatory requirements that are protective of human health. These control technologies must meet Best Available Control Technology (BACT), Lowest Achievable Emission Rate (LAER), and Maximum Achievable Control Technology (MACT) criteria. USEPA monitors and reports regional ambient air quality and compliance with NAAQS.

Air Quality Comment 17:

The DEIS does not state how Micron will minimize contamination of air. Rather than simply reciting the applicable legal standards and its intent to comply with those standards, Micron should be required to provide data on the pollution reduction that can be achieved via available air emission controls and assess the environmental impacts of the resulting emissions directly. Should provide more information on pollution reduction from air emission controls.

Response: See Responses to Air Quality Comments 9 and 15. FEIS Section 3.6 includes an assessment of the proposed emission control technologies, their efficacy and impacts, including thermal oxidation systems, point-of-use (POU) destruction systems, thin films Process Equipment Exhaust Conditioners (PEECs), centralized rotor concentrator thermal oxidizers (RCTOs), various types of scrubbers, and drift eliminators.

The Title V permit for the Micron Campus will also include additional details of the control technologies that will be required, including monitoring, maintenance, and reporting requirements. These control technologies will be subject to Best Available Control Technology (BACT) and Lowest Achievable Emission Rate (LAER) criteria, New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAPs) that require minimum control efficiencies, where applicable.

Air Quality Comment 18:

Concerns were expressed over the effect of dust on those living in immediate area. The DEIS should provide specific plans for dust control during construction.

Response: See Response to Air Quality Comment 1. FEIS Section 3.6.6 provides for the following BMPs to control the potential for fugitive dust emissions during construction activities:

- Use of water to control dust during demolition of existing buildings or structures, construction operations, the grading of roads, or the clearing of lands.
- Application of other substrates besides water for dust control as needed.
- Installation and use of hoods, fans and fabric filters or similar systems to enclose and vent dusty materials.
- Adequate containment methods are employed during sandblasting or other operations.
- Covering open-bodied trucks transporting materials likely to generate airborne dusts.

Air Quality Comment 19:

A commenter expressed concern about how a derailment containing chemicals to be used at the facility would impact the air quality for immediate communities.

Response: Micron will not use rail to transport hazardous materials. See FEIS Section 2.1.2.3. See also Response to Solid Waste and Hazardous Materials Comment 27.

Air Quality Comment 20:

Cumulative impacts of air pollution are not sufficiently addressed. DEIS does not sufficiently address cumulative exposure analysis, including hazardous air pollutants (HAPs) under Clean Air Act thresholds.

Response: See Responses to Air Quality Comments 1, 4, and 6. FEIS Chapter 3.6 includes a comprehensive analysis of emissions from both the construction and operation phases of the Project, including criteria pollutants (e.g., VOCs, particulate matter), HAPs and regulated non-

criteria pollutants from stationary and mobile sources. These emissions were evaluated in relation to Clean Air Act and New York State regulatory thresholds and health-protective guidelines. The air dispersion modeling discussed in Chapter 3.6 and Appendix I also included an analysis of cumulative impacts, from the Project as well as other area emission sources. In addition, FEIS Section 4.3.6 analyzes cumulative impacts, including reasonably foreseeable actions and regional trends that could contribute to increased air emissions. Based on this comprehensive assessment, cumulative air quality impacts are not anticipated to be significant.

Air Quality Comment 21:

The public has a right to understand long-term exposure risks, particularly for children, elderly residents, and immunocompromised individuals in nearby residential zones.

Response: See Responses to Air Quality Comments 1-3. FEIS Chapter 3.6 presents an analysis of Project-associated emissions for both construction and operation phases, including for criteria pollutants (e.g., VOCs, particulates), HAPs and regulated non-criteria pollutants, for both stationary and mobile sources. This analysis is in the context of Clean Air Act NAAQS thresholds and New York State's regulatory guideline concentrations established to be protective of human health, considering short-term and long-term exposures. The NAAQS specify the ambient concentrations of criteria pollutants to which the public can be exposed without adverse health effects and are designed to protect those segments of the public most susceptible to respiratory distress, including people with asthma, chronic obstructive pulmonary disease, or other lung diseases, as well as very young people, elderly people, and people engaged in strenuous work or exercise. The New York State annual and short-term guideline concentration requirements associated with non-criteria pollutants also consider sensitive populations such as children and the elderly.

Air Quality Comment 22:

Micron needs to adhere to state and federal requirements associated with hazardous chemicals, including risk management plan (RMP) requirements.

Response: FEIS Section 3.8 includes a discussion and analysis of the federal requirements associated with hazardous chemicals, including RMP requirements, and how the Project will comply with these requirements. The FEIS explains that Micron will be required to develop an RMP for regulated flammable and toxic "extremely hazardous substances" above applicable threshold quantities (40 CFR § 68.130) that would be used in covered on-site processes. Pending further review based on evolving Micron Campus designs, Micron would expect the RMP to cover eight regulated chemicals (ammonium hydroxide, anhydrous ammonia, hydrogen, hydrogen chloride, silane, chlorine, dichlorosilane, and HF) and would evaluate and add additional chemicals to the RMP on a case-by-case basis.

FEIS Table 3.9-2 also describes process hazards and discusses measures such as pre-task planning (PTP), job hazard analyses (JHA), permit-to-work (PTW), critical risk checklists, and PPE. Micron EHS professionals will be responsible for conducting risk assessment reviews consistent with the PTP, JHA, and PTW procedures. These measures would be applied across the fabs consistent with the NIOSH hierarchy of controls. See also Responses to Solid Waste and Hazardous Materials Comments 4 and 48.

Air Quality Comment 23:

What assurances do residents that live in Clay have that issues with foul odor and smells will not happen here.

Response: Micron will be required to comply with all applicable federal, state and local laws with respect to air emissions that may cause odors, including 6 NYCRR 211.1 and the Town of Clay Zoning Code Section 230-17(6). These laws prohibit odors that are a nuisance or unreasonably interfere with the comfortable enjoyment of life or property.

Micron also conducted air modeling, including hydrogen sulfide emissions that can cause odors (e.g., rotten egg smell). Modeled hydrogen sulfide concentrations are presented in FEIS Table 3.6-11. The modeling showed that emissions of hydrogen sulfide from the facility are not expected to result in foul offsite odors.

Air Quality Comment 24:

A commenter recommended that Micron explore an alternative approach to controlling F-gases: low-temperature condensation of the gases, followed by destruction using advanced technology such as super critical wet oxidation.

Response: See Responses to Air Quality Comments 1, 7, 8, 10, 13, and 17. Emissions modeling for applicable individual fluorinated compounds are presented in FEIS Appendix I-1, demonstrating compliance with applicable guidance concentrations. FEIS Section 3.6.3.2 discusses proposed control technologies (e.g. thermal oxidation systems, various types of scrubbers). Details of the applicable control technologies, including monitoring, maintenance, and reporting requirements, will be established by NYSDEC and included in Micron's Title V air permit based on NYSDEC's review and analysis of Micron's air permit application, and emission control requirements. The Title V permit will include maintenance, monitoring, reporting, and compliance requirements to ensure regulatory compliance and protection of human health.

Air Quality Comment 25:

Mitigation measures for construction equipment should include best available control technology as feasible in contract specifications to reduce emissions during construction.

Response: FEIS Section 3.6.6 identifies the following BMPs to be used in minimizing equipment-related emissions, which include:

- Limit idling of vehicles and equipment engines to no more than 5 minutes when not in use.
- Use construction equipment equipped with Tier 4 engines.
- Use cleaner burning fuel (renewable diesel, natural gas) or electric vehicles and equipment when feasible.
- Use only low sulfur diesel fuel in relevant equipment and emergency generators.

Air Quality Comment 26:

The DEIS must consider and impose mitigation measures to address PFAS air emissions in permits.

Response: See Responses to Air Quality Comments 7 and 13. PFAS-containing emissions from the Proposed Project are not anticipated to be significant due to project design, compliance with NYSDEC's air toxics program, Title V permit conditions, and CLCPA requirements, as well as the implementation of BMPs. No additional mitigation is therefore required.

Air Quality Comment 27:

To mitigate air pollution impacts, Micron should segregate all waste materials made with fluoropolymers and not allow them to be incinerated. It would be best to find a way to recycle this material.

Response: See Responses to Solid Waste and Hazardous Materials Comment 65 and Air Quality Comment 26. See also FEIS Appendix L-1. Recognizing that there is no one-size-fits-all technology or treatment program for PFAS-containing waste material, Micron through its RRR Program will implement feasible, practicable, and necessary measures to reuse, recycle, and recover materials or waste generated at the facility. To the extent that waste cannot be reused or recycled, it may be collected via licensed private haulers for transport to permitted private facilities authorized to receive the waste (FEIS Sec. 3.8.3.2) or transported to authorized off-site incineration facilities for energy recovery or for other RRR activities. USEPA has identified incineration of PFAS-containing material as "a viable PFAS destruction technology if done under certain conditions," and further describes that use of "temperatures above approximately 1,100°C / 2,012°F may result in high destruction efficiencies and few detectable fluorinated products of incomplete combustion." See USEPA "Interim Guidance on the Destruction and Disposal of Perfluoroalkyl and Polyfluoroalkyl Substances and Materials Containing Perfluoroalkyl and Polyfluoroalkyl Substances," V.2. <https://www.epa.gov/system/files/documents/2024-04/2024-interim-guidance-on-pfas-destruction-and-disposal.pdf>.

Air Quality Comment 28:

The DEIS does not say how Micron's Risk Management Plan will be made accessible. It is also unclear whether PFAS or emerging contaminants will be included in the RMP. Micron's RMP should include all chemicals that it internally identifies as hazardous.

Response: See Response to Air Quality Comment 22. Micron's Risk Management Plan (RMP) will address those chemicals regulated as "extremely hazardous substances" that are used in covered processes in quantities above threshold levels. At this time, PFAS and unidentified emerging contaminants are not subject to USEPA's Risk Management Program regulations. Micron's RMP will be accessible through the USEPA's Risk Management Program website (<https://www.epa.gov/rmp/how-access-risk-management-plan-information>) or by contacting the local Emergency Planning Committee (LEPC) when applicable and available during the operational phase of the Project.

Air Quality Comment 29:

Toxic chemicals from chips must not pollute the air.

Response: See Response to Air Quality Comment 1. USEPA monitors and reports regional ambient air quality. FEIS Chapter 3.6 presents a comprehensive analysis of Proposed Project-related emissions for both construction and operation phases, including emissions for criteria pollutants (e.g., VOCs, particulates), HAPs and regulated non-criteria pollutants, for both stationary and mobile sources, in the context of Clean Air Act and New York State regulatory thresholds and guideline concentrations protective of human health. The Micron Campus will be subject to a Title V air permit, which will include air emission limits, controls, standards, monitoring and reporting requirements to ensure the facility does not cause or contribute to ambient air exceeding concentrations protective of human health.

Air Quality Comment 30:

Burning natural gas will result in poor air quality for the area - and we already have poor air quality.

Response: See Response to Air Quality Comment 1. USEPA monitors and reports regional ambient air quality. FEIS Chapter 3.6 includes a detailed analysis of current ambient air quality, which meets the NAAQS, and emissions from both the construction and operation phases of the Proposed Project, including those associated with natural gas combustion. Emissions were evaluated against health-based thresholds and guidance concentrations established under the Clean Air Act and New York State requirements that ensure protection of public health. As demonstrated in the FEIS and in the Micron Campus' air permit application, the Proposed Project will not cause or contribute to an exceedance of the NAAQS.

Air Quality Comment 31

The DEIS assesses construction and operation emissions separately, yet there will be both construction and operations emissions between 2029 and 2041 so the cumulative effects of both construction and operations need to be considered for the coincident time periods and presented in the Final EIS.

Response: FEIS Chapter 3.6 evaluates construction and operational emissions separately to align with established environmental review practices and regulatory permitting frameworks. This approach reflects the distinct characteristics of each phase and allows for accurate analysis and modeling of emissions, comparisons to regulatory thresholds like NAAQS, SGCs and AGCs, and mitigation strategies appropriate for each phase. However, while FEIS Chapter 3.6 presents these analyses separately, FEIS Section 3.6.3.2 also includes cumulative air quality assessments, which consider overlapping emissions from both mobile and stationary sources. These cumulative analyses incorporate traffic growth, regional development, and technological improvements expected over time.

3.7 Climate Change & Greenhouse Gas Emissions

Climate Change/GHG Comment 1:

The project will be a new source of and increase to greenhouse gas and carbon emissions.

Response: FEIS Chapter 3.7 includes a detailed assessment of the GHGs associated with the Proposed Project and alternatives, including (1) direct emissions, which arise from the manufacturing process and stationary combustion that supports the manufacturing process (referred to as Scope 1); (2) indirect emissions, which arise from purchase of offsite fossil fuel generated electricity (referred to as Scope 2); and (3) indirect emissions, which result from the activities upstream and downstream of Micron's operations (referred to as Scope 3), analyzed in relation to federal and State regulatory frameworks. When compared to pre-mitigation GHG emissions, Micron will avoid approximately 77 percent of potential GHG emissions due to project design components, direct process emissions control measures, BMPs, and mitigation measures.

Climate Change/GHG Comment 2:

The amount of water and electricity required will contribute to all types of climate change issues.

Response: See also Response to Climate Change/GHG Comment 1. FEIS Chapter 3.7 includes a discussion of how greenhouse gases (GHGs) impact climate change, the effects of climate change, and an assessment of GHGs associated with the Proposed Project. As discussed in FEIS Chapter 3.7, the effects of climate change are driven by the combined emissions from various sources across the globe, rather than from any single event or emission. Each contribution, whether large or small, adds to the overall warming of the planet. As such, when assessing the impact of a specific project, like the Proposed Project, it is essential to consider how its emissions across alternative scenarios (including a scenario with no project) fit in relevant context into broader global and regional emissions, its contribution to the ongoing accumulation of GHGs in the atmosphere, and how the project and alternatives may impact climate commitments and goals.

FEIS Chapter 3.7 assesses the GHGs associated with the Project, including (1) direct emissions, which arise from the manufacturing process and stationary combustion that supports the manufacturing process (referred to as Scope 1); (2) indirect emissions, which arise from purchase of offsite fossil fuel generated electricity (referred to as Scope 2); and (3) indirect emissions, which result from the activities upstream and downstream of Micron's operations (referred to as Scope 3). NYSDEC has also assessed GHG emissions and climate change impacts as part of its review of the Micron Project under the CLCPA. See FEIS Appendix J-2.

Climate Change/GHG Comment 3:

The project will put unnecessary carbon emissions into our atmosphere.

Response: FEIS Chapter 1.1 details the purpose and need for the Proposed Project, including that (1) manufacture semiconductors is necessary to address gaps and vulnerabilities in the domestic

supply chain across a diverse range of technology and process nodes; and (2) to provide a secure supply of semiconductors necessary for the national security, manufacturing, critical infrastructure, and technology leadership of the U.S. and other essential elements of the economy of the U.S. See also Response to Climate Change/GHG Comments 1 and 2; Response to Purpose and Need Comments 2.

Climate Change/GHG Comment 4:

Semiconductor manufacturing uses chemicals and fluorinated gases that can be 17,000 times CO₂.

Response: FEIS Section 3.7.3.2 quantifies GHG emissions from all manufacturing operations, including fluorinated GHGs. Of note, point-of-use and other control devices will be utilized to remove fluorinated GHGs from emissions streams thereby significantly reducing the carbon dioxide equivalent (CO₂e) emissions.

Climate Change/GHG Comment 5:

Commenter is supportive of Micron's project in Clay because it will avoid approximately 77% of potential greenhouse gas emissions by adhering to New York's climate protection laws. In addition, more than 86% of the electricity used at the site will be generated from carbon-free energy sources. Locating the project elsewhere would risk significantly more carbon emissions and fewer environmental protections.

Response: Comment noted.

Climate Change/GHG Comment 6:

An analysis needs to be conducted of the true scope of GHG emissions, including construction, energy purchased, upstream and downstream emissions.

Response: See Responses to Climate Change/GHG Comments 1 and 2. FEIS Chapter 3.7 assesses Scope 1, 2 and 3 GHG emissions comprehensively, including all project phases, purchased energy, upstream and downstream emissions, and induced growth.

Climate Change/GHG Comment 7:

The GHG assessment should be repeated using a 5-mile radius.

Response: See Responses to Climate Change/GHG Comments 1 and 2. FEIS Chapter 3.7 evaluates climate change impacts associated with all aspects of the Project irrespective of geographic boundaries. As also noted in FEIS Chapter 3.7, the effects of climate change are driven by the combined emissions from various sources across the globe, rather than from any single event or emission, or in any particular geographic area. Each contribution, whether large or small and regardless of the geographic area, adds to the overall warming of the planet.

Climate Change/GHG Comment 8:

The analysis did not include the anticipated carbon footprint of construction. The proposed construction project will significantly increase GHG emissions, yet the DEIS incorrectly states that these impacts are not “reasonably foreseeable” and insufficiently discloses GHG emissions and air pollutants from construction materials, known as Scope 3 greenhouse gas emissions. Failing to disclose the GHG emissions associated with construction of the facility, significantly impairs the ability to determine if this project is in the public interest or is adequately mitigating impacts.

Response: Construction-associated GHG emissions are evaluated in detail and quantified to the extent practicable in FEIS Section 3.7.3.2. As further discussed in FEIS Chapter 3.7, upstream construction material lifecycle emissions have not been quantified due to variability and uncertainty in the future potential range of product designs and uses. Notwithstanding, the FEIS provides sufficient information on the Proposed Project’s construction related GHG emissions.

Climate Change/GHG Comment 9:

Appendix J, Greenhouse Gas Emissions, Climate Change, and Climate Resiliency, only accounts for part of Scope 1 emissions.

Response: FEIS Chapter 3.7 evaluates all reasonably quantifiable Scope 1 (direct) GHG emissions associated with various aspects of the Project, including construction and operation. Direct GHGs would be emitted during construction and as a result of manufacturing processes, from oxidation of organic compounds in thermal oxidation systems and Rotary Concentrator Thermal Oxidizers from the combustion of natural gas and diesel. A summary of total GHG that would be emitted by each process is included in Tables 3.7-10 and Table 3.7-11; and, construction emissions are summarized in Table 3.7-6. GHG emissions control measures and best management practices (BMPs) as proposed for Micron’s GHG BACT analysis for its air permit are also included in Appendix J-1 as supplementary material to support the analysis completed in FEIS Chapter 3.7.

Climate Change/GHG Comment 10:

To calculate Scope 2 (indirect) GHG emissions, marginal emission rates must be utilized and will produce results that are multiple times higher than Micron estimates.

Response: Per EPA’s eGRID Technical guidance, “while nonbaseload rates can be used to estimate the emissions reductions associated with projects that displace electricity generation, such as energy efficiency and/or renewable energy, these rates should not be used for assigning an emission value for electricity use in carbon-footprinting exercises or GHG emissions inventory efforts. Rather, eGRID subregion-level total output emission rates are recommended for estimating emissions associated with electricity use (scope 2 emissions).”

Climate Change/GHG Comment 11:

The DEIS must include an analysis of GHG emissions from construction activities, known as Scope 3 greenhouse gas emissions, and concrete and steel procurement must

require a commitment to reduce the concrete GHG levels 50% below Northeast average and steel for primary and secondary processes both 25% below industry values.

Response: See Response to Climate Change/GHG Comment 8. FEIS Section 3.7.3.2 provides all reasonably quantifiable Scope 1, 2, and 3 GHG emissions associated with construction activities. Per Section 3.7.3.2, there are potential upstream and/or downstream emissions associated with the Project (e.g., upstream construction and manufacturing material inputs, product end uses and lifecycle, etc.) which are not reasonably foreseeable, or readily quantifiable.

Micron has committed to explore using recycled steel where feasible. Micron plans to target greater than 75% recycled content in rebar and 90% recycled content in structural steel. These targets are documented in internal Environmental Product Declarations that are then used as inputs into the contracting process. Carbon-free steel is not part of the plans at this time. Actual recycled content will be determined as Micron proceeds through the contracting process. Micron works with suppliers, such as steel mills, as a member of the CDP Supply Chain program and Micron collaborates with suppliers around their GHG emissions-reduction programs and other initiatives that contribute to supply chain sustainability. According to Micron, it annually reports scope 3 emissions through CDP and analyzes the sources of the value chain emissions for potential reduction opportunities.

Micron has also committed to achieving Gold LEED status for all fabs and commercially reasonable efforts to achieve Platinum LEED status for all office buildings. See FEIS Section 3.6.7.

Climate Change/GHG Comment 12:

The project will use highly carbon polluting concrete. Micron should utilize carbon-negative and carbon-neutral concrete and recycled steel where feasible.

Response: See Response to Climate Change/GHG Comments 8 and 11.

Climate Change/GHG Comment 13:

What are the GHG emissions and impact on climate associated with filling parking spaces?

Response: Mobile-source GHG emissions including from Proposed Project-associated traffic are quantified in FEIS Section 3.7.3.2. See also Response to Climate Change/GHG Comments 15, 30, 31, and 48 related to loss of green space and wetlands.

Climate Change/GHG Comment 14:

Commenters expressed concerns that the project does not comply with the CLCPA; greenhouse gases from the project will interfere with meeting CLCPA goals.

Response: Pursuant to Section 7(2) of the Climate Leadership and Community Protection Act (CLCPA), and discussed in FEIS Section 3.7.1.3, NYSDEC will review Micron's CLCPA analysis as part of its processing of NYSDEC permits and determine whether the Proposed Project would

be inconsistent with or interfere with the attainment of the statewide GHG emission limits in ECL Article 75, and if NYSDEC determines that it would, whether it is otherwise justified and determine feasible mitigation measures to be imposed. See also FEIS Appendix J-2.

Climate Change/GHG Comment 15:

The Project will have indirect global warming effects from loss of green space.

Response: The lead agencies acknowledge these potential indirect effects which have been addressed by NYSDEC under the CLCPA (see FEIS Appendix J-2). See also Responses to Climate Change/GHG Comments 14, 30, 31, and 48.

Climate Change/GHG Comment 16:

The Project should provide a renewable energy procurement plan prioritizing new renewable capacity rather than existing RECs; evaluate rooftop solar, solar windows, geothermal, and waste heat recovery potential; utilize carbon-negative and carbon-neutral concrete and recycled steel where feasible; document how LEED- inspired strategies (e.g., low-emitting materials, advanced ventilation, daylighting where feasible, renewable energy integration) adapted to the unique requirements of semiconductor manufacturing. Micron should be required to assess many forms of renewable energy generation and provide binding commitments.

Response: As discussed in FEIS Section 3.7.6, Micron has committed to purchasing 100 percent carbon-free electricity utilizing power purchase agreements and renewable energy credits for the power consumption of the Micron Campus, thus avoiding up to approximately 2.4 MMT of CO₂e.

Micron has evaluated and tested placing solar panels on different types of buildings. However, the Fab has specifications surrounding vibration and other requirements that may inhibit placing solar panels on the Fabs. Other buildings like warehouses or administrative offices are more viable location options. Based on Micron's evaluations of available rooftop locations, solar panels would have a system capacity of ~4MW. Figure 3.10-3 shows current planned installation locations, including the roofs of the parking garages, wastewater treatment facilities, and BIO buildings.

Table 3.7-13 and Table 3.7-14 summarize the anticipated Proposed Project's GHG reduction measures. These measures include a host of strategies, including where feasible: process and design related measures, EV charging stations, shuttle buses, using alternative lower GHG process gases, operating abatement equipment, achieving Gold LEED status for all office buildings, installation of on-site renewable generation, optimizing processes, using energy efficient heating, ventilation and air conditioning, and use of light-emitting diode fixtures. When compared to pre-mitigation GHG emissions, Micron will avoid approximately 77 percent of potential GHG emissions due to these project design components, direct process emissions control measures, best management practices (BMPs), and mitigation measures.

As part of the permitting process, NYSDEC will also be reviewing Micron's CLCPA Analysis and may require additional or revised climate-related mitigation measures. A copy of the CLCPA analysis is included as Appendix J-2 of the FEIS. See also Response to Climate Change/GHG

Comment 14. Additionally, the New York State Green CHIPS Act requires program participants to include sustainability measures to mitigate the project's GHG emissions impact. N.Y. Econ. Dev. L. § 352(24)(b). The Green CHIPS Act does not dictate the purchase of wind or solar energy, or prohibit the purchase of renewable energy credits. Micron's Green CHIPS application will include proposed sustainability measures which will be updated through annual reporting under the Green CHIPS program.

Climate Change/GHG Comment 17:

Micron should commit to 24/7 carbon-free electricity through PPAs with new renewable sources combined with battery storage; include demand flexibility strategy to reduce fossil fuel use during peak, and disclose GHG emissions from grid buildout and embedded emissions from construction and development.

Response: See Responses to Climate Change/GHG Comments 14 and 16.

Climate Change/GHG Comment 18:

Micron's proposed use of unbundled RECs to mitigate greenhouse gas emissions from the facility's operations fails to address or ameliorate the facility's adverse impacts on achievement of New York's renewable energy mandates. Must generate or purchase new renewable energy without relying on RECs.

Response: See Responses to Climate Change/GHG Comments 14, 16, and 18. As discussed in FEIS Chapter 3.7, Micron has committed to 100% carbon free electricity through power purchase agreements and renewable energy credits. Micron has also committed to working with New York State entities including the New York Power Authority (NYPA), Empire State Development (ESD), and the New York State Energy Research Development Authority (NYSERDA) to identify reasonably feasible opportunities to procure and/or support new renewable or carbon-free electricity projects in New York, and is also reviewing opportunities for 24/7 and/or time-matched carbon-free electricity, aligned with New York's Clean Energy Standard (CES) and global Scope 2 accounting standards.

Climate Change/GHG Comment 19:

DEIS claims that the company will mitigate 2.4 million tons of CO₂e through the purchase of renewable electricity, but provides no procurement guidelines and fails to acknowledge the limitations of renewable energy credits. Unless it creates renewable energy, Micron will cause a release of huge amounts of carbon dioxide from energy generation.

Response: See Responses to Climate Change/GHG Comments 14, 16, and 18. Micron will utilize a combination of measures, including on-site renewable energy generation and the purchase of 100 percent carbon-free electricity utilizing power purchase agreements and renewable energy credits for the power consumption of the Micron Campus.

Climate Change/GHG Comment 20:

Micron must create a comprehensive plan to generate or purchase renewable energy. The DEIS does not state how Micron will meet its own goals for the facility to be powered by 100% renewable energy. The plans for use of renewable energy falls short of the requirements of the Green Chips Act and Micron's own goals. Micron should prioritize renewable energy sources that are safe and rapidly deployable. Clarify whether Micron's commitments are to carbon-free or renewable energy.

Response: See Responses to Climate Change/GHG Comments 14, 16, and 18.

Climate Change/GHG Comment 21:

As part of GREEN CHIPS legislation which is funding Micron, they are required to achieve 100% renewable energy for electricity use. The DEIS is vague on the source of renewable energy, listing solar on some buildings. Commenter is concerned that the Micron Proposed Project plans to draw from existing hydro, solar, wind, and nuclear sources. These energy sources are barely adequate to support existing developments and communities.

Response: See Responses to Climate Change/GHG Comments 14, 16, and 18. Micron plans to utilize a combination of measures, including on-site renewable energy generation and the purchase of 100 percent carbon-free electricity utilizing power purchase agreements and renewable energy credits for the power consumption of the Micron Campus, throughout the construction and operation of the Proposed Project.

Climate Change/GHG Comment 22:

The scale of renewable generation in the form of 4 MW solar is not sufficient. Is Micron actively exploring on-site renewable energy generation beyond the proposed rooftop solar panels?

Response: See Responses to Climate Change/GHG Comments 14, 16, and 21. Micron will continue to evaluate the practicability of additional on-site renewable energy generation and incorporating new clean energy technologies as they develop and as construction of the Proposed Project progresses over the next 16 years.

Climate Change/GHG Comment 23:

The FEIS should include an option for an on-site combined cycle gas turbine plant with co-generation and agricultural park option to reduce GHG emissions.

Response: See Responses to Climate Change/GHG Comments 14, 16, and 21. Micron plans to utilize a combination of measures to reduce GHG emissions associated with power, including on-site renewable energy generation and the purchase of 100 percent carbon-free electricity utilizing power purchase agreements and renewable energy credits for the power consumption of the

Micron Campus. As part of New York State's Green CHIPS legislation, Micron is not able to construct and operate a new on-site natural gas turbine plant.

Climate Change/GHG Comment 24:

The DEIS does not state how the project's enormous greenhouse gas emissions will be substantially mitigated.

Response: See Responses to Climate Change/GHG Comments 14, 16, and 21. FEIS Section 3.7.6, including Table 3.7-13 and Table 3.7-14 detail the specific measures that will be used to reduce and mitigate GHG emissions. When compared to pre-mitigation GHG emissions, Micron avoids approximately 77 percent of potential GHG emissions due to project design components, direct process emissions control measures, BMPs, and mitigation measures. NYSDEC will also be reviewing Micron's CLCPA Analysis (see FEIS Appendix J-2) for consistency with New York State's ability to meet its statewide GHG emission limits and may require additional climate-related mitigation measures pursuant to the CLCPA.

Climate Change/GHG Comment 25:

The project should use construction materials that reduce GHG emissions and carbon footprints.

Response: See Responses to Climate Change/GHG Comment 8, 11, and 12.

Climate Change/GHG Comment 26:

The DEIS fails to identify the full scope of impacts the Micron plant's energy use would entail. The CO₂e rate for electric generation used by EIA is 3x more than used in the DEIS.

Response: As discussed in FEIS Section 3.7.3.2, New York State-specific GHG emissions factors used to calculate GHGs were sourced from USEPA's eGRID database to reflect the power generation profile available to the Proposed Project.

Climate Change/GHG Comment 27:

Local climate effects must be considered, including urban heat island effect, heat waves, storms, and their impact on surrounding communities.

Response: Local climate impacts (including heat island, weather events, groundwater impacts, etc.) are assessed in FEIS Section 3.7.4 *Climate Change and Resiliency*. See also FEIS Appendix J-2.

Climate Change/GHG Comment 28:

Concerns were raised regarding the footprint and facility design contributing to a heat island effect. Should the parking be stacked?

Response: The Proposed Project is likely to contribute to a localized heat island effect due to the changes in land use and construction of concrete, pavement, and other dark-colored impervious surfaces, and built environment consisting of building structures. A combination of stacked parking garage and surface parking will be utilized, which is described in Table 2.1-3 Plan Marker K. The capacity of the parking garage for each fab (2400) significantly exceeds the surface parking (500). See also FEIS Appendix J-2.

Climate Change/GHG Comment 29:

Project will cause increase in Vehicle Miles Travelled which will result in additional GHG emissions that need to be mitigated.

Response: Transportation-associated increases in GHG emissions are discussed in detail in FEIS Section 3.7.3.2. Scope 3 (Indirect) Emissions are discussed, which include the upstream and downstream impacts associated with transportation. The Proposed Project will incorporate traffic mitigation measures, subject to NYSDOT and FHWA's determination and evaluation of final traffic improvements to be implemented, which are detailed in FEIS Section 3.11. The GHG impacts of regional vehicle travel and mitigation measures are summarized in Table 3.7-12. FEIS Section 3.7.6 and Table 3.7-13 also detail additional measures to reduce and mitigate GHG emissions associated with the Proposed Project including the use of EV charging stations and operating shuttle buses. See also Responses to Climate Change/GHG Comments 14 and 16.

Climate Change/GHG Comment 30:

Increased flooding risks from loss of wetlands is exacerbated by climate change.

Response: FEIS Section 3.7.4 discusses climate change effects, including the potential for increased temperatures, more frequent and intense storm events, and flooding and stormwater concerns. A key factor in the selection of the Proposed Project site was its very low climate risk. Measures to enhance the Proposed Project's resilience to climate change effects are detailed in FEIS Section 3.7.4 and Appendix J-2.

Cumulative impacts with respect to wetlands, flooding, climate change, and climate resiliency are also discussed in FEIS Section 4.2.7.3. As further discussed in Section 3.3, the loss of wetlands associated with the Proposed Project will require compensatory mitigation requirements to offset the loss of wetlands from the Proposed Project by creating and preserving wetlands (at a ratio of two acres or greater of created wetlands to each acre that is lost) within the watershed of the Proposed Project.

Climate Change/GHG Comment 31:

Destruction of wetlands will result in the loss of a carbon sequestration, which is not accounted for in the DEIS's evaluation of greenhouse gas emissions does not take into account the destruction of wetlands.

Response: As discussed in detail in FEIS Section 3.3, the loss of wetlands associated with the Proposed Project will require compensatory mitigation requirements to offset the loss of wetlands from the Proposed Project by creating and preserving wetlands (at a ratio of two acres or greater of created wetlands to each acre that is lost) within the watershed of the Proposed Project. See also FEIS Appendix J-2.

Climate Change/GHG Comment 32:

The DEIS does not consider the impacts of continuing and accelerating change in the climate from increased severity and length of high heat events, the increased flooding, erosion, and site drainage capacity required to deal with more and more severe storm events, and changes in water table height. While such climate effects cannot be accurately predicted, what consideration has been given to establishing a likely range of impacts and their respective offsets or mitigation?

Response: Section 17-b of the Community Risk and Resiliency Act (CRRRA) requires certain permit applicants to consider the future physical risks that climate change poses to their proposed projects, and whether their projects significantly affect the climate resilience of public infrastructure or services, natural resources, private property, or natural resources in the vicinity of the project. See FEIS Chapter 3.7.4, Climate Change and Resiliency. Section 3.7.4 also discusses the anticipated climate change effects, including the potential for increased temperatures, more frequent and intense storm events, and associated flooding and stormwater concerns. A key factor in the selection of the Proposed Project site was its very low climate risk. Measures to enhance the Proposed Project's resilience to climate change effects are detailed in FEIS Section 3.7.4. See also FEIS Appendix J-2. Additionally, Micron's Business Continuity process ensures that infrastructure is designed and constructed to withstand risks such as climate change and to re-evaluate those risks on a regular basis so appropriate action can be taken.

Climate Change/GHG Comment 33:

The DEIS does not address the carbon footprint of developing the residential and commercial infrastructure necessary for the Project, in addition to the miles of new roads and utility lines, and does not include any mitigation. The carbon footprint of the induced residential and commercial development should be accounted for and mitigation required.

Response: Additional GHG emissions resulting from the development of residential and commercial infrastructure are discussed in FEIS Section 3.7.5, Growth Inducing Effects. As these activities would be subject to state climate and resiliency requirements and would be supported by a grid powered increasingly by renewable energy, induced growth is not anticipated to have a significant adverse effect on GHG emissions or climate resiliency.

Climate Change/GHG Comment 34:

There is not enough information on how Micron will reduce GHG emissions. How will the greenhouse gases released from wetland destruction be mitigated?

Response: See Responses to Climate Change/GHG Comments 14, 16, 30, and 31. See also FEIS Appendix J-2.

Climate Change/GHG Comment 35:

Should provide alternatives such as construction of renewable energy for GHG mitigation.

Response: See Responses to Climate Change/GHG Comments 14 and 16.

Climate Change/GHG Comment 36:

Traffic planning should be used to reduce CO2 emissions.

Response: See Response to Climate Change/GHG Comment 29.

Climate Change/GHG Comment 37:

BMPs for GHGs should become enforceable permit conditions.

Response: The lead agencies will require implementation of BMPs. In addition, proposed GHG emissions control measures will be required by NYSDEC in its Micron Campus' Title V air permit.

Climate Change/GHG Comment 38:

Micron should replace trees with other trees that have the same environmental carbon capture value.

Response: While not listed as a mitigation measure with regard to climate change, tree plantings are a component of the Proposed Project design at the Micron Campus and several connected action locations. See Response to Biological Resources Comment 58; Responses to Climate Change/GHG Comments 30 and 31.

Climate Change/GHG Comment 39:

Funds should be provided to replace each tree cleared because of carbon capture capability. Given the habitat value and carbon capture capabilities of trees that will be removed during plant construction, for each tree cleared, provide funds to Onondaga Earth Corps, Onondaga Audubon, CNY Land Trust, and/or other qualified not-for-profit initiatives to plant an equivalent number of 3-foot tall or so trees within Onondaga County and/or Oswego County in proportion to the types of trees to be removed.

Response: While not listed as a mitigation measure with regard to climate change, tree plantings are a component of the Proposed Project design at the Micron Campus and several connected

action locations. See Response to Biological Resources Comment 58; Response to Climate Change/GHG Comments 30 and 31.

Climate Change/GHG Comment 40:

The following should be required in the air permit: low carbon concrete; use of recycled steel processed in electric arc furnace.

Response: See Responses to Climate Change/GHG Comment 8, 11, and 12.

Climate Change/GHG Comment 41:

The project is required to meet LEED requirements and use renewable or alternative energy to reduce GHG emissions.

Response: Micron commitments to reduce and mitigate GHG emissions, including LEED standards, on-site solar electricity generation, and non-carbon electricity purchase, are detailed in FEIS Section 3.7.6 BMPs and Mitigation Measures.

Climate Change/GHG Comment 42:

The commenter supports Micron's commitment to achieving LEED Gold certification for all fabrication facilities and urges the company to go further by committing to LEED Platinum certification for all office and administrative buildings associated with the campus. Achieving LEED Platinum would not only align with New York State's climate mandates but would also set a strong precedent for responsible corporate development in the region.

Response: Comment noted.

Climate Change/GHG Comment 43:

Micron should document how LEED-inspired strategies (e.g., low-emitting materials, advanced ventilation, daylighting where feasible, renewable energy integration) will be adapted to the unique requirements of semiconductor manufacturing, and how LEED principals can be integrated into cleanroom and fab design, including measures to reduce toxic material use, improve indoor air quality, and recover/reuse process water.

Response: Micron has developed a comprehensive LEED program addressing aspects such as carbon, energy, water, waste, transportation, materials, health, and indoor environmental quality. Projects that register for and achieve LEED certification are considered public, and their details are listed on the U.S. Green Building Council's (USGBC) project directory. See FEIS Table 3.7-14; see also FEIS Appendix J-2.

Climate Change/GHG Comment 44:

Micron should provide a public report on LEED-equivalent performance metrics for the production facilities, even if formal LEED certification is not sought for those areas.

Response: As outlined in FEIS Table 3.7-14 (BMPs for GHGs and Climate Change), Micron will pursue Gold LEED certification for fabrication facilities and make commercially reasonable efforts to achieve Platinum LEED certification for office buildings.

Climate Change/GHG Comment 45:

No efforts appear to be made on electrification of industrial processes. Why can't the boilers and vaporizers be electrified?

Response: Micron has reduced natural gas heating requirements with heat-recovery in the Proposed Project design, and use of electric heaters where feasible. Micron has also evaluated the use of non-carbon-based heating solutions such as green hydrogen, but at this time, green hydrogen is not a feasible solution. In addition, as detailed in FEIS Section 3.7.6, Micron has committed to procuring 100% carbon-free electricity for the Project.

Micron has also assessed electrically heated water bath vaporizers, but they are not considered a feasible alternative to natural gas-fired units as electrically operated units would be unable to reach a required temperature quickly enough to satisfy the fab demand for vaporized nitrogen. Micron will use electric boilers to the extent feasible to meet the remainder of its heating demand, but would still need natural gas-fired boilers to be available on the coldest days of the year and in the event of a power loss. See also FEIS Appendix J-2.

Climate Change/GHG Comment 46:

Review the possibility of carport solar for all parking spaces as a renewable energy source on campus to reduce energy consumption, as well as the use of solar arrays on the roof or ground. The FEIS should include a detailed site-specific solar deployment plan. Micron should use gray water systems as much as possible.

Response: As provided in FEIS Table 2.1-3, Micron plans to install approximately 4 MW of solar panels on the rooftops of the parking garages and administrative buildings as part of its efforts to offset GHG emissions. The fab buildings cannot accommodate solar panels due to specifications related to vibration and other operational requirements that preclude installing solar panels on those rooftops. There is no space on the Micron Campus to install wind generation facilities.

The FEIS explains how Micron would work to minimize the carbon footprint of the Project, including on-site solar panel installation, on-site heat recovery, use of electric heaters, and a commitment to use 100% carbon-free energy for the Proposed Project.

Micron has evaluated the use of gray water systems as part of its commitment to achieve LEED certification on the campus buildings. Micron has committed to achieve 75% RRR in the short

term, and aspires to achieve 100% RRR, but it has indicated that after evaluation, gray water will not be used.

See also Responses to Climate Change/GHG Comments 14 and 16.

Climate Change/GHG Comment 47:

Establish an on-site anaerobic digester, or composting facility during Phase I. Having a facility on site will allow for immediate disposal of food waste and lessen hauling and generation of GHG emissions from hauling and landfills. If there is a composting facility, compost could be used on the landscape as part of mitigation. Anaerobic digestion could produce energy for the Proposed Action.

Response: The lead agencies acknowledge Micron's commitment to sustainability and expect Micron to continue to evaluate, and where practical and feasible, ways to reduce GHG emissions.

Climate Change/GHG Comment 48:

There should be a climate resiliency plan that considers details of all mitigation efforts related to loss of wetlands, including cascading effects to waterways/flooding, effects on GHG emissions.

Response: See Responses to Climate Change/GHG Comments 30 and 31. See also FEIS Appendix F. Mitigation of wetland disturbances is anticipated to be done at an average 2.2:1 rate, as required by USACE and NYSDEC. This would mean an average of twice as many wetlands will be built as were impacted. The lead agencies also note that Micron's CLCPA analysis describes and analyzes loss of carbon sequestration from wetlands destruction and details proposed mitigation measures that will be undertaken, as required by NYSDEC, to reduce GHG emissions. See FEIS Appendix J-2.

Climate Change/GHG Comment 49:

Micron should reassess GHG mitigation annually and after each phase and generate recommendations.

Response: See Responses to Climate Change/GHG Comments 14, 16, and 21. Micron has committed to continue to evaluate the practicability of additional on-site renewable energy generation as construction of the facility progresses over the next 16 years.

Climate Change/GHG Comment 50:

Should have an independent third party assess the Proposed Project for renewable energy source options and mitigation of Greenhouse Gas Emissions.

Response: Micron is required to submit a sustainability plan as part of its Green CHIPS application which will include renewable energy source options and GHG mitigations. Micron's Green CHIPS sustainability plan will be reviewed by an independent third party as part of ESD's Green CHIPS

program. In addition, Micron has partnered with a number of different third-party experts on renewable energy and reduction of emissions during the design phase.

Climate Change/GHG Comment 51:

GHG alternatives in the DEIS are speculative.

Response: GHG alternatives as assessed in the FEIS are included as components of Micron's air permit application GHG BACT analysis based on reasonable quantitative estimations and would become commitments and enforceable permit conditions that Micron would be required to comply with.

Climate Change/GHG Comment 52:

Micron should set short term and long term quantitative GHG reduction targets aligned with CLCPA.

Response: See Responses to Climate Change/GHG Comments 14 and 16.

Climate Change/GHG Comment 53:

To meet the goals of the CLCPA, require Micron to reduce and eventually phase out fossil fuel use as quickly as practicable and to produce or acquire its electric supply from renewable sources as soon as possible.

Response: See Responses to Climate Change/GHG Comments 14 and 16. It is preferable to combust F-GHGs with natural gas rather than to release them directly to the atmosphere because: (1) it mitigates safety concerns (e.g. reactive and pyrophoric gases) associated with exhaust streams from thin films process tools, such that any CO₂ or CH₄ emissions are a necessary result of achieving important safety goals; and (2) the formation of CO₂ in control devices and RCS is a desirable outcome, because the global warming potential of CO₂ is significantly less than typical F-GHGs that are used in etching. Incomplete oxidation of process chemicals is accounted for in the emissions estimates in the FEIS. See also FEIS Appendix J-2.

Climate Change/GHG Comment 54:

Micron should incorporate embodied carbon accounting into project decision-making with binding reduction goals using low-carbon materials and circular economy principles.

Response: See Responses to Climate Change/GHG Comments 8, 11, and 12. Micron has indicated that it will use low-carbon materials where feasible.

Climate Change/GHG Comment 55:

Mitigation should include BMPs to reduce and eliminate Scope 1, 2 and 3 GHG emissions and require periodic collaboration between Micron and agencies.

Response: See Responses to Climate Change/GHG Comments 14 and 16.

Climate Change/GHG Comment 56:

A mitigation plan with Smart growth principles should be used to minimize GHG emissions from residential and commercial development induced from the Proposed Project, powered solely by renewable, non-fossil fuel energy.

Response: Additional GHG emissions resulting from the development of residential and commercial infrastructure are discussed in FEIS Section 3.1.3.2 and 3.7.5 *Growth Inducing Effects*. Although induced growth from the Proposed Project may add to the region's climate impacts, any future development would be conducted under applicable State and local policies and programs, including CLCPA, CRRA, and the Smart Growth Public Infrastructure Policy Act, which establishes 11 smart-growth criteria for use by state and local agencies to help ensure that future planning and implementation of transportation, sewer and water treatment, water, education, housing, and publicly supported infrastructure, among other things, is resilient to a changing climate. Accordingly, it is anticipated that any induced growth associated with the Proposed Project would be undertaken with climate resiliency in mind, and that the growth would not significantly negatively affect the current climate resiliency of the region.

Climate Change/GHG Comment 57:

It is inaccurate to claim that purchasing renewable electricity will mitigate 100% of Scope 2 emissions. The facility will need electricity 24/7, matching electricity on an annual basis (instead of more gradual) is inaccurate and misleading. To deliver real Scope 2 emissions mitigation, Micron must commit to power its facilities using 24/7 hourly-matched carbon-free energy, prioritizing new renewable electricity and battery storage. This is the only approach that would meaningfully decarbonize the grid and avoid additional fossil fuel buildout.

Response: See Responses to Climate Change/GHG Comments 14, 16, 18, and 19. Micron is committed to the use of renewable energy. As provided in FEIS Section 3.7, Micron has committed to reducing its Scope 2 greenhouse gas emissions by purchasing 100 percent carbon-free electricity, aligned with current GHG Protocol Scope 2 Accounting standards. This will be achieved through power purchase agreements and renewable energy certificates, covering the full power consumption of the Micron Campus. This approach is expected to avoid up to approximately 2.4 million metric tons (MMT) of CO_{2e} emissions. Micron has also committed to installing on-site renewable energy systems to the extent practicable, further reducing Scope 2 emissions associated with the Proposed Project.

Climate Change/GHG Comment 58:

Micron should prioritize renewable energy and reject nuclear energy.

Response: Micron has committed to prioritizing the use of renewable energy. As discussed in FEIS Section 2, Table 2.1-3, and Section 3.7, Micron has designed the Proposed Project to minimize electricity demand, and plans to install approximately 4 megawatts of solar panels on the rooftops of the parking garages, wastewater treatment buildings, and biological treatment buildings. The fab buildings cannot accommodate solar panels due to specifications related to vibration and other operational requirements that preclude installing solar panels on the rooftops. Micron has also reviewed geothermal electricity generation at the Project site and has determined that this type of generation is not feasible with current existing available technology and site suitability. Micron remains committed to reviewing technological advancements for consideration as technology evolves.

The Proposed Project will be built out over the next 16 years and as construction and implementation progresses, Micron plans to partner with local stakeholders to secure 100% carbon-free energy for the Micron Campus and incorporate new clean energy technologies as they develop.

As explained in FEIS Section 3.10, neither Micron nor the lead agencies have jurisdiction over regional or statewide planning for future electricity demand or generation, nor do they control the type or location of future electricity generation facilities, including nuclear development. These responsibilities fall within the jurisdiction of separate state and regional electricity planning entities. However, pursuant to state laws and requirements, the state has a target of 100% zero carbon electricity by 2040.

See also Responses to Climate Change/GHG Comments 14, 16, and 57.

Climate Change/GHG Comment 59:

The state would need to contract for an additional 10,971 GWh of renewable energy—70% of Micron’s anticipated 15,673 GWh of demand—to comply with the state’s renewable energy mandates. Yet the DEIS fails to discuss or address the environmental impacts of this additional energy development burden.

Response: The FEIS evaluates the Proposed Project’s energy needs and the GHG emissions associated with the Proposed Project’s construction and operations. See FEIS Chapter 3.10.

To the extent that the comment requests an assessment of environmental impacts from new generation, this is beyond the scope of the FEIS. The need for additional generation is not reasonably foreseeable nor is the nature, location, timing, etc. of any such additional generation. Notwithstanding, any new generation will be required to obtain all necessary permits and approvals from the NYSDEC and, where applicable, the NYSPPSC, which will trigger an environmental review and CLCPA consistency analysis.

See also Response to Climate Change/GHG Comment 58.

Climate Change/GHG Comment 60:

There should be an analysis of the social cost of carbon.

Response: An analysis of the social cost of carbon in the FEIS is not necessary. Although NYSDEC has issued a guidance document, *Establishing a Value of Carbon*, associated with the social cost of carbon, as noted in the guidance, it is not appropriate or useful in all situations. The guidance specifically states that it does not establish a requirement on any public or private entity, and is therefore voluntary. Any social cost of carbon analysis or guidance is subject to a host of variables, and any attempt at defining the variables and calculating methods is difficult and can be miscalculated and/or lead to erroneous results. In addition, the NYSDEC social cost of carbon guidance is primarily based on federal guidance, models, and values, which are no longer used by federal agencies.

Climate Change/GHG Comment 61:

When GHG emissions occur that have a negative effect on climate change, what financial or other penalty will Micron incur?

Response: To the extent that Micron exceeds its permitted levels of GHG emissions, Micron would be subject to fines, penalties and corrective actions, and potentially other legal actions that involve fines and/or payments. See also Response to Climate Change/GHG Comment 7.

Climate Change/GHG Comment 62:

What specific, measurable metrics will be used to track progress towards the Green CHIPS reduction of GHG goals, and how will Micron ensure regular public reporting on these metrics?

Response: As discussed in FEIS Appendix D-3, Empire State Development (ESD) is responsible for implementing the Green CHIPS program and ensuring applicable goals and requirements of the Green CHIPS program are met. As part of the Green CHIPS program, Micron will provide annual reports to ESD detailing the performance of the project against the milestones and commitments of the Green CHIPS plans. It is expected that reports regarding status of the projects will be issued by ESD. Additional information on the Green CHIPS program can be found in the Excelsior Jobs Program Regulations (updated for Green CHIPS 3/28/2023).

Climate Change/GHG Comment 63:

If Micron plans to allow supply of electricity from nuclear power, it must revise the Term Sheet with Empire State Development, Onondaga County, and OCIDA. Additionally, if Micron is contemplating nuclear energy to power its chip fabrication facility, it must consider the time frame for nuclear development and interim power needs. The EIS must consider the additional environmental impacts that would entail.

Response: See Responses to Nation Comment 29 and Utilities Comment 12.

Climate Change/GHG Comment 64:

The DEIS must acknowledge the responsibility to avoid actions which may cause climate damage in the interest of protecting U.S. and NYS residents not only from the effects of climate change, but from legally justified damage assessments awarded by the international court of justice.

Response: Comment noted.

Climate Change/GHG Comment 65:

General Concerns were raised indicating that the long-term GHG impacts from increased traffic are not adequately addressed.

Response: FEIS Section 3.7 and Table 3.7-12 contain an analysis of GHG emissions associated with increased traffic and other mobile source emissions associated with the Proposed Project. The mobile source GHG analysis was performed in accordance with methodologies presented in NYSDOT guidance. The emission values in Table 3.7-12 represent fuel combustion for vehicle traffic on the regional road network during construction and operation in 2027 and 2031, and operational traffic at full build out in 2041. The traffic evaluation in 2041 includes three traffic mitigation scenarios discussed in detail in FEIS Chapter 3.11, Transportation and Traffic.

Climate Change/GHG Comment 66:

New York's Green Chips Act requires companies receiving NYS funding to power their semiconductor manufacturing with 100% renewable energy, achieve LEED Gold status for buildings, reduce greenhouse gas emissions, and return zero hazardous waste in landfills by 2030. There is no mention of these goals in Micron's DEIS.

Response: The Green CHIPS requirements, including related to GHG emissions and LEED, are included throughout the FEIS. FEIS Chapter 3.7, including Tables 3.7-13 and 3.7-14, detail Micron's commitment to purchasing 100% carbon-free electricity using power purchase agreements and renewable energy credits for the power consumption of the Micron Campus, avoiding 2.4 MMT of CO₂e. Table 3.7-14 further discusses that the Proposed Project will achieve Gold LEED status for all fabs and make commercially reasonable efforts to achieve Platinum LEED status for all office buildings. As detailed in Section 3.8.4, it is Micron's goal to achieve

95% reuse, recycling, and recovery of solid waste and near-zero hazardous waste-to-landfill of hazardous waste by 2030.

Climate Change/GHG Comment 67:

Given the unprecedented scale of energy consumption projected for this facility it is imperative that Micron implement the most aggressive energy efficiency strategies available. All operational systems, whether for manufacturing, cooling, lighting, or computing, must be adjusted for minimal energy intensity.

Response: As discussed in FEIS Chapter 2, Table 2.1-3, and Section 3.7, the Proposed Project has been designed to minimize electricity demand and maximize energy efficiency. As also discussed in FEIS Section 3.7 and Table 3.7-14, Micron will be required to achieve Gold LEED status for all fabs, and make commercially reasonable efforts to achieve Platinum LEED status for all office buildings. See also Responses to Climate Change/GHG Comments 14 and 16.

Climate Change/GHG Comment 68:

A commenter strongly urges the incorporation of a transparent, facility-wide Energy Management Plan that includes annual reporting and continuous performance improvement benchmarks aligned with the CLCPA.

Response: To the extent that the CLCPA may require such a plan, NYSDEC will make that determination. See Response to Climate Change/GHG Comment 14.

Climate Change/GHG Comment 69:

A commenter urged consideration that a qualified, independent third-party professional should be used to assess potential current and future renewable sources of energy available to Upstate New York compared to Micron's energy needs in Clay.

Response: See also Response to Climate Change/GHG Comment 50.

Climate Change/GHG Comment 70:

Micron committed to negotiating a Clean Energy and Sustainability Action Plan that will “at minimum” “require Micron to [u]tilize 100% renewable energy for electricity by 2025 in its New York Fab Complex operations, which may include but not necessarily be limited to the use of renewable energy credits, and maintain that renewable energy for electricity supply for the duration of the Term.” The DEIS, by contrast, explains that “Micron would commit to purchasing 100% carbon-free electricity utilizing power purchase agreements and renewable energy credits (RECs).” Explain this discrepancy.

Response: See Response to Nation Comment 34. Micron’s commitment to purchasing 100% carbon-free electricity is not limited to power purchase agreements and renewable energy credits (RECs) and additionally includes renewable and carbon-free electricity sourced from utility providers. See FEIS Section 3.10, Utilities and Supporting Infrastructure.

Climate Change/GHG Comment 71:

Are there plans to use a central abatement system at the plant, and to what degree will this be expected to lower GHG emissions? Provide details related to the life of the project.

Response: As discussed in FEIS Section 3.7.2.1, thermal oxidation is used in point-of-use control (POU) devices to control F-GHG emissions by thermally treating exhaust streams from process tools that utilize GHGs in semiconductor manufacturing facilities. Other semiconductor process tools often include process equipment exhaust conditioners (PEECs) as required safety equipment to manage process gases and may incidentally manage GHG emissions that are co-mingled materials. These control methods will significantly reduce GHG emissions from operations. The Project would also incorporate project design GHG reduction measures to control and reduce GHG emissions from the manufacturing process, and implement additional BMPs to further avoid and minimize GHG emissions during construction and operation. Process chemical substitution in semiconductor manufacturing affecting direct use of F-GHGs is the subject of ongoing research within the industry to utilize alternative methods or process chemicals with a lower GWP. Direct reduction and control of GHG emissions along with mitigation measures and alternatives are quantified and discussed in Micron's air permit application. See FEIS Section 3.7.6; FEIS Appendix J-2 (Micron's CLCPA Analysis).

Climate Change/GHG Comment 72:

Provide details on GHG emissions expected in the Town of Dewitt. Set up monitoring for repeat GHG emissions assessment at regular intervals as part of the Sustainability Plan to assess compliance and success of proposed actions.

Response: FEIS Section 3.7.3.2 includes a complete analysis of the potential GHG impacts from construction, operation, mobile and indirect sources. Micron will be required to monitor and report GHG emissions as required by its NYSDEC-issued air permit and any additional identified federal and state requirements as applicable. See also Response to Climate Change/GHG Comment 16 regarding reporting in Micron's Sustainability Plan.

3.8 Solid Waste and Hazardous Materials**Solid Waste and Hazardous Materials Comment 1:**

The DEIS relies on only legal compliance to support its finding of no significant impacts from solid waste and hazardous materials.

Response: The lead agencies' analysis in the FEIS is not based solely on compliance with applicable hazardous waste and hazardous materials regulations. Notwithstanding, the lead agencies did consider compliance with these laws, which are designed to ensure that the environment and public health and safety are protected. The lead agencies also consulted with the federal and state agencies with regulatory authority and expertise in solid waste, hazardous waste and hazardous materials during development of the FEIS to ensure that all potential and reasonably foreseeable impacts were considered and addressed in the FEIS. They then considered Micron's

avoidance and minimization efforts through the implementation of BMPs, including but not limited to Micron's RRR program, that are identified in FEIS Section 3.8. See Response to Nation Comment 7.

Solid Waste and Hazardous Materials Comment 2:

The DEIS does not address the long-standing threat caused by solvents used in production. A commenter noted that some companies are using alternatives to solvents.

Response: The FEIS considers the long-term use of chemicals and solvents. To the extent that the comment suggests that Micron should consider other alternative solvents, Micron is continuously evaluating the feasibility of alternatives for raw materials, such as solvents. As viable options are identified, Micron will implement those options to the extent that they are deemed feasible.

Solid Waste and Hazardous Materials Comment 3:

Commenters requested a clear statement of mitigation measures to be taken for minimization of water and industrial waste from the facility.

Response: Minimization and mitigation are not synonymous. Micron will implement avoidance and minimization measures to minimize water and industrial waste from the facility. As described in FEIS Appendix K-6, Micron would work closely with equipment and material suppliers to reduce its energy and water consumption and waste generation. Section 3.10.5 of the FEIS, Table 3.10-5 provides BMPs for the minimization of water use at the Proposed Project. The BMPs include: (1) achieve LEED Gold certification for all fabs and use commercially reasonable efforts to achieve LEED Platinum certification for all office buildings; and (2) increase and maximize water recycling, reuse, and restoration, where feasible.

FEIS Section 3.8 explains that non-hazardous sludge from on-site wastewater treatment would be sent to a beneficial use vendor or recycled. For any hazardous waste, permitted private hazardous waste haulers would collect hazardous waste and bring it to facilities authorized by NYSDEC or analogous out-of-state regulatory agencies for disposal in accordance with applicable RCRA regulations. Because transport of all hazardous waste would be performed by permitted hazardous waste haulers and disposal of all hazardous wastes would occur at a RCRA-permitted treatment, storage, or disposal facility, no adverse effects to the environment or surrounding communities is anticipated.

The waste minimization program effectiveness at the Proposed Project would be continuously evaluated and updated to meet requirements of Federal regulations and Micron's Global Sustainability Standards. See FEIS Appendix K-12 for an example Micron waste minimization procedure that would be adapted for the Proposed Project and for an example of Micron's Recycling and Solid Waste Program that would be adapted for the Proposed Project.

Solid Waste and Hazardous Materials Comment 4:

General concerns were raised that the Project will result in pollution from solid waste and hazardous materials to the local environment.

Response: Micron's implementation of the Proposed Project would be subject to multiple federal and state regulations (RCRA, HMTA, EPCRA, CAA, TSCA, NYCRR Part 360, etc.) and extensive plans and procedures (e.g., RMP, CWMP, Waste Management Plan, SMMP, SPCC Plan/SPR, SWPPP, etc.) developed pursuant to those programs to prevent environmental exposure to chemicals used for the Project. See FEIS Section 3.8, Table 3.8-1. Micron would also implement several best management practices, as shown in FEIS Table 3.8-13, to address solid and hazardous waste generation and the use of hazardous materials over time and minimize the amount of waste that is generated and requires disposal. All disposal facilities used by Micron will be licensed in accordance with all applicable laws and regulations.

Solid Waste and Hazardous Materials Comment 5:

General comments indicated that Micron must adopt detailed plans that include best management practices to ensure the proper treatment, handling and disposal of solid and hazardous wastes, implementing state-of-the-art protocols. These plans should be publicly available.

Response: See Response to Solid Waste and Hazardous Materials Comment 4. As discussed in FEIS Section 3.8, Micron would be required to maintain a robust framework for managing both hazardous and non-hazardous waste at the Micron Campus, which is governed by applicable federal, State, and local hazardous waste generation, storage, and handling/transportation requirements, e.g., federal RCRA requirements and NYSDEC's Part 360 regulations. No waste or hazardous waste would be disposed of at the Proposed Project site. As explained in FEIS Section 3.8, waste would be disposed of or recycled off-site in appropriately licensed waste disposal facilities. For reference, a draft construction phase SMMP and a draft CWMP are included as FEIS Appendices K-7 and K-8, respectively.

Solid Waste and Hazardous Materials Comment 6:

A commenter stated that annual training for the handling of hazardous materials should be required. Other commenters requested information on the training that will be provided to all emergency personnel, including hospitals, to respond to chemical hazards at the site.

Response: Per the requirements set forth in 29 CFR Part 1910.120, any workers that are involved with hazardous waste/materials operations or emergency response are required to take a 40-hour training course and an annual 8-hour refresher course. Micron would develop and implement a Hazardous Waste Training Procedure outlining the federal and state (NYSDEC and NYSDOT) training requirements for employees who handle hazardous waste. See FEIS Section 3.8.3.2, Hazardous Waste. As indicated in the Hazardous Waste Contingency Plan outline included in FEIS Appendix K-9, Micron would provide personnel with the following: (1) hazardous waste training;

(2) fire extinguisher training; (3) first aid/CPR/AED training; and (4) emergency operations training.

Micron would be required to implement its EMS and deploy its ERT beginning with construction. As part of construction planning, Micron would engage closely and collaboratively with local fire departments, including Clay Fire and Cicero Fire, to familiarize local fire service personnel with any potential Proposed Project construction hazards such as construction site fuel and chemical storage, jointly prepare to implement best management practices for construction fire safety, and ensure compliance with applicable fire protection code requirements. See FEIS Section 3.14.3.2. The ERMS and ERT also would be in place and govern emergency response throughout continuous Proposed Project operations. As part of the ERMS, Micron management and the ERT would conduct regular emergency drills and would implement site-specific emergency response protocols in coordination with local first responders, including specialized emergency response measures developed in collaboration with the Clay Fire Department, and would establish an emergency response support agreement with the Syracuse Fire Department.

Micron also would be responsible for implementing its RMP, Process Safety Plan, and other measures consistent with USEPA regulations. Micron would ensure its emergency response protocols align with facility hazard monitoring systems, including leak detection and automatic shutdown systems and emergency evacuation alarms.

Solid Waste and Hazardous Materials Comment 7:

With respect to hazardous waste management, the commenter would like to see more details regarding the design of chemical/waste loading/unloading facilities, storage facilities (e.g., tanks, drums, ISO tanks, gas canisters, etc.), and conveyance systems.

Response: The requested information will be included in the joint SPCC, SPR, and Process Safety Plan, as discussed in FEIS Section 3.8.3.2.

Solid Waste and Hazardous Materials Comment 8:

A commenter requested that Micron develop a plan for food waste donation and have an on-site anaerobic digestion or composting system.

Response: As discussed in FEIS Section 3.8.3.2, Operational Effects, Solid Waste, Micron “would ensure that Proposed Project facility kitchens and eating areas segregate food waste via composting to the greatest extent practicable for on-site reuse, or transport to the Jamesville or Amboy Compost Sites, private compost facilities, or, in coordination with Onondaga County, other potential sites that may be able to beneficially reuse composted material.”

Solid Waste and Hazardous Materials Comment 9:

General comments were made indicating that Micron is not being transparent about what chemicals will be transported, used on-site in manufacturing and stored and the amounts, as well as justification for the quantities used. Micron should provide the public with all of this information, including extremely hazardous substance quantities

regardless of threshold reporting requirements. Micron should be subject to third party review of its compliance with chemical storage and management requirements.

Response: FEIS Section 3.8.3.2 summarizes the types and estimated quantities of chemicals to be used at the Micron Campus sufficient to analyze potential significant adverse impacts. Additional information on PFAS substances used in semiconductor manufacturing is set forth in Appendix L-1 as well as on the Semiconductor PFAS Consortium website at www.semiconductors.org/pfas, including “Background on Semiconductor Manufacturing and PFAS” (May 17, 2023). See also NIST, “Final Programmatic Environmental Assessment for Modernization and Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program” (2024) at Appendix C.

As discussed in FEIS Section 3.8.3.2, Micron would be required to store and handle all chemicals in compliance with applicable Federal and State laws and regulations, including the HMTA, EPCRA, USEPA RMP regulations, and the NYSDEC’s CBS, PBS, and MOSF Programs. The Micron Campus will be subject to third party review of its chemical storage and management by the PBS and CBS programs. Under EPCRA, Micron would be required to submit Tier II reports listing hazardous chemicals stored on-site above applicable threshold quantities to USEPA, the New York State Division of Homeland Security and Emergency Services, and local fire departments. Micron would also be required to submit TRI data using Form R reports to USEPA by July 1 of each year identifying the chemicals subject to the TRI used on-site and describing the toxic chemical management and release prevention activities that occurred on-site during the previous calendar year. The public would have access to the facility's Tier II reports and Form R reports as well as the Risk Management Plan (RMP) per Section 112(r) of the Clean Air Act and USEPA regulations, as described in Section 3.8.3.2. See FEIS Section 3.8.3.2 for a full discussion of the federal and state regulations related to storage of all chemicals and the handling requirements to which Micron must comply, as well as Micron's facility leak detection and monitoring methods, chemical storage practices, and plans for emergency spill response.

There are certain chemicals that are proprietary trade secrets and highly confidential business information. Micron does not share proprietary information with the public. Further, as discussed in FEIS Section 3.8.3.2, Micron will be required to have a policy requiring its chemical suppliers to provide full disclosure of chemical constituents to Micron, which often requires use of non-disclosure agreements. These disclosures are used to manage potential risks to human health and the environment while maintaining confidential business information. Regulatory agencies with permitting authority will have confidential access to specific compounds used at the Micron Campus and thus would have the ability to assess whether the use, delivery, storage, and disposal of these chemicals comply with applicable laws and regulations. Neither Micron nor the lead agencies can share proprietary information with the public. Notwithstanding, sufficient information has been provided to identify hazardous materials use and management, and to address the potential risks and procedural controls in place to manage the risk associated with using these materials.

Solid Waste and Hazardous Materials Comment 10:

While Micron’s 2024 Sustainability Report (Appendix K, Vol. 2, p. 395) mentions a “rigorous review and approval process” for hazardous and restricted substances, the DEIS does not disclose what this process entails.

Response: State and federal laws establish rigorous review and approval processes for the generation, treatment, storage, and disposal of hazardous waste at the facility, including the Resource Conservation and Recovery Act (RCRA) - a federal law for managing hazardous waste from “cradle-to-grave,” and which covers generation, storage, treatment, and disposal of such wastes. As discussed in FEIS Section 3.8.3.2 and Appendix L-1, in addition to these legal mandates, Micron will be required to have a policy to secure full chemical disclosure from all chemical suppliers, which often requires use of non-disclosure agreements. These disclosures are used to evaluate and manage potential risks to human health and the environment while maintaining confidential business information. The chemical constituents are reviewed against applicable legal requirements and internal policies to ensure that restricted chemicals are not used onsite or have appropriate constraints on use. Chemicals may not be brought onsite without completing this review. See also Response to Solid Waste and Hazardous Materials Comment 2.

Chemical selection also is built into the broader Micron business process which includes site and global tool and output planning teams. This global and local planning team develops equipment listing based on strategic process selection. From there, the team works through a multifunction review to ensure the appropriate tools, design, facilities, and internal laboratory needs are met. These teams typically develop the planning needs and requirements for key process chemicals. The key process chemicals undergo review by design, engineering, and process safety management teams to ensure appropriate quantity, storage and distribution system engineering and design, and safety procedures, training, and operational hazard review. Examples may include bulk nitrogen, nitrogen trifluoride, and ammonia. Once operational, additional chemical needs (e.g., process gases, chemicals) may be requested by facilities operations team members on an as-needed basis. Once chemicals are requested, they undergo an internal Micron review process. This internal process includes review for safety, environmental requirements, and a review of restricted chemicals. This process includes review of chemical identification, hazards, composition, first aid measures, firefighting measures, accidental release measures, handling and storage, exposure control and personal protection, physical and chemical properties, stability and reactivity, toxicological information, ecological information, disposal and transport considerations, and regulatory information, among others.

Solid Waste and Hazardous Materials Comment 11:

Micron must provide a full list of the hazardous substances to be used during construction and operation of the Proposed Project and Connected Actions. This list should include volumes and quantities and possible exposure pathways. Micron has not justified the quantities of chemicals used in manufacturing.

Response: See Response to Solid Waste and Hazardous Materials Comment 9. The types and quantities of chemicals to be used will be based on similar facilities, taking the proposed design and operations into account.

Construction of the Connected Actions would not be anticipated to involve the use of hazardous materials other than minimal amounts associated with typical construction materials, as described in FEIS Section 3.8.2.3, Construction Effects, Hazardous Waste. Operation of the National Grid improvements would not require chemical bulk storage or non-bulk containers of hazardous materials, or any increase in petroleum bulk storage capacity. OCWA anticipates operation of the off-site utility improvements would require increases in chemical bulk storage at the LOWTP Site and Terminal Campus Site and an increase in petroleum bulk storage at the LOWTP Site and Terminal Campus Site. The increases would be subject to NYSDEC CBS and PBS design requirements and updated registration requirements but do not represent an operational change to the existing facilities other than operating at an increased capacity. Chemicals required for operation of the IWWTP are listed in FEIS Table 3.8-11.

Solid Waste and Hazardous Materials Comment 12:

Micron must commit to the goal of reducing its use of hazardous substances over time. Micron should conduct a future review of its use of hazardous substances at the Proposed Project and provide it to the public for review.

Response: The lead agencies are satisfied with Micron's sustainability goals and internal chemical review process. Any additional requirements will be determined by the appropriate regulatory agencies.

Solid Waste and Hazardous Materials Comment 13:

Micron should disclose its internal chemical review process, including its criteria for eliminating substances of concern, and provide examples of chemicals that were phased out.

Response: See Response to Solid Waste and Hazardous Materials Comment 10.

Solid Waste and Hazardous Materials Comment 14:

Concerns were raised about the transparency of the volume and types of hazardous waste to be disposed of from the Proposed Project, as well as the percentage of hazardous waste to be recycled.

Response: The FEIS provides information regarding the volume and types of hazardous waste to be disposed of by the Proposed Project. FEIS Section 3.8.3.2 provides the volumes and types of hazardous waste associated with the Proposed Project as well as Micron's RRR program that deals with the handling of hazardous waste, among other types of waste. As shown in FEIS Table 3.8-6, beginning with the start of Fab 1 operations in 2029, the Micron Campus would generate an estimated 18,300 tpy of hazardous waste and 170 tpy of universal waste. By full build-out in 2041, these figures would increase to an estimated 50,300 tpy of hazardous waste and 470 tpy of universal waste. Table 3.8-7 shows the hazardous waste accumulation quantities by Fab, providing the waste type, quantity per day and year, storage type and disposal/management. Table 3.8-8 shows the various types of hazardous and universal waste or RRR material the Micron Campus would generate as well as anticipated management or disposal methods and locations. Micron

would manage hazardous and universal materials through its RRR Program to the greatest extent practicable to reduce the volume of material that would need to be managed as hazardous waste for disposal. For further details on the RRR Program, see FEIS Appendix K-6.

Solid Waste and Hazardous Materials Comment 15:

The DEIS references several key programs—such as hazardous waste reduction plans, contingency plans, and chemical approval protocols—but offers no documentation or evidence of implementation.

Response: The FEIS is a forward-looking document discussing activities that will occur if the Proposed Project is approved, constructed and implemented. Draft documentation of plans and procedures to be implemented, such as Micron’s SMMP (Appendix K-7), Construction Waste Management Plan (CWMP) (Appendix K-8), and Hazardous Waste Contingency Plan (HWCP) (outlined in Appendix K-9) are included in the FEIS and associated documentation.

Solid Waste and Hazardous Materials Comment 16:

While the DEIS announces a goal of “near-zero hazardous waste-to-landfill” by 2030, it includes no implementation plan, timeline, or metrics to track progress. There is no public explanation of how “near-zero” is defined, whether PFAS-containing waste is included, or what accountability mechanisms exist.

Response: FEIS Table 3.8-13 identifies the best practices for implementation of Micron’s hazardous waste goals. The term “near-zero” reflects Micron Technology’s goal of “zero (<1%) hazardous waste to landfill in CY30,” subject to vendor availability, as identified in Micron Technology’s 2025 annual sustainability report, which also discusses related metrics. PFAS-containing materials and wastes will be managed in accordance with legal requirements and the framework discussed in FEIS Appendix L-1. The best practices identified in the sustainability report exceed those required by applicable federal, state, and local law and analyzed in the FEIS.

Solid Waste and Hazardous Materials Comment 17:

Micron should fund daily or weekly testing of water, air and soil for levels of toxic chemicals.

Response: Regular testing of the Micron Campus’s air emissions and wastewater is required pursuant to applicable law, regulations, and permits that would govern its operations. Testing of soil would not be appropriate or required unless there is a material release.

Solid Waste and Hazardous Materials Comment 18:

The DEIS incorrectly assumed that the chemical usage during operation of the Connected Actions will be like that of the Proposed Project.

Response: See Response to Solid Waste and Hazardous Materials Comment 11.

Solid Waste and Hazardous Materials Comment 19:

Dispersion modeling is needed to assess risks to nearby childcare centers, homes, or schools, including risk from nearby chemical storage areas.

Response: Dispersion modeling has been conducted for the Micron Campus as part of the air permitting, to assess potential impact and risk to nearby receptors. See FEIS Section 3.6.3.2, Air Dispersion Modeling. See also Response to Air Quality Comment 2.

Solid Waste and Hazardous Materials Comment 20:

The Micron facility may be required to prepare and submit a Facility Response Plan for the handling of bulk petroleum storage. SPCC Plans are required to address petroleum bulk storage at the Proposed Project and wastewater treatment plants.

Response: See Responses to Solid Waste and Hazardous Materials Comments 4 and 5. A Facility Response Plan would be required if the total oil storage capacity at the site equals or exceeds 1 million gallons, in accordance with federal regulations under 40 CFR Part 112. For the wastewater treatment plant, a separate Spill Prevention, Control, and Countermeasure (SPCC) Plan would be required for the associated Connected Action if the combined petroleum storage capacity exceeds 1,320 gallons. Additionally, NYSDEC Petroleum Bulk Storage (PBS) registration would be required if the aggregate storage capacity exceeds 1,100 gallons, as specified under 6 NYCRR Parts 612–614.

Solid Waste and Hazardous Materials Comment 21:

Table 3.9-2: In the risk management measures for toxic and sensitizing hazards describe whether the exhaust from gas operations will be treated prior to discharge. The same comment applies to Table 3.9-3.

Response: Emissions associated with operations are discussed in FEIS Section 3.6, which includes a variety of air emissions control devices/technologies (e.g., thermal oxidation, acid scrubbers, etc.) that will be used. A comprehensive and detailed analysis was completed for applicable criteria pollutants (NAAQS), hazardous air pollutants (HAPs) and non-criteria pollutants from all project phases for stationary and mobile emissions sources, demonstrating compliance with all applicable regulatory thresholds and guidance concentrations (which are protective of human health), and therefore no significant adverse impacts to air quality are anticipated.

Solid Waste and Hazardous Materials Comment 22:

An inventory of chemicals used at the site should be provided to an oversight agency, along with projected annual use, formulations and treatability.

Response: See Response to Solid Waste and Hazardous Materials Comment 9. The Micron Campus will be subject to third party review of its chemical storage and management by the NYSDEC's Petroleum Bulk Storage (PBS) and Chemical Bulk Storage (CBS) programs. Under

the NYSDEC CBS Program, chemical storage tanks on the Micron Campus would be subject to registration and inspection. Under Federal law and the NYSDEC PBS and MOSF Programs, fuel storage tanks on the Micron Campus also would be subject to similar requirements.

Solid Waste and Hazardous Materials Comment 23:

It would help to note the available permitted capacity remaining at Seneca Meadows and High Acres landfills and any planned expansions that need to be permitted. (DEIS Page 3-224, Section 3.8.2.3)

Response: FEIS Appendix K-2 contains a thorough discussion of the remaining capacities of the various landfills in the area. As stated in Appendix K-2, although it is outside the study area, Onondaga County Resource Recovery Agency (OCRRA) has contracted with Seneca Meadows, Inc. through December 2025 for transfer of some MSW and CDD to Seneca Meadows Landfill in Waterloo, Seneca County, which accepts asbestos, industrial ash, CDD, contaminated soil, sludge, other industrial wastes, and MSW. However, the Seneca Meadows Landfill is expected to be at capacity in the near term, with no remaining permitted capacity to be constructed. A permit application has been submitted to expand the facility, but has not yet been approved (Seneca Meadows Inc., 2023).

Although it is outside the study area, High Acres Landfill & Recycling Center is a privately-owned landfill in Fairport that straddles the eastern edge of Monroe County and the western edge of Wayne County and receives waste from Onondaga County. The center receives asbestos waste, CDD, industrial waste, MSW, petroleum contaminated soil, and sewage treatment plant sludge. The center's 2022 annual report estimated its remaining life to be 3 years and 6 months based on constructed capacity and 31 years and 4 months based on permitted capacity still to be constructed.

Solid Waste and Hazardous Materials Comment 24:

The DEIS projects 50,300 tons of hazardous waste annually at full buildout. What chemical waste accounts for the missing 9,500 ton/year of hazardous wastes estimated for each fab? What are the solvents? What are the acids? What is the rest of the waste?

Response: Although the commenter's reference to "the missing 9,500 tons/year of hazardous waste estimated for each fab" is unclear, as the footnote to FEIS Table 3.8-6 indicates, the incremental increases in the estimated quantities of waste from the addition of each fab would be less than the estimated quantity of waste from the first fab due to economies of scale. See FEIS Section 3.8.3.2. Solvents likely to be used include isopropyl alcohol and propylene glycol monomethyl ether acetate. Acids likely to be used include hydrofluoric acid, sulfuric acid, copper sulfate, and nitric acid. See FEIS Table 3.8-8. See also Response to Solid Waste and Hazardous Materials Comment 2.

Solid Waste and Hazardous Materials Comment 25:

Table 3.8-8 lists categories such as “glues,” “lab waste,” and “resins,” but omits quantities and chemical identities. The lack of clarity makes it impossible to evaluate risk or ensure proper treatment.

Response: Table 3.8-8 shows the various types of hazardous and universal waste or RRR material the Micron Campus would generate and anticipated management or disposal methods and locations. More granular data is unnecessary.

As stated in the text following Table 3.8-8, collectively these chemicals will constitute over 25 tons/yr. Because the Micron Campus would generate 25 tpy or more of hazardous waste, under NYSDEC regulations, Micron would be required to, among other requirements, develop a Hazardous Waste Reduction Plan subject to NYSDEC review and approval. Micron would also manage hazardous and universal materials through its RRR Program to the greatest extent practicable to reduce the volume of material that would need to be managed as hazardous waste for disposal. See FEIS Appendix K-6. Permitted private hazardous waste haulers would collect hazardous waste generated by the Proposed Project and bring it to facilities authorized by NYSDEC or analogous out-of-state regulatory agencies for the disposal of hazardous waste in accordance with RCRA regulations.

Solid Waste and Hazardous Materials Comment 26:

DEIS Page 3-217, Section 3.8.1: The last paragraph indicates there are no local regulations or laws regarding hazardous waste or hazardous substances, which may be true but Table 3.8-1 does include local laws and regulations for solid waste. The text should be revised to note the local requirements listed in the table or delete the sentence regarding local regulations in the paragraph.

Response: The referenced text in the FEIS is correct. Hazardous waste, hazardous materials, and solid waste are different substances. The inclusion of the local solid waste regulations in the table does not contradict the statement prior to the table indicating that there are no local regulations that specifically regulate hazardous wastes/materials.

Solid Waste and Hazardous Materials Comment 27:

Page 2-18, Section 2.1.2.3: It would help to explain why the possibility of using the Rail Spur Site for transport of hazardous substances to be used at the facility is not being considered, as it is a safer transportation mode and likely preferable to the large number of tanker trucks running along our roadways which are susceptible to accidents and chemical spills.

Response: The Rail Spur Site is primarily intended and designed to facilitate materials movement for the construction of the Micron Campus and would be operated by a third party. The Rail Spur Site would not be used for hazardous materials/waste..

Solid Waste and Hazardous Materials Comment 28:

Page 3-89, Table 3.3-12: In the bullet list there is an auto shutoff valve mentioned, but this will require real-time monitoring, which is not possible for all discharge parameters, so the bullet should be qualified as such. The bullet list mentions an Accidental Spill Prevention Plan but it was not mentioned when spills were discussed previously, please describe this plan as it relates to the SPCC Plan. Spill response should also be included in the table.

Response: Table 3.3-12 has been revised in the FEIS to include the information requested in the comment.

Solid Waste and Hazardous Materials Comment 29:

Page 3-218, Table 3.8-1: The description for TRI under EPCRA should more clearly note the reporting requirements so the public understands that there will be periodic reporting about toxic releases that they will have access to. The latter part of the description implies the reporting but some additional clarity is warranted.

Response: TRI reporting requirements are further discussed in FEIS Section 3.8.3.2 which explains that Micron would be required to submit TRI data using Form R reports to USEPA by July 1 of each year identifying the chemicals subject to the TRI used on-site and describing the toxic chemical management and release prevention activities that occurred on-site during the previous calendar year (information which USEPA would make publicly available).

Solid Waste and Hazardous Materials Comment 30:

Page 3-220, Table 3.8-2: The table only references obtaining an ID number but there should be much more required for the facility under RCRA so please revise the table accordingly.

Response: The information requested is provided in FEIS Table 3.8-1, where references to obtaining an ID number, as well as additional information, are provided. The description for RCRA regulations in that table states that, "RCRA solid waste regulations establish general guidelines for the management of non-hazardous solid waste. The guidelines are generally implemented at the state level and are primarily focused on facilities that thermally process or dispose of municipal solid wastes, persons or facilities that generate or manage residential, commercial, or institutional wastes, and states developing solid waste management plans. RCRA regulations also define when non-hazardous secondary materials destined for use as fuels or ingredients in combustion units qualify as solid wastes regulated under the Clean Air Act, which are regulated in New York State by NYSDEC. RCRA regulations also establish standards for the characterization, transportation, storage, and disposal of hazardous waste, and prescribe requirements to obtain USEPA hazardous waste generator ID numbers, hazardous waste accumulation time and quantity limits, and recordkeeping and reporting requirements. NYSDEC is authorized to implement RCRA in lieu of USEPA in New York State."

Solid Waste and Hazardous Materials Comment 31:

Page 3-221, Section 3.8.2: It would help to list the 5 counties referenced in the first paragraph. In Section 3.8.2.1 regarding Phase 1 Assessments, it would help to indicate that the scope included a site walk of the properties examined. Also, it appears there were no Phase 2 activities completed on the properties but I would recommend Micron complete some baseline sampling of soils, groundwater, surface water, noise and air at the site (and surrounding areas for air and noise) so they know what conditions existed when taking ownership of the property. It could help in the future if extraordinary conditions arise, to establish whether conditions changed and to what extent.

Response: The five-county region is defined in an earlier section as Onondaga, Oswego, Madison, Cortland, and Cayuga Counties. See FEIS Section 3.1.3.2. Micron will address any necessary media sampling pertaining to Phase I ESA findings through the SMMP, as indicated in FEIS Section 3.8.2.1 and included as Appendix K-7. Phase I ESA methodology, including site inspection, is part of the ASTM standard practice, as described in Phase I ESAs provided in Appendix K. Noise and air resources are addressed separately in FEIS Sections 3.12 and 3.6, respectively.

Solid Waste and Hazardous Materials Comment 32:

Page 3-222, Section 3.8.2.2: Note if any hazardous substances (e.g., asbestos, lead paint, PCBs) were removed when homes were demolished. In the paragraph regarding National Grid's substation it should be noted whether any herbicides were used that could have contaminated groundwater (note arsenic based herbicides were commonly used at substations), are/were there any PCB containing transformers or capacitors, and whether an SPCC Plan exists to cover the bulk petroleum tank. The same comment applies relative to an SPCC Plan at the LOWTP and OOWWTP.

Response: Pursuant to 12 NYCRR Part 56, an asbestos survey must be completed by a licensed asbestos contractor prior to demolition. The referenced demolitions have already occurred, were done in accordance with all applicable federal, state and local requirements, and are outside the scope of the FEIS. Any required future demolitions will also be completed in accordance with all applicable federal, state and local requirements. Soil characterization will occur for all ground disturbing activities associated with Proposed Project construction, and any contaminated soil encountered will be dealt with in accordance with applicable local, state, and federal law.

With respect to the presence of PCB containing transformers or capacitors at National Grid's substation, dielectric oil in some substation equipment historically contained PCBs; however, none of the equipment currently in operation at Clay substation is known to contain PCBs, and no PCB-containing equipment will be installed at the station as part of this project. National Grid maintains and implements an SPCC Plan for Clay substation, which includes procedures to operate bulk petroleum tanks and measures for spill prevention and mitigation. None of the vegetation management products the Company currently uses or has records of using in the past are arsenic-based and National Grid is not aware of groundwater impacts resulting from application of the vegetation management products it uses.

See also Response to Solid Waste and Hazardous Materials Comment 20, for discussion of SPCC Plans (applicable to LOWTP and OOWWTP).

Solid Waste and Hazardous Materials Comment 33:

Page 3-226, Table 3.8-3: In the first entry, assess whether uncontaminated excavated soil ineligible for beneficial use could be used as landfill cover at solid waste facilities, as this would be another form of beneficial use. Relative to footnote 72, recommend the backup for the estimated quantities be provided in an appendix and referenced as such in the footnote.

Response: See Response to Geology/Soils Comment 10. ECL Article 27 and 6 NYCRR Part 360 govern the beneficial use of soil, fill, and other materials. Not all excavated soils will be suitable for reuse under the BUD program. Soils that are uncontaminated but ineligible for beneficial use may be directed to solid waste facilities for use as landfill cover, consistent with NYSDEC guidance and waste management protocols, as has been indicated in the revised table. To support this approach, Appendix E provides extensive geotechnical data characterizing the physical properties of native and excavated soils.

Solid Waste and Hazardous Materials Comment 34:

Page 3-228: In the final paragraph, provide a preliminary estimate of the amount of soil to be reused on-site. In addition, please assess whether some of the excavated wetland soils could be used in wetland restoration at the proposed mitigation sites. It may be optimistic to assume all remaining soils would be recyclable, which is inconsistent with Table 3.8-3 that indicates some soils may need to be disposed in commercial landfills.

Response: It is not possible to accurately quantify the volume of soil suitable for reuse on-site at this time. Notwithstanding, Micron will investigate the possible re-use of excavated wetland soils for re-use at the proposed mitigation sites. This would be based upon a number of factors, including soil condition and compatibility at the proposed wetland mitigation site, regulations regarding the re-use/transportation of soils, and feasibility of soil re-use, among other considerations.

Solid Waste and Hazardous Materials Comment 35:

Page 3-229: Please assess whether some of the soils described in the first paragraph could be used as daily cover at the landfills.

Response: See Response to Geology/Soils Comment 10.

Solid Waste and Hazardous Materials Comment 36:

Page 3-233: A Commenter recommended that the backup for all the estimates provided in this EIS be clearly documented in appendices. In the second to last paragraph describing industrial wastes, I would expect to see water and wastewater treatment sludges, spent filters, used PPE and other solid wastes, not just spent chemicals.

Response: Non-hazardous sludge from on-site wastewater treatment and non-hazardous contaminated debris, including wipes and filters, are categorized as an industrial material for the RRR program. See FEIS Table 3.8-5.

Solid Waste and Hazardous Materials Comment 37:

Page 3-235, Table 3.8-5: Describe the basis for determining that the non-hazardous sludge from wastewater treatment can be beneficially used. This could be accomplished using a footnote explaining the basis for concluding it can be beneficially used.

Response: Non-hazardous sludge, such as biosolids, can be reused in a number of ways, including as fertilizer, for biogas production, as a substitute for virgin materials in construction bricks, and many other uses. Materials would be tested for compliance with 6 NYCRR Part 360 Beneficial Reuse Determination (BUD) standards before off-site reuse.

Solid Waste and Hazardous Materials Comment 38:

Given the disclosed amount of hazardous liquids and gases stored per fabrication facility, Micron should consider on-site local monitoring, and continuous monitoring approaches that should be adopted in the environmental management plan.

Response: Storage systems for hazardous materials typically include continuous monitoring, as well as regular onsite inspections and best management practices. Those will be outlined in the Facility's Spill Prevention Report (SPR).

Solid Waste and Hazardous Materials Comment 39:

Page 3-241: Hazardous Materials subsection: In the list of example hazardous materials at the bottom of the page please add arsine if it will be used at the facility given its highly toxic characteristics.

Response: Micron utilizes a small volume of arsine in the n-type doping process of the silicon wafer to introduce arsenic into the semiconductor structure. The use of arsine is highly controlled due to its toxic nature and potential health risks. The FEIS has been revised where referenced to include arsine. See FEIS Section 3.8.3.2.

Solid Waste and Hazardous Materials Comment 40:

Page 3-242, Table 3.8-10: This table highlights the significant quantities of hazardous materials that will be stored on site, which includes a total of 55,780,000 gallons of bulk chemicals, and about 15,000 55-gallon drums. These quantities are broken down in general chemical types, but as noted in the general comments the DEIS, it does not list the specific chemicals delivered, stored and used at the facility. The Final EIS needs to include a complete list of chemicals used at the facility along with the quantities (by chemical) delivered, stored, used and disposed. The details can be provided in an appendix with Table 3.8-10 summarizing the total quantities by category. The Table should also clarify whether the quantities represent raw chemicals for use, or whether it

includes both raw chemicals as well as wastes. Finally, somewhere in this section the EIS needs to indicate which waste type PFAS compounds will fall under.

Response: See Response to Solid Waste and Hazardous Materials Comments 9, 22, and 29. There are certain chemicals that are proprietary trade secrets and highly confidential business information. Micron does not share proprietary information with the public. As discussed in FEIS Section 3.8.3.2, Micron will be required to have a policy that all of its chemical suppliers provide full disclosure of chemical constituents to Micron, which often requires use of non-disclosure agreements. These disclosures are used to manage potential risks to human health and the environment while maintaining confidential business information. Regulatory agencies with permitting authority will have confidential access to specific compounds used at the Micron Campus and thus would have the ability to assess whether the use, delivery, storage, and disposal of these chemicals comply with applicable laws and regulations.

Additionally, FEIS Appendix L-1 discusses the framework that Micron will use for management of PFAS-containing materials for RRR purposes and for treatment and disposal. Descriptions of the types of chemicals used onsite, including the types of PFAS used in semiconductor fabrication, have been provided. See FEIS Section 3.8.3.2; Appendix L-1. FEIS Appendix L-1 provides further detail on where PFAS are used in semiconductor fabrication, the types of PFAS used in such processes, the functionality of PFAS in these processes, the categories of PFAS that may be found in wastewater, the review of wastewater treatment technologies, and the management and disposal framework that will be applied at the Proposed Project.

Solid Waste and Hazardous Materials Comment 41:

The third bullet on DEIS page 3-297 should add increased risk of chemical spills from trucks delivering and transporting wastes, particularly during years when Fabs 1 and 2 are operational but Fabs 3 and 4 are under construction.

Response: The page referenced in this comment is in FEIS Section 3.11.2, with the referenced bullets summarizing 2018-2022 crash data. See Response to Transportation Comment 34. The analysis of potential environmental impacts in that section of the FEIS is exclusive to traffic and transportation, and not potential chemical spills. Instead, chemical spills are addressed in FEIS Section 3.8.

As discussed in FEIS Section 3.8, as a large quantity generator, Micron must comply with various regulations addressing transport and potential spills of hazardous waste, including USEPA and NYSDEC uniform hazardous waste manifest requirements (40 C.F.R. Pt. 262, Subpart B; 6 NYCRR Part 372), re-transport requirements (40 C.F.R. §§ 262.30 to 260.33; 6 NYCRR Part 372), and preparedness, prevention, and emergency procedure requirements (40 C.F.R. Pt. 262, Subpart M; 6 NYCRR §§ 373-3.3 to 373-3.4) (see page 3-236 of Section 3.8.3.2 of the FEIS).

As fabs become operational, the Micron Campus would require delivery of various hazardous materials by truck. See FEIS Section 3.8.3.2, All hazardous materials would be subject to applicable USDOT and NYSDEC permitting, registration, and reporting requirements. Micron would be required to manage the delivery of hazardous materials to the Micron Campus and their shipment for off-site disposal under the HMTA and USDOT and NYSDOT regulations. Micron

would apply for USDOT registration with the Pipeline and Hazardous Materials and Safety Administration and develop a Safety and Security Plan to adopt relevant personnel and facility security measures and provide USDOT training for relevant personnel (49 C.F.R. § 172.802).

Solid Waste and Hazardous Materials Comment 42:

Concerns were expressed regarding whether Micron will take responsibility for spills, and not the County. Costs of spill cleanup should not fall to the taxpayers. There is no plan for responsibility, and these types of plants are prone to accidents.

Response: See Response to Solid Waste and Hazardous Materials Comment 51. As part of its SPDES permit, Micron also would be required to implement SWPPP and SPCC/SPR Plan measures to reduce the risk of accidental releases, leaks, or spills during facility operations and provide for immediate containment and cleanup of any release. Typically, in such an instance, the Spill Response section of the NYSDEC would oversee remediation and monitoring of the spill, as per NYS laws and regulations. Liability for remediation due to potential future contamination is beyond the scope of the FEIS.

Solid Waste and Hazardous Materials Comment 43:

A commenter stated that the DEIS needs to assess the actual risks of spills and the method and timing for a spill response, especially given the fact that large quantities of chemicals are being transported to the facility, and large quantities of waste chemicals are being transported away from the facility. The risk analysis should include data on spills, violations, and exceedances within the domestic semiconductor industry or at other Micron facilities.

Response: See Response to Solid Waste and Hazardous Materials Comment 48, for discussion of the spill response plans and procedures for the Proposed Project. The Project would comply with all applicable state and federal laws and regulations with respect to hazardous material handling, use, disposal and prevention and remediation of spills. FEIS Table 3.8-13 provides a list of BMPs to be employed at the Proposed Project for construction and operation to prevent, contain and manage any potential spills at the site. Spill kits would be stationed throughout the site for quick response. Spill kits would be audited to make sure they are in good working order. Micron would also prepare a release response procedure and contingency plan to reflect hazardous material storage on the site. The Project's Spill Prevention Report would identify the measures being taken by the facility to prevent spills. Micron would maintain an on-site ERT for deployment, if necessary, to assess, manage, and respond to spills and emergency situations. Micron would contract with carriers and shippers of hazardous materials that maintain 24/7 emergency response support in the event of hazardous materials spills prior to and during transit, and appropriate incident reporting protocols. See FEIS Section 3.8.3.2. There have been no reportable spills or related violations at Micron Technology's domestic manufacturing operations within the last five years. Micron does not have access to records held by other domestic semiconductor manufacturers regarding related incidents or compliance metrics.

Solid Waste and Hazardous Materials Comment 44:

The DEIS does not consider the use of rail as a method of mitigating spill risk. It would help to explain why the possibility of using the Rail Spur Site for transport of hazardous substances to be used at the facility is not being considered. Rail would be a safer mode and likely preferable to the large number of tanker trucks on roadways which are susceptible to accidents and chemical spills.

Response: See Response to Solid Waste and Hazardous Substances Comment 27.

Solid Waste and Hazardous Materials Comment 45:

Describe in more detail the spill protection (e.g., secondary containment) that will be provided for the locomotive shed sump that is intended to collect waste fluids. (DEIS Page 2-20, Table 2.1-4)

Response: All design plans will be required to comply with applicable local, state and federal laws and regulations. The design for an engine sump is as follows: maintenance buildings for locomotive engines include several parallel tracks that run straight through the building with corresponding doors on either end. Under the building's canopy, one or more sumps cross under the tracks, running perpendicular to them. The sumps are made of cast iron and are deep enough for maintenance personnel to walk through under the tracks for access to the bottoms of the locomotive engines. Fuel and lubricants can be drained into containers located within the sumps during maintenance work to prevent spills.

Solid Waste and Hazardous Materials Comment 46:

The DEIS does not adequately address potential spills of hazardous chemicals, including during loading and unloading.

Response: See Response to Solid Waste and Hazardous Materials Comment 48.

Solid Waste and Hazardous Materials Comment 47:

Page 3-243: In the third paragraph, there is mention about shippers having spill procedures in place but protocols for spills at the Micron facility during chemical delivery unloading and loading for disposal or recycling needs to be described. The DEIS should add increased risk of chemical spills from trucks delivering and transporting wastes, particularly during the years when Fabs 1 and 2 are operating but Fabs 3 and 4 are under construction to transportation environmental impact analysis.

Response: See Response to Solid Waste and Hazardous Materials Comment 46. Hazardous chemical transfer procedures and spill response will be described specifically in the site SPR. Before the SPR can be drafted, the design of the hazardous chemical transfer and storage facilities must be finalized. Further, the specific chemical compounds and volumes must be finalized. Notwithstanding, the site SPR would include, reporting/notification requirements, spill assessment/response set up (e.g., isolating release, preventing spill from entering inappropriate or incompatible drains), cleaning up the material, decontamination of personnel and equipment,

verification of successful clean, determination of PPE), spill clean up methods, decontamination. Micron internal procedures would also indicate additional training, scenarios review.

Solid Waste and Hazardous Materials Comment 48:

Page 3-250, Table 3.8-13: The entries describing spills are very superficial and require further explanation. Spills and other inadvertent releases deserve much more discussion in the EIS, as they have the potential to contaminate building materials, soil, groundwater and surface water as well as potentially result in unacceptable employee exposure.

Response: The FEIS provides an extensive discussion of applicable federal and state-required plans and regulations required to prevent human and environmental exposure to chemicals associated with the Project in Section 3.9. See FEIS Sections 3.8.3.2 and 3.9.3.2; see also Response to Air Quality Comment 22.

Micron would be required to manage the delivery of hazardous materials to the Micron Campus and their shipment for off-site disposal under the HMTA and USDOT and NYSDOT regulations. See FEIS Section 3.8.3.2. Micron would apply for USDOT registration with the Pipeline and Hazardous Materials and Safety Administration and develop a Safety and Security Plan to adopt relevant personnel and facility security measures and provide USDOT training for relevant personnel (49 C.F.R. § 172.802). See FEIS Section 3.8.3.2, Operational Effects, Hazardous Materials. Micron would contract with carriers and shippers of hazardous materials that maintain 24/7 emergency response support in the event of hazardous materials spills prior to and during transit, and appropriate incident reporting protocols.

See also Response to Community Facilities Comment 1; Response to Solid Waste and Hazardous Materials Comment 57.

Solid Waste and Hazardous Materials Comment 49:

Page 3-254, Footnote 88: Commenter is concerned that health and safety protocols for operation of the Connected Actions will not be similar to those for construction and should be addressed separately.

Response: FEIS Section 3.9.3.2 (footnote) states that the human health and safety effects of the Connected Actions are assumed to be similar to those of the Proposed Project and are likely to pose a lesser degree of risk, not that the safety protocols for operations are similar to those for construction.

Solid Waste and Hazardous Materials Comment 50:

General concern was raised regarding the transportation of hazardous chemicals over local roadways to the site, as there is a high likelihood for spills on roadways escaping into the local environment, especially given the increase in traffic from the Project.

Response: Spills that occur during transportation are the responsibility of the transporter, as per USDOT regulations. See FEIS Section 3.8.3.2, Operational Effects, Hazardous Materials.

Typically, both the NYSDOT and the carrier retain on-call emergency response professionals that are immediately called when a chemical spill occurs during transportation. Initial response times vary based on the contract and the location of the spill. See also Response to Solid Waste and Hazardous Materials Comment 57.

Solid Waste and Hazardous Materials Comment 51:

Concerns were raised about who bears responsibility for future site remediation if contamination occurs? General statements were made concerning if Micron will be liable for future remediation.

Response: The FEIS evaluates the potential for adverse environmental impacts. Liability for speculative contamination is beyond the scope of the FEIS.

Solid Waste and Hazardous Materials Comment 52:

Concerns were raised about whether hazardous materials would be shipped via rail, and the impacts in the event of a derailment upon the community.

Response: The Rail Spur Site is not being considered for transport of hazardous materials. See FEIS Section 2.1.2.3; Responses to Solid Waste and Hazardous Substances Comments 27 and 44.

Solid Waste and Hazardous Materials Comment 53:

How long would it take for a national chemical carrier to respond to an accident involving a spill? What kinds of spills are they equipped to handle?

Response: See Response to Solid Waste and Hazardous Materials Comment 50. Hazardous waste would be handled in accordance with applicable federal, State, and local hazardous waste requirements, and disposed of in RCRA permitted hazardous waste facilities as appropriate. No significant impact to any community is anticipated from these activities.

Solid Waste and Hazardous Materials Comment 54:

Page 3-238: In the second paragraph where emergency response is discussed with notifications to first responders, there should be some discussion (or reference to another section where it's discussed) about training that will be provided to all first responders as well as hospital/urgent care facilities regarding the unique hazards, risks, and appropriate medical response to the myriad of chemicals that will be used at the facility. With respect to hazardous waste management, more detail is needed regarding the design of chemical/waste loading/unloading facilities, storage facilities (tanks, drums, ISO tanks, gas canisters, etc.), and conveyance systems. Somewhere secondary containment is mentioned and details on what that consists of would also be helpful to understand. This comment also applies to page 3-244.

Response: See Responses to Community Facilities Comments 1 and 2; Responses to Solid Waste and Hazardous Materials Comments 6, 7, and 46.

Solid Waste and Hazardous Materials Comment 55:

Page 3-241: Hazardous Materials subsection: In the list of example hazardous materials at the bottom of the page please add arsine if it will be used at the facility given its highly toxic characteristics.

Response: Micron utilizes a small volume of arsine in the n-type doping process of the silicon wafer to introduce arsenic into the semiconductor structure. The use of arsine is highly controlled due to its toxic nature and potential health risks. As such, this information has been revised in FEIS Section 3.8.3.2. See also Response to Solid Waste and Hazardous Materials Comment 39.

Solid Waste and Hazardous Materials Comment 56:

Page 3-242, Table 3.8-10: This table highlights the significant quantities of hazardous materials that will be stored on site, which includes a total of 55,780,000 gallons of bulk chemicals, and about 15,000 55-gallon drums. These quantities are broken down in general chemical types, but as noted in the general comments the DEIS, it does not list the specific chemicals delivered, stored and used at the facility. The Final EIS needs to include a complete list of chemicals used at the facility along with the quantities (by chemical) delivered, stored, used and disposed. The details can be provided in an appendix with Table 3.8-10 summarizing the total quantities by category. The Table should also clarify whether the quantities represent raw chemicals for use, or whether it includes both raw chemicals as well as wastes. Finally, somewhere in this section the EIS needs to indicate which waste type PFAS compounds will fall under.

Response: See Responses to Solid Waste and Hazardous Materials Comments 9 and 40. FEIS Table 3.8-10 represents hazardous materials to be used on-site and does not include hazardous wastes, which are discussed in FEIS Section 3.8.3.2, Hazardous Waste. FEIS Appendix L-1 provides additional information regarding PFAS solid waste treatment and disposal.

Solid Waste and Hazardous Materials Comment 57:

A commenter requested confirmation that Micron will maintain on-call contracts with trained private spill-response contractors capable of mobilizing quickly for on-site or off-site incidents.

Response: See Response to Solid Waste and Hazardous Materials Comment 48 and 50. Micron would maintain an on-site Emergency Response Team (ERT) for deployment, when needed, to assess, manage, and respond to spills and emergency situations. Further, Micron maintains on-call contracts with trained professionals to support Micron ERT, as needed or requested. See FEIS Section 3.8.4. Further as detailed in FEIS Section 3.8.3.2 “Micron would contract with carriers and shippers of hazardous materials that maintain 24/7 emergency response support in the event of hazardous materials spills prior to and during transit, and appropriate incident reporting protocols.” See also Responses to Community Facilities Comments 12 and 24.

Solid Waste and Hazardous Materials Comment 58:

Concerns were raised regarding plans for robust, independent oversight and enforcement of environmental regulations to prevent accidents, leaks, or spills during chemical transport, storage, or usage.

Response: See Response to Solid Waste and Hazardous Materials Comment 48.

Solid Waste and Hazardous Materials Comment 59:

Commenter requested further details on the training, expertise and ability, including equipment, of local and regional (City of Syracuse) fire and spill professionals to address a spill at the Micron site and the timeliness of the response. Commenter requested that all residents, including public schools, and plant workers be taught how to survive any potential future chemical spills and environmental accidents.

Response: See Responses to Community Facilities Comments 1 and 2. Micron's EHS team would be responsible for reviewing the facility's engineering design and developing occupational safety and health procedures, protocols, and training in accordance with OSHA, USEPA, and NYS Labor Law Article 27 requirements. Micron would establish Workplace Safety Committees (WSCs) to foster collaboration among management and employees and a structured process to proactively identify and address potential hazards and raise any safety concerns. FEIS Section 3.9.3.2, Operational Effects.

Micron would implement its ERMS and deploy its ERT beginning with construction. The ERMS and ERT also would be in place and govern emergency response throughout continuous Proposed Project operations. See FEIS Section 3.9.3.2, Operational Effects. As part of the ERMS, Micron management and the ERT would conduct regular emergency drills and would implement site-specific emergency response protocols in coordination with local first responders, including specialized emergency response measures developed in collaboration with the Clay Fire Department, and would establish an emergency response support agreement with the Syracuse Fire Department. Additionally, Micron would collaborate with the Local Emergency Planning Commission (LEPC), the Onondaga County Department of Emergency Management, in accordance with EPCRA requirements to develop comprehensive community emergency response plans and share chemical information with the local citizens.

Micron also would be responsible for implementing its RMP, Process Safety Plan, and other measures consistent with USEPA regulations. Micron would ensure its emergency response protocols align with facility hazard monitoring systems, including leak detection and automatic shutdown systems and emergency evacuation alarms.

Solid Waste and Hazardous Materials Comment 60:

A commenter requests that Micron create an independent citizen review board to monitor all chemical spills and water pollution.

Response: See Response to Solid Waste and Hazardous Materials Comment 48. Oversight of chemical spills and water pollution already exists through applicable state and federal programs.

Solid Waste and Hazardous Materials Comment 61:

The DEIS indicates that Micron intends to develop a Risk Management Plan (RMP), however, additional detail on how the public will access the RMP information is missing. The commenter asks if the RMP be published online or if hard copies will be available through local agencies and if updates will be automatically shared or only available by request?

Response: See Response to Solid Waste and Hazardous Materials Comment 9. RMP information may be accessed by the public via the EPA's Federal Reading Rooms, which information may include Off-Site Consequence Analysis (scenarios) portions of RMPs. RMP information without Off-Site Consequence Analysis is available upon request to EPA. Copies of the RMP would be provided to local police, fire, and emergency medical response personnel, and the public to foster local community emergency response planning and public awareness. Micron would be required to update and resubmit the RMP to EPA every 5 years with a history of any accidents that occurred in the 5 years prior. The updates would be automatically shared with local emergency responders.

Solid Waste and Hazardous Materials Comment 62:

Concerns were raised about whether the Project will be able to discharge hazardous waste chemicals into the wastewater above respective New York State Environmental Conservation Law standards.

Response: The Project's wastewater discharges will be required to adhere to all applicable federal and state standards for discharges as well as its IWDP to be issued by OCDWEP.

Solid Waste and Hazardous Materials Comment 63:

What analyses does the DEIS make regarding the availability of adequate volumes of permitted landfill capacity, and/or alternatives for waste reduction and reuse?

Response: FEIS Section 3.8 details conservative projections of how much additional solid waste would be generated associated with construction and operation of the Micron Campus. As stated in FEIS Appendix K-2, the OCRRA Solid Waste Management Plan, which is updated every two years, provides projections for waste and recyclables and outlines the facilities that OCRRA will use for recyclables and non-hazardous, commercial, and residential waste. OCRRA's Comprehensive Solid Waste Management Plan Update for 2023-2024 outlines steps OCRRA will take to achieve plan goals, including the education of waste generators on how to reduce waste streams and set up recycling programs. Based on the most recent Onondaga County LSWMP, the

MSW collected in 2021 was within OCRRA's projections, while the MSW collected in 2022 was below the projections (OCRRA, 2023).

To develop conservative projections of how much additional solid waste would be generated, Micron's analysis multiplied the higher induced household growth estimates included in FEIS Section 3.15 (Socioeconomic Conditions) by average county household size to derive estimated induced population growth and multiplied those population figures by the average daily MSW produced per person, based on available county-specific MSW data. The per capita MSW figures represent the total MSW collected within each county's solid waste management system, including residential, commercial, and institutional MSW.

FEIS Table 3.8-12 shows the resulting incremental MSW projections from induced growth. With certain permit modifications and expansions, solid waste disposal facilities in the five-county region are anticipated to be able to accommodate the solid waste flows from the proposed project. Additionally, Micron's RRR Program and other waste minimizations procedures would help reduce waste-to-landfill volumes. FEIS Tables 3.8-3 and 3.8-4 detail proposed project construction and operation-related solid waste vs. reusable or recyclable material. OCIDA has also coordinated with OCRRA regarding waste capacity availability for the project. See FEIS Appendix K-10.

Solid Waste and Hazardous Materials Comment 64:

General concerns were raised regarding hazardous waste materials being disposed of in local landfills.

Response: It is anticipated that hazardous waste would be sent out of-state for disposal, as Micron will only be able to dispose of hazardous waste at facilities permitted to accept such waste.

Solid Waste and Hazardous Materials Comment 65:

Commenter has concerns about the use of waste-to-energy facilities to incinerate waste from the Proposed Project. General concerns about the incineration of "non-recyclable" wastes with no accountability for hazardous emissions or ash disposal. Fluorinated and PFAS compounds should never be incinerated due to risk of toxic byproducts.

Response: FEIS Table 3.8-8 provides the disposal methods for various waste to be generated at the Micron facility, including incineration for designated types of waste. The only wastes currently intended for incineration are non-hazardous drummed used solvents, hazardous acidic waste, and miscellaneous maintenance waste (labpacks, cylinders, expired materials, glues, resins, etc.), as stated in FEIS Section 3.8.3.2. See also FEIS Table 3.8-8. NYSDEC is responsible for oversight of compliance with RCRA regulations, which includes waste incineration and associated permitting, performance standards, and operating requirements. Micron's use of incineration for waste generated at the site, including PFAS containing waste, will be in accordance with all applicable state and federal laws and will occur at USEPA licensed disposal facilities.

With respect to incineration of waste containing PFAS, U.S. EPA has identified incineration of PFAS-containing material as "a viable PFAS destruction technology if done under certain conditions," and further describes that use of "temperatures above approximately 1,100°C/2,012°F

may result in high destruction efficiencies and few detectable fluorinated products of incomplete combustion.” See USEPA “Interim Guidance on the Destruction and Disposal of Perfluoroalkyl and Polyfluoroalkyl Substances and Materials Containing Perfluoroalkyl and Polyfluoroalkyl Substances,” V.2., available at <https://www.epa.gov/system/files/documents/2024-04/2024-interim-guidance-on-pfas-destruction-and-disposal.pdf>.

Based on these and other considerations discussed in FEIS Appendix L-1, use of waste-to-energy facilities and incineration of fluorinated and PFAS-containing materials may be appropriate. In any case, Micron will comply with applicable laws, regulations, and permits in its management and disposal of PFAS-containing materials.

Solid Waste and Hazardous Materials Comment 66:

Comments were raised regarding the need for incineration of hazardous waste, including lab waste. Incineration of hazardous materials should include oversight by the appropriate agency. Reports should be made to the public about treatment of wastes and releases to the environment.

Response: See Response to Solid Waste and Hazardous Materials Comment 65. NYSDEC has oversight responsibility for compliance with RCRA regulations, which includes waste incineration and associated permitting, performance standards, and operating requirements. Per RCRA regulations, Micron is responsible for “cradle to grave” tracking of its onsite generated hazardous waste. This information is reported to NYSDEC annually on March 1st for the previous reporting year in the Hazardous Waste generator’s report, which includes volumes of hazardous waste generated, the disposal facilities where the hazardous waste is sent, and the disposal method (incineration, landfill, etc.).

Solid Waste and Hazardous Materials Comment 67:

Micron should commit to the complete destruction of chemicals before they enter the waste stream.

Response: See Response to Solid Waste and Hazardous Materials Comment 68.

Solid Waste and Hazardous Materials Comment 68:

Commenter stated that the EIS needs to define more fully the composition of the non-recyclable commercial waste. Waste containing fluoropolymers and PFAS should be segregated out before incineration.

Response: FEIS Section 3.8.3.2 states that, “[t]he commercial MSW from Proposed Project operations would consist primarily of various types of materials (e.g., metals, drums and cylinders, E-waste, batteries, plastic, foam, cardboard, scrap wood, office supplies, etc.). The non-RRR portions of this commercial MSW would be collected via licensed commercial haulers for transport to municipally owned waste disposal facilities within the OCRRA service area in accordance with the Onondaga County Flow Control Law, OCRRA’s Comprehensive and Local Solid Waste Management Plans (LSWMPs) (OCRRA, 2023), and OCRRA policies.”

The only wastes currently intended for incineration are non-hazardous drummed used solvents, hazardous acidic waste and miscellaneous maintenance waste (labpacks, cylinders, expired materials, glues, resins, etc.). See FEIS Section 3.8.3.2; Table 3.8-8; Appendix L-1. See also Response to Solid Waste and Hazardous Materials Comment 65.

As discussed in Appendix L-1, there is no one-size-fits-all technology or treatment program for PFAS-containing waste material. Micron's RRR Program will implement feasible, practicable, and necessary measures to reuse, recycle, and recover materials or waste generated at the facility that are consistent with USEPA's guidance on disposal and treatment of PFAS-containing wastes and New York State's beneficial use determination program. This may include incineration of PFAS-containing wastes, consistent with EPA guidance. .

Solid Waste and Hazardous Materials Comment 69:

The chemicals leaving the site as sludge, water discharge, and air releases should be monitored regularly, daily or weekly.

Response: Any required monitoring or testing will be done in accordance with all permits and applicable regulatory requirements.

Solid Waste and Hazardous Materials Comment 70:

Commenter requested that Micron be required to report on the location of solid waste and hazardous materials disposal, as well as the routes of the disposal trucks.

Response: See Response to Solid Waste and Hazardous Materials Comment 66. The FEIS provides an extensive discussion of the potential future disposal locations of solid waste and hazardous materials from the Proposed Project. See, e.g., FEIS Sections 3.8.2.3 and 3.8.3.2; Appendix K-6; Appendix K-8. Tracking and reporting of the disposal of solid waste and hazardous materials would be done in accordance with applicable permits and regulations.

FEIS Table 3.8-8 shows the various types of hazardous and universal waste or RRR material the Micron Campus would generate and anticipated management or disposal methods and locations. Micron would manage hazardous and universal materials through its RRR Program to the greatest extent practicable to reduce the volume of material that would need to be managed as hazardous waste for disposal. Permitted private hazardous waste haulers would collect hazardous waste generated by the Proposed Project and bring it to facilities authorized by NYSDEC or analogous out-of-state regulatory agencies for the disposal of hazardous waste in accordance with RCRA regulations. Micron would use a variety of local, regional, and national waste disposal and materials reuse vendors to appropriately manage hazardous waste and other materials. Micron anticipates that hazardous waste would be sent out of-state for disposal. Micron would be responsible for selecting specific vendors and disposal facilities as the Proposed Project progresses.

Per RCRA regulations, Micron is responsible for “cradle to grave” tracking of its onsite generated hazardous waste. This information is reported to NYSDEC annually on March 1st for the previous

reporting year in the Hazardous Waste generator's report, which includes volumes of hazardous waste generated, the disposal facilities where the hazardous waste is sent, and the disposal method (incineration, landfill, etc.).

Solid Waste and Hazardous Materials Comment 71:

Micron must disclose the expected quantity and composition of all sludge, require routine testing, and prohibit any reuse or land application without demonstrating it is safe. No beneficial use should proceed without prior contaminant screening.

Response: See Responses to Solid Waste and Hazardous Materials Comments 37 and 74.

Solid Waste and Hazardous Materials Comment 72:

A commenter states that grandfathering the treatment and remediation standards for the Project that isn't expected to be operating at its planned capacity for nearly 50 years is unacceptable given the certainty of changes in every aspect of plant operations.

Response: The lead agencies have not proposed any grandfathering. Micron and the entities implementing the Connected Actions and proposed environmental mitigation measures would be subject to ongoing federal, state, and local regulatory oversight, including permit conditions that require compliance with current and future environmental standards. These regulatory frameworks incorporate mechanisms such as permit renewals, inspections, and reporting, enabling agencies to address changing environmental conditions and operational practices. Any changes in operations or environmental conditions would be addressed through applicable permitting processes, which will apply current law and regulations and are designed to reflect current science and best practices.

Solid Waste and Hazardous Materials Comment 73:

Commenter requests a detailed list of the industrial wastes that will be disposed of in local landfills.

Response: See Responses to Solid Waste and Hazardous Materials Comments 23 and 70.

Solid Waste and Hazardous Materials Comment 74:

The DEIS fails to address the management of wastewater treatment solid by-products from the pretreatment process at the Micron Campus and the Oak Orchard Plant. The FEIS should estimate the quantity of sludge that will be generated on-site, describe its characteristics, including water content, and identify how it will be disposed of or options for disposal.

Response: See Response to Solid Waste and Hazardous Materials Comments 37 and 80. As discussed in FEIS Section 3.10.3.2, Water Treatment and Discharge Capacity, Micron is designing the Proposed Project to reclaim as much industrial wastewater from the manufacturing process as possible for reuse within the manufacturing facility before it would need to be directed to OCDWEP's systems. At this stage of the Proposed Project and IWWTP planning processes,

reclamation and remaining wastewater flow rate estimates are not yet available. Figure 3.10-4 in Section 3.10 of the FEIS illustrates the on-site water reclamation and reuse process. Micron would operate its wastewater pretreatment system in accordance with the limits set forth in its OCDWEP-issued IWDP. See FEIS Section 3.8.3.2, Operational Effects, Hazardous Waste.

Upon full buildout of all four fabs, Micron's onsite wastewater pretreatment facility will generate approximately 23,000 tons of by-product sludge per year (or approximately 5,750 tons/yr per fab). Micron's onsite wastewater pre-treatment sludge will be characterized/profiled to determine waste composition and proper disposal options per any applicable waste disposal and Beneficial Reuse Determination (BUD) regulatory requirements. As part of Micron's RRR sustainability goals, Micron is continuously evaluating beneficial reuse options for its sludge, such as reclamation in cement kilns. This information has been included in FEIS Section 3.8.

OCDWEP is similarly regulated by applicable waste regulations. OCDWEP would be responsible for ensuring that operation of the IWWTP complies with NYSDEC solids waste disposal regulations.

The Oak Orchard IWWTP is estimated to produce an annual average of biosolids of 8 tons./d during Fab 1 operations. An annual average of biosolids is estimated at 15 tons/d and an annual average of crystallized salt solids of 57 tons/d will be generated by Fab 1 and Fab 2 combined, with this quantity potential doubling during Fab 4 operations. Biosolids are produced from biological treatment, a wastewater treatment process that uses microbial communities present in nature harnessed in optimum conditions to break down organic material in the wastewater.

As a result of this process, wasted microbial solids are sent to solids handling which is comprised of gravity thickening followed by centrifugation for dewatering. Brine or TDS (salts) concentrate from the RO reject (to produce reclaim water) is concentrated by membranes treated using an evaporator followed by a crystallizer to further concentrate the TDS and generate brine solid slurry. The salt slurry is then further dewatered using centrifuges. The centrifuged solids are then disposed of off-site. Condensate water from the evaporation and crystallization processes are collected and will be reclaimed and/or discharged.

Disposal of sludge and brine from the IWWTP will be managed and disposed of in accordance with all applicable laws and regulations.

See also Responses to Solid Waste and Hazardous Materials Comments 71 and 80.

Solid Waste and Hazardous Materials Comment 75:

A previous draft of the DEIS (from March 2025) stated that, upon full buildout, the facility would generate "88,800 tons of RRR materials annually. Approximately 24 percent of this RRR volume would consist of recyclables (21,100 tons per year). The majority of the remaining RRR volume is anticipated to consist of [wastewater pre-treatment] sludge and metals." Based on that, over 67,000 tons of sludge and metals would be generated per year. These important details were removed from the draft released for public comment. They should be re-inserted.

Response: Upon full buildout of all four Fabs, Micron’s onsite wastewater pretreatment facility will generate a conservative estimate of 23,000 tons of by-product sludge per year (or approximately 5,750 tons/yr per fab). Micron’s onsite wastewater pre-treatment sludge will be characterized/profiled to determine waste composition and proper disposal options per any applicable waste disposal and Beneficial Reuse Determination (BUD) regulatory requirements. As part of Micron’s RRR sustainability goals, Micron is continuously evaluating beneficial reuse options for its sludge, such as reclamation in cement kilns.

Solid Waste and Hazardous Materials Comment 76:

“Non-hazardous sludge from on-site wastewater treatment” will be disposed of by “Send[ing] to [a] beneficial use vendor or recycle.” Is this sludge being generated from the four Biological Wastewater Treatment Facility described in DEIS Table 2.1-3 (DEIS, p. 2-13)? What substances are anticipated to be in this sludge and how will it be beneficially reused?

Response: See Responses to Solid Waste and Hazardous Materials Comments 37 and 71. The Hydrofluoride Wastewater sludge generated from onsite wastewater treatment operations would be handled through the RRR program. Reuse options being explored include reuse by cement kilns.

Solid Waste and Hazardous Materials Comment 77:

No explanation given in the DEIS as to how the sludge can beneficially reused or recycled. Appendix K-12 fails to provide or describe the beneficial reuse program used at other facilities.

Response: See Responses to Solid Waste and Hazardous Materials Comments 37, 71 and 76. Description of beneficial reuse programs at other facilities is outside the scope of the FEIS.

Solid Waste and Hazardous Materials Comment 78:

Page 3-257, Table 3.9-2: In the risk management measures for toxic and sensitizing hazards, describe whether the exhaust from gas operations will be treated prior to discharge. The same comment applies to Table 3.9-3.

Response: See Response to Solid Waste and Hazardous Materials Comment 21; Response to Air Quality Comment 15.

Solid Waste and Hazardous Materials Comment 79:

Page 3-274, Figure 3.10-4: Clarify the pretreatment that will occur at the Micron facility compared to the treatment by Onondaga County at Oak Orchard. Some clarification in the text and on Figure 3.10-4 would be helpful.

Response: Onondaga County (specifically OCDWEP) will be utilizing its Industrial Pretreatment Program, balancing USEPA categorical standards with NYSDEC SPDES permit limits to establish pretreatment/local limits that Micron must achieve for the wastewater discharge prior to

conveyance for further treatment at the IWWTP. Micron will need to comply with the pretreatment limits set forth by OCDWEP to discharge to the IWWTP. The IWWTP facility is designed to treat incoming pretreated Micron wastewater, and discharges will comply with all NYSDEC permit requirements. The outfall effluent will be closely monitored to ensure compliance. See also Response to Solid Waste and Hazardous Materials Comment 86.

In order to meet the effluent limitations in its IWDP, the Proposed Project will include wastewater treatment at the Micron Campus. As discussed in FEIS Section 3.8.3.2, Micron is evaluating various wastewater treatment technologies and their effectiveness to address the wastewater matrix anticipated for a high-volume semiconductor fabrication facility. See also FEIS Appendix L-1.

Solid Waste and Hazardous Materials Comment 80:

An estimate of the quantity of sludge that will be generated from the IWWTP should be provided in the Final EIS along with disposal options. A previous version of the DEIS provided an estimate of the industrial waste stream.

Response: See Response to Solid Waste and Hazardous Materials Comment 74; see generally FEIS Table 3.8-8. There is no prior version of the DEIS.

Solid Waste and Hazardous Materials Comment 81:

Transparency was requested regarding destination facilities and vendors, including Veolia, for disposal of hazardous waste.

Response: See Response to Solid Waste and Hazardous Materials Comment 70. FEIS Table 3.8-8 shows the various types of hazardous and universal waste or RRR material the Micron Campus would generate and anticipated management or disposal methods and locations.

As explained in FEIS Section 3.8, for any hazardous waste, permitted private hazardous waste haulers would collect hazardous waste and bring it to facilities authorized by NYSDEC or analogous out-of-state regulatory agencies for disposal in accordance with RCRA regulations. See FEIS Section 3.8.3.2, Hazardous Waste. Because transport of all hazardous waste would be performed by permitted hazardous waste haulers and disposal of all hazardous wastes would occur at a RCRA-permitted treatment, storage, or disposal facility, no adverse effects the environment or surrounding communities is anticipated.

Solid Waste and Hazardous Materials Comment 82:

What is Micron doing to prevent hydrogen sulfide and other noxious chemicals from running off the factory into the surrounding community.

Response: See Response to Air Quality Comment 23.

Solid Waste and Hazardous Materials Comment 83:

Commenters requested a list of PFAS that will be used in production at the Proposed Project as well as quantities.

Response: FEIS Section 3.8.3.2 and Appendix L-1 describe the types and instances where PFAS compounds generally will be used in the semiconductor manufacturing process. Specific forms or types of PFAS to be used are not provided due to the highly proprietary nature of this information or are not yet confirmed at this point in the Project development process.

Solid Waste and Hazardous Materials Comment 84:

How are the PFAS and other chemicals used in manufacturing being managed, handled and disposed of. Concerns raised about non-disclosure agreements for trade secret chemicals used and that information is being kept from the public and regulators.

Response: See Response to Solid Waste and Hazardous Materials Comment 83. There are certain chemicals that are proprietary trade secrets and highly confidential business information. Micron does not share proprietary information with the public. As also discussed in FEIS Section 3.8.3.2, Micron will be required to have a policy requiring that its chemical suppliers provide full disclosure of chemical constituents to Micron, which often requires use of non-disclosure agreements. These disclosures are used to manage potential risks to human health and the environment while maintaining confidential business information. Regulatory agencies with permitting authority will have confidential access to specific PFAS compounds used at the Micron Campus and thus would have the ability to assess whether the treatment technology used for the Proposed Project is sufficient to achieve compliance with applicable laws and regulations.

Micron would segregate process solvent waste containing PFAS from Micron Campus wastewater streams to closed bulk storage systems for off-site management by licensed and permitted treatment and disposal facilities. Micron would manage PFAS-containing materials and wastes consistent with the framework discussed in Appendix L-1, and as described in response to Solid Waste and Hazardous Materials Comment 65. Micron would dispose of or otherwise manage waste known to contain regulated PFAS in accordance with applicable state and federal regulations and as appropriate given its content and characteristics. In compliance with EPCRA TRI reporting, Micron would report the manufacture, process, or other use of individual TRI-listed PFAS that exceed reporting thresholds. This would include TRI-listed PFAS compounds.

Solid Waste and Hazardous Materials Comment 85:

Micron should commit to, and NYSDEC should require, evaluation of all available PFAS destruction technologies for use on-site with the goal of implementing one at the point of use. NYSDEC should regulate PFAS destruction systems. The goal of any such system should be zero release.

Response: FEIS Appendix L-1 discusses the framework that Micron will apply for management of PFAS-containing materials and wastes consistent with UESPA's 2024 interim guidance, federal and state regulation (including beneficial use determinations), and Micron Technology's RRR

program to implement its environmental sustainability goals. In sum, there is no one-size-fits-all technology or treatment program for managing PFAS-containing materials. USEPA has developed a framework for “decision-makers who need to identify the most effective means for destroying or disposing of PFAS-containing materials and wastes.” This framework for choosing a technology to destroy, dispose, or otherwise manage PFAS-containing materials considers the type of PFAS (including unknown PFAS), concentration, volume, availability of analytical methods, whether a particular technology is available at the scale needed, engineering controls to prevent or minimize release of PFAS into the environment, performance of the technology being considered, whether there are non-PFAS materials in the waste that may affect the technology’s performance, and other detailed considerations.

It also is not reasonable to uniformly prioritize “destruction” over removal technologies. Treatment may be sufficient if it removes, as opposed to destroys, PFAS. Treatment also may involve some combination of these technologies. Micron continues to assess emerging PFAS wastewater technologies capable of addressing PFAS at the ppt levels found in semiconductor fabrication wastewater and that will meet limits specified in the Micron Campus’s IWDP. See FEIS Section 3.8.3.2; FEIS Appendix L-1. Micron will comply with applicable laws, regulations, and permits in its management and disposal of PFAS-containing materials.

Solid Waste and Hazardous Materials Comment 86:

The DEIS should include a comprehensive analysis of the cumulative impacts of Micron’s PFAS discharges with a focus on the release to Oak Orchard wastewater treatment facilities and, in turn, to surface waters and wastewater biosolids.

Response: FEIS Appendix L-1 discusses cumulative effects of PFAS from the Proposed Project. NYSDEC will determine the SPDES effluent limitations for Oak Orchard IWWTP in accordance with federal, state, and local guidelines to protect surface waters, groundwater, and aquifers. OCDWEP will issue an IWDP to Micron that will require limitations of PFAS and other pollutants prior to discharge to the Oak Orchard IWWTP. Micron’s discharge will be closely monitored to ensure compliance with the Pretreatment Limits set forth by OCDWEP to Micron to protect Oak Orchard IWWTP Treatment Processes and ensure compliance with NYSDEC established discharge limits. See FEIS Section 3.10.1 Legal and Regulatory Setting.

Micron will have industrial wastewater pretreatment facilities on the Micron Campus to reduce or eliminate the quantity of pollutants, including PFAS, being discharged to the IWWTP in accordance with its IWDP issued by OCDWEP. Micron pretreated wastewater will be carefully tested during start up to make sure effluent discharge to the IWWTP is within the compliance parameters set forth by the IWDP. PFAS also would be addressed cumulatively by the other regulatory controls, including appropriate storage and handling of chemicals, and spill prevention planning, as discussed in the FEIS.

Solid Waste and Hazardous Materials Comment 87:

The FEIS should include an estimate of the quantities of fluoropolymers in each fab at Micron, by category of use, as well as life cycle analysis of the environmental impacts from exposure, release, spill, end of life, etc.

Response: See Response to Solid Waste and Hazardous Materials Comment 83; FEIS Appendix L-1.

Solid Waste and Hazardous Materials Comment 88:

Micron should conduct a comprehensive review and documentation of the state of PFAS impacts from use in the semiconductor industry within the country and provide it in the FEIS. 6 NYCRR 617.9(b)(6) requires an analysis of PFAS that summarizes existing credible scientific evidence and the nature and relevance of unavailable or uncertain information given the unique PFAS used for chip manufacturing.

Response: See FEIS Appendix L-1. To the extent that the comment requests additional information unrelated to the Proposed Project, that is beyond the scope of the FEIS.

The cited SEQRA regulation directs that the EIS include reasonably foreseeable catastrophic impacts to the environment. The transportation, use, handling and disposal of PFAS at the Proposed Project would not increase the risk of reasonably foreseeable catastrophic impacts to the environment, as contemplated by 6 NYCRR 617.9(b)(6).

Solid Waste and Hazardous Materials Comment 89:

The DEIS should specify how PFAS and PFCs are recycled, and how non-recycled, insoluble compounds are managed.

Response: Micron would segregate process solvent waste containing PFAS from the Micron Campus wastewater streams to closed bulk storage systems for off-site management by licensed and permitted treatment and disposal facilities. See FEIS Section 3.8.3.2; Appendix L-1. Micron would manage PFAS-containing materials and wastes consistent with the framework discussed in Appendix L-1 and as described in response to Solid Waste and Hazardous Materials Comment 65. Micron would dispose of or otherwise manage waste known to contain regulated PFAS in accordance with applicable regulations and as appropriate given its content and characteristics. In compliance with EPCRA TRI reporting, Micron would report the manufacture, process, or other use of individual TRI-listed PFAS that exceed reporting thresholds. This would include TRI-listed PFAS compounds. See FEIS Section 3.8.3.2, Operational Effects, Hazardous Waste.

See Response to Solid Waste and Hazardous Materials Comment 86; FEIS Appendix L-1.

Solid Waste and Hazardous Materials Comment 90:

Micron should explain why PFAs and PFCs are essential for the manufacturing process. Why aren't alternatives to these chemicals evaluated?

Response: As discussed in FEIS Appendix L-1, semiconductor fabrication involves the use of carefully selected and proprietary chemistries, some of which contain PFAS. Many semiconductor applications depend on PFAS and PFCs due to certain chemical properties—such as low surface tension, high stability, and compatibility. While the specific number and order of processing steps that will be used at the Proposed Project is proprietary, semiconductor fabrication facilities generally follow the same series of doping, deposition, etching, and planarization steps. For example, high-performance PFAS-containing lubricants are essential within the semiconductor manufacturing process because of their ability to meet multiple performance requirements simultaneously, including the need to prevent particle creation and outgassing while providing effective lubrication within the extreme physical environments present in manufacturing processes, and remaining inert to aggressive chemistries used in certain manufacturing process steps. See also NIST, “Final Programmatic Environmental Assessment for Modernization and Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program” (2024) at Appendix C.

Presently, there are no known drop-in substitutes for many critical PFAS uses in semiconductor fabrication. Substitutions will require fundamental changes in the design of processes, materials, and facilities in ways that are currently unknown. Review of alternative chemistries also may involve evaluation of chemistries that introduce other health, safety, and process safety risks. Micron is evaluating potential non-PFAS containing alternatives to the chemistries, equipment, and materials used in semiconductor fabrication. See FEIS Section 3.8.3.2; FEIS Appendix L-1. However, the timelines for replacements of non-PFAS compounds can be extensive or not currently possible, particularly where new chemistries and processes must be invented. This includes partnering with several suppliers to explore non-PFAS alternatives, as well as engagement with the broader semiconductor industry through groups like the World Semiconductor Council (WSC), the Semiconductor Industry Association’s PFAS Consortium, SEMI, and the National Science Foundation/ Semiconductor Research Corporation, as further discussed in Micron Technology’s 2025 Sustainability Report (chemical management).

Solid Waste and Hazardous Materials Comment 91:

Rather than focusing narrowly on whether identical PFAS substitutes exist, Micron should conduct a rigorous alternatives assessment that considers process redesign, material substitution, and other innovative solutions. A commitment to eliminating PFAS where safer options exist should be a minimum requirement for a project of this scale.

Response: See Response to Solid Waste and Hazardous Materials Comment 90. FEIS Appendix L-1 discusses challenges and timelines for identifying non-PFAS alternatives that meet functionality requirements, as well as Micron’s efforts to identify non-PFAS alternatives. These efforts include engagement with government and industry groups to identify non-PFAS alternatives and innovation.

Solid Waste and Hazardous Materials Comment 92:

The appropriate NY State agency and/or corresponding Federal agency need to work together with Micron and its competitor manufacturers of chips to identify alternatives to PFAS and PFCs that are less harmful to humans and the natural environment and, in the future if identified and marketed, agree to use PFAS and PFC replacement substances and chemicals if overall benefits exceed costs. Micron should support research and pilot projects to understand interactions of PFAs and PFCs with the environment, as well as methods to treat them or eliminate their use.

Response: See Responses to Solid Waste and Hazardous Materials Comment 90 and 91. See also Response to Water Resources Comment 29.

Solid Waste and Hazardous Materials Comment 93:

Major uncertainties including location and intensity of development sparked by this project, success of wetlands, PFAS discharge in wastewater, stormwater management plans, air pollutant criteria, spills and upset, and so on. Micron has committed to adaptive management for issues managing groundwater and storm water but does not commit to public sharing on-going monitoring efforts and updates with the public and outside experts.

Response: The uncertainties identified by the comment are typical of industrial project planning and implementation at this scale. The FEIS contains an analysis of the reasonably foreseeable growth impacts, and socioeconomic effects of the Proposed Project, consistent with the requirements of NEPA and SEQRA.

Mandated wetland replacement/mitigation measures would be enforceable commitments should the U.S. Army Corps issue a Section 404 wetlands permit. Such commitments are also anticipated to be conditions of any NYSDEC-issued wetlands permit. As explained in the FEIS, an approved SWPPP would be required to enable the applicant to manage stormwater runoff from the Micron Campus. In addition, adaptive management practices are a well-accepted supplementary method for ensuring that actual environmental impacts of a proposed action remain within acceptable levels and are not indicative of an analytical or other deficiency. Additional opportunities for public input are anticipated in conjunction with further permitting applications and more detailed design when more information is known.

OCDWEP utilizes the USEPA Enforcement and Compliance History Online (ECHO) database system, a public web database that publishes environmental compliance information for regulated facilities across the United States, including OOWWTP. This data is currently available and will be available during future operations.

Solid Waste and Hazardous Materials Comment 94:

The DEIS should specify the wastewater treatment technologies and plan to be used, including their projected treatment efficiencies for each chemical being managed, with the goal of pretreating PFAS in wastewater down to the lowest technically feasible and achievable. Given that conventional wastewater treatment plants cannot effectively treat PFAS, Micron must prevent off-site discharges of PFAS-contaminated wastewater.

Response: See Responses to Water Resources Comments 35 and 41; Responses to Solid Waste and Hazardous Materials Comments 80 and 89; FEIS Appendix L-1.

Solid Waste and Hazardous Materials Comment 95:

Micron must commit to phasing out all PFAS chemicals, not just those currently regulated, and prioritize non-PFAS alternatives wherever technically feasible. Substituting one PFAS chemical for another is not acceptable.

Response: See Response to Solid Waste and Hazardous Materials Comment 90; see also FEIS Appendix L-1, which discusses challenges and timelines for identifying non-PFAS alternatives that meet functionality requirements, as well as Micron's efforts to identify non-PFAS alternatives. These efforts include engagement with government and industry groups to identify non-PFAS alternatives and innovation.

Solid Waste and Hazardous Materials Comment 96:

Commenter requested information on whether any PFAS chemicals will be discharged into the Seneca River.

Response: The Proposed Project is not located within the Seneca River watershed, in which the Seneca River is part of. See also Response to Water Resources Comment 47.

Solid Waste and Hazardous Materials Comment 97:

Micron should support research and pilot projects to understand interactions of PFAs and PFCs with the environment, as well as methods to treat them or eliminate their use. The DEIS states that state of the art technology will be used by Micron to remove PFAS, however, there is no known technology that removes PFAS or other harmful chemicals on an industrial scale.

Response: See Responses to Solid Waste and Hazardous Materials Comments 89 and 92; FEIS Section 3.8.3.2; FEIS Appendix L-1. Micron is actively working with government and industry groups to advance methods for accurately identifying and quantifying PFAS in various media. Due to rapidly evolving PFAS wastewater treatment technology, Micron continues to assess emerging technologies and will select appropriate solutions for the Proposed Project as project design progresses. See also Responses to Water Resources Comments 33 and 34.

Solid Waste and Hazardous Materials Comment 98:

Micron should provide more information about the type and amount of PFAS that are used in the production processes in its other facilities and the amount and type found in those waste streams. Unless Micron can demonstrate otherwise, the DEIS should assume that all -- or a percentage based on past experience -- of this PFAS will escape detection or capture by any industrial wastewater treatment plant and assess the impacts of its discharge into the environment.

Response: See Responses to Solid Waste and Hazardous Materials Comments 9, 83, and 89. Even after the Proposed Project is operational, the specific types and amounts of chemicals will likely change as new chip technologies are adopted and, therefore, reference to other facilities would not be applicable. As discussed in FEIS Section 3.8.3.2, Micron requires its chemical suppliers to provide full disclosure of chemical constituents to Micron, which often requires use of non-disclosure agreements. These disclosures are used to manage potential risks to human health and the environment while maintaining confidential business information. Regulatory agencies with permitting authority will have confidential access to specific PFAS compounds used at the Micron Campus and thus would have the ability to assess whether the treatment technology used for the Proposed Project is sufficient to achieve compliance with applicable laws and regulations.

The FEIS assesses the potential impacts to various media (e.g., soil, wastewater, surface water) from the transport, storage, handling, use and disposal of PFAS at the Proposed Project and Connected Actions to the extent reasonable and feasible in light of the continued emergence of regulation, treatment technology and scientific information. See FEIS Sections 3.8.3.2, 3.3.4.2; FEIS Appendix L-1. Micron and the agencies implementing the Connected Actions and proposed environmental mitigation measures would be subject to ongoing federal, state, and local regulatory oversight, including permit conditions that require compliance with current and future environmental standards. These regulatory frameworks incorporate mechanisms such as permit renewals, inspections, and reporting, enabling agencies to address changing environmental conditions and operational practices. Any changes in operations or environmental conditions would be addressed through applicable permitting processes, which will apply current law and regulations and are designed to reflect current science and best practices.

Solid Waste and Hazardous Materials Comment 99:

The regulations are focused on two compounds - PFOA and PFAS - which are not used by the chip industry any longer, as noted by the CHIPS office in their environmental assessment, so the Project sponsors are looking at the wrong set of compounds in their analysis.

Response: See Response to Water Resources Comment 38. The FEIS does not use any definitional framework to exclude PFAS types from consideration. See FEIS Sections 3.8.3.2. The FEIS's analysis and Micron's ongoing assessment of available PFAS technologies capable of achieving compliance with potential permit limits are not limited to those technologies effective on only currently-regulated PFAS or to any subset of PFAS for which approved analytical methods exist. Limits and controls established for specific PFAS prioritized for regulation would reasonably be

expected to provide benefits and adequate levels of protection for other PFAS as well. Micron will continue to comply with all applicable law, including any additional future regulation of PFAS.

Solid Waste and Hazardous Materials Comment 100:

The EIS must rely on a science-based class definition of PFAS already enshrined in multiple provisions of New York State law.

Response: See Response to Water Resources Comment 23. FEIS Section 3.8.3.2 and Appendix L-1 discuss various PFAS definitions, all of which are science-based definitions that capture most substances that potentially may be considered PFAS. These definitional frameworks are also discussed in NIST's "Final Programmatic Environmental Assessment for Modernization and Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program" (2024). While the FEIS does not adopt a specific PFAS definitional framework, it also does not use these frameworks to exclude PFAS types from consideration. The FEIS identifies instances where PFAS compounds, broadly defined, generally are used in the semiconductor manufacturing process. See FEIS Section 3.8.3.2; FEIS Appendix L-1. Sufficient information has been provided to identify PFAS use and management, and to address the potential risks and procedural controls in place to manage the risk associated with using these materials.

Solid Waste and Hazardous Materials Comment 101:

Commenter stated that EPA method 1633 is inadequate in the detection of more than 40 PFAS chemicals in soil, water, and biological tissue, and Micron should be subject to a broader spectrum testing procedure that can identify scores more PFAS compounds than EPA method 1633, especially since the semiconductor industry reportedly utilizes hundreds, if not thousands of PFAS compounds.

Response: See Responses to Water Resources Comment 38; Response to Solid Waste and Hazardous Materials Comment 99. As discussed in FEIS Section 3.8.3.2 and Appendix L-1, government and industry groups, including semiconductor trade groups in which Micron actively participates, are working to advance the development of validated methods for accurately identifying and quantifying PFAS in various matrices, including wastewater. Presently, EPA Method 1633A is the only standardized validated method for analyzing PFAS in industrial wastewater. NYSDEC requires PFAS monitoring as provisions in its permits, including quarterly sampling for approximately 40 compounds, using EPA Method 1633 and leveraging state guidance values (e.g., 10 ppt for PFOA/PFOS). See NYSDEC, Emerging Contaminants in NY, available at <https://dec.ny.gov/environmental-protection/water/emerging-contaminants>.

Solid Waste and Hazardous Materials Comment 102:

Commenter stated that regulation of PFAS by the federal and state government are underway, while both entities continue to provide financial subsidies to "known" generators of PFAS. As it relates to the Micron project, commenter requested that Micron explain this discrepancy.

Response: See Response to Purpose and Need Comment 2; Response to Solid Waste and Hazardous Materials Comment 90; FEIS Appendix L-1.

Solid Waste and Hazardous Materials Comment 103:

Page 3-241: The commenter requests further information on what suite of PFAS compounds is proposed to be used along with a material balance showing the supply and disposition of the individual PFAS components. If Micron cannot find an acceptable disposal facility, PFAS wastes will need to be stored at the facility for prolonged period of time or properly stored somewhere and this needs to be discussed in the Final EIS. Recommend that Micron verify with each disposal facility whether the disposal facility will accept wastes that contain PFAS. The text should explicitly mention that the TRI listed PFAS compounds represent a very small fraction of all PFAS compounds, and specifically what fraction of PFAS compounds used at the facility will be subject to TRI reporting.

Response: See Responses to Solid Waste and Hazardous Materials Comments 89 and 98; FEIS Section 3.8; FEIS Appendix L-1.

FEIS Section 3.8.3.2 and Appendix L-1 identify and discuss a range of wastewater treatment technologies for use prior to discharge to the IWWTP and materials management and disposal options for different types of materials that may be generated by the Proposed Project, which may include PFAS-containing materials. USEPA's current "Interim Guidance on the Destruction and Disposal of Perfluoroalkyl and Polyfluoroalkyl Substances and Materials Containing Perfluoroalkyl and Polyfluoroalkyl Substances" describes the agency's latest assessment of available methods for treatment and management of PFAS-containing materials. Micron will use this and other guidance to assess suitable methods for disposal and management of PFAS-containing material and will comply with applicable law for the safe and proper disposal of any generated solid and hazardous waste.

FEIS Section 3.8 explains that non-hazardous sludge from on-site wastewater treatment would be sent to a beneficial use vendor or recycled. See also FEIS Table 3.8-5. For any hazardous waste, permitted private hazardous waste haulers would collect hazardous waste and bring it to facilities authorized by NYSDEC or analogous out-of-state regulatory agencies for disposal in accordance with RCRA regulations. Because transport of all hazardous waste would be performed by permitted hazardous waste haulers and disposal of all hazardous wastes would occur at a RCRA-permitted treatment, storage, or disposal facility, no adverse effects to the environment or surrounding communities are anticipated.

TRI reporting requirements are further discussed in FEIS Section 3.8.3.2 and Appendix L-1. Micron would be required to submit TRI data using Form R reports to USEPA by July 1 of each year identifying the chemicals subject to the TRI used on-site and describing the toxic chemical management and release prevention activities that occurred on-site during the previous calendar year, information which USEPA would make publicly available.

Solid Waste and Hazardous Materials Comment 104:

What is the likelihood that the fabs planned for later development in Clay will be designed without the need for fluorochemicals? Is there a plan or timeline for substitution of PFAS, and development of alternatives?

Response: As discussed in FEIS Section 3.8.3.2 and Appendix L-1, Micron is evaluating potential non-PFAS containing alternatives to the chemistries, equipment, and materials used in semiconductor fabrication. This includes partnering with several suppliers to explore non-PFAS alternatives, as well as engagement with the broader semiconductor industry through various groups, as described in Micron Technology's 2025 Sustainability Report. Presently, there are no known drop-in substitutes for many critical PFAS uses in semiconductor fabrication.

Micron also currently does not plan to use surfactants in wet etch for high-volume DRAM manufacturing. If surfactants are needed for wet etch in future DRAM tech nodes, Micron plans to consider non-PFAS alternatives, where feasible. Micron is also working with various semiconductor industry groups to investigate PFAS uses in applications throughout the manufacturing process, research the innovation and feasibility of substitutes, explore opportunities to reduce or eliminate PFAS use, and pursue pollution prevention and treatment options, as discussed in Micron Technology's 2025 Sustainability Report.

Solid Waste and Hazardous Materials Comment 105:

The DEIS did not include discussion of helium usage in CHIP manufacturing, and if not, the FEIS should.

Response: Helium is used in the manufacturing process as a carrier gas, heat transfer medium, as well as a film treatment. The general semiconductor industry demand and shortening supply of helium does raise concerns regarding the sustainability of helium supply chains. The list of example liquid and gas chemicals to be used at the Micron Campus has been updated to include helium. Micron has and will continue to evaluate potential alternative gases and process changes to transition away from helium dependence in certain processes.

Solid Waste and Hazardous Materials Comment 106:

Page 3-236, Table 3.8-6: Describe which category of wastes containing PFAS will fall under (e.g., RR, non-hazardous or hazardous) and provide information to support the estimated disposal volumes.

Response: It is anticipated that the Proposed Project will generate both non-hazardous and hazardous waste. FEIS Section 3.8.3.2 and Appendix L-1 identify and discuss a range of disposal options for different types of generated waste at the proposed Micron Campus. In sum, there is no one-size-fits-all technology or treatment program for managing PFAS-containing materials. USEPA has developed a framework for "decision-makers who need to identify the most effective means for destroying or disposing of PFAS-containing materials and wastes." This framework for choosing a technology to destroy, dispose of, or otherwise manage PFAS-containing materials considers the type of PFAS (including unknown PFAS), concentration, volume, availability of

analytical methods, whether a particular technology is available at the scale needed, engineering controls to prevent or minimize release of PFAS into the environment, performance of the technology being considered, whether there are non-PFAS materials in the waste that may affect the technology's performance, and other detailed considerations. USEPA's current interim guidance on PFAS destruction and disposal describes the agency's latest assessment of the available methods for treatment and management of PFAS-containing waste. Micron will be required to have a program to manage such materials consistent with the applicable regulatory requirements and this framework discussed in FEIS Appendix L-1.

Solid Waste and Hazardous Materials Comment 107:

A commenter notes that the DEIS outlines general commitments to implement a Risk Management Plan (RMP) and to coordinate with the Syracuse Fire Department's hazardous materials unit. The DEIS states that Micron expects its RMP to cover eight federally regulated substances, including hydrogen fluoride (HF), chlorine, and anhydrous ammonia. However, it omits other substances commonly used in fabs, such as arsine and phosphine, which may be lethal in small concentrations and are subject to more stringent thresholds under California's regulations. The commenter also notes that the DEIS leaves key questions remain unanswered, such as: Will the RMP include all regulated substances and extremely hazardous substances regardless of federal thresholds? Micron should include a full chemical inventory in the RMP and emergency response planning.

Response: See Response to Solid Waste and Hazardous Materials Comments 9 and 39; Response to Air Quality Comment 22.

Solid Waste and Hazardous Materials Comment 108:

The DEIS refers to internal banned and restricted chemical lists as part of Micron's best management practices provided for hazard control measure examples (p. 3-258). Consistent with a precautionary approach, Micron should include in its RMP not only any regulated substances, but also any chemicals it deems hazardous through its own internal evaluations—whether listed as restricted or banned or simply identified as potentially hazardous—regardless of their status under current federal or state regulations.

Response: Descriptions of the types of chemicals used onsite have been provided in FEIS Section 3.8.3.2 and Appendix L-1. FEIS Section 3.8 includes a discussion and analysis of the federal requirements associated with hazardous chemicals, including RMP requirements, and how the Project will comply with these requirements. Micron's RMP will address those chemicals regulated as "extremely hazardous substances" that are used in covered processes in quantities above threshold levels. Other unidentified emerging contaminants are not subject to USEPA's Risk Management Program regulations. Micron would evaluate and add chemicals to the RMP on a case-by-case basis. See also Responses to Solid Waste and Hazardous Materials Comments 9 and 99; Response to Air Quality Comment 22.

Solid Waste and Hazardous Materials Comment 109:

The DEIS does not disclose details of Micron's internal programming for managing hazardous and restricted substances. The DEIS provides no decision criteria, oversight structure, examples of restricted substances or indicators of how workers or regulators will verify compliance.

Response: The FEIS contains sufficient detail about Micron's internal hazardous material management programming, including engineered solutions, permissive exposure limits, administrative controls, incorporation of and adherence to OSHA compliance standards, and PPE. See FEIS Section 3.8.3.2. See also Response to Solid Waste and Hazardous Materials Comment 108.

3.9 Human Health & Safety**Human Health & Safety Comment 1:**

Commenters expressed general concerns regarding harm to Micron workers and harms or health consequences to the community caused by exposure to chemicals, including PFAs, used in manufacturing. The chemicals used by Micron are harmful to humans. The DEIS does not sufficiently address impacts to the community and does not detail how Micron will protect worker health and safety given the intensive use of chemicals in semiconductor production. Micron must commit to the highest safety standards to the facility and employees. The semiconductor manufacturing process is dependent on use of thousands of chemicals posing serious risk to workers and community safety. The DEIS falls short in specificity, transparency, and accountability to meaningfully assess and mitigate occupational health and safety risks.

Response: The lead agencies acknowledge the stated concerns. The FEIS therefore evaluates the potential harm to both workers and the general public due to Micron's proposed storage, use, handling and disposal of chemicals, including PFAS.

Micron will be required to comply with all applicable laws and regulations concerning the storage, use, handling and disposal of chemicals, including PFAS. See, e.g., FEIS Section 3.9.1 (Legal and Regulatory Setting); FEIS Appendix L-1. Beyond legal and regulatory compliance, the lead agencies will require Micron to implement a wide variety of safety standards and programs, many exceeding applicable regulatory requirements. These required risk management measures, hazard control measures, and emergency management programs will avoid and minimize to the maximum extent practicable the potential for impacts to workers and the community. See FEIS Section 3.9.3. Examples of risk management controls include, but are not limited to, use of process enclosure, interlocks, continuous monitoring and shielding. See FEIS Table 3.9-2. Examples of hazard control measures include, but are not limited to, elimination or removal of hazards, substitution of use of alternatives, engineered controls, administrative or work practice controls, and use of protective equipment. See FEIS Table 3.9-3; FEIS Appendix L-2.

Because of these stricter regulations on emissions of toxic and hazardous substances, advancements in modern semiconductor equipment safety controls, and disposal of those

substances, “the U.S. semiconductor industry incident rate is substantially lower than the U.S. manufacturing and economic sector incident rates, and semiconductor industry incident rates have steadily declined over the past three decades.” See FEIS Section 3.9.3.2.

Micron’s Global EHS program, and its EHS team would be responsible for reviewing the facility’s engineering design and developing occupational safety and health procedures, protocols, and training in accordance with OSHA, USEPA, and NYS Labor Law Article 27 requirements, including for worker health and safety, the handling and storage of chemicals, and the response to potential spills. Micron would also implement chemical monitoring and exposure controls in the fabs based on more protective standards than the OSHA permissible exposure limits (PELs). See also Response to Human Health and Safety Comment 4. In addition, Micron would manage potential risks from use and operation of semiconductor manufacturing equipment in accordance with the Semiconductor Equipment and Materials International (SEMI) S2 standard, which serves as the semiconductor industry-wide EHS guideline for semiconductor manufacturing equipment and covers installation, gas effluent handling, exhaust ventilation, fire risk avoidance and minimization, and electrical design and hazards. Micron would require its semiconductor manufacturing equipment suppliers to provide SEMI S2 compliance reports prior to equipment purchase to ensure that all equipment at the Micron Campus would meet the standards and industry best practices.

In addition to chemical exposure limits and protection measures, Micron would implement a comprehensive industrial hygiene (IH) program to control environmental factors or stressors in the workplace that could lead to discomfort, illness, or impaired health. The EHS team would be responsible for verifying the implementation and effectiveness of IH controls, such as worker health monitoring systems. Micron would incorporate all applicable OSHA general industry standards, including noise protection standards to protect employees from potential hearing damage from prolonged exposure to loud machinery and equipment in the fabs, including cleanroom environments where specialized tools and ventilation systems can generate high noise levels. Micron would install equipment noise reduction features and enclosures around loud equipment, provide hearing protection to employees, and incorporate noise safety protocols as part of workplace monitoring and training programs. In addition, applicable OSHA respiratory protection standards are followed to protect and reduce employee potential exposure to airborne contaminants. The EHS team would evaluate the use and applicability of respiratory protection as part of the hierarchy of safety controls for reducing exposure and risk. FEIS Table 3.9-4 lists additional IH program measures that would be implemented at the Micron Campus.

Also discussed in FEIS Section 3.9.3.2, Operational Effects, Micron would seek ISO 45001 and 14001 certifications for the Micron Campus, consistent with certifications at its existing facilities, which are globally certified to ISO 45001:2015 and ISO 14001:2015. ISO 45001 is the international standard for occupational health and safety and incorporates leadership commitment, worker participation, hazard identification and risk assessment, legal and regulatory compliance, emergency planning, incident investigation, and continual improvement standards. ISO 14001 is the international standard for environmental management systems and incorporates environmental compliance, resource use, waste management, monitoring, training, employee engagement, and stakeholder communication standards. Conformance to these standards is audited on a routine basis by a third party.

Micron would apply additional safety standards that exceed applicable regulatory requirements to address potential hazards associated with semiconductor process chemical exposure. For example, Micron would implement chemical monitoring and exposure controls in the fabs based on more protective standards than the OSHA permissible exposure limits (PELs).

Micron would establish a Workplace Safety Committee (WSC) to foster collaboration among management and employees and a structured process to proactively identify and address potential hazards and raise any safety concerns with oversight by the NYSDOL Safety, Health, & Essential Rights Program. The WSCs established in accordance with ISO 45001 and 14001 certification standards would be audited by a third party.

See also Responses to Solid Waste & Hazardous Materials Comment 4, and 48, and Water Resources Comment 29; FEIS Appendix L-1.

The comprehensive suite of risk management, hazard control, exposure controls and EHS programs mentioned above, and further discussed in the FEIS would protect workers and the community from potential chemical, including PFAS, exposures.

Human Health & Safety Comment 2:

The long-term effects of PFAs are not understood. Most chemicals introduced for industrial or other use are not tested in advance for health and safety impacts. There is no testing of chemical combinations.

Response: See Response to Human Health & Safety Comment 1. The generally applicable exposure controls identified in the FEIS would also protect workers and the community from potential PFAS exposures, individual chemicals, and combinations of chemicals. See FEIS Tables 3.9-2 and 3.9-3. These include use of enclosed automated chemical delivery systems (which physically separate workers from the production process) to minimize potential worker safety risks and exposures.

The FEIS appropriately identifies and discusses the laws and regulations to which the Proposed Project will be subject, including air emission monitoring, wastewater permitting and accompanying monitoring, required spill prevention protocols, and the reporting regimes that accompany federal, state and local regulatory programs. These programs include regulation of PFAS, as discussed in FEIS Section 3.8.3.2 and FEIS Appendix L-1. The FEIS also discusses the review of PFAS treatment options that go beyond what is currently legally mandated. The options under review are not limited to treatment of only those PFAS subject to drinking water limits. Also, NYSDEC requires PFAS monitoring as provisions in its permits, including quarterly sampling for approximately 40 compounds using EPA Method 1633 and leveraging state guidance values (e.g., 10 ppt for PFOA/PFOS). See <https://dec.ny.gov/environmental-protection/water/emerging-contaminants>. This will then be reflected in Micron's IWDP issued by OCDWEP which will include effluent limits as well as monitoring and reporting. Any additional future regulation of PFAS is speculative, though Micron will be required to comply with all applicable laws. Micron will also explore technological innovation to reduce or eliminate PFAS from semiconductor manufacturing.

For chemicals more broadly, Micron's Risk Management Program would include pre-task planning (PTP), job hazard analyses (JHA), permit-to-work (PTW), critical risk checklists, and PPE. Micron EHS professionals would be responsible for conducting risk assessment reviews consistent with the PTP, JHA, and PTW procedures. These measures would be applied across the fabs consistent with the NIOSH hierarchy of controls. See FEIS Section 3.9.3.2.

As referenced in FEIS Section 3.9.1, the Toxic Substances Control Act (TSCA) requires the USEPA to evaluate new and existing chemicals to identify unreasonable risks of injury to health or the environment. Manufacturers must submit premanufacture notices for new chemical substances, and EPA may impose restrictions, require additional testing, or prohibit manufacture if data are insufficient to permit a reasoned evaluation of the health and environmental effects of a chemical substance.

Human Health & Safety Comment 3:

The DEIS should also address how toxic chemicals will be stored and handled pre-production to ensure the safety of Micron employees and the environment.

Response: Hazardous materials would be stored in the HPM buildings associated with each fab. See FEIS Section 3.8.3.2, Operational Effects, Hazardous Materials. Table 3.8-10 lists the quantities and storage methods for specific types of liquid and gaseous chemicals that would be stored on-site. Table 3.8-9 lists the types of hazardous materials that would be used in the manufacturing process at the Micron Campus, the potential hazards associated with each part of the process, and the controls that would be used to protect worker and public health and safety.

Micron would be required to manage the delivery of hazardous materials to the Micron Campus and their shipment for off-site disposal under the HMTA, USDOT, and NYSDOT regulations. Micron would apply for USDOT registration with the Pipeline and Hazardous Materials and Safety Administration and develop a Safety and Security Plan to adopt relevant personnel and facility security measures and provide USDOT training for relevant personnel (49 C.F.R. § 172.802). Chemicals would be delivered to the Micron Campus by truck (see Appendix K-6 for information on anticipated truck routes to and from the campus) using a variety of packaging and containment methods, including tanks, drums, and pallets. Micron would maximize the use of closed systems and automation for chemical delivery in accordance with industry standards and would install and maintain leak detectors and employ toxic gas monitoring for hazardous chemical and gas delivery systems in accordance with State and international fire codes.

Once on the Micron Campus, Micron would store hazardous chemicals in the specially designed HPM buildings as noted above, which would include secondary containment measures, and would track the chemicals as they are transferred to and used in the fabs through an automated chemical management system equipped with unintentional release detection and control mechanisms. Micron would contract with carriers and shippers of hazardous materials that maintain 24/7 emergency response support in the event of hazardous materials spills prior to and during transit, and appropriate incident reporting protocols.

Additional storage and handling of chemicals preproduction will be dictated by the joint Spill Pollution Countermeasures & Control (SPCC) Plan, Spill Prevention Report (SPR), and Process

Safety Plan. As identified in Table 3.9-2, toxic hazards would also be addressed through the following risk managing measures, which include but are not limited to process enclosures, interlocks, local exhaust / ventilation, automation, and continuous monitoring.

Human Health & Safety Comment 4:

The DEIS does not disclose a full list of chemicals that will be used at the facility and does not include job-specific exposure assessments or risk matrices. Without this information, it is impossible to evaluate or comment on exposure risks or to establish adequate monitoring protocols. Micron should include hazard classifications, associated job functions or departments, storage methods and waste treatment or disposal pathways. Micron must take into consideration workplace safety. Micron must adopt detailed plans to minimize negative impacts to workers, including providing robust worker training and safety protocols. Key safety documents and hazard procedures remain inaccessible or incomplete.

Response: See also Response to Solid Waste and Hazardous Materials Comment 9 and 40, regarding chemical transparency; Response to Solid Waste and Hazardous Materials Comment 5, providing federal and state required plans.

FEIS Section 3.9.3.2, Operational Effects, indicates that to “address potential hazards associated with semiconductor process chemical exposure, Micron would implement chemical monitoring and exposure controls in the fabs based on more protective standards than the OSHA permissible exposure limits (PELs). An OSHA PEL is a legal limit for exposure of an employee to a chemical substance or physical agent that represents the maximum allowable concentration or level of a substance that a worker can be exposed to over a specific time period without experiencing adverse health effects, and is usually expressed as an eight-hour, time-weighted average exposure limit. In developing its safety procedures for the Proposed Project, Micron shall incorporate the most protective occupational exposure limit (OEL), pursuant to the American Conference of Governmental Industrial Hygienists (ACGIH) threshold limit values (TLVs), biological exposure indices (BEIs), or Micron's own limit if lower than the ACGIH TLVs, for the chemicals used in the facility manufacturing processes for the relevant scenarios (e.g., overarching, equipment-specific, or task specific) in which they are applied. To ensure maximum worker exposure protection, Micron would install toxic gas monitoring systems, exposure detection and evacuation alarms, and automatic equipment shutdown mechanisms based on these exposure limits and Immediately Dangerous to Life and Health (IDLH) atmospheric concentration values.”

Micron will employ Industrial Hygienists who evaluate and control those environmental factors or stresses arising in or from the workplace which may cause sickness, impaired health and well-being, or significant discomfort among workers or among citizens of the community. Industrial Hygienists collect information on potential hazard sources, exposure pathways, magnitude, frequency and duration of worker exposures. Industrial Hygienists analyze this information to identify the risk of negative health effects of exposures; determine options for controlling the sources, pathways, and exposures; and provide the risk and options required to control these risks. In addition, workplace medical surveillance programs would be utilized as needed in conjunction with the established medical clinic professionals.

Human Health & Safety Comment 5:

The DEIS and Appendix L provides a baseline for construction-phase safety but lacks critical operational-phase health, safety and environmental details.

Response: See Response to Human Health & Safety Comment 25.

Human Health & Safety Comment 6:

A commenter requests that Micron include an operational-phase Occupational Health & Safety Management Plan with: 1) formal, paid worker participation in health and safety committees, 2) employee and on-site contractor training on applicable Safety Data Sheets (SDS) in multiple languages and formats, 3) a detailed medical surveillance program managed by an occupational medicine physician, 4) air and water monitoring protocols for priority contaminants including PFAS, 5) a safety training facility and comprehensive training plan managed by Micron that includes ongoing operation of the facility beyond construction activities, 6) inclusion of at least one Certified Industrial Hygienist (CIH) as mandatory expertise on the Micron EHS team, and 7) annual public reporting of worker injury/illness rates (public access to OSHA 300 Logs).

Response: Micron will establish worker safety and health committees in accordance with ISO 45001 and 14001. See FEIS Section 3.9.3.2. Micron's internal Safety and Health policies also require establishment of team member lead health and safety committees that meet on a regular cadence, discuss events and concerns, and educate workers. The Micron Code of Business Conduct and Ethics oversees multiple channels for reporting ethics and compliance concerns – to include anonymous reporting of safety concerns. This is done through an anonymous hotline. Micron will also be required to follow applicable standards related to hazard communication. See FEIS Table 3.9-1 and Appendix L-2. OSHA Hazard Communication Standard 29 CFR 1910.1200(g) requires employers to ensure that SDS are readily accessible to employees in work areas and to provide training to help them find and understand information. SDS are required by chemical manufacturers to be provided to downstream customers. Further, Micron will establish an occupational medical clinic. See FEIS Section 3.9.3.2.

See Responses to Human Health & Safety Comments 1 and 2 and FEIS Sections 3.9.2 and 3.9.3.2 and FEIS Appendix L-1. Micron employs the Semiconductor Equipment and Materials International (SEMI) S2 standard, which establishes standards for design and installation of manufacturing processes to avoid or reduce workplace hazards, including for gas effluent handling, exhaust ventilation, fire risk avoidance and minimization, and electrical design and hazards. These efforts include use of enclosed automated chemical delivery systems (which physically separate workers from the production process) to minimize potential worker safety risks and exposures. Micron would also use advanced leak detection and employ toxic gas monitoring for hazardous chemical usage.

For PFAS, see comment Responses for Section 3.8. Solid Waste, Hazardous Waste, and Hazardous Materials, including Comment 40; FEIS Appendix L-1. Generally, PFAS-containing compounds are a component of other chemistries used in the facility, whereby generally applicable exposure controls would also protect workers from potential PFAS exposures. More generally, Micron

controls and mitigates chemical and process hazards in the workplace by employing the principles of the NIOSH Hierarchy of Controls (i.e., elimination, substitution, engineering, administrative, and personal protective equipment (PPE)), as well as USEPA's waste management hierarchy for source reduction, reuse, recycling, treatment and disposal. Micron incorporates these approaches in its evaluation and approval of chemical usage. PFAS also would be addressed cumulatively by the other regulatory controls, including appropriate storage and handling of chemicals, and spill prevention planning, as discussed in the FEIS.

Micron employs safety professionals, industrial hygienists, and emergency responders. Micron currently employs certified safety professionals (CSP), certified industrial hygienists (CIH), as well as emergency responders – basic (EMT-B) who are nationally and state certified. Micron will also provide safety training to workers in accordance with all local, state and federal regulations, as discussed throughout the FEIS.

As referenced in FEIS Section 3.9.1 and Appendix L-2, OSHA requires employers with more than 10 employees to maintain an injury log using Form 300 (log), Form 300A (Annual Summary), and Form 301 (Incident Report) to track worker-related injuries and illnesses. Form 300A summary must be posted in a conspicuous place in the workplace.

Human Health & Safety Comment 7:

A commenter indicates that although the DEIS notes significant hazardous waste generation and outlines a Hazardous Waste Training Procedure, it focuses on regulatory compliance rather than exposure prevention. There is no detail provided on what specific waste streams workers will handle, and there is little detail provided on how the Hierarchy of Controls will be applied to individual hazards. Micron's Reuse, Recycle, and Recovery (RRR) program is mentioned, but it lacks a discussion of hazards in reuse/recycling operations and the training needed to perform them safely. The commenter requests [that Micron]: 1) Specify hazardous waste streams, their associated hazards, and controls, 2) make Micron's hazardous waste procedures publicly available, and 3) require initial and annual refresher hazardous waste training for all affected employees and contractors.

Response: Micron's EHS team would be responsible for reviewing the facility's engineering design and developing occupational safety and health procedures, protocols, and training in accordance with OSHA, USEPA, and NYS Labor Law Article 27 requirements. See FEIS Section 3.9.3.2, Operational Effects. This would include hazardous waste training. See Section 3.8, Solid Waste, Hazardous Waste, and Hazardous Materials, for more detail on hazardous waste and material.

Because the Micron Campus would be a large quantity hazardous waste generator, Micron also would be required to implement a Hazardous Waste Contingency Plan (HWCP) to minimize hazards to the environment or human health from exposure to hazardous waste in the event of a fire, explosion, or release of any hazardous materials (see 40 C.F.R. Pt. 262, Subpart M; 6 NYCRR §§ 372.2(a), 373-3.3, and 373-3.4). Micron would prepare the required plans approximately six months before operations would be anticipated to begin, as sufficient design detail needed to

prepare adequate plans will be available at that time. Micron has prepared an initial outline of its HWCP. See FEIS Appendix K-9.

For hazardous waste management, the USEPA RCRA regulatory standards would be reviewed and implemented. As such, RCRA training requires personnel to be instructed on their specific hazardous waste management duties, including emergency procedures within 6 months of hire. Annual refresher training is also required for affected employees. Under the RCRA regulations regulation, the facility is required to keep comprehensive records to verify that training has been completed. For example, under RCRA, the facility is required to have training, procedures, inspections, contingency plans, job hazard analyses, and emergency response plans. Emergency Response Teams would be trained in HAZWOPER (Hazardous Waste Operations and Emergency Response) an Occupational Safety and Health Administration (OSHA) standard that establishes safety requirements for workers who handle hazardous substances and respond to emergencies involving them. It requires training and other protective measures to reduce the risk of illness and injury from exposure to hazardous materials during cleanup operations, treatment, storage, and disposal of hazardous waste, and emergency response to hazardous substance releases. See FEIS Sections 3.8, 3.9, 3.14, and FEIS Appendix L.

Human Health & Safety Comment 8:

A commenter notes that ergonomic risk is minimally referenced in the EIS and Appendix L, despite evidence that integrating ergonomics into initial facility design reduces injury rates and retrofit costs, while also improving employee performance and well-being. The commenter requests that Micron: 1) engage a Certified Professional Ergonomist during facility design - recommended ergonomics expertise includes physical, cognitive, and macro ergonomics, 2) integrate adjustable workstations, manual material handling aids, and human factors into equipment selection, and 3) include ergonomic training in both construction and operations phases.

Response: The comment raises an issue that is outside the scope of environmental review of the project under SEQRA/NEPA. Ergonomics is considered a process hazard and an industrial hygiene program health and safety element for the facility. See FEIS Section 3.9.3.2 and in Tables 3.9-2. Micron will maintain an internal comprehensive ergonomics program and staffing that addresses all the above-referenced concerns.

Human Health & Safety Comment 9:

A commenter notes that the DEIS includes only high-level language about its Global Environmental Health and Safety (EHS) programs and commitment to worker health, but it fails to provide the operational detail needed to evaluate occupational safety. Although there are 9,000 permanent on-site operational jobs projected for the Micron campus at full buildout, but the DEIS only provides broad categorizations of these roles (e.g., manufacturing, IT, security, procurement, etc.) (pp 3-488- 3-489). There is no breakdown of tasks by job category and no risk assessments tied to specific roles or workstations. There is an absence of job-level detail.

Response: See Response to Human Health & Safety Comment 4. Breakdown of tasks by job category or other job-level detail is beyond the scope of the FEIS.

Human Health & Safety Comment 10:

Chemical-specific hazards are not identified in either the DEIS or Appendix L, by process stage, job title, or department. The DEIS relies on general references to OSHA standards and mentions that risk matrices will be developed internally (Appendix L, p. 8)—without providing examples, criteria, or reporting mechanisms. The lack of these details is especially concerning for maintenance and support personnel, and contractors, who may not work full time in hazardous areas but are often the most exposed during equipment servicing, material handling, or emergency response. A commenter also notes that people who do not routinely work in hazardous areas, unless they are adequately trained and provided with protective equipment, the more protective chemical-specific environmental standards should be applied. Without job-specific risk assessments and targeted protective measures for these roles, key exposure risks may go unrecognized and unaddressed. The DEIS fails to address how job-specific exposures will be tracked, evaluated or addressed.

Response: Micron is subject to all applicable OSHA regulations for managing workplace safety and emergency response. See FEIS Section 3.9.3.2 and Appendix L detail the robust processes that Micron will employ to ensure worker safety. See also Response to Human Health & Safety Comments 1 and 4, and Response to Solid Waste and Hazardous Materials Comment 9, regarding chemical transparency.

Human Health & Safety Comment 11:

Micron should disclose which Occupational Exposure Limits (OEL) apply for each substance. Micron pledges to apply the most protective OELs, and to revise standards within 90 days of new thresholds, but the revision time should be faster. Micron should publicly report, and regularly share with NYSDOH, summary data on its exposure sampling results and the OELs against which the exposures are being measured, worker health monitoring trends (with patient identities removed), or any corrective actions taken. The DEIS does not identify a single applicable OEL for total PFAS or for the specific PFAS that Micron plans to use. There are no Occupational Safety & Health Administration permissible exposure limits or National Institute for Occupational Safety and Health recommended exposure limits for PFAS, and the American Conference for Governmental Industrial Hygienists has established Threshold Limit Values for only three PFAS. It is unclear what limit Micron intends to apply to protect its workers from PFAS exposures.

Response: See Responses to Human Health & Safety Comments 1, 2, 6, and 19 (including discussion of OELs); Response to Solid Waste and Hazardous Materials Comment 83; and FEIS Sections 3.8.3.2 and 3.9; and Appendix L-1. Micron employs the Semiconductor Equipment and Materials International (SEMI) S2 standard, which establishes standards for design and installation of manufacturing processes to avoid or reduce workplace hazards, including for gas effluent handling, exhaust ventilation, fire risk avoidance and minimization, and electrical design and

hazards. These efforts include use of enclosed automated chemical delivery systems (which physically separate workers from the production process) to minimize potential worker safety risks and exposures. Micron would also use advanced leak detection and employ toxic gas monitoring for hazardous chemical usage. Generally, PFAS-containing compounds are a component of other chemistries used in the facility, whereby generally applicable exposure controls would also protect workers from potential PFAS exposures. More generally, Micron controls and mitigates chemical and process hazards in the workplace by employing the principles of the NIOSH Hierarchy of Controls (i.e., elimination, substitution, engineering, administrative, and personal protective equipment (PPE)), as well as USEPA's waste management hierarchy for source reduction, reuse, recycling, treatment and disposal. Micron incorporates these approaches in its evaluation and approval of chemical usage. PFAS also would be addressed cumulatively by the other regulatory controls, including appropriate storage and handling of chemicals, and spill prevention planning, as discussed in the FEIS. See also FEIS Appendix L-1.

Human Health & Safety Comment 12:

The DEIS does not include illness rate data- chronic, chemical related or otherwise. Although it discusses injury rates, it does not include information about illness rates (Appendix K, Vol. 2, p. 447). Many occupational exposures—especially to chemicals—manifest as illnesses, not acute injuries, and these should be captured and reported alongside injury statistics. The commenter requests that Micron's occupational health clinic not only provide care, but also collect and share de-identified illness data in a format compatible with public health tracking. There is a well known potential for semiconductor workers to develop occupational diseases due to long term exposure to toxic substances.

Response: The comment raises issues that are outside the scope of the FEIS. However, Micron will be required to comply with all regulatory requirements regarding the storage, use and disposal of hazardous materials. It will also be required to comply with all applicable OSHA requirements, which require third-party medical monitoring for any worker that interacts with hazardous substances.

In addition to chemical exposure limits and protection measures, Micron would implement a comprehensive industrial hygiene (IH) program to control environmental factors or stressors in the workplace that could lead to discomfort, illness, or impaired health. Micron's EHS team would be responsible for verifying the implementation and effectiveness of IH controls, such as worker health monitoring systems. As referenced in FEIS Section 3.9.1 and Appendix L-2, OSHA requires employers with more than 10 employees to maintain an injury log using Form 300 (log), Form 300A (Annual Summary), and Form 301 (Incident Report) to track worker related injuries and illnesses. Form 300A summary must be posted in a conspicuous place in the workplace. See Responses to Human Health & Safety Comments 1, 2, 4, 6, 11, 19, 23, and 27 (including discussion of OELs).

Human Health & Safety Comment 13:

The DEIS mentions that Micron will establish Worker Safety Committees (WSCs) to promote hazard identification and resolution (3-256), however, it provides no detail on how these committees will be structured to protect workers. The commenter asks if employees have the right to raise concerns anonymously, if participation will be voluntary and protected from retaliation, and if committee proceedings be recorded or summarized for public or third-party review. Internal EHS programs, however well-intentioned, can fail to catch or correct dangerous trends when there is inadequate transparency or worker empowerment. Micron should clarify how it will ensure these WSCs are effective, inclusive, and insulated from fear-based suppression.

Response: Micron will establish worker safety and health committees in accordance with ISO 45001 and 14001, which are audited by an external third party. See FEIS Section 3.9.3.2. Micron's internal Safety and Health policies also require establishment of team member lead health and safety committees that meet on a regular cadence, discuss events and concerns, and educate workers. The Micron Code of Business Conduct and Ethics identifies multiple channels for reporting ethics and compliance concerns – to include anonymous reporting of safety concerns. This is done through an anonymous hotline. WSCs are overseen by the NYSDOL Safety, Health, & Essential Rights Program, as stated in FEIS Table 3.9-1 and Section 3.9.3.2.

Human Health & Safety Comment 14:

Appendix L provides over 100 pages of detailed EHS requirements for construction contractors—including risk controls, compliance inspections, and method statements with job hazard analyses (Appendix L, pp. 10-115), but does not provide an equivalent document or plan presented for operational workers who will face daily exposure to hazardous chemicals. Many of the same standards should apply across both phases: critical risk checklists, PPE documentation, emergency response kits, pre-task planning. The DEIS mentions these elements for operations on pages 3-255 to 3-261, but does not provide access to the operational equivalent of the construction EHS performance standard. Will Micron publish these procedures? Will EHS metrics for operational staff be tracked and reported, as they are for contractors? Will there be a reward and recognition program for EHS participation by operational employees? These are basic elements of a mature safety culture—and their absence from the DEIS is concerning.

Response: Micron will establish worker safety and health programs in accordance with ISO 45001 and 14001, which include communication and/or publication of EHS procedures as well as tracking and reporting of EHS metrics. See FEIS Section 3.9.3.2. Micron's internal Safety and Health policies also require establishment of team member lead health and safety committees, risk reduction programs, PPE, emergency response and training. The Micron Code of Business Conduct and Ethics identifies multiple channels for reporting ethics and compliance concerns – to include anonymous reporting of safety concerns. Micron also has an established globally aligned internal EHS worker safety culture program called Live Safe. This program is comprised of team member engagement teams, auditing, fatality prevention programs, risk reduction programs, observational and behavioral based safety programs, among others.

Human Health & Safety Comment 15:

While Micron's ISO 45001 certification is cited repeatedly as proof of strong health and safety practices (ex: 3-256), and it is a widely respected framework, the certification standard is not publicly available, it must be purchased for \$222 USD, preventing workers, community members, and many researchers from understanding what the certification truly entails or what commitments are being made.

Response: ISO is an independent, non-governmental, international standard development organization composed of representatives from approximately 163 national standards bodies of member countries. ISO 45001, and all its publications, are protected by copyright, which are owned by ISO, and therefore cannot be reproduced or otherwise shared publicly by the lead agencies or Micron. Disseminating the certification may constitute copyright infringement.

As discussed in the FEIS, Micron would seek ISO 45001 and 14001 certification, international standards that specify requirements for an occupational health and safety management system, and an environmental management system, respectively. ISO 45001 provides a framework for organizations to manage risks and improve OH&S performance. The certification process involves implementing the management system, undergoing necessary audit and review, then receiving certification, demonstrating Micron's commitment to the underlying health and safety practices in ISO 45001.

Human Health & Safety Comment 16:

The DEIS does not respond or provides incomplete responses to NYSDEC and members of the public during as documented during the SEQRA comment period for requested chemical inventories, mitigation strategies and commitments to avoid harm.

Response: The FEIS sufficiently identifies, to the extent reasonably known, the type of materials that may be used as well as numerous avoidance, minimization, and mitigation measures that will be required of Micron and enforced by the lead agencies. The lead agencies worked closely with the NYSDEC during development of the FEIS. See NYSDEC Comment 13. They also recognize that NYSDEC is concurrently reviewing permit applications submitted by Micron for the Proposed Project.

Human Health & Safety Comment 17:

As per the 10th Amendment to the Constitution, states are responsible for the public health safety and welfare. NY will need to establish strong PFAS sharing relationships with like-minded states and countries.

Response: Comment noted.

Human Health & Safety Comment 18:

Syracuse already has the highest rate of thyroid cancer due to Allied Chemical Dumping in Onondaga Lake. People living near the Micron Plant in Manassas, VA complain of health problems. Another commenter is concerned that the economic boon of the Micron plant could again bring the bust of high health care costs for employees and community residents.

Response: Review of the Manassas, VA plant is outside the scope of this FEIS.

The FEIS acknowledges the potential for indirect and induced impacts associated with the Proposed Project. The FEIS includes an analysis of the impacts of the Proposed Project on community services and infrastructure, including health care systems. See FEIS Section 3.14.

Human Health & Safety Comment 19:

The DEIS must make clear how Micron will implement exposure limits to mitigate reproductive harm to workers. Has the government or regulators on any level given exemption from liability to Micron for damage related to the emissions? PFAS and related compounds can cause fertility and other health issues. If so, what are the details of this exemption?

Response: See Response to Human Health & Safety Comment 1, 4, 10, and 11, as well as Air Quality Comments 7, 13, and 26. Exposure limits are not necessarily the same as mitigation. Regarding a liability exemption, the lead agencies are not aware of one which would necessarily be dependent on many factors outside the scope of the FEIS.

Micron explains risk management measures and worker protection plans that will be implemented to protect exposure of workers to chemicals, including PFAS in the FEIS. See FEIS Section 3.9.3.2; Appendix L-2. Micron will comply with all applicable OSHA regulations.

Potential health effects of PFAS generally were addressed in NIST's "Final Programmatic Environmental Assessment for Modernization and Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program" (2024), available at <https://www.nist.gov/system/files/documents/2024/06/28/Final%20PEA%20for%20Modernization%20and%20Expansion%20of%20Semiconductor%20Fabs%206-28-2024%20-%20OGC-508C.pdf>. The analyses and measures discussed in the FEIS, including new Appendix L-1 and referenced responses to comments, support the absence of significant adverse effects from PFAS due to the Proposed Project, including with respect to health and safety, and do not warrant additional measures.

Human Health & Safety Comment 20:

SEQRA mitigation measures require that Micron's Hazard Communication Program, prepared pursuant to OSHA regulations, shall include an inventory of all PFAS used at the facility and a Safety Data Sheet for each PFAS.

Response: Micron will be required to comply with all applicable OSHA requirements. See Response to Human Health & Safety Comment 1. It will also be required to have a policy to secure full chemical disclosure from all chemical suppliers, including through the use of non-disclosure agreements with these suppliers, to ensure that it has sufficient information to evaluate regulatory compliance and worker safety. See FEIS Appendix L-1.

Human Health & Safety Comment 21:

SEQRA mitigation measures require that Micron shall conduct personal breathing zone air sampling for all detectable PFAS used at the facility. The results of such sampling shall be made available to all facility workers.

Response: SEQRA mitigation measures do not require personal breathing zone sampling. Micron will be required to comply with all applicable OSHA requirements. See also Responses to Human Health & Safety Comments 1, 19, and 20 regarding Micron's worker safety plans and practices.

Human Health & Safety Comment 22:

SEQRA mitigation requires that Micron adopt an Exposure Control Plan to prevent or minimize workplace exposures to PFAS in a manner consistent with the occupational hierarchy of controls.

Response: See Responses to Human Health & Safety Comments 1, 2, 6, 11, 19, and 20.

Human Health & Safety Comment 23:

Commenters questioned whether there are cancer-causing chemicals. Micron should fund local cancer treatment centers for those who will suffer from impacts from the sludge and chemicals. Will Micron be responsible for medical bills for those impacted by hazardous materials. Micron should provide a list of potential health issues that workers or the community would be exposed to. Concerns were raised that the Project will result in increased cancer rate among the community. Human exposure to PFAs is linked to serious health outcomes. Health information from other Micron workers of Micron communities, or communities with similar facilities should be shared.

Response: The FEIS evaluates and discloses the potential environmental effects of the Proposed Project and Connected Actions, not unrelated facilities or locations. Based on the required BMPs and Micron's obligation to comply with all regulatory requirements regarding the storage, use and disposal of hazardous materials and with all applicable OSHA requirements, mitigation is not warranted. See also FEIS Appendix L-1.

Human Health & Safety Comment 24:

Commenter asked in which categories does OSHA place the chemicals used in production of chips in the required safety data sheets.

Response: In the context of OSHA, as referenced in FEIS Section 3.9, an SDS (Safety Data Sheet) is a standardized document containing detailed information about a hazardous chemical, mandated by OSHA's Hazard Communication Standard to ensure workers understand the chemical's properties, hazards, safe handling, storage, and emergency procedures. These documents must be readily accessible to employees during their work shifts and are crucial for workplace safety, compliance, and proper chemical management. Chemical manufacturers are required to complete and provide SDS to downstream customers. Chemicals provided to Micron vary and range in physical and health hazard properties.

Human Health & Safety Comment 25:

Micron should provide robust worker training and safety protocols.

Response: Micron will provide robust worker training and safety protocols. See FEIS Section 3.8.3.2, Operational Effects, Hazardous Materials. For example, the Proposed Project's RMP would incorporate: (1) a hazard assessment detailing the potential effects of any accidental chemical release that could occur at the Micron Campus, with an evaluation of worst-case and alternative accidental release scenarios; (2) a chemical accident prevention program including safety precautions, maintenance and monitoring measures, and employee training; and (3) a chemical accident emergency response program detailing the emergency response procedures Micron would provide for emergency employee care and notify relevant agencies, local first responders, and the public should an accident occur.

Copies of the RMP would be provided to local police, fire, and emergency medical response personnel, and the public to foster local community emergency response planning and public awareness. Micron would be required to update and resubmit the RMP to USEPA every five years with a history of any accidents that occurred in the five years prior and share all updates with local emergency responders. In the event of a reportable chemical accident, Micron would be required to hold a public meeting within 90 days following the accident (40 CFR § 68.210(b)). See also Response to Human Health & Safety Comment 34.

Human Health & Safety Comment 26:

The DEIS does not detail how Micron will protect worker health & safety given the intensive use of toxic chemicals. Micron must adopt detailed plans to minimize negative impacts to workers.

Response: See Responses to Human Health and Safety Comment 1, 4, 19, and 28.

Human Health & Safety Comment 27:

Micron should hire independent health and safety professionals trained in the fabrication processes to monitor the worker health and safety. The independent professional should be allowed to interact with the workers about health and safety protections.

Response: Micron intends to comply with the federal OSHA regulations that require third-party medical monitoring for any worker that interacts with hazardous substances. In addition to chemical exposure limits and protection measures, Micron would implement a comprehensive industrial hygiene (IH) program to control environmental factors or stressors in the workplace that could lead to discomfort, illness, or impaired health. Micron's EHS team would be responsible for verifying the implementation and effectiveness of IH controls, such as worker health monitoring systems. Micron would incorporate all applicable OSHA general industry standards (see FEIS Appendix L-2, Table L-1), including noise protection standards to protect employees from potential hearing damage from prolonged exposure to loud machinery and equipment in the fabs, including cleanroom environments where specialized tools and ventilation systems can generate high noise levels. Micron would install equipment noise reduction features and enclosures around loud equipment, provide hearing protection to employees, and incorporate noise safety protocols as part of workplace monitoring and training programs. FEIS Table 3.9-4 lists additional IH program measures that would be implemented at the Micron Campus.

Human Health & Safety Comment 28:

A business owner directly adjacent to the proposed facility is concerned for the health of those business employees, particularly due to potential exposures to the chemicals used at, disposed or released into the air and water by Micron. These chemicals should be carefully and thoroughly researched. There should be specific information as to how the chemicals will be treated for disposal and in a manner that is proven safe to human health. The commenter provided articles about PFAs and forever chemicals which support the concerns expressed regarding human health.

Response: See Response to Human Health & Safety Comment 27 and Response to Solid Waste and Hazardous Materials Comment 70, for discussion of disposal of waste.

See also responses to Human Health & Safety Comments 1, 2, and 6; FEIS Section 3.8.3.2; FEIS Appendix L-1. Potential health effects of PFAS generally were addressed in NIST's "Final Programmatic Environmental Assessment for Modernization and Expansion of Existing Semiconductor Fabrication Facilities under the CHIPS Incentives Program" (2024), available at <https://www.nist.gov/system/files/documents/2024/06/28/Final%20PEA%20for%20Modernization%20and%20Expansion%20of%20Semiconductor%20Fabs%206-28-2024%20-%20OGC-508C.pdf>.

Human Health & Safety Comment 29:

There must be an alert system in place in case of industrial accidents.

Response: There will be alert systems in place at the facility in case of accident per the referenced OSHA requirements in FEIS Section 3.9 and Micron's policies. See also Response to Community Facilities Comment 18.

Human Health & Safety Comment 30:

Plant workers and residents must be taught how to survive potential spills or accidents.

Response: See Responses to Human Health & Safety Comments 1, 3, and 4. See also Response to Solid Waste and Hazardous Materials Comment 48, for discussion of spill response.

Human Health & Safety Comment 31:

Public schools must be given proper equipment to protect students from potential chemical contamination from the plant.

Response: See Response to Human Health & Safety Comment 34, discussing training for local responders. See also Response to Solid Waste and Hazardous Materials Comment 48, for discussion of spill response.

Human Health & Safety Comment 32:

Healthy food should be sold at the canteen. No unhealthy foods should be sold onsite at the chip plant.

Response: Comment noted.

Human Health & Safety Comment 33:

Micron must prepare, review and update, and adhere to various plans and policies that include a Risk Management Plan or Program that includes a chemical accident prevention program with appropriate safety precautions, employee training, chemical accident emergency response program detailing emergency response procedures that Micron would provide for emergency employee care and notify relevant agencies, local first responders and the public should an accident occur.

Response: See Responses to Solid Waste and Hazardous Materials Comments 4 and 48. See also Response to Air Quality Comment 22; Response to Human Health & Safety Comment 25.

Micron would be required to update and resubmit the RMP to USEPA every five years with a history of any accidents that occurred in the five years prior and share all updates with local emergency responders. In the event of a reportable chemical accident, Micron would be required to hold a public meeting within 90 days following the accident (40 CFR § 68.210(b)).

Human Health & Safety Comment 34:

The Human Health and Safety chapter, when discussing the possibility of accidents, must clarify if this includes traffic accidents during construction of the facility.

Response: The Traffic Impact Study Section 4 (FEIS Appendix M) evaluated traffic related crashes throughout the study area. This includes by year, location, severity, contributing factors and types of collisions. Crash rates in the study area are calculated and compared to statewide averages to identify locations with above-average rates. NYSDOT and FHWA are programmed to implement several planned improvements on the roadway network within the Transportation Evaluation Area by 2027 that will assist in improving safety for motorists and construction vehicles accessing the Micron Campus, and other daily travelers through the area. These are identified in Chapter 6, Table 6-2 Planned Roadway Improvements of the Traffic Impact Study (Appendix M). Additional longer-term improvements were identified within FEIS Section 3.11 that are anticipated to be constructed by 2031, which can include locations identified with crash rates higher than the statewide average. These improvements are anticipated to provide safety benefits to these high crash locations and include re-configured interchanges (such as I-81 and NYS Route 31), providing new interchanges and roadway connections to reduce the intensity of traffic volumes at existing locations, and adding capacity to NYS Route 31, which can lower the risk of head-on and congestion-related collisions. These improvements will assist in reducing the possibility of traffic crashes during construction and operation of the Proposed Project. See also Response to Transportation Comment 16. Use of the Rail Spur Site would also substantially reduce the need for construction-related truck traffic and associated risk of accidents.

Human Health & Safety Comment 35:

Micron does not assess impacts of water pollution from their main campus potentially reaching the childcare center to be built on-site if there is a spill event. The safety of the children of their workers are at risk. Micron has refused to release the chemicals they are using, and a spill event could reach the childcare center.

Response: The Childcare Site is over one-half mile away from the Micron Campus. See FEIS Fig. 2.1-1. It is extremely unlikely that any spill event at the Micron Campus, which would be subject to Micron's joint Spill Pollution Countermeasures & Control (SPCC) Plan, BMPs, and SWPP, would affect the Childcare Site.

Human Health & Safety Comment 36:

Lighting pollution not only impacts wildlife but has also been linked to human health risks.

Response: See FEIS Section 3.13.4.2, discussing the plan for lighting at the Proposed Project.

3.10 Utilities -Energy, Water, Wastewater, Natural Gas

Utilities Comment 1:

General concerns were raised about the amount of energy the Proposed Project will consume and that there is not adequate energy supply. Page 0-11, Section 0.4: Utilities and Infrastructure, must better describe why the significant effects of the Micron facility on the electricity demand are not adverse.

Response: The lead agencies acknowledge the significant energy needs of the Proposed Project. These effects are not adverse because there is already a robust planning process that ensures adequate utility capacity to meet energy demand in New York State. That process, governed by the New York Independent System Operator (NYISO), ensures that there is adequate capacity to meet existing and projected demand so there is not a tradeoff between the Proposed Project and the demand for other users in the community. See also FEIS Section 3.10.4. Further, the Proposed Project's full energy needs will ramp up over time. This allows for the planning process to conduct the necessary system planning to ensure that the grid can meet current and future demands, including substantial new interconnections. See FEIS Section 3.10.1.

As illustrated in Figure 3.10-2 of the FEIS, the NYISO has incorporated Micron's first phase (Fabs 1-2) into its 2030 base case large load projection, identifying it as the largest anticipated new load to interconnect with the state electric grid by that date. The project will primarily draw electricity from local generation facilities in Load Zone C, including Micron's on-site renewable energy systems. See FEIS Section 3.10.3.2. As a result, the Preferred Action Alternative is expected to have a significant impact on electricity and transmission demand in Load Zone C. Specifically, it will lead to a greater and earlier exceedance of the zone's local generation capacity compared to the No Action Alternative.

Given the robustness of statewide and utility-level planning processes, it is anticipated that future electricity needs—both for the Proposed Project and broader statewide growth—will be adequately addressed. Therefore, while the Preferred Action Alternative will have significant effects on electricity demand and transmission, these effects are not expected to be adverse. See FEIS Section 3.10.3.2.

Utilities Comment 2:

Commenters expressed concern that the Project will cause utility rates to rise for consumers. Micron should fund the Town of Clay or Onondaga County energy and water to keep the community from being impacted by lack of supply or increased costs due to the Project.

Response: Although increased utility costs are a financial impact that is outside the scope of NEPA and SEQRA review, the FEIS acknowledges concerns regarding the potential impacts of Micron's energy and water use on affordability and public resources. As detailed in FEIS Section 3.15.3.2, the Connected Actions associated with the Proposed Project are not expected to result in significant adverse effects on ratepayers. Micron will be required to enter into user agreements with OCWA. Onondaga County will establish policy and guidelines for appropriate user rates for the IWWTP

to support Micron's operations in Clay. The IWWTP is not part of the OOWWTP system that provides wastewater service to residential and commercial users. These agreements will ensure that the costs associated with the project are not passed onto Onondaga County ratepayers. In addition, there are Federal and State funding sources for these infrastructure expansions that the utilities may seek to receive. Micron will also be required to pay for gas and electrical upgrades from National Grid. Any increase in rates for National Grid customers would be subject to NYSPSC approval through rate case proceedings.

Micron will directly fund gas and electrical system upgrades through National Grid. New York State law and PSC regulations establish clear safeguards to ensure that the costs associated with serving large new developments are not unfairly shifted to existing utility customers. Under these rules, utilities are required to apply provisions that obligate developers to fund infrastructure beyond standard service allowances. These measures collectively protect current customers from unanticipated rate increases resulting from new development projects. Any potential increase in customer rates resulting from these upgrades would be subject to review and approval by the New York State Public Service Commission (PSC) through formal rate case proceedings and is outside the scope of the FEIS.

Utilities Comment 3:

Commenters expressed concerns about the amount of water usage, including the availability and affordability of clean water for the community. Some commenters compared volumes of current usage, including comparison to the City of Syracuse's daily use and raised concerns that public water will be diverted in favor of the Project.

Response: The Proposed Project's anticipated water usage will not have a significant effect on water usage and capacity. See FEIS Section 3.10.

Much of the water used by Micron will be recycled. Micron will collaborate with OCWA and OCDWEP to establish sources of recycled water to support the industrial water needs of the Proposed Project and reduce overall demand on the water and wastewater systems. Micron will reuse treated industrial effluent as makeup water for the facility's cooling towers and other mechanical systems. See FEIS Section 3.10.3.2 Preferred Action Alternative.

Where recycled water is insufficient, available water supply will be sufficient to accommodate both public and project needs. As detailed in the FEIS, the necessary system modifications and upgrades (see FEIS Section 2.1.7), the required withdrawal permit modifications, and the construction of required supply infrastructure, together with OCWA's and local water management authorities' planning processes, are anticipated to collectively ensure adequate water system capacity to serve the Proposed Project and the increased customer base in 2041.

Utilities Comment 4:

What is the plan for powering the plant, and will renewable energy use be incorporated, such as solar, geothermal and wind. Commenter strongly recommended that the final EIS includes a detailed, site-specific solar energy deployment plan and urges the inclusion of binding commitments to install on-site renewable energy systems that scale with the facility's development phases.

Response: See Response to Utilities Comment 1. NYISO is responsible for managing New York's electricity supply, ensuring the grid remains reliable and stable. The state's electric grid is made up of a unique electricity supply profile that combines power from various sources. NYISO coordinates this mix to meet demand, so all electricity users—including large projects like Micron—receive power through this system. Renewable energy will be provided through grid-supplied sources and will be called upon by the NYISO using established policies and guidelines.

In the short term, the New York Power Authority (NYPA) has awarded Micron a power allocation through the ReCharge NY program to meet the Proposed Project's short-term electricity requirements. The ReCharge NY program provides qualified companies with seven-year contracts for NYPA power in exchange for certain job and economic commitments in New York State. Micron's initial ReCharge NY allocation consists of 140,000 kW (or 1,226 GWh), 50 percent of which is NYPA hydropower.

To the extent feasible, solar arrays will also be installed on rooftops on the Micron Campus. As discussed in FEIS Section 3.7.6 (Best Management Practices and Mitigation Measures, Table 3.7-14), one key strategy is to "install on-site renewable energy systems and on-site battery storage systems to supplement the Proposed Project's energy supply to the extent practicable." To support this commitment, Micron will supplement electricity demand with on-site renewable energy systems, including planned installation of approximately 4 megawatts (MW) of solar panels on the rooftops of parking garages, wastewater treatment (WWT) buildings, and BIO buildings (See Rooftop Solar Energy line item in Table 2.1-3 Micron Campus Components).

Importantly, the fab buildings, which comprise large areas on the Micron Campus, cannot accommodate solar panels due to specifications related to vibration and other operational requirements that preclude installing solar panels on the rooftops.

Micron's stated commitment of installing solar panels on the Micron Campus considers the construction spacing and sequencing, operational needs of the Micron Campus, reduction and avoidance of other environmental impacts related to placing solar panels on site, including impacts to wetlands, and the Town of Clay Zoning Code, which imposes limitations of accessory structures in front of principal buildings. Micron has also reviewed geothermal electricity generation at the WPCP and has determined that this type of generation is not feasible with current existing available technology and site suitability. Micron remains committed to reviewing technological advancements for consideration in this space as technology evolves.

Utilities Comment 5:

Concerns were raised about the unintentional water contamination. Does the massive projected outflow of Lake Ontario water to Micron violate the Great Lakes Compact? A commenter requested a review of the OCWA existing water withdrawal permit by the DEC to ensure that the spirit of the Great Lakes Compact is upheld, considering statements in the DEIS that OCWA's water capacity will be exceeded after construction of fab 2. Commenter believes every effort should be made now to predict and request permissions related to water withdrawals before the project is fully underway.

Response: Micron's water use will be governed by the Great Lakes-St. Lawrence River Basin Water Resources Compact, which New York State enforces through ECL Article 21 Title 10. This compact regulates water withdrawals from Lake Ontario and prohibits diversions outside the Great Lakes Basin, except under strict conditions. Micron's proposed water use remains within the Basin and will be subject to state-level permitting and oversight, ensuring full compliance with the Compact.

OCWA has commenced the process of amending its water withdrawal permit to ensure it complies with NYSDEC regulations, and the Great Lakes Compact. Notice of Complete Application was issued by NYSDEC on July 25, 2025, and Notice was given to the Great Lakes Compact for comment on July 29, 2025.

Concerning consumptive water use, Micron would commit to achieve up to a 75 percent water conservation rate through on-site and off-site water reclamation, recycling, and reuse. See FEIS Section 3.10.3.2 Water Usage and Capacity. In sum, Micron's operations will be subject to comprehensive federal, state, and local regulations designed to protect water resources. These regulations are intended to prevent unintentional spills, ensure that discharges remain within permitted limits, and safeguard both surface and groundwater quality.

Utilities Comment 6:

Commenters expressed concern regarding the energy usage. Other communities that have data or AI centers have raised alarms concerning the negative impacts from the facilities.

Response: See Response to Utilities Comment 1. The Proposed Project is neither a data center nor an AI center. However, as with Micron's energy needs, the NYISO interconnection and planning process will ensure that the grid can meet current and future demands across New York. See FEIS Section 3.10.3.2 Preferred Action Alternative under Electricity Consumption and Capacity.

Utilities Comment 7:

The area currently exports its electricity. The project will cause the area to be a net importer of power.

Response: The FEIS acknowledges this likelihood that Zone C is likely to become a net importer of electricity. The NYISO, the entity responsible for managing New York's electricity supply, will

ensure that the grid remains reliable and stable, notwithstanding the implementation of the Proposed Project. See Response to Utilities Comment 1

Utilities Comment 8:

Commenters expressed concern that there is not adequate energy supply, and it will impact the community. An independent, third-party professional should provide an assessment of current and potential future renewable sources of energy that are available. A report should be made to NYSERDA.

Response: See Responses to Utilities Comments 1 and 7. NYISO is an independent, third-party entity. It is not affiliated with any state or federal agency or energy company. NYISO is led by an independent Board of Directors, and its federally approved tariffs contain strict requirements preventing its Board of Directors and employees from having any financial relationship with any of the companies that participate in the wholesale energy markets.

Utilities Comment 9:

The Proposed Project will use an excessive amount of energy and as much natural gas as 107,000 typical NY households.

Response: See Responses to Utilities Comments 1, 6 and 7. The Proposed Project's electric and natural gas needs are not excessive but rather required for operations. While the project will use a significant amount of energy, this can be accommodated through the existing infrastructure and the planning process.

Concerning natural gas capacity, the Proposed Project, at full build-out in 2041, when conservatively compared to the 2024-2025 base case, would account for approximately two percent of National Grid's existing Upstate New York service area capacity and leave approximately 22 percent spare capacity on top of the demand from the Proposed Project and the existing customer base. Although the actual figure in 2041 could change based on growth in the region throughout the Proposed Project's incremental 16-year construction period, National Grid's Long-Term Plan Upstate Upgrade initiative already accounts for additional anticipated capacity needs from the Proposed Project based on National Grid's conservative future reference case for gas demand in Upstate New York. Under the Preferred Action Alternative, National Grid and Micron would engage in cooperative long-term planning to accommodate the Proposed Project's increasing gas demand and anticipated growth in Upstate New York, including in the five-county region, and including induced growth as a result of the Proposed Project. This cooperative planning would include additional natural gas delivery contracting and system infrastructure installation and upgrades to ensure that the region's natural gas needs would continue to be more than adequately met. Micron also would commit to minimizing natural gas usage at Proposed Project facilities. See FEIS Section 3.10.3.2 (Preferred Action Alternative, section on Natural Gas Consumption and Capacity).

Utilities Comment 10:

The Project should result in connection to a new sewer system for riverfront/waterfront properties along Henery Clay Boulevard.

Response: This is not a connected action as part of the Proposed Project. This will require long term community planning under a separate SEQRA process, including coordination with SOCPA, Town of Clay, OCHD, OCDWEP and NYSDEC.

Utilities Comment 11:

The DEIS does not address how the Project is in compliance with the requirements of the Great Lakes Water Quality Agreement.

Response: See Response to Utilities Comment 5. Compliance with the Great Lakes Water Quality Act (GLWQA) will be addressed in the permitting process. See FEIS Section 3.10, Utilities and Supporting Infrastructure, under the section Water Usage and Capacity.

Utilities Comment 12:

Concern was raised that the Project's electricity usage relies on the three nuclear sites that are about to be decommissioned.

Response: There are no nuclear sites about to be decommissioned in NYISO Zone C. According to the Nuclear Regulatory Commission (NRC) website (<https://www.nrc.gov/info-finder/region-state/new-york>), the three nuclear facilities located within Load Zone C, Nine Mile Point Nuclear Station Unit 1 and Unit 2 and the James A. FitzPatrick Nuclear Power Plant, are currently in operation and not are identified on the list of facilities undergoing decommissioning.

See also Response to Utilities Comment 1. NYISO is responsible for managing New York's electricity supply, ensuring the grid remains reliable and stable and dispatching electricity in accordance with its established practices. The state's electric grid is made up of a unique electricity supply profile that combines power from various sources. NYISO coordinates this mix to meet demand, so all electricity users—including large projects like Micron—receive power through this system. Micron has been awarded a power allocation through the ReCharge NY program and has sufficient power to meet the Proposed Project's short-term electricity requirements during construction and interconnection of Fabs 1 and 2. See FEIS Section 3.10.3.2. Micron is actively working with power providers to ensure adequate long-term supply.

Utilities Comment 13:

Who is covering the cost of the water pipeline from Lake Ontario for the Project?

Response: Micron will enter agreements with OCWA to ensure that the Proposed Project's utility usage is paid by Micron, not by current customers. In addition, there are Federal, State, and local

funding sources for these infrastructure expansions that the utilities may seek to receive. See DEIS Section 3.15.3.2, Connected Actions.

Utilities Comment 14:

A commenter requested a breakdown of the day-to-day electric usage of the Project, including the water treatment plant.

Response: The request is beyond the level of detail required in a FEIS. As stated in FEIS Section 3.10.3.2 (Preferred Action Alternative, Section Electricity Consumption and Capacity), the Proposed Project has been designed to minimize electricity demand to the greatest extent practicable. Utility usage will vary over the life of the Proposed Project and as additional fabs are constructed and become operational.

Utilities Comment 15:

General concerns were raised that ratepayers and tax dollars should not be used for infrastructure upgrades because Micron has the resources to address the issue.

Response: See Response to Utilities Comment 2.

Utilities Comment 16:

A commenter expressed concern over National Grid's plan to install smart metering and the potential for accidental or intentional actors turning off power and what impacts that could have on the local grid.

Response: National Grid is implementing its smart meter (Advanced Metering Infrastructure, or AMI) program throughout its Upstate New York service area to replace the Company's aged metering assets and provide greater capability and functionality for the Company and its customers. The PSC authorized National Grid to implement the AMI program in 2020, and the program is unrelated to the Micron project. Micron would not be exposed to accidental or intentional actors turning off power to the grid via the AMI solution as multiple safeguards prevent unauthorized or excessive disconnections.

In addition, only the Company's single-phase meters up to 240V (typically used for residential and smaller commercial services) support remote disconnect functionality. More information on National Grid's smart meter program, including reliability and data security, is available at this link: [Smart Meters | National Grid](#).

Utilities Comment 17:

A commenter expressed concern that National Grid is not increasing distribution capacity or generation capacity despite the amount of energy the Proposed Project will use.

Response: The Proposed Project is on the transmission system and not the distribution system. National Grid does have plans to increase the capacity of the distribution system in the area through

projects other than the expansion of Clay substation. Regarding generation, the NYISO maintains the electricity market and is responsible for resource adequacy on the transmission system. See Response to Utilities Comment 1. The Micron project will increase electric system demand and require some generation units to run more in the future than they do now. The NYISO also has acknowledged the need for additional electric generation to meet greater demand due to increasing electrification of building heat and transportation.

National Grid and NYISO are addressing regional energy needs, with the Micron project included in their planning. As shown in EIS Figure 3.10-2, NYISO's base case large load projection for 2030 includes the first phase of the Proposed Project (Fabs 1–2) as the largest of several anticipated large loads expected to interconnect with the state electric grid. The Proposed Project would primarily draw power from local generation facilities in Load Zone C.

With upgrades to grid infrastructure the responsibility of the utility provider, not the end user, National Grid has proposed several improvements to support the Project and community. As detailed in FEIS Section 3.10, these include expanding the existing Clay Substation, constructing new 345kV electric transmission lines and eight new underground duct banks to connect to the Micron Campus, expanding an existing gas regulator station (GRS), and constructing a new natural gas distribution line from the GRS to the Micron Campus. For Fab 2, National Grid is also in the preliminary phases of siting a new substation in Lysander.

Further, as noted in FEIS Section 3.7.5 Growth Inducing Effects associated with electricity, “Several grid resiliency projects are underway across New York State (see Section 3.10, Utilities and Infrastructure), including National Grid’s Upstate Upgrade (expected to be complete in 2030), which focuses on improving the integration of locally generated renewable energy like solar and wind. This project will enhance the reliability of energy delivery to the region. Similarly, Avangrid’s LineVision introduces real-time monitoring technology for transmission lines, allowing the grid to reliably carry more renewable energy. These efforts are essential for supporting State and regional energy needs, ensuring that future growth, including the induced growth from the Proposed Project, benefits from a more resilient and sustainable grid powered by increasing renewable energy generation with zero GHG emissions. As a result, the induced growth associated with the Proposed Project is not anticipated to have a significant impact on the resiliency of the electrical grid to climate change.”

Utilities Comment 18:

The cost of infrastructure upgrades and increased energy demand should not be borne by the ratepayers. The FEIS must clearly state who will pay for upgrades to infrastructure and utilities and whether the cost of utility tax abatements to Micron will be borne by ratepayers.

Response: See Response to Utilities Comment 2; FEIS Section 3.15.3.2.

New York State law and PSC regulations establish clear safeguards to ensure that the costs associated with serving large new developments are not unfairly shifted to existing utility customers. Under these rules, utilities are required to apply provisions that obligate developers to fund infrastructure beyond standard service allowances. These measures are intended to protect

current customers from unanticipated rate increases resulting from new development projects. As such, Micron is responsible for the vast majority of the capital costs for the electrical service upgrades needed for the Proposed Project. In addition to funding the capital costs associated with the service upgrades, Micron will be a ratepayer subject to National Grid's rates and will pay for the electrical services it consumes. Moreover, the PSC does not allow utilities to provide service at rates that fail to recover the utility's incremental cost of providing such service plus a reasonable contribution to utility overhead.

Utilities Comment 19:

The DEIS fails to address the importance or potential of demand flexibility in avoiding significant spikes in fossil fuel demand.

Response: See Response to Utilities Comment 1. Demand flexibility is outside the scope of the FEIS. While certain consumers can adjust their energy consumption in response to changes in the grid's supply and demand, the Micron Campus operations would need to operate 24/7.

Utilities Comment 20:

Micron is only proposing to expand transmission to the Micron facility and is not proposing to support transmission expansion in the state, which is contrary to the CLCPA.

Response: See Response to Utilities Comment 17; Response to Climate Change/GHG Comment 14. The comment suggests activities that are beyond the scope of the Proposed Project and not required by the CLCPA.

Utilities Comment 21:

The Proposed Project will cause more frequent power outages.

Response: The Proposed Project is not anticipated to cause more frequent power outages. The Proposed Project is designed such that an issue on one of the 345kV cables serving the project or on customer electrical equipment will not propagate to the rest of the transmission system. The station and cable design provides for an adequate number of circuit breakers and relays to limit any sustained impacts to the directly affected equipment. Any additional outage exposure would be *de minimis*.

NYISO coordinates the state's unique electricity supply profile that combines power from various sources to meet demand for all electricity users—including large projects like the Proposed Project.

As noted in FEIS Section 3.7.5, Growth Inducing Effects associated with electricity, “[s]everal grid resiliency projects are underway across New York State (see Section 3.10, Utilities and Infrastructure), including National Grid's Upstate Upgrade (expected to be complete in 2030), which focuses on improving the integration of locally generated renewable energy like solar and wind. These grid projects will enhance the reliability of energy delivery to the region. Similarly,

Avangrid's LineVision introduces real-time monitoring technology for transmission lines, allowing the grid to reliably carry more renewable energy. These efforts are essential for supporting state and regional energy needs, ensuring that future growth, including the induced growth from the Proposed Project, benefits from a more resilient and sustainable grid powered by increasing renewable energy generation with zero GHG emissions. As a result, the induced growth associated with the Proposed Project is not anticipated to have a significant impact on the resiliency of the electrical grid to climate change."

Utilities Comment 22:

Include information on whether Micron plans to have their own water tank/tower for fire demand and equalization of usage to minimize impacts to other water users.

Response: Micron would be required to work with the Town of Clay Town Board and the Planning Board to ensure that the Proposed Project design complies with the Town of Clay Zoning Code and all applicable building and fire codes. Code requirements include but are not limited to, proper fire engine access and maneuverability, and may incorporate any measures to address any fire access or fire-related concerns. FEIS Section 3.14.3.2, Operational Effects; see also FEIS Table 3.9-2; 19 NYCRR Part 1219 *et seq.*

Water for fire demand is provided by OCWA, which manages and plans the water supply system. Storage for fire flow and other customer demands are provided for in the water supply system. See FEIS Section 3.10.2.3 (Water Supply) ("OCWA also maintains 63 water storage facilities with a total volume of more than 170 million gallons to provide additional capacity during times of peak demand or system maintenance (OCWA, 2024b)."). As further stated in FEIS Section 4.3.10.3 (Water), "the impact analysis for water in Section 3.10 (Utilities and Supporting Infrastructure) is based on regional planning efforts that already account for past, present, and anticipated future development and growth demand, including the residential, commercial, and mixed-use developments identified in Table 4.2-1." See also Response to Utilities Comment 23.

Utilities Comment 23:

A commenter expressed concern that the region is already ill-equipped to deal with repairs needed to public utilities. During any repairs, residents may go without water and sewer as it will be diverted to keep Micron running.

Response: Utilities maintain adequate staff and have adequate resources to address maintenance and repair to their respective systems. In addition, utilities, including water supply and energy providers, are mandated by NYS to develop preparedness and response plans in the event of emergencies, which include procedures for dealing with operational outages. FEIS Section 3.10 analyzes the existing utilities infrastructure and capacities. There will be no need to divert or prioritize service to Micron and away from residents. Further, the available water supply and sanitary wastewater system capacity will be sufficient to accommodate both public and project needs, including during planned maintenance and emergency repair.

Regarding the water supply capacity, see the discussion in FEIS Section 3.10, Utilities and Supporting Infrastructure, and FEIS Section 3.10.3.2, Water Usage and Capacity. For discussion related to sanitary wastewater capacity and planning, see FEIS Section 3.10.3.2.

Utilities Comment 24:

A commenter expressed concern that the Proposed Project will result in power outages that may result in interruption to the natural gas service because some compressor stations are electric and the grid-tied solar systems without backup power will not work.

Response: See Response to Utilities Comment 1 and 21. Both NYISO and National Grid conduct reliability analyses of the transmission system in accordance with standards, rules, and requirements of the Federal Energy Regulatory Commission, North American Electric Reliability Corporation (NERC), Northeast Power Coordinating Council, Inc. (NPCC), and New York State Reliability Council, LLC (NYSRC). All NERC standards, NPCC Directories, and NYSRC Reliability Rules are available through their respective websites. National Grid also analyzes the system in accordance with its own Planning Guidelines (TGP-28), which are publicly available from National Grid's OASIS (<https://www.nationalgridus.com/Oasis/Filings-and-Studies>).

As discussed in FEIS Section 3.10.3.2, the Proposed Project was studied under NYISO's System Impact Study process, and the transmission system performed within requirements when limited transmission system upgrades were added to the models. The Proposed Project's scope provides for the customer to interconnect to National Grid's transmission substation, and given the design of the connection, reliability for customers in the area, including natural gas compressor stations, is not expected to be adversely affected by the Proposed Project.

Utilities Comment 25:

General comments were raised about the relocation of the Oak Orchard solar array.

Response: Future sites for the relocated solar panels will be determined. Although construction of the IWWTP would necessitate the removal of existing solar panel arrays located on an existing WWTP lagoon on the Oak Orchard site, OCDWEP would work with the solar company that is currently leasing the space at Oak Orchard to identify locations for potential relocation of the solar facility at other County properties. See FEIS Section 2.1.8.3.

Utilities Comment 26:

The DEIS does not make clear what operations require natural gas for the Proposed Project.

Response: The use of natural gas in operations is described in FEIS Section 3.7.3.2, Manufacturing Operations.

Utilities Comment 27:

Micron initially projected discharging 4 million gallons of wastewater per day, which was later revised to 8-20 million gallons/day. What factors contributed to this significant increase, and what further details can be provided on the anticipated volume and composition of the discharge?

Response: While the 2021 Supplemental Generic Environmental Impact Statement (SGEIS) and Findings Statement for the WPCP site provided an estimate of the sanitary wastewater discharge from potential development at the WPCP, that was a generic review of potential impacts from businesses OCIDA sought to attract to the site. Based on the specifics of the Proposed Project, OCIDA determined that a full EIS was warranted under SEQRA. As such, this is not an “increase” in wastewater discharge; rather, it is an analysis of the potential impacts to resource areas from the Proposed Project and Connected Actions. See also Response to Purpose and Need Comment 1 (discussing the need for a 4-fab facility).

With respect to the volume of wastewater discharges, as discussed in FEIS Section 3.10.3.2, Wastewater Treatment and Discharge Capacity, the Proposed Project would involve the discharge of two different types of wastewater streams: sanitary wastewater and industrial wastewater. The Proposed Project would result in the discharge of approximately 2.6 MGD of sanitary wastewater at full build-out in 2041 for treatment at the OOWWTP. Treatment of this sanitary wastewater would be within the OOWWTP’s current maximum month-rated treatment capacity of 10 MGD and within the planned Major Upgrade Project capacity of up to 25 MGD by 2041. The planned Municipal Sewer Expansion would further support the system’s sanitary sewage capacity.

FEIS Table 3.10-4 provides the estimated Proposed Project annual industrial wastewater discharge, demonstrating varying amounts of wastewater treated per day based on the Proposed Project’s buildout phasing. For discussion of the composition of wastewater and the on-site reclaim and reuse process, see Responses to Solid Waste and Hazardous Materials Comments 9 and 74, respectively.

Utilities Comment 28:

The Proposed Project would increase New York’s electricity demand by 10%. This level of demand is environmentally unsustainable, particularly in light of New York’s Climate targets under the Climate Leadership and Community Protection Act (CLCPA).

Response: While the Proposed Project is being assessed for compliance with Section 7(2) of the CLCPA by NYSDEC (see Appendix J-2), the comment raises a broader issue regarding New York’s ability to meet its GHG emission reductions as detailed in the CLCPA which is outside the scope of this project specific FEIS. See also Response to Utilities Comment 1.

Utilities Comment 29:

The DEIS does not specifically state if discharging to the Oneida River will directly impact intake for surrounding municipal water treatment facilities and who's drinking water is at risk should their treatment plan fail.

Response: See Responses to Water Resources Comments 24, 40, 47, 48 and 52.

Utilities Comment 30:

The scale of the Proposed Project would add electricity loads amounting to more than 10% of current statewide consumption. Typically, electricity demand in Zone C is the third- or fourth greatest in NYISO, but the addition of the Micron facility could elevate it to the second largest. The DEIS fundamentally misrepresents impacts on Load Zone C, and suggests that the Proposed Project can exhaust all of the net generation capacity from Load Zone C that is currently supporting electricity reliability statewide for the operations of the Micron Plant and it assumes that doing so would only impose an impact on the grid once the Micron Plant's electricity consumption exceeds net generations in the zone.

Response: See Response to Utilities Comment 1.

Utilities Comment 31:

A commenter stated that the substantial enlargement of the substation that National Grid and Micron are now planning is evidence that the existing transmission infrastructure is insufficient to accommodate the plant's loads.

Response: The planned expansion of the National Grid substation is part of the Proposed Project. It demonstrates that the established planning processes for electrical supply and transmission works and the Proposed Project's energy needs will be met on a going forward basis without significant adverse impacts.

Utilities Comment 32:

A commenter stated that the Proposed Project may result in the Syracuse area being designated as a load pocket by NYISO, and even if not, NYISO may decide to institute new capacity zones or other market mechanisms in an effort to drive investment in transmission and generation capacity into the area.

Response: See Responses to Utilities Comment 1 and 30. As discussed, NYISO is responsible for managing New York's electricity supply, ensuring the grid remains reliable and stable. The state's electric grid is made up of a unique electricity supply profile that combines power from various sources. NYISO coordinates this mix to meet demand, so all electricity users—including large projects like the Proposed Project, which already is included in National Grid's future planning efforts—receive power through this system. NYISO's future planning efforts, including new capacity zones, are governed by the NYISO and outside the scope of the FEIS.

Utilities Comment 33:

The DEIS does not include reasonably foreseeable factors that could exacerbate impacts on the grid, including unplanned retirements of existing generation sources in Zone C, such as the Nine Mile Point unit 1 (621 MW), Nine Mile Point unit 2 (1,311 MW), and James A. FitzPatrick (838 MW).

Response: See Response to Utilities Comment 12. The comment proposes circumstances that are currently speculative. FEIS Section 3.10.1 states how NYISO administers a Comprehensive System Planning Process to conduct long-term planning for additional energy generation and reliability in the State, which operates on an interconnected electricity grid, and to ensure the grid can meet current and future demands, including substantial new interconnections. NYISO is responsible for managing New York's electricity supply, ensuring the grid remains reliable and stable. The state's electric grid is made up of a unique electricity supply profile that combines power from various sources. NYISO coordinates this mix to meet demand, so all electricity users—including large projects like Micron—receive power through this system. NYISO base case large load projection for 2030 includes the first phase of the Proposed Project (Fabs 1–2). See FEIS Figure 3.10-2. The Proposed Project would primarily draw power from local generation facilities in Load Zone C because the Proposed Project is located in Load Zone C.

Further, National Grid has proposed several improvements to support the Proposed Project, including expanding the existing Clay Substation, constructing new 345kV electric transmission lines and eight new underground duct banks to connect to the Micron Campus, expanding an existing gas regulator station (GRS), and constructing a new natural gas distribution line from the GRS to the Micron Campus.

Utilities Comment 34:

If Onondaga County cannot competently build and operate a facility to process ordinary wastewater into sludge, how can we trust it to build a pretreatment facility that will eliminate PFAS and other harmful chemicals.

Response: The comment raises issues that are outside the scope of environmental review. The IWWTP will be subject to a SPDES permit issued by NYSDEC, which will monitor compliance.

Utilities Comment 35:

Lead agencies should ensure that benefits from the Proposed Project go to expansion of broadband access to underserved communities.

Response: Broadband access is the jurisdiction of the NYSPSC.

Utilities Comment 36:

The DEIS does not include enough detail on the proposed design, operation, or oversight of the temporary wastewater treatment plant.

Response: Micron will not construct a “temporary water treatment facility.” Instead, wastewater treatment will be implemented in stages, one of which is to construct pre-treatment facilities for industrial wastewater on the Micron Campus.

Utilities Comment 37:

Section 3.2.3.2 does not include two 15-million-gallon storage tanks planned at the OCWA facility.

Response: Construction of two 15-million-gallon storage tanks at the OCWA Terminal Site in Clay as part of its proposed Phase 2 improvements is addressed in FEIS Section 2.1.7.3, Table 2.1-7.

Utilities Comment 38:

The DEIS does not mention the pretreatment permit for the Micron facility (issued) by Onondaga County. It should be included in table 3.2-6.

Response: The correct table reference is Table 3.3-2 Permits and Approvals. OCDWEP will issue Micron an industrial wastewater discharge permit (IWDP) which will require Micron to meet certain discharge limits. This permitting action is covered by Table 1.4-1, Permits, Approvals, and Consultations, which states that the Proposed Project will require Micron to obtain a “[w]aste discharge permit to connect to or discharge into the County sewer system (Onondaga County Administrative Code Article XXII, Section 22, et seq.; Appendix 11-A, Sections 1153 g, j, 11.67, 11.68, 11.79).” Compliance with the IWDP effluent limits will require pretreatment by Micron at the Micron Campus prior to the permitted IWDP effluent discharge monitoring location(s).

Utilities Comment 39:

Figure 3.10-4 and the related text is unclear as to what pretreatment will occur at the facility versus what treatment will occur at the Oak Orchard facility.

Response: Figure 3.10-4 is a simplified block flow diagram, rather than a specific process flow diagram. Specific pretreatment will be defined in the permitting process. See Response to Water Resources Comment 37; see also Responses to Solid Waste and Hazardous Materials Comments 79 and 86.

Utilities Comment 40:

Micron should partner with NYPA to have it build enough publicly owned renewable energy to power their operations, and if used heat pumps and thermal energy networks to heat the building instead of gas.

Response: Micron cannot direct the development of publicly owned renewable energy (see Responses to Utilities Comments 1 and 8). FEIS Table 3.10-2 shows the Proposed Project's gradually increasing natural gas consumption per phase. Section 3.10.3.2, Natural Gas Consumption and Capacity, notes that actual consumption would likely be lower when substitutable energy sources become available to replace natural gas in operations, as Micron would commit to minimizing natural gas usage at Proposed Project facilities. See FEIS Section 3.7 (Greenhouse Gas Emissions, Climate Change, and Climate Resiliency); Table 3.10-5.

Utilities Comment 41:

A commenter expressed concern about the amount of water that the project will withdraw. Other commenters asked about the amount of water withdrawals needed and the purpose of same.

Response: See Response to Utilities Comment 3. FEIS Table 3.10-3 shows the Proposed Project's increasing freshwater usage and remaining spare capacity in the OCWA system per phase. As stated in FEIS Section 3.3.4.2, Preferred Action Alternative "Operation of the Proposed Project would rely on water supplies from OCWA, which obtains water from surface water sources." The 48 MGD that would be required for the full build-out of the Proposed Project would be sourced from Lake Ontario through the LOWTP, which currently has a practical sustained output of approximately 54 MGD, a maximum capacity of 60 MGD, and a permitted water withdrawal limit of up to 62.5 MGD. OCWA's existing infrastructure could accommodate the freshwater demand exclusively from Fabs 1 and 2 with minor upgrades. However, to accommodate the freshwater demand beyond Fabs 1 and 2 and induced growth, OCWA would need to obtain a modification to its withdrawal permit. Water withdrawals are considered as part of NYSDEC Water Withdrawal permitting and that process was initiated July 25, 2025.

The semiconductor manufacturing process requires a large quantity of fresh water, particularly ultra-pure water (UPW) for production. UPW is essential for cleaning, rinsing, and chemical dilution throughout the manufacturing process. Water is also essential for cooling sensitive manufacturing tools and supporting fab operations, including humidification, air scrubbing, and cooling towers. In addition, water is needed for general facility uses such as fire suppression, employee safety, and wastewater treatment systems.

Under the Preferred Action Alternative, Micron would commit to achieve up to a 75 percent water conservation rate through on-site and off-site water reclamation, recycling, and reuse. Micron also is working with OCDWEP to develop additional methods for off-site water reuse, including evaluating two sources of recycled water to further reduce the Proposed Project's anticipated demand for freshwater supply from OCWA (see additional details in FEIS Section 3.10.3.2, Wastewater Treatment and Discharge Capacity).

See also Response to Utilities Comment 42.

Utilities Comment 42:

A commenter stated that the DEIS does not evaluate the potential impact of higher water withdrawals from Lake Ontario or the near-shore ecosystem where water will be drawn.

Response: Potential impacts from water withdrawals will be considered as part of OCWA's NYSDEC Water Withdrawal permitting, which process was initiated on July 25, 2025. The magnitude of the proposed withdrawal increase is de minimis relative to a waterbody as large as Lake Ontario and is not anticipated to have any effect. See also Response to Utilities Comment 43.

Utilities Comment 43:

A commenter stated that the DEIS should assess general trends in water demand in the area and overall water demands on Lake Ontario in addition to project-induced growth effects.

Response: As discussed in FEIS Section 3.10.3.2, the effects of the Proposed Project on water usage and capacity must be considered in the context of OCWA's longer-term planning. Local water management authorities in the five-county region, including for example OCWA, maintain plans for future growth that incorporate and subsume projections for induced growth associated with the Proposed Project. See FEIS Section 3.10.3.2, Water Usage and Capacity. As explained in FEIS Section 3.10.3.2, Wastewater Treatment and Discharge Capacity, Lake Ontario is a massive waterbody that ensures continued availability of freshwater for withdrawal and use, almost all of which will be returned to Lake Ontario. The impact of increased withdrawal for the project and the OCWA service area as a whole (based on the REMI Study population projections) are presented and considered as part of the NYSDEC Water Withdrawal permitting process which was initiated on July 25, 2025.

Utilities Comment 44:

Commenter requested a review of the OCWA existing water withdrawal permit by the DEC to ensure that the spirit of the Great Lakes Compact is upheld, considering statements in the DEIS that OCWA's water capacity will be exceeded after construction of fab 2. Commenter believes every effort should be made now to predict and request permissions related to water withdrawals, before the project is fully underway. No mention is made in the DEIS of the loss of water to consumptive use – potentially millions of gallons.

Response: See Response to Utilities Comment 5.

Utilities Comment 45:

Concern was raised that the infrastructure expansion required to support induced growth is not discussed in the DEIS.

Response: FEIS Section 3.10.3.2 provides discussion of the effects of induced growth from the Proposed Project and expansion of utility infrastructures for the region. See also Responses to Utilities Comments 1 and 17. Anything further or more detailed would be speculative at this point.

The OOWWTP service area will require upgrades and expansion outside of the Proposed Project and therefore is not a connected action. Environmental impacts are covered under a separate SEQRA process. An analysis of potential residential and commercial growth in the Oak Orchard sewershed was performed to identify future treatment requirements to include increased capacity in addition to current planned upgrades. The OOWWTP upgrades will provide additional capacity to also accommodate the additional projected growth in the sewershed.

3.11 Transportation**Transportation Comment 1:**

A Commenter indicated that the traffic modeling lacks granularity, and failed to incorporate cumulative impacts from induced growth, school bus patterns and associated traffic, etc. Commenter also suggested that supplemental review should include multi-modal transportation impacts, identify specific upgrades required, and analyze long-term regional congestion patterns during phased build-out.

Response: FEIS Section 3.11 summarizes the findings of the Traffic Impact Study (TIS), which evaluates how transportation systems will be affected by Micron's Proposed Project. The study considers both current traffic patterns and how future growth, including the expansion of the Micron facility, will influence travel in the area. It assesses impacts on roads, transit, and related infrastructure, ensuring that recommended mitigation strategies address both immediate and long-term changes. The analysis in the TIS included a two-hour AM and two-hour PM Visum model, which utilized inputs from the Syracuse Metropolitan Transportation Councils (SMTCC) regional model. Forecasted traffic volumes take into account background growth and trips generated by the planned developments, roadway projects in the area, and anticipated traffic from the Micron site (Chapter 6 of the Traffic Impact Study in supplemental documentation, Appendix M). The outputs from the Visum model were used to perform micro level analysis using Vissim and Synchro software. The roadway network included approximately 70 intersections plus freeway segments in Cicero, Clay, Brewerton and North Syracuse. The years selected for analyses were 2027, 2031, and 2041, as these represent the periods when the combined number of construction and operations employee trips to the Micron Campus will be at their highest. During each of the analysis years, the impacted intersections and freeway segments were analyzed to determine regional congestion and the impact to the study locations.

From a multi-modal standpoint, Centro will provide transit services to the site by adjusting and creating new routes. See FEIS Section 3.11.3.6. This includes Centro's plans to evaluate the need

and provide additional transit services from downtown Syracuse to the Micron Campus, including an express bus route connecting Centro's Transit Hub to the Micron Campus, as well as extending an existing bus route to the Micron Campus along U.S. Route 11. See FEIS Section 3.1.3.6. As stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the site begin their intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses. In addition, FEIS Section 3.11.4.4 identifies pedestrian and bicycle improvements including the provision of shared-use paths and sidewalks along NYS Route 31 and US Route 11, connecting paths and sidewalks along existing corridors, and the provision of crosswalks and other safety improvements at intersections and interchanges.

Transportation Comment 2:

A question was raised about whether Project sponsors have coordinated regarding all the projects on Interstate Highway 81.

Response: The Proposed Project's impacts on I-81 in relation to the program of projects along the I-81 corridor have been taken into consideration in the TIS. As stated in FEIS Appendix M, traffic volumes reflect background growth and trips generated by the planned developments discussed in Section 5.2. The traffic analysis established a baseline to compare I-81 freeway operations through speed data and volumes against the Proposed Project's impact to this facility. See Appendix M Table 5.2 and Table 5-4. As summarized in Appendix M Section 6.1.2, the changes to the roadway network from the I-81 Project are included in the model to reflect changes in geometry and operations within the Transportation Evaluation Area. NYSDOT has been actively engaged in the development of this FEIS to ensure thorough coordination with the ongoing I-81 project.

Transportation Comment 3:

General comments were made that the Project will increase congestion on roadways and obstruct current traffic patterns. Concerns were raised regarding a transportation plan for workers.

Response: FEIS Section 3.11 presents a detailed analysis of traffic conditions in the No Build Alternative, where the WPCP would remain in its current condition, and the Preferred Action Alternative, with the proposed Micron Campus, but no improvements implemented to identify the significant impacts (the definition of what constitutes a significant impact can be found in Table 3.11-4 Significant Impacts Criteria). As detailed in FEIS Section 3.11, several freeway segments and intersections would be significantly impacted by the Preferred Action Alternative without mitigation. Accordingly, the FEIS recommends traffic improvements designed to mitigate the potential impacts of the Proposed Project, including those impacts cited in the comment. The report then analyzed and identified recommended mitigation scenarios that would alleviate these significant impacts. These mitigation scenarios included the widening of NYS Route 31 and a section of US Route 11, upgrades at the NYS Route 31 interchanges with NYS Route 481 and I-81, a new interchange along NYS Route 481 and a road parallel to Caughdenoy Road, a new interchange at I-81 and Sneller Road, and intersection improvements throughout the Project area such as additional turn lanes.

In addition to vehicular traffic, the FEIS identifies transit (Section 3.11.3.6) and multi-modal (Section 3.11.4.4) improvements within the study area. Centro is planning to evaluate the need and to provide additional transit services from downtown Syracuse to the Micron Campus. This includes an express bus route connecting Centro's Transit Hub to the Micron Campus as well as extending an existing bus route to Micron Campus along US Route 11. As stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the Micron site begin, their intent is to provide transportation services bringing individuals to Micron and surrounding businesses. Micron is also planning on operating a shuttle service for construction workers running approximately 30 shuttle trips during peak hours to reduce the amount of vehicle trips to the Micron Campus. Regarding multi-modal improvements, the FEIS identifies the provision of shared-use paths and sidewalks along NYS Route 31 and US Route 11 as well as connecting paths and sidewalks along existing corridors.

Transportation Comment 4:

The planned traffic patterns are concerning. Caughdenoy Road between Maple Road and Route 31 is not adequate to handle heavy traffic and commercial trucks- there is no shoulder, drainage ditches are only 5 ft. off the road, as there are many housing developments, it is used by people for jogging, biking, scooters. Most traffic will exit at Caughdenoy Road from Route 481. Traffic should be encouraged to use Route 31 or Henry Clay Boulevard.

Response: In addition to Caughdenoy Road, multiple routes exist for vehicles and trucks to access the site including US Route 11, the NYS Route 31 and I-81 interchange, and the NYS Route 31 and NYS Route 481 interchange to help disperse the traffic away from Caughdenoy Road. In addition, NYSDOT and FHWA plan to implement several initial traffic improvements by 2027, as detailed in Chapter 6 of the TIS (Appendix M). These measures are designed to enhance traffic flow in the area and will lay the foundation for further upgrades and mitigation strategies.

By 2031, NYSDOT is anticipating the completion of more significant improvements including a parallel road (New Access Road) to Caughdenoy Road and a new interchange at NYS Route 481 for this parallel road. This will provide a direct access between NYS Route 481 and the Micron facility, which will reduce traffic using Caughdenoy Rd. Caughdenoy Road north of NYS Route 31 is also planned to be converted to a cul-de-sac, which will make the New Access Road a more direct route from NYS Route 481 compared to using Caughdenoy Road.

Transportation Comment 5:

Several commenters concluded the DEIS adequately addressed transportation, noting funding from the Green CHIPS Community Investment Fund will improve public transit and infrastructure.

Response: Comment noted.

Transportation Comment 6:

A comment indicated that the DEIS does not address traffic congestion at East Genesee and Linden [sic (Lyndon)] Corridor.

Response: The transportation evaluation area was established in partnership with NYSDOT. The extents are defined by where the Preferred Action Alternative is expected to cause a significant impact. This approximately five-mile radius boundary was supported by detailed corridor capacity analysis and assessments, and anticipated changes in projected traffic patterns, connectivity, and land use.

Transportation Comment 7:

The FEIS should include an assessment of impacts from traffic within a 10-mile wide corridor around each new highway proposed interchange.

Response: See Response to Transportation Comment 6.

Transportation Comment 8:

The traffic analysis did not consider the traffic delays during construction of the project or construction of roadway improvements.

Response: As part of the TIS, traffic impacts for the years 2027, 2031, and 2041 were studied. This evaluation specifically focused on the busiest periods (both time of day and specific years) when both construction workforce and operational employees would be traveling to and from the Micron Campus. It covered periods when the construction and operation workforces overlap, ensuring traffic impacts for all phases were adequately considered.

For the potential roadway improvements, NYSDOT (or the responsible agency for the roadway facility) will be performing the detailed planning and design for any roadway improvements within the area. As part of these planning processes, NYSDOT (or the responsible agency) will perform needed work zone traffic analyses to determine impacts associated with construction of transportation improvements.

Transportation Comment 9:

Concerns were raised regarding increased rail traffic during construction and operations and whether it would increase wait time for drivers.

Response: According to FEIS Section 3.11.3.7, rail freight deliveries to the site are planned to occur during off-peak hours, with trains scheduled to cross NYS Route 31 twice a day (each crossing requiring approximately five to ten minutes) in order to minimize disruption and avoid significant traffic impacts at the at-grade crossings. To further reduce the potential for congestion and lengthy delays for motorists, the Project includes provisions for rail car storage areas at the Rail Spur Site.

Transportation Comment 10:

A commenter indicated that the DEIS proposes no mitigation for the increased Vehicle Miles Travelled (VMT), estimated 67 million miles annually by 2041. The proposed mitigation traffic mitigations would actually increase VMT, which would worsen other environmental harms, including traffic fatalities and surface runoff.

Response: Although the FEIS does not directly define a significant impact threshold associated with VMT on the transportation network, there are mitigation measures that are proposed that will positively impact VMT.

Centro plans to evaluate the need and provide additional transit services from downtown Syracuse to the Micron Campus, including an express bus route connecting Centro's Transit Hub to the Micron Campus, as well as extending an existing bus route to the Micron Campus along U.S. Route 11. See FEIS Section 3.1.3.6. As stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the site begin their intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses.

In addition, FEIS Section 3.11.4.4 identifies multi-modal improvements to offset VMT. These include the provision of shared-use paths and sidewalks along NYS Route 31 and US Route 11, connecting paths and sidewalks along existing corridors, and the provision of crosswalks and other safety improvements at intersections and interchanges. Micron is also planning on operating a shuttle service for construction workers running approximately 30 shuttle trips during peak hours to reduce the amount of vehicle trips to the site.

Transportation Comment 11:

The timing of proposed traffic improvements was questioned, noting concern that mitigation is not proposed to be implemented until 2027. Suggestions were made that widening and other measures be implemented in anticipation of construction impacts or that the project be phased in segments and at different locations to disperse traffic patterns.

Response: NYSDOT and FHWA are programmed to implement several planned improvements on the roadway network within the Transportation Evaluation Area by 2027. These are identified in Chapter 6, Table 6-2 Planned Roadway Improvements of the Traffic Impact Study (Appendix M). Additional longer-term improvements were identified within Section 3.11 that are recommended to be constructed by 2031 to mitigate significant impacts. Because the recommended mitigation measures in the FEIS fall under the jurisdiction of federal, state, and local transportation agencies, the detailed design and implementation would be subject to further review and approval by NYSDOT, FHWA, and other relevant agencies.

Transportation Comment 12:

The Draft EIS appears to have substantially underestimated the traffic caused by delivery vehicles. The commenter proposes the alternative of relying on railways for deliveries.

Response: The traffic analysis presented in the FEIS focused on the AM and PM peak periods, when the combination of construction and operational workforce-related travel to and from the Micron Campus is expected to be most significant. This evaluation included anticipated truck traffic associated with site operations during these times. It is anticipated, however, that the majority of delivery vehicle movements will occur outside of these peak hours. As such, the impacts from delivery-related truck traffic are not expected to exceed those evaluated for the primary operational workforce commuting periods. Additionally, as detailed in Section 2.1.2.1 “Micron...proposes to build the Rail Spur Site as part of the Proposed Project to facilitate a more efficient construction timeline, minimize the need to rely on transportation of construction material by truck over the Proposed Project’s 16-year construction period, and avoid or minimize the environmental effects such truck transportation would cause, particularly effects relating to increased transportation emissions, noise, and traffic congestion.”

Transportation Comment 13:

There are no proposed mitigation measures for increases in vehicle miles traveled (VMT). The proposed mitigation traffic mitigations would actually increase VMT, which would worsen other environmental harms, including traffic fatalities and surface runoff. The DEIS touches on traffic safety but avoids mentioning flooding risks from increase surface area. A better measure would be to implement a Transportation Demand Management Plan- encouraging employees and visitors to arrive by means other than driving.

Response: See Response to Transportation Comment 10.

Transportation Comment 14:

Implementation of a Transportation Demand Management Plan would fulfill the requirements identified in the NYS Green Chips and should include stakeholders such as Centro, SMTC and other planning Departments.

Response: Public transportation connectivity to the Micron Campus will be an important element of the comprehensive transportation strategy. Centro plans to evaluate the need and provide additional transit services from downtown Syracuse to the Micron Campus, including an express bus route connecting Centro's Transit Hub to the Micron Campus, as well as extending an existing bus route to the Micron Campus along U.S. Route 11. See FEIS, Section 3.1.3.6. As stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the site begin their intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses.

Transportation Comment 15:

The traffic improvement schedule is optimistic. The assessment should include whether there are adequate number of qualified contractors to complete the improvements

Response: As part of FEIS development, ongoing coordination has occurred with NYSDOT regarding the potential transportation improvements. NYSDOT and FHWA are programmed to implement several planned improvements on the roadway network within the Transportation Evaluation Area by 2027. These are identified in Chapter 6, Table 6-2 Planned Roadway Improvements of the Traffic Impact Study (Appendix M). Additional longer-term improvements were identified within Section 3.11 that are anticipated to be constructed by 2031 to mitigate significant impacts. Because the recommended mitigation measures in the FEIS fall under the jurisdiction of federal, state, and local transportation agencies, the detailed design and implementation would be subject to further environmental review and approval by NYSDOT, FHWA, and other relevant agencies.

Transportation Comment 16:

The proposed new interchanges on Route 81 at Sneller Road should be constructed first in order to divert traffic from the Route 31 intersections. Another commenter is concerned that the potential new interchange at Sneller Road may impact his business which is located on Route 11.

Response: The recommended traffic mitigation measures presented in the DEIS will be subject to further environmental review and approval by NYSDOT, FHWA, and local transportation agencies. As stated in the DEIS Section 3.11, the determination of which roadway improvements will be prioritized and implemented first will be guided by the agency that holds jurisdiction over the specific roadway (e.g. NYSDOT/FHWA). This sequencing will be based on their comprehensive assessment of needs, logistical and maintenance of traffic considerations, and strategic planning objectives.

Transportation Comment 17:

The FEIS must have a comprehensive analysis of Centro's current bus routes to determine transit adequacy for LMI residents. The FEIS should also include a comprehensive assessment of other future transit options.

Response: Public transit will play a key role in Micron's transportation plan. The FEIS appropriately discusses the transportation evaluation area's existing public transit system, the anticipated proposed changes in transit use and the Preferred Action Alternative recommended mitigations. Centro plans to evaluate the need and provide additional transit services from downtown Syracuse to the Micron Campus, including an express bus route connecting Centro's Transit Hub to the Micron Campus, as well as extending an existing bus route to the Micron Campus along U.S. Route 11 (FEIS Section 3.11.3.6). As stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the site begin, their intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses. In addition, Micron is also planning on operating a shuttle service for

construction workers running approximately 30 shuttle trips during peak hours to reduce the amount of vehicle trips to the site. The construction worker shuttle would be independent of the public transit system and operate on a fixed schedule to and from the Micron Campus from designated off-site parking lots during the peak hours. The location of this shuttle service's pick-up and drop-off is to be determined.

Transportation Comment 18:

Citing Page 3-295, the commenter encouraged utilizing bus and rail options to improve mass transit to support the Micron facility, which would help alleviate passenger vehicle traffic problems and also potentially reduce the GHG footprint for the project.

Response: See Response to Transportation Comment 17.

Transportation Comment 19:

Several commenters suggested Micron should implement incentive programs for employees to carpool or other ride sharing programs to reduce traffic impacts and the need for parking facilities. One commenter suggested Micron provide a free or subsidized shuttle service for employees to supplement mass transit options. Another commenter suggested incentivizing use of public transit through on-site parking policies.

Response: See Response to Transportation Comment 17.

Micron will encourage commuting using an EV, carpooling, or bicycle by creating reserved parking spaces for carshare vehicles and alternative-fueled vehicles, adding EV charging stations, and providing infrastructure that promotes bicycle usage (such as bicycle storage and shower rooms). Micron will also establish the Commuter Choice Program which allows employees who use mass transit to and from work to use pre-tax dollars to purchase tickets, tokens, and passes for local public transit services.

Transportation Comment 20:

Concerns were raised with respect to proposed parking facilities to accommodate workers commuting by personal vehicles, citing 12,000 spaces that would require 80-90 acres. Suggestions were made that integrating mass transit solutions could reasonably reduce the need in half, avoiding conversion of approximately 45 acres to impermeable surface.

Response: The proposed parking solution incorporates a combination of structured garages and surface lots to maximize spatial efficiency and minimize the overall footprint dedicated to parking. Additionally, the design of roadway improvements will integrate pedestrian and bicycle facilities to enhance site accessibility. Public transportation connectivity to the Micron Campus will be an important element of the comprehensive transportation strategy. Centro plans to evaluate the need and provide additional transit services from downtown Syracuse to the Micron Campus, including an express bus route connecting Centro's Transit Hub to the Micron Campus, as well as extending an existing bus route to the Micron Campus along U.S. Route 11. See FEIS Section 3.11.3.6. As

stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the site begin their intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses. In addition, Micron is also planning on operating a shuttle service for construction workers running approximately 30 shuttle trips during peak hours to reduce the amount of vehicle trips to the site.

Transportation Comment 21:

The DEIS indicates Micron will create four new bus stops for the Project but doesn't explain how they will be utilized.

Response: Centro plans to evaluate the need and provide additional transit services from downtown Syracuse to the Micron Campus, including an express bus route connecting Centro's Transit Hub to the Micron Campus, as well as extending an existing bus route to the Micron Campus along U.S. Route 11. See FEIS Section 3.11.3.6. As stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the site begin their intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses. The details of additional bus stops will be identified by Centro as part of its planning process.

Transportation Comment 22:

A commenter inquired into the viability of providing an express bus service and/or a new rail line service between the CENTRO hub in Syracuse and the Micron Clay site.

Response: See Response to Transportation Comment 17.

Transportation Comment 23:

Several commenters stated that the Draft EIS should better align with the anticipated Bus Rapid Transit (BRT) system, by proposing means of coordinating mass transit infrastructure improvements to facilitate rollout of the BRT system.

Response: See Response to Transportation Comment 17. Ongoing coordination will occur between Micron and Centro regarding transit improvements.

Transportation Comment 24:

Bicycle and pedestrian access plans could be improved in order to encourage more alternatives to accessing the facility. Consider auxiliary parking at strategic locations. See DEIS Page 3-339, Section 3.11.3.6.

Response: FEIS Section 3.11.4.4 identifies multimodal improvements. These include the provision of shared-use paths and sidewalks along NYS Route 31 and US Route 11, include connecting paths and sidewalks along existing corridors, and the provision of crosswalks and other safety improvements at intersections and interchanges. Micron is also planning on operating a shuttle

service for construction workers running approximately 30 shuttle trips during peak hours to reduce the amount of vehicle trips to the site.

Transportation Comment 25:

Micron must invest in and expand access to public transportation in the local and regional areas to accommodate the estimated population growth and Micron employees, ensuring reliable and affordable transportation.

Response: See Response to Transportation Comment 17.

Transportation Comment 26:

The FEIS should make clear how plans for various forms of transportation will support the Onondaga County Comprehensive Plan.

Response: The FEIS assesses how the regional transportation networks will be affected by the Proposed Project, identifies significant impacts, evaluates alternatives, and outlines potential mitigation measures while considering Plan Onondaga, SMTC MTP and LRTP and agency specific planning documents. See FEIS Appendix M, Section 2.1.7. The FEIS's recommended traffic mitigation measures align specifically with the Onondaga County's comprehensive plan in the planning of transit and bicycle and pedestrian facilities corridors within the impacted transportation evaluation area. These recommended mitigation measures include dedicated and continuous shared-use paths and sidewalks and the onboarding as the demand increases of transit route connectivity to the Micron Campus. See Appendix M, Section 10.6.

The design and implementation of recommended traffic mitigation measures will be collaboratively led by the responsible agencies, including, but not limited to, NYSDOT, the County, the towns, SYR Airport, and Centro, ensuring that all modes of transportation, such as transit, cycling, walking, flying and driving, are fully integrated and prioritized within the overall system.

Transportation Comment 27:

Concerns were raised regarding damage to roads and who will pay for it.

Response: Responsibility for roadways typically rests with the designated governmental authority, such as state departments of transportation, county agencies, or local municipalities, depending on jurisdiction and the classification of the road. The agencies are responsible for planning, maintaining, and upgrading public roadways to ensure safe, accessible and efficient transportation. Coordination among these agencies is essential, particularly for large-scale projects or developments that impact multiple facilities. Roadway work is typically coordinated among agencies with public input to address current and future needs. See Response to Oswego County Comment 15.

Transportation Comment 28:

Several commenters stated that the DEIS does not sufficiently address public transit investments to reduce traffic congestion and ensure job access from DACs. Eight bus routes currently operate around the evaluation area are regional rather than local, and make widely spaced, infrequent stops. If no bus routes directly connect the Project to the City of Syracuse this will create a DAC issue.

Response: Response to Transportation Comment 17.

Transportation Comment 29:

Several comments were concerned the DEIS does not incorporate the Green CHIPS CEC community priorities, or that the 2050 Long Range Transportation Plan sufficiently captures the Project's impacts such that the final EIS should acknowledge whether amendments are required.

Response: SMTC is currently in the process of creating a new 2050 Long Range Transportation Plan, which draft update was open to public comments until September 12, 2025. This draft updated document includes the Proposed Project.

In line with the goals of the Green CHIPS Act, the FEIS considers alternative transportation solutions and traffic mitigations through multi-modal improvements. Centro plans to evaluate the need and provide additional transit services from downtown Syracuse to the Micron Campus, including an express bus route connecting Centro's Transit Hub to the Micron Campus, as well as extending an existing bus route to the Micron Campus along U.S. Route 11 (FEIS Section 3.11.3.6). As stated by Mr. Steven Koegel at the public hearing (VP of Business Communications with CENTRO), once operations at the site begin their intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses. In addition, FEIS Section 3.11.4.4 identifies pedestrian and bicycle improvements including the provision of shared-use paths and sidewalks along NYS Route 31 and US Route 11, connecting paths and sidewalks along existing corridors, and the provision of crosswalks and other safety improvements at intersections and interchanges. Micron is also planning on operating a shuttle service for construction workers running approximately 30 shuttle trips during peak hours to reduce the amount of vehicle trips to the site.

Transportation Comment 30:

A commenter suggested building a new exit on Interstate 81 in Cicero and a complete redesign of the I-81/Route 31 intersection by 2031.

Response: See Response to Transportation Comment 16. Recommended proposed transportation improvement projects include an upgraded and reconfigured interchange at I-81 and NYS Route 31 as well as a new interchange at I-81 and Sneller Road. The I-81/ Sneller Rd interchange is anticipated to be completed by 2029 and the I-81/NYS Route 31 interchange by 2031.

Transportation Comment 31:

A commenter suggested denying local and state land use approvals until there is an enforceable transportation improvement agreement in place.

Response: NYSDOT (or the responsible agency for the roadway facility) will be performing the detailed planning and design for any roadway improvements within the area. NYSDOT and FHWA are programmed to implement several planned improvements on the roadway network within the Transportation Evaluation Area by 2027. These are identified in Chapter 6, Table 6-2 Planned Roadway Improvements of the Traffic Impact Study (Appendix M). Additional longer-term improvements were identified within FEIS Section 3.11 that are anticipated to be constructed by 2031 to mitigate significant impacts.

Transportation Comment 32:

Commenters in support acknowledged the Draft EIS's detailed plans to reduce traffic impacts.

Response: Comment noted.

Transportation Comment 33:

The DEIS does not consider the impact on commercial and private air traffic volumes based on project-related travel and the air travel commercial and private air traffic volumes based on project-related travel and the air travel needs of the thousands of added Central New York families employed directly and indirectly in connection with the Project.

Response: FEIS Section 3.11.3.8 includes an analysis of airport travel. The level of analysis for project-related air travel is commensurate with the expected effects, which are considered de minimis compared to those associated with vehicular traffic. Therefore, a more detailed quantitative analysis was not included, as it would not alter the conclusions of the FEIS regarding transportation-related impacts. Further, considerations related to commercial air traffic at Syracuse Hancock International Airport are being integrated into the ongoing update of the Airport's Master Plan. The Airport is currently executing a five-year improvement plan designed to address near-term operational needs (refer to FEIS Section 3.11.3.8).

Transportation Comment 34:

The third bullet on DEIS page 3-297 should add increased risk of chemical spills from trucks delivering and transporting wastes, particularly during years when Fabs 1 and 2 are operational but Fabs 3 and 4 are under construction.

Response: The bullet point list on Page 3-297 identifies high crash locations within the study area (i.e. locations exhibiting crash rates higher than the statewide average for similar types of facilities). The goal of the third bullet point is to identify the number of high crash intersection locations. See also Response to Solid Waste and Hazardous Materials Comment 41.

Transportation Comment 35:

The traffic analysis does not incorporate cumulative impacts from induced growth, school bus patterns, and concurrent construction traffic.

Response: See Response to Transportation Comment 1.

3.12 Noise & Vibration**Noise Comment 1:**

General comments were made that the Project will cause noise and vibrations that will disrupt the local community. Micron should prioritize effective noise mitigation measures protecting all residents and ensuring quality of life is not compromised, especially those in close proximity to the project and its transportation corridors.

Response: FEIS Section 3.12 presents a comprehensive analysis of noise and vibration impacts associated with all phases of the Proposed Project, including construction and operations. Section 3.12.5.3 summarizes the anticipated noise impacts, while Section 3.12.6 outlines the proposed mitigation measures. The analysis concludes that no significant vibration impacts are expected over the life of the Project, however, there will be significant adverse noise effects. As discussed in FEIS Section 3.12.5.3, construction and operations only accounts for a small percentage of significant adverse effects. Transportation-related noise is the most significant generator of noise, because it is the closest noise source to most of the receptors.

To protect residents and maintain quality of life, particularly for those living near the Micron Campus, Rail Spur Site, and transportation corridors—the FEIS proposes a combination of operational BMPs and both permanent and temporary sound barriers to reduce noise levels. These measures are designed to minimize disruption and ensure compliance with applicable noise standards.

Regarding transportation-related noise, Section 3.12.6 notes that most impacted locations have driveway access to adjacent roads, which limits the feasibility of installing effective noise barriers. However, one area along Route 31 has been identified where noise abatement is feasible and will be pursued. Additionally, as stated in FEIS Section 3.11.5, further traffic noise impact analysis along state-owned roadways will be conducted by FHWA and NYSDOT as part of a separate environmental review. See FEIS Section 3.11.5.

Throughout the development process, Micron will continue to implement effective noise mitigation strategies and continuing coordination with regulatory agencies to ensure that community concerns are addressed and that residents are protected.

Noise Comment 2:

The noise effects from construction, operation and traffic are uncertain or unpredictable as the information is based on modeled data.

Response: Modeling is an industry- and agency-accepted method of determining potential noise impacts as it has been found to be a reliable (and often the only feasible) method of predicting future sound conditions in complicated sound environments. FEIS Section 3.12 presents the results of a comprehensive, robust, and conservative model completed using industry standard modeling software, the details of which are presented in Appendix N.

Noise Comment 3:

A commenter stated that the DEIS does not consider the impacts of project-related noise, particularly on-going traffic noise, on wildlife.

Response: The comment is incorrect. FEIS Section 3.4.4.2 acknowledges that project-related activities, including noise, may result in potentially significant adverse impacts to wildlife. This includes consideration of how ongoing noises, such as that associated with traffic, could affect habitat use, behavior, and species presence.

To address these concerns, FEIS Section 3.4.5 outlines a range of BMPs and mitigation measures aimed at reducing and offsetting impacts to wildlife. These include noise reduction strategies identified in Table 3.4-12, which are designed to minimize disturbance during sensitive periods such as breeding and migration.

Because transportation-related noise is primarily concentrated along major corridors, its impact on wildlife is expected to be limited in scope and localized. Nonetheless, the FEIS incorporates these considerations into its broader ecological impact analysis to ensure that wildlife protection remains a priority throughout project planning and implementation.

Noise Comment 4:

Concern was raised that the wooded buffer zone between the Oak Orchard plant will not actually protect the surrounding homes from impacts.

Response: The Oak Orchard site planning is considering spatial separation to locate the new Oak Orchard IWWTP facilities at the maximum allowable distance from existing residential homes leaving wooded areas in place to the extent possible. In addition, the Oak Orchard facility is considering physical barriers to minimize impacts to the public.

Noise Comment 5:

A commenter stated that Micron should build sound barriers for residential communities surrounding NYS Route 31, Caughdenoy Road, NYS Route 481 and U.S. Route 11.

Response: See Responses to Clay Comments 7 and 10.

Noise Comment 6:

Page 3-397: In the first bullet mentions that less audible backup alarms, such as quackers and strobes (nighttime only) will be considered as well. Backup alarms are notorious for resulting in complaints, even if average noise levels are acceptable.

Response: The referenced text included in FEIS Section 3.12.6, BMPs and Mitigation Measures, reflects Micron's commitment to require the use of less intrusive backup alarm technologies to minimize and eliminate potential impacts associated with backup alarms.

Noise Comment 7:

Page 3-399: In the final paragraph it would help to estimate the fraction of EVs expected, which would tend to reduce the vehicle noise and GHG emissions.

Response: While increases in EV adoption may have the potential to reduce transportation noise impacts in some cases, fuels used by public and private vehicles operating on public roadways are not under the purview of the applicant, not reasonably foreseeable and cannot be predicted with any level of certainty. Applicable noise impact mitigation measures can be found in FEIS Section 3.12.6.

Noise Comment 8:

A Community Oversight Committee should review noise effects from construction and operations.

Response: Noise effects from construction and operations of the Proposed Project are reviewed in the FEIS in Section 3.12, providing a list of BMPs and mitigation measures to avoid and minimize potential noise effects during construction and operation. See FEIS Section 3.12.6. Construction and operation of the Proposed Project will be subject to the noise requirements in the Town Codes of Clay and Cicero; no further oversight is necessary to ensure compliance. See FEIS Section 3.12.2.

Noise Comment 9:

Page 3-361: In the first full paragraph describe how noise and dust during the construction of traffic improvements (between 2027 and 2031) is addressed.

Response: As stated in FEIS Section 3.11 Transportation and Traffic, the recommended mitigation measures are provided for consideration by the local, state, and federal traffic agencies with jurisdiction over the identified roadways. NYSDOT and FHWA will undertake a separate NEPA/SEQRA environmental review of the recommended mitigations and implement these or other mitigations that the agencies deem appropriate to ensure the best overall operational performance of the transportation network with the Proposed Project. Therefore, construction-related noise and dust associated with construction of the recommended traffic improvements as put forward as potential mitigation measures will be analyzed and addressed in their environmental review.

3.13 Visual Impacts & Community Character

Visual/CC Comment 1:

The DEIS provides little detail about the physical layout or visual impact of the plant itself and Micron should release detailed publicly accessible building plans before approvals are issued.

Response: The FEIS provides visual renderings, along with details of the Micron Campus site Plan (see Figure 2.1-4 and Figure 2.1-5), which includes fab building structures together with all support facility locations and structures. FEIS Section 3.13.4.2 provides further detailed descriptions, including dimensions of the campus structures and support facilities.

As described in FEIS Section 3.13.1 and Appendix O-1, a total of 76 viewpoints of the Proposed Project and Connected Actions were initially identified within the visual effects study area, inclusive of viewpoints from designated aesthetic resources in the study area. As described in FEIS Section 3.13.3 and Appendix O, potential lines of sight to the Micron Campus structures were reviewed, based on photos taken at the 76 viewpoints, and a representative sample of 15 viewpoints of the Micron Campus were selected to prepare photo simulations of how the relevant structures would appear from the viewpoints (Figure 3.13-6 through Figure 3.13-20). The Proposed Project will also be undergoing site plan approval where details of project site designs will be reviewed by the Town of Clay and all relevant agencies.

Visual/CC Comment 2:

Micron should significantly expand the wooded buffer and include targeted mitigation measures such as berming and screening.

Response: As described in FEIS Section 3.13.5, the Micron Campus and the Rail Spur Site would include various setbacks, perimeter vegetation screening, on-site vegetative screening, and downward directional, shielded, warm lighting where feasible to help reduce overall visual effects on the surrounding area. The Childcare Site and the Connected Actions are not anticipated to result in highly noticeable visual effects on surrounding areas once completed. As a result, the Preferred Action Alternative would not result in any significant aesthetic impacts on designated aesthetic resources; therefore, no mitigation for those resources is required.

Visual/CC Comment 3:

Concerns were expressed that Micron's development could hinder religious congregations from continuing community services and support programs.

Response: Construction and operation of the Proposed Project are not anticipated to hinder any religious congregations from continuing community services and support programs.

With respect to potential noise impacts on religious congregations, FEIS Section 3.12 presents a detailed comprehensive analysis of combined noise and vibration impacts from all project activities, including from increased traffic, throughout the life of the project. Modeled receiver

location R16 was located near the Lutheran Church (see Figure 3.12-6). FEIS Table 3.12-6, Table 3.12-8, Table 3.12-11, and Table 3.12-14 show the noise metrics associated with R16 and establish that R16 is not predicted to experience a significant noise impact from Micron Campus or Rail Spur Site construction alone. As shown in Table 3.12-8, R16 is not predicted to experience a significant noise impact from Micron Campus operation alone. The combined Micron Campus and Rail Spur Site construction, operation, and traffic noise of the Preferred Action Alternative is predicted to have a noise impact varied dependent on time of day and the Proposed Project's development year. However, with the driveway/parking lot access to NYS 31, noise barrier mitigation is not feasible as stated in FEIS Section 3.12.6. See also Response to Noise Comment 1.

In regard to vibration, truck traffic is not known to cause noticeable vibrations. See FEIS Section 3.12.4. All studies to assess the impact of traffic-induced vibrations have shown that both measured and predicted vibration levels are less than any known criteria for structural damage to buildings. Regarding human annoyance, normal living activities within a building (e.g., closing doors, walking across floors, operating appliances) have been shown to create greater levels of vibration than highway traffic (FHWA, 2011, Appendix G "Highway Traffic-Induced Vibration").

Regarding potential traffic impacts, FEIS Section 3.11 presents a detailed analysis of anticipated traffic impacts from the construction and operation of the Proposed Project and provides a list of BMPs and mitigation measures to avoid or minimize anticipated impacts. The recommended mitigation measures are provided for consideration by the local, state, and federal traffic agencies with jurisdiction over the identified roadways.

The suite of traffic mitigation measures presented in the FEIS will be subject to further environmental review and approval by NYSDOT, FHWA, and local transportation agencies. Specifically, NYSDOT and FHWA will undertake a separate NEPA/SEQRA environmental review of the recommended mitigations and implement these or other mitigations that the agencies deem appropriate to ensure the best overall operational performance of the transportation network.

Finally, as noted in FEIS Section 3.13, the Proposed Project would not directly affect community cohesion, as it would not physically separate surrounding communities from vital facilities and resources. See FEIS Section 3.13.4.2.

3.14 Community Facilities, Open Space & Recreation

Community Facilities Comment 1:

Concerns were raised about whether emergency services, including fire and police, can accommodate the Proposed Project's needs during construction and operation. The Proposed Project will create an additional burden on emergency resources. A commenter raised concerns about the ability of local emergency services to have the funding necessary to adequately respond to emergencies at the Proposed Project, including whether local emergency services have the required resources (e.g., number of employees), training and emergency plans in place. Commenters are concerned that the massive scale of the project will strain emergency services. Details are lacking on impacts on services like how emergency response will be managed, particularly during a potential

chemical incident. The public deserves to see the full plan to address these circumstances. Others similarly commented that the DEIS contains no information on whether volunteer fire departments have had the full training in hazmat that should be available on a 24/7 basis. Hazmat training is very difficult to accomplish with volunteer departments, particularly during normal business hours when many of the volunteers are at their paid jobs.

Response: The Proposed Project's potential impacts to local emergency services, including fire and police, from the construction and operation of the Proposed Project are addressed in FEIS Section 3.14. Although construction and operation of the Proposed Project will not create an undue burden on local emergency services, including fire, police, emergency medical services (EMS), induced growth would likely significantly impact fire services. Mitigation measures for fire services are detailed in Section 3.14.4, BMPs and Mitigation Measures.

Requests for police assistance are not expected to substantially increase during construction or operation of the Proposed Project. Micron would contract with private security services during construction, and throughout ongoing construction as fab operations come online and become operational. Permanent on-site security personnel would be employed and can respond to minor incidents. For other incidents, Micron's security team can engage police assistance from the Onondaga County Sheriff's Office or the New York State Police. The Cicero Police Department would only respond to incidents within the Town of Cicero. As most of the Micron Campus would be within the Town of Clay, it is expected that calls to the Cicero Police Department would be minimal. Overall, the limited number of potential police service calls would not warrant an increase in patrols or a need to hire additional officers. Accordingly, local police services would be anticipated to have adequate capacity to address any incidents that arise in connection with Proposed Project operations.

The number of fire and EMS incidents can be anticipated based upon incidents recorded at Micron's Boise operations, which are depicted on FEIS Table 3.14-5. In order to avoid burdens on local emergency services for medical and fire incidents during construction and operation, Micron would continuously employ its EHS personnel, along with its highly-trained Emergency Response Team (ERT), acting as an initial line of response and thereby limiting emergency calls and burdens on community first-responders. A complete summary of the ERT roles and responsibilities is found in FEIS Appendix L-3. The ERT members are trained in OSHA communication and emergency response standards (HAZWOPER), as well as State and National Emergency Medical Technician standards (EMT-B). The ERT team is overseen by a physician trained in US Department of Homeland Security incident management standards. In addition to these measures, and maintaining construction safety best management practices, Micron plans to construct and operate an on-site occupational health clinic staffed with an occupational medical physician, as well as physician's assistant, registered nurse, licensed nurse practitioner, physical therapist, and other support staff. The ERT would transport injured workers or personnel to the on-site health clinic for medical care, as appropriate, and would assist in transporting personnel in instances requiring urgent or hospital care.

As more fully discussed in the FEIS, in advance of construction and operations, Micron intends to coordinate closely with Town of Clay fire departments, Syracuse Fire Departments, and all other necessary fire departments or agencies in order to establish necessary joint protocols for responses

to fires and incidents involving hazardous materials. As discussed in the FEIS, Syracuse Fire has a trained hazmat response team that can respond to incidents on the Micron Campus. See FEIS Section 3.9.3.2, Operational Effects. See also Response to Clay Comment 17; Response to Solid Waste and Hazardous Materials Comment 48.

Community Facilities Comment 2:

Concerns were raised about whether emergency services, including fire and police, can accommodate the induced growth due to the Proposed Project.

Response: The reasonably foreseeable impacts to local emergency services, including fire and police, from induced growth from the Proposed Project, as well as mitigation measures, are addressed in FEIS Section 3.14. The FEIS acknowledges that induced growth associated with the Preferred Action Alternative would result in a potentially significant increase in demand for volunteer firefighting services. It is anticipated that over time, local and regional fire departments will likely need to increase service capacity to accommodate induced growth. Any increases to service capacity associated with induced growth in any of the five counties is anticipated to be funded via taxes and revenues associated with the induced growth itself. As the population and tax base grows, local governments and service providers have the capacity to allocate additional resources to public services, such as the police, to keep pace with demand. Additionally, induced growth will occur gradually over time as construction starts and elements of the Proposed Project become operational, allowing local emergency services to expand over time to meet potential demand.

To address the potentially significant adverse effect on volunteer fire services as a result of induced growth associated with the Proposed Project, including on the Clay Fire's response capacity, Micron would commit to pay for and support ongoing training efforts with Clay Fire and other local fire departments. Similarly, Micron would work with Clay Fire to determine any future need for the development of a full-time professional fire service. The determination of future needs planning could be completed through a feasibility study or similar alternative method.

Induced growth would potentially require some police services in the five-county region to expand their capacity over time and shift services and patrols due to changes in population patterns. In general, because emergency services are funded by taxes, the increased tax base associated with induced population growth would likely help to fund the needs of those services to expand over time to keep pace with that growth. The New York State Police, the Onondaga County Sheriff's Office, and the Cicero Police Department indicated that they do not anticipate the gradual build-out of the Proposed Project to hinder their service capacities. EMS in the five-county region are private businesses with paid employees that are coordinated through 911 centers and bill per call. These businesses are expected to expand and hire additional employees as needed as revenues increase from increased calls.

Community Facilities Comment 3:

The commenter encourages Micron to include more specific details regarding the Syracuse Fire Department and other nearby fire stations in case of an emergency.

Response: See Response to Community Facilities Comment 1. As more fully discussed in the FEIS Section 3.9, in advance of construction and operations, Micron will coordinate closely with Town of Clay fire departments, Syracuse fire departments, and other necessary fire departments or agencies in order to establish necessary joint protocols for responses to fires and incidents involving hazardous materials.

Community Facilities Comment 4:

The EIS should fully disclose all municipal costs to be incurred for expanded municipal services including police and fire which are necessary for the project. It should assess whether PILOT payments will be sufficient to meet community needs and mitigation costs for these services.

Response: An assessment of community facilities and the impacts associated with the Proposed Project is provided in FEIS Section 3.14. Any increases to service capacity associated with induced growth in any of the five counties is anticipated to be funded via taxes and revenues associated with the induced growth itself. Because these effects are not anticipated to be significant, no further analysis is required. It is generally understood that as population and tax base grow, local governments and service providers would have the capacity to allocate additional resources to public services, such as the police, to keep pace with demand. Accordingly, no additional data is required.

Where potential adverse impacts are anticipated, Section 3.14.4 provides best management practices and proposed mitigation. See also Response to Community Facilities Comment 2; Responses to Socioeconomic Conditions Comments 4 and 12.

Community Facilities Comment 5:

The DEIS states that the proposed site will be served by the Onondaga Sheriff's Office and the Clay, and possibly, the Cicero Volunteer Fire Departments. The DEIS does not mention that any of these agencies were contacted to inquire and determine their capacity to respond to a wide variety of potential problems that could occur during construction and/or operations. The commenter questions the capacity of these agencies to respond in a timely manner to unique events that would not necessarily happen at other facilities in their service areas. A commenter indicates that it is curious that the Town of Clay was the only local government contacted, but that repeated phone calls and messages were not replied to. Another noted that the DEIS fails to indicate whether municipalities were consulted before making conclusions about community services. Were other governments contacted to inquire about impacts to professional capacity? Any correspondence with municipalities substantiating claims should be part of the Appendix.

Response: Micron consulted directly with and continues to consult with the fire and police services that serve the area impacted by the Proposed Project and that would be expected to respond to incidents at the Micron Campus. The entities contacted include the Town of Clay Volunteer Fire Department (Clay Fire), the Town of Cicero Volunteer Fire Department (Cicero Fire), the Syracuse Fire Department, the Town of Cicero Police Department, the Onondaga County Sheriff's Office, and the New York State Police. Micron also consulted with the local EMS services, including the North Area Volunteer Ambulance Corps (NAVAC) and the Northern Onondaga Volunteer Ambulance (NOVA). Through this outreach, the fire, police, and EMS services provided information and feedback to Micron, including any potential concerns with responding to incidents at the proposed manufacturing facility during construction and operation, as well as potential capacity issues associated with induced population growth. This information is reflected in the assessment provided in FEIS Section 3.14. See also Responses to Community Facilities Comments 1 and 2.

Community Facilities Comment 6:

The DEIS contains no information regarding locations of substations of the Sheriff's office, or if one will be built and what organization will pay for it and when.

Response: FEIS Figure 3.14-1 and Table 3.14-1 identify the location of the Sheriff's Office North Community Police Station. As indicated in FEIS Section 3.14, local police services are anticipated to have adequate capacity to address incidents during construction and operation of the Proposed Project. Induced growth would potentially require some police services in the five-county region to expand their capacity over time and shift services and patrols due to changes in population patterns. In general, because police services are funded by taxes, the increased tax base associated with induced population growth is anticipated to fund the needs of police services to expand over time to keep pace with that growth. The New York State Police, the Onondaga County Sheriff's Office, and the Cicero Police Department indicated that they do not anticipate the gradual build-out of the Proposed Project to hinder their service capacities.

Community Facilities Comment 7:

A commenter questioned how the federal official Incident Command System (ICS) will be implemented if any event occurs. The New York State Police are nearby. How will quick decisions be made in this regard? Will there be debating response agencies (state and local governments)?

Response: Agencies responding to any incidents during construction or operations of the Proposed Project will respond according to their own established response protocols. Micron also has an established Incident Command System. Micron maintains internal globally-established emergency response procedures and protocols, which would be utilized at the Proposed Project. This includes, but is not limited to, Global Emergency Response Standard, Global Emergency Response Team Review, Global Automated External Defibrillation Standard, Global. Global Bloodborne Pathogen Standard. The Global Emergency Response Standard outlines the requirements of the Micron Emergency Response Program, including incident command. This program also includes roles and responsibility determination for the Micron personnel responsible for implementation of incident command, including those responsibilities of the Micron Incident Commander. Micron would

utilize local resources such as New York State Police, as needed, or requested based on event type. In addition, Micron will continue partnering with local and state responding agencies.

Community Facilities Comment 8:

A large influx of additional people to the area could exacerbate the need for public safety, medical and/or fire response.

Response: See Responses to Community Facilities Comment 1 and 2.

Community Facilities Comment 9:

The potential significant effect on volunteer fire services due to induced growth is acknowledged, with Micron committing to support training efforts with Clay fire and other departments. These commitments need to translate into equitable and robust support for all emergency services serving the expanded population so that public safety is not compromised in any community, including low-income or minority communities.

Response: See Response to Community Facilities Comment 1 and 2. To address the reasonably foreseeable significant adverse effect on volunteer fire services as a result of induced growth associated with the Proposed Project, including on Clay Fire and the Town of Clay's fire response capacity, Micron would commit to pay for and support ongoing training efforts with Clay Fire and other local fire departments. Similarly, Micron would work with Clay Fire to determine any future need for the development of a full-time professional fire service. The determination of future needs planning could be completed through a feasibility study or similar alternative method. However, as stated in FEIS Section 3.16.3.2, "[o]verall, significant adverse impacts to police, fire, EMS, and healthcare facilities are not anticipated, and the Proposed Project is not expected to cause or increase a disproportionate pollution burden on DACs or minority or low-income communities related to the availability of police, fire or healthcare facilities services."

Community Facilities Comment 10:

The DEIS does not evaluate the project's effects upon fire and EMS operations on surrounding communities. Maintaining access during construction will require municipal oversight and require technical capacity beyond municipal staffing levels. Mitigations may include signal coordination of adaptive signaling, and emergency preemption at traffic signals.

Response: FEIS Section 3.14 contains a thorough discussion of the potential impacts of the Proposed Project on police, fire, and EMS operations. This includes BMPs and mitigation measures where necessary to address impacts to fire services from induced growth. See FEIS Section 3.14.4; Table 3.14-8. Measures, such as signal coordination, or emergency pre-emption at traffic signals fall under the jurisdiction of federal, state, and local transportation agencies, and the detailed design and implementation of those measures would be subject to further review and approval by those agencies, who may evaluate additional measures such as optimizing signal coordination and adjusting traffic signal timing to further enhance overall traffic movement. See also Responses to Community Facilities Comments 1 and 2.

Community Facilities Comment 11:

The scale of the construction activity and operational footprint will create sustained demand impacting public safety readiness and municipal capacities in areas of engineering, planning, code enforcement, stormwater management, and snow removal.

Response: The FEIS addresses issues of public safety (see FEIS Section 3.14 Community Facilities, Open Space, and Recreation) and stormwater management (see FEIS Section 3.3.4.2).

The FEIS acknowledges that induced growth may increase demand for local emergency services. See FEIS Section 3.14.3.2 (Growth Inducing Effects). Funding for emergency service staffing, training, and equipment is provided through municipal budgets, which are supported by the local tax base. The Proposed Project is expected to substantially expand the tax base in Onondaga County and surrounding municipalities, thereby providing additional resources to support emergency services and municipal services. Municipalities will direct necessary investments to support such services.

Community Facilities Comment 12:

Clarification is requested if Micron will maintain on-call contracts with appropriately trained and equipped private emergency response and cleanup contractors that would be prepared to mobilize and address any spills or releases on an emergency basis.

Response: See Response to Solid Waste and Hazardous Materials Comment 57.

Community Facilities Comment 13:

The appropriate plans and policies meeting State and Federal Requirements will need to be adhered to. Micron must prepare, review and update, and adhere to plans and policies that include a Risk Management Plan or Program that will apply to listed Regulated Substances identified by the USEPA under section 112 of the Clean Air Act and that will include a hazard assessment that anticipates the potential effects of any accidental chemical release that could occur at the Micron Campus, with an evaluation of worst-case and alternative accidental release scenarios; a chemical accident prevention program including safety precautions, maintenance and monitoring measures, and employee training; and a chemical accident emergency response program detailing the emergency response procedures Micron would provide for emergency employee care and notify relevant agencies, local first responders, and the public should an accident occur.

Response: See Responses to Solid Waste and Hazardous Materials Comments 4 and 48, and Responses to Community Facilities Comments 1 and 2.

Community Facilities Comment 14:

Federal- and state-mandated Spill Prevention, Containment, and Countermeasure (SPCC) Plans, Spill Prevention Reports (SPR), and Risk Management Plans (RMP) will govern Micron's on-site operations, but spills or releases during transport to and from the facility may occur on local roadways and in nearby neighborhoods. Effective

response to such incidents will require volunteer fire departments and other first responders to receive specialized training in the specific hazards posed by these materials and they must also be equipped with the necessary protective gear, containment tools, and monitoring equipment.

Response: See Responses to Community Facilities Comments 1, 2, 12, and 19, and Response to Solid Waste and Hazardous Materials Comment 48. See also Response to Air Quality Comment 22.

As discussed in FEIS Section 3.9, Micron would implement its internal set of policies, procedures and resources to govern emergency management (or ERMS) and deploy its Emergency Response Team (ERT) beginning with construction. The ERMS and ERT also would be in place and govern emergency response throughout continuous Proposed Project operations. As part of the ERMS, Micron management and the ERT would conduct regular emergency drills and would implement site-specific emergency response protocols in coordination with local first responders, including specialized emergency response measures developed in collaboration with the Clay Fire Department, and would establish an emergency response support agreement with the Syracuse Fire Department. Micron also would be responsible for implementing its RMP, Process Safety Plan, and other measures consistent with USEPA regulations. Micron would ensure its emergency response protocols align with facility hazard monitoring systems, including leak detection and automatic shutdown systems and emergency evacuation alarms. Micron will assess all resources needed for responders which includes protective gear, tools and related equipment prior to commencement of construction.

Community Facilities Comment 15:

Micron, Onondaga County, New York State, and OCIDA must provide funding and technical support to train, equip, and maintain the readiness of the Town's volunteer fire departments, police, and code enforcement staff. The scale of the project poses unacceptable risks to community health, safety, and quality of life.

Response: See Responses to Community Facilities Comments 1 and 2. As described in FEIS Section 3.14, the Proposed Project would be required to comply with all applicable laws and regulations. This, coupled with the avoidance, minimization and, where appropriate, mitigation measures, establish that the Proposed Project does not pose an unacceptable risk to community health, safety or quality of life.

Funding for emergency service staffing, training, and equipment is provided through municipal budgets, which are supported by the local tax base. The Proposed Project is expected to substantially expand the tax base in Onondaga County and surrounding municipalities, thereby providing additional resources to support both emergency and municipal services, and it is anticipated that municipalities would direct necessary investments to support those services.

Community Facilities Comment 16:

The project should be built to the north of Route 31 to protect Meltzer Park. Meltzer Park should be protected from being demolished.

Response: The Proposed Project would be constructed in the WPCP which is located on the north side of Route 31. There is no demolition of Meltzer Park proposed. In fact, as noted in FEIS Section 3.14, “[t]he park would remain open throughout construction... and would continue to be able to host both quiet recreational activity and active use of its athletic fields and other amenities throughout the year.”

Community Facilities Comment 17:

Will local fire departments have adequate staffing, resources and training to respond to semiconductor-specific chemical emergencies?

Response: See Responses to Community Facilities Comments 1, 2, 13, and 14.

Community Facilities Comment 18:

A commenter indicates that Micron should also clarify how it will ensure rapid notification and evacuation protocols for surrounding communities.

Response: FEIS Section 3.14 states that, “[i]n the event of a structural fire or a hazardous material spill requiring outside assistance, the ERT would notify Clay Fire via 911. Prior to operations, Micron, Clay Fire, and the Syracuse Fire Department would establish a joint protocol for when the Syracuse Fire Department’s hazardous material response unit would be brought in to address a relevant incident. Onondaga County DEM also would alert and deploy Cicero Fire as needed.” Incident responders would follow their established protocols for notifications to communities and if any actions by the community are needed.

Community Facilities Comment 19:

Micron should provide financial support for staffing and equipping local hazmat responders and commit to annual joint training exercises with local agencies and third-party evaluators.

Response: See Response to Community Facilities Comment 1, 2, 13, and 14.

Community Facilities Comment 20:

The conclusions in the DEIS that impacts on community services can be easily adjusted over the 16-year construction period is not supported by relevant projections, municipal confirmations or other facts. There are no details to support that rising municipal revenue will offset service needs.

Response: See Response to Community Facilities Comment 1, 2, and 4.

Community Facilities Comment 21:

Although the DEIS suggests that a feasibility study will be undertaken, there is no actual commitment by Micron to undertake any such action. This must be a requirement as a mitigation measure.

Response: As described in the FEIS Section 3.14, Micron would, as a mitigation measure, commit to, pay for and support ongoing training efforts with Clay Fire and other local fire departments. Micron also would work with Clay Fire to determine any future need for the development of a full-time professional fire service, and that the determination of future needs planning could be completed through a feasibility study or similar alternative method.

Community Facilities Comment 22:

The DEIS contains no facts to back up the statement that the increased tax base from induced growth would 'help' police services. Since it would only 'help' where will other revenue come from? The in-migration of workers during construction will likely cause a rise in incidents requiring police response, thereby taxing police and municipal services.

Response: See Responses to Community Facilities Comments 1, 2, 4 and 5.

Community Facilities Comment 23:

There are no details or analysis of the cost to professionalize or upgrade fire services.

Response: See Responses to Community Facilities Comment 1, 2, 14, and 19.

Community Facilities Comment 24:

What is the impact of having only one hazmat unit, which resides in the City of Syracuse. Will hazmat services need to be expanded and who will fund the expansion?

Response: See Responses to Solid Waste and Hazardous Materials Comments 57 and 59. Prior to operations, Micron, Clay Fire, and the Syracuse Fire Department would establish a joint protocol for when the Syracuse Fire Department's hazardous material response unit would be brought in to address a relevant incident. Coordination efforts will identify additional needs, if any.

Community Facilities Comment 25:

A commenter is concerned how the County will coordinate with surrounding towns to ensure that there is equitable distribution of tax revenues or state/federal aid to offset costs associated with emergency services.

Response: See Responses to Community Facilities Comments 1, 2, 9, 14, and 19; Responses to Town of Clay Comment 2.

Community Facilities Comment 26:

The existing designated snowmobile trail C7L is not addressed as a recreational resource. It is a corridor trail meaning highest classification in the statewide network of trails. It will used as a connection to Oneida Lake and to any destination on the statewide trail network. The trail has been actively use since 2002. The club that grooms this trail hopes the trail would continue through the National Grid service road or other location on the Micron property. Another commenter requested that the DEIS indicate whether the snowmobile trail will be relocated as part of this project, to avoid closure of an important community resource.

Response: As discussed in FEIS Section 3.14, portions of the existing snowmobile trail would be unavailable for use and the Snow Owls Club has been notified there is no space for relocations on the property. “The portions of the Snow Owls Snowmobile Trail noted above would be permanently closed, except for the four-mile segment of the trail in Oswego County running parallel to OCWA’s existing clear water transmission main, which, which could re-open after construction....Parties maintaining the snowmobile trail through year-to-year license agreements with private landowners would potentially be able to seek new agreements with landowners to re-route affected portions of the trail to avoid Proposed Project and Connected Action construction areas.” See FEIS Section 3.14. National Grid generally maintains good relations with snowmobile clubs that access the Company’s properties across its Upstate service territory and would continue to do so.

3.15 Socioeconomic Conditions**Socioeconomic Comment 1:**

The area is already seeing commitments to expand and improve the region’s civic infrastructure with needed investments in childcare and health care across the region.

Response: Comment noted.

Socioeconomic Comment 2:

Building permits for new housing are up by more than 50%, which will help address both current and future housing needs.

Response: Comment noted.

Socioeconomic Comment 3:

General statements were made concerning providing tax breaks or financial incentives to Micron. The taxpayers cannot afford to provide a tax benefit to the developers of the site. This is an inappropriate use of tax dollars.

Response: See Response to Purpose and Need Comment 2 (discussing the purpose and need for the Proposed Project and Connected Actions); Response to Purpose and Need Comment 3.

Socioeconomic Comment 4:

General concerns were raised regarding potential local economic benefits (jobs, tax revenue) not equitably reaching local workers, schools, and small businesses.

Response: Development of the WPCP is expected to significantly benefit Onondaga County and its residents. The local and regional socioeconomic benefits of the Proposed Project are adequately addressed in FEIS Section 3.15 Socioeconomic Conditions. The Proposed Project would introduce new job opportunities, grow local economies, generate additional sales and property tax revenues and payments in lieu of taxes (PILOT), and, over the 20-year term of the Green CHIPS Community Investment Fund (CIF), would invest \$500 million in local and regional initiatives that advance identified community needs, including funding for local workforce and education initiatives. See FEIS Appendix R-2.

The monies collected in additional tax revenues and PILOT payments would add to current local and regional school districts revenues. Micron has submitted an application to OCIDA for Phase 1, requesting a 49-year PILOT agreement. If approved, the PILOT agreement would exempt Micron from county, town, and school property taxes. In place of these local tax payments, Micron would make PILOT payments that would be apportioned to those taxing jurisdictions in an identical manner as the apportionment of property taxes using the applicable yearly tax rates. See FEIS Section 3.15.3.2, Funding for Local Governments and Taxing Districts.

The Proposed Project's projected induced growth is expected to generate substantial new revenues for local governments and taxing districts from new commercial businesses and household growth principally through the form of property and school taxes. The REMI Study estimates that a 4-fab facility's economic activity would, on average, generate nearly \$500 million annually in local government and taxing district revenues for municipalities within the region. See FEIS Section 3.15.3.2, Growth Inducing Effects; Appendix C-2 (REMI Study).

As discussed in FEIS Section 3.15.3.2, the Proposed Project would provide new employment opportunities within the local and regional study area for the foreseeable future. The Proposed Project would generate over 4,000 on-site construction jobs and over 9,000 permanent on-site operational jobs, providing long-term skilled employment opportunities for unemployed, underemployed, and job-changing residents in the local and regional study areas. Based on projected availability of union labor when accounting for other projects, including the Syracuse I-81 project's construction, it is estimated that approximately 2,700 workforce participants from the commuter shed might be available for construction of the Proposed Project. See FEIS Appendix Q, Table Q-50. The Proposed Project's operational labor needs are expected to be met in large part by existing labor force participants residing within reasonable commuting distance of the Micron Campus. See also Response to Socioeconomic Comment 8.

The Proposed Project would generate substantial new economic activity in the five-county region (i.e., growth inducing impacts), facilitating the growth of industries and commercial and residential development. By 2045 the Proposed Project would generate demand for nearly 9,500 jobs at regional supply chain businesses and approximately 23,500 jobs at regional governments, institutions, and businesses supporting the growth in regional household spending (approximately

33,000 off-site jobs in total). This growth in job opportunities within a range of industry sectors would be a significant benefit to the local and regional study areas.

Micron would also invest in recruiting, workforce training, and educational programs in the local and regional areas necessary to develop talent for the Proposed Project. See FEIS Appendix Q-3.2. Given the Micron Campus' proximity to local colleges and universities, the regional collaborations, and initiatives for training already in place, and with additional investments through the Green CHIPS CIF, it is reasonable to assume that Micron could exceed the 60 to 70 percent local job recruitment rates experienced at Micron's Boise, Idaho and Manassas, Virginia facilities. For the Proposed Project, this equates to over 6,300 permanent operational high-paying jobs secured by existing local and regional residents within the study area.

See also Response to Socioeconomic Comment 39, discussing access to employment and training.

Socioeconomic Comment 5:

Commenter stated that approving the Proposed Project is a short-sighted means to bring jobs and resources to the regional area.

Response: See Response to Purpose and Need Comment 2.

Socioeconomic Comment 6:

Commenters requested mechanisms and concrete plans (e.g., regional task forces, Micron-funded grants, citizens conservation management group, Community Benefits Agreement) that will be implemented to help local communities plan for and manage growth without overextending local budgets. Commenters suggested working with local, state and regional agencies to provide support for induced growth, including impacts to housing.

Response: FEIS Section 3.15 analyzes the socioeconomic impacts from the Proposed Project and Connected Actions and specific measures to mitigate effects on housing are addressed in FEIS Section 3.15.4. In addition to mitigation measures proposed in the FEIS, Micron is working with ESD to identify and provide funding for local and regional initiatives. See also Response to Environmental Justice Comment 2, discussing the community outreach conducted by the Central New York Community Engagement Committee (CEC) to help guide the \$500 million Green CHIPS Community Investment Fund (CIF) towards the community's most pressing needs and goals. See also FEIS Appendix Q-3.2. Over the 20-year term of the Green CHIPS, the CIF would invest \$500 million in local and regional initiatives that advance identified community needs. Local and regional groups interested in receiving CIF funding may submit a Letter of Intent. <https://esd.ny.gov/green-chips-community-investment-fund#how-to-apply> See Response to Socioeconomic Comment 19, discussing state funding support and initiatives for local and regional housing.

Socioeconomic Comment 7:

A commenter requested verification that Great Northern Mall is still planning on developing housing at the site.

Response: FEIS Table 4.2-1 includes the Great Northern Mall Redevelopment as a present and reasonably foreseeable project. The project proposes to develop a 541,651 SF complex of commercial, retail, supermarket, and hotel space, 755,850 SF of medical office space, 1,636 apartment units, and 875 hotel rooms.

Socioeconomic Comment 8:

General concerns were raised that Micron be required to hire a meaningful number of permanent local residents, including from marginalized local communities, particularly within the City of Syracuse, and that such employment targets be enforceable. Further concerns that the local jobs created must provide sustainable wages and benefits. Micron should be transparent with its hiring process, including educational requirements.

Response: See Response to Socioeconomic Comments 4, discussing Micron's hiring of local employees and investment in training. As stated in FEIS Section 2.1.1.6, "construction of the Micron Campus would require approximately 4,200 construction workers on-site daily during peak construction periods lasting roughly six months for each fab. Micron Campus operations would require at least 2,000 manufacturing employees for each fab, with the total number of manufacturing employees increasing sequentially as each fab comes online...Information on the local labor market suggests that approximately 2,000 local workers may be available for each phase of the Micron Campus construction, which could help reduce the number of construction crews traveling to Clay, NY from other geographical locations...At full production in 2045, the operational headcount of the Micron Campus, including manufacturing, business, and administrative employees, would be 9,005 employees, with a nominal remaining presence of approximately 300 construction workers."

As demonstrated in FEIS Appendix Q-3.1, Micron, Onondaga County, OCIDA, and ESD have taken steps to realize local economic opportunities from construction activity. Micron has committed to working with state and local partners and construction contractors and subcontractors to establish a target percentage of the construction workforce to be from disadvantaged populations. As explained in the FEIS Section 3.15.3.2, Micron will partner with CenterState Corporation for Economic Opportunity (CEO) and ESD to scale existing programs to train new construction workers and promote entry into trades. Micron is among the first signatories to U.S. Department of Commerce CHIPS Women in Construction Framework, which establishes best practices to double the number of women in construction over the next decade. Micron would encourage contractors to conduct focused recruiting and pipeline development activities to strive, in good faith, to meet the target, and Micron would require contractors to report their results. FEIS Appendix Q-3.1 also provides a list of the numerous specialized trades required for construction of Fabs, including concrete workers, pipe fitters and steelworkers.

Operational workers will require special skills, for which there is a regional and national shortage. Micron is investing in recruiting, workforce training, and educational programs to help develop a local workforce for work at the Micron Campus. Appendix Q to the FEIS identifies education and workforce programs that will help prepare a regional workforce for long-term operational jobs at the Micron Campus. Appendix Q-3.1 also provides a general overview of the qualifications for on-site manufacturing jobs. As stated in FEIS Section 3.15.3.2, Micron has estimated that 90 percent of on-site operational workers would be dedicated to manufacturing, and the remaining 10 percent would provide support services, including IT, security, quality, procurement, supply chain, smart manufacturing technology, finance, people, and legal services. Annual salaries plus cash bonuses to employees at the Micron Campus are expected to average approximately \$100,000. This amount exceeds the average annual wages per employee in Onondaga County (\$62,768 in 2023) and for manufacturing employment specifically (\$83,578).

See also Response to Socioeconomic Comment 39, for further discussion on targeted initiatives for hiring and training, including those from marginalized communities.

Socioeconomic Comment 9:

Induced growth job creation will be limited to the low-wage employment sectors, thereby furthering wage gaps and poverty issues in the regional communities.

Response: As stated in FEIS Section 3.15.3.2, “Micron has estimated that 90 percent of on-site operational workers would be dedicated to manufacturing, and the remaining 10 percent would provide support services, including IT, security, quality, procurement, supply chain, smart manufacturing technology, finance, people, and legal services. Annual salaries plus cash bonuses of employees at the Micron Campus are expected to average approximately \$100,000. This amount exceeds the average annual wages per employee in Onondaga County (\$62,768 in 2023) and for manufacturing employment specifically (\$83,578). Appendix Q-3 provides additional information on Micron manufacturing jobs and required skillsets. In addition to on-site Micron jobs detailed above, the Proposed Project would generate labor demand in industries supporting Micron’s construction and operations. The REMI Study projects that by 2041, approximately 33,000 non-Micron jobs would be created within the five-county region...by 2041 state and local governments (including public schools) are expected to receive the highest amount of job creation from increased household spending, followed by health care and social assistance; accommodations and food services; professional, scientific, and technical services; and retail trade.” See also Responses to Socioeconomic Comments 4 and 8.

Socioeconomic Comment 10:

General statements were made in support of the Proposed Project and its projected job creation and economic growth both regionally and nationally. The Proposed Project will build a durable ecosystem of innovation, education, skilled trade, resiliency and inclusion.

Response: Comment noted.

Socioeconomic Comment 11:

General statements were made in support of Central New York becoming a national leader in semiconductor manufacturing and creating a high-tech corridor within New York State.

Response: Comment noted.

Socioeconomic Comment 12:

General comments raised issues regarding population influx and whether local infrastructure (e.g., schools, health care facilities) can handle growth. Is there a plan for schools and health care facilities?

Response: The impact of population growth upon school enrollment and health care facilities due to the proposed development are addressed in FEIS Section 3.14 Community Facilities, Open Space and Recreation and Section 3.15 Socioeconomic Conditions. There are six (6) public school districts that serve the Local Study Area, which is comprised of the Town of Clay and Town of Cicero. As set forth in the FEIS Table 3.14-3, these districts have experienced declining enrollment, ranging from 9–38%. The direct effects of the Proposed Project are projected to result in minimal effects on school enrollment, as only 1,400 of the 4,200 projected Micron construction workers would be part of in-migrating households locating within the regional study area (including approximately 100 locating in the Towns of Clay and Cicero (local study area)). See FEIS Section 3.14.3.2.

Induced growth from the Proposed Project is expected to gradually begin reversing the current decline in school enrollments by school aged children across the five-county region. See FEIS Section 3.14.3.2, Growth Inducing Effects. However, even Onondaga County, which would experience the highest rate of induced growth in the region, would likely only experience an eight percent total increase in school aged children in a high induced growth scenario over the course of 21 years, from 2020 to 2041. This estimate assumed that the increase in the student population would be proportional to the increase in the number of households and that the households are evenly distributed throughout the Syracuse Metropolitan Statistical Area (MSA). This included the assumption that every employee hired for a permanent job at the Proposed Project will have school age children, making it a more conservative estimate than what may be the end result. Thus, the influx of students to local and regional schools would not be expected to overburden public school district capacity, and private schools in the area could also help absorb some of the increase in school-aged children. Moreover, induced population growth and business activity would help expand the regional tax base to further fund area school districts and any additional construction needs resulting from an increase in enrollment. See FEIS Section 3.15.3.2, Growth Inducing Effects. See also Response to Socioeconomic Comment 4.

As discussed in FEIS Section 3.14.3.2, construction and operation of the Proposed Project is not anticipated to materially increase the number of visits to hospitals and urgent care centers or other healthcare facilities located throughout Onondaga County. Micron and its contractors would implement and follow construction safety best management practices. Micron would deploy environmental health & safety (EHS) personnel to respond to and contain a range of construction

and operational incidents and would continuously employ its ERT to address medical incidents. As part of the construction of the Proposed Project, Micron would establish a dedicated on-site occupational health clinic (separate from the proposed Childcare Site healthcare center) staffed with an occupational medical physician, physician's assistant, registered nurse, licensed nurse practitioner, physical therapist, and other support staff. The ERT would transport injured workers or personnel to the on-site health clinic for medical care, as appropriate, with the goal of avoiding the use of local health care facilities except in instances of serious medical emergencies. See also Response to Community Facilities Comment 1.

Moreover, the induced growth effects from the Proposed Project would occur gradually over the 16-year construction period, would bring new healthcare workers to the region to support the growing population, and would likely generate additional economic benefits and tax revenue that would support planned expansions of healthcare facilities in Syracuse and other longer-term healthcare planning initiatives in the region. Independent of the Proposed Project, Upstate University Hospital and New York State are planning to expand the hospital's emergency room and increase the number of beds from 35 to 120 to better serve the area. With increased economic benefits, tax revenue, the expanded worker pool, and the planned Upstate University Hospital expansion, the Proposed Project would not be anticipated to result in significant adverse growth inducing effects on the regional healthcare facilities. See FEIS Sections 3.15.3.2, Growth Inducing Effects; 3.14.3.2, Growth Inducing Effects.

Socioeconomic Comment 13:

Please clarify the statements in the DEIS that the Proposed Project would not cause direct or indirect effects on the real property and housing in the local and regional areas but would cause induced effects.

Response: As explained in FEIS Chapter 3.0, “[t]he environmental analysis in Chapter 3 evaluates the direct and indirect effects of the No Action Alternative and the Preferred Action Alternative. Direct effects are effects that are caused by an action (e.g., the construction and operation of the Proposed Project) and occur at the same time and place as the action. Indirect effects are effects that are caused by the action and are later in time or farther removed in distance from the action but are still reasonably foreseeable. Indirect effects include growth inducing effects (e.g., effects the Proposed Project would generate through increases in population, commercial activity, and development in the surrounding region). In general, the lead agencies considered the effects on a resource to be significant if they would result in a substantial adverse change to the resource within the resource area.” For information on the growth inducing effects methodology, see Appendix C.

The direct socioeconomic effects of the Preferred Action Alternative are considered in FEIS Section 3.15.3.2, Relocation and Displacement (Direct Residential Displacement and Direct Business Displacement). This analysis found that the Preferred Action Alternative would not have the potential for significant adverse effects on socioeconomic conditions due to direct residential or business displacement. As stated in FEIS Section 3.15.3.2, Real Property and Housing (Construction and Operational Effects), “[t]he in-migration of workers and families for construction of the Proposed Project in the local and regional study areas would not create direct or indirect effects to real property and housing within the local and regional study area,” but would

necessitate induced effects from growth. Direct effects on housing would be found where the Proposed Project funds and undertakes the construction of housing; no such proposal has been put forth by Micron. Indirect effects are business to business purchases, of which there are no indirect effects on housing. Instead, the induced growth from the Proposed Project would create a need for additional housing in the local and regional areas.

As stated in FEIS Section 3.1.3.2, “housing demand in the areas of highest population growth is not expected to be met by existing rental units and for-sale homes, induced household growth would result in noticeable land use changes in some areas over time to accommodate new residential construction, such as through construction of new housing subdivisions on vacant, underutilized, or former agricultural land.”

Socioeconomic Comment 14:

Micron should conduct comprehensive impact analyses on housing, labor shortages, earnings distribution, and low-wage spinoff job impacts.

Response: FEIS Section 3.15 and Appendix Q provide a comprehensive review and analysis of the potential impacts, including growth inducing effects, on real property and housing and labor and employment, including potential wages. See Responses to Socioeconomic Comments 4, 8, and 9.

Socioeconomic Comment 15:

The DEIS does not contain details on projected price increases or housing cost trends tied to population growth.

Response: FEIS Appendix Q, Table Q-33 provides data on housing market trends for the Town of Clay, Town of Cicero, City of Syracuse and Onondaga County (January 2025). Table Q-42 provides data on housing market trends for the regional area for the same period. FEIS Section 3.15.3.2 states, “the local study area would experience increased demand for rental and for-sale housing, which in turn could lead to increases in property values, home purchase prices, and residential rents....While there would be rent pressures attributable to the Proposed Project’s induced growth in markets beyond the local study area, the projected growth within regional communities is more disperse, and in larger part attributable to non-Micron induced growth that would not be as immediate, allowing time for regional markets to respond to the increased demand through new housing production. Areas which are highly desirable to the incoming populations may see larger rent and home price increases; different communities may experience these increases at different temporal scales, although the property market should be expected to react to the new demand within approximately four years.”

Fluctuations in housing costs can result from several factors including but not limited to local regulations, supply chain costs, availability of developable land, and others. Due to the interaction of a variety of components, estimating long-term housing cost trends based on population growth is largely infeasible and does not offer the opportunity for reliable projections. Historical data shows largely varied paces of housing cost growth between the geographies making up the local and regional study area; see FEIS Section 3.15.2.2 Real Property, Housing, Relocation, and

Displacement (Local Study Area and Regional Study Area) for specific year-over-year changes in housing costs. FEIS Section 3.15.3.2 Growth Inducing Effects utilized ranged estimates based on available information to determine the distribution of population growth. While in some areas, the induced population growth may be large enough to cause changes in the local housing market, projecting price increases solely from this growth is not feasible.

Socioeconomic Comment 16:

General concern that Micron is not being transparent with its disclosure of anticipated permanent on-site job titles and salary ranges.

Response: See Responses to Socioeconomic Comments 8 and 9.

Socioeconomic Comment 17:

Provide support for not including the City of Syracuse in the analysis in the DEIS of potential for displacement of residents in the local study area from rising housing costs.

Response: The local study area is the area in which the Preferred Action Alternative has the potential to directly affect socioeconomic conditions. See FEIS Section 3.15.2. As the Proposed Project's footprint intersects the Towns of Clay and Cicero, these areas define the local study area. The regional study area is defined as the area in which the Preferred Action Alternative has the potential to indirectly affect socioeconomic conditions. As the City of Syracuse would not be subject to any direct effects, it is appropriate that this geography is included only in the regional study area.

The FEIS provides a comprehensive analysis of the City of Syracuse across all primary areas of indirect and induced assessment, including population, housing, local districts, and labor and employment, as it is part of the regional study area. Additionally, the FEIS specifically considers existing market conditions in the City of Syracuse (see Section 3.15.2.2 Affected Environment, Real Property, Housing, Relocation, and Displacement); projects potential household growth in Syracuse resulting from the Preferred Action Alternative (see Section 3.15.3.2 Growth Inducing Effects, Population and Demographics); and highlights potential future impacts unique to the area (see Section 3.15.3.2 Growth Inducing Effects, Real Property and Housing).

Socioeconomic Comment 18:

General comments noted that local employers will experience adverse impacts on their abilities to retain or pay workers. A commenter also requested additional information on short-term local labor shortages as a result of the Proposed Project.

Response: Potential impacts on the labor force are likely to be short-term. With respect to the construction industry, the Proposed Project has the potential to create temporary shortages within local and regional construction labor supply. Temporary labor shortages could lead to higher construction labor costs for some specialized trades in markets within the region. However, these potential adverse effects are expected to be limited and short-term as the market adjusts to new entries. See FEIS Section 3.15.3.2.

The potential for significant adverse short-term effects would be avoided through Micron's partnership with various stakeholders in the community to scale the construction workforce. Examples include partnering with CenterState Corporation for Economic Opportunity (CEO) and ESD to scale existing programs that train new construction workers and facilitate entry into the trades and partnering with the local Building Trades Unions to increase membership and encourage training opportunities on semiconductor-specific construction skills as well as planning to provide training and certifications through suppliers and distributors for semiconductor-specific construction skills, such as specialty welding skills. See FEIS Section 3.15.3.2.

Outside the construction industry, the Proposed Project could induce over 3.5 jobs in the region for every job created on-site. See FEIS Section 3.15.3.2. While the growth in job opportunities within a range of industry sectors would be a significant benefit to the local and regional study areas, the induced labor demand generated by the Preferred Action Alternative could lead to temporary labor shortages in some sectors where the existing labor force is unable to readily meet demand. This temporary shortage could lead to increases in labor cost. However, this potential adverse effect within the local and regional study areas is expected to be short term—likely during the earliest years of construction and operations, prior to any labor shortages being met through in-migrating workers and/or job training for existing unemployed or underemployed workers—and would not result in significant adverse effects on the labor market. See also Response to Socioeconomic Comment 8.

Socioeconomic Comment 19:

Multiple commenters raised concerns about affordable housing and increased demand could raise housing costs or rents for long-term residents. There is risk of indirect displacement of renters or homeowners, especially vulnerable or low-income households. The area already has a housing crisis. There should be a concrete plan to prevent indirect displacement of existing residents, reliance on state and local initiatives will not adequately address the impacts.

Response: The FEIS recognizes concerns regarding housing availability and affordability associated with induced growth associated with the Proposed Project. The effects of population growth from construction and operation of the Proposed Project on housing demand, property values and housing costs are fully addressed in FEIS Section 3.15.3.2.

These challenges from increased housing demand, costs and rents, and the potential indirect displacement of residents unable to afford their homes are expected to be short-term. See FEIS Section 3.15.3.2; see also FEIS Figure 3.15-3 (providing the estimated Proposed Project on-site Micron Campus construction jobs for 2025-2045). They also have been and continue to be addressed through investments from the State of New York through Governor Hochul's long-term statewide housing approach and New York Housing Compact initiatives; and local initiatives like the Onondaga County Housing Initiative Program (O-CHIP) and the OCIDA's tax exemption program for housing projects. See FEIS Section 3.15.4.

Governor Hochul has made housing and affordability a top priority and has enacted several programs aimed at increasing the production of housing, including \$650 million in state funding

for Pro-Housing communities and \$100 million in capital funding to assist with infrastructure to build new housing. Additionally, housing was identified as an immediate priority by the Community Engagement Committee and will be a central focus of the \$500 million CIF in Central New York. New housing supply—inclusive of affordable housing—would serve to control rent increases and is a critical component of meeting existing and future community demand for housing at lower income levels.

Currently, there are a number of identified planned projects in the local study area that are expected to generate an estimated over 4,000 new residential units and, thereby, alleviate pressure on the housing market. One of the largest planned projects is within the Town of Cicero: Lakeshore Village, a 602-unit multi-family housing development, will contain a variety of housing options, such as apartments, condominiums, single-family homes, and townhomes. Other planned residential and mixed-used projects anticipated in the local study area will introduce single-family homes and a mix of townhomes and apartments, as well as commercial retail, office space, and restaurants. See FEIS Table 3.1-2, Table 4.2-1, Appendix Q-2.2. The property market is expected to respond to the increase in housing demand from the Proposed Project within approximately four years of commencement of construction. See also Response to Socioeconomic Comment 15.

Socioeconomic Comment 20:

A commenter is concerned that house values within close proximity of the Proposed Project will decrease as a result of the Proposed Project.

Response: Reductions in home values are not anticipated. FEIS Section 3.15.3.2, Growth Inducing Effects, considers the potential effects of the Preferred Action Alternative on housing markets within the local and regional study areas and identifies the potential for short-term increases in house prices within markets due to the increase in local jobs and associated demand for housing from in-migrating workers. The FEIS finds that this effect would be most pronounced within close proximity of the Proposed Project. See also Response to Socioeconomic Comment 15.

Socioeconomic Comment 21:

A commenter provided general support for the significant economic benefits of the Proposed Project and its resulting beneficial effects on regional economic development policy goals.

Response: Comment noted.

Socioeconomic Comment 22:

The DEIS does not include reference to planned affordable housing within the local and regional areas.

Response: FEIS Appendix Q-2.2 provides an overview of the local and regional real estate and housing market, while Table 4.2-1 provides a list of present and reasonably foreseeable actions, including future housing developments in the local and regional areas for both affordable and market rate projects. See also FEIS Table 3.1-2.

See also Response to Socioeconomic Comment 19, for state funding for local and regional housing initiatives.

Socioeconomic Comment 23:

In the DEIS, page 3-503, it states that Micron will work with local agencies and stakeholders to identify actionable measures to address short-term housing impacts. Has Micron initiated this process?

Response: Micron has and continues to work with state and local agencies to address impacts to housing from the Proposed Project. See Response to Socioeconomic Comment 19, for discussion of state-funded housing initiatives.

Socioeconomic Comment 24:

General concerns were raised that the job growth estimates (e.g., use of the term “up to”) provided in the DEIS do not provide the required level of specificity and certainty.

Response: The use of terms such as “up to” reflects the uncertainty inherent in forecasting long-term induced job growth for a project of this scale. Actual employment levels will depend on factors such as market demand, build-out timing, and operational needs, which cannot be predicted with precision at this stage. Estimates are provided to disclose the potential range of outcomes without overstating certainty.

Socioeconomic Comment 25:

The DEIS should include an analysis of how the Project will reduce and prevent poverty, including child poverty. Micron should commit to actions that reduce poverty, especially child poverty, in Onondaga County and the City of Syracuse.

Response: The comment, which is focused on existing conditions, goes beyond what is required by NEPA and SEQRA. Notwithstanding, FEIS Section 3.15.2.1 provides an analysis of poverty rates within the local and regional study areas while FEIS Appendix Q, Tables Q-2 through Q-10 provide additional population and demographics data for the local study area. Further, as discussed in FEIS Section 3.15.3.2, increased economic activity due to the presence of the Proposed Project, as well as anticipated investments into educational resources through the Green CHIPS CIF, create the potential for reduced poverty and increased employment opportunities. See also Response to Socioeconomic Comment 4, for discussion of the economic benefits of the Proposed Project.

Socioeconomic Comment 26:

The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g., education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers.

Response: See Responses to Socioeconomic Comments 8 and 39.

Socioeconomic Comment 27:

Micron should implement targeted housing mitigation measures with a regional housing mitigation fund and dedicated staffing.

Response: FEIS Section 3.15.4 discusses mitigation measures to address the Preferred Action Alternative's has the potential to result in a short-term significant adverse effect on housing. Although Micron does not control the housing market and cannot specifically mitigate such effects, Micron will continue to work with agencies and local stakeholders to identify specific actionable measures to avoid or minimize the potential for this short-term significant adverse effect on the local housing market. As detailed in Chapter 4, there are already a number of planned projects in the study area that would increase housing supply within those communities that are predicted to experience induced growth from the Proposed Project and, therefore, may serve to reduce rent pressures within the local and regional study areas. Over time, the production of additional housing including affordable housing, would avoid the potential for long-term significant adverse effects due to rent increases. Micron has provided funding for the Community Investment Fund, of which housing initiatives are a priority for funding awards. See FEIS Appendix R-2. See also Response to Socioeconomic Comment 19, discussing state housing and funding initiatives.

Socioeconomic Comment 28:

A commenter is concerned that the number of Micron employees during operation will decrease with future advances in technology, providing less job benefits than stated in the DEIS.

Response: The FEIS provides projections of the direct (on-site) operational jobs at the Micron Campus. As demonstrated in Figure 3.15-4, operational jobs are projected to steadily increase as fabs are brought online over the Proposed Project's full build. By 2041, with four fabs in operation, there would be approximately 8,200 permanent on-site operational jobs. When at full operational capacity in 2045, the Proposed Project would generate approximately 9,000 permanent on-site operational jobs. Concerns raised about decreased operational jobs at the Micron Campus are speculative and contradict the analysis of reasonably foreseeable circumstances provided in the FEIS.

Socioeconomic Comment 29:

A commenter requested information on whether local governments have analyzed how local and regional areas will support housing for the initial wave of in-migrating Micron workers.

Response: Local housing policies and related regulations will largely determine the capacity and flexibility of areas to accommodate in-migrating Micron workers. FEIS Appendix D-3 summarizes the public policies related to land use and planning in the local region (e.g., local comprehensive, land use, and transportation plans), including the Onondaga County Comprehensive Plan (2023)

and the draft Vision Cicero. Beyond the policies highlighted in Appendix D-3, the assessment of socioeconomic impacts was informed by a range of studies providing additional context, including the Syracuse Housing Strategy (2024), Plan Onondaga (2023), City of Syracuse Comprehensive Plan 2040 (2012), Vision CNY (2020), and the Central New York REDC Report (2022). See Appendix Q for further information on these resources.

Socioeconomic Comment 30:

A commenter requested clarification of whether the term “existing rental units” refers only to housing that is currently habitable and available or also includes the many units in the City of Syracuse and nearby villages that are vacant or underutilized due to disrepair and long-term disinvestment. What measures will be used to promote urban residency?

Response: Existing rental units refers to the number of units that are available and suitable for occupancy. FEIS Appendix Q presents detailed data on housing vacancy status sourced from the U.S. Census Bureau’s American Community Survey (ACS) 2019-2023 5-Year Estimates. Additional discussion of the City of Syracuse and deferred maintenance can be found in FEIS Section 3.15.3.2 Growth Inducing Effects (Real Property and Housing).

The introduction of a major employer within commuting distance of Syracuse—an area with available housing and urban amenities attractive to those seeking an urban lifestyle—would generate induced employment both within Syracuse and in surrounding communities accessible by commuting. As shown in FEIS Table 3.15-5, by 2041, the City of Syracuse is projected to experience the largest number of project-related induced households among municipalities in Onondaga County. Within urban cores like Syracuse, the resulting increase in housing demand could help to address longstanding issues related to deferred housing maintenance. Higher demand can also be expected to spur the development of new housing throughout the region, including housing types that have historically been underdeveloped in the region. See FEIS Section 3.15.3.2. See Response to Socioeconomic Comment 6, for discussion of support for induced growth. See also Response to Socioeconomic Comment 19, discussing state funding support and initiatives for local and regional housing.

Socioeconomic Comment 31:

Commenters requested clarification on the methodology or contingencies used to model population growth in the local and regional study areas.

Response: As stated in FEIS Section 4.3.15.1, “[t]o assess the potential magnitude of cumulative population effects at a community level, this assessment utilizes ranged estimates of cumulative household growth at the town and county levels based on SMTC growth projections for the Syracuse Metropolitan Planning Area (MPA), which is inclusive of known planned projects such as those in Table 4.2-1, as well as residential growth projections for the regional study area from the 2022 REMI Study.” SMTC growth projections are official forecasts prepared by the regional planning agency using established methodologies. These forecasts are the standard data sources required for environmental review and provide a consistent basis for evaluating potential impacts. FEIS Appendix D-3 includes a detailed summary of the Syracuse Metropolitan Transportation

Council (SMTC) 2050 Long Range Transportation Plan 2020 Update. FEIS Appendix C provides additional detail on the methodologies used to model population growth in the local and regional study areas, including the approach and findings of the 2022 study prepared by REMI and sponsored by Empire State Development.

Socioeconomic Comment 32:

Information should be provided as to whether government subsidy levels and/or payments under PILOT agreements will be adjusted if the Proposed Project fails to provide the currently estimated on-site employment.

Response: As a Green CHIPS project, Micron must meet certain eligibility conditions and achieve job and investment commitments in order to be eligible for specific levels of refundable tax credits under Empire State Development's Excelsior Jobs Program. The refundable tax credits are directly calculated based on Micron's qualified expenditures and number of jobs and salaries created each year. Additionally, any PILOT agreement approved by the Onondaga County Industrial Development Agency is subject to possible termination and recapture of benefits for failure to meet required on-site employment numbers.

Socioeconomic Comment 33:

Commenter questioned whether the REMI Study utilized the population and household projection information from the 2022 amendment to the Syracuse Metropolitan Transportation Council.

Response: The REMI Study did not utilize the population and household projection information from the 2022 amendment to the Syracuse Metropolitan Transportation Council. See Response to Socioeconomic Comment 31. See FEIS Appendix C-2, providing the 2022 REMI Study methodology.

Socioeconomic Comment 34:

Micron should provide employees access to on-site childcare, pay equity and a diverse workforce that would be allowed to unionize.

Response: See Responses to Socioeconomic Comments 4, 8, and 39. The Proposed Project includes construction and operation of the Childcare Site, which includes a childcare center, recreation center, and healthcare center for Micron employees. See FEIS Section 2.1.3.

FEIS Section 2.1.1.6 discusses the projected labor force required for both construction and full-time operation of the Proposed Project. Section 3.15 (Socioeconomic Conditions) and Appendix Q also discuss construction employee considerations. As stated in FEIS Section 3.15.3.2, "Micron's partnership with various stakeholders in the community to scale the construction workforce including: partnering with CenterState Corporation for Economic Opportunity (CEO) and ESD to scale existing programs that train new construction workers and facilitate entry into the trades; partnering with the local Building Trades Unions to increase membership and encourage training opportunities on semiconductor-specific construction skills; and planning to

provide training and certifications through suppliers and distributors for semiconductor-specific construction skills, such as specialty welding skills.”

Micron has also entered into a Project Labor Agreement with local trade unions, which establishes a framework for labor-management cooperation and stability throughout construction. This agreement outlines the use of the Center for Military Recruitment, Assessment and Veterans Employment and its “Helmets to Hardhats” program. See FEIS Appendix Q-3.1.

Socioeconomic Comment 35:

Micron should partner with unions and community organizations for workforce development.

Response: See Responses to Socioeconomic Comments 8 and 34.

Socioeconomic Comment 36:

Commenters are concerned about adverse impacts to local school funding as a result of tax abatements granted by IDAs.

Response: See Responses to Socioeconomic Comments 4, 12, and 25.

Socioeconomic Comment 37:

The Final EIS should evaluate whether there are an adequate number of qualified contractors and rail-accessible aggregate availability to be able to handle all this construction under the schedules presented.

Response: The FEIS evaluates construction schedules, workforce requirements, and potential environmental impacts associated with the Proposed Project. See FEIS Section 3.15. While the FEIS identifies the number of construction workers needed and the overall sequencing of construction activities, procurement of available contractors or rail-accessible aggregate supplies are operational and commercial matters that will be managed by the project sponsor and relevant suppliers during the construction process. See also Responses to Socioeconomic Comments 4 and 18, discussing Micron and state commitments to address labor shortages.

Socioeconomic Comment 38:

General concerns were raised about increased real property tax liabilities for existing residents due to increased property values as a result of the Proposed Project. Existing housing values will increase because of the Proposed Project thereby increasing property taxes.

Response: See Responses to Oswego County Comment 24 and Socioeconomic Comment 19, discussing state initiatives for housing in the region. Notwithstanding, economic impacts, such as impacts to the value of individual homes, are beyond the scope of NEPA and SEQRA.

Socioeconomic Comment 39:

Micron should make training and apprenticeship commitments enforceable, with clear eligibility, partnerships, and targeting of marginalized workers.

Response: See also Responses to Socioeconomic Comments 4 and 8. Micron's multibillion dollar investment reflects a strong commitment to staying and growing in the area, as it intends to establish and sustain operations in the region over the coming decades. As discussed in FEIS Section 2.1.16, construction of the Micron Campus will require approximately 4,200 construction workers on-site daily during peak periods, which are expected to last about six months for each fab. Once operational, each fab will employ at least 2,000 manufacturing workers, with staffing levels increasing as additional fabs come online. Labor market data indicates that around 2,000 local workers may be available for each construction phase, potentially reducing the need for crews to travel from outside the Clay, NY area. By 2045, when the campus reaches full production, the total operational workforce—including manufacturing, business, and administrative staff—is projected to be 9,005 employees, with a residual construction presence of approximately 300 workers.

In the Community Investment Framework (CIF), Micron has pledged to work with state and local partners and construction contractors and subcontractors to establish a target percentage of the construction workforce to be from disadvantaged populations. Specifically, Micron has committed to use good faith efforts to achieve 30% of eligible construction spend from eligible categories with businesses owned by socially and economically disadvantaged individuals (SEDI). Micron is partnering with ESD to identify business and industry specific skills that could benefit the small businesses who are interested in these opportunities and help them with navigating through existing and new resources, such as gaining access to capital and bonding. Additionally, Micron has committed to establishing a target percentage of permanent hires for facility operations to be made from targeted census tracts and historically disadvantaged populations. See EIS Appendix Q.

Micron has also pledged to use good faith efforts to achieve 20% of eligible operating spend with SEDI-owned businesses. To ensure that these goals are met, Micron will require applicable Tier 1 and Tier 2 suppliers to establish spend goals on their contracts as well. Micron and its general contractor hosted an opportunities and awareness session for local and diverse subcontractors, vendors, suppliers, and professional service providers in Syracuse.

Micron's commitments to local community colleges have already been realized. In 2023, Governor Hochul unveiled plans for a new state-of-the-art cleanroom simulation lab at Onondaga Community College (OCC) made possible by a \$5 million grant from Micron, the largest ever single donation in OCC history. Students at OCC and other SUNY community colleges can also take advantage of Micron's new internship program that provide hands-on, experiential learning for New York students in either its Boise, Idaho or Manassas, Virginia fabs, in preparation for joining the Clay, NY fab once the facility is operational.

In addition, the \$200 million ON-RAMP program will build four new workforce development centers in strategic, high impact locations across upstate New York. The South Side of Syracuse will be home to the state's flagship ON-RAMP Center and will provide robust wraparound services to connect diverse and skilled New Yorkers with careers in dynamic, high-growth advanced manufacturing industries like semiconductors.

Socioeconomic Comment 40:

Commenters requested data to support the conclusion that adverse impacts on housing and rent prices will be temporary, including in environmental justice communities. Commenters requested that impacts to housing and rent be considered permanent and properly evaluated.

Response: The FEIS's impact assessment of the housing market utilized data from the U.S. Census Bureau, sales and price data from Redfin, and a variety of housing studies from local governments and the Central New York Regional Economic Development Council (see Appendix Q, Section Q-2.2 for more information on these sources). As described in FEIS Section 3.15.3.2, Growth Inducing Effects, Real Property and Housing, "while there would be rent pressures attributable to the Proposed Project's induced growth in markets beyond the local study area, the projected growth within regional communities is more disperse, and in larger part attributable to non-Micron induced growth that would not be as immediate, allowing time for regional markets to respond to the increased demand through new housing production. Areas which are highly desirable to the incoming populations may see larger rent and home price increases; different communities may experience these increases at different temporal scales, although the property market should be expected to react to the new demand within approximately four years." Determining the precise timing of market reactions to new demand would be largely speculative and not necessary for determining the potential for significant adverse impacts under SEQRA and NEPA. However, higher demand for housing can be expected to spur further development in a variety of housing types and geographies, including in areas like the City of Syracuse, where a portion of the housing stock has been rendered unavailable due to deferred maintenance resulting from low housing costs. See also Response to Socioeconomic Comment 19.

Socioeconomic Comment 41:

The DEIS estimate of 5,852 housing units currently planned for development falls far short of the 27,546 estimated to be required by Micron in migration. Further, none of the listed units have been designated as affordable.

Response: FEIS Table 3.15-5 states that the projected-induced households by 2041 is 27,546. Effects from induced growth, however, are anticipated to be experienced over time, as the Proposed Project will be constructed over a 16-year period. As discussed in FEIS Section 3.15.3.2, Growth Inducing Effects, Real Property and Housing, in-migrating workers would be expected to settle in local and regional areas, or beyond. "There are numerous communities within reasonable commuting distance of the Micron Campus (i.e., within approximately 45 minutes), such that demand pressures created locally would be alleviated to some degree by housing availability in

the broader regional study area.” See also FEIS Appendix Q, Table Q-37 (showing that the regional study area had 36,906 vacancies in 2023).

While FEIS Table 4.2-1 provides a list of known economic development projects anticipated for completion within the regional study area, primarily in Onondaga County, it is anticipated that the induced growth from the Proposed Project will spur future housing developments throughout the region to accommodate long-term estimated population projections. See also Response to Socioeconomic Comment 19, providing a discussion of state funding for local and regional housing initiatives, and Response to Socioeconomic Comment 22, providing a discussion of anticipated future housing developments.

Socioeconomic Comment 42:

Commenter requested information on whether the Micron in-migration can be accommodated before permits are issued for this project. Have Towns expressed support for or against these residential growth projections? And if so, include this evidence to document each towns’ concurrence or disfavor.

Response: The FEIS incorporates available information from local comprehensive plans and land use studies, including the Town of Clay Northern Land Use Study and Town of Cicero Comprehensive Plan, which identify growth trends and policies relevant to accommodating potential population increases. The FEIS further acknowledges that actual residential growth is subject to separate municipal approvals, permitting processes, and market dynamics. FEIS Section 3.15.3.2. While the Towns of Clay, Cicero, and surrounding municipalities have provided input during the environmental review process, the FEIS does not serve as a mechanism to formally approve or disapprove housing developments.

Various municipalities also commented in favor of the Proposed Project as part of the comment period on the Draft EIS. See, e.g., Response to Oswego Comment 1; Response to Clay Comment 1; Response to Syracuse Comment 5.

Socioeconomic Comment 43:

A commenter noted that recent changes to wetland regulations have affected the ability of the City of Troy to build planned residential housing units. The DEIS accounts for the need for new housing but does not account for the combined effect of wetland restrictions, infrastructure capacity, and transportation network changes on where new housing can be built. The commenter requested regulatory flexibility to address housing needs.

Response: Decisions regarding regulatory flexibility, wetland permitting, and local housing approvals fall under the authority of the relevant federal, state, and local agencies and are outside the scope of the FEIS. See also Response to Socioeconomic Comment 22, providing a discussion of anticipated future housing developments.

Socioeconomic Comment 44:

The DEIS failed to take into account that some migrating workers will bring their families to the area, while others will not, and that some temporary workers may choose to stay permanently.

Response: See Response to Socioeconomic Comment 4. The FEIS accounts for population growth and workforce in-migration in the local and regional study areas using planning-level projections. These projections incorporate estimates of household formation and population change resulting from the Proposed Project and Connected Actions. While it is possible that some migrating workers may bring families, and some temporary workers may remain permanently, the FEIS uses reasonable assumptions based on available demographic data to estimate the likely population and household growth. These assumptions are intended to capture the range of potential environmental effects without requiring precise tracking of individual decisions, which are inherently uncertain. See Response to Socioeconomic Comment 31, discussing methodology for modeling data.

Socioeconomic Comment 45:

The REMI Report states that the Proposed Project will result in 44,943 jobs in the regional area by 2055, with 5.5 jobs created for every 1 Micron job. Assuming 2.31 persons per household and 1 Micron worker per household, this would result in a population growth of over 100,000 people and 49,500 jobs if 5.5 jobs created for every one Micron. The DEIS failed to acknowledge this discrepancy in the data.

Response: There is no discrepancy. The 2022 REMI Study states on page 3, “[f]or every direct company hire, there would be about 5.5 other jobs created in the state economy.” In contrast, the FEIS reporting of jobs creation was specific to the local and regional study areas, not the entirety of New York State. FEIS Section 3.15.3.2 Growth Inducing Effects, Labor and Employment, states, “[w]hen accounting for both supply chain jobs and jobs at businesses supporting household spending, based on projections from the REMI Study, the Proposed Project could induce over 3.5 jobs in the region for every job created on-site.”

In addition, not all direct, indirect, and induced jobs created will be filled by in-migrating workers. Rather, many of the jobs created by the Preferred Action Alternative would be filled by existing local residents; local resident-workers and their families would not grow the population, as they are already part of the existing regional population.

Socioeconomic Comment 46:

A commenter raised a concern that converted farmland for wetland mitigation in Oswego County will be taken off the tax rolls, and that tax revenue will be lost.

Response: See Response to Oswego Comment 6.

3.16 Environmental Justice

Environmental Justice Comment 1:

General comments were made that the Project is inconsistent with the CLCPA's disadvantaged community requirements. General comment was made that the Proposed Project and Connected Actions will disproportionately impact potential environmental justice areas (PEJAs)/disadvantaged communities (DACs) and low-income and minority communities.

Response: Section 7(3) of the CLCPA requires all state agencies to ensure its permitting decisions will not disproportionately impact disadvantaged communities (DACs). See Response to Environmental Justice Comment 7. DACs are identified by using NYSDEC's Disadvantaged Communities Assessment Tool (DACAT). The closest DAC to the Proposed Project is five miles south in the North Syracuse area. As such, the NYSDEC, in accordance with its guidance, has determined that there are no DACs that will be disproportionately burdened by the Proposed Project.

As detailed in FEIS Section 3.16, a full analysis of the potential impacts of the Proposed Project and Connected Actions on DACs as well as low-income and minority communities within the study area was conducted in compliance with all applicable state laws, regulations, and policies. See FEIS Table 3.16-1. The study area was selected as the area with the greatest potential for adverse effects and informed the public outreach process. See FEIS Section 3.16.2. Although this expansive study area was selected to be inclusive and to include study areas from other technical analysis, the potential adverse effects from construction and operation of the Preferred Action Alternative on DACs and minority or low-income communities are expected to be limited to within an approximately 5-mile radius around the Proposed Project sites, and a ½ mile of the Connected Actions. See FEIS Section 3.16.3.2.

As outlined in FEIS Section 3.16.2.3, DACs, low-income and minority communities within the study area were designated. The DACs largely overlap with the identified minority and low-income communities (see Figure 3.16-2). See Appendix R-1 for a detailed summary of the burdens and vulnerabilities for each DAC in the study area.

As summarized in FEIS Section 3.16.3.3, "when analyzing the associated DAC burdens at or above the 80th percentile, the Preferred Action Alternative would not cause or increase a disproportionate burden from construction or operation of the Proposed Project or Connected Actions. Similarly, in the low-income and minority communities identified within the study area, the Preferred Action Alternative would not cause or increase a disproportionate burden within those communities, except a potential temporary adverse impact on housing and rent pricing. Instead, the Preferred Action Alternative would produce beneficial effects for the local and regional communities, including identified DACs and minority and low-income communities, by generating thousands of new jobs both on- and off-site through business-to-business supply chain services, stimulating local and regional development through induced residential and worker spending, generating additional tax revenues and, over the 20-year term of the Green CHIPS

Community Investment Fund (CIF), by investing \$500 million in local and regional initiatives that advance identified community needs.”

Environmental Justice Comment 2:

There was insufficient outreach to environmental justice, disadvantaged or underserved communities.

Response: A summary of Micron’s public outreach program to DACs and low-income and minority communities is provided in FEIS Appendix R-2. In addition to the public outreach and comment periods required by SEQRA, Micron provided enhanced public outreach to identified DACs, low-income and minority communities within a defined radius of the Proposed Project and Connected Actions. Specifically, prior to the SEQRA scoping process, Micron conducted two environmental justice focus groups to provide communities with an overview of the Proposed Project and next steps for environmental review, solicit feedback on Proposed Project elements, and gain an understanding of community priorities. These focus group events were attended by over 30 individuals from various environmental and community-based organizations in the greater Syracuse metro area. Micron led an additional 16 public outreach events to DACs and low-income and minority communities, including a site walkthrough with Tribal Nations representatives and various community education opportunities. These events are outlined in FEIS Appendix R-2. Concerns raised during public outreach events were considered and weighed in the development of the DEIS. Further public outreach, including to DACs and low-income and minority communities, will continue during construction and permitting, as appropriate.

In addition, extensive public outreach has been conducted through the Central New York Community Engagement Committee (CEC), which is made up of local stakeholders to ensure meaningful participation in the oversight of Micron’s investments in the local and regional communities. See FEIS Appendix R-2. The CEC outreach included a comprehensive representation of the region’s diverse communities to ensure that underrepresented and marginalized groups were integrated into the planning process. The Committee provided materials in Spanish and employed bilingual facilitators.

The CEC engaged in public hearings, focus groups, one-on-one interviews, and online surveys to identify and compile local priorities for inclusive growth and benefits to the greater Central New York region. 12,734 residents and over 316 local organizations participated in the CEC’s engagement efforts. These engagements included:

- Public events and meetings attended by over a thousand Central New Yorkers
- Canvassing efforts in communities across the region
- Presentations both online and in person
- Focus groups targeted at diverse and underrepresented groups
- Digital engagements, including regular mass emails, online surveys, and a website available in both Spanish and English

The Committee's findings were published in the [Community Priorities Document](#) (CPD) published in June 2024. The CPD represents the strategic framework to help guide the \$500 million Green CHIPS Community Investment Fund (CIF) towards the community's most pressing needs and goals. The CIF was created in partnership with ESD with Micron contributing at least \$250 million, ESD contributing \$100 million, and the remaining funding being raised from local, statewide and national partners.

Environmental Justice Comment 3:

Community outreach to environmental justice communities must address barriers to participation, such as transportation, digital access and language.

Response: See Response to Public Review Comment 1. Neither technology nor transportation was a barrier to meaningful public participation. The DEIS was made available to the public in multiple formats. Electronic versions were available on OCIDA's and CPO's websites through links on Micron's website. Paper copies of the complete DEIS, with appendices, were also available for public review at OCIDA's offices as well as at both the Town of Clay and Town of Cicero municipal offices, and the Onondaga County Public Library, in the main branch at 447 South Salina Street. Computer access was not needed to review the document. In addition, computer access was not needed to participate in the comment process. In addition to email, comments were accepted at the OCIDA mailing address and in-person. Indeed, some commenters participated by submitting letters and postcards.

See Response to Public Review Comment 10; Response to Environmental Justice Comment 2.

Environmental Justice Comment 4:

General concerns that the environmental justice analysis in the DEIS is deficient because it should have analyzed a larger area around both the Proposed Project and Connected Actions for its effects on environmental justice, especially given that this is one of the largest development projects in NYS history.

Response: See Response to Environmental Justice Comment 1. The study area was established consistent with current New York State laws, regulations, guidance and policies. See FEIS Table 3.16-1. As described in FEIS Section 3.16, the study area was defined using census tract and block group data to identify DACs and minority and low-income communities most likely to experience direct or reasonably foreseeable indirect impacts from the Proposed Project and Connected Actions. See FEIS Sections 3.16.2, 3.16.3.2. Further detail on methodology and geographic boundaries is provided in Appendix R-1, which documents the demographic analysis, data sources, and the rationale for the delineated study area.

Environmental Justice Comment 5:

Micron should quantitatively and specifically evaluate the long-term impacts of growth inducing effects on environmental justice.

Response: See also Response to Environmental Justice Comment 1. The growth inducing effects from the Proposed Project on low-income and minority communities and DACs within a 5-mile radius of the Proposed Project and 1/2-mile radius of the Connected Actions is provided in FEIS Section 3.16.3.2, Growth Inducing Effects. As detailed in that section, the Preferred Action Alternative is expected to generate long-term benefits for DACs and minority, and low-income communities through job creation, workforce training, and investments via the Green CHIPS Community Investment Fund. While some short-term pressures on housing and rents may occur, these effects are expected to be temporary and mitigated over time through increased housing supply and local planning initiatives. Overall, induced growth could increase demand for services such as police, fire, and healthcare, but these impacts are anticipated to be manageable and not disproportionately affect DACs or low-income and minority communities. The project is not expected to result in a disproportionate pollution burden, and long-term economic and social benefits are projected for the study area.

Environmental Justice Comment 6:

The DEIS should address how air emissions may exacerbate pre-existing air quality concerns in DACs.

Response: The impacts on air quality from the Proposed Project and Connected Actions were analyzed and discussed in FEIS Section 3.6. The analysis of air quality impacts in DACs and low-income and minority communities is in accordance with applicable NYSDEC guidance and policy documents and state law (see Table 3.16-1). Section 3.16 considered whether the Proposed Project and Connected Actions would cause or increase a disproportionate pollution burden on DACs and low-income and minority communities within the study area. As discussed in Section 3.16.3.2, impacts to air quality from the project are an effect common to all DACs and minority or low-income communities within the study area, since many of the effects would be the same or similar across this distance. The primary source of air quality emissions associated with the Proposed Project is the Micron Campus, which represents over 90 percent of the emissions associated with the Preferred Action Alternative. The Micron Campus is not located within a DAC. The nearest DAC is approximately five miles away from the Micron Campus. As described in Section 3.6 (Air Quality), at all locations surrounding the Micron Campus, the Preferred Action Alternative would not result in an exceedance of the NAAQS. Furthermore, the dispersion modeling associated with the Preferred Action Alternative affirms that ambient pollutant concentrations are highest immediately adjacent to the Micron Campus and decrease with distance in all directions as one moves away from the Micron Campus. This confirms that pollution burdens are not disproportionate to any of the DACs within the study area.

Environmental Justice Comment 7:

Micron must evaluate how their contributions to climate change will affect environmental justice communities. CLCPA GHG and DAC compliance need to be evaluated.

Response: See Response to Environmental Justice Comment 1 and 6. As discussed in Section 3.16.3.2, while the Proposed Project would result in a significant adverse effect related to greenhouse gas emissions, these types of emissions contribute to global climate change, which is a regional issue and not specific to individual communities. Moreover, the nearest DAC is nearly five miles away from the Proposed Project sites. Micron has committed to controlling the direct GHG emissions from operation of the four fabs at the Micron Campus to maximum extent practicable. Therefore, the Proposed Project would not cause or increase a disproportionate pollution burden related to greenhouse gases on DACs within the study area.

The CLCPA is a separate analysis from the FEIS. In accordance with its guidance, NYSDEC has determined that there are no DACs that will be disproportionately burdened by the Proposed Project. A copy of Micron's CLCPA analysis is attached to the FEIS in Appendix J-2.

Environmental Justice Comment 8:

Micron should be required to report on where waste from the Project site will be transported to and evaluate the environmental justice impacts on these locations.

Response: See Response to Solid Waste & Hazardous Substances Comment 70, for discussion of disposal locations for solid waste and hazardous materials from the project.

The exact location of where waste will be disposed is not yet known, and Micron does not have control over the final destination of the waste. Any analysis of the environmental justice impacts of a disposal facility would be conducted as part of that facility's permitting/environmental review process.

While the Proposed Project may utilize existing landfills in and outside of the five-county region, the Proposed Project would follow all applicable regulations and would include waste minimization measures. Micron would be subject to Federal and State solid and hazardous waste management regulations, and would work with vendors to arrange for transportation, shipment, and disposal of waste at facilities authorized to receive industrial and other waste. Therefore, the Proposed Project is not anticipated to cause or increase a disproportionate pollution burden related to solid or hazardous waste on DACs or minority or low-income communities within the study area. See also FEIS Section 3.16.3.2.

In addition, all trucks loaded on the Micron Campus would exit the vicinity using only approved truck routes. These are the most appropriate routes and take into account: (a) limiting transport through residential areas and past sensitive sites; (b) prohibiting off-site queuing of trucks entering the facility; (c) limiting total distance to major highways; and (d) overall safety in transport.

At this point in time, however, generation of solid or hazardous waste or the use of hazardous materials from construction and operation of the Connected Actions would be limited or negligible

and would be subject to regulatory requirements. Therefore, the Connected Actions would not cause or increase a disproportionate pollution burden on DACs or low-income and minority communities within the study area related to solid or hazardous waste.

Environmental Justice Comment 9:

Micron should be required to develop a community-expert advisory and oversight committee that can assist with ongoing and meaningful community engagement. The community engagement to date was insufficient.

Response: See Response to Nation Comment 35. See also Response to Environmental Justice Comment 2, discussing the sufficiency of public outreach.

Environmental Justice Comment 10:

Commenters stated that a Supplemental EIS should be prepared that evaluates cumulative burdens on DACs. The DEIS fails to conduct a cumulative burden analysis as required under NYSDEC Commissioner Policy 29 (CP-29) and pending SEQRA revisions.

Response: There is no need for a supplemental EIS. The Proposed Project would be located in the Town of Clay, New York, at the WPCP, which is not designated as a DAC. The closest DAC to the Proposed Project is five miles south in the North Syracuse area. Therefore, the Proposed Project is not likely to disproportionately burden or otherwise impact a DAC. In addition, NYSDEC Commissioner Policy 29 (CP-29) does not apply here as NYSDEC is not the lead agency.

Notwithstanding, the FEIS evaluated potential cumulative impacts on minority and low-income communities and DACs. See FEIS Section 4.3.16; see also Response to Cumulative Impacts Comment 9. As detailed there, none of the projects identified in Table 4.2-1 would be located within a low-income or minority community or DAC. The FEIS acknowledged that certain reasonably foreseeable housing, retail commercial, industrial, roadway improvement, transit improvement, regional trail network improvement, and infrastructure improvement projects may be located near a low-income or minority community or DAC and therefore have the potential to adversely affect it. The exact impact of certain impacts would be dependent on the nature and extent of ultimate development. However, many of the projects identified in Table 4.2-1 would have anticipated benefits for low-income and minority communities and DACs.

As such, there is no need, nor regulatory requirement, to prepare a supplemental EIS to further assess potential cumulative impacts on DACs and low-income and minority communities in the study area. Any future development in the regional area is anticipated to undergo SEQRA review and comply with applicable and enforceable state laws, regulations, guidance and policies regarding environmental justice.

Environmental Justice Comment 11:

A commenter stated that the “Environmental Justice” section has been removed as an environmental impact category in the DEIS.

Response: The comment does not accurately reflect the FEIS. FEIS Section 3.16 provides an assessment of the Preferred Action and No Action Alternatives’ potential to result in effects on DACs and minority or low-income communities within the study area, in accordance with New York State laws, regulations, guidance and policies. This section was also provided in the DEIS.

Environmental Justice Comment 12:

The DEIS does not ensure low-income communities will have meaningful access to workforce training and employment at the Micron facility, including transportation to the facility.

Response: See Response to Socioeconomic Comment 39, for discussion of training. See Responses to Socioeconomic Comments 4 and 8, for discussion of the hiring of local employees.

See Responses to Transportation Comments 17 and 18. Once operations at the site begin, Micron’s intent is to provide transportation services bringing individuals to Micron and surrounding supporting businesses.

Environmental Justice Comment 13:

Micron should address housing displacement risks for marginalized and low-income communities.

Response: See Response to Socioeconomic Comment 19.

Environmental Justice Comment 14:

The DEIS fails to assess the impacts of Connected Actions on environmental justice communities.

Response: See Response to Environmental Justice Comment 1. FEIS Section 3.16.3.2 assesses the impacts of both the Proposed Project and the Connected Actions on identified low-income and minority communities and DACs within the study area (within a 5-mile radius of the Proposed Action and 1/2 mile of the Connected Actions). See Response to Environmental Justice Comment 1. Table 3.16-2 summarizes the data provided in Appendix R-1 and provides a list of the DACs within the study area, along with their burdens and vulnerabilities at or above the 80th percentile compared to the rest of the tracts in the state. Figures 3.16–3, 4, and 5 depict the DACs and Minority or Low-Income Communities Near the Connected Actions. Section 3.16.3.2 directly addresses the construction and operational impacts to identified DACs or low-income and minority communities near the Connected Actions and whether the proposed action would cause or increase a disproportionate pollution burden on those communities. As stated in that section, “[b]ased on a review of the other technical resource analyses included in Chapter 3 of this EIS, it can be reasonably concluded that many of the DACs and minority or low-income communities within the

study area would be unaffected by the Preferred Action Alternative (aside from growth inducing effects, which are discussed qualitatively under “Growth Inducing Effects,” below).”

Environmental Justice Comment 15:

Micron should work with the appropriate government agency to establish an alternative Environmental Justice screening tool based on USEPA's screening tool that has been eliminated. This new screening tool can then be applied in the future to the facility.

Response: The creation or implementation of alternative screening tools is outside the scope of the FEIS. The environmental justice analysis presented in the FEIS relies on established methodologies and coordination with relevant government agencies and stakeholders to support ongoing consideration of environmental justice impacts, as appropriate. See FEIS Section 3.16.

Environmental Justice Comment 16:

The commenter stated that there is a need for oversight and concrete commitments from Micron that potential adverse effects to environmental justice communities must not unduly impact these communities even if the impact is not disproportionate.

Response: Micron will be required to implement all BMPs and mitigation measures detailed in the FEIS as well as comply with all applicable permit conditions and approvals and applicable federal, state and local laws. The lead agencies and permitting authorities will oversee these requirements. See also Response to Environmental Justice Comment 1.

Environmental Justice Comment 17:

The commenter requested direct and equitable allocation of Green CHIPS Community Investment Fund monies to DACs and low-income/minority communities, as well as transparency in the allocation of these funds.

Response: See Response to Socioeconomic Comment 4, for discussion of the Green CHIPS CIF. The Green CHIPS Community Investment Fund is administered by ESD and Micron and is designed to support projects that provide community benefits, including environmental, educational, and economic programs. See FEIS Appendix R-2. Decisions regarding the allocation of these funds, including criteria for transparency and equity, are determined and implemented by ESD and Micron in accordance with State guidelines and oversight procedures.

Environmental Justice Comment 18:

The commenter requested equitable support for all emergency services, including those located in DACs and low-income/minority communities.

Response: See Response to Community Facilities Comment 1, discussing impacts to local emergency services, as well as mitigation measures for impacts to fire services from induced growth. The Proposed Project is not expected to cause or increase a disproportionate pollution

burden on DACs or minority or low-income communities related to the availability of police, fire or healthcare facilities services. See FEIS Section 3.16.3.2; see also Sections 3.14.3.2 and 3.14.4.

Environmental Justice Comment 19:

One possible location for handling hazardous waste is an Overburdened Community under New Jersey law and is considered an environmental justice community.

Response: As explained in FEIS Section 3.8, for any hazardous waste generated, permitted private hazardous waste haulers would collect hazardous waste and bring it to facilities authorized by NYSDEC or analogous out-of-state regulatory agencies for disposal in accordance with RCRA regulations. The exact location of any sludge disposal location is currently uncertain given that operations are not expected for many years. Notwithstanding, the transport of all hazardous waste would be performed by permitted hazardous waste haulers and disposal of all hazardous wastes would occur at a RCRA-permitting treatment, storage, or disposal facility such that no adverse effects to the environment or surrounding communities are anticipated.

Environmental Justice Comment 20:

An environmental justice analysis should be conducted for the sludge disposal locations.

Response: See Response to Environmental Justice Comment 19. FEIS Section 3.8 explains that non-hazardous sludge from on-site wastewater treatment would be sent to a beneficial use vendor or recycled. See also FEIS Table 3.8-5.

Environmental Justice Comment 21:

Will there be environmental justice impacts within the Town of Dewitt? Include potential environmental justice impacts related to flight paths, air pollution, traffic, housing, from the new traffic patterns, and other.

Response: The Town of Dewitt is outside the study area for evaluating potential environmental impacts that was defined in the Final Scope. The study area was based on the determination that the potential for adverse effects from construction and operation of the Preferred Action Alternative on low-income and minority communities, as well as DACs, are expected to be limited to within an approximately 5-mile radius around the Proposed Project sites, and a ½ mile of the Connected Actions.

Notwithstanding, no significant impacts on DACs or low-income and minority communities would be anticipated in the Town of Dewitt. Even within the study area, the Preferred Action Alternative would not cause or increase a disproportionate burden from construction or operation of the Proposed Project or Connected Actions. Similarly, in the low-income and minority communities and DACs identified within the study area, the Preferred Action Alternative would not cause or increase a disproportionate burden within those communities, except a potential temporary adverse effect on housing and rent pricing. Instead, the Preferred Action Alternative would produce beneficial effects for the local and regional communities, including identified DACs, by generating thousands of new jobs both on- and off-site through business-to-business supply chain services,

stimulating local and regional development through induced residential and worker spending, generating additional tax revenues and, over the 20-year term of the Green CHIPS Community Investment Fund (CIF), by investing \$500 million in local and regional initiatives that advance identified community needs. See FEIS 3.16.3.3.

4.0 Cumulative Impacts

Cumulative Impacts Comment 1:

Cumulative impacts and Induced Growth from the Proposed Project are not adequately assessed. These impacts are simplistically dismissed as short term or as being worked out with time.

Response: The FEIS evaluates the reasonably foreseeable indirect (induced growth) and cumulative impacts of the Proposed Project. Each resource area discusses impacts associated with induced growth while Chapter 4 of the FEIS analyzes the cumulative effects of the Proposed Project and Connected Actions together with other ongoing and reasonably foreseeable future actions within the local and regional areas. Certain impacts will be short-term by their very nature while others will change over the 16-year construction timeline, which gives time for the potential adverse impacts to be avoided or mitigated. For example, as discussed in FEIS Section 4.3.14, the anticipated increase in demand for community services will ramp up as each fab is constructed and becomes operational. This ramp up period will allow communities to prepare and secure any necessary additional revenue through increases in tax revenue.

Cumulative Impacts Comment 2:

It is unclear whether the entire growth induced effects of population increases are being considered as cumulative in the cumulative effects analysis.

Response: The FEIS utilized estimates of cumulative household growth at the town and county levels based on SMTC growth projections for the Syracuse Metropolitan Planning Area (MPA) which are official forecasts prepared by the regional planning agency using established methodologies. These forecasts, which are the standard data sources required for environmental review and provide a consistent basis for evaluating potential impacts, were used to assess induced growth effects on resources throughout FEIS Chapter 3 (see induced growth discussion of each resource) and FEIS Chapter 4 (Cumulative Impacts) where relevant.

Cumulative Impacts Comment 3:

The DEIS fails to assess cumulative impacts of PFAs, industrial greenhouse gases and extremely hazardous substances in the cumulative effects analysis. The project is expected to attract related activities, including research and development, chemical suppliers and competitors and these other facilities may release hazardous substances to the environment, including the County wastewater system. The DEIS should analyze and mitigate for cumulative impacts for hazardous substance use, storage and release from all sources.

Response: Cumulative impacts are assessed in FEIS Chapter 4 for actions that are ongoing and reasonably foreseeable to occur and are based on available and relevant information.

Specific potential PFAS uses and releases from various commercial and residential uses cannot be known given the ubiquitous nature of PFAS and are not reasonably determinable at this time. Notwithstanding, other future projects will be required to comply with applicable wastewater discharge limits and requirements as well as all applicable laws and regulations regarding the use, storage, disposal and emissions of PFAS and chemical compounds. See also FEIS Appendix L-1.

Cumulative Impacts Comment 4:

Those projects that are listed in Table 4.2-1 are considered as contributing to cumulative effects, but certainly there will be cumulative effects of the entire growth induced housing. The expanded population with related needs for transportation and commercial purposes are growth induced effects as well as cumulative. It should be made clear whether or not the cumulative impacts of greenhouse gas emissions from the induced households have been included in the cumulative impacts section.

Response: Impacts associated with induced growth are assessed in each resource area section of the FEIS. Chapter 4 then evaluates the cumulative impacts of the projects identified in Table 4.2-1, the Proposed Project and induced growth. As a result, the FEIS does consider the induced growth effects and cumulative effects for all resources areas, including housing, transportation and greenhouse gas emissions. See, e.g., FEIS Section 3.7.5; FEIS Section 4.3.7.

Cumulative Impacts Comment 5:

One specific area of confusion is in section 4.3.7.2 mobile source greenhouse gas emissions; here the statement is made that mobile source greenhouse gas emissions for the preferred action alternative which includes induced growth will result in higher mobile source greenhouse gas emissions compared to the no action alternative. But it is unclear if those greenhouse gases only include transportation related impacts, or do they include stationary impacts of housing for the growing population.

Response: See Response to Cumulative Impacts Comment 4.

Cumulative Impacts Comment 6:

Micron should assess the cumulative impacts of PFAS use and discharge from the Proposed Project with the broader contamination of PFAs within the region. PFAs already contaminate multiple sites within the vicinity of the project, which increased potential for cumulative exposure. The DEIS never evaluated the cumulative PFAs impacts from this project and other development likely to be undertaken as a result of the project, which violates SEQRA.

Response: See Response to Cumulative Impacts Comment 3 and FEIS Appendix L-1, addressing cumulative PFAS impacts.

Cumulative Impacts Comment 7:

SEQRA requires OCIDA to evaluate the cumulative effects of nearly 50 ongoing or reasonably foreseeable actions, including apartment units and homes, new commercial, retail and office space development, and industrial park on a 105-acre site owned by OCIDA.

Response: FEIS Chapter 4.0 Cumulative Effects, Table 4.2-1 identifies the present and reasonably foreseeable actions, in the immediate vicinity of the Proposed Project, and Table 4.2-1 identifies present and reasonably foreseeable actions in the five-county area, that have bearing on the potential impacts of the Preferred Action Alternative. The actions identified include developments such as apartments, homes, commercial, retail and industrial developments, as well as the White Pine Science & Technology Park, which is the 105-acre site referenced by the commenter.

Cumulative Impacts Comment 8:

OCIDA should conduct an economic impact analysis of the cumulative impacts of all the businesses that will likely come to the region as a result because of the Proposed Project.

Response: See Response to Cumulative Impacts Comment 1. While additional businesses may choose to locate in the region because of the Proposed Project, conducting a separate economic impact analysis for all potential future businesses would be speculative, and is not required. Notwithstanding, the FEIS considered the 2022 REMI Study. The REMI Study analyzed the economic and fiscal impact of the Proposed Project at the state and local levels, specifically including how the capital expenditures, facility operations, and contractors would affect employment, economic output, Gross Domestic Product (GDP), disposable personal income, state government revenue, and local government revenue for New York and the Central New York model region in which Onondaga County is located.

Cumulative Impacts Comment 9:

There should be a thorough reassessment of the cumulative impacts on environmental justice communities.

Response: See Response to Environmental Justice Comment 10. Section 4.3.16 evaluated the potential for cumulative impacts on DACs and low-income and minority communities within the study area. As detailed there, none of the projects identified in Table 4.2-1 would be located in a low-income or minority community or DAC. Notwithstanding, the FEIS acknowledges that certain reasonably foreseeable housing, retail commercial, industrial, roadway improvement, transit improvement, regional trail network improvement, and infrastructure improvement projects may be located near a low-income or minority community or DAC and therefore have the potential to adversely affect it. The exact impact of certain impacts would be dependent on the nature and extent of ultimate development. However, many of the projects identified in FEIS Table 4.2-1 would have anticipated benefits for DACs and low-income and minority communities within the study area.

Cumulative Impacts Comment 10:

The cumulative effects review needs more details, for instance the impacts upon broadband, and floodplains and the potential for impacts from nearby material suppliers that may forgo closure because of the potential to supply materials to the Proposed Project, e.g., Lehigh Cement Company.

Response: The FEIS provides a comprehensive evaluation of cumulative impacts across all relevant resource areas, addressing potential interactions between the Proposed Action and other past, present, and reasonably foreseeable future actions. The comment proposes evaluation of impacts that are not reasonably foreseeable.

Cumulative Impacts Comment 11:

A commenter expressed interest in knowing what other businesses and/or developments have been announced since the announcement of Micron, and other downstream economic impacts.

Response: A list of current and reasonably foreseeable future actions in the local and regional project area, which have bearing on the impacts of the Preferred Action Alternative, can be found in FEIS Table 4.2-1 and Table 4.2-2.

5.0 Public Review**Public Review Comment 1:**

Concern was raised that many members of the community have difficulty in accessing the documents or have difficulty with or are unable to provide comment. There is a technological barrier or lack of understanding of the technology to provide meaningful comment.

Response: The DEIS was made available to the public in multiple formats. Electronic versions were available on OCIDA's and CPO's website, and through links on Micron's website. In addition to the electronic versions, paper copies of the complete DEIS, with appendices, were available for public review at OCIDA's offices. Paper copies were also available for review at both the Town of Clay and Town of Cicero municipal offices, as well as the Onondaga County Public Library, in the main branch at 447 South Salina Street. Computer access was not needed to review the document. In addition, computer access was not needed to participate in the comment process. In addition to email, comments were accepted at the OCIDA mailing address and in-person. Some commenters participated by submitting letters and postcards. Technology was not a bar to meaningful public participation.

Public Review Comment 2:

General concerns were raised that the public input will not influence final project decisions, or that the project is being pushed through the review process, and the outcome is predetermined or assumed. OCIDA is rushing the process and limiting input from the public. You're fast-tracking the largest industrial project in New York history with barely enough time to read the footnotes, let alone 20,000 pages of appendices. If you extend the comment period on the DEIS to 120 days and allow more public hearings for the public to comment on the plan, you will see that the public does not want Micron here or at least requires accommodations to be met before Micron's implementation.

Response: The environmental review of the Proposed Project has not been rushed. The outcome is not predetermined, and all public input will be considered by the lead agencies.

The environmental review has complied with the procedural requirements of NEPA and SEQRA. An EIS was required for the Proposed Project. Public scoping was conducted, during which time the public was invited to identify issues that should be addressed during development of the EIS. The lead agencies then worked closely with Micron, as well as the NEPA participating agencies and SEQRA involved agencies, to prepare a comprehensive DEIS. The public was then given 47 days to submit written comment, which exceeds that required by SEQRA. Three public hearing sessions were also held. See Response to Public Review Comment 4.

SEQRA regulations establish the process to consider environmental impacts early in the planning stages of actions that are directly undertaken, funded, or approved by local, regional, and state agencies. On July 20, 2023, OCIDA passed a resolution at a regular meeting designating itself as Lead Agency under SEQRA and classifying the proposed action as a Type 1 action for purposes of a coordinated SEQRA review, commencing the current SEQRA process. Over the course of the last two years, OCIDA has closely evaluated the potential significant environmental impacts of the Proposed Project and Connected Actions, providing the regulatorily required opportunities for public review and comment.

Further, prior to this review, OCIDA conducted multiple environmental reviews under SEQRA for the WPCP location, including the most recent review outlined in the 2021 Final Supplemental Generic Environmental Impact Statement where OCIDA studied the potential impacts of a semiconductor facility at the WPCP site. As such, the reasonably foreseeable environmental impacts of a semiconductor manufacturing facility at the WPCP location have been studied numerous times under SEQRA, and review of such impacts has not been rushed or subject to hasty decision-making. Public comments continue to be considered in this review, as well as previous SEQRA reviews.

Public Review Comment 3:

Commenters raised concerns that the 45-day comment period was inadequate to review the DEIS and provide meaningful comment. Commenters requested extension of the public comment period, some suggesting a 120-day review period or October 25, 2025. Some commenters referenced the size or number of pages in the DEIS and the Appendix to the DEIS, which must be read and understood. Commenters also mentioned that many

people are on vacation during this time of the year, or had other distractions, or are out of town, which further supports a request for extension of the comment period. The agencies have been working on the DEIS for over two years. Cutting the review process short disregards the public's right and responsibility to give informed input on something that will affect their future and future generations. The shortened review times have limited the public's participation.

Response: The lead agencies conclude that the public has had a meaningful and reasonable opportunity to comment on the Proposed Project. *See Jackson v. New York State Urban Dev. Corp.*, 67 N.Y.2d 400 (N.Y. 1986).

The DEIS was released for public comment on June 25, 2025, by OCIDA and June 27, 2025, by CPO, and the comment period closed on August 11, 2025. This resulted in a 47-day comment period during which the lead agencies held three public hearings over the course of one day, July 24, 2025. The 47 days provided exceeds the NEPA 45-day minimum comment period and the SEQRA 30-day minimum comment period.

During development of the DEIS, the lead agencies met and communicated with NEPA participating and coordinating agencies (including, but not limited to, the USEPA and U.S. Army Corps of Engineers) and other SEQRA involved and interested agencies (including, but not limited to, NYSDEC and NYDOT) to ensure that all reasonably foreseeable significant environmental impacts were identified and fully evaluated in the DEIS.

Despite comments that the DEIS was 20,000 pages, it was 719 pages, more than half of which were figures, maps, and tables. The majority of the 20,000 pages were appendices to the DEIS that include raw data supporting the DEIS as well as publicly available documents (e.g., Final SEQRA Scope) and permitting documents (e.g., air permit application, wetlands mitigation plan). Appendix M, the Traffic Mitigation Study, alone represents thousands of pages of raw data. The appendices also provide additional details on the methodology used to analyze impacts in the DEIS as well as existing conditions.

To date, the Proposed Project has been subject to extensive public scrutiny and will continue to be subject to additional public scrutiny and comment as local, state, and federal permits and approvals are processed for the Proposed Project. First, both OCIDA and CPO conducted public scoping. OCIDA released a Draft Scope for public comment on September 20, 2023. The comment period for the scoping process was extended beyond the minimum required 30 days from September 20, 2023, to October 31, 2023. During this period, OCIDA held a public scoping meeting on October 11, 2023, to obtain input from the public. *See FEIS, Appendix A-2.* Thereafter, a NEPA scoping period was held from March 5 to April 5, 2024, during which time a NEPA public scoping meeting was held on March 19, 2024. *See FEIS Appendix A-3.* The U.S. Army Corps of Engineers twice sought public comment on the Clean Water Act Section 404 applications submitted by Micron and the New York State Public Service Commission also had a separate comment period and hearing as part of National Grid's Article VII application. NYSDEC also conducted its own public comment period for Freshwater Wetlands, Incidental Take, and 401 Water Quality Certification applications, and will do so for the required air permit for the Proposed Project as will the Town of Clay for purposes of site plan approval.

This also is not the first time that the public has been given the opportunity to comment on development at the WPCP. OCIDA previously evaluated the siting of a semiconductor manufacturing facility at the WPCP as part of the 2021 Supplemental Generic Environmental Impact Statement (SGEIS). As part of that SEQRA review, OCIDA provided the public with 36 days to comment on the Draft SGEIS and also held a public comment hearing where everyone who registered or asked to speak was given the opportunity to submit a verbal comment.

Public Review Comment 4:

Commenters requested additional public hearings to allow more public input. Some commenters suggested conducting 5 public hearings.

Response: See Response to Public Review Comment 3. A public hearing is not required under NEPA or SEQRA. Notwithstanding, based upon the degree of interest in the Proposed Project and identification of significant adverse environmental impacts, the lead agencies determined that it was appropriate to conduct public hearings concerning the Proposed Project. Three public hearing sessions were held by the lead agencies to allow public input.

On July 24, 2025, three public hearing sessions were held over the course of the day at Liverpool High School, located in the Town of Clay. At each session, every person who wished to speak was given the opportunity to do so, with some individuals speaking more than once.

Public Review Comment 5:

Other commenters indicated it would be helpful to have public sessions to present the findings of the EIS and explain what the project means.

Response: See Response to Public Review Comment 4. NEPA and SEQRA do not require public sessions. The FEIS fully describes the Proposed Project and Connected Actions and includes both an executive summary as well as a summary of impacts to help facilitate the public's understanding of the action.

Public Review Comment 6:

The size and volume of the DEIS was a technique to distract review and comment on the DEIS. Micron and its enablers do not want transparency and we the public must just accept it is 'for our own good' This shows that you really don't care what local citizens have to say about something that will affect their homes and lives.

Response: The lead agencies considered the public and local citizen's concerns. The DEIS was approximately 719 pages and included a number of additional appendices that provided greater technical detail on the Proposed Project and the anticipated environmental impacts. The size was not meant to distract but rather to educate the public about the project, its potential environmental impacts, and the mitigation being proposed to minimize those impacts.

Public Review Comment 7:

Micron should commit to continued public review and input throughout the life of the Project.

Response: Micron and New York State have made strong commitments to the community, including the creation of a Community Engagement Committee. The Committee continues to meet regularly and engage the public and will continue to do so. See also Response to Empire State Development Comment 3; Nation Comment 35.

Public Review Comment 8:

The DEIS was noted to be “most exhaustive environmental analyses ever considered for a project in New York,” validating the multi-year extensive expert review and significant public input, including open houses and public hearings, our community’s extensive planning.

Response: Comment noted.

Public Review Comment 9:

Onondaga County held the DEIS for three months and that violates public notice laws—it should have been available to the public.

Response: No public notice laws were violated. The DEIS was released for public comment once it was determined to be complete by OCIDA. No prior version of the DEIS was required to be released to the public.

Public Review Comment 10:

The DEIS materials should have been provided in the Spanish language.

Response: Neither NEPA nor SEQRA require environmental documents to be translated. Based on federal guidance, translation of environmental documents is generally suggested when a substantial portion of the affected community would otherwise be excluded from meaningful participation.

As shown in Section 3.15.2.1 and Appendix Q-2.1 of the FEIS, the local study area has a population of an estimated 91,301 persons (USCB, American Community Survey 2023). FEIS Appendix R-1, Table R-3 provides the estimated number of persons (2,265) reported to have limited English proficiency (LEP). This equates to approximately 2.50% LEP population within the study area. Because the Spanish-speaking LEP population represents a very small percentage of the study area’s overall population and is not concentrated within the Proposed Project area, the DEIS was not translated into Spanish or any other language.

Public Review Comment 11:

Commenters expressed appreciation of the transparency and detail demonstrated in the DEIS. Commenters expressed appreciation for the opportunity to comment on the DEIS.

Response: Comment noted.

Public Review Comment 12:

There has been no response to the petition signed by over 1,500 residents of the region asking for an extended comment period.

Response: See Response to Public Review Comment 3.

Public Review Comment 13:

DEIS is thorough and provides sufficient detail to assess the project for decision-making. The commenter noted that he/she did not identify any fatal flaws or significant gaps.

Response: Comment noted.

6.0 General Comments

General Comments 1:

Commenter stated that the DEIS shows that Central New York is one of, if not the, best places in the world for critical, leading-edge semiconductor manufacturing.

Response: Comment noted.

General Comments 2:

Central New York will benefit from needed investments in regional infrastructure including water and wastewater systems, the electric grid and much-needed road and highway investments in Onondaga County's northern suburbs.

Response: Comment noted.

General Comments 3:

NY SMART I-Corridor noted that building the Micron Project in Onondaga County is both an economic opportunity and an environmentally responsible choice given New York State's strong state environmental standards.

Response: Comment noted.

General Comments 4:

Commenter noted that the current DEIS does not satisfy SEQRA’s “hard look” standard, nor does it allow the public and reviewing agencies to fully assess the environmental, social, and economic impacts of the project. Multiple commenters request that a Supplemental Environmental Impact Statement (SEIS) be prepared to correct the deficiencies in the DEIS.

Response: The DEIS provided the public and involved agencies with the necessary information to evaluate project impacts, alternatives, and mitigation measures. Under SEQRA, specifically 6 NYCRR § 617.9, an EIS must assemble relevant and material facts upon which an agency’s decision is to be made and must analyze the significant adverse impacts and evaluate all reasonable alternatives. The DEIS met those requirements and provided the public, and involved agencies, with the necessary information to evaluate project impacts, alternatives, and mitigation measures.

A lead agency has the discretion to require a supplemental EIS in limited circumstances. Here, the FEIS does include additional detail on certain topics in response to public and agency comments. However, the lead agencies find there is no need to prepare a supplemental EIS given that all reasonably foreseeable significant adverse environmental effects have been adequately addressed.

General Comments 5:

NY SMART I-Corridor noted that although the proposed project carries environmental impacts that must be carefully managed, it also presents significant opportunities, including thousands of well-paying jobs, strengthened national security, and long-term economic growth that will establish Upstate New York as a national leader in this critical industry.

Response: Comment noted.

General Comments 6:

NY SMART I-Corridor commented that Micron’s impact will be substantial: up to 9,000 direct jobs, more than 50,000 additional regional jobs, and \$100 billion in private investment over the next two decades. With thoughtful mitigation strategies in place, these economic benefits can be achieved in an environmentally responsible way.

Response: Comment noted.

General Comments 7:

If the project is a good fit for the community, then almost everyone will be supportive. If it is not, it should be modified, or in extreme cases, should not be built. Orange County is already saddled with a huge gas power plant that was never properly permitted but was built anyway. Once something is built, it is very hard to undo the momentum, so despite ongoing hardship and protest, everyday residents are forced to live with it.

Response: Comment noted.

General Comments 8:

The final EIS should ask that the plan include ways that local experts can voluntarily suggest potential solutions that allow the potential for creative best practice, practical and creative ideas, based on local conditions.

Response: The FEIS process follows specific regulatory requirements and methodologies that guide how alternatives and mitigation measures are evaluated. During development of the FEIS, technical experts at the federal and state level were engaged to review and provide comments on the DEIS. In addition, the DEIS was subject to a public comment period during which the public was invited to comment and provide recommendations. There are also separate permitting processes that are occurring where the public either has or will be able to provide comments. See also Responses to Public Review Comments 2 and 3.

General Comments 9:

Executive Director for New York State's first ever regional STEAM High School in the Syracuse City School District, expressed sincere appreciation for Micron's unwavering commitment to education in the region, noting that Micron has been a wonderful partner in helping us get this transformative project off the ground.

Response: Comment noted.

General Comments 10:

President of Onondaga Community College detailed the college's experience with Micron Technology and how it is having a positive impact on the lives of students of all ages at Onondaga Community College.

Response: Comment noted.

General Comments 11:

Executive Director of the Central New York Regional Planning and Development Board commented on the Micron Project's consistency with community planning and noted that the area has the infrastructure, people, education, resources, healthcare, public safety, environmental resources, and public commitment to make the Micron Project a success.

Response: Comment noted.

General Comments 12:

A representative of the Onondaga and Cortland-Madison BOCES noted that Micron has been a fantastic partner over the last couple of years and that the company has taken the time to communicate with O.C.M. BOCES about its workforce development needs. The representative further stated that it is encouraging work with Micron, which is willing to

be a learner and to help B.O.C.E.S. know the skills needed to help workers have what they need know to be successful.

Response: Comment noted.

General Comments 13:

The C.E.O. of Center State, a Regional Chamber of Commerce and Economic Development Organization in Central New York, discussed the hope surrounding the Micron Project, noting recent meetings focused on individuals, mostly from minority women owned businesses, who are hoping to grow their businesses alongside the Micron Project and are excited for the project. He also commented on the large number of business members and nonprofit members that believe that the area is well suited for the Micron Project.

Response: Commented noted.

General Comments 14:

Commenters indicated that the project prioritizes private or economic gain over environmental and community health.

Response: See Response to Purpose and Need Comment 2. SEQRA regulations require that, for an involved agency to approve an action, the agency must be able to conclude that the action, including any conditions attached to its approval, avoids or minimizes anticipated adverse impacts to the maximum extent practicable, or that public need and benefit outweigh the identified environmental impact.

General Comments 15:

The SEQR process contemplates that new information, new opportunities for improvements and new environmental issues will develop even before the first phase is built. Moreover, the duration of the construction of the overall project is 16 years. Fab 3 and 4 will be constructed many years in the future. It should be a condition of approval that a SEIS be drafted and reviewed when the Fab 3 and 4 project is under design. It is inevitable that changes in the industry, the communities affected, climate and environmental needs, impacts, and opportunities will have changed over that time. SEQR requires a new hard look at the Project when the new phase is under review. The SEQR review that is embodied in the DEIS is not and may not legally be a 'one and done' process. In fact, while avoidance of segmentation requires the full build out be considered now, the impacts of the second phase of the project are in the nature of a Generic EIS, as they are speculative and uncertain. Even more importantly, environmental concerns, requirements and opportunities will certainly change and evolve in the next decade, all of which necessitates a Supplemental DEIS. (617.9 (a) (7)).

Response: It would be speculative to determine whether a supplemental EIS would be required for construction of Fabs 3 and 4 at a later date. The requirements for when a supplemental EIS must be prepared under SEQRA will dictate if a supplemental EIS is needed in the future.

General Comments 16:

The Draft EIS defines the Preferred Action as the construction of four fabrication facilities. However, the CHIPS funding for the project actually only pertains to the construction and outfitting of two fabs.

Response: Although the Department of Commerce's final award to Micron only includes direct funding to support Micron's construction and operation of Fabs 1 and 2, the Department of Commerce based its award decision on Micron's proposal to establish a full four-fab cluster by 2041 (which would ramp up to full operational capacity by 2045). See FEIS Section 1.1.1. The FEIS therefore considered the reasonably foreseeable impacts from full build-out of the Proposed Project, including all four fabs.

General Comments 17:

The commenter asked that attention be paid to opinions that were submitted to the local newspaper, indicating that those opinions were thorough.

Response: The commenter did not attach the opinions that were submitted to the newspaper or otherwise identify or specify which opinions the commenter requested the lead agencies consider. Without knowing which opinions the commenter was referring to, the lead agencies were unable to consider these in response to this comment. All comments properly submitted during the public comment period on the DEIS, including at the three public hearing sessions, were considered.

General Comments 18:

The commenter requested clarity on whether his property or residence would be impacted by construction or phases, including road expansion, utility work or related components, and would like to be informed of disruptions or risks to the property and quality of life.

Response: The lead agencies will require that Micron provide notice to the affected landowner.

General Comments 19:

One commenter requested a paper copy of the DEIS.

Response: The DEIS was available in hard copy at OCIDA as well as at both the Town of Clay and Town of Cicero municipal offices and the Onondaga County Public Library.

General Comments 20:

New technologies and new information are going to occur and there should be ongoing review of the Project, and an adaptive management program with active public involvement. Micron should also commit to incremental build and assessments to ensure that commitments are being fulfilled.

Response: The Proposed Project will be subject to ongoing technical review as permit renewals are required. Further, to the extent new information and subsequent agency action may necessitate further environmental review, such review would be undertaken.

General Comments 21:

Concern was expressed regarding whether there is adequate numbers of qualified personnel and rail-accessible aggregate available to handle the construction schedule.

Response: Micron has selected Railworks, a leading provider of rail infrastructure construction and maintenance services across North America, serving transit authorities, freight railroads, and industrial clients. Railworks is headquartered in New York and forecasts that over 80% of the qualified personnel for the construction of the spur can be sourced locally and the remaining will be sourced regionally. Aggregate contracts have been issued to suppliers for proposal and all are indicating they will be able to source the amount needed on the forecasted schedule.

General Comments 22:

Micron should carefully choose the companies they use for construction.

Response: Micron has a robust, structured and competitive process for selecting construction companies. This process includes defined roles, change control, and continuous improvement cycles to ensure consistent value delivery.

General Comments 23:

Commenter concerned that most if not all the jobs at Micron will go to machines.

Response: The concern is misplaced. The Proposed Project is estimated to generate over 4,000 on-site construction jobs over the approximately 16-year construction period, and over 9,000 permanent on-site operational jobs. It is also anticipated to generate demand for nearly 9,500 jobs at regional supply chain businesses and approximately 23,500 jobs at regional governments, institutions, and businesses supporting the growth in regional household spending (approximately 33,000 off-site jobs in total by 2045). See FEIS Section 3.15.3.2.

General Comments 24:

Commenters described the investment that Micron has made in education in the local community now and into the future.

Response: Comment noted.

General Comments 25:

Micron should commit to third-party monitoring of air, water and noise pollution during the operation of the Project.

Response: There are numerous federal, state, and local entities permitting and monitoring Micron facilities during both the construction and operation of the Proposed Project. For example, regarding water monitoring, Micron's wastewater discharges will require a discharge permit issued by OCDWEP, and OCDWEP's discharges will require a State Pollutant Discharge Elimination System (SPDES) permit from NYSDEC. SPDES permits establish effluent limitations and monitoring requirements to ensure compliance with established limits. NYSDEC requires that wastewater samples be collected and then analyzed by independent, certified laboratories. The results are then reported to NYSDEC. See Response to Water Resources Comment 31; FEIS Section 3.4.4.2.

As for air monitoring, the Clean Air Act and New York state laws and regulations require USEPA monitoring, assessment and reporting of ambient air quality and compliance with the National Ambient Air Quality Standard (NAAQS). NYSDEC air permitting requirements include emissions reporting and certification to ensure compliance with permit thresholds and regulatory limits. Site specific monitoring, recordkeeping, and reporting requirements will also be included in an air Title V permit issued by NYSDEC and will require air emission monitoring reports and certifications to be submitted to NYSDEC to ensure compliance with permit and regulatory thresholds and limits. USEPA and NYSDEC maintain ongoing authority to monitor and ensure compliance with all air permit and applicable air quality requirements and compliance with the NAAQS, and deviations from permit requirements must be reported to NYSDEC. See Response to Air Quality Comment 12.

Regarding noise monitoring, the FEIS proposes a combination of operational best management practices (BMPs), noise monitoring, and adaptive noise mitigation measures, including both permanent and temporary sound barriers to reduce noise levels. See FEIS Section 3.12.6 and Response to Noise Comments 1 and 2. Micron also has committed to implementing continuing coordination with regulatory agencies to ensure that community concerns are addressed and that residents are protected throughout the development process.

General Comments 26:

Commenter requested information on whether lead pipes in the City of Syracuse will be replaced for the Project.

Response: Replacement of lead pipes in the City of Syracuse is not part of the Proposed Project.

General Comments 27:

Micron should go above and beyond what is required by law, or by just paying money into funds.

Response: Comment noted.

General Comments 28:

At other comparable Micron sites in the country, what are the PFAS levels in the air and water?

Response: The FEIS must analyze the reasonably foreseeable significant impacts of the Proposed Project, not to separate Micron or other facilities. The Proposed Project would be located in Clay, NY. Additional information concerning PFAS has been added to the FEIS as Appendix L-1. See also Responses to Water Resources Comments 33 and 34; Response to Air Resources Comments 7 and 13.

General Comments 29:

A commenter stated that investment should be made in the City of Syracuse, not just the suburbs.

Response: Comment noted.

General Comments 30:

A commenter requested information on who will pay for the cost of animal control needed for displaced animals.

Response: Animal control is not anticipated to be needed for any displaced animals. To the extent that the comment is concerned about displaced wildlife, see FEIS Section 3.4.

General Comments 31:

Concerns were raised that the Community Investment Fund is not binding nor sufficiently transparent, denying public oversight.

Response: Micron's funding for the Community Investment Fund (CIF) is a requirement of the NYS Green CHIPS program and, therefore, Micron must fund CIF-eligible projects to receive Green CHIPS incentives. As part of the Green CHIPS program and continued receipt of Green CHIPS funding, Micron is required to provide Empire State Development with annual reporting on CIF funding. This annual reporting will be available to the public. See Responses to Empire State Development Comments 1-5.

General Comments 32:

A commenter indicated that approvals for the fab development be contingent on robust, binding mitigation commitments with measurable objectives.

Response: Comment noted.

General Comment 33:

One commenter challenged, based on his experience as an architect, the acceptance of “unavoidable” environmental impacts in the DEIS, arguing that decades of advancements in sustainable design and construction offer practical alternatives that were overlooked and should be reconsidered for mitigation.

Response: NEPA, as does SEQRA, requires agencies to consider a “reasonable range of alternatives to the proposed action, including an analysis of any negative environmental impacts of not implementing the proposed action in the case of a no action alternative, that are technically and economically feasible, and meet the purpose and need of the proposal.” 42 U.S.C. 4332(C)(iii); see also 6 NYCRR 617.9(b)(5)(v). See FEIS Section 2.2. The FEIS meets those requirements. The FEIS also thoroughly contemplates mitigation measures. See, e.g., Section 3.1.4. Conclusory allegations that additional alternatives and mitigation measures were overlooked cannot be addressed.

General Comment 34:

Commenters stated general or enthusiastic support for the project, some noting the economic benefits for the towns, county and region, and positive impacts on employment.

Response: Comment noted.

General Comment 35:

The Micron project in Central New York leverages the region's talent and infrastructure building upon the thriving aerospace and defense industry. The success of local companies such as Lockheed Martin and Micron will enhance the U.S. defense industry and their presence will have a positive impact on the Central New York community, driving growth and expansion.

Response: Comments noted.

General Comment 36:

Some commenters expressed concern that the project was taking too long to permit and start construction.

Response: Comment noted.

General Comment 37:

Commenters expressed general opposition to the project, without identifying specific concerns regarding the project's impacts on environmental resources.

Response: Comments noted.

General Comment 38:

The commenter stated that they and others are not in support of a PILOT agreement with OCIDA and a hotel.

Response: Comment noted.

General Comment 39:

The commenter stated that the diversity of the panel at the public hearing did not instill optimism regarding the ability of the Project sponsors to appreciate and adequately address the needs and concerns of the diverse population of the local community.

Response: There were three separate sessions of the public comment hearing, and written comments were received by the lead agencies.

General Comment 40:

One commenter indicated opposition to the project based on both military strategy and national security reasons. The facility would be a target for aerial bombardment and long-range, missile attacks or it could be a target for a cyberattack, as it would be easy to cause a lot of damage to production and maybe even to the facility itself. The facility could be subject to purposeful sabotage.

Response: There is no reason to suspect that the Micron Campus would be a target. Access to the Micron Campus will be secure. Micron will have private security services on site during construction and operation as well as security fencing. Micron has a dedicated security team that works closely with local, state, and federal law enforcement agencies to identify and prevent physical and cyber security attacks.

General Comment 41:

Micron may purposefully abandon the project for financial reasons, such as to boost the price of stock, as it is a poor use of the company money.

Response: Comment noted. As a condition to accepting the CHIPS Award, Micron has agreed to a series of policy commitments and disbursement milestones that would further increase the value of the Proposed Project to U.S. national and economic security. Additionally, disbursement milestones are structured to incentivize continued commitment to the Proposed Project and to ensure that the Proposed Project manufactures commercial wafers within a target timeframe.

Further, CPO assesses that once one fab in NY is complete, Micron will be motivated to continue investing in additional fabs to reach the benefits of scale. This assessment is based on well-established benefits of economies of scale across the memory industry, as seen in similarly large fabs built in East Asia. The structure of the CHIPS award incentivizes the continued building of fabs in New York.

General Comment 42:

Commenter appreciates the proactive investment in environmental stewardship and enhancements, along with the clear commitment to sustainability, ecological restoration and responsible growth. The commenter worries that Micron is setting a mitigation bar too high for other development projects in the future.

Response: Comment noted.

General Comment 43:

Concerns regarding failure to adequately address PFAS could result in a claim under the Green Amendment of the New York State Constitution.

Response: The reasonably foreseeable significant adverse effects related to PFAS have been adequately addressed in the FEIS, including Appendix L-1.

General Comment 44:

What standard helps determine what is in the public interest.

Response: SEQRA requires agencies to evaluate reasonably foreseeable environmental impacts and social and economic impacts of a proposed project. NEPA requires federal agencies to consider the reasonably foreseeable environmental effects of their proposed actions. Neither law includes an express public interest determination. The lead agencies have thoroughly evaluated the reasonably foreseeable impacts of the proposed action and alternatives, as documented throughout the FEIS. Each agency will make a decision based on this information and what it believes best serves the public's interest. See also Response to Purpose and Need Comment 2.

General Comment 45:

Micron's investment goes far beyond jobs and buildings. It's about our community and our people's futures. For our region: economic revitalization, population growth, and a renewed position at the forefront of American innovation. For students: new internships, career paths, and hands-on learning. For faculty and staff: new collaboration opportunities, research expansion, and professional growth and development. Much like the Erie Canal once opened New York to the world and transformed its economic future, Micron's presence in our community has the potential to redefine what's possible for this region and for the nation.

Response: Comment noted.

General Comment 46:

The Micron project is highly desirable from a social and economic perspective.

Response: Comment noted.

General Comment 47:

Concerns were raised that the Proposed Project will not deliver the economic growth as promised or as projected. Economic growth is at the expense of displacing people and protecting resources. The Project puts profit ahead of protecting resources. The project will take years to complete, taking longer to achieve profit.

Response: The FEIS demonstrates that the Proposed Project will provide significant and beneficial economic and fiscal benefits both on the state and regional levels. The New York State Empire State Development (ESD) commissioned a September 29, 2022, report entitled, “Economic and Fiscal Impact of Establishing a Semiconductor Manufacturing Facility in Onondaga County, New York,” in which Regional Economic Models, Inc. (REMI) modeled the potential economic and fiscal impacts of the Proposed Project at the state and local levels over the period 2025-2055 (hereinafter the “REMI Study”). See FEIS, Appendix C-2. The REMI Study found strong positive economic and fiscal impacts that are driven largely by the highly productive and well-compensated Proposed Project employees who create significant supply chain demand and spend robustly in the local economy. Specifically, the key results of the REMI Study included:

1. The Proposed Project would create an average annual employment impact of 45,418 at the state level over the time period 2025-2055, with 39,975 of those jobs coming from the Central New York region.
2. For every direct company hire, there would be about 5.5 other jobs created in the state economy.
3. By 2055, the Proposed Project would create 50,911 jobs at the state level (44,943 of which would be based in Central New York), including 9,005 of the facility’s direct hires and 9,431 indirect and 32,474 induced jobs (indirect and induced 41,905).
4. The average annual total investment employment impact associated with the capital and other infrastructure spending (2025-2044) would be 11,871 (6,647 direct; 1,146 indirect; 4,079 induced). In terms of direct investment employment, construction related jobs would be over 84 percent (5,595) on average during the 2025-2044 timeframe.
5. The Proposed Project would grow the state economy significantly, adding an annual average of \$16.7 billion in real economic output and \$9.6 billion in real Gross Domestic Product (GDP) over the time period 2025-2055.
6. The Proposed Project would add an annual average of 59,575 in state population over the time period 2025-2055.
7. The Proposed Project would add an annual average of \$5.4 billion in real disposable personal income for New York residents over the time period 2025-2055.
8. The Proposed Project would generate an average annual increase of \$378.5 million in real state government revenue, for a present value (PV) of \$7.1 billion over 2025-2055 using a three percent discount rate, and a fiscal benefit-cost ratio of 2.0 relative to the PV of proposed real New York State incentives at a three percent discount rate.
9. The Proposed Project would generate an average annual increase of \$565.5 million in real revenue to local governments in New York State, for a PV of \$10.7 billion over 2025-2055 using a three percent discount rate. Most of these revenue gains would occur in Central New York region.

Thus, the REMI Study concluded that “[u]ltimately, these results point to substantial positive impacts on New York’s economy and budget, supported by productive and high-paying jobs and a fostering of further growth in the semiconductor manufacturing ecosystem in the state.” Further discussion of the REMI Study and the socioeconomic impacts of the Proposed Project are provided in Section 3.15 of the FEIS.

General Comment 48:

At a time when global supply chains are under pressure and national security is tied to technological independence, the Micron project positions NY as a national leader in semiconductor manufacturing.

Response: Comment noted.

General Comment 49:

Micron has the potential to create thousands of good-paying, advanced manufacturing jobs, establish our region as a hub for semiconductor manufacturing, and attract a robust network of supply chain companies. Beyond its economic impact, the Micron project will significantly strengthen national security and bolster U.S. competitiveness. The DEIS is a vital step to ensure that the project moves forward responsibly, balancing economic growth with community well-being.

Response: Comment noted.

General Comment 50:

Failure to properly assess alternatives means that the Micron project cannot be issued a Section 404 wetlands permit.

Response: The FEIS properly assesses alternatives. See Response to Project Description/Alternatives Comment 1. The USACE will determine whether to issue a Clean Water Acts Section 404 wetlands permit in accordance with applicable laws and regulations.

General Comment 51:

Suggestion was made that OCIDA and other agencies with approval authority issue conditional approval for clearing activities prior to final issuance of a full EIS, to facilitate minimal disturbance to impacted species and allow more time for review of other aspects of the DEIS.

Response: Tree clearing impacts cannot be conditionally approved before the EIS is complete.

General Comment 52:

Comment indicated that the EIS must be updated periodically to consider the environmental impacts as they change over the course of the 16-year construction schedule.

Response: The requirements of NEPA and SEQRA will dictate if and when any updates are necessary to the FEIS. See Response to Public Review Comment 4.

General Comment 53:

General concerns that Micron will leave the area or change its plans once tax breaks expire or based on the twenty-year timeframe if circumstances change.

Response: Micron's investment reflects a strong commitment to staying and growing in the area and intends to establish and sustain operations in the region over the coming decades.

General Comment 54:

A comment in support acknowledges that Micron does not have control over a number of impacts; however, the DEIS raises awareness as to what localities can do to improve infrastructure, economic growth, and housing development.

Response: Comment noted.

General Comment 55:

Commenters raised procedural concerns that the existing water withdraw permit covers only the first two fabs, but this public review period is for all four fabs.

Response: The existing water withdrawal permit pre-dates the Proposed Project and has no relation to any of the proposed fabs. A modified water withdrawal permit is being sought by OCWA. See FEIS Section 3.10.3.2. Notice of Complete Application for a modified water withdrawal permit was issued by NYSDEC July 25, 2025, and Notice was given to the Great Lakes Compact for comment July 29, 2025. This application, if approved, would manage water needs for the entire service area inclusive of the four fabs.

General Comment 56:

The DEIS fails to satisfy the legal standards of NEPA, SEQRA, the Clean Water Act, the Endangered Species Act, CLCPA, and EJ requirements. These deficiencies must be addressed through permit denials, supplemental review, or project cancellation.

Response: The FEIS satisfies SEQRA and NEPA. The agencies with jurisdiction over the remaining regulatory regimes will assess the Proposed Project's compliance based on the application materials before them.

General Comment 57:

Commenters sought additional information on usage of the proposed Rail Spur, asking what fuels are proposed and if any are non-fossil fuels.

Response: The Rail Spur Site, its construction, operation, and use, are fully described in Section 2.1.2. Locomotives will be operated and fueled by CSX. No on-site use or storage of fuels is anticipated at the Rail Spur Site. The conveyer will be electric.

General Comment 58:

Question about what costs will be born by taxpayers with respect to the Rail Spur and related infrastructure upgrades, and whether eminent domain will be exercised for any of the necessary land.

Response: FEIS Section 2.1.2.1 provides an overview of the Rail Spur Site. Micron proposes to construct the rail spur and associated conveyance facility on approximately 38 acres of land consisting of two contiguous parcels which Micron has already purchased. Eminent domain will not be used for the Rail Spur Site. The rail spur would be operated by an independent contractor pursuant to an agreement with Micron. It will not use taxpayer money.

General Comment 59:

What monitoring and reporting requirements does Micron have with regard to planned and unanticipated changes in design, configuration, and operation of the facilities over their construction, operation, and closure?

Response: Any changes in design, configuration, and operation of facilities over their construction and operation would be governed by the permits applicable to the changes, including, but not limited to, any wetlands permits, wastewater permits, air permits, site plan approval and building permits. Micron and the entities responsible for implementing the Connected Actions would continue to be required to comply with all applicable monitoring and reporting requirements established by federal, state, and local permitting authorities throughout construction and operation of facilities. To the extent any changes would require permit modification, the relevant entity would apply for such modification to the appropriate permitting authorities.

General Comment 60:

Commenter requested transparency and equity in allocation of the Green CHIPS Community Investment Fund. CPO and ESD should monitor Micron's compliance with the goals of the CHIPS Incentive Program and Green CHIPS Act.

Response: The Green CHIPS Community Investment Fund is administered by the New York State ESD and is designed to support projects that provide community benefits, including environmental, educational, and economic programs. Decisions regarding the allocation of these funds, including criteria for transparency and equity, are determined and implemented by ESD in accordance with State guidelines and oversight procedures.

As a condition to accepting the CHIPS Award, Micron has agreed to a series of policy commitments and disbursement milestones that would further increase the value of the Project to U.S. national and economic security. Additionally, disbursement milestones are structured to incentivize continued commitment to the Proposed Project and to ensure that the Proposed Project manufactures commercial wafers within a target timeframe.

General Comment 61:

Approval decisions should impose a requirement to establish baseline conditions in the local air, water and soil for all chemicals that foreseeably will be introduced to the environment by the Project.

Response: Required approvals will comply with all applicable requirements.

General Comment 62:

In addition to following the Green Chips legislation, it is the responsibility of New York to monitor and enforce its environmental laws and policies.

Response: Comment noted.

General Comment 63:

A commenter expressed interest in knowing what other businesses or developments have been announced since the announcement of Micron, and other downstream economic impacts.

Response: Comment noted. The request is outside the scope of the FEIS except to the extent noted in FEIS Chapter 4, Cumulative Effects.

Subject: [EXTERNAL] RE: Draft Environmental Assessment EISX-006-55-CPO-001

CHIPS Program Office CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable

energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,
Lauren

Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Dominique Edmondson

Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Jared Cornelia

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Martha Ellison

- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

CATHY CRONIN

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Susan Gilmore

Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

CHIPS Program Office
CHIPS Program Office,

I am very concerned about the environmental impact of this project on the wetlands which are home to a diverse and rich species population. I also have a lot of dread when it comes to the PFAS that will enter the water and the soil. These chemicals are "forever" and they are NOT healthy for any living thing.

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Melanie Dieringer

Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act. It would be great if Micron would partner with

NYPA to have them build enough publicly owned renewable energy to power their operations, and if they used heat pumps and thermal energy networks to heat the building instead of gas. Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Allister Layne

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.

Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Charles Wieland

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

James Deshotels

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

As a 76 year old I see so many things that people will regret allowing to take over our future and the future of many generations to come. Just because some people think we'll all embrace these far fetched ideas doesn't mean they should happen without more lengthy and involved investigation.

Thank you for your consideration of my comments.

Sincerely,

Florence Carnahan

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Lou Priem

The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Marisa Morales

Importance: Normal

Sensitivity: None

CHIPS Program Office
CHIPS Program Office,

Thank you for the opportunity to comment on the Draft Environmental Impact Assessment (DEIS) for Micron's proposed semiconductor manufacturing facility in Clay, New York. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Despite the submission of the following comments, please consider that the 45-day public comment period does not give the public enough time to read and fully understand the 20,000-page report. I am asking you to extend the comment period to October 25, 2025, at a minimum, and noting that there has been no public response to a petition signed by over 1500 residents of the region asking the same. Based on my current understanding of the DEIS, I still want to highlight key environmental, social, and economic impacts as well as mitigation measures, which are insufficiently addressed in the DEIS.

I urge consideration and response to the following issues and concerns:

- **Water and Ecological Resources.** The DEIS fails to adequately address hydrological and ecological issues, provide sufficient plans to restore nearby wetlands and mitigate on site wetlands loss, and address watershed and habitat destroyed by the project. The DEIS must provide additional analysis related to water quality, ground water, and surface water impacts (including seasonal variations, location and loss of surface water channels, springs, intermittent flows and streams, wetlands, swamps, and ponds). Furthermore, ecological features, soil types, and other related elements must be thoroughly assessed to consider the negative impacts from habitat loss.
- **Protection of Air, Water, and Workers.** The DEIS does not detail how Micron will minimize contamination of air, water, and soil or protect worker health and safety given the intensive use of toxic chemicals, including forever chemicals, in semiconductor production. Micron must adopt detailed plans to minimize negative impacts to workers and ecological communities, including best practices to minimize use of toxic chemicals to ensure their appropriate handling, treatment, and disposal, and provide robust worker training and safety protocols.
- **Greenhouse Gases:** The DEIS does not state how Micron will meet its own 100% renewable energy commitment or substantially mitigate the factory's enormous greenhouse gas emissions. Micron must create a comprehensive plan to generate or purchase renewable energy using wind and solar –and without relying on renewable energy credits or using renewable energy that is already on the grid – to meet New York State's climate change objectives and the requirements of the New York Green CHIPS Act.

Affordable and abundant water and energy: The DEIS does not ensure Micron's massive energy and water use will not affect the affordability of energy and clean water nor ensure that ratepayers and tax dollars will not ultimately bear the cost of infrastructure upgrades and higher energy demands as a result of this project. The DEIS must clearly confront these issues.

- Job Access, Housing & Transportation. The DEIS does not ensure communities with high poverty rates and individuals facing barriers to good jobs (e.g. education level, language, criminal record) will have meaningful access to workforce development, training, jobs, and career advancement at Micron particularly for production workers. Nor does the DEIS sufficiently address the public transit investments needed to reduce traffic congestion while ensuring job access for workers from disadvantaged communities. The DEIS indicates that there will be a huge housing demand for workers drawn to the area by the plant, but fails to address how the inevitable price pressure will affect those in lower cost market rate units. Therefore, the DEIS must address how Micron will work with state and county governments to expand the availability of mixed income affordable, climate friendly, and safe housing while protecting affordability of existing housing for current residents.

Thank you for your consideration of my comments.

Sincerely,

Kate Skolnick
