Draft EIS Review Introduction

One EIS document will be prepared to satisfy both NEPA and SEQRA requirements.

Chapter 1 and Chapter 2

Chapter 1, Purpose and Need, and Chapter 2, Alternatives are under review by the state (Onondaga County Industrial Development, OCIDA) and federal lead agencies (CHIPS Program Office, CPO).

Summary of project elements to be analyzed in the EIS (note – some terminology may differ from what is presented in the initial drafts of Chapters 1 and 2 that are currently under review):

Full Scale Alternative:

Proposed Project

- Micron Campus – 4 Fabs
- Childcare Site
- Utility Conveyance
- Rail Spur Site

Off-Site Improvements

- Natural Gas (National Grid)
- Electricity (National Grid)
- Wastewater (Onondaga Water Development Corporation)
- Water Supply (OCWA)
- Fiber

Reduced Scale Alternative:

A developer would construct 2 Fabs on the western portion of the White Pine Commerce Park. The Rail Spur site would be developed with a spur. There would be no development on the Childcare site. All off-site improvements would continue to be required. The eastern portion of the site would remain vacant until such time as OCIDA identifies another development proposal for the site. Any such future development will be addressed in the Cumulative analyses of the EIS.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

Transportation mitigation will be identified in the Transportation section as mitigation for project impacts.

State Environmental Quality Review ACT (SEQRA) scoping document by OCIDA

OCIDA prepared a scoping document and held a public scoping session on the draft scope on October 11, 2023. The scoping document can be accessed at: Final-Scope2.pdf (ongoved.com). Please refer to the scoping document for further information related to project location, project description, purpose and need, project alternatives, analysis framework, and agency and public coordination.

Submitted Documents

The documents provided for review are detailed technical analyses for the resource/impact topic. From these documents and to meet the page requirements for a federal EIS, a summarized narrative for each topic will be included in the Draft Environmental Impact Statement after the technical analyses are finalized. All or part of these documents may be appended to the EIS.

The Micron consultant team is working with stakeholders and agencies with jurisdiction for technical input on the analysis of each resource topic. As this coordination for each resource topic is ongoing, some of the sections provided for review are full sections including study area, methodology, affected environment (existing conditions), environmental consequences, and mitigation, while some sections are partially completed (e.g., for Air Quality, the Stationary Source subsection will be presented in full, and the Mobile Source subsection will be a placeholder until the full analysis is complete). For some resource topics, prior to receiving the full section a workshop or briefing will be held to solicit early agency feedback.

Construction impacts are analyzed and presented under the environmental consequences section for each resource area. There will not be a separate construction chapter for this DEIS.

Cumulative impacts analysis of the Proposed Project will be presented in a separate chapter after impacts analyses for all resource topics are completed.

A maximum of two weeks (calendar day) is allocated for agency review. If the agency received a document on Monday 6/24/2024, comments are expected back to Micron on Monday 7/8/2024.

CIDA reserves the right to take the time necessary to review EIS chapters to ensure that SEQRA can be satisfied. OCIDA plans to allow involved agencies, as appropriate, time to

review and comment. OCIDA also reserves the right to review this chapter again once it has been redrafted as page limited and addresses OCIDA's high level comments.

1 INTRODUCTION

1.1 Purpose

This memorandum describes the analytical methods, assumptions, criteria, and thresholds used to assess roadway segments and intersections within the study area for the extensive traffic analysis conducted for the Micron semiconductor manufacturing facility (the "Proposed Project"., Draft Environmental Impact Statement (Draft EIS).

1.2 Background

In October 2022 Micron announced its intention to construct a new semiconductor manufacturing campus at the White Pine Commerce Park, an industrial development site located in the Town of Clay, NY, north of the City of Syracuse in Onondaga County. A Draft EIS is being prepared pursuant to the New York State Environmental Quality Review Act (SEQRA) and to the National Environmental Policy Act (NEPA) to evaluate the potential impacts of the Proposed Project.

Construction is anticipated to be completed over a 20-year period, with four memory fabrication facilities (fab) becoming operational on a rolling timeframe. The traffic analysis assessed the existing traffic conditions, and four analysis years for the No Action, the Action without Mitigation, and the Action with Mitigation Scenarios– 2026, 2029, 2031, and 2041. The 2026 and 2029 analyses represent the critical construction years for the first two fabs, and it is assumed, based upon project guidance from New York State Department of Transportation (NYSDOT), that any major infrastructure mitigation specifically needed to address impacts generated by the Proposed Project would not be in place during these years. For years were major conceptual improvements may not be in place, minor improvements and mitigation strategies were considered to achieve acceptable operations. 2031 represents the year major infrastructure mitigation could be in place. 2041 represents the worst-case year because traffic demand related to Micron activities is anticipated to peak at that time.

2 DATA COLLECTION PLAN

2.1 Study Area

Micron is proposing to acquire the approximately 1,400-acre White Pine Commerce Park (WPCP), located at 5171 Route 31, Clay, NY 13041, from the Onondaga County Industrial Development Agency (OCIDA) to construct the semiconductor manufacturing facility over a continuous 20-year period. The Proposed Project consists of: 1) construction of the Micron Campus, which would include four individual memory fabrication units (fabs), ancillary support facilities, driveways, and parking; 2) construction of a childcare and health care center located at 9100 Caughdenoy Road, Brewerton, NY; 3) construction offsite utilities adjacent to the Micron Campus; and 4) construction of a rail spur on an approximately 38.2-acre property west of Caughdenoy Road (this property does not have an assigned address). Separately, Onondaga County plans to improve the water supply and wastewater infrastructure to support operations of the manufacturing facility. The National Grid utility company plans to upgrade the energy infrastructure to support the Proposed Project. Future discussion of the Proposed Project elements can be found in the DEIS. Specific information on the trip generation for each piece of the Propose Project can be found in the Traffic Impact Study (TIS).

Within the Micron Campus, each fabrication building, or "fab" is expected to cover approximately 1.2 million sf of land and contain approximately 600,000 sf of cleanroom space[1], 290,000 sf of cleanroom support space[2], and 250,000 sf of administrative space. Each set of two fabs would be supported by approximately 470,000 sf of central utility buildings[3], 200,000 sf of warehouse space, and 200,000 sf of product testing space housed in separate buildings.

The proposed campus and associated activities would also have supporting on-site elements including:

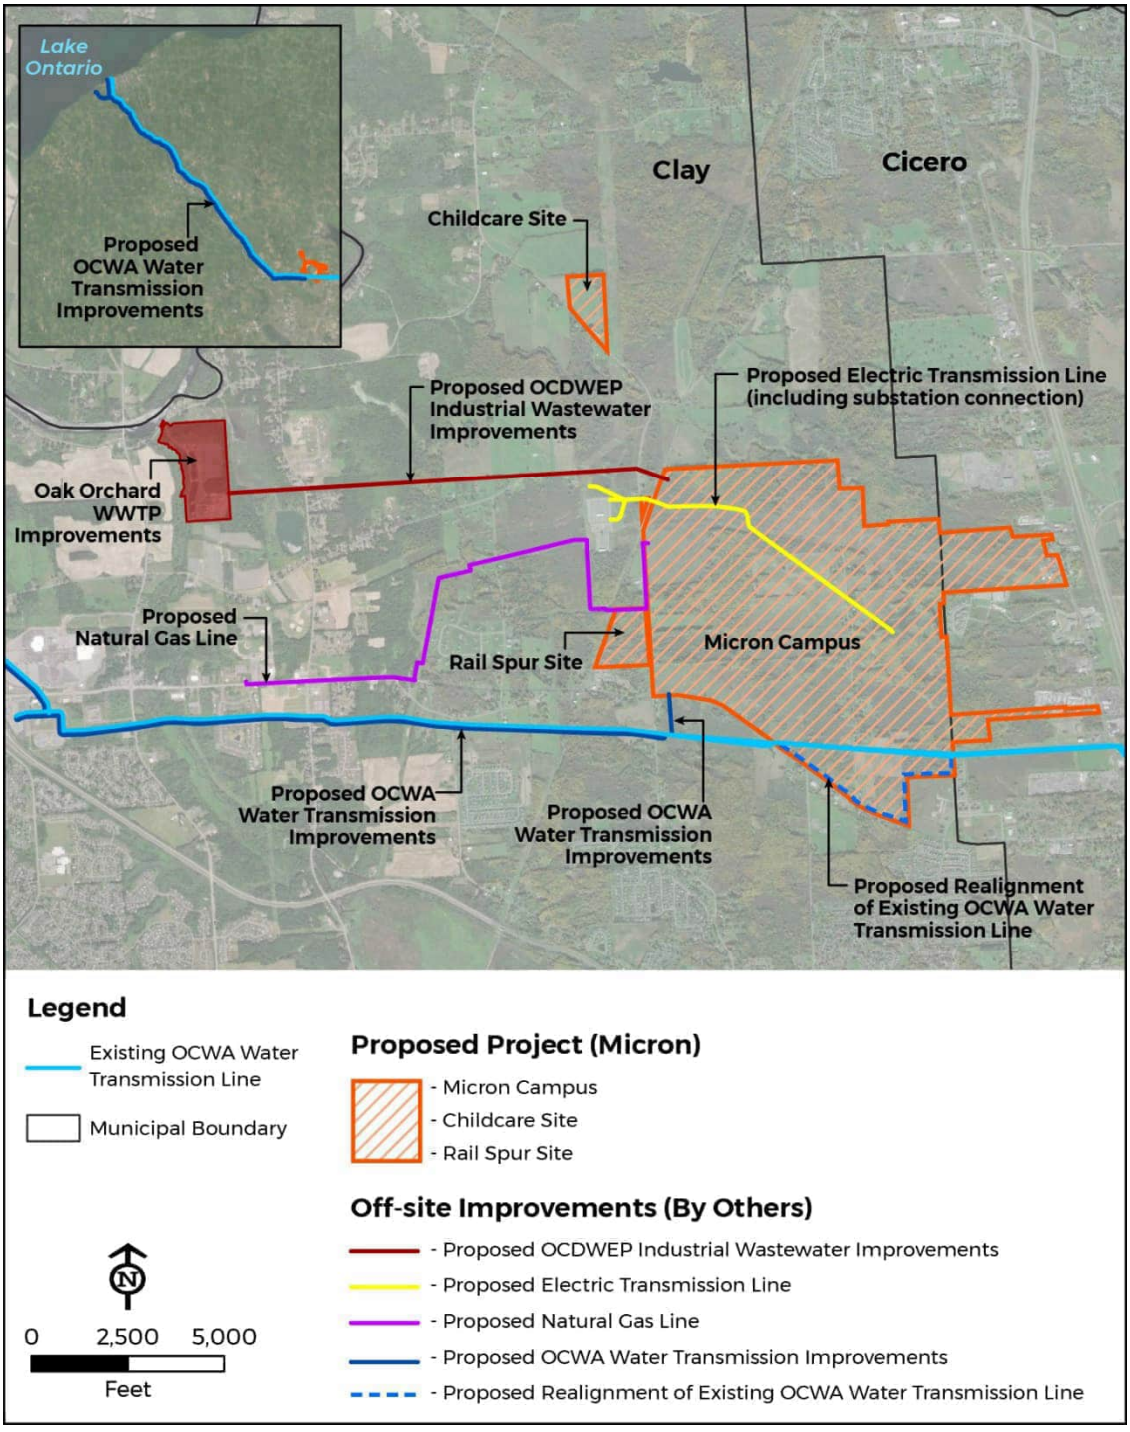
[1]Cleanroom: This part of the campus is where the thousands of advanced equipment are housed that are used to take raw silicon wafers and build the chips. It is called a cleanroom because there are strict requirements on particles in the air that can impact the functionality of the chips. The chips are built up in layers of metals and insulators, similar to how a building is constructed floor-by-floor.

[2] Cleanroom support: This part of the campus includes functions such as workshops to refurbish parts, labs to complete incoming chemical tests, surface analysis of what is on the wafers, and perform cross-sections of the wafer to validate the structure of the chips meets requirements.

[3] Central utility building: These buildings house the systems required for delivering the utilities necessary to produce the chips. These utilities include systems such as HVAC, electrical transmission equipment, water purification and recycling, and chemical/specialty gas delivery systems.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

- electrical substation and duct bank
- natural gas meter station
- central utility buildings ("CUBs")
- utility lines
- water and wastewater pre-treatment and storage
- industrial gas and material storage areas
- access/egress (including construction/operation phase access to NYS Route 11)
- parking and EV charging stations
- wastewater pump station (pump house)
- stormwater management
- offices
- green areas, landscaping
- material staging and laydown areas (for construction of subsequent fabs).



In addition, off-site improvements are necessary to address energy supplies (natural gas and electricity), telecommunications, water and wastewater. Off-site improvements would be constructed without federal funding, but for the purposes of this EIS, the impacts from the construction of these improvements are considered along with the Proposed Project as they support and connect to the Micron Campus.

The Micron Campus, with four (4) fabs and all ancillary support facilities, driveways, and parking; the childcare site, and the rail spur comprise the "Proposed Project" and is shown on Figure 2-1.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

Micron would operate three (3) worker shifts over a 24-hour day. Day and night shifts would be utilized to sustain 24-hour manufacturing activities as well as a maintenance shift. Micron would create approximately 9,000 high-paying jobs by 2045 to support the Micron Campus when operating at full capacity and is expected to induce about 40,000 jobs over a 20-plus year period to include suppliers, contractors, and other supporting roles located within Onondaga County and its environs, including Cayuga, Cortland, Madison and Oswego Counties,

The Micron Campus is bordered by NYS Route 31 to the south, Caughdenoy Road to the west, a series of National Grid overhead power lines to the north (although the site extends approximately 100 feet beyond the power lines), and the Town of Clay/Town of Cicero boundary line to the east. The majority of the Micron Campus is contained within the Town of Clay, Onondaga County, New York, and is accessible from I-81 from an interchange with NYS Route 31.

It is expected that construction workers, Micron employees, and Project induced jobs would be distributed throughout Onondaga County and beyond. TheTIS examines the impacted traffic areas through regional, highway, and local analyses. The regional analysis focused on the broader transportation network links within a roughly 30-minute drive around the Micron Campus. The

DRAFT

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

highway and local network analysis focused on the major highways, interstates, and intersections within a five-mile radius around the Micron Campus. The study area is shown on Figure 2-2.

2.2 Data Collection

Traffic data was collected in Spring 2023 at intersections and highway segments that would have the greatest potential to be affected by traffic traveling to and from the Micron Campus. Various data collection methods were used to establish the existing traffic patterns and conditions. These data collection methods included automatic traffic recorder (ATR) counts, turning movement counts (TMCs), vehicle classification counts (VCC), as shown on Figure 2-3. Streetlight Data was also used to provide data on typical travel speeds, existing route behavior, and general traffic background.

Figure 2-3 Data Collection Locations

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

2.2.1 Automatic Traffic Recorder (ATR) Counts

Continuous 24-hour, two-way ATR counts were collected at 190 locations within NYSDOT jurisdiction, 65 locations within Onondaga County Department of Transportation (OCDOT) jurisdiction, and 12 locations within New York State Thruway Authority (NYSTA) jurisdiction, each for a total of 7 days. The ATR count locations were primarily collected along interstates, interstate ramps, and at locations along the highways within the 45-minute radius of the Micron Campus. ATR counts are primarily used to represent the flow of traffic throughout the study area; thus, the ATR count locations were selected to accurately model the regional and local traffic conditions. Data provided by the ATRs was limited to vehicle volumes. The ATR counts were collected using traffic data collection cameras and pneumatic count tubes and summarized in 15-minute intervals. ATR counts were collected on a rolling basis across the count locations, with the majority of the data collection beginning on April 13, 2023, and ending on May 27, 2023. The ATR count locations for each jurisdiction are listed in Attachment A.

2.2.2 Turning Movement Counts (TMC)

TMCs were collected at 25 signalized and 8 unsignalized intersections within NYSDOT jurisdiction and collected at 3 signalized and 6 unsignalized intersections within OCDOT jurisdiction. The TMC data were primarily collected at major intersections along NY 31 and at major highway intersections within a 5-mile radius of the Micron Campus. TMCs were primarily used for the local traffic analysis and to supplement the regional traffic analysis; thus, TMCs were collected closer to the Micron Campus to provide for a more detailed analysis. Camera recordings of the study intersections were processed to determine TMCs by vehicle class and pedestrian crosswalk volumes for two 5-hour time periods. The time periods chosen for processing were 5:00 AM to 10:00 AM and 3:00 PM to 8:00 PM to capture the peak period. Traffic recorded in the TMCs were sorted into four classifications: autos, buses (including non-articulated buses, articulated buses, and jitneys), medium trucks, and heavy trucks. The pedestrian and bicyclist movements at the intersections were counted simultaneously with vehicle turning movement counts. The pedestrians and bicyclists represent conflicting movements against vehicle traffic and were included in the analysis to provide an accurate traffic analysis model. TMC data was collected on a rolling basis across the count locations, with the majority of the data collection completed on April 19, 2023, and the remaining TMC data collected on April 25, 2023, and May 10, 2023. The TMC locations for each jurisdiction are listed in Attachment A.

2.2.3 Vehicle Classification Counts (VCC)

VCC are primarily used to supplement the ATR counts; thus, VCC are collected to provide more detailed counts at various ATR locations. Twenty-nine (29) ATR locations were identified within NYSDOT jurisdiction, and 4 ATR locations were identified within NYSTA jurisdiction for VCC. The

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

VCC locations were collected at the major highway intersections and interstate interchanges within the 45-minute radius of the Micron Campus. VCC were collected over a 24-hour period during one of the three representative mid-weekdays (Tuesday, Wednesday, or Thursday). Traffic recorded from the VCC were sorted into four vehicle classes: autos (passenger cars), buses (which would include non-articulated buses, articulated buses, and jitney's), medium trucks, and heavy trucks. VCC data was collected on a rolling basis across the count locations, with the majority of the data collected on April 19, 2023, and the remaining VCC data collected on April 25, 2023, and May 10, 2023. The VCC locations for each jurisdiction, are listed in Attachment A.

2.2.4 StreetLight Data

To supplement the data collection program, a StreetLight Data license was obtained to provide historical data for much of Onondaga County. StreetLight Data is a big data provider that provides insight into origin-destination patterns, regional routing, travel times, travel speeds, and other information that is difficult to obtain through traditional on-site data collection practices. StreetLight Data was used to supplement the count program and provide information that was not initially identified, helping to balance the existing conditions network.

THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

3 ANALYSIS YEARS AND TIME PERIODS

Construction of the Micron Campus would occur over 20 years with 2045 as the estimated full build year. The traffic analysis evaluated the existing traffic conditions and the four analysis years for the No Action, the Action without Mitigation, and the Action with Mitigation – 2026, 2029, 2031, and 2041 - which represent the most critical construction stages during the 20-year construction timeline, including the year expected to produce the largest demand on the transportation network. It is also understood that as the fabrication facilities are completed and become operational, Micron operations staff would gradually begin working on-site, resulting in operations traffic as well as construction traffic.

Each of the analysis years was evaluated for an AM and PM peak hour identified based on the data collected in Spring 2023 and the anticipated operations and construction shift schedule. The AM and PM peak hours used for analysis are 7:00 AM to 8:00 AM and 5:00 PM to 6:00 PM, respectively. The expected trip generation of the main campus is shown in Figure 3-1.

Figure 3-1 Micron Campus Trip Gen

The 2041 peak is projected to produce the largest demand on the transportation network due to the expected number of operations staff and construction workers that would overlap at the site at the same time and therefore represents the worst-case scenario for traffic impact analysis. The three mitigation scenarios were tested to evaluate their capacity to support the 2041 traffic demand. Based on the impact analysis and consultation with regional stakeholders (NYSDOT, OCDOT, etc.), one mitigation scenario was recommended for implementation. Based on a timeline

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

calculated to account for the Draft EIS review process, the construction timeline, and further based on input from NYSDOT, the major transportation infrastructure projects that would serve as mitigation are not expected to be constructed by 2026 or 2029. Short-term mitigation analysis was identified and assumed to be in place for 2026 and 2029. 2031 was identified as the Estimate to Complete (ETC) year when major improvement concepts would be in place, and thus was included in our analysis to evaluate the conditions that could be reasonably anticipated. The analysis scenarios and years that were analyzed in the Draft EIS are shown in Table 3-1.

A reduced scale alternative two-fab analysis was also analyzed quantitatively within the Draft EIS.

Table 3-1 Analysis Scenarios and Years

SCENARIO	ANALYSIS YEAR	ANALYSIS HOURS

4 METHODOLOGY

4.1 Analysis Methodology

Due to anticipated regional and local traffic effects generated by the Proposed Project, a tiered multi-disciplinary and comprehensive Multi-Resolution Modeling (MRM) approach was used for the traffic analysis for the Draft EIS. The tiered structure captures the dynamics among demographics, land use, development, people movements, and vehicular interactions. At the macro level, the travel demand forecast is based on the regional demographics and socio-economic projections. Using the results from the travel demand forecasts, parcel level land use data, and development site plan information, a mesoscopic model forecasted local level trips and traffic volumes by time of day based on travel mode. A traffic micro simulation model was used to analyze traffic operations at the level of individual vehicle movements and to identify mitigation options.

The multi-resolution modeling methodology is the basis for the traffic forecasts, which takes advantage of methods already in place using the Syracuse Metropolitan Transportation Council (SMTC) travel demand forecast model. A subnetwork covering the Proposed Project study area was extracted from the SMTC model and analyzed at a more refined level using the Visum mesoscopic traffic modeling software. The Visum model was used to conduct existing, future No Action, and Action traffic analyses. High-level traffic engineering analysis for high-trafficked corridors was performed using microscopic Vissim models by extracting forecasted traffic patterns from the Visum models.

4.2 SMTC Regional Model

The SMTC is the state-designated Metropolitan Planning Organization, responsible for administering continuous, cooperative, and comprehensive transportation planning for its jurisdiction, called the Metropolitan Planning Area, covering Onondaga County, the Town of Sullivan in Madison County, and the Towns of Hastings, Schroeppel, West Monroe and a small portion of Granby in Oswego County. SMTC maintains a regional travel demand model that has been reviewed and approved by NYSDOT. A sub-area of the SMTC regional travel demand model was extracted and used as a foundation for creating a mesoscopic Visum model of Onondaga

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

County. Traffic data collected throughout the study area was used to aid in the calibration of the Visum model to create a detailed travel demand model for evaluating No Action and potential Action alternatives for the Draft EIS. information specific to the SMTC model and methodology is in Attachment B.

4.2.1 SMTC Sub-Area Extraction

The sub-area extraction was used to capture traffic diversions and analyze and mitigate major corridors and intersections in the study area used for the regional traffic demand model. The SMTC model was developed with TransCAD; thus, the sub-area extraction involved linking the demand matrix from the regional model into the Visum sub-area mesoscopic model. To accomplish this, traffic analysis zones (TAZs) within the study area were identified and compiled to form a corresponding database used for Visum modeling. Roadway network links within the study area were also identified and compiled. Roadway link nodes at the study area outer limits were treated as external stations and were modeled as "sinks" and/or "sources" of trips depending on whether the roadway link is unidirectional or bidirectional. Initial seed trip tables for the AM and PM peak hours, consisting of private autos, buses, medium trucks, and heavy trucks, were extracted from the SMTC model, and subsequently fed into Visum for assignment and calibration. Trip tables for other time periods were developed using the seed trip tables and calibrated to field counts to capture diurnal distribution of trip purpose and directionality.

4.3 Base Visum Model Network Development

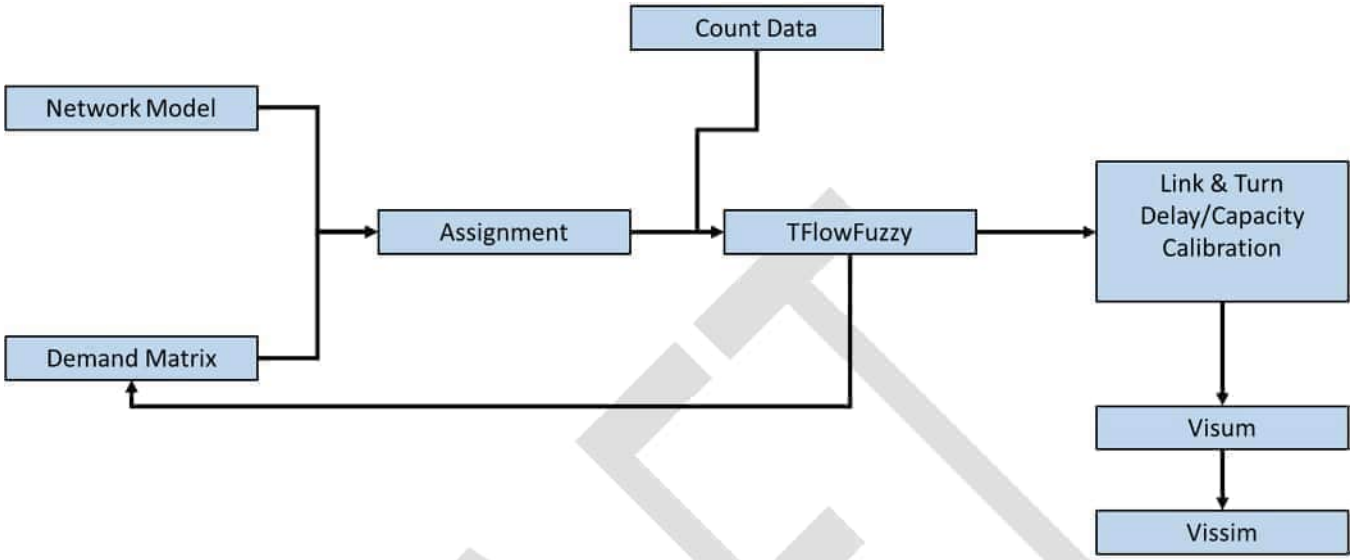
The base year (existing 2023) Visum network was initially extracted from the SMTC model and refined using geometry data from Open Street Maps / Bing Aerial, and detailed intersection geometry and signal phasing and timing data provided by each jurisdiction for highly trafficked intersections within the primary study area.

The main components for the base year Visum network development included:

- Zones: Areas of trip origins (such as residences) and trip destinations (such as office buildings).
  - SMTC provided a sub-network from their regional model with 833 zones, including 737 TAZs and 96 external loading zones (including 10 external loading zones from SMTC model and 86 external stations at the subarea outer limits). This network was imported into Visum as the base for model development.
- Trip tables: A matrix summary of the number of trips generated and attracted to each zone in the model to/from every other zone in the model.
- Roadway links:
  - Roadway links from the SMTC model were maintained as the base. Within the local study area centered around the Proposed Project, additional local roads and major driveways were added to the network. Local roads and major driveways are too detailed for the scale

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

of the SMTC regional model but are required for the Visum sub-area model to accurately assign traffic to the local roadway network.



- Centroid connectors: Modeling object that connects the zone to the roadway links, typically via driveways.
  - Centroid connectors for each TAZ within the study area were refined to connect with newly constructed site driveways allowing the analyst to calibrate the model to account for instances such as “entrance only” or “exit only” driveways which affect how traffic from a zone/development gets to and from public roads.
- Geometric Data / Network Attributes:
  - Number of lanes by travel direction for roadway links;
    - Carried over from the regional model and cross-checked with Google Maps.
  - Intersection geometry and signal timings for intersections were coded at nodes which function as intersections in the model;
  - Posted free flow speeds for roadway links;
  - Link capacities: the number of vehicles that can theoretically traverse a link within the analysis period.
    - The functional class code for each link was coded. Link capacity was calculated based on a lookup table from the SMTC model which is based on the type of roadway and the number of lanes.
  - Turn capacities: the number of vehicles that can theoretically turn at an intersection within the analysis period;
  - Turn restrictions: intersection movements that are not possible in the field or not allowed.
  - Turn delays: an attribute that accounts for a route with more turns taking longer to traverse in the real world than a route with less turns;
  - Lane usage restrictions: most commonly used to account for roadways that do not allow commercial vehicles but can be used to limit vehicle type based on the needs of the analysis.
  - Roadway tolls: an attribute that factors in the direct additional cost of a toll making the route potentially less desirable in favor of cheaper routes with similar travel times.

4.3.1 Base VISUM Model Calibration

The TFlowFuzzy demand matrix correction procedure embedded in the Visum model, shown on Figure 4-1, was used to refine and update the demand matrix from the SMTC regional models. TFlowFuzzy adjusted the demand matrix so that its assignment results could reasonably match field count data. The model was further refined by adjusting intersection turn delays, link capacity and free flow speed, and centroid connector shares to achieve a closer match with the field count data. Both ATR and TMC data at analyzed intersections and links were used to update the demand matrix.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

Figure 4-1 Visum Calibration Process

4.3.1.1 Visum Calibration Guidance

There are two major statistics parameters comparing link assignment volumes and field counts: coefficient of correlation (R-squared) and root mean squared error (RMSE). Federal Highway Administration (FHWA) recommends a minimum R-squared value of 0.88. RMSE should generally be less than 40 percent. Table 4-1 shows the calibration statistics of FHWA recommendations:

Table 4-1 VISUM Calibration Threshold

CALIBRATION STATISTICS	FHWA RECOMMENDATIONS
Coefficient of Correlation [R]	0.88
Percent Error Region-Wide	
Sum of Differences	+/- 5%
Freeways	+/- 7%
Principal Arterials	+/- 10%
Minor Arterials	+/- 15%
Collectors	+/- 25%

Source: FHWA 2019 Toolbox

Since the Visum base model was extracted from the SMTC calibrated model, the R squared value should be at least better than or as good as SMTC calibration statistics. The goal of R-squared value would be roughly 0.94 or above.

The Geoffrey E. Havers (GEH) formulastatistic was also used to compare the vehicle volume assigned by the model to the volume counted in the field. On the GEH statistic scale a value of 5 or less is considered reasonably calibrated.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

4.3.1.2 Measures of Effectiveness

Visum is capable of modeling large-scale networks while producing refined time varying path flows for Vissim microscopic simulation. The model also has a built-in interface that seamlessly translates the output into Vissim and Synchro for operational analyses.

All Visum inputs and outputs were shared with technical reviewers and are included in the DEIS. All roadway segments analyzed were evaluated for the incremental change in volume and level of service (LOS) between the No Action and Action conditions. Where significant impacts are identified, mitigation measures were evaluated.

An existing conditions summary was developed using the following measures of effectiveness (MOEs) based on the calibrated Visum models:

- VMT, VHT
- Hours of delay
- Average speed and travel time

4.4 Future Conditions Model Development

Using the calibrated Visum base models, the base year network was updated to reflect future year conditions within the study area. Updates included planned roadway changes and planned developments that would create or reduce the amount of vehicle trips during the analysis hours. Future year demand matrices were developed using a delta approach which calculates the difference between the number of trips in each zone of the SMTC base and SMTC future models and adds the difference to the same zones in the calibrated Visum base year matrices. This approach allows the Visum model to maintain its calibrated trip matrices while incorporating new trips forecasted by the SMTC model. Future projects and no-action transportation improvements that have been included are detailed in Table 4-2 .

4.5 Capacity Analysis Methodology

Capacity analysis was conducted following guidelines required by NYSDOT in the Highway Design Manual (HDM) Chapter 5[4]. Synchro 11 and Vissim 2023 were used for the intersection and freeway analyses, respectively.

As described in Section 5.2.3.7 of the HDM, exceptions to the required capacity analysis methodology can be approved by NYSDOT with proper justification. NYSDOT Region 3 and the NYSDOT Main Office were consulted and NYSDOT concurred with the following exceptions from typical guidelines:

- Estimated time of Completion (ETC)+20 – It is standard practice for bridge or highway projects, such as those being considered for the Micron DEIS mitigation scenarios, to use a design year of ETC+20 years to evaluate the potential impacts and effectiveness of proposed infrastructure improvements. In the year 2041, peak traffic volumes during construction of the Proposed Project are anticipated to exceed the forecasted ETC+20 traffic demand due to the overlap of ongoing construction and active on-site operations. For this reason, 2041 was recommended as the analysis year instead of ETC+20 for the purposes of the Micron DEIS traffic analysis. The anticipated NYSDOT/FHWA DEIS that would follow the Micron DEIS would provide a full environmental review of the proposed transportation mitigation and is expected to use a typical ETC+20 design year.
- Utilization of NYC DOT Calibration Guidelines and Impact Criteria – The recommended calibration of traffic modeling software varies between federal, state, and local agencies. It was recommended that the NYC DOT traffic analysis guidelines[5] be used where appropriate given the stricter standards for calibration and impacts, thus providing for a more conservative analysis.
- Omission of SimTraffic and Handling of Queue Results – Given the use of NYC DOT guidelines and its strict criterion of potential impacts, NYSDOT agreed that the use of SimTraffic is not needed for the Micron DEIS analyses. Vissim will be used to provide queue analysis results for the I-81 interstate and NY-481 freeway segments within the Micron DEIS study area. Synchro will be used to report queues for intersections without the use of SimTraffic.

[4] NYSDOT HDM Chapter 5 used the revision dated May 15th, 2023.

[5] Guidelines are detailed in the NYC 2021 CEQR Technical Manual.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

- No Build Signal Timing – Signal timing for the No Build scenarios will be held constant and not optimized in the No Build analyses. Given the lack of infrastructure changes expected for the No Build conditions, if the proposed project is not built. the signals are expected to generally keep their existing actuated timings which are already programmed to respond to fluctuations in demand.

The Highway Capacity Manual 7th Edition (HCM) measures the quality of traffic flow in terms of LOS. There are six levels of service, with LOS A indicating free flow conditions and LOS F indicating high levels of delays associated with congestion. These represent a qualitative measure of operational conditions within a traffic stream, and the perception of conditions by motorists and/or passengers. Depending on the type of facility being analyzed, LOS is based on density (freedom to maneuver), delay (traffic flow interruptions), and comfort and convenience (for non-motorized road users) providing an index to quality of traffic flow.

Levels of service and capacity for signalized intersections are calculated for each lane group (a lane group consists of one or more movements through an intersection), each intersection approach, and the intersection as a whole. Levels of service at unsignalized intersections are only calculated for minor movements at 2-way stops since the through movement on the major street is not affected by intersection traffic control.

The level of service for freeway facilities is based on a measurement of density expressed as the number of passenger car equivalents/lane/mile. Higher densities reflect conditions in which travel speed is more likely to fall below the posted speed limit and in which changing lanes is more difficult because of the lack of available gaps between vehicles. The corresponding level of service grade represents the congestion of the roadway. Table 4-3, , and Table 4-5 detail the LOS criteria for signalized intersections, non-signalized intersections, and for freeways. Through consultation with NYSDOT, it was recommended that roundabout analysis use the signalized intersection scale for LOS shown in Table 4-3 instead of the Non-Signalized LOS scale in Table 4-4.

4.5.1 Vissim Modeling Methodology

Vissim 2023 was used to perform a detailed analysis of the performance of roadway segments (basic freeway segments, merge segments, diverge segments, and weaving segments) identified as requiring analysis based on the current traffic conditions and importance to providing access

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

to the Proposed Project. Models were created for each analysis year and peak period. The analysis findings for 10 simulation runs per analysis, using variable seeds, were summarized for the following MOEs:

- LOS (Density)
- Queue Lengths
- Average speed
- Travel Time

4.5.1.1 Vissim Calibration & Validation

The Vissim models were calibrated to existing 2023 data with each base time period calibrated independently. The observed existing speeds, travel times, queue evaluations and the standard GEH volume comparison approach was used to determine if each model was adequately calibrated.

The existing conditions targeted two MOEs. First, the volumes were calibrated to match volumes from the balanced vehicle counts for each hour. Second, model speeds were validated against 2023 speed run data and GPS data from Streetlight Data.

4.5.1.2 Modeling Guidelines

The parameters of the Vissim model were calibrated to match field data, measurements, and other observations, so that the simulation model replicated existing operating conditions. The model calibration process involved comparing and adjusting simulated overall traffic volumes, travel speeds, and queuing caused by traffic congestion. For the Action condition, existing assumptions remained where applicable, and modifications were made to reflect proposed roadway and ramp conditions. Modeling guidelines used for the Vissim analysis are presented in Table 4-6.

Bottlenecks Visually Acceptable Queuing	To Analyst's Satisfaction

4.5.1.3 Vissim Measures of Effectiveness

The Vissim results provide an overview of overall network operating performance for existing, future No Action and Action conditions. Assessment of network performance includes roadway density/LOS at segments and critical speed and density comparisons for basic freeway, merge/diverge, overlap, and weaving areas. The Vissim LOS is derived from the density output and adjusted to account for the vehicle classification. Queuing information at bottlenecks and travel times along roadway corridors was provided. The network performance is also evaluated through its ability to process the demand.

All Vissim inputs and outputs were shared with technical reviewers and are included in the DEIS. All roadway segments analyzed were evaluated for the incremental change in volume and LOS between the No Action and Action conditions. Where significant impacts are identified, mitigation measures were evaluated.

The impact thresholds for freeway segments are defined as:

- A change in LOS from LOS A, B, C, or D to LOS E or F;
- A change in LOS from LOS E to LOS F; or

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

- An increase in density at LOS F with a reduction in speed of 5 mph or more along a segment length of 500 feet or more.

4.5.1.4 Roadway Segments

For the Vissim analysis, roadway segments were analyzed to determine their LOS. LOS is calculated from the density (in vehicles per mile per lane) reported by the Vissim output. The methodology prescribed by the 2022 Highway Capacity Manual was used to calculate density on these roadway segments into a LOS value. The HCM methodology analyzes freeway roadway segments as one of six types based on their function and geometric configuration (basic segments, freeway merge/diverge segments, overlap segments, and weaving segments). Each of these segments has their own LOS criteria, which is shown in Table 4-7, Table 4-8, Table 4-9, and Table 4-10.

Table 4-7 Level of Service Criteria for Highway Segments

4.5.2 Synchro Modeling Methodology

Synchro 11 was used to perform a detailed analysis of the intersections within the study area. Input values including, but not limited to traffic volumes, peak hour factors, heavy vehicle percentages, number of parking maneuvers, bus blockages, and conflicting pedestrians were verified before making any modifications to the Synchro default values (e.g., saturation flow rates, start-up lost times, extension of green, etc.). An uncalibrated model was created and analyzed before starting the calibration process. The uncalibrated model was maintained without any parameter adjustments and used for comparison with the calibrated models.

4.5.2.1 Synchro Calibration

Calibration parameters that were adjusted from the default values were documented. When generating LOS results, the outputs were reported by lane group. The default Synchro report was used to provide all MOEs including delay, volume/capacity (v/c) ratio, LOS, and 50th percentile and 95th percentile queue lengths. Synchro calibration procedures were adopted from procedures created by New York City Department of Transportation (NYCDOT) which did extensive research on the best practices for using Synchro to replicate real world conditions. To guard against the use of unreasonably low peak hour factors (PHF) under the existing condition which may lead to results that are not representative of typical field conditions, the formula below, also developed by NYCDOT, was used to calculate a minimum PHF utilized in the analysis. The use of a minimum PHF helps prevent overestimating delay at low volume intersections in the analysis.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

Minimum Peak Hour Factor formula:

$$PHF_{\text{Minimum}} = 0.8033 \times 1.000083^{\text{Volume}}$$

$$1 \leq \text{Volume} \leq 2300$$

The Synchro models were calibrated with the primary targets of all lane groups having v/c ratios at or below 1.05. Model calibration or adjustment to the default parameter values were applied when the v/c ratio for a lane group exceeded 1.05 under existing conditions.

For calibration purposes, the following adjustments to default values were applied according to the order below:

1. Saturation Flow Rate (SFR) – while 1,900 passenger cars per hour per lane (pcphpl) is the default value, the maximum allowable SFR is 2,050 pcphpl. However, any increase to the maximum permissible SFR of 2,050 pcphpl or decrease to the default 1,900 pcphpl is based on field-verifiable and quantifiable information. When increasing the SFR is justifiable, it is generally good practice to use 2,050 pcphpl rather than any other arbitrary increments.
2. Parking Maneuvers – the number of default parking maneuvers for an area with high parking turnover is 20 maneuvers/hour. Intersections without on-street parking nearby are set to 0 to establish areasonable adjusted saturation flow rate (capacity).
3. Lost Time Adjustment – Synchro combines the Start-up Lost Time and the Extension of Green with one Lost Time Adjustment factor, which is 0.0 seconds. Consistent with the preceding two sections, the Lost Time Adjustment factor is reduced to as low as -2.0 seconds, if warranted. Any further decrease to Lost Time Adjustment is only done if supported by field verified/quantified information.
4. Lane Utilization – The Lane Utilization adjustment factor for a lane-group should be closer to 1.0 as demand approaches capacity. On the contrary, if not all lanes are observed to be equally utilized by motorists (for example: far side lane drops, or lanes approaching tunnels or bridges), the appropriate adjustment to Lane Utilization factor is made for proper calibration. In addition, the Lane Utilization factor could decrease to account for spillback of a turn bay, double parking, or illegal standing in a curbside travel lane. Any adjustment to the Lane Utilization factor is based on actual traffic volume data.
5. Right- and left-turn values – The estimated right- and left-turn factors in Synchro is not modified unless it is supported by quantified information collected in the field.

Additional field observation inputs:

- Bus Blockages – bus blockages are applied where near and/or far side bus stops are present within 250 feet of an intersection. The bus blockages are applied to through lane groups only and not a conflicting left or right turn. However, buses moving in the traffic stream (not stopping at bus stops) are considered part of the heavy vehicle percentage.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

- Bus Lanes – Synchro cannot model bus lanes. Designated bus-only lanes are modeled as through travel lanes from the LOS analysis at intersections, and any associated bus volumes are removed from the through traffic, where the heavy vehicle percentage is adjusted accordingly. However, if right-turns are permitted from the bus lane, then the lane is identified as an exclusive right-turn movement in the model.
- Timing/Phasing – the official signal timing is used in the Synchro analysis and field verified.
- Right Turn On Red (RTOR) – unless a posted sign prohibiting RTOR has been observed in the field, RTOR is allowed in the model.
- Traffic Volumes – if traffic volumes are not balanced between adjacent intersections, all sinks and sources are identified.
- Lane Widths – field verified instead of default lane widths are used in the Synchro analysis. Any lane width modifications as part of improvement/mitigation measures use whole numbers. Lane width calculation methodology for lane groups with multiple lanes of varying width is documented.
- Heavy Vehicle Percentages (HV%) – The estimated HV% is based on vehicle classification counts collected concurrently with turning movement counts. According to the HCM: "The heavy-vehicle factor accounts for the additional space occupied by these vehicles and for the difference in operating capabilities of heavy vehicles compared with passenger cars." Therefore, all buses—including those that stop at a near-side or far-side bus stop within 250 feet of the stop line, as well as those buses not stopping at bus stops—are accounted for in the HV% because these buses occupy additional space in the traffic stream and have different operating capabilities than passenger cars.
- Conflicting Pedestrians – The number of pedestrians crossing at crosswalks collected concurrently with turning movement counts are included in the model.
- Double Parking / Blocking a Travel Lane – There are no friction factors for double-parking in Synchro. The duration of double-parked vehicles blocking moving lanes are recorded in the field if observed and the saturation flow rate is adjusted accordingly. However, the Area Type (CBD) factor can partially account for double-parking because it reduces the lane-group capacity by 10%, which in many cases is sufficient to account for occasional double-parking for a short duration (such as taxi pick-up/drop-off). On the other hand, double-parking can be so prevalent, and/or for a longer duration, that the lane is not used as an effective moving lane (such as truck loading/unloading activity). For situations where double-parking occurs under the existing conditions, one of the following procedures is followed in accordance with the nature of the lane blockage described above:
    - As with queue spillback, a method to account for the effects of double parking is to leverage the Lane Utilization factor. The travel lane adjacent to the parking lane has lower utilization of processed vehicles due to double parking than the other lanes in the lane group. Therefore, for locations with observed double parking, it is recommended to count volumes by lane to estimate a Lane Utilization factor.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

  - Convert the duration of double-parking to number of equivalent parking maneuvers, assuming one parking maneuver takes 18 seconds. For example, if a lane is blocked for 15 minutes, this equates to 50 parking maneuvers (i.e., [15 minutes*60 seconds/minute]/18 seconds/maneuver = 50 parking maneuvers).
  - A weighted average of the base saturation flow rate may be used. For example, if field conditions indicate that double-parking uses up 1/2 of the capacity of one of three lanes of a lane group, the base saturation flow rate is calculated as (1+1+1/2)/3*1900 = 1583 passenger cars per hour per lane.
  - For extreme cases, the lane adjacent to the parking lane is not coded as a travel lane.
  - Please note that double-parking (lane blockage) may affect the operation of upstream intersections/lane-groups and the intersection LOS analysis.
- Curbside Travel Lanes Occupied by Standing Vehicles – Caution is exercised when coding a curbside lane as a travel lane, even though "No Standing" regulations may be present and in effect during the analysis time period. The duration of illegally parked or standing vehicles blocking curbside moving lanes is recorded in the field and the Base SFR is adjusted accordingly. As with double-parking, oftentimes vehicles that illegally stand or park make it unrealistic to code the curbside lane as an effective moving lane. Depending on the severity, the procedure used above for double-parking in a travel lane may also be used for reducing the Base SFR for curbside lanes (such as coding it as a travel lane, but with a reduced base saturation flow rate). When "No Parking" regulations are in effect, it is usually not appropriate to code the curbside lane as a travel lane (even one with reduced capacity), because standing and loading are still permitted and often take place.
- Guidance Regarding Left-turn Phase and Leading Pedestrian Interval:
  - Left-turn Phase – if there is an existing protected plus permitted left-turn phase, the number of vehicles turning left during the protected phase are counted and the percentage of turns during the protected phase is reflected in the Synchro analysis. If a left-turn phase is proposed, a warrant analysis is conducted. Permitted plus protected lagging left turn phases is not proposed because of left-turn trap unless there is no left turn in the opposing direction.
  - Leading Pedestrian Interval (LPI) – An LPI, which is a phase where all traffic is held with red signals to give a pedestrian in the crosswalks adjacent to an approach a head start, is at least six seconds.

The walking speed for pedestrian clearance time that are provided on official signal timing plans are used in the LOS analysis. A walking speed of 3.0 feet per second (fps) is used (as a conservative assumption for slow walking speeds associated with children, seniors, and other vulnerable street users) if the pedestrian walking speed is not provided on the official signal timing plan.

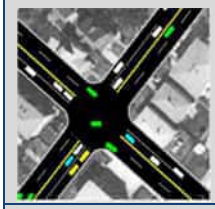
DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

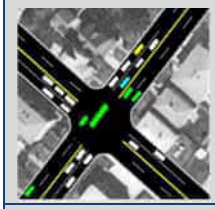
Once the Synchro analysis for existing conditions were calibrated and validated following the guidelines, no changes were made to adjusted values under the future conditions (No Action or Action).

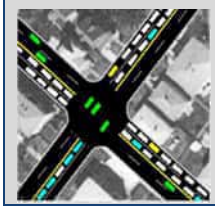
4.5.2.2 Synchro Measures of Effectiveness

The primary MOE for Synchro analysis is comparing the change in delay and LOS between future No Action and Action scenarios. Intersection LOS is typically based on the average delay per vehicle, either for the intersection as a whole or for specific lane groups (e.g., westbound left-turn lane). The analysis methodology and impact thresholds listed below are based on previous thresholds used for other SEQRA analyses.

- An increase in movement delay of 5 or more seconds at LOS E or F during the peak hour is considered a significant impact.
- Increases in movement delays greater than 5 seconds are allowable if the resulting LOS is D or better.
- If the LOS deteriorates from LOS A, B, C, or D to LOS E or F, it is considered a significant impact.
    - If the LOS deteriorates from LOS A to midlevel LOS D (>45 sec of delay), the movement was reviewed on a case-by-case basis to establish if the change should be considered a significant impact.







All intersections analyzed were evaluated for the incremental change in volume and LOS between the no Action and Action conditions. Where significant impacts are identified, mitigation measures were evaluated. Additional output statistics, such queue length (50^{th} percentile and 95^{th} percentile) and v/c ratio were also generated.

Table 4-11 shows the relationship between vehicle delay and LOS at signalized and unsignalized intersections.

THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

4.6 Crash Analysis Methodology

A crash analysis was performed at intersections and highway segments examining the number of crashes, type of crash, and contributing causes. Identifying the cause(s) of crashes provides insight into what corrective measures can be taken to minimize future crashes. All crash analysis procedures followed the guidance presented in the NYSDOT Highway Design Manual, Chapter 5, Section 5.3.4.

The purpose of performing a crash analysis is to identify safety problems by reviewing the quantity of crashes within the traffic study area and identifying crash patterns and clusters. Through a thorough examination of the crash history, if a pattern is identified, further analysis is conducted to determine the cause(s) of the crashes. The severity of the crashes is also reviewed to determine if they represent consistent, rather that coincidental, occurrence. If consistent patterns are determined at a crash location, mitigations are identified to reduce the probability of future incidents.

Five years of crash data from January 2018 to December 2022 was reviewed and evaluated to identify locations where:

1. The overall crash rate is less than 1.5 times the average rate for a comparable type facility as shown in Safety Information Management Systems (SIMS);
2. There are no non-standard features within the limits reviewed that could be associated with a High Accident Location (HAL) or other identifiable patterns of crashes.
3. The occurrence of Fatal, Injury, and combined Fatal+Injury crashes is not above average;
4. Any locations on the regular Priority Investigation Location (PIL) list within the limits reviewed have been addressed. A PIL is considered addressed if it has been investigated within the last 5 years and the recommendations implemented or planned to be implemented by this or another programmed project.
5. Any locations on the Fixed Object & Run-Off Road PIL list or any locations on the Wet-Road PIL list are addressed.

Intersection crash data during the analyzed time period was collected for NYS Route 31 from Carling Road to Lakeshore Road, NYS Route 481 from Verplank Road to Thompson Road, I-81 from Church Street to County Road, Caughdenoy Road from Maple Road to Verplank Road, and US 11 from Baily Road to Mud Mill Road. Further interchange/ramp crash data was collected from on/off ramps along I-81 and NYS Route 481 within the Proposed Project study area, and at the 42 TMC locations.

The crash rates for the intersections were calculated in crashes per million entering vehicles (MEV). The calculated crash rate for each study area intersection used the following equation:

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

$$Intersection\left(\frac{crash}{MEV}\right) = \frac{1,000,000 * Total\ Number\ of\ Crashes}{365 * Number\ of\ Years * AADT}$$

The calculated crash rates for intersection crashes were compared to the statewide average crash rates for intersections along this type of facility (2020 NYSDOT Average Accident Rates). The comparison includes crash rates for all types, rear end, overtaking, left turn, right turn, right angle, head on, sideswipe, and wet road crashes. Table 4-12 and Table 4-13 summarizes the statewide average crash rates used.

Highway crash analysis was performed along the mainlines and interchanges/ramps along a 10.5-mile stretch of I-81 NB, 8.5 miles of I-81 SB, 11.3 miles of NY 481 EB, and 11.2 miles of NY 481 WB. In order to better identify crash clusters and analyze the data, the directional mainline stretches

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

of I-81 and NY 481 were divided into basic, merge, diverge, or weaving segments for analysis. Crashes along the highways were then grouped into the segments they occurred on, while individual ramps and interchanges were assigned as their own segments.

The crash rates for the highway segments were calculated in crashes per million entering vehicles (MEV). The calculated crash rate for each study area segment used the following equation:

$$\boldsymbol{Segment}\left(\frac{\boldsymbol{crash}}{\boldsymbol{MEV}}\right) = \frac{\boldsymbol{1,000,000 * Total\ Number\ of\ Crashes}}{\boldsymbol{365 * Number\ of\ Years * AADT * Segment\ Length\ (miles)}}$$

The calculated crash rates for highway crashes were compared to the statewide average crash rates for intersections along this type of facility (2020 NYSDOT Average Accident Rates). The highways in the study area all fell within Urban Function Class. The comparison includes crash rates for all types, fixed object, and wet road crashes. Table 4-14, Table 4-15 and Table 4-16 summarizes the statewide average crash rates used.

4.7 Signal Warrant Methodology

A signal warrant analysis following the procedures outlined in the Manual on Uniform Traffic Control Devices (MUTCD) 2009 Edition was performed to determine whether installation of a traffic control signal is justified at particular locations in the study area.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

The investigation of the need for a traffic control signal included an analysis of factors related to the existing operation and safety at the study location and the potential to improve these conditions and the applicable factors contained in the following MUTCD traffic signal warrants:

- Warrant 1, Eight-Hour Vehicular Volume
- Warrant 2, Four-Hour Vehicular Volume
- Warrant 3, Peak Hour
- Warrant 4, Pedestrian Volume
- Warrant 5, School Crossing
- Warrant 6, Coordinated Signal System
- Warrant 7, Crash Experience
- Warrant 8, Roadway Network
- Warrant 9, Intersection Near a Grade Crossing

If a warrant is satisfied, this does not immediately indicate that the installation of a traffic control signal is required. Conversely, if no warrants are satisfied it does not immediately indicate that a signal may not be recommended. The MUTCD provides guidance on the signal warrant process. The following is an excerpt from the 2009 Edition Chapter 4C.01 Studies and Factors for Justifying Traffic Control Signals:

> *A traffic control signal should not be installed unless one or more of the factors described in this Chapter are met.*
>
> *A traffic control signal should not be installed unless an engineering study indicates that installing a traffic control signal will improve the overall safety and/or operation of the intersection.*
>
> *A traffic control signal should not be installed if it will seriously disrupt progressive traffic flow.*
>
> *The study should consider the effects of the right-turn vehicles from the minor-street approaches.*
>
> *Engineering judgment should be used to determine what, if any, portion of the right-turn traffic is subtracted from the minor-street traffic count when evaluating the count against the signal warrants listed in Paragraph 2.*
>
> *Engineering judgment should also be used in applying various traffic signal warrants to cases where approaches consist of one lane plus one left-turn or right-turn lane. The site-specific traffic characteristics should dictate whether an approach is considered as one lane or two lanes. For example, for an approach with one lane for through and right-turning traffic plus a left-turn lane, if engineering judgment indicates that it should be considered a one-lane approach because the traffic using*

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

the left-turn lane is minor, the total traffic volume approaching the intersection should be applied against the signal warrants as a one-lane approach.

The approach should be considered two lanes if approximately half of the traffic on the approach turns left and the left-turn lane is of sufficient length to accommodate all left-turn vehicles.

Similar engineering judgment and rationale should be applied to a street approach with one through/left-turn lane plus a right-turn lane. In this case, the degree of conflict of minor-street right-turn traffic with traffic on the major street should be considered. Thus, right-turn traffic should not be included in the minor-street volume if the movement enters the major street with minimal conflict. The approach should be evaluated as a one-lane approach with only the traffic volume in the through/left-turn lane considered.

At a location that is under development or construction and where it is not possible to obtain a traffic count that would represent future traffic conditions, hourly volumes should be estimated as part of an engineering study for comparison with traffic signal warrants. Except for locations where the engineering study uses the satisfaction of Warrant 8 to justify a signal, a traffic control signal installed under projected conditions should have an engineering study done within 1 year of putting the signal into stop-and-go operation to determine if the signal is justified. If not justified, the signal should be taken out of stop-and-go operation or removed.

For signal warrant analysis, a location with a wide median, even if the median width is greater than 30 feet, should be considered as one intersection.

At an intersection with a high volume of left-turn traffic from the major street, the signal warrant analysis may be performed in a manner that considers the higher of the major-street left-turn volumes as the "minor-street" volume and the corresponding single direction of opposing traffic on the major street as the "major-street" volume.

For signal warrants requiring conditions to be present for a certain number of hours in order to be satisfied, any four sequential 15-minute periods may be considered as 1 hour if the separate 1-hour periods used in the warrant analysis do not overlap each other and both the major-street volume and the minor-street volume are for the same specific one-hour periods.

For signal warrant analysis, bicyclists may be counted as either vehicles or pedestrians.

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

When performing a signal warrant analysis, bicyclists riding in the street with other vehicular traffic are usually counted as vehicles and bicyclists who are clearly using pedestrian facilities are usually counted as pedestrians.

Engineering study data may include the following:

a. *The number of vehicles entering the intersection in each hour from each approach during 12 hours of an average day. It is desirable that the hours selected contain the greatest percentage of the 24-hour traffic volume.*

b. *Vehicular volumes for each traffic movement from each approach, classified by vehicle type (heavy trucks, passenger cars and light trucks, public-transit vehicles, and, in some locations, bicycles), during each 15-minute period of the 2 hours in the morning and 2 hours in the afternoon during which total traffic entering the intersection is greatest.*

c. *Pedestrian volume counts on each crosswalk during the same periods as the vehicular counts in Item B and during hours of highest pedestrian volume. Where young, elderly, and/or persons with physical or visual disabilities need special consideration, the pedestrians and their crossing times may be classified by general observation.*

d. *Information about nearby facilities and activity centers that serve the young, elderly, and/or persons with disabilities, including requests from persons with disabilities for accessible crossing improvements at the location under study. These persons might not be adequately reflected in the pedestrian volume count if the absence of a signal restrains their mobility.*

e. *The posted or statutory speed limit or the 85th-percentile speed on the uncontrolled approaches to the location.*

f. *A condition diagram showing details of the physical layout, including such features as intersection geometrics, channelization, grades, sight-distance restrictions, transit stops and routes, parking conditions, pavement markings, roadway lighting, driveways, nearby railroad crossings, distance to nearest traffic control signals, utility poles and fixtures, and adjacent land use.*

g. *A collision diagram showing crash experience by type, location, direction of movement, severity, weather, time of day, date, and day of week for at least 1 year.*

DRAFT

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

The following data, which are desirable for a more precise understanding of the operation of the intersection, may be obtained during the periods described in Item B of Paragraph 17:

a. *Vehicle-hours of stopped time delay determined separately for each approach.*

b. *The number and distribution of acceptable gaps in vehicular traffic on the major street for entrance from the minor street.*

c. *The posted or statutory speed limit or the 85th-percentile speed on controlled approaches at a point near to the intersection but unaffected by the control.*

d. *Pedestrian delay time for at least two 30-minute peak pedestrian delay periods of an average weekday or like periods of a Saturday or Sunday.*

e. *Queue length on stop-controlled approaches.*

4.8 Mitigation Development

Micron and WSP continue to coordinate with NYSDOT, OCDOT, the Town of Clay, the Town of Cicero, and the FHWA on the development of mitigation concepts and strategies to support the Proposed Project. This section will be updated to detail the specific process conducted for evaluating the various options once final mitigation details have been determined.[6].

[6] Final mitigation details are still in development. It is anticipated that this section will be updated by September, 2024.

DRAFT

Micron Confidential

DRAFT FOR AGENCY REVIEW – CONFIDENTIAL BUSINESS INFORMATION
THIS DOCUMENT CONTAINS TRADE SECRET, PROPRIETARY, OR CONFIDENTIAL INFORMATION OF MICRON TECHNOLOGY, INC.

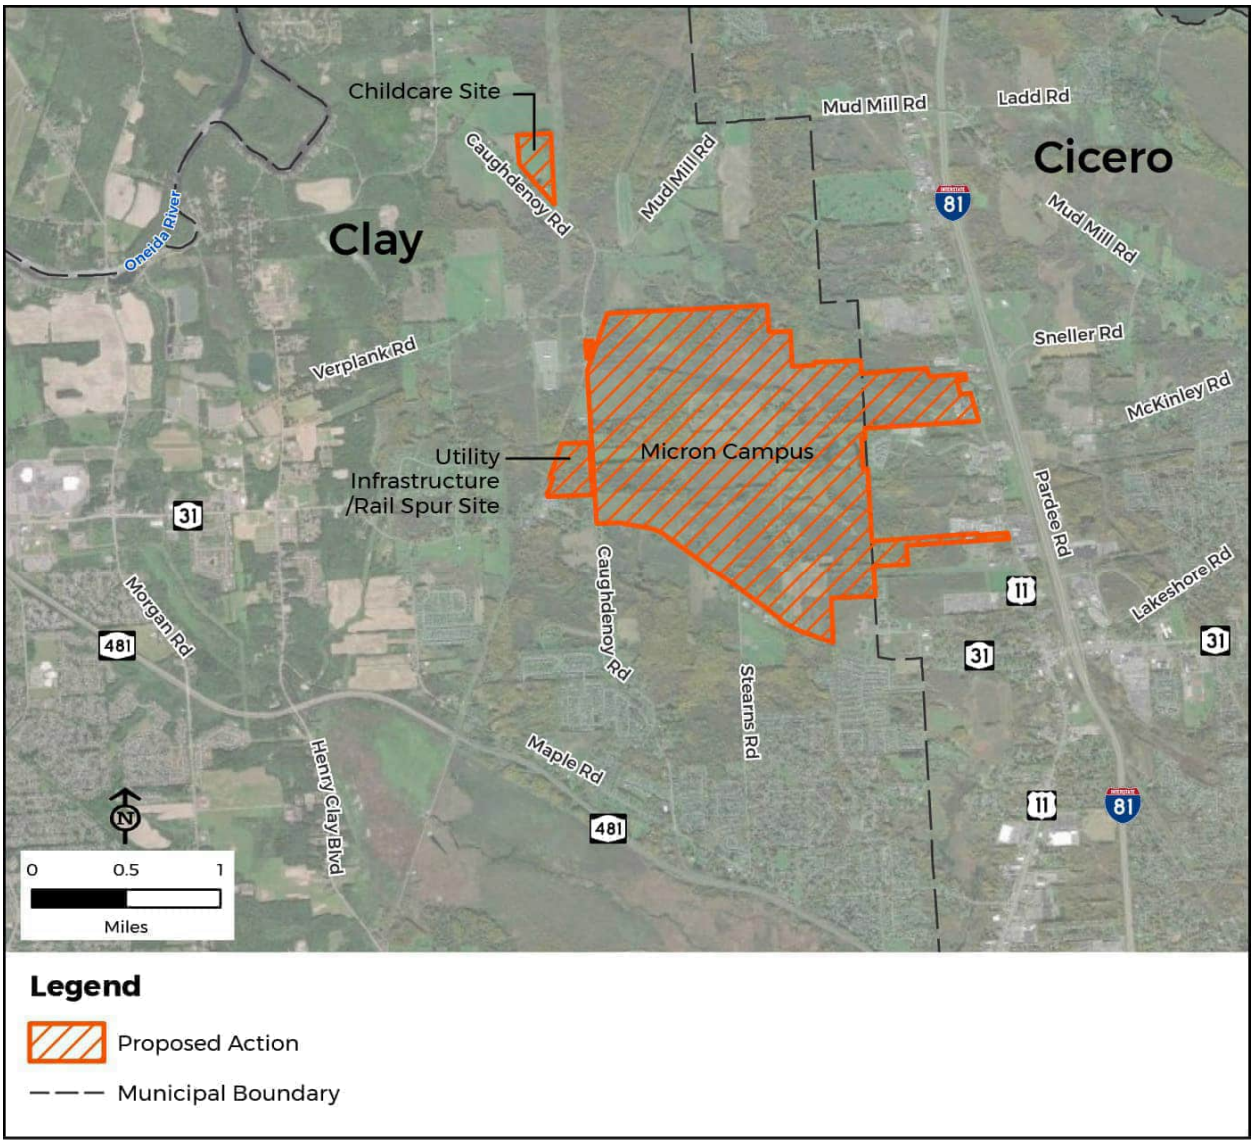
TO: Micron

FROM: WSP USA



SUBJECT: Micron Clay, NY, Semiconductor Fabrication Project Traffic Mitigation Scenarios Memo - Draft

DATE: May 1, 2024

1 PURPOSE

The purpose of this memo is to describe the various traffic mitigation concepts to minimize potential traffic impacts from the proposed Micron Clay, NY, Semiconductor Fabrication Project shown on Figure 1.

Figure 1: Proposed Micron Semiconductor Fabrication Site

Micron and WSP regularly coordinated with and will continue to coordinate with the New York State Department of Transportation (NYSDOT), Onondaga County Department of Transportation (OCDOT), the Town of Clay, the

Town of Cicero and the Federal Highway Administration (FHWA) on development of these mitigation concepts. From these coordinated meetings, community concerns identified the desire for an improved I-81 & NY 31 interchange, improved NY 31 and the addition of increased mobility options, such as bike lanes and sidewalks.

This draft memo describes the various traffic mitigation concepts under consideration, packages the traffic mitigation concepts into three (3) different traffic mitigation scenarios (Table 1), and provides high level cost estimates, and construction timelines for the traffic mitigation scenarios.

Once the 2041 Proposed Action with Mitigation analysis is complete, Micron will seek input from the stakeholders on the traffic mitigation scenarios, working toward consensus on a preferred traffic mitigation scenario. The preferred traffic mitigation scenario would be advanced for additional traffic analysis to support a presumed New York State Environmental Quality Act (SEQRA) draft environmental impact statement.

2 TRAFFIC MITIGATION CONCEPTS

This memo describes traffic mitigation concepts in five categories:

- Interchange Improvement Concepts
- New Interchange Concepts
- Roadway Expansion Concepts
- Mitigation Program Concepts

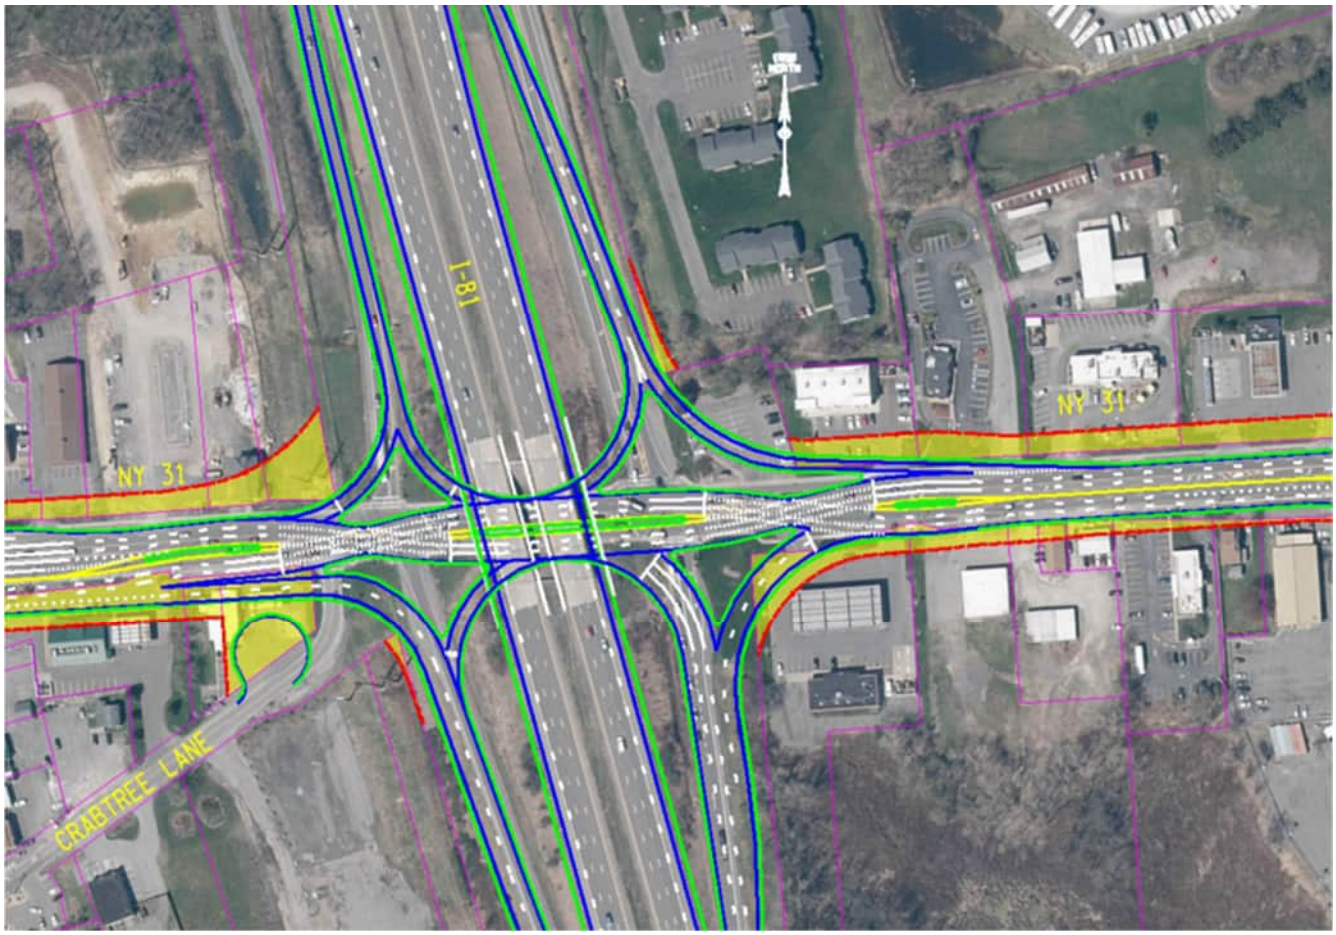
- Other Roadway Modification Concepts

There could be the need for additional mitigation beyond what is describe in this Draft memo. The memo also defines three scenarios that are packages of different combinations of traffic mitigation concepts to test in the traffic analysis.

2.1 Interchange Improvement Concepts

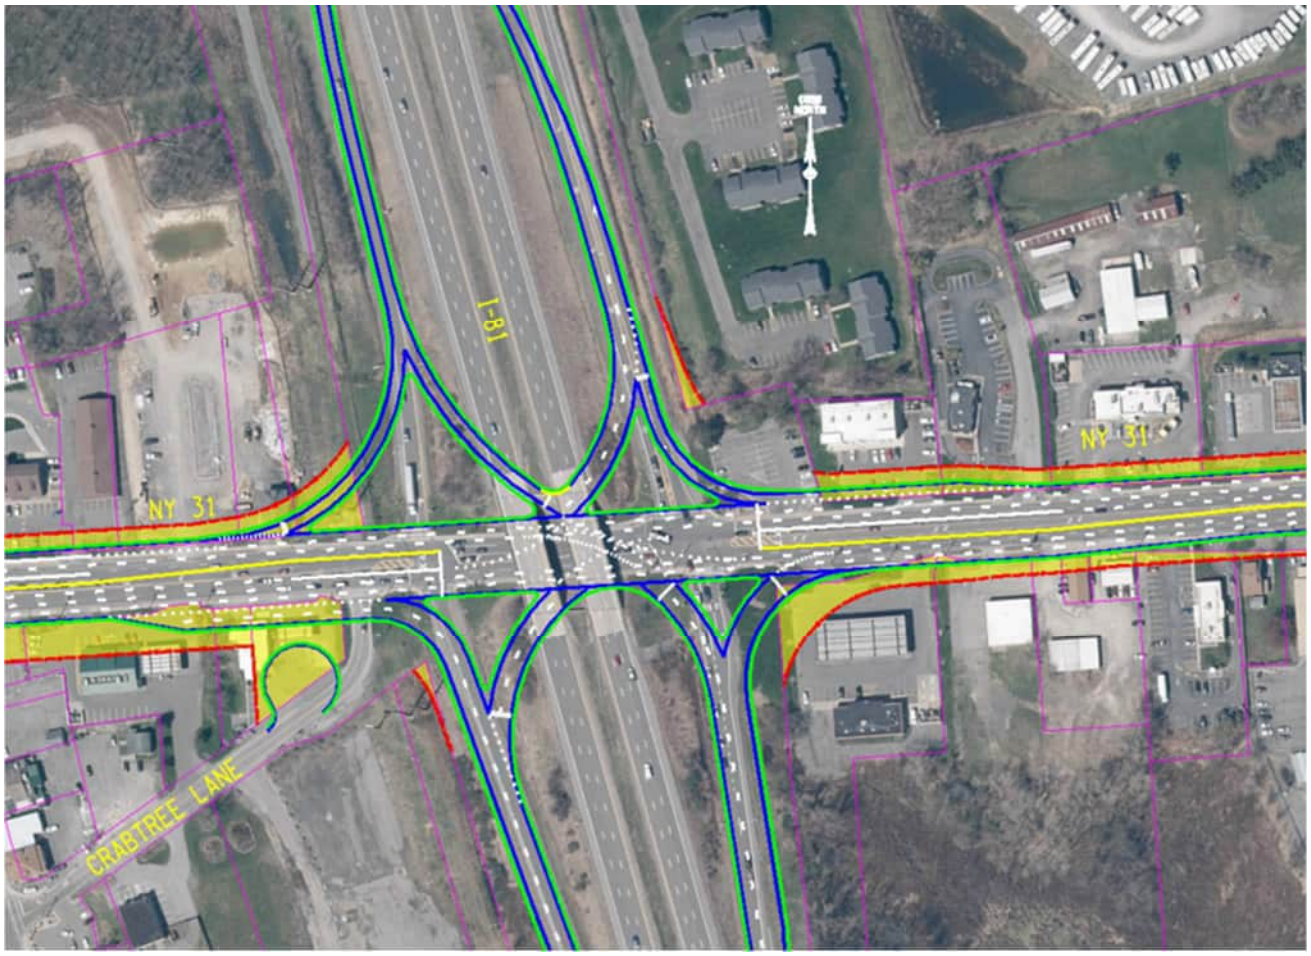
Interchange Improvements include potential modifications and improvements to the existing interchanges in the project study area. The three existing locations determined for possible modification are the I-81 & NY 31 diamond interchange, the NY 481 & NY 31 diamond interchange, and the NY 481 connection to Caughdenoy Road.

2.1.1 I-81 & NY 31 Interchange



Located east of the planned Micron site, the existing I-81 & NY 31 diamond interchange, shown on Figure 2, experiences high hourly demand for its design and is expected to need modification in the future due to the project. The interchange is located only eight hundred feet away from NY 11, with properties near all exit and entrance ramps. NY 31, which runs under I-81, is expected to be the main feeder roadway to the Micron site, and already experiences congestion during AM and PM peak hours. The location of this interchange to both the project and community make it a priority location to analyze.

Figure 2: Existing I-81 & NY 31 Interchange



Given its location, limited right-of-way and expected project demand, two concepts to increase capacity were developed at this interchange. The first option, shown on Figure 3, is a Diverging Diamond Interchange (DDI). The DDI concept is expected to have a slightly higher capacity than the other option (Single Point Urban Interchange (SPUI)), allowing it to process more vehicles each hour. However, the DDI has a larger footprint, and could require more property acquisitions. Additionally, the DDI makes for a less familiar design for pedestrians, bikes, and other active transportation users.

Figure 3: I-81 & NY 31 DDI Concept

The SPUI, shown on Figure 4, would also increase capacity at the existing interchange, utilizing a single signal array under the I-81 bridges to control the flow of traffic. The SPUI has a smaller footprint than the DDI and could have less right-of-way impact. It has the added benefit of providing the opportunity to include a more familiar design for pedestrians, bikes, and other active transportation users.

Figure 4: I-81 & NY 31 SPUI Concept

Both the DDI and the SPUI concepts could address the project's traffic needs, while allowing for greater functionality compared to the existing design. Both concepts are proximate to wetlands located to the southeast.

2.1.2 NY 481 & NY 31 Interchange

Located west of the planned Micron site, the NY 481 & NY 31 diamond interchange, shown on Figure 5, is a highly traveled access point within the traffic study area. The interchange today is generally able to accommodate existing demand. Given its location, the interchange could be used by those driving to the Micron site in the future, but given its distance from the site, it would be a less attractive route compared to the I-81 & NY 31 interchange. This location could draw more demand with future development both directly and indirectly related to Micron, thus it was included for possible improvements.

Figure 5: Existing NY 481 & NY 31 Interchange

The concept considered for the improvement of the NY 481 & NY 31 interchange includes changing from a diamond interchange to a DDI. The benefits of using a DDI could improve the capacity and functionality of the interchange, within the existing footprint. However, the same mobility considerations with the other DDI concepts, regarding the design of the pedestrians, bikes, and other active transportation users, would be considered with this interchange as well.

2.1.3 NY 481 & Caughdenoy Road

Located approximately 2.0 miles south of the planned Micron site, the NY 481 & Caughdenoy Road connection currently provides access exclusively from northbound NY 481 to the intersection of Maple Road & Caughdenoy Road, shown on Figure 6. Caughdenoy Road continues north supporting both northbound and southbound traffic, eventually along the western edge of the planned Micron site. Given the existing access configuration, Caughdenoy Road provides an option for potential improvements to support the project. Additionally, improving access from Caughdenoy Road to NY 481 is a common suggestion from the consulted agencies to support the project.

Figure 6: Existing NY 481 & Caughdenoy Road Interchange

Two concepts were considered at this location. The first concept, shown on Figure 7, would provide an entrance ramp from Caughdenoy Road to southbound NY 481, allowing traffic to utilize the I-81 & NY 481 northern interchange. The second option, shown on Figure 8, creates a full diamond interchange, providing access to and from both directions of NY 481.

Figure 7: NY 481 & Caughdenoy Road New Ramp Concept

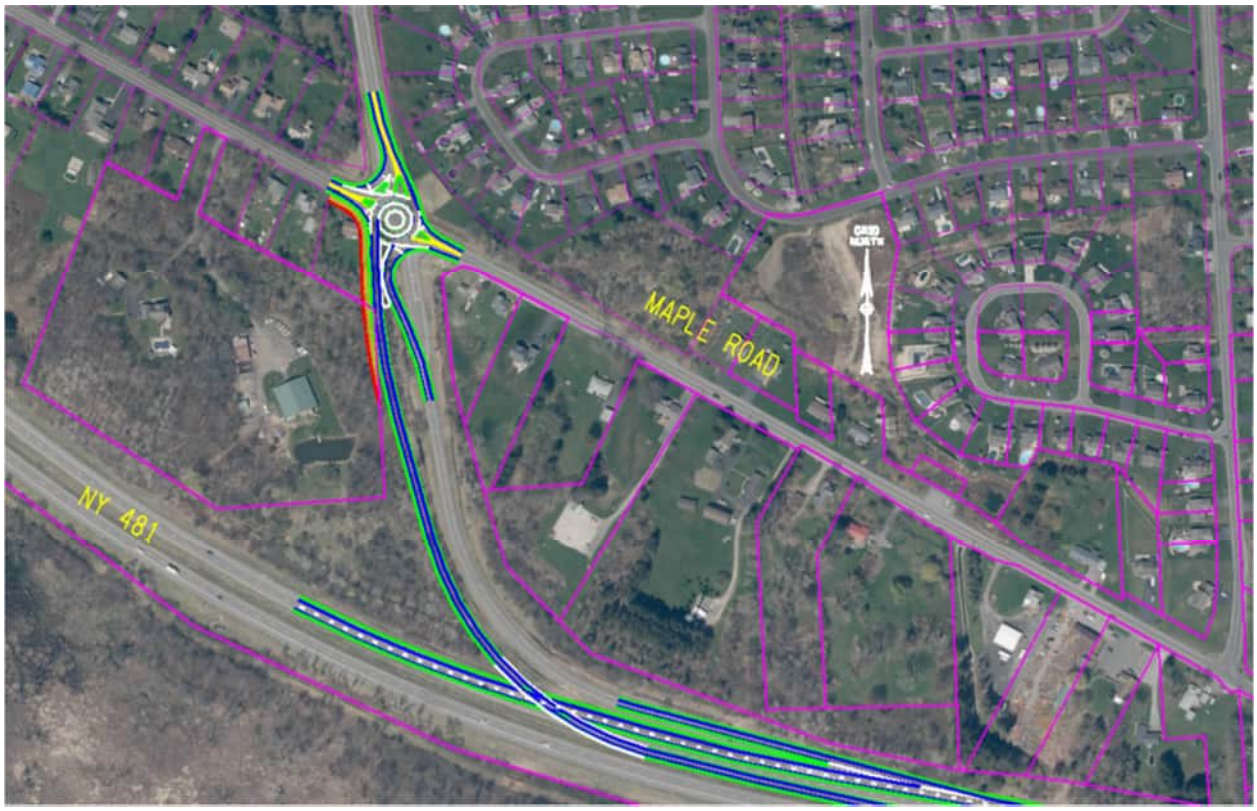


Figure 8: NY 481 & Caughdenoy Interchange Concept

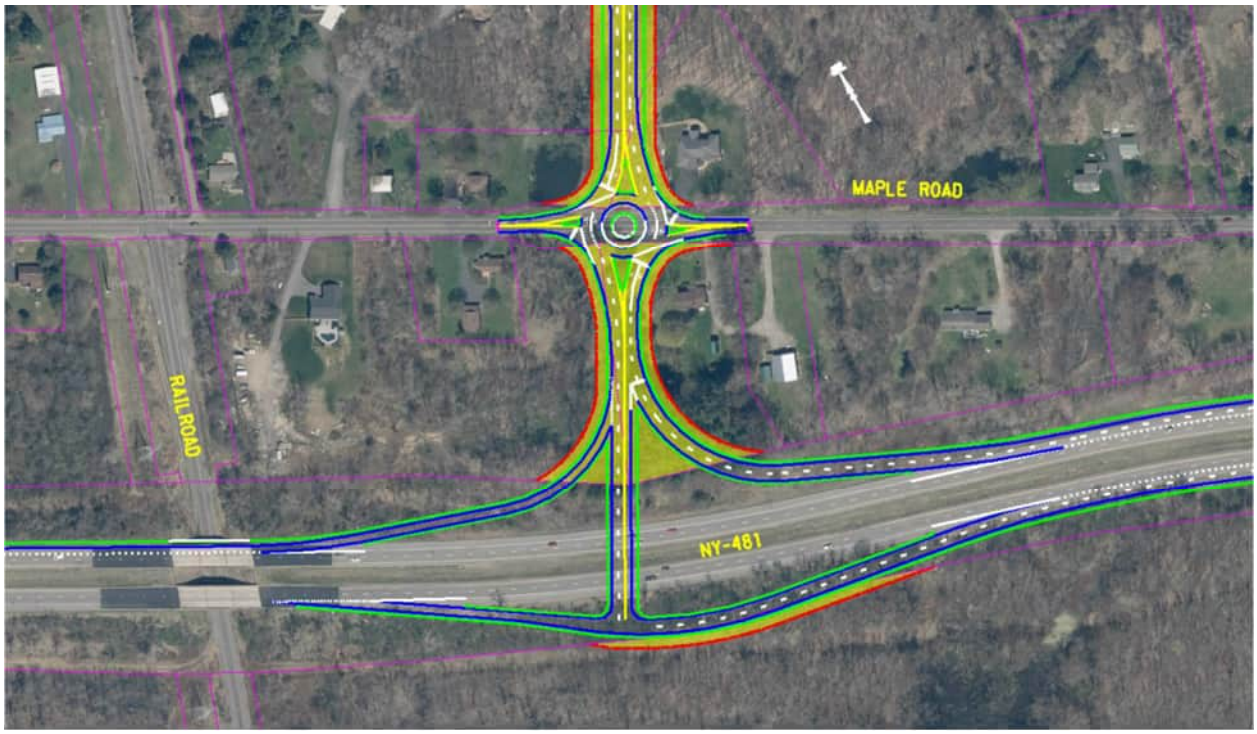
Both concepts could be utilized by traffic generated by the project, reducing existing traffic on some of the local roadways and providing a new access point from the Micron site to disperse traffic. Both concepts are proximate to wetlands located to the south. Additional traffic attracted to Caughdenoy Road could result in air quality and noise impacts. Right-of-way impacts to the properties along Caughdenoy Road would also need to be examined.

2.2 New Interchange Concepts

New interchange concepts were developed as additional access points and connections from the existing highways, providing enhanced access to the Micron site to support traffic generated by the project. Four locations are considered for conceptual new diamond interchange connections at NY 481 east of the existing CSX rail line, I-81 at Sneller Road, I-81 at McKinley Road, and I-81 at Mud Mill Road.



2.2.1 NY 481 Interchange

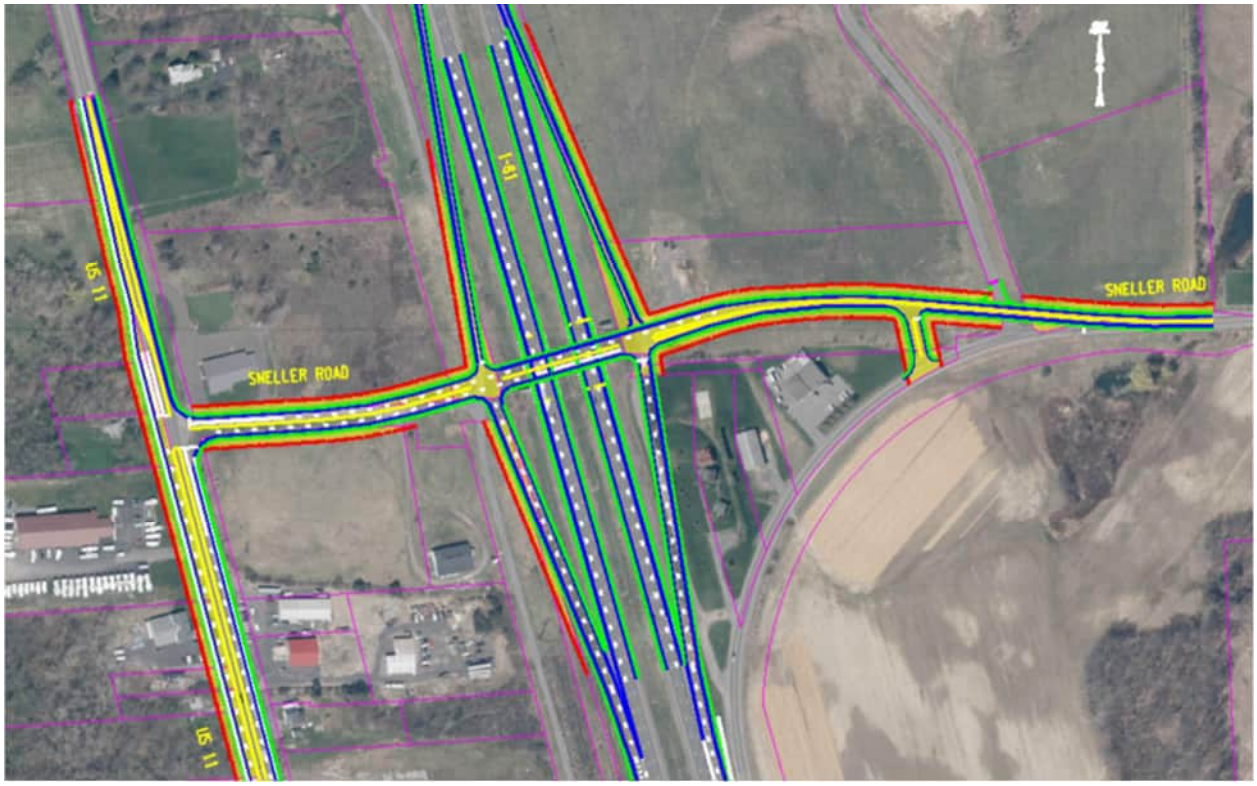
The new NY 481 interchange concept, shown on Figure 9 and Figure 10, is approximately 1.0 mile west of the existing Caughdenoy Road exit ramp from northbound NY 481 (as shown on Figure 5), and approximately 0.2 miles east of the CSX rail line. The new conceptual interchange connects NY 481 at grade to Maple Road with a new roadway extending north, parallel to the CSX rail tracks, to the Micron site. Details of the new roadway and its connection to NY 31 and the Micron site are described below in section 2.3.6.

Figure 9: Existing NY 481

Figure 10: New NY 481 Interchange Concept

The new NY 481 interchange concept is a new facility providing direct access to the Micron site without adding additional traffic to NY 31, while also allowing traffic to split more evenly between I-81 and NY 481. The concept is

proximate to wetlands located to the south. The right-of-way impacts will need to be evaluated but are expected to be less than the NY 481 and Caughdenoy Road improvement concepts.



2.2.2 Sneller Road Interchange

A new I-81 interchange at Sneller Road, shown on Figure 11and Figure 12, would be located approximately 1.6 miles north of the existing I-81 & NY 31 interchange (shown on Figure 2). The new interchange would provide access to I-81 from Pardee Road from the southeast, Sneller Road to the east, and NY 11 to the west.

Figure 11: Existing Sneller Road

Figure 12: New Sneller Road Interchange Concept

The Sneller Road interchange concept provides access to NY 11, channeling traffic towards the proposed Micron site entrance on NY 11 as an additional connection, which would in turn support the I-81 & NY 31 interchange by reducing congestion. A new bridge would connect Pardee Road to NY 11, extending over I-81.

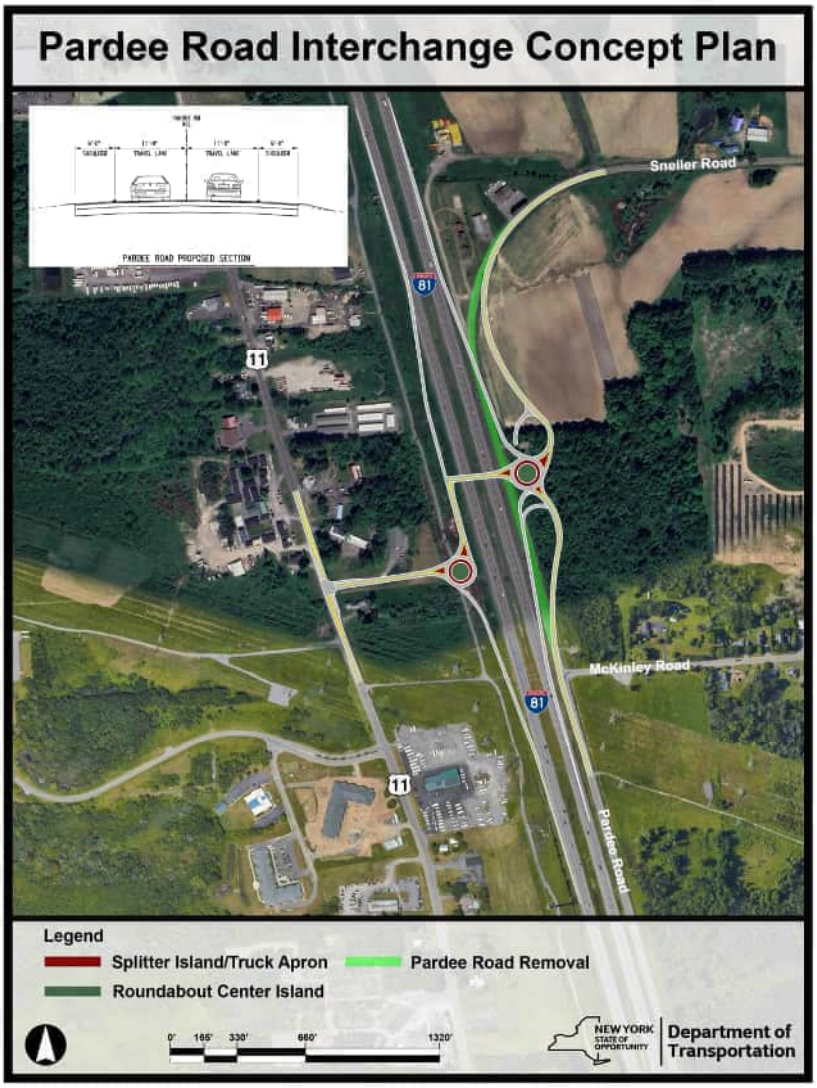
This concept is proximate to existing transmission and power lines which run along the west side of I-81 and parallel to Sneller Road across I-81. This concept would introduce a new interchange along the interstate system. FHWA approval would be necessary to progress this concept into design.

2.2.3 McKinley Road Interchange

A new I-81 interchange at McKinley Road, shown on Figure 13 and Figure 14, would be located approximately 1.2 miles north of the existing I-81 & NY 31 interchange (shown on Figure 2). This new interchange would provide access to I-81 from Pardee Road from the northeast and southeast, McKinley Road to the east, and NY 11 to the west.

Figure 13: Existing McKinley Road

Figure 14: McKinley Road Interchange Concept



The McKinley Road interchange provides a connection between I-81 and NY 11, channeling traffic towards the proposed Micron site entrance on NY 11 as an additional connection, which would in turn support the I-81 & NY 31 interchange by reducing congestion. A new bridge would connect McKinely Road and Pardee Road to NY 11, extending over I-81.

This concept is proximate to existing transmission and power lines which run along the west side of I-81. Environmental concerns are present given the proximity of wetlands to the southeast. This concept would introduce a new interchange along the interstate system. FHWA approval would be necessary to progress this concept into design.

2.2.4 Pardee Road Interchange

A new I-81 interchange at Pardee Road, shown on Figure 11 and Figure 15, would be located approximately 1.4 miles north of the existing I-81 & NY 31 interchange (shown on Figure 2). The new interchange would provide access to I-81 from Pardee Road from the southeast, Sneller Road to the north, and NY 11 to the west.

Figure 15: Pardee Road Concept

The Pardee Road interchange concept provides access to NY 11, channeling traffic towards the proposed Micron site entrance on NY 11 as an additional connection, which would in turn support the I-81 & NY 31 interchange by reducing congestion. A new bridge would connect Pardee Road to NY 11, extending over I-81.

This concept is proximate to existing transmission and power lines which run along the west side of I-81 and parallel to Sneller Road across I-81. This concept would introduce a new interchange along the interstate system. FHWA approval would be necessary to progress this concept into design.

2.2.5 Mud Mill Road Interchange

A new I-81 interchange at Mud Mill Road, shown on Figure 16 and Figure 17, would be located approximately 3.0 miles north of the existing I-81 & NY 31 interchange (shown on Figure 2). This new interchange would provide access to I-81 from the existing Mud Mill Road which currently extends above I-81.

Figure 16: Existing Mud Mill Road

Figure 17: Mud Mill Road Interchange Concept

The Mud Mill Road interchange traffic provides a connection between I-81 and NY 11 and Mud Mill Road, channeling traffic towards the proposed Micron site entrances on NY 11 to the south and Caughdenoy Road to the west. The additional connection would support the I-81 & NY 31 interchange by reducing congestion.

Environmental concerns are present given the proximity of wetlands located to the east. This concept would introduce a new interchange along the interstate system. FHWA approval would be necessary to progress this concept into design.

2.3 Roadway Expansion Concepts

The existing primary local roadways expected to be utilized to access the Micron site are NY 31, NY 11, Caughdenoy Road, Mud Mill Road and Verplank Road. These roads may not provide enough capacity for the anticipated future project demand.

Concepts developed for each of these facilities increase capacity to account for project demand and complement regional highway improvements. A new roadway concept extending from NY 481 to the project site was also developed, as well as the expansion of a section of I-81 to provide additional capacity.

2.3.1 NY 31 Widening

NY 31 runs east-west along the southern border of the proposed Micron site. NY 31 provides direct access to I-81 as well as local businesses, schools, and residences. West of NY 11, NY 31 drops from five lanes to two, continuing for approximately 4.1 miles before expanding to five lanes at the westbound approach to Morgan Road. Continuing west of Morgan Road, NY 31 has five lanes for several miles. Three access points to the Micron site are planned along NY 31 and it is expected to be the primary local access roadway.

It is expected that there will be various access routes to the planned Micron Site, thus the NY 31 widening concept is divided into two sections:

- Widening from NY 11 to Caughdenoy Road
- Widening from Caughdenoy Road to Morgan Road

For both sections, NY 31 is conceptually envisioned to be expanded to five lanes, with two travel lanes in both the eastbound and westbound directions. A shared middle lane would allow for left turns or have medians where needed. Sidewalks and bike lanes are ultimately expected to be included in the design.

2.3.2 NY 11 Widening

NY 11 is a heavily trafficked roadway running north-south and is parallel to I-81. North of NY 31, NY 11 operates as a two-lane roadway. South of NY 31, NY 11 is largely a four-lane roadway. It is expected that an entrance to the Micron site will be located on NY 11 north of NY 31, so it is expected to receive increased traffic demand.

Conceptual widening of NY 11 is largely based on anticipated future demand and pairing with the improved I-81 & NY 31 interchange concepts. The various sections for widening concepts include:

- Widening from Mud Mill Road to NY 31
- Widening from McKinley Road to NY 31
- Widening from Sneller Road to NY 31
- Widening from Micron entrance to NY 31
- Widening from Bartell Road to Mud Mill Road

2.3.3 Caughdenoy Road Widening

Caughdenoy Road runs north-south and borders the western edge of the Micron site. Two entrances to the Micron site will connect to Caughdenoy Road, north of NY 31, so it is expected to receive increased traffic demand.

A connection from NY 481 northbound makes it an attractive option for future trips to the Micron site. Caughdenoy Road currently operates as a two-lane roadway, and increased traffic activity may require the need for modification or expansion, especially if a full interchange is built to supplement the existing NY 481 exit ramp. If the Mud Mill Road interchange were to be constructed, expansion of the existing Mud Mill Road from I-81 to the Micron site would be expected to support the new access.

Caughdenoy Road could require a combination of the following widening concepts:

- Widening from Maple Road to NY 31
- Widening from NY 31 to Micron entrances
- Widening from NY 31 to Mud Mill Road

The need to widen Caughdenoy Road is directly affected by various interchange modifications that provide additional access to Micron site in addition to I-81/ NY 31 route. Caughdenoy Road widening would generally not be needed if those additional access are implemented.. Widening Caughdenoy Road could impact adjacent residential properties.

2.3.4 Mud Mill Road Widening

Mud Mill Road runs in a general east-west direction, north of the Micron site, from Caughdenoy Road to Lakeshore Road. Currently Mud Mill Road operates as a two-lane roadway for its entirety.

Conceptual widening of Mud Mill Road is largely based on anticipated future demand and pairing with the new Mud Mill Road interchange concepts. The various sections for options for widening included:

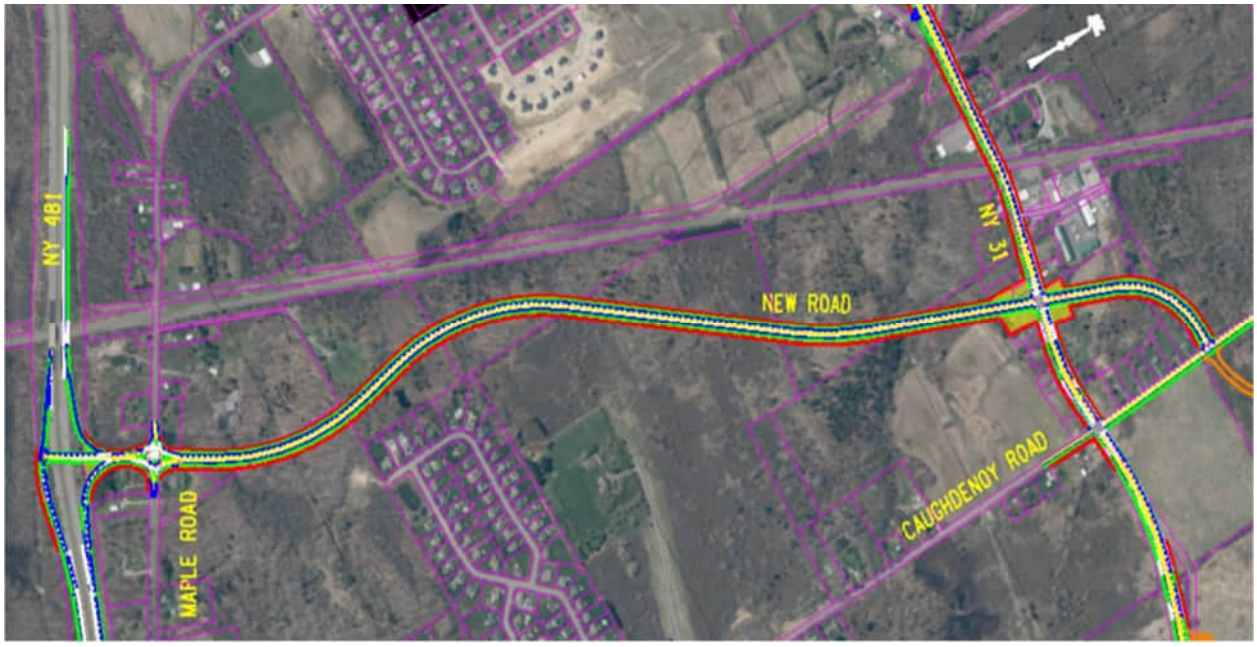
- Widening from NY 11 to Caughdenoy Road
- Widening from NY 11 to Bear Spring Road

For both concepts, sections of Mud Mill Road are envisioned to be widened to a four-lane roadway, with two travel lanes in either direction to Caughdenoy Road.

The first concept would widen to Caughdenoy Road and be paired with a Caughdenoy Road widening concept to provide increased access to the Micron site.

The second concept envisions an expansion to a four-lane roadway to Bear Spring Road. This expansion would continue to a new roadway heading south, creating an additional entrance to the Micron site.

2.3.5 Verplank Road Widening



Verplank Road runs in a general east-west direction, generally parallel to NY 31, from Oswego Road to Caughdenoy Road. Located west of the Micron Site, Verplank Road provides an alternative to NY 31. Currently Verplank Road operates as a two-lane roadway along its entirety.

Widening Verplank Road would support improvements made to the NY 481 & NY 31 interchange. The section identified for potential widening coincides with the NY 31 expansion concept, expanding to a four-lane roadway from Morgan Road to Caughdenoy Road.

2.3.6 New NY 481 Interchange Roadway (Name pending decision on owner)

This concept includes a new north-south roadway, shown on Figure 18, that would connect the new interchange at NY 481 to NY 31 and extend to Caughdenoy Road. Envisioned as a four-lane roadway running near the existing CSX line, the road creates new intersections at Maple Road, NY 31, and Caughdenoy Road, where it would connect directly to the Micron site.

Figure 18: New NY 481 Interchange Roadway Concept

The new roadway, which provide direct access to Micron, would absorb the high traffic demand to the facility , thus avoiding the added burden on existing local roadways.. Additionally, by providing a new access point to NY 481 and the highway network, local traffic could utilize this roadway in lieu of other existing connections, helping ease existing congestion conditions and splitting project-generated demand between I-81 and NY 481 more evenly.

2.3.7 I-81 Widening

To support the various new I-81 interchange concepts at McKinley Road and Sneller Road, a section of I-81 could need to be widened to provide additional capacity. Currently, the section of I-81 between the I-481 interchange and the NY 31 interchange is three lanes in each direction. I-81 is the most heavily trafficked road in the immediate area, and with a potential new I-81 interchange north of NY 31 it is expected that the demand for I-81 would increase.

To support any new I-81 interchange, the interstate may need to be expanded from three lanes to four lanes in each direction. This section is at-grade, which simplifies the expansion process, but is likely to require sound mitigation given the new roadway demand and proximity to residential homes and businesses. As an interstate highway, an expansion of I-81 would need to be approved by FHWA.

2.4 Mitigation Program Concepts

Mitigation program concepts are intended to supplement larger scale infrastructure improvements and modifications. Some programs could be implemented to support construction traffic, and some could continue though the twenty-year buildout and beyond. These concepts are meant to provide mitigation by removing, rerouting, and further dispersing traffic to lessen anticipated congestion at critical facilities. The impact of each program would vary, but all have the potential to alleviate some stress on the region's roadway network.

2.4.1 CSX Rail Spur

Approximately 0.3 miles west of the Micron site, an existing CSX freight line crosses NY 31 and continues further north, crossing Caughdenoy Road at the corner of the proposed Micron site. A rail spur concept branching off this railway between NY 31 and Caughdenoy Roady has been envisioned to support the Micron site. The rail spur would be constructed to the east of the proposed Micron site. The use of rail could help reduce truck traffic to the Micron site.

2.4.2 Shuttle Bus

Over the twenty-year build-out of the Micron fabrication plants, there will be thousands of construction workers traveling to and from the site daily. The arriving and departing shifts could introduce recurring congestion and delay. These impacts could be more severe in the buildout timeframe prior to the implementation of long-range infrastructure improvements (such as interchange improvements). To reduce the number of workers coming directly to the site, two conceptual shuttle bus services were developed:

- Shuttle service from the Syracuse Hancock International Airport (SHIA) - The SHIA is centrally located in the Syracuse region, surrounded by major residential areas, and has direct connections to the highway network. It is located approximately fifteen minutes south of the Micron site.
- Shuttle service from the Great Northern Mall - The Great Northern Mall is located west of the Micron site, off NY 31 and near the NY 481 & NY 31 interchange. It is about a five-minute drive to the site.

Each concept would provide shuttle bus service for up to 100% of the construction workforce. Workers would drive to the shuttle location, board buses and be transported to the site in the morning. At the end of their shift,

buses would take them from the construction site back to the lot where they parked. Both concepts could require parking, site or other transportation facility modifications to accommodate these new traffic demands. Construction workforce shuttling from the Great Northern Mall would still need to use roadways near the project site, creating the potential need for additional local roadway traffic mitigation. The duration of these programs would be determined based on the needs of the project.

2.4.3 Centro Direct Access

Centro is the Central New York Regional Transportation Authority and operates the region's bus service. To promote mass transit and provide additional travel options to the Micron site, a concept was developed to provide direct transit access to the Micron site. This access could come from either a new route, or an extension of an existing route. The roadways immediately around the proposed Micron site currently lack connections to mass transit, so any new transit stop could also serve the community. If created, it is expected that some Micron operational employees could use the service rather than driving. Providing public transit is also a requirement of the CHIPS grant.

2.4.4 Hybrid Work

Hybrid work has become more prominent following the COVID-19 pandemic and is a strategy that could be utilized to reduce the number of trips coming to Micron. Not all operational employees would be able to work remotely, but it was estimated that as many as 6% of the Micron workforce could theoretically utilize this program.

2.4.5 Satellite Offices

While construction of the Micron site is underway, the use of satellite offices to support operations while infrastructure improvement projects are being implemented could reduce traffic demand. Depending on the capacity of the satellite offices, this would remove some vehicle trips to and from the Micron site, helping to reduce congestion.

2.4.6 Carpool

In an effort to reduce the number of vehicle trips coming to and from the Micron site a carpool service could be implemented, including incentives and disincentives to help encourage adoption of the program by Micron employees.

2.4.7 Vanpool

Similar to carpooling but on a larger scale, vanpooling could be implemented to help reduce the number of vehicle trips coming to and from the Micron site. Van service could either be contracted or owned by Micron and would pick workers up at specific locations near their residences. Vanpooling could also utilize incentives and disincentives to help encourage adoption of the program by Micron employees.

2.4.8 Traffic Management Plan (TMP)

Traffic Management Plans are common programs implemented to support projects of various sizes and needs. The goal of a TMP is to improve roadway network performance. Under this program, a traffic management center could be created to monitor the traffic in the region around the proposed Micron site and optimize traffic operations using real time dynamic messaging and smarter signalization. Traffic management centers are able respond quickly to sudden changes due to unexpected events, helping to distribute traffic through the network, reducing the likelihood of any one roadway being overly congested.

2.5 Other Roadway Modification Concepts:

Outside the major infrastructure mitigation concepts and mitigation programs, it is expected that several other modifications could be necessary, depending on changes to the roadway network.

2.5.1 Maple Road

Maple Road and the NY 481 ramp currently intersect at a two-way stop-controlled intersection with Caughdenoy Road. It could be necessary to modify this location by either creating a roundabout or by adding a traffic signal to improve safety and capacity.

2.5.2 Pardee Road and Connections

Pardee Road is located northeast of the I-81 & NY 31 interchange running north-south, shown on Figure 19. Pardee Road operates as a two-lane roadway with direct connections to NY 31. The new I-81 & NY 31 interchange concepts would remove access from Pardee Road to NY 31. Pardee Road currently provides access to several properties and would lose access to I-81 and the highway network. With each of these concepts, an additional concept would need to be developed to reconnect Pardee Road.

Figure 19: Existing Pardee Road

Three concepts were developed to provide Pardee Road connections to work in conjunction with the new I-81 & NY 31 interchange:

- A new roadway around Carmenica Drive, connecting to Lakeshore Road and NY 31
- Modification of Carmenica Drive
- Modification and extension of Pasubio Terrace

The area between Pasubio Terrace and Carmenica Drive is expected to be developed and these concepts would require collaboration with the developer to ensure that they would be feasible.

2.5.3 Lakeshore Road

Located 0.2 miles east of the I-81 & NY 31 interchange, Lakeshore Road intersects with NY 31 at a stop-controlled intersection, shown on Figure 20. It is expected that this connection could need modification and improvements to better fit within the new I-81 & NY 31 interchange and NY 31 widening concepts.

Figure 20: Existing Lakeshore Road

3 TRAFFIC MITIGATION SCENARIOS

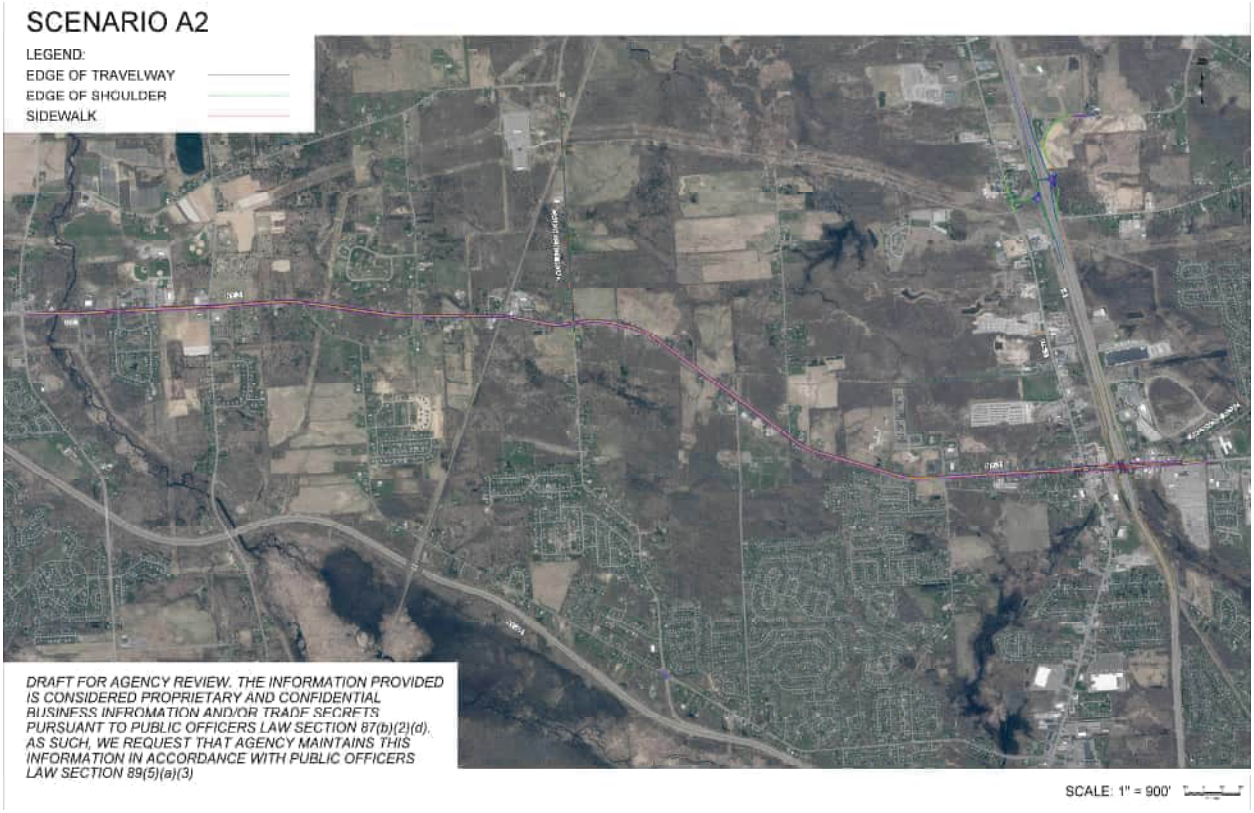
Micron and WSP have coordinated with NYSDOT to select concepts described within this memo and create three distinct traffic mitigation scenarios to be analyzed to evaluate their effectiveness in mitigating traffic impacts.

3.1 Traffic Mitigation Scenario A: Base Mitigation Concepts (Included in All Three Traffic Mitigation Scenarios)

Scenario A includes all the concepts below, which are maintained in Scenario B and C.

- Interchange Improvement Concepts
  - I-81 & NY 31: SPUI (Estimated 10 years construction at $100MM)
- New Interchange
  - New Pardee Road Interchange (Estimated 10 years construction at $100MM)
- Roadway Expansion Concepts
  - NY 31 Expansion: NY 11 to Caughdenoy Road (Estimated 10 years construction at $25MM)
  - NY 31 Expansion: Caughdenoy Road to Morgan Road (Estimated 10 years construction at $25MM)
  - US 11: NY 31 to Sneller Road Interchange (Estimated 10 years construction at $40MM)
  - Caughdenoy Road Expansion: NY 31 to Micron Entrances (Estimated 3 years construction at $10MM)
- Mitigation Program Concepts
  - CSX Rail Spur

- Shuttle Bus: Service from Syracuse Hancock International Airport
- Centro Direct Access
- Carpool
- Vanpool
- Traffic Management Plan



- Other Roadway Modification Concepts
  - Maple Road (Estimated 1 year construction at $5MM)
  - Lakeshore Road (Estimated 4 years construction at $10MM)

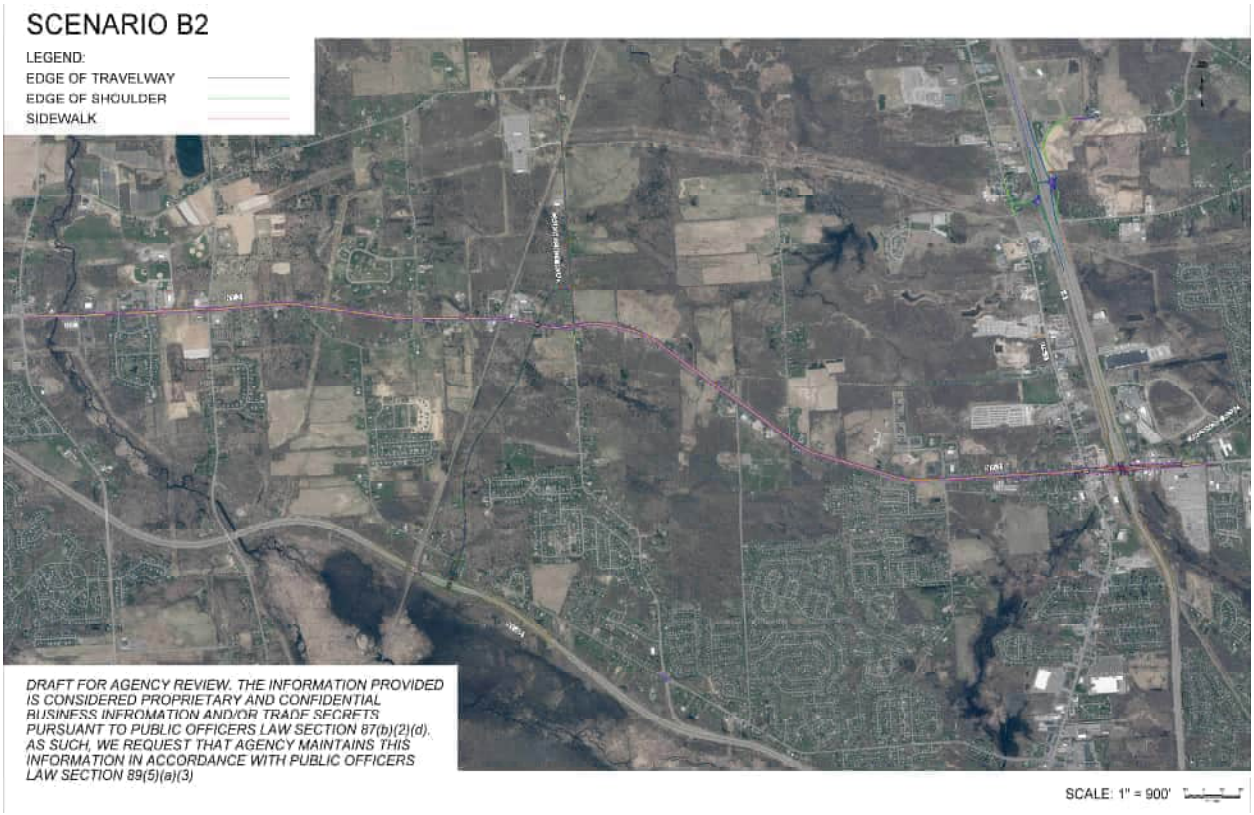
Interchange Improvement, Roadway Expansion, and Other Roadway Modification concepts included in Scenario A are codependent and could all be needed to support future project demands.

It is expected that the mitigation program concepts could be needed to support the construction timeline of the infrastructure concepts. The mitigation program concepts could continue once the infrastructure has been completed.

The total estimated cost of the base mitigation concepts is approximately $315MM and would take at least 10 years to implement if all were constructed concurrently. [Costs and timeline will be refined and updated as more information becomes available]

Figure 21: Scenario A Overview

Under the base mitigation concepts, Pardee Road loses access to NY 31. Since the new interchange would not restore the lost connection for Pardee Road, the new Pardee Interchange would be constructed to maintain access and connecting it to US 11.



The total estimated cost for Scenario A is $315MM. The approximate implementation timeframe is 10 years if all concepts are constructed concurrently. [Costs and timeline will be refined and updated as more information becomes available]

3.2 Traffic Mitigation Scenario B: New NY 481 Interchange and Roadway

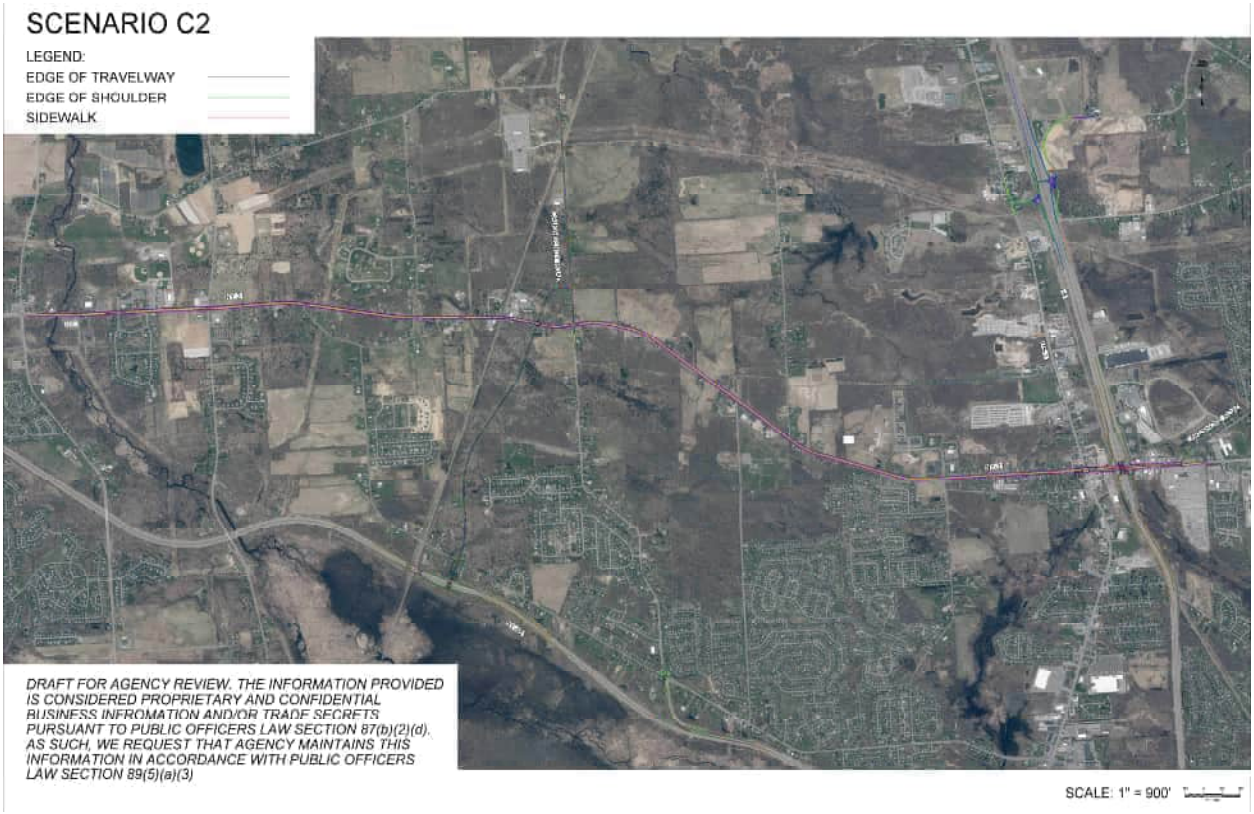
Scenario B includes all the Base Mitigation Concepts and the following additional concepts.

- New Interchange
    - New NY 481 Interchange near the CSX rail line (Estimated 10 years construction at $50MM)
- Roadway Expansions
    - New Roadway: Maple to Micron Entrance at Caughdenoy Road (Estimated 10 years construction at $30MM)

Figure 22: Scenario B Overview

Scenario B is similar to Scenario A, but includes the new NY 481 interchange near the CSX rail line and associated new road to Micron. This scenario provides direct access to the Micron site and more evenly distributes traffic.

The total estimated cost for Scenario B, including the base mitigation concepts (approximately $315MM) and these additional concepts (approximately $80MM) is $395MM. The approximate implementation timeframe is 10 years



if all concepts are constructed concurrently. [Costs and timeline will be refined and updated as more information becomes available]

3.3 Traffic Mitigation Scenario C: New NY 481 Interchange and Roadway plus Caughdenoy Road Access to NY 481 SB

Scenario C includes all the Scenario B concepts and the following additional concept.

- Improved Interchanges
    - NY 481 & Caughdenoy Road: New Ramp to NY 481 Southbound (Estimated 10 years construction at $15MM)

Figure 23: Scenario C Overview

Under Scenario C, a new ramp connecting Caughdenoy Road to NY 481 SB would be created. This connection would provide another egress path for Micron workers while adding additional highway access for local residents, allowing for a greater dispersion of traffic.

The total estimated cost for Scenario C, including the Scenario B concepts (approximately $395MM) and these additional concepts (approximately $15MM) is $405MM. The approximate implementation timeframe is 10 years if all concepts are constructed concurrently. [Costs and timeline will be refined and updated as more information becomes available]

Appendices

Appendix A. Data and Referenced Documents

Appendix B. Calibration

Appendix C. Crash Data

Appendix D. Model Output

Appendix D.
Model Output

Due to varying modeling software configurations, digital models are available upon request.

TIS Model Documentation Naming

The traffic model files were developed using the nomenclature for the scenarios at the onset of the TIS. Partway through the study, the scenario names were revised to those used in this report. The model files were not renamed to avoid unnecessary rework, and reports were not regenerated in response to the scenario name changes.

This table correlates the model name to the documentation name.

Traffic Impact Study Documentation Name	Traffic Model Files Scenario Name
Existing Conditions	2023/24 Existing
2027 No Action Alternative	2027 No-Build
2027 Preferred Action Alternative	2027 Build
2031 No Action Alternative	2031 No-Build
2031 Preferred Action Alternative	2031 Build
2031 Preferred Action Alternative with Mitigation Scenario C	2031 Build Scenario C
2041 No Action Alternative	2041 No-Build
2041 Preferred Action Alternative	2041 Build (4-Fab)
2041 Preferred Action Alternative with Mitigation Scenario A	2041 Build Scenario A (4-Fab)
2041 Preferred Action Alternative with Mitigation Scenario B	2041 Build Scenario B (4-Fab)
2041 Preferred Action Alternative with Mitigation Scenario C	2041 Build Scenario C (4-Fab)
