1 Introduction

1.1 Purpose

This report sets forth the analytical methods, assumptions, criteria, and thresholds used to calibrate the VISSIM model utilized in the traffic analysis of the proposed Micron Semiconductor Fabrication facility in Clay, NY (referred to hereafter as the Project) Draft Environmental Impact Statement (DEIS).

1.2 Background

Micron announced in October 2022 their intentions to build a new semiconductor manufacturing plant at the White Pine Commerce Park, an industrial development site located in the Town of Clay, NY, north of the City of Syracuse in Onondaga County. A DEIS is being prepared following the standards of the National Environmental Policy Act (NEPA) and the State Environmental Quality Review Act (SEQRA) to evaluate the potential impacts of the Project.

Construction is anticipated to be completed over a 20-year period (estimated time of completion in Year 2044), with the four fabrication plants becoming operational on a rolling timeframe. The traffic analysis will assess the existing (Year 2023) traffic conditions and future analysis years, 2027, 2031 and 2041 - which represent the peak construction stages for each fabrication plant. The Year 2031 is the Estimated Time of Completion of major traffic improvement concepts. The year 2041 is equivalent to ETC + 20. The projected traffic volumes for 2041, considering construction, operation, and background traffic, are comparable to those expected for 2051. A detailed traffic volume comparison was documented in APPENDIX A. Three scenarios, the No Build Alternative, the Build Alternative without mitigation, and the Build Alternative with mitigation, will be analyzed for each future analysis year to evaluate the impact of construction plans and network mitigation strategies. The Build Alternatives (with or without mitigation) will analyze the cumulative operational traffic impact, including construction traffic, regional traffic growth, and land use development. The traffic analysis will follow the established Travel Demand Forecasting (TDF) methodology. **Exhibit** 1.1 illustrates the actions and analysis years.

Exhibit 1.1 Analysis Years and Actions		
Action	**Approximate Year**	**Analysis**
Existing Conditions	2023	Existing only
Peak Construction of Fab 2	2027	Micron Build with minor roadway improvements
Build Year of Major Traffic Improvement Concepts	2031 (ETC)	Micron Build with Micron Build with Major Traffic Improvement Concepts
Peak Construction of Fab 4	2041 (ETA+20)	No Build, Micron Build, Micron Build with Major Traffic Improvement Concepts

PTV VISSIM Microsimulation (Version 2023) models are being used to perform a detailed analysis of the performance of the key interstate and highway segments (basic freeway segments, merge segments, diverge segments, and weaving segments) identified as requiring analysis. To correctly model the traffic operations of the network within the study area, key intersections feeding into the interstate and highway segments were included in the model as well.

1.3 Study Area

The Project site is in White Pine Commerce Park, an industrial development site located in Clay, NY, north of the City of Syracuse in Onondaga County. **Figure** 1-1 shows the project study area of the VISSIM network. As part of the analysis, the study area consists of the surrounding intersections, interchanges, and highways that would be affected by trips to and from the Project site. The intersections, CR-37 and Caughdenoy Rd, and CR-37 and Burnet Rd, which are close to the Micron proposed site were analyzed in separate Synchro models. The detailed study segments and intersections are listed below:

- Freeway Segments
    - Interstate 81 (I-81) from E Taft Road in Syracuse, NY to County Route 37 (CR-37) in Central Square, NY.

  - Interstate 481 (I-481)/New York State Route 481 (NY-481) from Verplank Road in Clay, NY to Totman Road in Syracuse, NY

- Interchanges
  - I-81 and I-481/NY-481 Interchange
- Intersections (Shown as **Exhibit** 1.2)

2 Data Collection

An extensive data collection effort was undertaken in Spring 2023 at key intersections and highway segments that would have the greatest potential to be affected by traffic traveling to and from the Project site. Various data collection methods were used to establish the existing traffic patterns and conditions. These data collection methods include automatic traffic recorder (ATR) counts, turning movement counts (TMCs), vehicle classification counts (VCCs), StreetLight Data, SMTC Regional Model, and field visits detailed below, and shown in **Figure 2-1**.

ATR data was gathered to identify peak periods and collect volume data on freeways. Turning movement counts were obtained for intersection movements, aiding model development. Vehicle classification counts from several ART locations helped assess truck percentages along the corridor. StreetLight data provided OD patterns, corridor travel time, and speed, validating truck percentages. All the data, except StreetLight, was collected between April and June 2023. Because of the limitations of the StreetLight service, only data from 2022 was accessible when the projects were underway. To supplement StreetLight, a field visit was conducted in April 2023 to collect travel time information along two corridors.

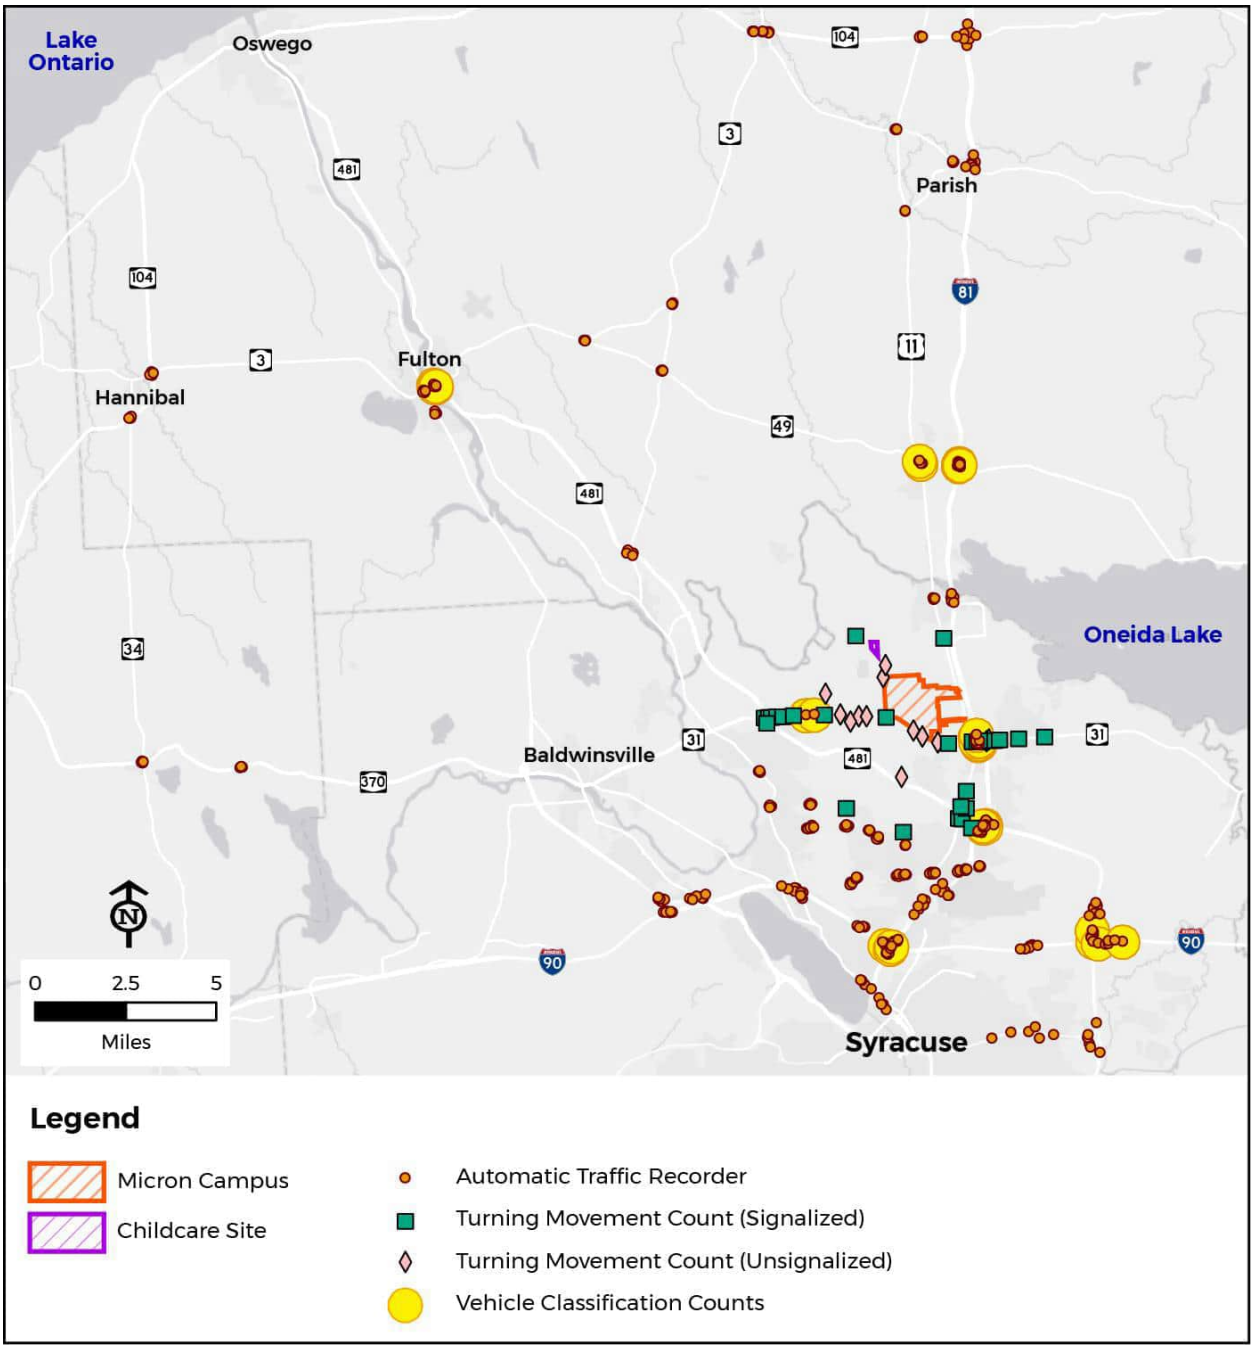

Figure 2-1: Data Collection Locations

2.1 Automatic Traffic Recorder (ATR) Counts

Continuous 24-hour, two-way ATR volume counts were collected at one hundred and ninety (190) locations within the New York State Department of Transportation (NYSDOT) jurisdiction, sixty-five (65) locations within the Onondaga County Department of Transportation (OCDOT) jurisdiction, and twelve (12) locations within the New York State Thruway Authority (NYSTA) jurisdiction, each for a total of seven (7) days. The ATR count locations were primarily collected along interstates, interstate ramps, and at key locations along the highways within a 45-minute radius of the Project site. The volume collected from ATR counts are primarily used to represent the flow of traffic throughout the study area; thus, the ATR count locations were selected to accurately model the regional and local traffic conditions. The ATR counts were collected by a third-party vendor using traffic data collection cameras and pneumatic count tubes and summarized in 15-minute intervals. ATR counts were collected on a rolling basis across the count locations, with most of the data collection beginning on April 13, 2023, and ending on June 10, 2023. Each ATR count covers five to ten days of traffic data. The ATR count locations for each jurisdiction are listed in **APPENDIX B** ATR counts were used to calibrate the inputs of VISSIM volumes.

2.2 Turning Movement Count (TMC)

TMCs were collected at twenty-five (25) signalized and eight (8) unsignalized intersections within the NYSDOT jurisdiction, as well as two (2) signalized and seven (7) unsignalized intersections within the ODOT jurisdiction. Camera recordings of the study intersections were processed to determine TMCs by vehicle class and pedestrian crosswalk volumes for two five (5)-hour time periods. The time periods chosen for processing were 5:00 AM to 10:00 AM and 3:00 PM to 8:00 PM to capture the peak period.

Traffic recorded in the TMCs were sorted into four classifications: autos (passenger cars), buses (including non-articulated buses, articulated buses, and jitneys), medium trucks, and heavy trucks. The pedestrian and bicyclist movements at the intersections were counted simultaneously with vehicle turning movements. The pedestrian and bicyclist volumes represent movements that conflict with vehicle traffic and were included in the analysis to provide a more accurate traffic analysis model. TMC data was collected on a rolling basis across the count locations, with most of the data collection completed on April 19, 2023, and the remaining TMC data collected on April 25, 2023, and May 10, 2023. The TMC intersections and locations for each jurisdiction are listed in **APPENDIX B**. TMC counts were used to calibrate inputs of VISSIM volumes.

2.3 Vehicle Classification Counts (VCCs)

Twenty-nine (29) ATR locations were identified within the NYSDOT jurisdiction, and four (4) ATR locations were identified within the NYSTA jurisdiction for VCCs. The VCC locations were primarily collected at the major highway intersections and interstate interchanges within the 45-minute radius of the Project site. VCCs are primarily used to supplement the ATR counts; thus, VCCs are collected to provide more detailed counts at various ATR locations. VCCs were collected over a 24-hour period during one of the three representative mid-weekdays (Tuesday, Wednesday, or Thursday). Traffic recorded from the VCCs were sorted into four vehicle classes: autos (passenger cars), buses (which would include non-articulated buses, articulated buses, and jitney's), medium trucks, and heavy trucks. VCC data was collected on a rolling basis across the count locations, with the majority of the data collected on April 19, 2023, and the remaining VCC data collected on April 25, 2023, and May 10, 2023. The VCC locations for each jurisdiction are listed in **APPENDIX B**.

2.4 StreetLight Data

To support the data collection program, a StreetLight Data license was obtained to provide historical data for much of Onondaga County. StreetLight Data is a big data provider that provides insight into origin-destination (OD) patterns, regional routing, travel times, travel speeds, and other information that is difficult to obtain through traditional on-site data collection practices. StreetLight Data was used to supplement the count program and provide information that was not initially identified. The StreetLight travel time, collected between April 2021 - October 2021, excluding summer, and February 2022 - April 2022, was used along with I-81 field travel times to validate the VISSIM model. The StreetLight speed data along I-81 were collected to specify the desired speed distributions along two corridors for both AM peak and PM peak periods with auto (personal) vehicle, medium truck, and heavy truck vehicle types.

2.5 Syracuse Metropolitan Transportation Council (SMTC) Regional Model

The SMTC is the state-designated Syracuse Metropolitan Planning Organization, responsible for administering continuous, cooperative, and comprehensive transportation planning for its jurisdiction, called the Metropolitan Planning Area, covering Onondaga County, the Town of Sullivan in Madison County, and the Towns of Hastings, Schroeppel, West Monroe and a small portion of Granby in Oswego County. SMTC maintains a regional travel demand model that has been reviewed and approved by NYSDOT.

A sub-area of the SMTC regional travel demand model was extracted and used as a foundation for creating a mesoscopic VISUM model, supporting the generation of OD patterns that were used for VISSIM model inputs.

2.6 Field Visit

A field visit was conducted on April 19th, 2023 (Wednesday) to capture typical weekday traffic patterns and collect field travel time along I-81. The field travel runs were performed between 5:00 AM and 10:00 AM and between 3:30 PM and 8:00 PM along Interstate 81 (I-81) from E Taft Road in Syracuse, NY to County Route 37 (CR-37) in Central Square, NY. The I-81 segment has a total length of 5.85 miles for northbound and 5.99 miles for southbound with 65 mph posted limit speed. The travel times for I-481/NY-481 were collected from StreetLight data. The I-481/NY-481 segment has a total length of 8.45 miles eastbound and 8.43 miles southbound with 65 mph posted speed. **Exhibit** 2.1 shows field travel times collected along I-81 between NY-481 and Bartell Road. The average speed data along I-81 and I-481/NY-481 were collected from field and Streetlight data. **Exhibit** 2.2 shows the average operating speed along the corridors.

Exhibit 2.2 Field/StreetLight Peak Hours Average Travel Speed

Corridor	Direction	AM Average Speed (mph)		PM Average Speed (mph)	
		6:00 AM – 7:00 AM	7:00 AM – 8:00 AM	4:00 PM – 5:00 PM	5:00 PM – 6:00 PM
I-81	Northbound	68.3	71.5	70.4	68.1
	Southbound	66.5	69.1	70.2	69.9
NY-481	Eastbound	68.4	68.3	67.4	67.8
	Westbound	65.6	65.9	67.2	67.2

Field inventory was collected along NY-31 and adjacent intersections along I-81 and NY-481, documenting intersection and segment geometry, intersection layout, signal timings, and other relevant information.

3 VISSIM Model Development

3.1 Peak Hour Determination

ATR counts were analyzed to help determine the peak hours for existing (Year 2023) conditions. The typical weekday (Tuesday, Wednesday, and Thursday) ATR data was summarized into average 15-minute hourly volumes along I-81 and NY-481, presented in **Figure** 3-1**.** The peak hourly volume in the morning and afternoon are from 7:15 AM to 8:15 AM, and 4:15 PM to 5:15 PM based on existing traffic patterns.

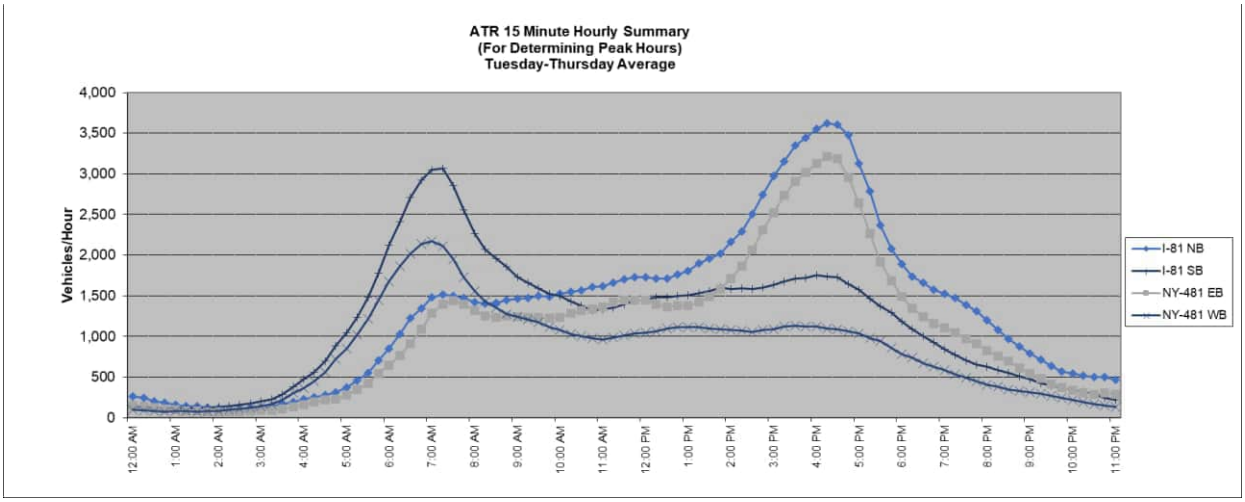

Figure 3-1: Automatic Traffic Recorder 15 minutes Hourly Volume (Tuesday – Thursday) Average

Considering Micron operation and construction shift schedules, peak analysis periods were determined as 6:00 AM to 8:00 AM for AM peak hour, and 4:00 PM to 6:00 PM for PM peak hour with any necessary preload (i.e., seeding) time before analysis to build-up traffic into the models.

3.2 Vehicle Classification and Speed Distribution

Vehicles were categorized into autos, buses, medium trucks, and heavy trucks in the VISUM model based on VCCs along NY-481 and I-81. **Figure 3-2** shows average vehicle classification percentages in 15-minute time intervals along the study area corridors during typical weekdays (Tuesday to Thursday). **Exhibit** 3.1 shows the vehicle classification percentages along NY-481 and I-81 corridors in peak hours which were applied to VISSIM models.

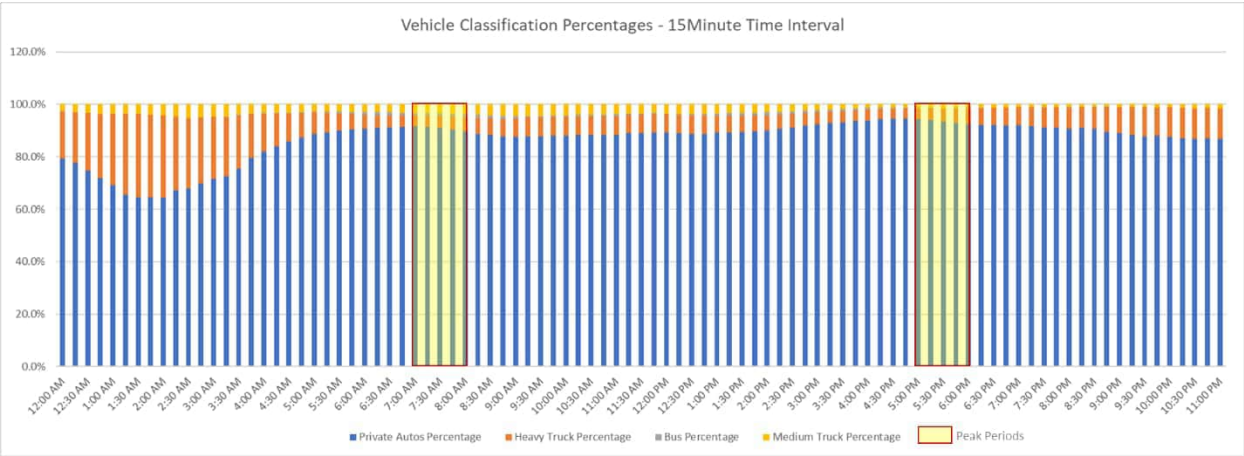

Figure 3-2: Vehicle Classification Percentage along NY-481 and I-81

Exhibit 3.1 Vehicle Classification and Composition Ratio for NY-481 and I-81								
Time	NY-481				I-81			
	Private Autos Percentage	Buse Percentage	Medium Truck Percentage	Heavy Truck Percentage	Private Autos Percentage	Buse Percentage	Medium Truck Percentage	Heavy Truck Percentage
AM Peak	91.2%	1.3%	6.1%	1.4%	93.0%	1.4%	4.5%	1.1%
PM Peak	95.3%	0.3%	3.5%	0.9%	97.3%	0.3%	1.9%	0.5%

StreetLight data was used to extract the desired speed distribution along I-81 and NY-481. Five (5) desired speed distributions were generated and applied in the Existing VISSIM models. To prevent outliers of unreasonably slow or fast speeds from skewing the simulation, one standard deviation below the mean was used as the lower speed boundary and two standard deviations above the mean was used as the upper speed boundary. The speed distributions used in the VISSIM models are shown below in **Exhibit** 3.2 for private autos, medium trucks, and heavy trucks and buses.

Exhibit 3.2 NY-481 & I-81 Peak Hours Vehicle Desired Speed Distribution						
Cumulative Percentage	Auto		Medium Truck		Bus & Heavy Truck	
	AM	PM	AM	PM	AM	PM
Lower Boundary	57	58	56	56	58	59
50th	69	69	66	66	64	65
84th	75	75	71	72	68	68
95th	79	79	74	75	70	70
Upper Boundary	81	81	76	77	72	72

3.3 Existing Volume Development

All measures of effectiveness (MOEs) from traffic operational analysis were reported to represent typical weekday traffic conditions during the AM and PM peak hours by summing all counted volumes together:

- AM peak hours: 6:00 AM – 8:00 AM
- PM peak hours: 4:00 PM – 6:00 PM

With the peak hours determined, the demand volumes were developed using a multi-stage process. The existing raw traffic data counts were error checked before balancing the corridor counts and the intersection TMCs. The on- and off-ramp peak hour volumes were derived from field counts with ramp terminal intersections. The peak hour freeway volumes were developed for each peak period by summing on-and off-ramps on each facility. TMCs were balanced to develop hourly volumes for AM and PM peak hours. **APPENDIX C** shows balanced volumes for all existing time periods.

The base OD tables were from SMTC models which capture the regional traffic OD patterns, while the field counts were used in the VISUM calibration process to match assigned link volumes with field data. OD trip Tables from SMTC were used as seed tables in the VISUM model. Existing traffic count data were coded as control points into the model wherever available and TFlowFuzzy procedure was run to calibrate the model. TFlowFuzzy adjusted the OD trip tables so that the model assignment could reasonably match the traffic count data.

The existing VISSIM volume network was developed by the calibrated VISUM model volumes that were used as the input volumes.

3.4 Methodology and Model Tools

The PTV Vision Traffic Suite software VISSIM (version 2023) was used to perform a detailed analysis of the performance of the key roadway segments (basic freeway segments, merge segments, diverge segments, and weaving segments) identified as requiring analysis. Models were created for each analysis year and peak period. To support VISSIM microsimulation model development, mesoscopic simulation models were developed with the PTV Vision Traffic Suite application VISUM (version 2023).

The analysis findings from VISSIM microsimulation models will be summarized for the following MOEs:

- Freeway/Highway (I-81 and NY-481) mainline segment
    - Simulated throughput volumes (vehicle per hour)

  - Percent of demand served: simulated volume (output volume) divided by actual demand volume (input volume)
  - Simulated average density (pc/ln/mile)
  - Simulated travel times (minutes)
  - Simulated average speeds (mph)
- Terminal intersections
  - Simulated intersection HCM Delay-Based Level of Service (LOS) and Average Control Delay: reported by approach and by intersection (sec/vehicle, HCM 7th is proposed where it permits)
  - Simulated Queue Length: reported for 50th and 95th percentiles (feet)
  - Simulated throughput: simulated volume (output volume) for each movement
  - Percent of Demand Served: simulated volume (output volume) divided by actual demand volume (input volumes)

The PTV Vision Traffic Suite application VISUM (version 2023) was used to run trip assignments and to develop Origin-Destination (OD) tables for use in the VISSIM models, using an internal OD estimation package called TFlowFuzzy. TFlowFuzzy adjusted the demand matrix so that its assignment results could reasonably match field count data.

The Existing year VISUM network was initially extracted from the SMTC model. The sub-area VISUM model covered the Micron site and surrounding interstates, highways, and local streets within a 5-mile radius. The model includes 737 TAZs within this area and 96 external loading zones from the sub-area extraction. **Figure** 3-3 shows the extracted sub-area in VISUM. The geometry data from Open Street Maps / Bing Aerial was used to refine the extracted model, including the detailed intersection configurations. Signal phasing and timing data were provided by each jurisdiction for key intersections within the primary study area.

Figure 3-3: VISUM Sub-Area

The latest SMTC model was calibrated for 2017 conditions, so the extracted sub-area model needed to be recalibrated to reflect the existing (Year 2023) conditions with the collected field data. The comprehensive demand volume set developed from ATR, VCC and TMC data at key intersections and links was used to

develop appropriate OD patterns for traffic in the study area. This information was fed into the VISSIM models as peak hour volumes inputs and routings.

Figure 3-4 shows the procedure of generating VISSIM inputs. The trip tables extracted from SMTC were used as the seed demand matrices for TFlowFuzzy OD correction, which is an iteration process until the assigned volumes match the processed field counts. VISUM predicts traffic volumes and vehicle routes for regional studies. These predictions are then imported into VISSIM for detailed microsimulation. Given the complexity of setting up a VISSIM microsimulation network, this approach maintains consistency between the broader regional model and the local highway analysis.

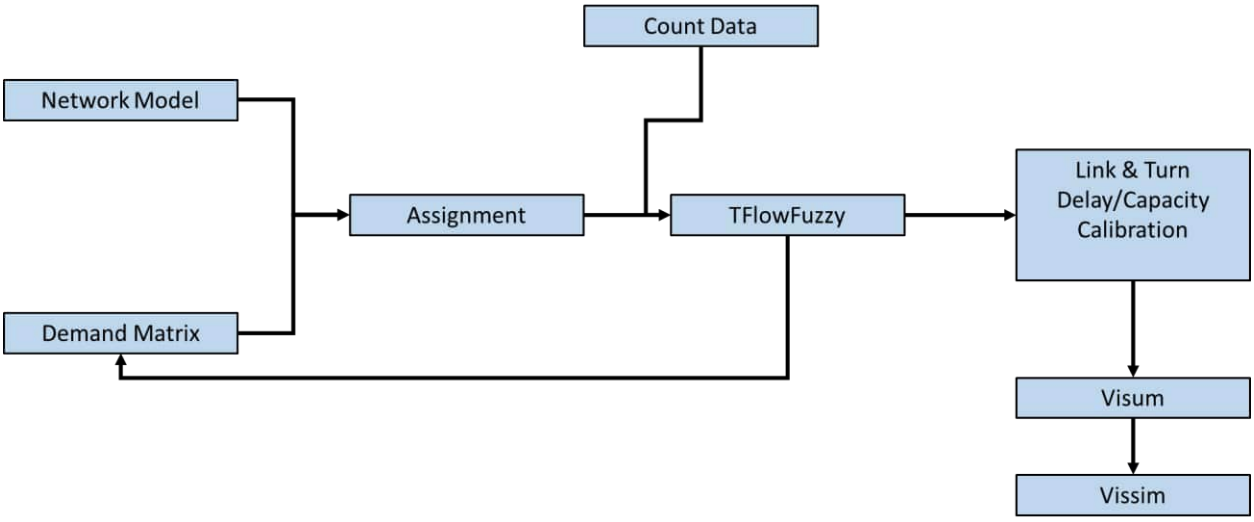

Figure 3-4: VISSIM Input Generation Procedure

VISUM predicts traffic volumes and vehicle routes for regional studies. These predictions are then imported into VISSIM for detailed microsimulation. Given the complexity of setting up a VISSIM microsimulation network, this approach maintains consistency between the broader regional model and the local highway analysis. **Exhibit** 3.3 show the VISUM calibration statistics, at a regional level, with 0.9936 coefficient of correlation for AM, and 0.9943 for PM.

Exhibit 3.3 VISUM Calibration Statistics			
	AM	**PM**	**FHWA Recommendations**

Minor Arterials	0.6%	-0.3%	+/- 15%
Collectors	-4.4%	0.3%	+/- 25%

The volume assignment results from VISUM were utilized as input demand for the VISSIM models. **Exhibit 3.4** illustrates the comparison between ATR peak hour field counts and VISSIM model throughputs. Given the close alignment of VISSIM throughputs with ATR field counts, the current VISSIM models can be validated using the field counts as demand inputs.

Exhibit 3.5 Analysis Software and Purpose	
Software	**Purpose**
PTV VISSIM (version 2023)	Microsimulation models for detailed roadway operational analysis and generate detailed operational analysis results (MOEs)
PTV VISUM 2023 (version 2023)	Support VISSIM models and provide OD matrices
Microsoft Excel	Support VISSIM models and data analysis

3.5 Simulation Parameters and Assumptions

Seeding Time

A VISSIM model simulation starts with zero vehicles on the roadway network. Since this is not representative of how the peak hour begins in the field, seeding time must be added to the beginning of the simulation period to allow vehicles to be present on the roadway network by the time the analysis period begins. The seeding time is determined based on three (3) criteria:

- Travel time through the study corridor
- Network equilibrium conditions
- Congestion level or queuing conditions at the beginning of the peak period

The guidance from FHWA suggests that seeding time should be determined based on either the existing peak-hour travel time to traverse between the farthest points of the study network in the peak direction of travel or twice the off-peak travel time between the network study limits.

VISSIM study corridor includes two corridor segments used to determine travel time: I-81 and NY-481. The I-81 segment is between NY-481 and Bartell Rd, with a total length of 5.85 miles for northbound and 5.99 miles for southbound, and a posted speed limit of 65 mph. The NY-481 segment is between NY-31 and I-81, with a total length of 8.45 miles eastbound and 8.43 miles southbound, and a posted speed limit of 65 mph.

Error! Reference source not found.**4** shows the summary I-81 field travel time and NY-481 StreetLight travel t ime with error and outlier checks.

Exhibit 3.6 Field / StreetLight Travel Time								
Corridor	Direction	Start	End	Distance (miles)	AM Travel Time (min)		PM Travel Time (min)	
					6:00 AM – 7:00 AM	7:00 AM – 8:00 AM	4:00 PM – 5:00 PM	5:00 PM – 6:00 PM
I-81	Northbound	NY-481	Bartell Rd	8.47	5.7	5.5	5.6	5.7
	Southbound	Bartell Rd	NY-481	6.42	5.8	5.6	5.5	5.5
NY-481	Eastbound	NY-31	I-81	8.48	7.4	7.5	7.6	7.5
	Westbound	I-81	NY-31	8.43	7.8	7.7	7.6	7.6

In addition, the VISSIM models were tested to determine when they reached equilibrium conditions, where the vehicles entering the network were equal to the vehicles existing the network. As seen in **Figure** 3-5 and **Figure** 3-6

The congestion level and queueing conditions were also taken into consideration of seeding time. The level of congestion in the simulation model should reach peak conditions observed in the field visit. Based on these considerations, a seeding time of 1800 seconds (i.e., 30 minutes) was utilized for both the AM and PM models.

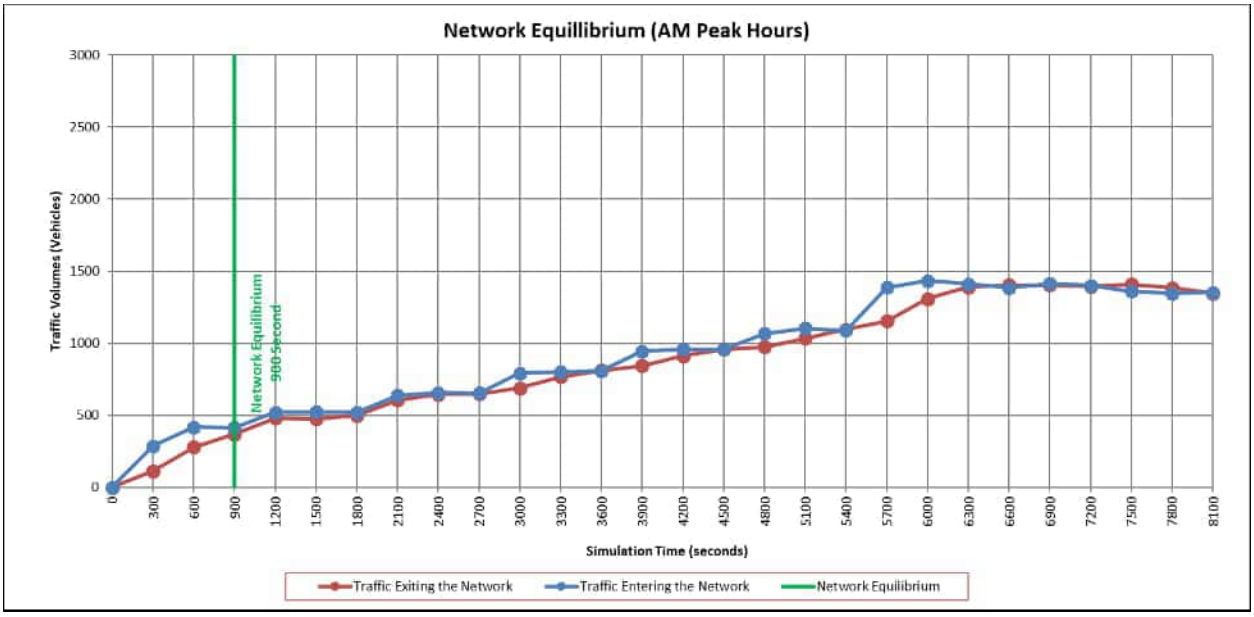

Figure 3-5. VISSIM Model Network Equilibrium (AM Model)

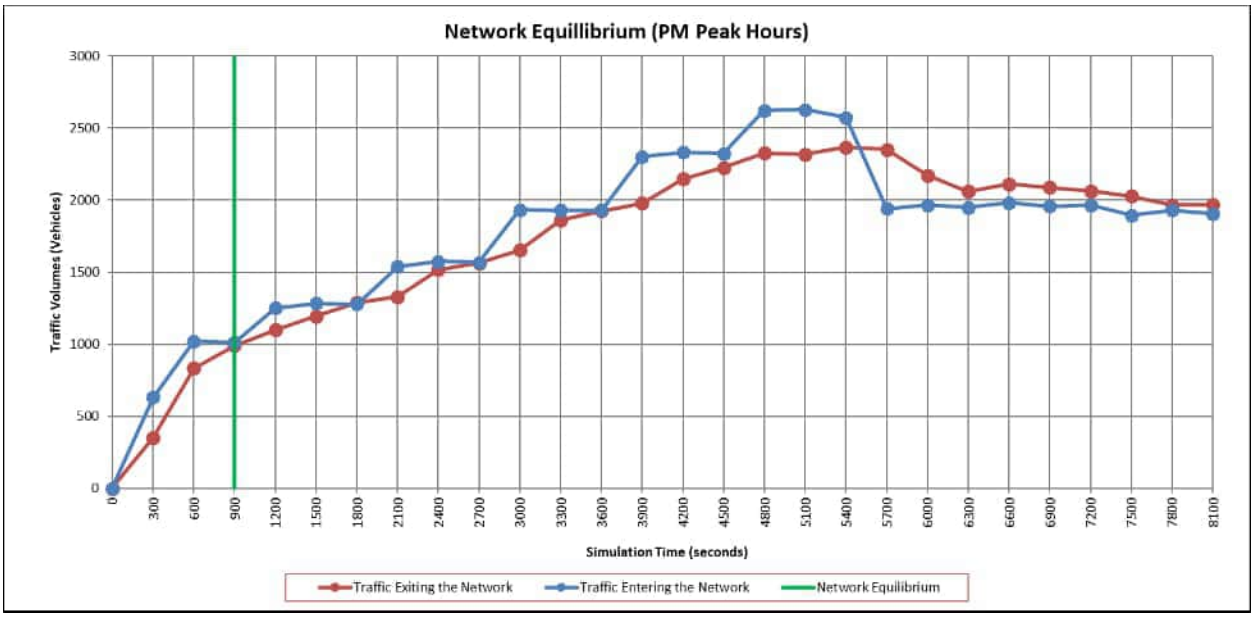

Figure 3-6. VISSIM Model Network Equilibrium (PM Model)

Traffic Dissipation

Traffic dissipation refers to how traffic queues form and then disperse. In the VISSIM model, the longest queues are expected to dissipate during the cooling down time. Based on field visits, the I-81 and NY-481 corridors in the study area do not anticipate congestion or bottlenecks. Both the AM and PM models include a 10-minute cooling down period. The MOEs in cooling time were not reported in this document.

Analysis Period

Based on the size of the network, field observations, and traffic counts within the project limits, the models were run for AM peak hours (6:00 AM to 8:00 AM) and PM peak hours (4:00 PM to 6:00 PM) after the 30-minute seeding period to evaluate traffic operational performance during the peak periods for the entire network.

Number of Runs

Given the stochastic nature of microsimulation, VISSIM models need to be run with several different random seeds. The results need to be post-processed and averaged to determine the representative state of traffic operations in the study network. Per typical industry standards, 10 simulations were conducted using random seed numbers, and the average outcomes were utilized for reporting and calibrating the model results, as per section 5.3.2 of the NYSDOT highway design manual.

Summary of Simulation Parameter and Assumptions

Detailed VISSIM simulation parameters used in the development and calibration of the VISSIM models are summarized in **Exhibit** 3.7**6.** The posted speed was used as the base speeds on the corridors. Based on the field data collected, a speed distribution range of +15 mph to -2 mph was applied to the base speed for all vehicles traveling in the corridor. The distribution of individual vehicles in this range was derived from StreetLight data. The link-specific changes for driving behavior were done during the calibration process and listed in the following sections.

Exhibit 3.7 VISSIM Model Parameters and Assumptions for Existing Calibration

Parameter	Existing (2023) AM	Existing (2023) PM
VISSIM Version	Version 2023	
Simulation Resolution	10-time steps/second	
Simulation Duration	9900 sec	
Seeding Time	1800 sec	
Off-Peak Period	900 sec	
Number of Simulation Runs	10	
Vehicle Types	Private autos, bus, medium truck, and heavy truck	
% Heavy Vehicle	Freeway/Highway: 7.7% Arterial: 5.4%	Freeway/Highway: 3.6% Arterial: 2%
Arterial Car Following Model	Wiedemann 74	
Freeway Car Following Model	Wiedemann 99	
Driver Behavior	Default or adjusted for calibration	
Signal Controller Type	Based on timing sheet data (PRBC)	
Signal Timings/Offsets	Existing signal timing data obtained from NYSDOT and local jurisdictions	
Desired Speed on Freeways	Posted speed +15/-2 mph	
Desired Speed on Arterials	Posted speed +5/-5 mph	
Ramp Curve Speed	Use Reduced Speed Areas as per as-built plans or based on field observations; otherwise use AASHTO Exhibit 3-16	
Intersection Turning Speed	Use Reduced Speed Areas for right and left turns (10-15 mph).	
Lane Change Distance	Freeways based on exit sign location and arterials default 656 ft. Adjust for calibration.	

4 VISSIM Model Calibration Process

The main objective of calibration is to best match model performance against field measures of performance, ensuring the model accurately replicate existing conditions along the corridors and can be used to produce reliable future condition results. The calibration corridor includes I-81 and NY-481.

Calibration of the models followed guidance from *FHWA's Traffic Analysis Toolbox Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software.*[1]

The model MOE values were compared with field collected MOE values based on existing field data. Modeled network travel times were targeted to be within 15 percent of field-measured network travel times. Speed/congestion plots were developed based on the model output to determine queue lengths and bottlenecks which were compared with field measured speed/congestion plots until the results were visually acceptable.

The following criteria were used to verify the adequacy of the model calibration:

- Capacity calibration criteria:
  - Throughput volumes on freeway segments and ramps on I-81 and NY-481.
- System performance calibration criteria:
  - Travel times on the freeway/highway segments
  - Travel speeds on the freeway/highway segments
  - Key bottleneck locations (by visual comparison with field observations) comparisons with Google® typical traffic snapshots

4.1 Calibration Criteria

The models were developed to simulate the peak periods, the focus of the calibration effort was on the peak hours. Volumes and travel time targets were met for the peak hours; however, length, duration, and extent of congestion were the focus of the entire peak periods. Those targets, based on the Wisconsin DOT Example from *Traffic Analysis Toolbox Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software*, are shown in **Exhibit** 4.1.

Exhibit 4.1 FHWA VISSIM Calibration Criteria	
Criteria and Measures	**Calibration Acceptance Targets**
Hourly Flows, Model Versus Observed	
GEH Statistic[1] < 5 for Individual Link and Ramp Flows	> 85% of all cases during the Peak Analysis Hour
Individual link flows	
Within 100 vph, for link flow < 700 vph	> 85% cases of all cases during the Peak Analysis Hour
Within 15%, for 700 vph < link flow < 2,700 vph	> 85% cases of all cases during the Peak Analysis Hour
Within 400 vph, for link flow > 2,700 vph	> 85% cases of all cases during the Peak Analysis Hour
Difference in sum of all link flows	Within 5% of all cases during the Peak Analysis Hour
Travel Times, Model Versus Observed	
Travel Times – Entire Sector	Within 15% of field observed of all cases during the Peak Analysis Hour
Travel Times – Sector Subsections	Within 15% or 1 minute, if higher. >85% of all cases of all cases during the Peak Analysis Hour
Visual Audits	
Bottlenecks – Visually Acceptable Queuing	To analyst's satisfaction – during the Peak Analysis Period.

Exhibit 4.1 FHWA VISSIM Calibration Criteria	
Criteria and Measures	**Calibration Acceptance Targets**
[1]The GEH Statistic is computed as follow: $GEH = \frac{\sqrt[2]{(E-V)^2}}{\frac{E+V}{2}}$	Where: *E* = Model estimated Volume *V* = Field Count

Model calibration is a process used to achieve adequate reliability or validity of the model by establishing suitable parameter values so that the model replicates local traffic conditions as closely as possible. A customized multi-step strategy was applied. In order of priority, the steps are:

1. **Capacity Calibration** – VISSIM model parameters were adjusted to meet the calibration criteria of the throughput volumes. These candidate model changes included parameters for lane-change distances, distribution of speeds, and driving behavior parameters (car-following parameters and lane-changing parameters) for different facilities.
2. **System Performance Calibration** – Travel time and speed profiles from VISSIM model results were then compared to field measurements. Link free-flow speed and capacity-related parameters were further refined to match field conditions.
3. **Visual Review** – VISSIM simulation animation was then reviewed to compare queuing and congestion conditions at key locations between the model and the field observations. INRIX congestion diagrams were compared with the congestion profiles from the VISSIM models to match bottleneck locations and the level of congestion occurring at these locations during the peak hour. Google® traffic congestion maps were also used to perform a visual comparison to VISSIM simulation results.
4. Freeway throughput volumes and freeway mainline travel times were used as the key targets in the base model calibration procedure for this study. Average speeds on the freeway mainlines were used as the system performance target.

4.2 Driver Behavior Parameter Changes

Calibration of the VISSIM models required changes to default driver behavior parameters at select links within the model to replicate field conditions. Changes were applied to freeway and arterial links within the model. There were altogether six (6) driver behavior categories, four (4) categories applied Wiedemann 99 Car Following Model, and two (2) categories applied Wiedemann 74 Car Following Model, used in the models. **Exhibit** 4.2 lists the parameter changes for these categories which apply to the Wiedemann 99 Car Following Model.

Within 15%, for 700 vph < link flow < 2,700 vph	> 85% cases of all cases during the Peak Analysis Hour	83	100%	**Yes**
Within 400 vph, for link flow > 2,700 vph	> 85% cases of all cases during the Peak Analysis Hour	8	100%	**Yes**
Difference in sum of all link flows	Within 5% of all cases during the Peak Analysis Hour	190213	-3%	**Yes**

5.2 Simulated Travel Time

Exhibit 5.2 compares field-measured travel times and model travel times along the I-81 and NY-481 for existing conditions in AM peak hour. Travel time measures were aggregated by corridor and direction of travel. The differences between model outputs and the field measurements for all corridors are within the allowable calibration criteria of 15 percent.

Exhibit 5.2 Corridor Travel Time Summary - AM

Corridor	Time	Field Measured Travel Time (Mins)	VISSIM Simulated Travel Time (Mins)	Δ (min)	Δ%
NY-481 Westbound	6:00 AM - 7:00 AM	7.8	7.6	-0.2	-2%
	7:00 AM - 8:00 AM	7.7	7.6	-0.1	-1%
NY-481 Eastbound	6:00 AM - 7:00 AM	7.4	7.7	0.3	4%
	7:00 AM - 8:00 AM	7.5	7.8	0.3	4%
I-81 Northbound	6:00 AM - 7:00 AM	5.7	5.8	0.1	2%
	7:00 AM - 8:00 AM	5.5	5.8	0.3	6%
I-81 Southbound	6:00 AM - 7:00 AM	5.8	5.8	0.0	-1%
	7:00 AM - 8:00 AM	5.6	5.8	0.2	3%

5.3 Speed Congestion Diagram (Visual Audit)

Congestion was analyzed with a qualitative process using congestion diagrams based on model outputs. Model output was compared with “typical day” Streetlight field congestion and speed profiles. The Streetlight data, which is based on the continuously collected Location Based Vehicles (LBS) and Connected Vehicle (CV) data, was summarized for the same peak period. The speed profiles are broken down into different speed bins each assigned a different color and depict a profile of speeds along the corridor throughout the entire peak period. The speed profiles make it easy to identify the bottleneck locations and intensity of the congestion within the corridors. They also help identify the length of queues in a particular direction.

From the speed congestion diagrams below, the VISSIM model generally simulated the field speed profiles on freeway mainlines along I-81 and NY-481, especially the bottleneck locations and length of queues.

Figure 5-9 shows speed calibration results in AM peak hour. **Figure** 5-6 through

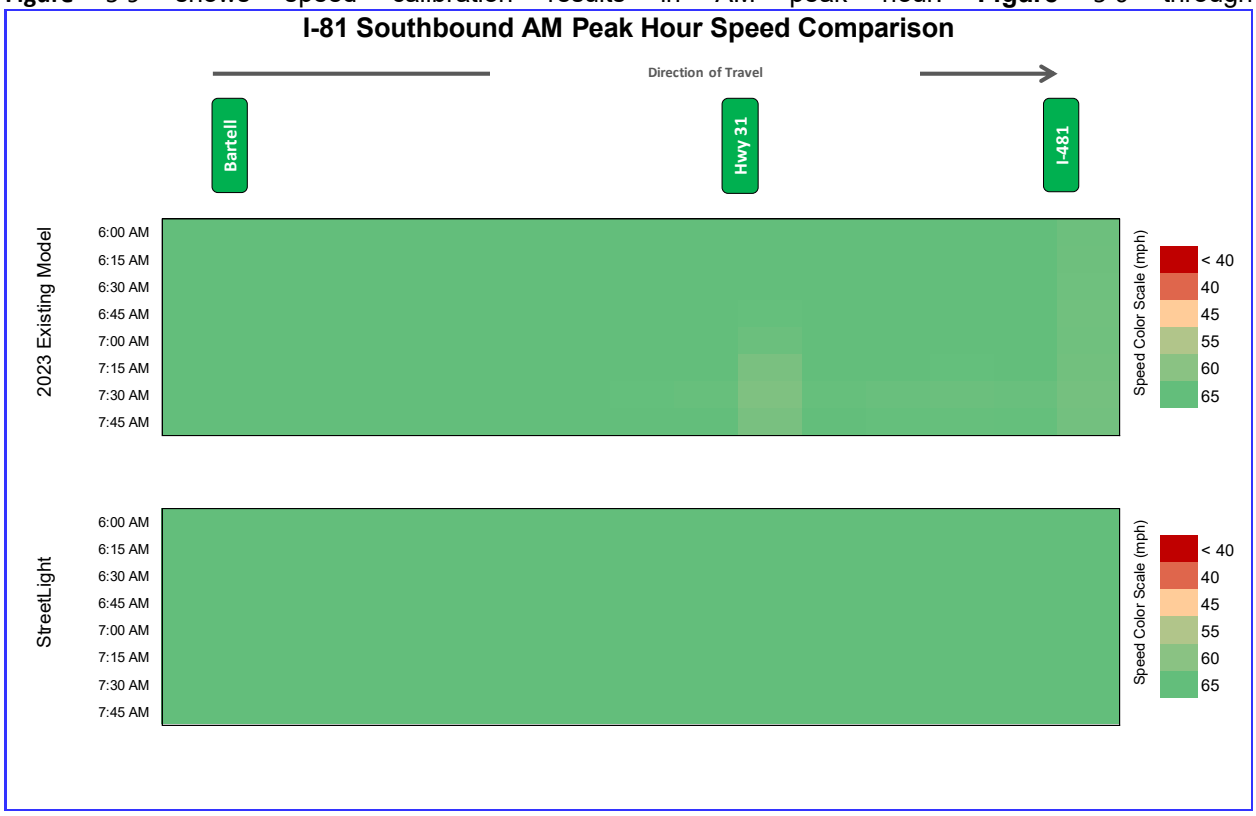

Figure 5-9 show the speed comparison between VISSIM output and field condition. Both two corridors show free-flow speed except several locations with minor slowdown.

Exhibit 5.3 Speed Calibration Summary - AM					
Facility	**Time**	**Field Average Speed (mph)**	**VISSIM Average Speed (mph)**	**Δ (mph)**	**Δ%**
NY-481 Westbound	6:00 AM - 7:00 AM	65.6	66.9	1.3	2%
	7:00 AM - 8:00 AM	65.9	66.6	0.8	1%
NY-481 Eastbound	6:00 AM - 7:00 AM	68.4	66.0	-2.5	-4%
	7:00 AM - 8:00 AM	68.3	65.3	-2.9	-4%
I-81 Northbound	6:00 AM - 7:00 AM	68.3	67.1	-1.2	-2%
	7:00 AM - 8:00 AM	71.5	67.4	-4.2	-6%
I-81 Southbound	6:00 AM - 7:00 AM	66.5	66.8	0.4	1%
	7:00 AM - 8:00 AM	69.1	66.8	-2.3	-3%

Within 15%, for 700 vph < link flow < 2,700 vph	> 85% cases of all cases during the Peak Analysis Hour	171	99%	**Yes**
Within 400 vph, for link flow > 2,700 vph	> 85% cases of all cases during the Peak Analysis Hour	11	100%	**Yes**
Difference in sum of all link flows	Within 5% of all cases during the Peak Analysis Hour	330052	-3%	**Yes**

6.2 Simulated Travel Time

Exhibit 6.6.2 compares the field-measured travel times and model travel times along the freeways for existing conditions in PM peak hour. Travel time measures were aggregated by corridor and direction of travel. The differences between model outputs and the field measurements for two corridors are within the allowable calibration criteria of 15 percent.

Exhibit 6.6.2 Corridor Travel Time Summary - PM					
Corridor	**Time**	**Field Measured Travel Time (Mins)**	**VISSIM Simulated Travel Time (Mins)**	**Δ (min)**	**Δ%**
NY-481 Westbound	4:00 PM - 5:00 PM	7.6	7.8	0.3	3%
	5:00 PM - 6:00 PM	7.6	7.8	0.3	3%
NY-481 Eastbound	4:00 PM - 5:00 PM	7.6	7.7	0.2	2%
	5:00 PM - 6:00 PM	7.5	7.7	0.2	3%
	4:00 PM - 5:00 PM	5.6	5.9	0.4	7%

I-81 Northbound	5:00 PM - 6:00 PM	5.7	5.9	0.2	3%
I-81 Southbound	4:00 PM - 5:00 PM	5.5	5.7	0.2	4%
	5:00 PM - 6:00 PM	5.5	5.7	0.2	4%

6.3 Speed Congestion Diagram (Visual Audit)

Exhibit 6.3shows speed calibration results in PM peak period. **Figure 6-6** through **Figure 6-9** show the speed comparison between VISSIM output and field condition. Both two corridors show free flow speed except several locations with minor slowdown.

Exhibit 6.3 Speed Calibration Summary - PM

Facility	Time	Field Average Speed (mph)	VISSIM Average Speed (mph)	Δ (mph)	Δ%
NY-481 Westbound	4:00 PM - 5:00 PM	67.2	64.9	-2.3	-3%
	5:00 PM - 6:00 PM	67.2	64.9	-2.2	-3%
NY-481 Eastbound	4:00 PM - 5:00 PM	67.4	66.0	-1.4	-2%
	5:00 PM - 6:00 PM	67.8	66.0	-1.9	-3%
I-81 Northbound	4:00 PM - 5:00 PM	70.4	65.8	-4.6	-6%
	5:00 PM - 6:00 PM	68.1	65.9	-2.3	-3%
I-81 Southbound	4:00 PM - 5:00 PM	70.2	67.3	-3.0	-4%
	5:00 PM - 6:00 PM	69.9	67.3	-2.6	-4%

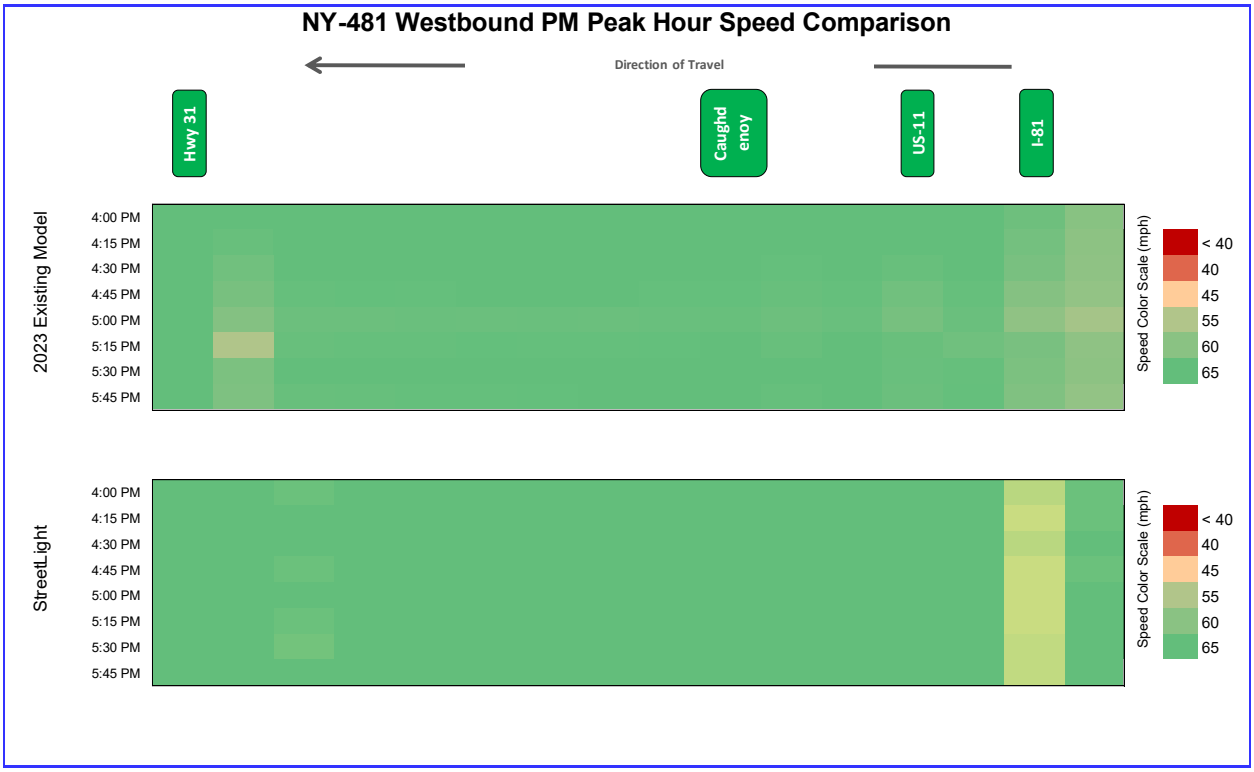

Figure 6-6. NY-481 Westbound Speed Congestion Diagram, PM Peak Period

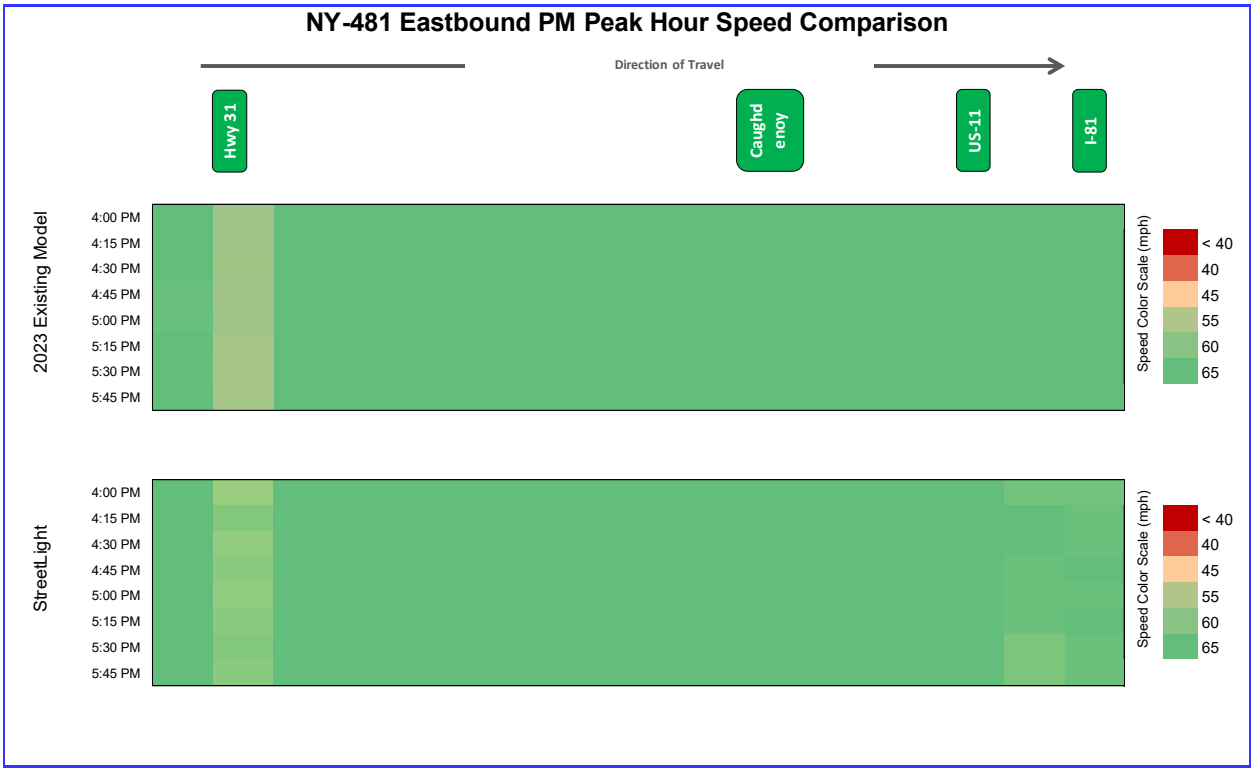

Figure 6-7. NY-481 Eastbound Speed Congestion Diagram, PM Peak Period

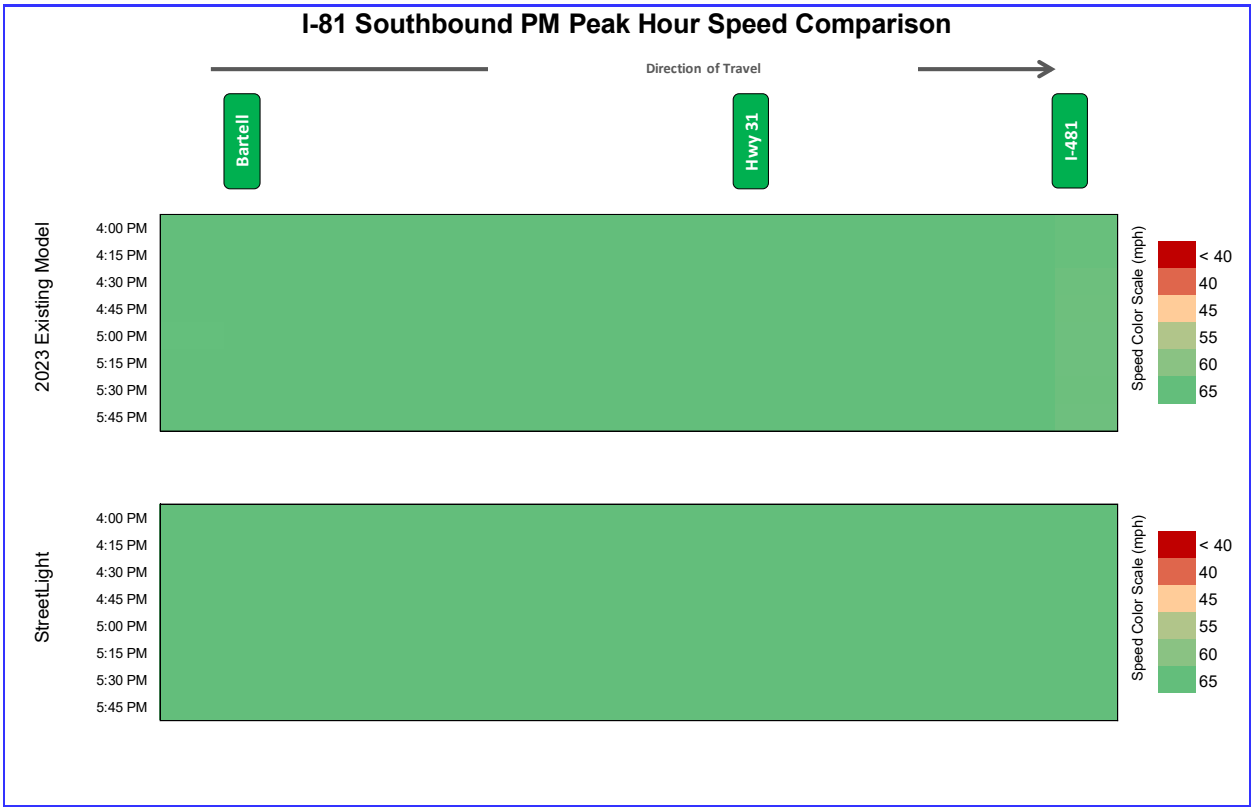

Figure 6-9. I-81 Southbound Speed Congestion Diagram, PM Peak Period

7 Conclusion

Based on the results obtained from the VISSIM AM and PM peak hour models and their comparison with field data for all the calibration measures listed in previous sections, it can be concluded that the models are reasonably calibrated and can be used to develop future conditions for the analysis.

APPENDIX A – Micron Semiconductor Fabrication Plan Traffic Analysis Volume Comparison Memorandum

Micron Semiconductor Fabrication Plan Traffic Analysis – Future Year Traffic Volume Comparison Memorandum

Date: September 10, 2024
Project name: Micron Semiconductor Fabrication Plan Traffic Analysis
Prepared by: Jacobs

1851 Alexander Bell Drive
Suite 100
Reston, VA 20191
T +1.202.785.5800
F +1.202.785.4755

Summary

Jacobs conducted the traffic volume comparison between different analysis years of Micron Semiconductor Fabrication Plan Traffic analysis. For the analysis, the Syracuse Metropolitan Transportation Council (SMTC) travel demand forecast models, which cover multiple future years, were used. The traffic volume comparisons were performed using PTV VISUM software between the Year 2041 and Year 2051. This memo aims to summarize the findings from comparing traffic volumes for future analysis years within the study area.

Background and Purpose

Micron announced in October 2022 their intentions to build a new semiconductor manufacturing plant at the White Pine Commerce Park, an industrial development site located in the Town of Clay, NY, north of the City of Syracuse in Onondaga County. A Draft Environmental Impact Statement (DEIS) is being prepared in accordance with the National Environmental Policy Act (NEPA) and the State Environmental Quality Review Act (SEQRA) to evaluate the potential adverse impacts that would result from implementation of the Project.

Construction is anticipated to be phased over a 20-year period (estimated time of completion in Year 2044), with the four fabrication plants becoming operational on a rolling timeframe. The traffic analysis will assess the existing (Year 2023) traffic conditions and future analysis years, 2027, 2031 and 2041, which represent the peak construction stages for each fabrication plant.

The Estimated Time of Completion (ETC) for major traffic improvements is 2031. To plan for future traffic needs, projections for 20 years after the ETC (ETC + 20) are typically analyzed. Thus, 2051 is the ETC + 20 from 2031. However, the year with the highest projected traffic volume is more appropriate to use as the equivalent ETC + 20. In this case, 2041, which has the highest projected volume due to the Micron site's construction, operation, and background traffic, is considered equivalent to 2051.

Study Scope

The Micron site study area was used as the basic land use development influence area in the traffic volume comparison process. A site location map, presented in **Figure 1,** showing the total of 32.4 Square Miles, NY-481 to I-481, andSR-31 to NY-481. The following corridors were included in the study area.

- I-81 from E Taft Rd to Mud Mill Rd
- NY-481 from Northern Blvd to Verplank Rd

- SR-31 from Oswego Rd to Thompson Rd
- SR-11 from Mud Mill Rd to Chestnut St
- Adjacent local streets

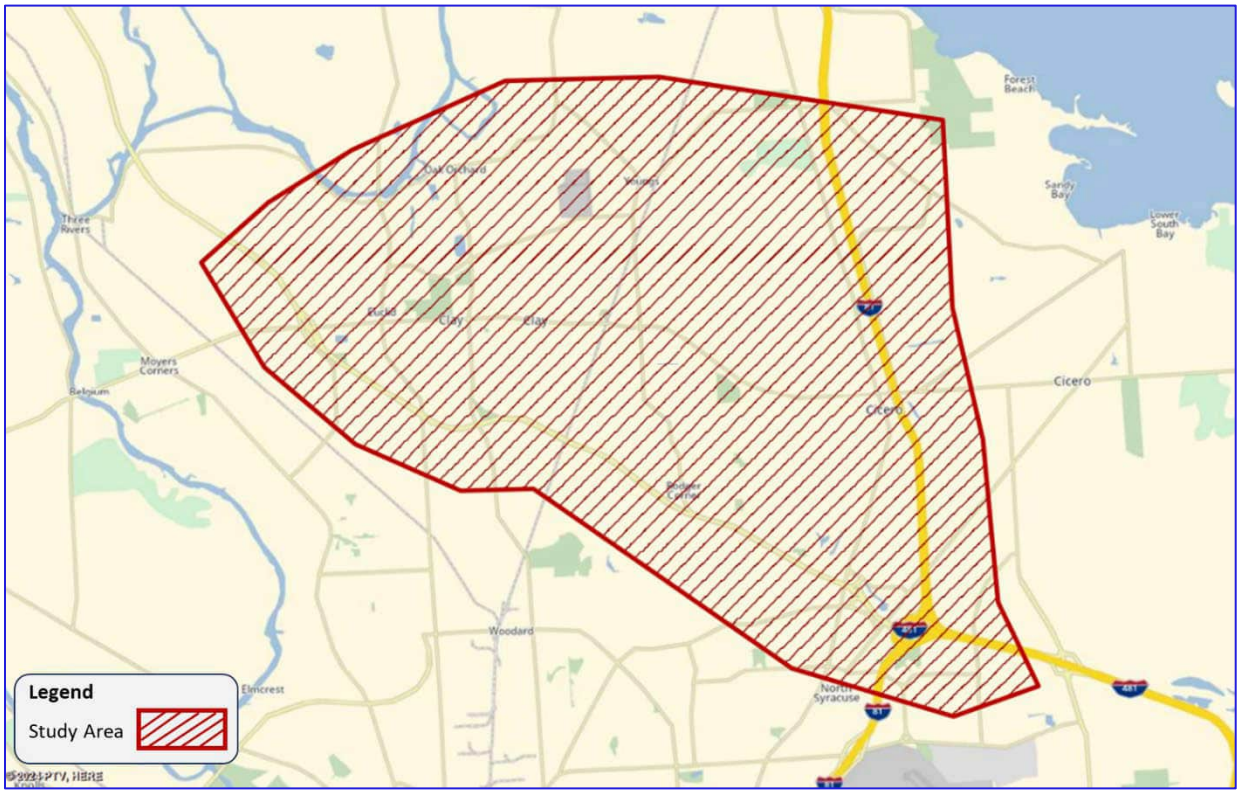

Figure 1: Study Area – Subarea from the Syracuse Metropolitan Transportation Council (SMTC) Travel Demand Forecast Models

Traffic Volume Comparison

Five analysis years were examined using both No Build Alternatives and Build Alternatives without mitigations to assess the impact of construction plans and network mitigation strategies. Build Alternatives consider scenarios that evaluate the cumulative operational traffic impact, including construction traffic, regional traffic growth, and land use development. The traffic volume comparison was conducted to inform the chosen process for analyzing future build years.

Table 1 summarizes the actions and traffic analysis years.

Table 1 Traffic Analysis Years and Actions

Action	Approximate Year	Analysis
Existing Conditions	2023	Existing only
Peak Construction of Fab 2	2027	No Build, Micron Build, Micron Build with Minor Traffic Improvement Concepts
Build Year of Major Traffic Improvement Concepts	2031 (ETC)	No Build, Micron Build, Micron Build with Major Traffic Improvement Concepts

Action	Approximate Year	Analysis
Peak Construction of Fab 4	2041 (ETA+20)	No Build, Micron Build, Micron Build with Major Traffic Improvement Concepts

Table 2 presents the total traffic volumes for the study area across various analysis years and scenarios. The 2041 Build PM has a higher overall network volume compared to the 2051 Build PM. In contrast, the 2051 Build AM shows a 0.5% increase in volume over the 2041 Build AM network volumes. However, the construction work at the Micron site will lead to more traffic congestion due to a higher volume of trucks than in 2051.

Table 2: Traffic Volume Comparison - Subarea

Action / Scenario	AM				PM			
	Origin Demand	Destination Demand	Internal Trips	Total Trips	Origin Demand	Destination Demand	Internal Trips	Total Trips
2023	4,663	4,298	1,184	**10,145**	6,754	6,911	2,773	**16,437**
2027 Build	6,264	9,197	2,632	**18,092**	12,527	9,535	4,974	**27,035**
2041 No-Build	6,593	6,917	2,748	**16,258**	10,359	10,014	5,369	**25,742**
2041 Build	6,685	12,629	3,526	**22,840**	16,664	11,936	10,254	**38,853**
2051 Build	6,882	12,518	3,546	**22,947**	15,314	10,327	6,059	**31,699**

Table 3 details the volume comparisons along I-81 corridor in the subarea. In the AM peak hour, the total traffic volume in both directions on I-81 is expected to be 502 vehicles (4.8%) higher in 2051 compared to 2041. In the PM peak hour, the total volume is projected to be 114 vehicles (1.0%) higher in 2051 than in 2041.

Table 3: Traffic Volume Comparison – I-81

Section - I-81 Corridor Only		AM			PM		
		2041	2051	Difference (2051 vs 2041)	2041	2051	Difference (2051 vs 2041)
North of I-81/NY-31	I-81 NB	1,124	1,214	90	2,723	2,745	22
	I-81 SB	2,893	3,056	164	1,613	1,745	131
	Total	**4,017**	**4,270**	**253**	**4,336**	**4,490**	**154**
South of I-81/NY-31	I-81 NB	2,722	2,779	57	3,136	3,310	174
	I-81 SB	3,819	4,011	192	3,884	3,670	-214
	Total	**6,541**	**6,790**	**249**	**7,020**	**6,980**	**-40**
Total		10,558	11,060	**502**	11,356	11,470	**114**

Figure 2 and **Figure 3** present the volume differences between 2041 and 2051 in both AM and PM peak hours.

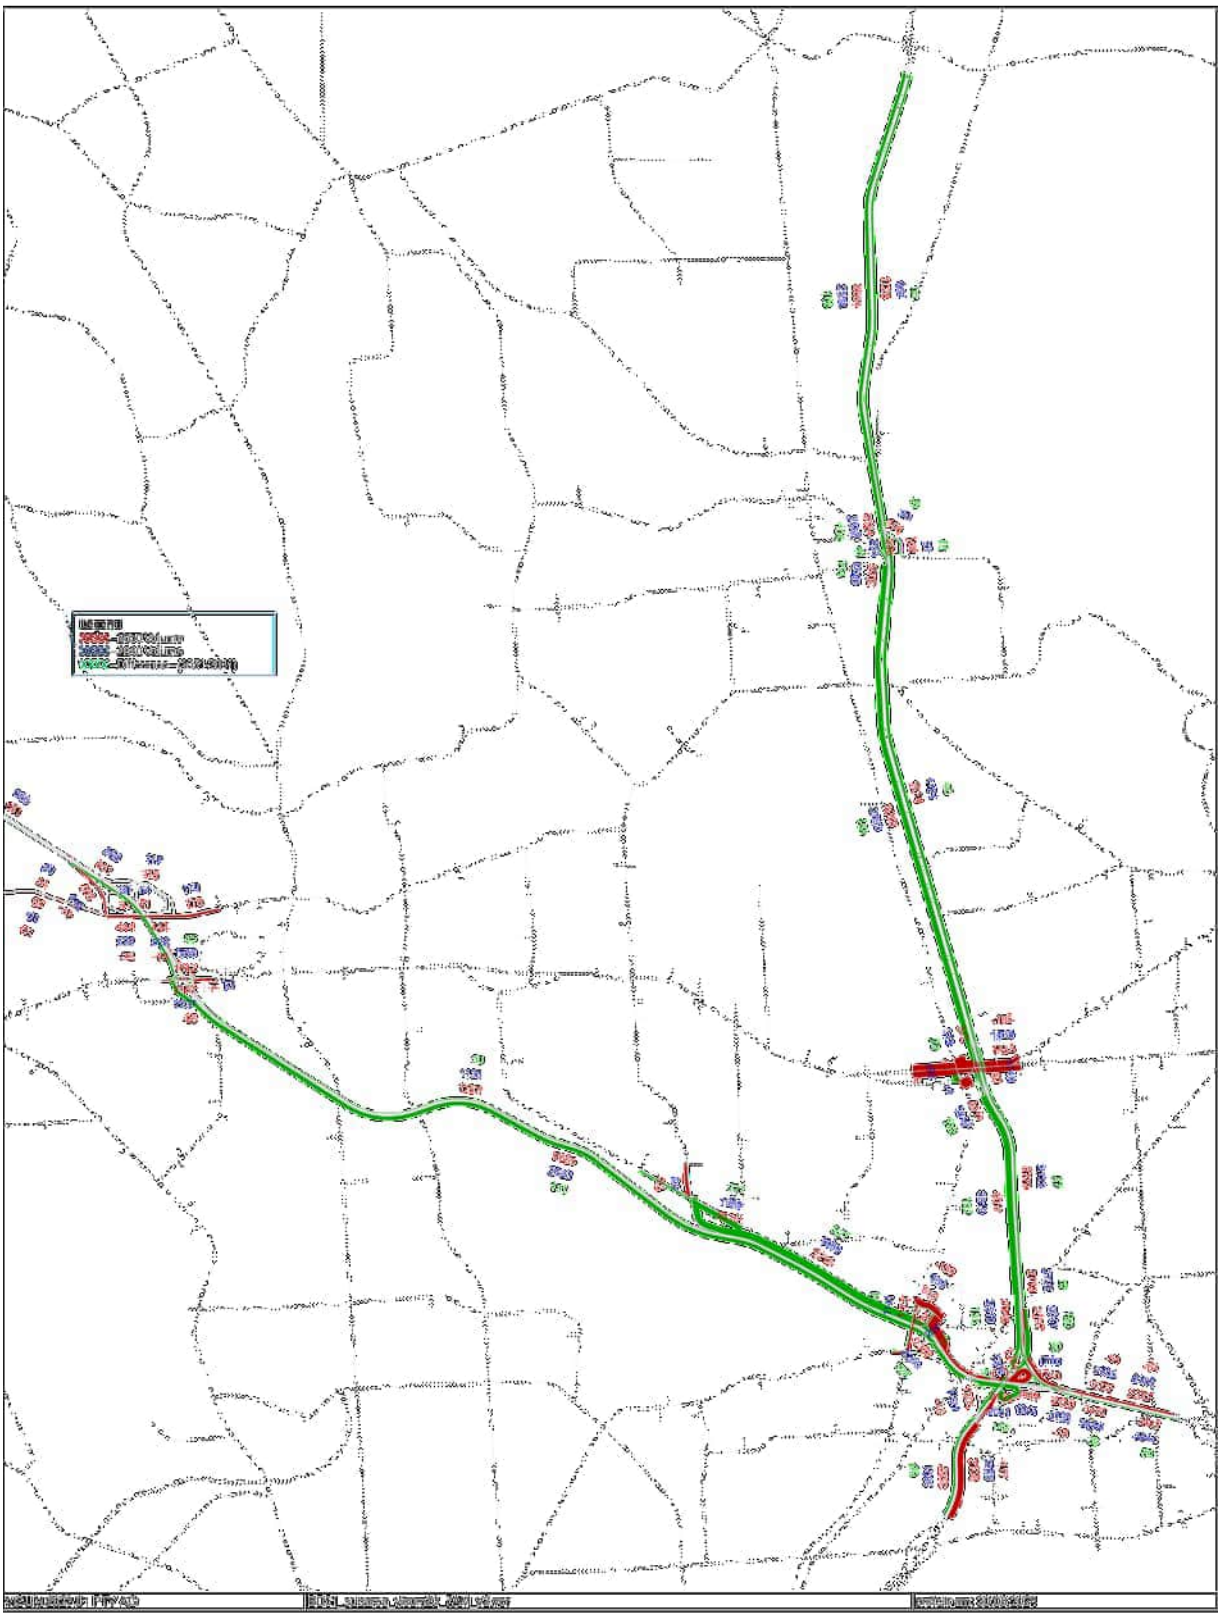

Figure 2: Corridor Volume Comparison – 2041 & 2051 AM

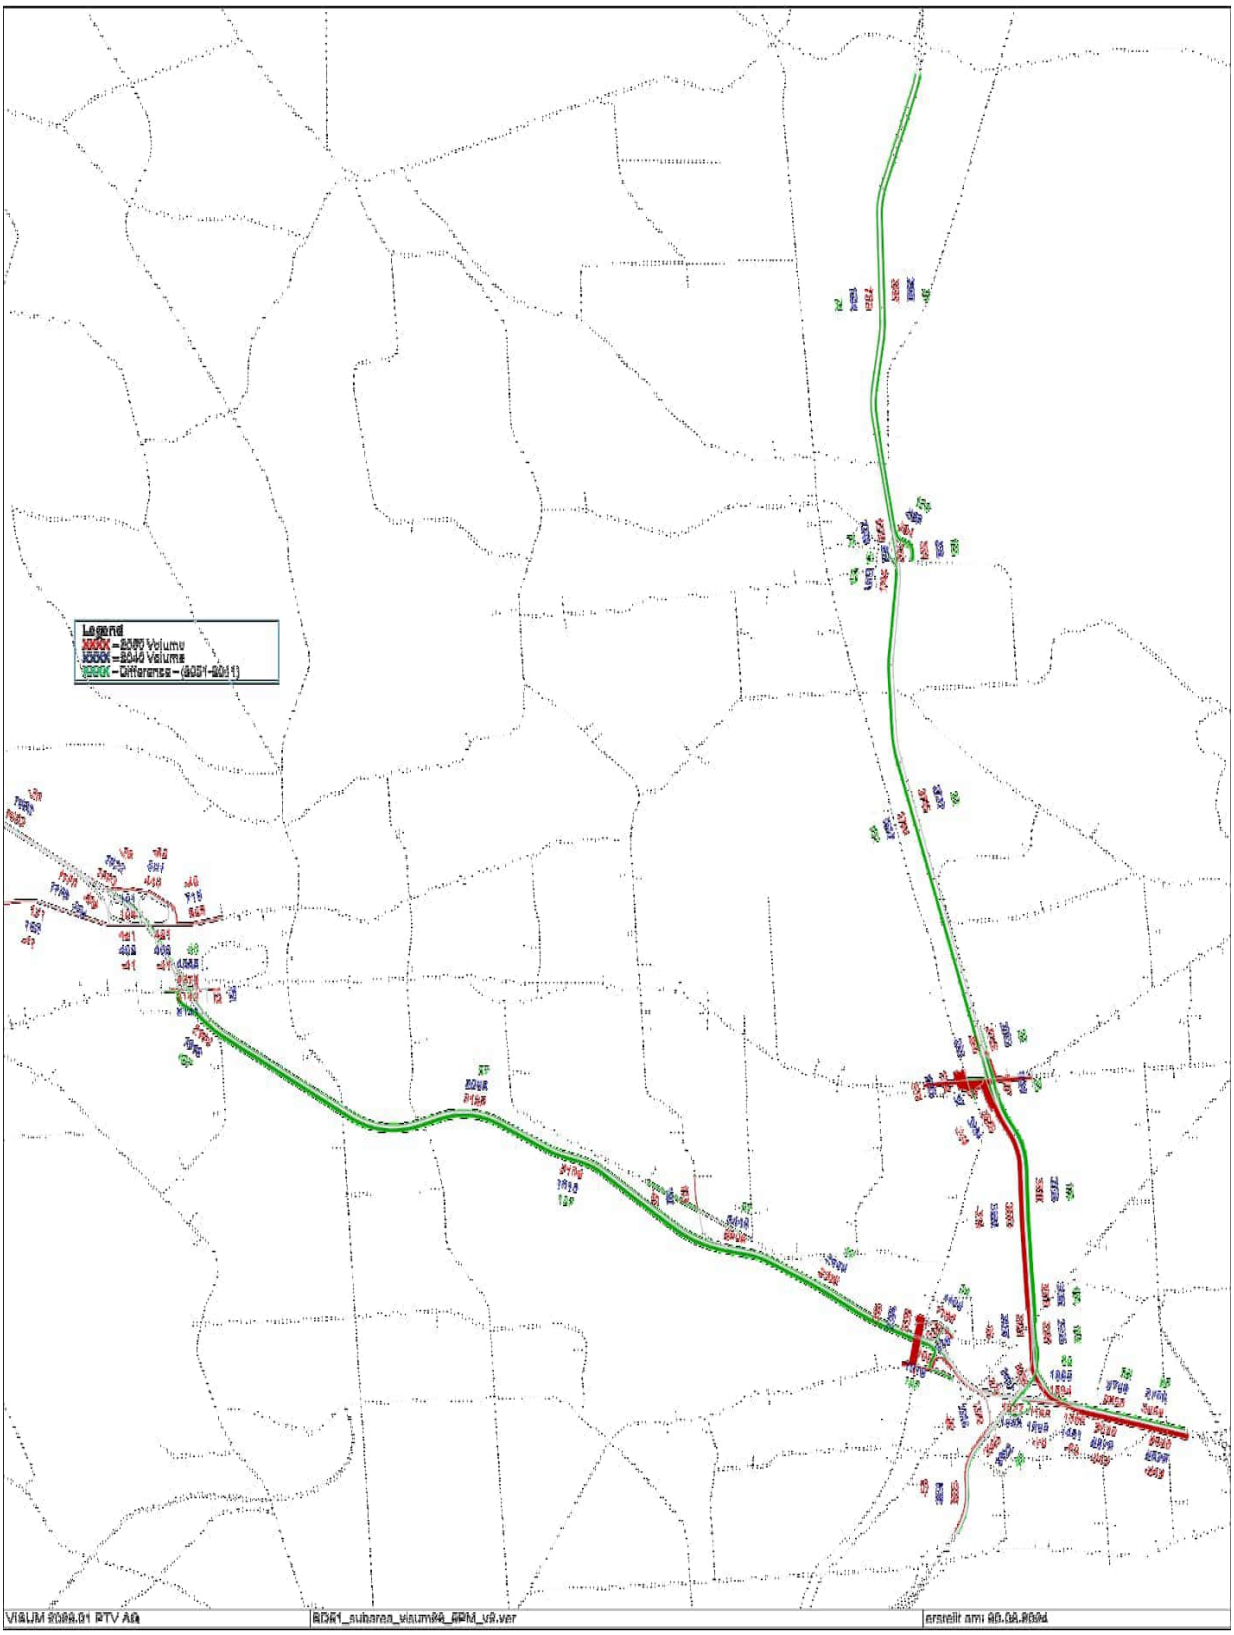

Figure 3: Corridor Volume Comparison – 2041 & 2051 PM

Conclusion

The differences in traffic volume during both the AM and PM peak hours between 2041 and 2051 are less than 5%.

Note: "Other" is a summation of Animal, Pedestrian, Bicycle, Fixed Object, and Unknown

Above the NYSDOT Average Accident Rates

Source: HIGHWAY DESIGN MANUAL (ny.gov Source: AverageAccidentRates2019.pdf (ny.gov)

Segment Crash Rate (acc/MVM) = 1,000,000 x No. of crashes per year / 365 x AADT x segment length (in miles)

$$R = \frac{1{,}000{,}000 \times C}{365 \times N \times V}$$

Where:

R = Crash rate for the intersection expressed as accidents per million entering vehicles (MEV).
C = Total number of intersection crashes in the study period.
N = Number of years of data.
V = Traffic volumes entering the intersection daily.[10]

Micron Intersections - Accident Analysis (2018-2022)

Intersection	Crash Location ID	Crash Severity					Crash Type				
		Fatal	Injury	Property Damage Only	Non-Reportable	Total	Unknown	Rear End	Overtaking	Left Turn	Right Turn

Crash Type Summary		
Crash Type	Number of Crashes	Percent of Total
Rear End	14	35.9%
Left Turn	2	5.1%
Right Turn	0	0.0%
Right Angle	14	35.9%
Head-On	2	5.1%
Sideswipe	0	0.0%
Overtaking	1	2.6%
Animal	*1*	*2.6%*
Pedestrian	*0*	*0.0%*
Bicycle	*0*	*0.0%*
Fixed Object	*2*	*5.1%*
Unknown	*3*	*7.7%*
Other	6	15.4%
Total	39	100.0%

Note: "Other" is a summation of Animal, Pedestrian, Bicycle, Fixed Object, and Unknown

$$R = \frac{1{,}000{,}000 \times C}{365 \times N \times V}$$

Where:

R = Crash rate for the intersection expressed as accidents per million entering vehicles (MEV).
C = Total number of intersection crashes in the study period.
N = Number of years of data.
V = Traffic volumes entering the intersection daily.[10]

Micron Intersections - Accident Analysis (2018-2022)

TMC	Intersection	Crash Location ID	Crash Severity					Crash Type					
			Fatal	Injury	Property Damage Only	Non-Reportable	Total	Unknown	Rear End	Overtaking	Left Turn	Right Turn	Right Angle

Crash Type Summary		
Crash Type	Number of Crashes	Percent of Total
Rear End	366	41.5%
Left Turn	70	7.9%
Right Turn	12	1.4%
Right Angle	178	20.2%
Head-On	6	0.7%
Sideswipe	19	2.2%
Overtaking	128	14.5%
Animal	*45*	*5.1%*
Pedestrian	*3*	*0.3%*
Bicycle	*4*	*0.5%*
Fixed Object	*47*	*5.3%*
Unknown	*3*	*0.3%*
Other	102	11.6%
Total	881	100.0%

Note: "Other" is a summation of Animal, Pedestrian, Bicycle, Fixed Object, and Unknown

$$R = \frac{1{,}000{,}000 \times C}{365 \times N \times V}$$

Where:

R = Crash rate for the intersection expressed as accidents per million entering vehicles (MEV).
C = Total number of intersection crashes in the study period.
N = Number of years of data.
V = Traffic volumes entering the intersection daily.[10]
