|----|---------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| 2  |         | NY 31 & NY 481 NB                      | Optimize timing; Lengthen NB R storage length                                                                            |                                                |
| 7  |         | NY 31 & Henry Clay Boulevard           | EBR & WBR lanes added; NBL lane extended; AM signal optimized                                                            |                                                |
| 8  |         | NY 31 & Grange Road West               | Signal added                                                                                                             |                                                |
| 11 |         | NY 31 & Caughdenoy Road                | Add left turn lanes to all approaches                                                                                    |                                                |
| 12 |         | NY 31 & Stearns Road                   | Signal added                                                                                                             |                                                |
| 17 |         | NY 31 & I-81 SB Service Road           | Close Crabtree Ln, add EB dedicated right, widen ramp to 2 lanes and taper before 81, optimize timing                    | Followed Synchro Design?                       |
| 18 |         | NY 31 & Pardee Road/I-81 NB Service Ro | Lengthen NB storage as much as possible within ROW, 1 NB left, 1 NB thru, 1 NBR, optimize timing                         | Confirm the extended length of the NB storage? |
| 19 |         | NY 31 & Lakeshore Road                 | Close Node 19 and improve 20 to include a left turn lane                                                                 | Confirm this change?                           |
| 31 |         | NY 481 SB On-Ramp & Soule Road         | what do we gain by disabling NB RTOR? Consider making SB middle lane a thru/left and adding short 2nd rec                | SB middle lane to be shared thru and left?     |
| 34 |         | US 11 & Bear Road                      | SB lanes reconfigured to 2 SBL, 1 SBT, 1 SBR; SBL permitted phase removed                                                |                                                |
| 35 |         | Bear Road & I-481 EB Ramps             | EBL turn bay extended; EB lanes reconfigured to 2 EBL, 1 EBT (with 2 EBL lanes); PM signal optimized                     | Confirm the layout for the NB RT movement      |
| 40 |         | Caughdenoy Road & Maple Road & NY 41   | temp signal with wooden poles since DOT EIS will modify again                                                            |                                                |
| 42 |         | NY 31 & Crabtree Lane                  | Close Crabtree Ln, add EB dedicated right, widen ramp to 2 lanes and taper before 81, optimize timing - same as INT # 17 |                                                |

Confirm US11 & Crabtree Ln design?

## 1.0 INTRODUCTION

---

The Syracuse Metropolitan Transportation Council (SMTC) is the designated Metropolitan Planning Organization (MPO) for the greater Syracuse Metropolitan Region, which includes the City of Syracuse, Onondaga County, and small portions of Madison and Oswego Counties. SMTC is responsible for the development of the region's Long Range Transportation Plan (LRTP), Transportation Improvement Program (TIP) and Unified Planning Work Program (UPWP). These three items serve as the basis for transportation planning and programming in the region. This also involves conducting transportation planning and needs assessment studies as well as ensuring the LRTP and TIP conform to Air Quality Standards.

To assist with the conduct of these responsibilities SMTC maintains a Travel Demand Model ("the model"). The model was originally run in the Tmodel2 software package, which was installed and calibrated for the Syracuse region in the early 1990's. In 2004 SMTC retained the transportation consulting firm of Edwards and Kelcey to update the region's travel demand forecasting capabilities and build a new model using the TransCAD modeling platform. The completed model was installed onto the SMTC computers in 2005.

In 2009, SMTC retained RSG under the I-81 Travel Demand Modeling contract to review and update the model for use in the I-81 Alternatives Analysis project and to support the SMTC's other planning needs. In 2014, the model was further refined and updated to cover the region's expanded Metropolitan Planning Area (MPA). In 2019, RSG updated the model code to run in TransCAD version 7 and recalibrated the model to 2017 conditions.

The purpose of this SMTC Travel Demand Model Documentation is to:

- Describe in detail the latest model's structure, input data, and parameter estimation,
- Present model validation results that demonstrate that the model is suitable for use as the SMTC's travel demand modeling tool, and
- Describe how the model meets the minimum requirements of and responds to the suggested good practices of federal and state guidelines.

## 2.0 MODEL OVERVIEW

The STMC Travel Demand Model, Version 5.0 (“the model”) is an integrated transportation demand model developed by Resource Systems Group (RSG) for the Syracuse Metropolitan Transportation Council.

The model estimates the movement of people and vehicles within the region during an average fall weekday in 2017. The 2017 Model is a daily model with hourly traffic assignments. The 2017 model is based on updated housing and employment estimates from 2017, and includes a revised network. The model has also been transferred from TransCAD 5.0 to TransCAD 7.0. The model includes 1,125 internal Transportation Analysis Zones (TAZs) covering the City of Syracuse, Onondaga County, and several towns in Madison and Oswego Counties. Traffic entering and exiting the region does so through 68 external zones.

Transportation planners can use the model to perform comprehensive regional transportation analyses, and to evaluate traffic impacts resulting from:

- multi-modal transportation improvements,
- changes in traveler behavior,
- changes to the roadway system,
- changes in land use activity, and
- implementation of demand management strategies.

The purpose of this report is to describe:

- the data sources and parameter estimation that are the foundation of the model,
- the structure of the model itself,
- the use of the model for forecasting purposes, and
- the history of enhancements and changes made to the model.

### 2.1 | CONCEPTUAL OVERVIEW OF MODEL STRUCTURE

The SMTC model is based on a four-step modeling process: trip generation, trip distribution, mode choice, and vehicle assignment. An overview of the model system is shown in Figure 1.

At the start of a full model run, trip generation uses land-use data to calculate person trip ends at the transportation analysis zone (TAZ) level. These person trip ends are then paired into origins and destinations in the distribution model. In the next step, the person trips are split into each respective mode (e.g. auto, bus). Finally, the vehicle trips are assigned to the highway network in the assignment model.

**FIGURE 1: 4-STEP MODEL CONCEPT**

The model has an important feedback loop that has been added in Figure 2. Accessibility, which is a measure of the relative ease of travel, is calculated based on outputs from the

assignment model, which is also an important determinant of trip distribution. Simply put, the decisions individuals make about where and how far to travel are a function of congestion levels and travel times. Therefore, it is customary to iterate between the trip distribution and assignment models in order to reach a convergent solution. The iteration loop in Figure 2 occurs within a given simulation year.

**FIGURE 2: 4-STEP MODEL CONCEPT WITH FEEDBACK**

While transit travel is critical for many people in the SMTC region, the reality is transit carries a relatively small portion of the overall travel market in the region at this time. Since transit demand in the SMTC region does not measurably impact roadway level-of-service, a decision was made to not include the mode choice model in the feedback loop to reduce model run time and complexity. However, the mode choice model is still part of the overall model, and the SMTC model operates as presented in Figure 3. This model application decision does not limit the ability of the modeling system to adequately represent non-auto modes, and does not bias the model results, but it does significantly reduce model run time since the mode choice component takes the longest to run due to the nature of the complex path-building that is required.

**FIGURE 3: FEEDBACK IN THE SMTC MODEL STRUCTURE**

The model is calibrated to reflect traffic conditions on an average weekday in Fall 2017. Fall was chosen because it is a time during which public schools and colleges are in session, while seasonal (summer) traffic is still observed.

The model is a daily model that performs hourly traffic assignments so as to account for both travel across an entire day and to adequately depict peak hour congestion. To accomplish this, the model relies on static time of day factors that divide the daily trips by hour for the purposes of assignment. This process is illustrated in Figure 4.

**FIGURE 4: COMPLETE SMTC MODEL STRUCTURE**

## 2.2 | BRIEF DESCRIPTION OF MODEL COMPONENTS

While the model is a traditional 4-step model, the modeling process itself consists of several steps worth noting. Each of the steps below will be discussed in-depth later in the document.

**Daily trip generation**, which calculates the number of person trip ends generated by and attracted to each zone.

**Daily trip distribution**, which pairs the trip-ends for each zone for each of six trip purposes. The result of this is a person trip table for each trip type. One output of trip distribution is the person trip table for home to work that can be compared to the “Journey-to-Work” data provided by the Census Bureau.

**Time of day (diurnal) distribution**, which takes the daily production-attraction trip matrices and converts them to origin-destination matrices by time period (e.g. AM peak hour). Trips by time of day were initially estimated using the 2004 SMTC Household Travel Survey and the NHTS in the previous version of this model.

**Vehicle assignment**, the most widely used model, which locates the best routes between each origin/destination pair and assigns the vehicle trips accordingly. An important output of this step is the number of vehicles on each roadway segment. Several other pieces of data can be extracted, including operating speeds, travel times, VMT, VHT, and V/C. In addition, one can configure the vehicle assignment to save all the vehicle trips that use a single link in either direction (select link analysis) or all the vehicle trips that originate or are destined for a zone (select zone analysis).

**Highway/transit skim builder** finds the best available travel path via each of the travel modes explicitly modeled and describes the attributes of the best paths for each mode (i.e. travel time, cost, distance, etc.). Several modes are explicitly modeled in the SMTC model, including auto, transit, and non-motorized modes. Skims are reasonable approximations of the travel time and cost between all pairs of TAZs, and skims are described for each travel mode. The path-finding algorithms are calibrated based on observed travel paths and observed relationships between volumes and congested speeds.

**Mode choice model** calculates which mode the person trips are likely to take based on availability and mode-specific parameters (e.g. time, cost, transit frequency). Mode choice provides a breakdown of person trips by mode. The mode choice model is

developed based on observed data on mode preferences and what those preferences imply about sensitivities to mode attributes.

FIGURE 5: SMTc MODEL REGION

## 3.0 ZONE SYSTEM AND DATA

### 3.1 | TAZ SYSTEM

The SMTC model is a zone-based forecasting tool, modeling traffic flows between TAZs. The model includes a total of 1,193 TAZs. Table 1 shows a breakdown of the TAZ structure: 1,125 cover the 41 municipalities and the Onondaga Nation in the SMTC region, while traffic entering and exiting the region does so through 68 external zones. Of the internal TAZs, most are in Onondaga County, which accounts for the majority of the SMTC region. The quantity of households and employment in each of these zones is used to develop estimates of the trips produced by and attracted to them. Sixteen TAZs are special generators, which are specific locations such as Syracuse Airport, Hospitals and large educational institutions that are modeled differently than zones containing more typical residential and commercial land. External TAZs are used to generate traffic at the cordon of the SMTC region. The 68 external TAZs are located where major roadways cross the SMTC region boundary. Traffic counts recorded at these points are used as input data to modeling trip generation at these locations, which is discussed in Section 6.0.

**TABLE 1: TAZ SUMMARY**

|                       | DESCRIPTION             | NUMBER OF ZONES |
|-----------------------|-------------------------|-----------------|
| Within                | Onondaga County*        | 920             |
| SMTC                  | Outside Onondaga County | 189             |
| MPA                   | Special Generators      | 16              |
|                       | <b>Total in MPA</b>     | <b>1,125</b>    |
| External Stations     |                         | 68              |
| <b>Total in Model</b> |                         | <b>1,193</b>    |

\*Excluding special generator TAZs

The previous version of the model included 1,185 TAZs, of which 1,117 were internal and 68 external. The model update included splitting a few zones within Onondaga County to provide higher detail at these locations. Figure 6 shows the TAZ structure for the SMTC region.

In the updated SMTC model, the socioeconomic, trip production and trip attraction attributes are maintained outside of the TAZ geographic file. Now only geographic data is maintained in the TAZ file, and socioeconomic, trip production and trip attraction attributes are maintained in support files within the Inputs\3\_TAZ and TripGen folder. These include the 'LandUse.bin' file, which contains all household and employment data.

Attributes associated with TAZs are listed in Table 2. The development of these data are discussed in Section 3.2 |.

FIGURE 6: SMTC REGION TAZ STRUCTURE

**TABLE 2: TAZ ATTRIBUTES**

| Field             | Description                  | Update Type     |
|-------------------|------------------------------|-----------------|
| ID                | TAZ identification number    | Immutable       |
| Area              | TAZ Area (square miles)      | User-maintained |
| TAZ               | TAZ identification number    | User-maintained |
| Zone_Type         | Zone type                    | User-maintained |
| Town_City         | Town/City name               | User-maintained |
| Town/Ext.Station  | Town/external                | User-maintained |
| Outside_Onondaga  | Onondaga Indicator           | User-maintained |
| TerminalTime      | Terminal Time (minutes)      | User-maintained |

| Description       | Description                  | User-maintained |

### 3.2 | SOCIOECONOMIC DATA

Socioeconomic (SE) data are essentially the number of households and jobs located in each of the model's TAZs. The number of households and jobs are the key explanatory variables of the number of trips produced and attracted to each TAZ. Therefore, if the model is to reflect travel in the region it is important to correctly locate and quantify households and jobs. Furthermore, the change in land use – growth or decline in the number of household and jobs – is the key driver of changes in the amount of regional travel between the base and future forecast years.

A multistep process was undertaken to develop the base and future year data:

- Conversion of the model's forecast years: the base year was moved forward from 2014 to 2017, and the future year was maintained as 2050.

- The addition of more detail to the TAZ system required the disaggregation of employment and households reflect where TAZs were split.

- Version 5.0 SE data was developed based on current socio-economic and census data sources, including data from the NY State Department of Labor, in combination with SMTC local knowledge and maintaining local adjustments established with local partners during previous outreach in generating Version 4.0 2014 SE data inputs.

- Updated 2050 projections were then obtained by reviewing previous 2014 and 2050 SE data, along with the newly updated 2017 SE data and strategically updating the previous 2050 SE data to reflect changes from 2014 to 2050. Logic was applied to maintain previous 2050 values for a given TAZ when the 2017 values reflect a natural progression along the previously defined growth trajectory – i.e. where 2017

values fall between the 2014 and 2050 values and reflect incremental change due to time passing from 2014 to 2017. However, in some cases, 2017 SE data was updated to reflect corrections to 2014 SE allocations (often the number and/or type of employees in a given zone). In such cases, logic was used to translate these corrections to the 2050 values. In all cases, town-wide control totals were applied after redistribution, with exceptions for any cases if 2017 values exceeded 2050 totals for a given town.

As mentioned previously, the Socioeconomic data is maintained outside of the TAZ system in the 'LandUse.bin' file. The attributes associated with the Socioeconomic data are listed in Table 3.

The remainder of this section describes each step in the process of developing the socioeconomic data in more detail and presents regional summaries of the socioeconomic data.

**TABLE 3: SOCIOECONOMIC DATA ATTRIBUTES**

| Field              | Description                                | Update Type     |
|--------------------|--------------------------------------------|-----------------|
| TAZ                | TAZ identification number                  | Immutable       |
| Town               | Town/City name                             | User-maintained |
| CBD                | Central Business District                  | User-maintained |
| HH_IncludingGQ     | Households including Group Quarters        | User-maintained |
| HH                 | Households                                 | User-maintained |
| HH_GQ              | Group Quarters                             | User-maintained |
| Population         | Population (persons)                       | User-maintained |
| Vehicles           | Vehicles                                   | User-maintained |
| Agriculture        | Agricultural sector employees              | User-maintained |
| Bus_Legal_Personal | Business, Legal, Personal sector employees | User-maintained |
| Communications     | Communication sector employees             | User-maintained |
| Construction       | Construction sector employees              | User-maintained |
| Eat_Drinking       | Eating, Drinking sector employees          | User-maintained |
| Education          | Education sector employees                 | User-maintained |
| FIRE               | Fire sector employees                      | User-maintained |
| Government         | Government sector employees                | User-maintained |
| Health             | Health sector employees                    | User-maintained |
| Hotels_Lodge       | Hotels, Lodging sector employees           | User-maintained |
| Manufacturing      | Manufacturing sector employees             | User-maintained |
| Mining             | Mining sector employees                    | User-maintained |
| NonClassifiable    | Nonclassifiable sector employees           | User-maintained |
| RetailTrade        | Retail sector employees                    | User-maintained |
| Service            | Service sector employees                   | User-maintained |
| SocialServices     | Social Services sector employees           | User-maintained |
| Transportation     | Transportation sector employees            | User-maintained |
| Utilities          | Utilities sector employees                 | User-maintained |
| WholesaleTrade     | Wholesale sector employees                 | User-maintained |
| Total              | Total employees                            | User-maintained |

## DATA COLLECTION

Collecting and verifying housing and employment data is a very intensive process and requires input from local experts. In developing model SE data, the SMTC met with local officials and professionals with experience in demographic analysis and/or knowledge of local demographic conditions. For this current update, SMTC staff further reviewed and updated SE data to reflect 2017 conditions.

A comprehensive socioeconomic data update outreach was completed over a several week period in the spring of 2014 and included representatives from various geographic levels. This process, which formed the initial foundation of the 2017 model data – currently updated to reflect 2017 conditions – is described below.

The SMTC met with the Empire State Development Corporation and the New York State Department of Labor to understand current conditions and trends at the state level. The central New York Regional Planning and Development Board, Syracuse-Onondaga County Planning Agency, Onondaga County Office of Economic Development, CenterState Corporation for Economic Opportunity, City of Syracuse Department of Neighborhood and Business Development, City of Syracuse Industrial Development Agency and the City of Syracuse Bureau of Planning & Sustainability provided feedback on socioeconomic data at the city, county and region level. Additionally, in 2009, the SMTC collected information from local representatives from the Towns of Camillus, Cicero, Clay, DeWitt, Lysander, Manlius, Onondaga, Salina and Van Buren. These municipalities were determined to be the most dynamic in regards to household and employment change over the 36 year modeling period.

Socioeconomic information that was previously gathered, during a similar effort in 2009, was presented to these representatives in tabular and graphic format. Each representative had the opportunity to review and comment on the previous work to update the datasets to the new base and horizon model years. Comments were collected and compiled into a single database and the appropriate changes were made to the base and horizon year datasets.

The development of data in 2009 utilized New York State Department of Transportation (NYSDOT) forecasted employment data created by Global Insight. In addition to the database compiled during meetings with local representatives, other datasets were referenced to update the model data to 2014 and 2050 for the version 4.0 model:

- 2000 U.S. Census data on households at the block level (U.S. Census Bureau)
- 2010 U.S. Census data on households at the block level (U.S. Census Bureau)
- 2012 U.S. Census American Community Survey (ACS) 3-year data on households (U.S. Census Bureau)
- 2012 parcel data for Onondaga County (Syracuse-Onondaga Planning Agency)
- 2009 Business Location Analysis Tool (BLAT) data on employment (NYSDOT)
- 2013 Infogroup data on employers with 10+ employees (NYSDOT)
- 2012 Onondaga County employment totals by sector (New York State Department of Labor)

- 2012-2013 aerial photography for household and employment location confirmation (NYSDOT)
- 2010 US Bureau of Economic Analysis (BEA) Onondaga County full-time employment by industry sector (CA25N)
- 2012 Onondaga County Industrial Development Agency (OCIDA) employment report
- 2013 Downtown Committee of Syracuse employment data

Previous Future year forecasts:

- 2020 employment projections by sector for Central New York (New York State Department of Labor)
- 2035 employment projections by sector and population projections for Onondaga County (Woods and Poole Economics, Inc.)
- 2040 population projections for Onondaga County (Cornell University Program on Applied Demographics)

## DEVELOPMENT OF BASE YEAR HOUSEHOLDS & POPULATION

Prior to updating the model base year from 2007 to 2014 the 2007 household data were reviewed for accuracy and completeness. Parcel data and aerial photography were used to validate the placement of households in the 2007 TAZ structure<sup>1</sup>. Otherwise, the updated demographic data for 2014 was prepared using the 2010 Census and 2012 parcel data. For the latest 2017 data update, previous 2014 HHs were again reviewed and updated by SMTC staff.

### 3.3 | DEVELOPMENT OF FUTURE YEAR HOUSEHOLDS & POPULATION

In the SMTC version 4 model, previous 2035 household and population data served as the basis for projecting 2050 conditions. The 2035 year household and population data were previously presented to local representatives for review and comment. The general consensus was to retain the 2035 conditions out to 2050 with a few exceptions. The local representatives identified site-specific locations of growth or decline in their geographic areas of expertise. This feedback was applied to the household data at the TAZ level and the remaining growth or decline, projected for 2050, was added and distributed using the previous model growth rates. The 2035 household totals were used as the 2050 household control totals at the municipal and county level. These control totals (approximately 208,000 total households in Onondaga County - not including group quarters) were validated with results of a trend analysis using Decennial Census data, American Community Survey 3-year data, Cornell University projections, and Woods and Poole Economics projections. The projections for the City of Syracuse were adjusted in this version of the model based on the

---

<sup>1</sup> For more information on how the 2003 household and population data was derived please refer to the SMTC Travel Demand Model Data Development Report (Version 1.2) dated November 2006. This report also describes the development of 2027 household and population data and 2003 and 2027 employment data

2010 Census data showing a lower level of decline than had been expected and that has been incorporated in to the projections.

For the current SMTc version 5 model, previous 2050 projections were used as a starting point for updated 2050 projections. The current version 5 model 2050 SE data projections were obtained by reviewing previous version 4 2014 and 2050 SE data, along with the newly updated 2017 SE data and strategically updating the previous 2050 SE data to reflect changes from 2014 to 2050. Logic was applied to maintain previous 2050 values for a given TAZ when the 2017 values reflect a natural progression along the previously defined growth trajectory – i.e. where 2017 values fall between the 2014 and 2050 values and reflect incremental change due to time passing from 2014 to 2017. However, in some cases, 2017 SE data was updated to reflect corrections to 2014 SE allocations. In such cases, logic was used to translate these corrections to the 2050 values. In all cases, town-wide control totals were applied after redistribution, with exceptions for any cases if 2017 values exceeded 2050 totals for a given town.

### **3.4 | DEVELOPMENT OF BASE YEAR EMPLOYMENT**

Employment data for the 2017 base year in version 5.0 were developed by SMTc based on employment data provided by NYSDOT and comparison to historical employment data by TAZ from the version 4 model.

Historical version 3 base year employment numbers relied on BLAT data, provided by NYSDOT (geocoded locations of business which include employment sector and employee information), 2010 Census Local Employment Dynamics (LED) data, aerial photos, and 2010 county-level BEA control totals and parcel data to correct any large discrepancies.

For the previous version 4 update, local representatives were presented with employment data tables and maps to review and comment. The goal of this outreach was to review the current model conditions and to determine areas of growth and/or decline in regards to total employment and employment sector for the new model years. In some cases, local representatives were able to identify employment changes that occurred between 2007 and 2014. The remaining employment change, using the same rates as the 2007 to 2035 projections, was applied to the 2014 TAZ structure. Additionally, 2009 BLAT and 2013 Inforgroup employment data were used for verifying employer locations, employment sector and number of employees at the TAZ level. The final 2014 employment data from version 4 were controlled at the county level using 2012 New York State Department of Labor employment data and at the municipal level using 2010 LEHD data.

The employment sectors used in previous model iterations are again retained for the version 5 update of employment data. The sectors are combinations of Standard Industrial Classification (SIC) codes. The sectors and corresponding SIC codes are shown in Table 4.

**TABLE 4: EMPLOYMENT SECTORS AND SIC CODES**

| EMPLOYMENT SECTORS                  | SIC CODES                             |
|-------------------------------------|---------------------------------------|
| Agriculture                         | 0100 – 999                            |
| Mining                              | 1000 – 1499                           |
| Construction                        | 1500 – 1800                           |
| Manufacturing                       | 2000 – 4000                           |
| Transportation                      | 4100 – 4799                           |
| Communications                      | 4800 – 4899                           |
| Utilities                           | 4900 – 4999                           |
| Wholesale Trade                     | 5000 – 5199                           |
| Retail Trade                        | 5200 – 5799, 5900 – 5999              |
| Eating and Drinking Establishments  | 5800 – 5899                           |
| Financial / Insurance / Real Estate | 6000 – 6800                           |
| Hotels / Lodging                    | 7000 – 7099                           |
| Business / Legal / Personal         | 7200 – 7400, 8100 – 8200, 8700 – 8799 |
| Service (General)                   | 8400 – 8500, 8600 – 8700, 8800 – 8999 |
| Health Services                     | 8000 – 8100                           |
| Educational Services                | 8200 – 8299                           |
| Social Services                     | 8300 – 8399                           |
| Government                          | 9100 – 9800                           |
| Nonclassifiable                     | 9900+                                 |

### DEVELOPMENT OF FUTURE YEAR EMPLOYMENT

In the SMTC version 4 model, the previous horizon year (2035) employment data were developed using a combination of local knowledge and forecasted employment data created by Global Insight, provided by NYSDOT. Projecting the employment data using only the Global Insight data did not take into account all local considerations related to site-specific development plans. Therefore, during the meetings with local representatives they were asked to provide information on any economic development that had or was likely to occur between 2007 and 2035. These details were incorporated into the final projected 2035 TAZ level employment data in the version 3 model.

The effort put into projecting the 2035 employment data was utilized for the version 4 model update and also largely influences the current version 5 update. During outreach efforts in the spring of 2014 it was determined the employment numbers that were projected

for 2035 were to be used in 2050. There was an overall consensus on this assumption due to then current economic conditions that had slowed growth for several years and in some sectors created a decline. In addition, local representatives provided updated information on site-specific development plans as well as projected job gains/losses by sector. Large potential but unapproved developments (such as future portions of Destiny USA) have not been included in the future employment forecasts.

Based on information provided by the New York State Department of Labor, the projected annual growth rate for central New York is 0.04%, which equals just over 1,000 jobs per year in Onondaga County. The 34,000 jobs (approximately 1,000 jobs per year over a 36 year period) were distributed to TAZ's using previously projected rates and site-specific information collected during the outreach effort. Combining the previous efforts to develop 2035 forecasts with updated information resulted in an updated and refined 2050 employment dataset at the TAZ level.

## SUMMARY OF SOCIOECONOMIC DATA

The results of the socioeconomic data development process for the version 5 model are shown in Table 5, which summarizes household and employment data by municipality<sup>2</sup>. The table shows that the number of households in the model region is projected to grow by 6% from 220,487 in 2017 to 233,358 in 2050, and the number of jobs in the model region is projected to grow by 13% from 267,276 in 2017 to 303,125 in 2050. Figure 7 and Figure 8 show 2017 and 2050 household density by TAZ, and Figure 10 and Figure 11 show 2017 and 2050 employment density by TAZ. Figure 9 and Figure 12 show the change in household density and employment density between 2017 and 2050 respectively. There is, generally, relatively little change in households in the City of Syracuse and growth in communities outside the City. Most employment growth is expected to occur (in absolute terms) in the City of Syracuse and towns such as DeWitt, Clay, Cicero, and Lysander. The growth rates of regional households and employment are similar to those in the previous model.

## CROSS CLASSIFICATION OF HOUSEHOLD DATA

The socioeconomic data development process created base and future year household numbers by TAZ. For trip generation purposes, the households are cross classified by household size and vehicle ownership as input in the HHAndVeh\_Percent.bin file (See section 6.2 | for more details of the trip generation model). The base year cross classification was controlled using 2010 Census block group data. Each TAZ was joined to one of the 418 block groups composing the SMTC region and assigned with the corresponding block group's joint distribution of household size (1,2,3,4+ person households) and number of vehicles (0, 1, 2, and 3+ vehicles) as documented in the 2006-

---

<sup>2</sup> TAZ geography does not overlay exactly municipal geography; therefore, data for certain municipalities may vary.

2010 ACS data. Bucket rounding was applied across joint distributions and across TAZs to round to whole households.

The modeled population of Onondaga County derived from the cross classified households was confirmed to match closely to the 2013 population of 468,400 at an average of 2.42 people per household (based on 2013 ACS population estimates). The household size distribution was skewed lower in each TAZ so that this region-wide population control was matched.

**TABLE 5: HOUSEHOLDS AND EMPLOYMENT BY MUNICIPALITY IN 2017 AND 2050**

| Town/City      | Households Including Group Quarters |         |        |          | Employment |         |        |          |
|----------------|-------------------------------------|---------|--------|----------|------------|---------|--------|----------|
|                | 2017                                | 2050    | Change | % Change | 2017       | 2050    | Change | % Change |
| Baldwinsville  | 2,608                               | 2,765   | 157    | 6%       | 2,114      | 2,219   | 105    | 5%       |
| Camillus       | 10,230                              | 11,017  | 787    | 8%       | 7,975      | 8,850   | 875    | 11%      |

## 4.0 MODEL HIGHWAY NETWORK

---

For modeling purposes, a set of roadways within the modeling region was selected to reliably represent the entire highway network. In application, there are over 11,500 road segments represented as network links, of which approximately 1,418 are one-way only. The model includes a limited number of local roads – most local roads are represented and accounted for in the model by centroid connectors that link TAZ centroids to the rest of the model’s highway network. There are 8,649 endpoints (known as “nodes”) in the model, which include intersections and TAZs. Figure 13 shows the highway network in the SMTC region. As part of this model update, SMTC refined the highway network. A combination of field verification and review of aerial images were used to verify network attributes such as number of lanes, posted speeds, turn penalties, intersection types, and centroid connector placement.

### 4.1 | NETWORK ATTRIBUTES

In the SMTC model, some of the link and node attributes are maintained in the roadway geographic file while other attributes are maintained in lookup tables. The attributes associated with the links and nodes include:

- Functional classification
- Link direction, number of lanes, length, and tolls
- Link and node hourly capacities
- Free flow and congested speeds and travel times
- Turn prohibitions and turn penalties
- Area type, i.e. Syracuse, Urban, Other Census Designated Place, or Rural

Table 6 and Table 7 list the node attributes and the highway link attributes, respectively.

TABLE 6: HIGHWAY NODE ATTRIBUTES

| Field        | Description                        | Update Type     |
|--------------|------------------------------------|-----------------|
| ID           | Node identification code           | Immutable       |
| Longitude    | Longitude of node                  | Immutable       |
| Latitude     | Latitude of node                   | Immutable       |
| Elevation    | Elevation of node                  | Immutable       |
| ID:1         | Secondary Node ID code             | User-maintained |
| Centroid     | Highway Centroid                   | User-maintained |
| Transit_CE   | Transit Centroid                   | User-maintained |
| TAZ          | TAZ number                         | User-maintained |
| Model_Node   | Model Node                         | User-maintained |
| Transit_Node | Transit Node                       | User-maintained |
| Node_Type    | Node type                          | User-maintained |
| HCAP         | Intersection capacity (vph)        | Lookup Table    |
| Daily_Vol    | Daily model volume (vehicles)      | Computed        |
| AM_Vol       | AM hour model volume (vehicles)    | Computed        |
| PM_Vol       | PM hour model volume (vehicles)    | Computed        |
| AM_VoC       | AM hour volume-capacity ratio      | Computed        |
| PM_VoC       | PM hour volume-capacity ratio      | Computed        |
| TurnPen      | Indication of Turn Penalty at node | User Maintained |

## LINK FUNCTIONAL CLASSES

For modeling purposes, links are organized into 10 functional classes (Table 8). Links of the same functional class have similar speeds, capacities, and volume-delay parameters. To allow aggregation of VMT for emissions calculations, the Federal Highway Administration

(FHWA) Functional Class designation (including urban/rural designation) is also maintained on the highway network for each link.

**TABLE 8: LINK FUNCTIONAL CLASSES**

| MODEL CLASS NUMBER | FHWA FUNCTIONAL CLASS | MPA LANE MILES | ONONDAGA COUNTY LANE MILES | CITY OF SYRACUSE LANE MILES |
|--------------------|-----------------------|----------------|----------------------------|-----------------------------|
| 1                  | Interstate/Freeway    | 1,305          | 1074                       | 147                         |
| 2                  | Principal Arterial    | 513            | 499                        | 112                         |
| 3                  | Minor Arterial        | 668            | 620                        | 152                         |
| 4                  | Major Collector       | 824            | 697                        | 66                          |
| 5                  | Minor Collector       | 339            | 258                        | 0                           |
| 6                  | Local                 | 1,681          | 1378                       | 153                         |
| 7                  | High Capacity Ramp    | 115            | 111                        | 33                          |
| 8                  | Low Capacity Ramp     | 28             | 28                         | 3                           |
| 9                  | Centroid Connector    | N/A            | N/A                        | N/A                         |
| 10                 | External Connector    | N/A            | N/A                        | N/A                         |

### LINK CAPACITIES AND FREE-FLOW SPEEDS

Table 9 and Table 10 show link free-flow speeds and capacity, which are defined by link functional class and area type. The speed and capacity values are stored in lookup tables and automatically imported to the network each time the model runs. The main benefits of importing these data from a lookup table, as opposed to maintaining an explicit speed and capacity for every link within the highway network, are that the user has less data to manage and can easily quote values. However, there are some links in the SMTC network that warrant special attention because their actual speed or capacity is substantially different from what the lookup tables say. Therefore, the SMTC model also supports the ability to code a speed or capacity for each link by entering a value into the “CapPerLane\_UI” or “Speed\_UI” fields on the network (see). A null value in either of these fields, the default condition, indicates that the lookup table is to be used.

**TABLE 9: FREE-FLOW SPEED (MPH) LOOKUP TABLE**

| FUNCTIONAL CLASS   | SYRACUSE | OTHER CDP | URBAN | RURAL |
|--------------------|----------|-----------|-------|-------|
| Interstate/Freeway | 55       | 65        | 65    | 65    |
| Principal Arterial | 40       | 50        | 50    | 55    |
| Minor Arterial     | 30       | 35        | 45    | 55    |
| Major Collector    | 25       | 25        | 35    | 40    |
| Minor Collector    | 25       | 25        | 35    | 40    |
| Local              | 25       | 25        | 30    | 35    |

| Low Capacity Ramp  | 30       | 30        | 30    | 30    |
| Centroid Connector | 30       | 30        | 30    | 30    |

**TABLE 10: CAPACITY (VEHICLES PER LANE PER HOUR) LOOKUP TABLE**

| FUNCTIONAL CLASS   | SYRACUSE | OTHER CDP | URBAN  | RURAL  |
|--------------------|----------|-----------|--------|--------|
| Interstate/Freeway | 1,900    | 1,900     | 1,900  | 1,900  |
| Principal Arterial | 1,600    | 1,600     | 1,600  | 1,600  |
| Minor Arterial     | 1,200    | 1,200     | 1,200  | 1,200  |
| Major Collector    | 1,000    | 1,000     | 1,000  | 1,000  |
| Minor Collector    | 950      | 950       | 950    | 950    |
| Local              | 450      | 450       | 450    | 450    |
| High Capacity Ramp | 1,500    | 1,500     | 1,500  | 1,500  |
| Low Capacity Ramp  | 1,500    | 1,500     | 1,500  | 1,500  |
| Centroid Connector | 99,999*  | 99,999    | 99,999 | 99,999 |

\*99,999 = unconstrained capacity

## LINK TRAVEL TIMES

The free-flow speeds (Table 9) are used along with the link length field to calculate a free-flow travel time which is used during the first model iteration in the distribution and mode choice steps. Following an initial highway assignment and feedback step (see section 13.0), congested travel times are loaded onto the network and used in the subsequent iteration through the distribution and mode choice steps.

## INTERSECTION CAPACITIES

The SMTTC model uses 54 node types (Table 11); 45 of these node types describe different signalized intersections designs. Each node type is associated with a different intersection capacity.

**TABLE 11: NODE CLASSES**

| NODE DESCRIPTION           | NODE TYPE VALUE | CAPACITY                                                                                                                                                                                 |
|----------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signalized Intersections   | 1-28; 70-86     | From Lookup Table                                                                                                                                                                        |
| 1 or 2 way stop            | 30              | Governed by cap. of local street with stop control                                                                                                                                       |
| 3 or 4 way stop            | 41-43           | From Lookup Table                                                                                                                                                                        |
| Ramp Merge/Lane Drop       | 51              | Governed by cap. of entering/exiting segments                                                                                                                                            |
| Ramp Diverge/Lane Addition | 52              | Governed by cap. of entering/exiting segments                                                                                                                                            |
| Tollbooth                  | 61              | By Equation: $[(1,400 * \# \text{ E-Z Pass Lanes}) + (360 * \# \text{ Cash Lanes})]$ where 1,400 is the hourly capacity of an E-ZPass lane and 360 is the hourly capacity of a cash lane |
| Internal Centroid          | 101             | N/A                                                                                                                                                                                      |

### ***Signalized Intersections***

Previously for the SMTTC model, a series of capacity analyses were performed in Synchro/SimTraffic (version 5.0) to determine appropriate planning-level capacities for signalized intersections. Several assumptions were necessary:

Cycle length = 90 seconds

Traffic volume on the main street is directionally balanced and is distributed among turning movements in the ratio of 1:4:1 (left turns: through vehicles: right turns)

Traffic volume on the side street is directionally balanced and is distributed in the ratio of 1:2:1

Capacity is reached when critical movements have a v/c ratio between 1.0 and 1.1

The capacities of the nodes that represent signalized intersections are based on analyses historically performed in Synchro/SimTraffic (version 5.0). The node capacities for signalized intersections and the intersection codes used to identify the type of signalized intersection in the node attribute table are shown Table 12. The intersection codes are shown in parentheses in each cell in the table and the node capacities are shown as approximate daily capacities, which are calculated as the hourly capacity multiplied by 10.

**TABLE 12: SIGNALIZED INTERSECTION CODES AND 24-HOUR CAPACITY VALUES**

### Unsignalized Intersections

Unsignalized intersections are separated into two types: two-way stop controlled and four-way stop controlled. Delay at a two-way stop-controlled intersection is typically much greater on the stop sign controlled approaches than the uncontrolled (no stop sign) approaches. Since stop-controlled approaches are generally local streets which intersect with each other or higher functional class roadways, the link capacity of local streets was set at 450 vehicles per lane per hour to reasonably replicate the capacity of stop-controlled approaches. In this way, delay is attributed to the local street links that are stop controlled, and no delay is attributed to the uncontrolled approaches. Four-way stop control intersections have more uniform delay for the intersection because all approaching vehicles must stop. Capacity analysis runs were performed for four-way stop control intersections to develop hourly intersection capacities; the daily node capacities shown in Table 13 are calculated as the hourly capacity multiplied by 10. The table also shows, in parentheses in each cell, the intersection codes used to identify the type of unsignalized intersection in the node attribute table.

**TABLE 13: UNSIGNALIZED 4-WAY STOP INTERSECTION CODES AND 24-HOUR CAPACITY VALUES**

|                                                                                   |                                                                                   |                                                                                   |                                                                                    |

**Ramp Junctions**

Ramp junctions are found where a ramp joins either another ramp or a freeway. Ramp junctions can be classified as either “merges” or “diverges”. A merge is where traffic flows come together, such as an onramp, and a diverge is the opposite. The Highway Capacity Manual (HCM) indicates that the capacity of a merge or diverge area is controlled by the capacity of the freeway segments upstream and downstream of the merge/diverge area, or the ramp itself.<sup>3</sup> Therefore, since the freeway segments and ramp both have link capacities, it is redundant to also apply a capacity restraint to the merge point. Ramp junctions are identified using a unique value for the “node type” field for tracking purposes, but are not given capacity values independent of the adjacent links.

**Lane Additions/Drops**

Similar to ramp junctions, the HCM indicates that lane additions and drops are controlled by the lower of the capacity of either the segment upstream or downstream of the lane addition/drop.<sup>4</sup> In the case of a lane addition, the governing capacity is the upstream link; vice versa for a lane drop. Since these capacity values are contained in the roadway links themselves, it would be redundant to also include a capacity restraint at the lane addition/drop, and these situations were treated in a similar manner to ramp junctions.

**Tollbooths**

Tollbooths are found in the SMTC area only at the entrances/exits to the NY Thruway. The on and off toll plazas are modeled separately. Capacity is determined by the following equation:

$$\text{Hourly Directional Capacity} = [1,400 * (\# \text{ E-Z Pass Lanes})] + [360 * (\# \text{ Cash Lanes})]$$

<sup>3</sup> HCM 2000 Edition; page 25-3

<sup>4</sup> HCM; page 25-9

Where 1,400 is the hourly capacity of an E-ZPass lane and 360 is the hourly capacity of a cash lane.

**Allocation of Intersection Capacity to Links**

Intersection delay is calculated separately for each of the approach links and necessitates having an “intersection” capacity, separate from the “link” capacity of each link. The delay calculations are described in Section 11.0. For signalized intersections, each approach link is awarded a share of the total intersection capacity based on the shares of link capacity between the approaches. Table 14 presents a sample calculation of node capacity allocation, showing what the intersection capacity for each of four approaches to a intersection would be, based on assumed link capacities. This method was adopted because it awards intersection capacity based on the expected shares of green time between the approaches and their ability to move vehicles through the intersection.

**TABLE 14: SAMPLE ALLOCATION OF NODE CAPACITY**

| Link Segment | Link Capacity (vph) | Share | Node Capacity (vph) |  | INT Capacity (vph) |
|--------------|---------------------|-------|---------------------|--|--------------------|
| 1            | 1,200               | 25%   | x    4000    =      |  | 1,011              |
| 2            | 1,600               | 34%   |                     |  | 1,347              |
| 3            | 1,000               | 21%   |                     |  | 842                |
| 4            | 950                 | 20%   |                     |  | 800                |
| Total        | 4,750               | 100%  |                     |  | 4,000              |

## TURN PENALTIES AND PROHIBITIONS

Turn penalties were included in the model for two general reasons. First, turn penalties were included to simulate the extra time typically needed to make a left or right turn at an intersection. Second, turn penalties were included to discourage the model from building routes with abrupt or complicated movements. In the absence of turn penalties, the route builder may select a zigzagging shortcut to save a few seconds of travel time, while in reality drivers generally prefer simpler routes with few turns. A 1/6 minute penalty was applied to left turns, and a 1/12 minute penalty was applied to right turns.

Freeway ramp penalties were also added to discourage trips from switching to the freeway for short distances. Since the ramp penalties are a constant amount of time they have the most impact on short (one or two exit) freeway trips. Switching to the freeway for these small distances will typically only gain a small time saving compared to the best arterial path, and so adding the ramp penalty maintains most of these trips on the best arterial path. Trips that might benefit from longer freeway segments, spanning several exits, which have a large time savings compared to the best arterial path, are less likely to be pushed to the best arterial path by the ramp penalties.

The ramp penalties add 20 seconds of delay to transitions from freeway to ramps. The ramp penalties were adjusted during the model calibration process to improve the goodness of fit compared to observed data.

The model also includes a number of turn prohibitions. The list of turn prohibitions includes all of the posted, illegal movements, U-Turns, and other link-to-link movements that involve greater than 90-degree turns.

## 5.0 MODEL TRANSIT NETWORK

---

Transit routes were coded into the model based on information obtained from the SMTTC region's transit operator, CENTRO, including routes, fare, and headway information. The service offered by CENTRO is represented in the model by 104 routes serving 2,145 stop locations. Figure 14 shows the model's transit network.

### 5.1 | TRANSIT NETWORK DESIGN

The model's transit network is built at run-time from a series of text files that enumerate the routes (Table 16), stops (Table 15), and stops visited by each route in the region (Table 17). This design, as opposed to one where the transit network is precompiled to a geographic database, allows for better data management and ease and flexibility in making edits. The transit network is built on top of the highway network and has access to all of the highway network attributes (Table 7).

### ROUTE SIMPLIFICATIONS

The CENTRO bus system is quite detailed, with base routes and multiple route deviations/extensions for most of the base routes. In general, the route deviations associated with a base route overlap to a large degree with each other and serve largely the same population, but the deviations provide infrequent service to some riders/destinations which otherwise are not as well served. Because transit modeling methodologies used in regional models are not sensitive to the very precise detail in CENTRO's bus system, minor and infrequent deviations of primary routes were grouped into one or two routes to represent bus service in a corridor. Therefore, although the model route system is a simplification of the CENTRO bus system, the forecasting results are similar to results that would have been achieved if the full detail of the route network had been included.

### STOP SIMPLIFICATIONS

Local bus service is assumed to stop at every model node, while express service only stops at specified locations. This assumption was made to ease the burden of managing the stops layer. For local services, key stops (those indicated in the CENTRO schematic maps) visited by local bus routes are indicated and the route-building procedure adds in the intermediate stops. Although this assumption leads to an over prediction in the number of local bus stops, the transit travel times are not altered by this procedure.

### ROUTE BUILDING

The transit route system is built by the following procedure:

Each stop in the stops file (Table 15) is coded to the closest node in the highway network.

1. For each route, the schedule of bus stops (Table 17) is translated into a schedule of highway nodes.
2. The shortest path between successive stops is calculated by minimizing generalized cost.

3. For local bus routes, stops are added in at each highway node along the traversed path.

### WALK ACCESS/EGRESS/TRANSFERS LINKS

Transit models need a set of links to support the access/egress/transfer walk movements made in traveling to a destination. In this model, the highway network doubles as the set of valid walk links.

**FIGURE 14: SMTC REGION TRANSIT NETWORK**

## 5.2 | TRANSIT NETWORK ATTRIBUTES

Some of the attributes of the transit network, such as travel times, are inherited from the highway network, while others are maintained in either the transit routes table (Table 16), transit stops table (Table 15), transit route-stops table (Table 17), or the transit mode table (Table 18). The key variables in the transit network are travel times (peak and off-peak), walk times, headways (peak and off-peak), and fares.

### TRAVEL TIMES

Transit travel times were estimated by scaling up auto travel times. The auto travel times were scaled to account for time lost by transit vehicles as they are making stops (deceleration before the stop, dwell time at the stop, and acceleration away from the stop) and their slower speeds than autos in general. The scale factors were estimated by taking scheduled travel times for a set of transit routes, and dividing these times by the modeled auto travel times for the corresponding paths. Local bus service was set to travel at 60% of the congested auto speed and express bus service was set to travel at 95% of the congested auto speed. Peak transit travel times were developed using the AM auto travel times and off-peak transit travel times were developed using the midday highway auto travel times.

### WALK TIMES

Transit walk times (access/egress/transfer) were calculated for each link by assuming a 4 mph walk speed, which was retained from the previous version of the SMTc model.

### HEADWAYS

Peak and off-peak headway times were developed for each route by considering the route schedules obtained from CENTRO. Two estimates of the headway time were calculated and judgment was used to select between them. The traditional method of dividing the period length by the number of buses run in that period was used to obtain one estimate, but also, the route schedules were inspected to see if a mode (highest frequency) time interval appeared between subsequent runs. For instance, if the first half-hour of the AM period had no transit trips, but the service then ran at regular 15 minutes intervals for the rest of the period, then 15 minutes would have been selected as the headway time.

### FARES

The model assumes a one dollar fare with free transfers. The one dollar fare is less than the generic, one-ride fare because there are a number of special deals for children, students, the elderly, and frequent riders, that would drive the realized average cost down.

**TABLE 15: TRANSIT STOPS TABLE**

| FIELD    | DESCRIPTION                        | UPDATE TYPE     |

## 6.0 TRIP GENERATION

The trip generation model estimates person-trips produced in and attracted to each TAZ in the model. These estimates result from multiplying the land-use data for each TAZ, such as the number of dwelling units and employment numbers, by regional trip generation coefficients.

### 6.1 | TRIP PURPOSE AND MODEL STRUCTURE

The model has four internal trip purposes (which include trips with one trip end outside of the model region), commercial trips, and external trips. These trip purposes are shown in Table 19.

**TABLE 19: TRIP PURPOSE DEFINITIONS**

| TRIP PURPOSE         | ABBREVIATION | DESCRIPTION                                                                                     |
|----------------------|--------------|-------------------------------------------------------------------------------------------------|
| Home-Based Work      | HBW          | A trip where one end is home and the other end is work                                          |
| Home-Based Shopping  | HBS          | A trip where one end is home and the other end is a shopping location                           |
| Home-Based Other     | HBO          | A trip where one end is home and the other end is NOT work or shopping                          |
| Non Home-Based       | NHB          | A trip where neither end is home                                                                |
| Light Commercial     | L_COMM       | A trip made by a commercial vehicle with 4 tires                                                |
| Medium Commercial    | M_COMM       | A trip made by a commercial vehicle with 6 tires                                                |
| Heavy Commercial     | H_COMM       | A trip made by a commercial vehicle with >6 tires                                               |
| Internal to External | IX           | A trip with origin inside and destination outside model                                         |
| External to Internal | XI           | A trip with origin outside and destination inside model                                         |
| External-to-External | XX           | A trip originating and terminating outside of the model, but passing through the model en route |

Productions and attractions are most useful in describing home-based trips. For home-based trips, the production ends occur at the trip maker's residence. Trip productions are estimated from the number and type of housing units within a TAZ. Non home-based (NHB) trips do not feature a "trip maker's residence" and so the production end is defined as being the origin end. Attraction ends are estimated from the quantity of trip-attracting land uses in the TAZ, including workplaces, shops, other residences and schools. For home-based trips, the attraction end is defined as the end that is not the trip maker's residence. For NHB trips, the attraction end is defined as being the destination end. The total number of attractions for each trip type must equal the total number of productions; if productions and attractions are out of balance, the total regional attractions are adjusted to match total regional productions.

Productions and attractions are different from origins and destinations in that productions and attractions do not indicate the direction of travel for 1-way trips. When one leaves home for work in the morning, the origin (home) is also the production. In the afternoon, when one returns home from work, it is the destination (home) which is the production. The origin end is defined as the starting point of any 1-way trip, and the destination end is defined as the ending point of any 1-way trip.

Daily trip production and attraction models were developed for the 2014 model from a combination of sources, including the 2004 SMTC Household Travel Survey, the 2001 NHTS, and the Institute of Transportation Engineers (ITE) trip generation manual.

## 6.2 | TRIP PRODUCTION RATES

The model uses a cross-classification approach to estimate trip productions. For each TAZ, households are cross classified according to size (1 person, 2 persons, 3 persons, or 4+ persons) and auto ownership (0 auto, 1 auto, 2 autos, or 3+ autos). Separate trip production estimates are used for each of the 16 household types and for each trip purpose. Table 23 shows the trip production rates for internal HBW, HBS, HBO and NHB trip productions, and the total trip production rates.

### ESTIMATION

An initial estimate of the trip production rates was calculated from the 2004 SMTC Household Travel Survey by dividing the number of survey trips by total households for each cross-class (Table 20). A number of refinements were then made to the initial estimates. It was asserted that as household size increases, the production rate must also increase, and as number of vehicles increases, the production rate must not decrease. This assertion was important for obtaining reasonable production rates for cross-class combinations that were poorly represented in the survey, such as one person, 2+ vehicle households. The production rates were smoothed manually, but the general heuristic applied was that cross-class combinations involving more survey records, such as one person, one vehicle households, should be used as the guide values on which to base the row and column trends. The 2004 SMTC production rates were also checked for reasonableness against the 2001 and 2009 NHTS production rates (Table 21) for Rochester, NY, a city of comparable size.

**TABLE 20: INITIAL DAILY TRIP PRODUCTION RATES**

| HH SIZE | HH VEHICLES |      |      |      |
|---------|-------------|------|------|------|
|         | 0           | 1    | 2    | 3+   |
| 1       | 1.6         | 4.0  | 3.4  | 3.7  |
| 2       | 4.3         | 7.2  | 7.7  | 7.3  |
| 3       | 6.2         | 12.0 | 10.2 | 8.6  |
| 4+      | 10.2        | 12.9 | 17.1 | 16.0 |

**TABLE 21: 2001 NHTS DAILY TRIP PRODUCTION RATES FOR ROCHESTER, NY**

| HH SIZE | HH VEHICLES |      |      |      |
|---------|-------------|------|------|------|
|         | 0           | 1    | 2    | 3+   |
| 1       | 3.4         | 4.5  | 3.9  | 6.0  |
| 2       | 4.5         | 6.8  | 7.2  | 7.8  |
| 3       | 7.0         | 9.7  | 11.2 | 12.6 |
| 4+      | 10.8        | 13.2 | 13.8 | 15.4 |

Each trip in the 2004 SMTC Household Travel Survey was classified as belonging to one of the four model trip purposes, and then trip purpose shares were calculated for each household size group as shown in Table 22. These trip purpose shares were then multiplied into the smoothed daily trip production rates to calculate the number of trip productions.

**TABLE 22: TRIP PURPOSES SHARES BY HOUSEHOLD SIZE**

| HH SIZE | HBW   | HBS   | HBO   | NHB   | Total |
|---------|-------|-------|-------|-------|-------|
| 1       | 19.8% | 24.1% | 28.9% | 27.1% | 100%  |
| 2       | 21.3% | 22.0% | 33.1% | 23.6% | 100%  |
| 3       | 22.3% | 10.8% | 43.1% | 23.8% | 100%  |
| 4       | 18.0% | 7.9%  | 52.3% | 21.8% | 100%  |

## ADJUSTMENTS TO TRIP PRODUCTIONS

In the SMTC version 4.0 model, a number of adjustments to the trip productions were made at run-time. These adjustments were made to help calibrate the model, discard trips using special, non-auto modes, and/or compensate for biases typically introduced into household travel surveys (the model production rates are based on household travel survey data). The current model employs only one of these former adjustments (school bus trip reduction). Other previous adjustments are no longer made, however, the overall production rate table has been updated to accomplish a similar goal. The following cumulative change is made to the initial productions totals:

School bus trips are removed from the initial production because they represent a negligible number of vehicle-trips and would otherwise add unneeded complexity; in accordance with the number of school bus trips in the 2004 Household Survey, 22.6% of HBO trips are discarded.

The version 5 production rate table is shown below.

**TABLE 23: PRODUCTION RATES (TRIPS/HOUSEHOLD/DAY) BY TRIP PURPOSE, HOUSEHOLD SIZE AND HOUSEHOLD VEHICLES SMTC MODEL 5.0**

|         |    | HH VEHICLES |      |      |      |
|---------|----|-------------|------|------|------|
| HH SIZE |    | 0           | 1    | 2    | 3+   |
| HBW     | 1  | 0.5         | 0.7  | 0.7  | 0.8  |
|         | 2  | 0.9         | 1.4  | 1.5  | 1.5  |
|         | 3  | 1.3         | 2.1  | 2.3  | 2.4  |
|         | 4+ | 1.8         | 2.2  | 2.6  | 2.8  |
| HBS     | 1  | 0.8         | 1.1  | 1.2  | 1.2  |
|         | 2  | 1.2         | 1.9  | 2.0  | 2.0  |
|         | 3  | 0.8         | 1.4  | 1.5  | 1.5  |
|         | 4+ | 1.0         | 1.3  | 1.5  | 1.6  |
| HBO     | 1  | 0.8         | 1.2  | 1.2  | 1.3  |
|         | 2  | 1.5         | 2.5  | 2.5  | 2.6  |
|         | 3  | 2.8         | 4.6  | 5.0  | 5.1  |
|         | 4+ | 5.7         | 7.2  | 8.3  | 8.9  |
| NHB     | 1  | 0.8         | 1.3  | 1.3  | 1.4  |
|         | 2  | 1.2         | 2.0  | 2.1  | 2.2  |
|         | 3  | 1.8         | 2.9  | 3.2  | 3.3  |
|         | 4+ | 2.8         | 3.5  | 4.1  | 4.3  |
| Total   | 1  | 2.8         | 4.3  | 4.4  | 4.6  |
|         | 2  | 4.7         | 7.9  | 8.1  | 8.3  |
|         | 3  | 6.8         | 11.0 | 12.1 | 12.3 |
|         | 4+ | 11.2        | 14.2 | 16.4 | 17.5 |

### 6.3 | TRIP ATTRACTION RATES

Trip attraction rates for HBW, HBS, HBO and NHB trip purposes were developed using ITE trip generation rates by land-use type and are shown in Table 24. The trip attraction rates are in units of person-trips per employee per day (or person-trips per housing unit per day in the case of households). The attraction rates vary across trip purposes and (possibly) within each trip purpose to reflect the nature of the trip in conjunction with the nature of the employment class. HBW attraction rates, for instance, do not vary by employment class

because the number of trips a worker is expected to make to/from her place of work does not vary much based on what type of job she has. However, HBS/HBO/NHB attractions rates do vary by employment class because certain businesses, such as restaurants, have many more non-work attractions per employee than others, such as factories.

**TABLE 24: ATTRACTIONS RATES (TRIPS PER EMP/HH/DAY) BY PURPOSE AND LAND-USE**

| LAND USE EMPLOYMENT CLASS                 | HBW  | HBS   | HBO   | NHB   |
|-------------------------------------------|------|-------|-------|-------|
| AGRICULTURAL                              | 1.45 | -     | -     | 1.57  |
| BUS_LEGAL_PERSONAL                        | 1.45 | -     | 1.12  | 0.75  |
| COMMUNICATION                             | 1.45 | -     | -     | 2.55  |
| CONSTRUCTION                              | 1.45 | -     | -     | 0.55  |
| EAT_DRINKING                              | 1.45 | -     | 10.83 | 7.22  |

## 6.4 | NON-MOTORIZED TRIPS

The SMTTC Version 5.0 model includes a pre-distribution non-motorized binomial logit model where non-motorized shares are related to zone's walkability, residential density, employment density, and intersection density, which serve as proxies for variables which tend to increase walking and bicycling activity. A subsequent post-distribution nested multinomial logit-form mode choice model is used to estimate the split among auto trips,

bus trips, and rail trips, and there are separate mode choice models for work and non-work trips.

The 4-step model process arbitrarily splits a simultaneous decision-making process into 4 sequential steps in order to facilitate computation. This simplification can introduce a number of errors when it comes to replicating travel behavior. Some of these errors can be addressed programmatically or algorithmically. However, there is no obvious way to correct for non-motorized trip behavior in a standard 4-step model formulation. In the typical 4-step model, travelers first decide where to travel without considering potential walking destinations, realize they can't walk to the destination and then chose to drive. In such a model, walk trips can only substitute or replace very short driving trips. Moving the non-motorized mode choice ahead of the trip distribution step attempts to solve this problem.

A binomial logit mode split model is applied to calculate non-motorized mode shares. Non-motorized shares are calculated for all TAZ-to-TAZ pairs based on urban form variables on each end of the trip. Then, zone pairs with walk times greater than 20 minutes (approximately 1 mile) are eliminated from consideration. Intrazonal non-motorized trips are always permitted, but this approach limits the number of interzonal trips to those that are actually feasible. The urban form variables used in the logit model are zone's walkability, housing density, employment density, and intersection density. At first glance it may appear strange that walk time is not included as part of the model. However, walk time is implicitly included in the urban form variables. When there is a high density of land uses and a dense street grid, walk times to some destinations will be short.

Finally, the trip distribution and mode choice steps are adjusted to properly account for the pre-distribution non-motorized trip model. The walk trips are removed from the production-attraction trip table prior to the main model distribution step, so that only motorized person trips are then distributed.

## **6.5 | SPECIAL GENERATORS**

Special generators are TAZs with unique characteristics and whose trip making is best represented with a custom model. The special generator designation is typically given to land uses that attract or produce an unusually high number of trips, or are characterized by an unusually flat or steep trip distribution, such as airports, which attract auto trips by passengers from near and far, and universities, which predominantly attract short, walk trips by students living on or close to campus.

Attractions to the 16 special generator TAZs (Figure 15) were developed using ITE trip generation rates in conjunction with data collected by the SMTC from the principal employers in each special generator. In most cases, the total attractions to each special generator were calculated by multiplying the amount of a key variable, such as the number of beds in a hospital, into an ITE formula specifically designed for that key variable. The key variable is either a proxy (e.g. the number of square feet in a mall) or related to the actual reason (e.g. the number of students in a university) for why each business attracts trips. The specific key variable selected for each special generator was based both on what data the

SMTTC could collect from specific employers and what variables the ITE has developed attraction rates for.

For two of the special generators, the normal technique for estimating trip attractions (as described in Section 6.2 |) of multiplying the number of employees categorized by SIC code by the ITE based rates shown in Table 24 was used. This approach was used where the custom ITE trip generation rate approach did not yield reasonable results. Three of the special generators were not modeled because they attract trips at only infrequent/irregular intervals and are unlikely to impact traffic on a typical weekday. For instance, the Carrier Dome is not modeled because it attracts a significant number of trips only when it hosts events. Table 25 presents the type of calculation (“type”), which indicates whether the special generator is modeled by a key variable or based on employment by SIC code; if there is a key variable, then the table presents that variable (“key variable”), the key variable amount (“VAR Amount”), and the corresponding formula (“Trip End Formula”); finally, the table presents the resulting number of total attractions (“Attractions”).

The SIC employment data were used to allocate special generator attractions among the four trip purposes. First, the standard technique, as described in Section 6.2 |, of estimating trip attractions from SIC data was used to calculate total attractions by trip purpose. Then, these shares were multiplied into the total trip-ends presented into Table 25. Finally, the resulting trip purpose splits were adjusted using judgment.

For special generators containing households, home-based productions were estimated using the same methodology as employed for internal TAZs (see Section 6.2 |). Non-home-based productions were set equal to the number of non-home-based attractions.

(SE): Special Event locations that are not included in a model run that represents a typical day

## 6.6 | EXTERNAL TRIPS

Trips can be categorized based on whether both the origin and destination are internal to the model region, or whether the trip has an external trip end. External trips can be classified as internal-to-external (IX), external-to-internal (XI), and external-to-external (XX). In the SMTC model, IX and XI trips are classified as being HBW, HBS, HBO, or NHB, and are treated no differently from internal-to-internal (II) trips in model distribution. XX trips, on the other hand, are modeled as a fifth trip purpose and have a fixed distribution.

In the base year, the total IX, XI and XX trips are set to match base year traffic count data at the 68 external stations (shown in Figure 13). The percentage of XX trips is derived in large part from an external license plate survey conducted as part of the I-81 Corridor Study<sup>5</sup>. The license plate survey recorded and matched vehicles at several locations on the interstate network to identify whether they were passing through the region or destined for a location

<sup>5</sup> See Draft Final Technical Memorandum #1: Physical Conditions Analysis, pp 2-25 to 2-31, available at: [http://thei81challenge.org/cm/ResourceFiles/resources/Technical\\_Memorandum\\_s.pdf](http://thei81challenge.org/cm/ResourceFiles/resources/Technical_Memorandum_s.pdf)

inside the region (however, the survey did not capture I-90 pass through trips). The remaining external trips are split among IX and XI trips based on traffic count data. Base year IX and XI trips are set to match base year traffic count data (less XX trips) at the external stations. Future year external trips are assumed to grow annually at a rate of 0.5% per year, based on historical growth rates calculated using NYSDOT traffic count data.

## 6.7 | TRIP BALANCING

It is common practice in transportation modeling to balance attractions to productions. The rationale is that productions are more fundamental. More housing will produce more trips; more retail space, for example, may simply draw customers from other retail space.

This practice has important implications for using the model to analyze regional traffic impacts emanating from changes in employment land use. For example, if traffic impacts of a proposed major employer are to be analyzed, the projected amount of new employment must be inserted into appropriate TAZ in the socioeconomic database. These new jobs will attract new trips. However, without also increasing by some amount the number of residences in the region, no net increase in trips will result. Thus, these types of scenarios must be carefully considered as to their employment and residential impacts in order for the model to lend proper insight into transportation implications.

Incorporating special generator attraction rates introduces some complexity to the balancing calculations. Balancing adjustment factors are calculated for each of the trip purposes. It is not desirable to factor the special generator attractions because they are based on location specific traffic counts that reflect the unique trip making characteristics of the land use. Therefore, only attractions that are not special generators are factored in the balancing process. The following general formula is used to calculate the balancing factors for each trip type:

$$\text{Balancing Adjustment Factor} = (\text{Productions} - \text{Special Generator Attractions}) / (\text{Non Special Generator Attractions})$$

For NHB trips, where the connection to home-based productions is less obvious, the destination trip end (an attraction) is balanced to the origin trip end (a production) and then productions are set equal to attractions in each TAZ.

## 6.8 | TRIP GENERATION SUMMARY

Table 27 summarizes the number of motorized trips produced by trip purpose inside the SMTC model region for the 2017 base year, and those produced externally to the SMTC model region but attracted to locations inside the SMTC model region. External-to-external travel is not included in this table (see Section 6.6 |), nor is non-motorized travel (see Section 6.4 |).

**TABLE 27: INTERNAL AND EXTERNAL TRIPS BY PURPOSE**

| PURPOSE      | INTERNAL TRIPS | % TRIPS |
|--------------|----------------|---------|
| HBW          | 324,643        | 16%     |
| HBS          | 314,446        | 15%     |
| HBO          | 606,680        | 29%     |
| NHB          | 540,395        | 26%     |
| L_COMM       | 18,195         | 1%      |
| M_COMM       | 8,364          | 0%      |
| H_COMM       | 4,362          | 0%      |
| IX           | 112,438        | 5%      |
| XI           | 114,642        | 6%      |
| XX           | 29,386         | 1%      |
| ALL PURPOSES | 2,073,549      | 100%    |

## 7.0 NETWORK SKIMMING

Network skimming is the model process that traces the shortest path (highway skims) or composite path (transit skims) between every TAZ pair, and then writes out the quantity of key attributes, such as travel times, costs, and distances, “skimmed” between each TAZ. These “skims” are used in the trip distribution (highway skims only) and mode choice models.

### 7.1 | HIGHWAY NETWORK SKIMMING

The highway skims are built by minimizing a simple “generalized cost” formula, a metric that accounts for the out-of-pocket costs (tolls), implied costs (travel times, operating expenses) and biases (turn penalties) that are incurred in traveling between each TAZ pair.

#### AUTO GENERALIZED COST

The formula for auto generalized cost is presented in Figure 16. Because in-vehicle travel time varies by model period, the generalized cost equation is solved four times, once for each of the model periods (AM, MD, PM, OP). The asserted value of time, used to convert monetary values to time values in the generalized cost calculation, is \$20/hour.

**FIGURE 16: AUTO GENERALIZED COST**

$$GC = IVT + OVT + .6 * DIST + 6 * TOLL + TP$$

Where: GC = Generalized Cost (minutes)

IVT = In-Vehicle Time (minutes)

OVT = Out-of-Vehicle Time (minutes)

Dist = Distance (miles)

Toll = Toll fare (dollars)

TP = Turning penalties

Value of Time = \$20/hour

Operating Cost = \$.19/mile

#### **Tolls**

The SMTc network features one toll road, I-90. The assumed toll rate along I-90 is \$.048/mile, based on an average of the per mile rate of exit to exit tolls charged on I-90.

#### **Operating Costs**

The assumed average auto operating cost is \$.19/mile and represents just fuel costs and not long term costs such as vehicle costs or maintenance costs. In reality, operating cost varies depending on speed and acceleration/deceleration, fluctuations in gas costs, and variations in vehicle fuel economy from vehicle to vehicle, but basing operating cost only on distance is a

reliable simplification and helps bias the model towards picking more direct paths with fewer turns.<sup>6</sup>

### ***In-Vehicle Travel Times***

In the first iteration of the model, the in-vehicle times for all four generalized cost equations (AM, MD, PM, OP) is assumed to be the free-flow travel times. After the first iteration, in-vehicle travel times vary by time period depending on the results of the assignment model. Section 11.0 explains how these congested travel times are calculated.

### ***Out-of-Vehicle Travel Times***

An auto walk access/egress time is assumed for each TAZ. TAZs located in the downtown or University Hill area of Syracuse are assumed to have 3 minute access/egress times and all other TAZs are assumed to have 1 minute access/egress times; for instance, a trip from outside of Syracuse to the downtown area would be assigned 4 minutes of total out-of-vehicle time. The out-of-vehicle time for trip-ends in the downtown or University Hill area is assumed to be greater than elsewhere in the region, because travelers to those areas may often need to park off-site and walk to their destination.

### ***Turning Penalties***

Turning penalties, as discussed in Section 4.1 |, are added are used to guide the model towards tracing a particular shortest path that tends to avoid excessive zigzagging movement. Although these turning penalties are expressed in minutes, they do not represent actual travel time and they are not added to the In-Vehicle Travel Time or Generalized Cost skims so as not to affect the results of the trip distribution or mode choice models. .

## **SKIMMED VARIABLES**

For each of the four time periods (AM, MD, PM, OP) the model creates the following skims:

- Distance
- Toll
- IVTT (In-Vehicle Travel Time)
- OVTT (Out-of-Vehicle Travel Time)
- Operating Cost
- Generalized Cost (where generalized cost does not include any biases such as turning penalties)

From these skims, a set of “work” and “non-work” skims, and a set of “peak” and “off-peak” skims are created for use in application where the work and non-work skims are used in the distribution model, and the peak and off-peak skims are used in the mode choice

---

<sup>6</sup> For forecasting purposes, operating cost assumptions remain static, i.e. base year values are used in the future. Future forecasts of vehicle operating costs are uncertain, and the relationship between future vehicle operating costs, future household income, and resulting route choice behavior are sufficiently uncertain and complex to make any adjustments for forecasting unsupportable.

model. However, at this time, the work and peak skims are simply duplicates of the AM skim, and the non-work and off-peak skims are duplicates of the MD skim.

## 7.2 | TRANSIT NETWORK SKIMMING

The transit skims are built by minimizing a generalized cost formula, subject to a number of special constraints and the possibility of combining service across alternative routes to create a more favorable, composite path. The composite path (if one exists) is solved by Caliper's Pathfinder algorithm.

### TRANSIT GENERALIZED COST

The generalized cost formula used in creating the transit network is presented in Figure 17. The transit generalized cost formula uses a lower value of time (\$12/hour) than is used for highway generalized cost (\$20/hour) because transit users tend to have a lower income and are more sensitive to cost. The transit generalized cost formula also double weights OVT, which is the standard convention.

**FIGURE 17: TRANSIT GENERALIZED COST**

$$GC = IVT + 2 \cdot OVT + 7.5 \cdot FARE$$

GC = Generalized Cost

Where: (minutes)

IVT = In-Vehicle Time  
(minutes)

OVT = Out-of-Vehicle Time  
(minutes)

Fare = Transit Fare  
(dollars)

Value of Time = \$12/hour

#### ***In-Vehicle Travel Times***

Transit in-vehicle travel times are created by factoring up the auto in-vehicle times. The model does not explicitly assume a dwell time at each stop or model deceleration/acceleration when visiting stops, so these factors are needed to decrease the average speed of the transit service. Local bus service is assumed to travel at 60% of the auto speed, and express bus service is assumed to travel at 95% of the auto speed, as explained in Section 5.2 |.

#### ***Out-of-Vehicle Travel Times***

The out-of-vehicle time in the transit network is composed of:

Walk access time  
Initial wait time

(Possible) Transfer walk and wait times  
Walk egress time

The wait times are calculated by taking 50% of the route headway, subject to a few constraints (see section 5.2 | ). Out-of-vehicle times are all double-weighted to account for the fact that out-of-vehicle time is perceived as more onerous to riders than in-vehicle time.

### Fare

Transit fares are discussed in section 5.2 | . However, because all transit fares were assumed to be \$1 with free transfer, at this point, fares do not have an impact on the transit skimming.

### PATH-FINDING PARAMETER CONSTRAINTS

The transit path-finding algorithm is subject to a number of constraints that may disallow certain paths or constrain attributes used in the generalized cost formula or written to the skims. The constraints are presented within Figure 18. For a path to be allowed by the model, the total travel time must be less than 180 minutes, there must be fewer than three transfers, and the walk access and egress times must be less than 20 minutes. Disallowing these paths ensures that the model will award zero trips to these paths instead of some small number.

The transit pathfinder puts a floor/ceiling on the range of values certain attributes can take on. In particular, the maximum wait time for a transit trip is 45 minutes and the minimum initial wait time is set to 2 minutes.

**FIGURE 18: TRANSIT PATH-FINDING PARAMETER CONSTRAINTS**

| PARAMETER         | VALUE          | UNITS     |
|-------------------|----------------|-----------|
| Max Xfers         | 2              |           |
| Value of Time     | .133           | \$/Minute |
| Flat Fare         | 1              | \$        |
| Xfer Cost         | 0              | \$        |
| Weighting Factors |                |           |
| Fare              | 1              |           |
| Link Time         | 1              |           |
| Init Wait Time    | 2              |           |
| Xfer Wait Time    | 2              |           |
| Dwell Time        | 0              |           |
| Walk Time         | 2              |           |
| Headway           | Route Specific | Minutes   |

| PARAMETER              | VALUE | UNITS   |
|------------------------|-------|---------|
| Max Init Wait Time     | 45    | Minutes |
| Max Xfer Wait Time     | 45    | Minutes |
| Min Init Wait Time     | 2     | Minutes |
| Min Xfer Wait Time     | 0     | Minutes |
| Dwelling Time          | 0     | Minutes |
| Max Access Walk Time   | 20    | Minutes |
| Max Egress Walk Time   | 20    | Minutes |
| Max Total Time         | 180   | Minutes |
| Park and Ride          | No    |         |
| Interarrival Parameter | 0.5   |         |
| Path Threshold         | 0     |         |

## **PATHFINDER**

Pathfinder is the route-building algorithm developed by Caliper to solve for composite, transit paths where having several options for how to go from A to B would allow the transit user to pick the first available service, and reduce average wait times. In the SMTTC transit model, the “combination factor” parameter is set to 0, the minimum level, where a composite path will be created only if there are two or more equally fast paths (i.e. there is more than one, single “best path”). The skims generated from composite paths have reduced wait times according to their combined headway.

## 8.0 TRIP DISTRIBUTION

Trip distribution is the pairing of productions and attractions to form complete trips. The pairing is done separately within each trip purpose. For example, HBW productions from residences are paired with HBW attractions at work places. The trip distribution within a trip purpose is done using a gravity model. The concept underlying a gravity model is that trip end locations that are closer together will exhibit a stronger attraction than those that are farther apart, and that trip end locations with higher trip generation will be more attractive than trip end locations with lower trip generation.

### 8.1 | GRAVITY MODEL

The functional form of the distribution model is shown in Figure 19. The model uses a doubly constrained gravity model for the HBW and commercial trip purposes and a singly constrained gravity model for the HBS, HBO, and NHB trip purposes, as well as IX and XI externals.

To doubly-constrain a trip distribution an iterative process is used that alternatively balances productions by evaluating the first equation and then balances to attractions by evaluating the second equation. This function is applied separately for each of the trip types.

**FIGURE 19: GRAVITY MODEL FUNCTIONAL FORM**

$$T_{ij} = P_i * \frac{A_j * f(d_{ij})}{\sum_{\text{all zones } z} A_z * f(d_{iz})} \quad (\text{Constrained to Productions})$$

$$T_{ij} = A_j * \frac{P_i * f(d_{ij})}{\sum_{\text{all zones } z} P_z * f(d_{iz})} \quad (\text{Constrained to Attractions})$$

Where:

|             |   |                                                                  |
|-------------|---|------------------------------------------------------------------|
| $T_{ij}$    | = | the forecast flow produced by zone $i$ and attracted to zone $j$ |
| $P_i$       | = | the forecast number of trips produced by zone $i$                |
| $A_j$       | = | the forecast number of trips attracted to zone $j$               |
| $d_{ij}$    | = | the impedance between zone $i$ and zone $j$                      |
| $f(d_{ij})$ | = | the friction factor between zone $i$ and zone $j$                |

The inputs to trip distribution include productions and attractions by TAZ, and a generalized cost impedance matrix representing the cost of travel between each pair of TAZs. The impedance is used in the trip distribution model to estimate friction factors, which represent the impact of travel time on the likelihood of travel and are calibrated so that observed trip lengths and times are reasonable and match patterns in survey data. Observed trip length distributions were estimated using 2004 SMTC Household Travel Survey.

The friction factor equations take the form shown in Figure 20, with the estimated parameter values shown in

Table 28 and are plotted in Figure 21, with the values scaled between 0 and 1 to be comparable across trip purposes. HBW trips tend to be longer than NHB, HBO, or HBS trips, and this is reflected in the calibrated friction factors.

**FIGURE 20: FRICTION FACTOR FUNCTIONAL FORM**

$$f(d_{ij}) = \frac{a}{d_{ij}^b * e^{c(d_{ij})}}$$

Where:  $f(d_{ij})$  = the friction factor between zone  $i$  and zone  $j$   
 $d_{ij}$  = the impedance between zone  $i$  and zone  $j$   
 $a, b, c$  = constants derived for each trip type to replicate survey data

**TABLE 28: ESTIMATED FRICTION FACTOR PARAMETERS**

| TRIP TYPE | A       | B     | C     |
|-----------|---------|-------|-------|
| HBW       | 28,507  | 0.823 | 0.010 |
| HBS       | 139,173 | 1.456 | 0.052 |
| HBO       | 139,173 | 1.456 | 0.052 |
| NHB       | 139,173 | 1.456 | 0.052 |

**FIGURE 21: FRICTION FACTORS CURVES BY TRIP PURPOSE**

## 8.2 | EXTERNAL TRIPS

The distribution of external-to-external trips is input to the model as a fixed trip table. Major externals – I-81 North and South, the New York State Thruway East and West, and Route 481 – have any external-to-external trips. Table 29 and Figure 22 show the flow of external-to-external trips. As part of the recent I-81 planning effort, NYSDOT conducted a pass through study, using license plate capture at several locations on the Interstate Highway system, to identify the number of trips passing through the area using I-81. The results of this study were used during the development of the external-to-external trip table.

**TABLE 29: EXTERNAL-TO-EXTERNAL TRIPS**

| EXTERNAL ORIGIN TAZ | ORIGIN HIGHWAY | EXTERNAL DESTINATION TAZ | DESTINATION HIGHWAY | AM TRIPS     | PM TRIPS     | DAILY TRIPS   |
|---------------------|----------------|--------------------------|---------------------|--------------|--------------|---------------|
| 10001               | I-81 (N)       | 10007                    | I-90 (E)            | 35           | 43           | 602           |
| 10001               | I-81 (N)       | 10022                    | I-81 (S)            | 75           | 92           | 1,287         |
| 10001               | I-81 (N)       | 10036                    | I-90 (W)            | 52           | 63           | 886           |

FIGURE 22: EXTERNAL-TO-EXTERNAL TRIPS

## 9.0 MODE SPLIT

The mode choice model estimates the fraction of person-trips between each origin and destination that use public transit vs. auto. Auto trips are then converted to vehicle-trips using an auto occupancy factor and the resulting auto vehicle-trips are loaded onto the highway network.

The split of person-trips among modes is estimated using a logit model. A logit model is shown in Figure 23. The share of trips using each mode in the mode choice model is a function of the relative attractiveness of each mode. The attractiveness of each mode is a function of the characteristics of the mode and the preferences of different travelers.

**FIGURE 23: EXAMPLE LOGIT MODEL**

$$\text{Transit Mode Share} = \frac{1}{1 - e^{(V_{\text{auto}} - V_{\text{transit}})}}$$

$$\text{Auto Mode Share} = 1 - \text{Transit Share}$$

Where:  $V_{\text{auto}} = f(\text{auto service, traveler attributes})$

$V_{\text{transit}} = f(\text{transit service, traveler attributes})$

The utility functions (Vs) in this equation can contain mode-specific travel time, cost and access variables as well as traveler-specific variables, each multiplied by parameters.

The multinomial logit model is an extension of this form that allows comparisons among more than two alternative modes. A further extension, the nested logit model allows for differential competition among modes. A multinomial logit model assumes that each alternative mode draws in fixed proportions from all other alternatives. This is an appropriate assumption when the alternatives are substantially unique but becomes less appropriate when subsets of the alternatives have important shared attributes.

The SMTC mode choice model is not estimated from survey data as survey data of the type typically used to estimate mode choice models, such as a transit on-board origin-destination survey coupled with a stated preference survey taken by transit riders, are not available. Instead, it is asserted based on professional judgment and experience estimating mode choice models in dozens of U.S. cities. The parameters are consistent with FTA guidance and are defensible representations of mode choice behavior. The mode choice model is calibrated to match the observed regional shares of trips between transit and auto.

The mode split macro skims the network for the optimal path in each mode. In the current version of the model, this includes an auto path and a bus path. The mode skims are then input to the mode split model and the trips are divided among the available modes. The auto and bus skimming process are described in Section 7.0.

The utility equations used in the mode choice model are shown in Figure 24 and the mode choice model parameters are shown in Table 30.

**FIGURE 24: MODE CHOICE MODEL UTILITY EQUATIONS**

$$V_i = \alpha + \beta_1 * \text{WalkTime} + \beta_2 * \text{IVTT} + \beta_3 * \text{OVTT} + \beta_4 * \text{OperatingCost} + \beta_5 * \text{Xfer} + \beta_6 * \text{EmpDens} + \beta_7 * \text{CBD}$$

$i$  = auto, bus

WalkTime = walk time (minutes)

IVTT = in-vehicle time (minutes)

OVTT = out-of-vehicle time (minutes)

OperatingCost = auto operating cost (minutes)

Xfer = number of transit transfers

EmpDens = employment density (employees/square mile)

CBD = indication of central business district (1 = CBD)

**TABLE 30: MODE CHOICE MODEL COEFFICIENTS**

|            |             | $\alpha$ | $\beta_1$ | $\beta_2$ | $\beta_3$ | $\beta_4$ | $\beta_5$ | $\beta_6$ | $\beta_7$ |

The auto person-trips calculated by the mode choice model are converted to auto vehicle-trips using the occupancy factors shown in Table 31. These rates were informed by the 2004 Household Survey and the 2009 NHTS.

**TABLE 31: AUTO OCCUPANCY FACTORS BY TRIP PURPOSE**

| TRIP PURPOSE | AVERAGE AUTO OCCUPANCY |
|--------------|------------------------|
| HBW          | 1.05                   |
| HBS          | 1.25                   |
| HBO          | 1.75                   |
| NHB          | 1.50                   |

## 10.0 DIURNAL DISTRIBUTION

The trip generation, trip distribution and mode split models estimate daily trips. The traffic assignment model then assigns traffic for each hour. Trips from each trip purpose are allocated to each time period based on time-of-day factors derived from the 2004 SMTC Household Travel Survey (and adjusted to more closely match observed traffic counts and following comparison to the 2001 and 2009 NHTS data). For home-based trips, the time-of-day (diurnal) distribution is unique by direction (e.g. home-to-work vs. work-to-home), but for NHB trips the directionality of the trip matrix does not vary by time of day. The estimated diurnal distribution for all trips is shown in Figure 25. Figures 27-30 show the same information by trip purpose. “DEP” stands for departing trips and implies trips from the production TAZ (home for home-based trips) to the attraction TAZ. Conversely, “RET” stands for returning trips (from attraction to production).

**FIGURE 25: DIURNAL DISTRIBUTION FOR ALL TRIPS**

## 11.0 HIGHWAY ASSIGNMENT

---

The purpose of the assignment model is to locate a specific route along links and through intersections for every vehicle trip. The vehicle-trips calculated in the mode split model, which are in the form of an origin/destination matrix, are "assigned" to the network based on a user equilibrium model. The user equilibrium model is an iterative process that finds a convergent solution in which no travelers can improve their travel times by switching to another route.

The assignment model includes travel delay from five sources:

- Volume-Dependent Link Delay – calculated using volume-delay functions described below.
- Volume-Dependent Node Delay – calculated using volume-delay functions described below.
- Global Turn Penalties – specified as 10 seconds per left turn and 5 seconds for right turns. U-turns are prohibited.
- Facility Type Penalties – specified in seconds for ramp access from arterials, collectors, and locals to reduce the number of very short trips routed via interstates/freeways.
- Specific Turn Prohibitions – these are specified in the Turn Penalty Table.

The model was calibrated to 2014 daily traffic conditions. The assignment calibration is assessed based on how accurately the model output link volumes match observed traffic counts and speeds by direction and time of day. Calibration of the assignment model involves adjusting the delays for turning movements and on links.

The volume-delay function used in the SMTTC model estimates both link and node delay. The function equations are shown in

Figure 30. Table 33 shows the volume-delay function parameters for interstates/freeways and all other roads. The parameters are the values that, when entered into the equations of the volume-delay function, affect its shape and hence the relationship between traffic volume and the amount of delay. Interstates/freeways operate very differently in traffic flows terms than other types of road, and in particular intersection delay is not a meaningful concept and speeds fall more slowly as volume to capacity ratios increase.

**FIGURE 30: SMTC MODEL VOLUME-DELAY FUNCTION EQUATIONS**

$$d = D_l + I_l$$

$$D_l = t_0 \cdot c_1 \left[ \frac{1}{1 - \frac{c_2}{1 + \exp\left(c_3 - c_4 \cdot \frac{x}{C}\right)}} \right]$$

Where:

$D_l$  = link delay

$t_0$  = free – flow travel time

$x$  = traffic flow

$C$  = link capacity

$c_1, c_2, c_3, c_4$  = link parameters

$$I_l = d_0 \cdot p_1 \left[ 1 + \frac{p_2}{1 + \exp\left(p_3 - p_4 \cdot \frac{x}{X}\right)} \right]$$

Where:

$I_l$  = node delay

$d_0$  = free – flow travel time

$x$  = traffic flow

$X$  = node capacity

$p_1, p_2, p_3, p_4$  = node parameters

**TABLE 32: VOLUME-DELAY FUNCTION PARAMETERS**

| Facility Type      | LINK PARAMETERS |       |     |     | NODE PARAMETERS |     |    |    |
|--------------------|-----------------|-------|-----|-----|-----------------|-----|----|----|
|                    | C1              | C2    | C3  | C4  | P1              | P2  | P3 | P4 |

## 12.0 TRANSIT ASSIGNMENT

---

The transit assignment model tabulates the number of riders using each stop and route. Unlike highway assignment, transit assignment is not formally constrained by a capacity, and therefore, the transit routing computed between each TAZ pair during the transit skimming procedure (see section 7.2 |) is imitated in assignment. The SMTC transit assignment model relies on Caliper’s “pathfinder” algorithm, the compatible assignment algorithm to that used in skimming, and for cases where pathfinder built a composite path between TAZ pairs in skimming, the trips are apportioned among the alternative routes based on the ratio of headway times.

## 13.0 FEEDBACK AND MODEL CONVERGENCE

The model is converged if and only if the outputs are consistent with the inputs. This means that the congested travel times coming out of assignment must be consistent with the travel times that were used in trip distribution. Because the SMTC model starts “cold” and uses free-flow times in the first pass of trip distribution, it is expected that assignment travel times will look slower than those used in trip distribution. To account for this discrepancy, the assignment travel times are used to create new congested skims for trip distribution. However, this is not the end of the process. Because the first pass of trip distribution used free-flow times, each destination appeared unrealistically accessible, leading to too much VMT and slow travel times on the highway. Therefore, the assignment travel times sent to the second pass of distribution are expected to make destinations appear too inaccessible. In turn, this leads to lower VMT on the highway and faster travel times in the second round of assignment. Continuing this feedback process indefinitely leads to oscillating VMT and travel times, but with each subsequent loop, the absolute change decreases. Eventually, the absolute change is judged to be small enough where the model has reached equilibrium.

### 13.1 | MSA FEEDBACK

The SMTC model follows the method of successive averages (MSA) process of feedback where new travel times are calculated by applying the volume-delay function to an unweighted average of volumes from each assignment iteration (see Figure 31). Because the weight of the next assignment run is inversely proportional to the number of iterations, the new travel times change less and less, and convergence will be reached in a finite amount of time.

**FIGURE 31: MSA FEEDBACK**

$$\text{MSAFLOW}_N = \text{MSAFLOW}_{N-1} + (1/N) * (\text{FLOW}_N - \text{MSAFLOW}_{N-1})$$

where:

$n$  = current MSA iteration number

$\text{MSAFlow}_n$  = calculated MSA flow at iteration  $n$

$\text{Flow}_n$  = resulting flow directly from trip assignment

## 13.2 | FEEDBACK CRITERIA

Some of the symptoms of an unconverged model include: fluctuations in travel times and in VHT, fluctuations in assignment volumes and in VMT, and fluctuations in trip tables between subsequent iteration. The SMTC model includes tight overall assignment convergence criteria including a global convergence criterion of 0.000001 and a maximum of 500 iterations. While this adds to model runtimes it ensures a convergence is reached. Additionally, the SMTC model performs a link volume convergence check for each time period during the DA Feedback loop. Within this loop, at least 98% of link volumes must change by less than 1% between loop iterations. This test is run for each assignment period.

## 14.0 FUTURE YEAR MODELS

The future year models use the same structure and parameters as the base year model, but several of the inputs are updated. The adjusted inputs include the highway network, socioeconomic data for TAZs, demand for special generator TAZs, external demand to/from internal TAZs, and external demand to/from other external TAZs.

The focus of the future modeling was on creating reasonable inputs for a 2050 horizon year. Once the 2050 inputs were created, weighted interpolations/extrapolations of the 2017 to 2050 data were developed to build assumptions for two other future years: 2030 and 2040 .

### 14.1 | HIGHWAY NETWORKS

The future year highway network includes projects that are suggested (i.e. included in the SMTC LRTP, or otherwise programmed by NYSDOT, Onondaga County, or other municipalities) to be built before 2050. Projects that are coded in future year networks are presented in Table 33. The table indicates which future year scenario the project first appears in. Most of the projects involved changes to network and network attributes, such as a change in the number of lanes, and edits to the node types to reflect intersection improvements.

**TABLE 33: FUTURE YEAR NETWORK PROJECTS**

| Project                                                                | Year |
|------------------------------------------------------------------------|------|
| Route 370 at John Glenn Blvd intersection improvements                 | 2030 |
| Onondaga Lake Parkway safety improvements                              | 2030 |
| Reconstruct Rt 11 at Rt 49 intersection                                | 2030 |
| NY 31 at Thompson Rd and South Bay Rd intersection improvements        | 2030 |
| Route 481 NB Off-Ramp at Circle Drive                                  | 2030 |
| Caughdenoy Rd and NY 31 improvements                                   | 2030 |
| Buckley Road from Hopkins Rd to Taft Rd Improvements                   | 2030 |
| N, S, E, W corridors interconnect expansion                            | 2030 |
| CENTRO Change in future peak and off-peak headways                     | 2030 |
| CENTRO New express transit route along I81                             | 2030 |
| CENTRO Two new BRT routes with identified stops                        | 2030 |
| I-81 Interchange at Rt 31                                              | 2040 |
| Intersection improvements at NY 5 and NY 257                           | 2040 |
| Buckley Rd shared turn lane and Buckley at Bear intersection upgrades  | 2040 |
| 7th North Street at Buckley Rd intersection upgrades                   | 2040 |
| James Street three lane cross section from State to Grant and Shotwell | 2040 |
| Conversion of downtown streets to 2-way                                | 2040 |
| Roundabout at James and Shotwell/Grant                                 | 2040 |
| Water St closure                                                       | 2040 |

## 14.2 | SOCIOECONOMIC DATA

The development of 2050 socioeconomic data was discussed in sections 3.3 | (households and population) and 3.4 | (employment).

## 14.3 | SPECIAL GENERATORS

For special generators that relied on a hand-selected ITE formula in base year estimation (see Table 25), the 2050 attractions were estimated by growing the key variable by the same percentage that total employees grew between 2017 and 2050 and reapplying the ITE formula. The attractions for other special generators were estimated based on projected growth in employment totals. Table 34 presents the 2050 motorized productions and attractions.

**TABLE 34: 2050 SPECIAL GENERATOR MOTORIZED PRODUCTIONS AND ATTRACTIONS**

| TAZ   | SPECIAL GENERATOR          | PRODUCTIONS | ATTRACTIONS |
|-------|----------------------------|-------------|-------------|
| 8001  | NY State Fairgrounds       | (SE)        | (SE)        |
| 8002  | Destiny USA                | 14,342      | 42,249      |
| 8003  | Onondaga Community College | 4,719       | 9,292       |
| 8004  | Van Duyn Home & Hospital   | 561         | 5,235       |
| 8005  | Loretto                    | 631         | 1,839       |
| 8006  | SU South Campus            | 6,949       | 3,757       |
| 8007- |                            |             |             |
| 8009  | OnCenter                   | 4,014       | 17,958      |
| 8010  | Lemoyne College            | 4,570       | 4,052       |
| 8011  | University Hill Hospitals  | 17,871      | 43,126      |
| 8012  | Syracuse University        | 9,459       | 41,968      |
| 8013  | Carrier Dome               | (SE)        | (SE)        |
| 8014  | St. Joe's Hospital         | 339         | 4,972       |
| 8015  | NBT Bank Stadium           | (SE)        | (SE)        |
| 8016  | Hancock Airport            | 5,867       | 20,254      |

(SE): Special Event locations that are not included in a model run that represents a typical day

## 14.4 | EXTERNAL TRIPS

External demand was assumed to grow at 0.5% per year from 2017 to 2050. However, this rate can be user adjusted by changing input values in the ExtTAZGR.bin input file.

**FIGURE 32: FUTURE INCREASES IN DAILY TRAFFIC VOLUMES (MODEL REGION)**

*Note: Volume increases for divided roadways are shown for only one-direction of travel only.*

**FIGURE 33: FUTURE INCREASES IN DAILY TRAFFIC VOLUMES (CITY OF SYRACUSE AND VICINITY)**

*Note: Volume increases for divided roadways are shown for only one-direction of travel only.*

## 14.5 | FUTURE YEAR TRANSIT NETWORK

Several changes were made to the future year transit networks that are detailed in this section. In the transit network for 2030, 2040, and 2050, the peak and offpeak headways were altered for certain bus routes.

In the 2050 transit network, one express bus route and two new BRT routes were added as follows:

- 1) A new express transit route along I-81 that stops at the following Park-n-Ride facilities.
  - a. I-81 & Taft Road
  - b. I-81 & I-481
  - c. I-81 & RT 31
  - d. I-81 & Bartel Road (in Brewerton)
  - e. I-81 & RT 49 (in Central Square)
- 2) Two new BRT routes with identified stops (see Figure 34).
  - a. Added as additional bus service on these corridors.

- b. The services have 10 minute headways

**FIGURE 34: FUTURE BRT ROUTES**

## 15.0 MODEL CALIBRATION, VALIDATION AND REASONABLENESS CHECKS

---

Model calibration is the process of reviewing and adjusting parameter values in the various model steps to ensure that it reasonably replicates the existing conditions. Model validation and reasonableness checking is performed for each step in the model. Generally speaking, the model is calibrated when the model-generated roadway volumes and speeds reasonably reflect reality, and other key indicators and parameters are reasonable from a behavioral standpoint and consistent with other models, survey data and industry benchmarks.

Examples of parameters that can be modified as part of the calibration process include:

- Trip generation rates;
- Friction factors in the gravity model (trip distribution);
- Coefficients in the mode split equations (e.g. the relative weight of time vs. money);
- Time-of-day parameters;
- Network and TAZ structures;
- Free-flow speeds and capacities on the roadway network; and
- Coefficients in the assignment model relating V/C ratio to delay.

Calibration is as much an art as a science, and it requires the model developer to exercise considerable judgment as to “reasonableness.” There is an inherent balance in the process, between the extremes of an uncalibrated model that does not accurately replicate measurable field conditions and a model that is “overcalibrated” through the use of unjustifiable correction factors such that a model’s ability to predict future travel conditions is compromised.

Four (4) publications used to guide the calibration effort were:

- Calibrating and Adjustment of System Planning Models, FHWA, December 1990.  
Publication No. FHWA-ED-90-015
- NCHRP Report 365 – Travel Estimation Techniques for Urban Planning, TRB, 1998
- Model Validation and Reasonableness Checking Manual – Second Edition; FHWA,  
September 2010
- NCHRP Report 716 – Travel Demand Forecasting: Parameters and Techniques, TRB,  
2012

The calibration process used in the SMTC model development included evaluating the following metrics:

- Trip generation
- Trips/person per day
- Trips/household per day
- Trip distribution
- Average trip duration by trip purpose
- Trip length frequencies by trip purpose
- Mode choice

Regional transit ridership  
 Auto occupancy  
 Traffic assignment  
 Regional 24-hour ground counts v. model volumes  
 24-hour ground counts v. model volumes by functional class  
 Highway Performance Monitoring System (HPMS) data

## 15.1 | TRIP GENERATION

To validate the overall output from the trip generation model, the total regional trip productions were compared to trip rates extracted from the 2001 and 2009 NHTS. The average number of trips per household in the model is 8.8, close to the 9.6 trips per household in the NHTS.

## 15.2 | TRIP DISTRIBUTION

To validate the trip distribution model, the trip length frequency distributions were extracted from the survey and the model to determine if the model was replicating the overall shape of the observed frequency distributions. The model and the survey frequency distributions are examined at 2-mile distance bins (0-2 miles, 2-4 miles, etc) and 3-minute time bins (0-3 minutes, 3-6 minutes, etc). The average trip distance and average trip time can then be determined from the modeled and observed frequency distributions. Table 35 and Table 36 compare the modeled and observed average trip distance and time respectively. In both cases, the model matches closely with the observed trip lengths.

**TABLE 35: AVERAGE TRIP DISTANCE (MILES)**

| TRIP TYPE | OBSERVED | MODEL |
|-----------|----------|-------|
| HBW       | 9.0      | 9.9   |
| HBS       | 5.2      | 6.0   |
| HBO       | 6.0      | 6.3   |
| NHB       | 6.1      | 4.9   |

**TABLE 36: AVERAGE TRIP TIME (MINUTES)**

| TRIP TYPE | OBSERVED | MODEL |
|-----------|----------|-------|
| HBW       | 19.4     | 17.0  |
| HBS       | 10.3     | 8.3   |
| HBO       | 11.9     | 11.3  |
| NHB       | 12.3     | 9.0   |

Figure 35 to Figure 38 present comparisons of the observed and modeled trip distance frequency distribution. Figure 39 to Figure 42 present comparisons of the observed and

modeled trip time frequency distribution. In all cases, the model replicates the observed trip length frequency distributions closely.

## 15.3 | MODE CHOICE

Transit demand was compared with observed data – ridership counts by time of day – to confirm that the mode choice model was producing reasonable results. While the mode choice model parameters are not estimated statistically using survey data, the comparison shown in Table 37 confirms that the asserted model produces results that match closely to daily transit boardings.

**TABLE 37: COMPARISON OF MODEL AND OBSERVED TRANSIT BOARDINGS**

|                 | MODEL  | CENTRO |
|-----------------|--------|--------|
| Daily Boardings | 39,211 | 42,000 |

## 15.4 | ASSIGNMENT

The FHWA has developed recommendations for calibration standards. The following sections detail the calculation of the various statistics used to measure calibration. Individual link errors were calculated by subtracting the model link volume from the ground count for that link.

### COEFFICIENT OF CORRELATION

The coefficient of correlation, “R”, is commonly used to measure the strength and direction between two sets of variables. An R value of 1.0 would indicate a perfect one to one correlation between the two variables, an r value of zero would indicate a completely random correlation, and an R value of -1 would indicate a perfect inverse correlation. The value of R can be estimated using the following formula.

$$r = \frac{\sum(x \cdot y) - n \cdot \bar{x} \cdot \bar{y}}{\sqrt{(\sum(x^2) - n \cdot \bar{x}^2)(\sum(y^2) - n \cdot \bar{y}^2)}}$$

where:

x = Ground count

y = Calibration volume

n = Number of observations

FHWA recommends a minimum R-squared value of 0.88; the daily model has a correlation coefficient (R) of 0.94 which is equivalent to an R-squared of 0.88. Note, the most recent FHWA manual on calibration and validation has downplayed the importance of the Coefficient of Correlation (R-squared) metric. However, the statistic is included in this section of the model documentation because it continues to be a common industry measure.

*“R-squared probably tells more about the coding of facility type and number of lanes than about how the model and assignment is performing. Thus, achieving a regional R-squared of 0.88, as has been suggested as a “standard” for determining a model’s validity, has little if any meaning.”*

## ROOT MEAN SQUARED ERROR

The root mean squared error (RMSE) is an average link error that weights the larger volume errors in a network. It should be noted that the RMSE is always higher than the actual average network error because of the weighting scheme. RMSE is calculated as:

$$\text{RMSE} = \sqrt{\frac{\sum [(x - y)^2]}{n}}$$

where:

x = Ground count

y = Calibration volume

n = Number of observations

The RMSE should generally be less than 40%; the daily model has an RMSE of 36.5%.

## SUM OF DIFFERENCES

The sum of differences is the average error of the network. It is similar to FHWA's percent error region-wide threshold.

$$\text{SumDif} = \sum (y - x) \quad \text{or} \quad \frac{\sum (y - x)}{n} \times 100\%$$

where:

x = Ground count

y = Calibration volume

n = Number of observations

The region-wide percent sum of differences for the daily model is -1.93%.

## COMPARISON TO CALIBRATION THRESHOLDS

A comparison between the FHWA recommendations and the calibrated daily model is shown in Table 38. All measures of performance exceed thresholds published by the FHWA.

**TABLE 38: FHWA ASSIGNMENT CALIBRATION THRESHOLDS**

|                                              | FHWA      | MODEL   |
|----------------------------------------------|-----------|---------|
| Correlation Coefficient                      | 0.88      | 0.94    |
| Percent Error Region-Wide                    | + / - 5%  | -2.31%  |
| <b><u>Sum of Differences by Facility</u></b> |           |         |
| Freeways                                     | + / - 7%  | 4.93%   |
| Principal Arterials                          | + / - 10% | -0.74%  |
| Minor Arterials                              | + / - 15% | -10.13% |
| Collectors                                   | + / - 25% | -3.78%  |

Table 39 presents the assignment validation reports generated by the model for the all day (Daily), the AM Peak Hour and the PM Peak Hour. The tables show the correlation, percent error overall, and percent error by facility type.

**TABLE 39: ASSIGNMENT VALIDATION**

| Calibration Statistics         | FHWA Recommendations | Daily Model | AM Peak Hour Model | PM Peak Hour Model |
|--------------------------------|----------------------|-------------|--------------------|--------------------|
| Coefficient of Correlation {R} | 0.880                | 0.942       | 0.930              | 0.927              |
| Percent Error Region-Wide      | + / - 5%             | -2.31%      | 2.20%              | -1.04%             |
| Sum of Differences             |                      |             |                    |                    |
| Freeways                       | + / - 7%             | 4.93%       | 1.62%              | 1.46%              |
| Principal Arterials            | + / - 10%            | -0.74%      | 6.72%              | -1.49%             |
| Minor Arterials                | + / - 15%            | -10.13%     | 3.88%              | -0.67%             |
| Collectors                     | + / - 25%            | -3.78%      | -3.34%             | -5.08%             |

The Michigan Department of Transportation (MDOT) has developed error targets for comparing daily model and observed volumes for individual links. The MDOT error targets are presented in Table 40 and are displayed as the red lines in Figure 43. Outliers are expected and typically having a majority of the data points within the error boundary is deemed acceptable with more stringent criteria applied to the high volume links.

**TABLE 40: MICHIGAN DOT VOLUME-BASED CALIBRATION STANDARDS**

| (Upper Bound)<br>Link Volume | MDOT error |
|------------------------------|------------|
| 0                            | 200%       |
| 1,000                        | 100%       |
| 2,500                        | 50%        |
| 5,000                        | 25%        |
| 10,000                       | 20%        |
| 25,000                       | 15%        |
| 50,000                       | 10%        |

**FIGURE 43: COMPARISON OF INDIVIDUAL LINK LEVEL ERRORS USING MDOT CRITERIA**

Scattergrams which plot the observed count on the x-axis versus the model volume on the y-axis are used to visually inspect the model fit to observed data. A 'perfect fit' is illustrated by the  $y=x$  line where the model volume is equal to the count volume on the link. Data points distant from the  $y=x$  line are cases where the model is not well-aligned with the observed count data. Again, as the link volumes increase, the model should do a better job matching existing counts on the high class facilities such as interstates and freeways. Figure 44, Figure 45, and Figure 46 show daily, AM and PM scattergrams respectively.

**FIGURE 44: SCATTERGRAM SHOWING DAILY COUNTS VS. MODEL VOLUMES**

**FIGURE 45: SCATTERGRAM SHOWING AM COUNTS VS. MODEL VOLUMES**

**FIGURE 46: SCATTERGRAM SHOWING PM COUNTS VS. MODEL VOLUMES**

Figure 47 shows volume error (Model Volume – Observed Counts) and Figure 48 shows the same volume area with a focus on Syracuse proper.

## 16.0 MODEL CHANGES BY VERSION

---

This section of the report lists the changes that were made in this revision to the model. This section is a cumulative record of changes that have been made since SMTC Travel Demand Model, Version 3.00, which was documented in the SMTC Travel Demand Model Validation Report (December 2010)<sup>7</sup>.

### 16.1 | SMTC TRAVEL DEMAND MODEL, VERSION 3.02 (NOVEMBER 2011)

The changes made in this revision to the model are:

As part of the I-81 Corridor Study, calibration adjustments were made to the model to better match traffic count data in the area around the I-81 viaduct in central Syracuse. Adjustments were made to some turn penalties and ramp penalties, through trip numbers on I-90, and parameters in the highway network skimming process. While the changes made insignificant differences on a regional level, they did improve the match with observed traffic patterns in the I-81 study area, and resolved a small number of anomalous locations close to I-81 that had been identified during model output reviews by the I-81 Corridor Study team.

### 16.2 | SMTC TRAVEL DEMAND MODEL, VERSION 3.023 (APRIL 2012)

The changes made in this revision to the model are:

Changes to the land-use data describing the number of households, the household population and the group quarters population in the City of Syracuse for both the base year (2007) and the future year (2035) to better reflect observed growth rates seen in the 2010 Census data for Syracuse, which was not available when the land-use inputs to model version 3.02 were developed. These changes are described in Section 3.2.6 of SMTC Travel Demand Model Version 3.023 Documentation.

### 16.3 | SMTC TRAVEL DEMAND MODEL, VERSION 4.04 (NOVEMBER 2014)

The changes made in this revision to the model are:

Expanded the model coverage north of the existing model coverage area into the towns of Schroepfel, Hastings, West Monroe, and a portion of Granby, and west of the existing model area into the town of Sullivan area.

Changes to the land-use data describing the number of households, the household population and the group quarters population in the City of Syracuse for both the base year (2014) and the future year (2050) to better reflect observed growth rates seen in the 2010 Census data for Syracuse, which was not available when the land-

---

<sup>7</sup> Note that the model version number used in this report was SMTC Travel Demand Model, Version 2.2; this was later revised to be SMTC Travel Demand Model, Version 3.00

use inputs to model version 3.02 were developed. These changes are described in the sections above.

Added interim model years 2020 and 2030.

Reviewed the existing transit system and updated it based on the latest information from CENTRO.

#### **16.4 | SMTC TRAVEL DEMAND MODEL, VERSION 5.0 (JUNE 2020)**

The changes made in this revision to the model are:

Updated model code to work in TransCAD version 7.

Updated base-year land use data based on more recent NY state employment data.

Updated future land-use distributions based on base-year revisions.

Increased the number of TAZs from 1,185 to 1,193.

Updated non-motorized mode-split.

Created a new Master Network tool.

Added interim model years 2030 and 2040.

Updated base-year validation to 2017 conditions.

## 17.0 MODEL INPUT FILES

---

This section lists the input files to the SMTc model.

### 17.1 | HIGHWAY NETWORK INPUTS

Model Network (“SMTc\_Network\_20\*.dbd”) – A geographic file that contains the structural detail and lists (most of) the link and node attributes of the highway network.

Link Type Lookup Table (“LTLTable.bin”) – A binary table that contains some link data organized by facility and area type.

Node Type Lookup Table (“NTLTable.bin”) – A binary table that contains some intersection data organized by node type.

Link Turn Prohibitions (“Link\_Turn\_Prohibitions.bin”) – A binary table that lists all the link-to-link turn prohibitions and penalties.

Interfacility Turn Penalties (“FC\_TurnProhibitions.bin”) – A binary table that lists all the inter facility turn penalties.

Volume-Delay Function Parameters (“VDF\_Param.bin”) – A binary table that lists the volume-delay parameters by functional class.

### 17.2 | TRANSIT NETWORK INPUTS

Transit Stops Layer (“Stops.bin”) – A binary table that lists the key stops and via points in transit network.

Transit Route Stops (“RouteStops.bin”) – A binary table that lists each stop or via point visited by each route.

Transit Routes (“Routes.bin”) – A binary table that lists each route in the transit network.

Transit Mode Table (“transitModeTable.bin”) – A binary table that lists the argument to various network parameters by transit submode.

Headway table (“headwayTab.bin”) – A binary table that lists the peak and off-peak headways by route.

### 17.3 | TRIP GENERATION INPUTS

TAZ Layer (“SMTc\_TAZs\_20\*.dbd”) – A geographic file that contains the structural detail of the TAZ layer.

Land Use table (“LandUse.bin”) – A binary table that lists socio-economic inputs for each TAZ.

Special Gen (“SpecialGen\_PA.bin”) – A binary file that lists the productions and attractions by special generator.

IXXI Trips (“IXXI\_ExternalTripEnds.bin”) – A binary file that lists the productions and attractions by external TAZ.

IX Production percent (“IXProdPercentage.bin”) – A binary file that lists the percent of internal productions by TAZ destined for externals.

IXXI\_Truck Percent (“IXXI\_Truck.bin”) – A binary file that lists the IXXI truck percentages for each zone.

Production Rates (“ProdRates.bin”) – A binary table that lists trip production rates by the joint distribution of trip purpose, household size, and number of vehicles.

#### **17.4 | TRIP DISTRIBUTION INPUTS**

XX Trip Distribution (“XXTrips.mtx”) – A matrix that lists the number of daily external-to-external trips.

External Growth (“ExtTAZGR.bin”) – A binary file that lists percent annual growth applied to future-year scenarios for external stations.

#### **17.5 | DIURNAL DISTRIBUTION INPUTS**

Diurnal Distribution (“hourlyLookupTable.bin”) – A binary table that lists the distribution of trips by time of day.

#### **17.6 | ASSIGNMENT INPUTS**

Query File (“\*\*\*\*.qry”) – An optional query file that may be used in assignment.

#### **17.7 | REPORTING INPUTS**

Calibration report aggregations (“calrepinfo.bin”) – A binary table that lists the functional class and geographic aggregation scheme to be used in reporting.

## 18.0 MODEL SCRIPTS

---

This section lists the scripts used to run the SMTC model. There are a total of 14 scripts. One script is responsible for declaring the other 13 scripts, which are used to execute different phases of the model.

- MacrosLIST\_SMTC.lst – Declares each of the scripts used in the model by specifying their paths.
- Utility\_SMTC.rsc – Contains general purpose utility macros.
- GUI\_SMTC.rsc – Controls the graphical user interface.
- Globals\_SMTC.rsc – Declares which variables are shared between scripts.
- Defaults\_SMTC.rsc - defines the output file paths
- InitializeNetwork\_SMTC.rsc – Initializes the highway network for a new model run.
- PrepareSEData\_SMTC.rsc – Prepares SE data for trip generation.
- TripGeneration\_SMTC.rsc – Executes the trip generation model
- CreateNetwork\_SMTC.rsc – Executes the highway network creation and skimming procedure
- CreateTransitNetwork.rsc – Executes the transit route-building and skimming procedures
- DistributionTimeSkim\_SMTC.rsc – Executes time skims for distribution.
- TripDistribution\_SMTC.rsc – Executes the trip distribution model.
- AutoTrips\_SMTC.rsc – removes non-auto trips prior to assignment.
- Assignment\_SMTC.rsc – Executes peak period assignment.
- TerminalTime\_SMTC.rsc – converts terminal time bin file into matrix format.
- ModeSplit\_SMTC.rsc – Executes the mode choice model and converts auto person-trips to vehicle-trips
- Diurnal\_SMTC.rsc – Tabulates hourly, auto demand
- FinalAssignment\_SMTC.rsc – Executes the final iteration of highway assignment.
- DAFeedback\_SMTC.rsc – Test for model convergence
- Calibration\_SMTC.rsc – Prepares summary reports for model validation.
- Reports\_SMTC.rsc – Generates a number of model reports

## 19.0 MODEL OUTPUTS AND REPORTING

---

This section lists the commonly used outputs of the SMTC model.

### 19.1 | HIGHWAY NETWORK OUTPUTS

Highway Network File (“network.net”) – A network file that contains all the compiled data for the highway network.

Model Network (“NetworkOut.dbd”) – The data within the highway network (see section 17.1 | ) is updated during model application.

### 19.2 | TRANSIT NETWORK OUTPUTS

Valid Transit Nodes (“PotentialTransitStops.dbd”) – A geographic file that contains the set of valid highway nodes for which the transit stops are snapped to.

Route Stops (“Bus\_RouteStops\_Adj.bin”) – A binary table that lists all stops visited by all routes, including those that were automatically added in the route-building process.

Transit Route System (“TransitRoutes.rts”) – A geographic file that contains the structural detail and lists stop and route attributions of the transit network.

Transit Network File (“transitnetwork.tnw”) – A network file that contains all the compiled data for the transit network.

Transit Skim Matrices (“\*\*\*.mtx”) – A series of matrices (peak, off-peak) that list the skimmed transit attributes between valid TAZ pairs.

### 19.3 | TRIP GENERATION OUTPUTS

Trip Productions Table (“ProductionTrips.bin”) – A binary table that lists the number of productions by TAZ by trip purpose.

Attraction Trips Table (“AttractionTrips.bin”) – A binary table that lists the number of attractions by TAZ by trip purpose.

IXXI Passenger Table (“IXXI\_Passenger.bin”) – A binary table that lists the IX productions and XI attractions by TAZ.

### 19.4 | TRIP DISTRIBUTION OUTPUTS

Distribution Matrix (“\*\*\*\*\*.mtx”) – Matrix files that lists the productions and attractions and distribution metrics by trip purpose for TAZ pair.

### 19.5 | MODE CHOICE OUTPUTS

Mode Choice Probability Matrices (“\*\*\*Prob.mtx”) – A series of matrices that list mode choice probabilities.

Mode Choice Trip Matrices (“\*\*\*TripsOut.mtx”) – A series of matrices that list person-trips by mode.

### 19.6 | DIURNAL DISTRIBUTION OUTPUTS

Hourly, Auto Origin-to-Destination Matrix (“odVehicleTripByHour.mtx”) – A matrix that lists the number of origin-to-destination auto trips by trip purpose and hour.

Auto Origin-to-Destination Matrix (“allODTripsByHour.mtx”) – A matrix that lists the number of origin-to-destination auto trips by trip purpose and period.

## 19.7 | HIGHWAY ASSIGNMENT OUTPUTS

Highway Assignment Table (“flowTable xx.bin”) – A series of binary tables (by hour) that list the assignment results by network link.

Final assignment table (“finalAssignmentTable.bin”) – A table that lists assignment results for all hours by link

Assigned trip matrices (“\*\*\*\*Trips.mtx”) – A series of matrices containing the assigned auto, bus, and rail (placeholder) trips by between each TAZ pair.

Highway Congested Travel Times (“\*\*\*\*CongTTskim.mtx”) – A series of matrices that list the congested travel times between each TAZ pair.

## 19.8 | TRANSIT ASSIGNMENT OUTPUTS

Transit Flow Table (“buFlowTable”) – A binary table that list the transit volume along each route segment.

Transit Boardings Table (“busOnOff.bin”) – A binary table that lists the transit boardings and alightings at each stop for each route.

## 19.9 | REPORTS

Summary report visualizer (“Reports\_\*\*\*\*.xslm”) – A macro-enabled excel file that collects data from co-located model-generated reports and summarizes in an excel format.

- Trip statistics
- Daily and peak hour calibration statistics
- Mode choice summary
- Trip length distance and time distribution summaries

## 20.0 GLOSSARY

---

**Accessibility:** measure describing the ease with which travelers can reach activities and/or destinations.

**Accuracy:** degree of conformity of a measure to a standard, known or true value

**Aggregate:** a collection of units into a single body or mass (in this case TAZs)

**Attractions:** the non-home end of any home-based trip or the destination of any non-home-based trips

**Calibration:** procedure used to estimate the various parameters and coefficients of a travel demand model so the results produced replicate known travel behavior for a base year

**Computed Data:** data that the model will automatically calculate at during a model run. No maintenance is needed by the analyst)

**Delay:** the difference between congested travel time and free-flow travel time

**Free-flow travel time:** travel time under free-flow conditions typically calculated as the distance divided by the posted speed limit

**Friction Factors:** represent the reluctance of persons to make trips of various duration or distances. The general friction factor indicates that as travel times increase, travelers are increasingly less likely to make trips of such lengths. Calibration of the gravity model involves adjusting the friction factor

**Gravity Model:** a mathematical model of trip destination based on the premise that trips produced in any given area will distribute themselves in accordance with the accessibility of other areas and the attractions those areas offer

**HOV2:** 2-person high occupant vehicle

**HOV3+:** 3+person high occupant vehicle

**Immutable Data:** data that should never be edited by the analyst. The immutable status is typically reserved for identification fields in tables .

**Logit Choice Model:** statistical procedure that describes choices made by people among a finite set of alternatives

**Lookup Table Data:** data that is automatically imported from another source, such as a text file. Although the model executes this import during a model run, the analyst typically needs to manage the lookup source (e.g. a binary file with link speeds and capacities)

**Pivoting:** process used to adjust raw model volumes by applying the difference between two scenarios to observed ground counts

**Precision:** strictly conforming to a pattern, standard or convention

**Productions:** the home end of a home-based trip and the origin end of non-home-based trip

**Shortest path:** the shortest path between two locations measured in terms of either distance, time or both distance and time

**Skimming:** the process of collecting all the shortest-path information for all zones in the travel model network. An automated process that typically uses commercially available transportation planning software such as TransCAD

**Smart Growth:** building urban, suburban and rural communities with housing and transportation choices near jobs, shops and schools. This approach supports local economies and protects the environment.

**SOV:** single occupant vehicle

**Transporation analysis zone (TAZ):** geographical unit the region is broken down into for the purpose of collecting and analyzing land-use data. Model calculations are performed at this level of spatial disaggregation

**Transit Oriented Development (TOD) -** is a mixed-use residential or commercial area designed to maximize access to public transport

**Trip length frequency:** a graphical distribution which shows the number of trips plotted by trip time

**Value of time (VOT) -** is the opportunity cost of the time that a traveler spends on his/her journey. In essence, this makes it the amount that a traveler would be willing to pay in order to save time, or the amount they would accept as compensation for lost time

**Volume-delay function:** a set of functions that calculate congested travel time base on the relationship between a road's volume and capacity

**User-Maintained Data:** data that the analyst is responsible for entering and maintaining

**VMT:** vehicle miles of travel (link volume multiplied by link distance summed for all links in the network)

**VHT:** vehicle hours of travel (link time multiplied by link volume summed for all links in the network)

The following is a list of projects that are documented in the SMTC LRTP (<https://smtcmpo.org/publications/lrtp/>) and included in the regional travel demand model when applicable. This information was collected in 2020 as part of our LRTP update process. Limited information was available for most of these projects and general assumptions were made to include them in the model. The changes made in the model for these projects are a proxy for creating or constraining capacity. Please note that the current SMTC TDM does not include the planned changes for the NYSDOT I-81 project (community street grid alternative) in any of its future years. The following list includes projects that may no longer be valid based on the I-81 project and other recent project updates by member agencies. Coordination with the identified agencies is recommended for more detail.

## **Short-Term Projects (2030) – Included in Regional Travel Demand Model**

### **NYSDOT**

- **Route 370 at John Glenn Blvd intersection improvements**
  - o Install additional thru lane on Route 370 NB, right turn lane Route 370 SB, right turn lane John Glenn WB, left turn lane John Glenn EB.
- **Onondaga Lake Parkway safety improvements**
  - o Onondaga Lake Parkway from 4 lanes to 2 lanes from Ska Center to I-81
  - o Reduce speed on same section from 55 to 45mph
  - o Add left turn lanes on Old Liverpool Road at Electronics Parkway
- **Reconstruct Rt 11 at Rt 49 intersection**
  - o Basic single lane roundabout assumed
- **31 at Thompson Rd and South Bay Rd intersection improvements**
  - o Basic single lane roundabouts assumed at both intersections
- **Route 481 NB Off-Ramp at Circle Drive**
  - o Install a designated right turn lane (300'), and longer left turn lane (1000') for the Route 481 off ramp approach.
  - o Install an additional 400' right turn lane for the westbound Circle Drive approach at its intersection with Route 11. This would create a signalized dual right turn lane at this intersection.

### **OCDOT**

- **Caughdenoy Rd and NY 31 improvements**
  - o Route 31 and Caughdenoy left turn lanes all approaches, right turn lanes N, W, E and signal.
  - o Caughdenoy Road add second northbound lane to railroad tracks
- **Buckley Road from Hopkins Rd to Taft Rd Improvements**
  - o Add new signal at Buckley and Dolshire including turn lanes from Buckley

## City of Syracuse

- **N, S, E, W corridors interconnect expansion – signal coordination**
  - o Project limits include James St from Teall Ave to City Line (9 intersections), S. Salina St from Taylor St to Dorwin Ave (16 intersections), Seneca Turnpike from S. Salina St to Valley Drive (2 intersections), E. Genesee St from Beech St to Carlton Rd (9 intersections), South Ave from W. Onondaga St to Glenwood Ave (8 intersections), Valley Drive from South Ave to West Seneca Turnpike.

## Centro

- **Change in future peak and off-peak headways**
  - o as shown in table below

| Centro Average Headways - September 2019 |                                 |                                  |                            |                             |                            |                            |                             |                            |

\* Multiple lines go to Destiny USA during the AM peak.

\* The AM headway to Destiny USA from all routes is approximately 15 minutes.

- **New express transit route along I81**
  - o stops at the following Park-n-Ride facilities
    - I-81 & Taft Road
    - I-81 & I-481
    - I-81 & RT 31
    - I-81 & Bartel Road (in Brewerton)
    - I-81 & RT 49 (in Central Square)
- **New BRT routes with identified stops**
  - o See map from SMART study below

- Added as additional bus service on these corridors
- The services have 10-minute headways

## **Mid-Term Projects (2040) - Included in Regional Travel Demand Model**

### **NYS DOT**

- **I-81 Interchange at Rt 31**
  - To improve capacity issues there will be a complete interchange replacement. The interchange will be upgraded from the current configuration to a cloverleaf interchange. Remove Crabtree access to Route 31. End Pardee at Cracker Barrel. Use Carmenica Drive as access from Pardee to Lakeshore.
- **Intersection improvements at NY 5 and NY 257**
  - Include basic intersection capacity improvements

### **OCDOT**

- **Buckley Rd shared turn lane and Buckley at Bear intersection upgrades**
  - Addition of a shared turn lane along the entire length of Buckley Road (from Old Liverpool Road to Morgan Road) – not included in model. The intersection of Buckley/Bear will be expanded with the addition of EB left, EB thru and NB left turn lanes.
- **7th North Street at Buckley Rd intersection upgrades**
  - The intersection of Seventh North/Buckley will be upgraded with the addition of SB and EB lefts, and NB and SB thru lanes

### **City of Syracuse**

- **James Street three lane cross section from State to Grant and Shotwell**
  - Change from 2 lanes each direction to 1 lane each direction. Center turn lane (not included in regional model), transition to left-turn only lanes at signalized intersections.
- **Conversion of downtown streets to 2-way**
  - Alternative 2b from study - <https://smtcmpo.org/partner/downtown-syracuse-two-way-feasibility-technical-analysis/>
  - Jefferson St
    - Montgomery to State – 1NB 1SB lane
  - Montgomery Street (North of Jefferson)
    - Erie to Water – 2NB 1SB lanes
    - Water to Washington – 1NB 1SB lane
    - Washington to Fayette – 2NB 1SB lanes
    - Fayette to Jefferson – 1NB 1SB lane
  - Montgomery Street (South of Jefferson)
    - Jefferson to Adams – 1NB 1SB lane
  - Warren Street
    - Willow to Washington – 1NB 1SB lane
  - Clinton Street
    - Herald to Water – 1NB 2SB lanes

- Water to Washington – 1NB 3SB lanes
  - Washington to Fayette – 2NB 1SB lanes
  - Fayette to Dickerson – 1NB 1SB lane
  - Dickerson to Adams – 1NB 2SB lanes
- **Roundabout at James and Shotwell/Grant**
    - Roundabout
  - **Water St closure**
    - Close Water St from to S. Crouse to S. Beech

### **Mid-Term Projects (2040) - NOT Included in Regional Travel Demand Model**

The following projects were not included in the regional model because they could not be adequately represented in a meaningful way.

- **Rt 31 widening: center turn lane Morgan Rd to Rt 11**
- **Soule Road widening: center turn lane**
- **South Bay Rd: center turn lane Bear Road to Rt 31**
- **Henry Clay Blvd: center turn lane Wetzel Rd to Rt 31**
- **Kirkville Rd widening: center turn lane I-481 to Fremont Rd**
- **Commerce Blvd and Vine St intersection improvements and Vine St widening: center turn lane Thruway to Henry Clay Blvd**

### **Long-Term Projects (2050)**

- **None identified**

# MEMO

**TO:** Jason Deshaies  
**FROM:** Ben Swanson; Colin Smith  
**DATE:** May 4, 2023  
**SUBJECT:** SMTC Travel Demand Modeling for Micron

---

On behalf of the Syracuse Metropolitan Council (SMTC), RSG has conducted a series of scenario model runs, using the SMTC Version 5.0 travel model, to assist ongoing analysis for the proposed Micron facility in Clay, NY.

The SMTC Version 5.0 travel model has a base-year of 2017. Future-year scenarios were previously developed for planning purposes to represent anticipated land-use and roadway conditions in 2030, 2040, and 2050. Each of these future-year scenarios were run with minor adjustments (removing previously assumed employment at the Micron site and previously assumed improvements at the SR-31 & Caughdenoy Road intersection) to serve as No Build reference scenarios.

The following model No Build scenario runs were included in this effort<sup>1</sup>:

1. 2017 No Build – Base-year model with no Micron investments.
2. 2030 No Build – includes 2030 regional employment projections and road network.
3. 2040 No Build – includes 2040 regional employment projections and road network.
4. 2050 No Build – includes 2050 regional employment projections and road network.

Micron Build scenarios were run by adding various levels of site employment, regional household growth, increased external trips to/from the site, and secondary household and employment growth to the established No Build scenarios. Build scenarios for various phases of site development were added onto No Build scenarios for the most appropriate No Build year available, rather than interpolating multiple new No Build scenarios for specific estimated development years.

The following model Build scenario runs were included in this effort:

1. 2025 Build – adds 2025 Micron land-use projections to 2030 No Build.

---

<sup>1</sup> All scenarios remove previously assumed general employment assumptions for the Micron site and previously assumed roadway improvements at the SR-31 & Caughdenoy Road intersection, which have been included in prior planning efforts for other projects.

2. 2030 Build – adds 2030 Micron land-use projections to 2030 No Build.
3. 2036 Build – adds 2036 Micron land-use projections to 2040 No Build.
4. 2041 Build – adds 2041 Micron land-use projections to 2040 No Build.
5. 2044 Build – adds 2044 Micron land-use projections to 2050 No Build.

## **Regional Land Use Assumptions**

AKRF developed projections of Micron employee residence locations both within the modeled area and in nearby parts of Oswego, Madison, Cortland, and Cayuga counties outside of the model boundary.

For Micron workers and contractors with residence locations internal to the model, RSG added households to their residence zones that will produce additional trips and added employees to the Micron site that will attract work trips from residents, as indicated in the projections provided by AKRF.

For the remaining Micron employees and contractors projected to live outside the model area, additional internal-to-external (IX) and external-to-internal (XI) trips were needed to reflect travel by these individuals. By default, the model can generate IX and XI trips by balancing traffic counts at the external ends with either user-specified percentage of productions (for IX trips) or the sum of internal model attractions based on employment (for XI trips). RSG determined that simply adding employment to the Micron site and adjusting external counts to match the increase in external traffic would not reliably direct these trips to the Micron site without the need for significant modifications to trip distribution. RSG instead added the assumed work trips made by these external households to the Micron site as exogenous inputs in the form of new Micron externals matrices, by adding 2 trips per employee (XI for home to work and IX for work to home) to the trips matrix after trip distribution. These new Micron external trips were allocated to model external stations based on the total amount of external employment per cardinal direction (North, East, South, or West) provided by AKRF and proportionately to Base-Year 2017 external traffic levels at each station.

Additionally, AKRF provided estimates of secondary household growth at a zonal level, assumed to occur in response to increased economic activity created by the Micron development and their employees' households. These secondary-growth households were added to Build scenarios as presented by AKRF, and additional secondary employment was added to accompany these households by scaling No Build employment at the same rate as the increase in households projected by AKRF in each town.

## Allocation of Workers across the Micron Site

The future Micron site is represented by 2 traffic analysis zones (TAZs) in the SMTc model (1111 and 1112). Workers were allocated to these zones based on the expected construction phasing.

| SCENARIO YEAR | ZONE 1111 (WEST)                                    | ZONE 1112 (EAST)                                    |
|---------------|-----------------------------------------------------|-----------------------------------------------------|
| 2025          | 3/5 of construction jobs                            | 2/5 of construction jobs                            |
| 2030          | 3/5 of construction and all operations jobs         | 2/5 of construction jobs                            |
| 2036          | 2/5 of construction jobs and 1/2 of operations jobs | 3/5 of construction jobs and 1/2 of operations jobs |
| 2041          | 2/5 of construction jobs and 1/3 of operations jobs | 3/5 of construction jobs and 2/3 of operations jobs |
| 2044          | 1/4 of operations jobs                              | 3/4 of operations jobs                              |

For employees residing internally, these jobs were added to the Micron zones as specified above. For employees residing externally, the internal ends of the added IX/XI trips were allocated as shown above while the external ends were allocated to model externals as described above.

## Future Year Road Networks

The future year road networks are based on a master network design such that individual road projects may be included or excluded by the user. The following road projects were included in the future network scenarios:

| SCENARIO YEAR | INCLUDED PROJECTS                                                                                                                                                                                                                                                                                                                              |

---

While previous modelling efforts for long-range planning have included an assumed intersection improvement at the SR-31 & Caughdenoy Road, this project was not included in any analysis scenarios at the request of the project team.

## **Subarea Analysis**

RSG conducted subarea analyses on all scenario runs to assist in translating regional model outputs to the dimensions of a smaller Visum model currently in development by WSP. Figure 1 presents the subarea provided by WSP for this analysis and the resulting selection set of model roadways created by the subarea analysis.

**FIGURE 1: SUBAREA SELECTION MAP**

Subarea analyses were conducted using the TransCAD Multi-Modal Multi-Class Subarea Analysis module for the AM (7:00-8:00) and PM (17:00-18:00) peak hours.

Peak hour demand from the hourAutoTrips.mtx model output assigned to the output network using the output scenario networks and .net files for the subarea analysis. Because the subarea analysis module in TransCAD does not support the Israel Institute of Transportation Planning and Research (IITPR) volume delay function implemented in the SMTC travel model, the precise model assignment for each scenario could not be recreated within the subarea analysis. Instead, following exploratory analysis to best match the model assignment, the AM or PM congested travel times were used as input to the Bureau of Public Roads (BPR) volume delay function within the subarea analysis model along with model link capacities and default parameters for alpha and beta values.

## Analysis Outputs

The following output files are provided for each scenario run:

- The hourly assignment matrices from the full model run (*hourAutoTrips\_<scenarioYY>.mtx*)
- AM peak hour subarea OD matrix (*AM\_MMA\_Subarea OD.mtx*)

- AM peak hour assigned subarea link flows (*AM\_MMA\_LinkFlows.bin*)
- PM peak hour subarea OD matrix (*PM\_MMA\_Subarea OD.mtx*)
- PM peak hour assigned subarea link flows (*PM\_MMA\_LinkFlows.bin*)
- Subarea network export (<scenario>\_<YY>\_subarea\_links.dbd)
  - o Includes network link and node ids to accompany subarea OD outputs
  - o Includes original model scenario network attributes and assignment results for reference

## MEMORANDUM

---

**TO:** Ethan Smolinsky  
**FROM:** Jason Deshaies *JRD*  
**DATE:** 3/27/2024  
**RE:** SMTC Great Northern Mall Redevelopment Select Link Analysis

---

The Syracuse Metropolitan Transportation Council (SMTC) was asked by the New York State Department of Transportation (NYSDOT) to assist with a select link analysis for the Great Northern Mall redevelopment area Traffic Analysis Zone (TAZ). This memorandum serves as documentation of the files being transmitted.

As requested, the SMTC utilized the most current version of the regional travel demand model to do a select link analysis for the Great Northern Mall (GNM) TAZ. The model used for this effort is not the same as the version used for the Micron no-build analysis (completed in early 2023) and does not include all the same details that are included in the model used for the Micron build alternatives analysis. The standard SMTC 2020 Base and 2050 Future models were used for this analysis to simplify the process and meet the tight schedule as requested. Below are the details of what is included in this package.

The SMTC added the provided GNM redevelopment land use details to the 2020 existing conditions base as well as the 2050 future scenario. Both models were also run with the addition of a new interchange at NY481 and Verplank Road to see how that might generally impact traffic patterns. This is not intended to be an analysis of the NY481/Verplank Road interchange.

The purpose of this effort is to provide trip distribution results, or the relative trip flows by direction, to the site. The total peak period trips to the site will not match the consultant's estimates because the standard SMTC model trip generation and time-of-day assumptions were used for these runs. However, the consultant could factor, or redistribute, its own forecasts based on the SMTC model's trip tables and select link results. It should be noted that the standard SMTC model trip distribution assumptions were used for these runs, which does not consider if the site holds special regional appeal (like Destiny USA).

As discussed on the last coordination call, the GNM redevelopment household and employment details as well as anticipated transportation mitigation should be incorporated in the more detailed Micron build scenario modeling effort. Due to the size of the proposed redevelopment, it may be more appropriate to treat the GNM TAZ as a special generator for that separate effort.

The following model runs were completed by the SMTC, all these runs include a select link analysis for the GNM connectors:

1. 2020 Base + GNM Redevelopment (details below)
2. 2020 Base + GNM Redevelopment (details below) + New Interchange at 481 & Verplank
3. 2050 Base + GNM Redevelopment (details below)
4. 2050 Base + GNM Redevelopment (details below) + New Interchange at 481 & Verplank

### GNM Redevelopment Details

- New centroid connectors for the GNM TAZ were added to generally represent the proposed new access locations.
- The internal mall roads were removed as model links and the connectors were relocated to connect directly to the surrounding road system to be consistent with all connectors.
- Added 1,452 total households and adjusted the household size and number of vehicle classification for the TAZ to better represent the proposed apartment breakdown:
  - 799 - 1-bedroom apartments
  - 653 - 2-bedroom apartments
- Total number of jobs by sector are an input to the regional model but were not provided by the consultant teams. The SMTC estimated the number of jobs for **TAZ 3073** based on the proposed square feet:

| Sector                                     | SF               | Estimated Jobs |
|--------------------------------------------|------------------|----------------|
| NAICS 44 - Retail Trade                    | 425,225          | 910            |
| NAICS 62 - Health Care & Social Assistance | 818,913          | 1,800          |
| NAICS 71 - Arts, Entertainment, Recreation | 67,890           | 80             |
| NAICS 72 - Accommodation & Food Service    | 20,000           | 600*           |
| <b>Total</b>                               | <b>1,332,028</b> | <b>3,390</b>   |

\*This also includes jobs for 875 hotel rooms not included in the SF

### File Transmittal

Please find the following files included with this document.

- 1) Maps displaying AM and PM peak hour directional volumes to and from the GNM TAZ for all four scenarios at local and neighborhood scales.
- 2) Loaded Model Network (*NetworkOut.dbd*) for each scenario – includes directional and peak hour volume select link output fields:
  - AB/BA\_AM\_SelectLink
  - AB/BA\_PM\_SelectLink

3) An assignment matrix (*hourAutoTrips.mtx*) for each scenario – includes trips between each TAZ pair.

- GNM redevelopment area is within TAZ 3073.
- A TAZ boundary file is included for reference.

A link to the files will be provided via email. Please confirm receipt of this data and let us know if you have any questions.

Below is a map of the AM Select Link results for Scenario A “v4\_SPUI\_LowCap”. Numbers written on the map are 1000s of vehicles.

# MEMO

**TO:** Jason Deshaies  
**FROM:** Stephen Tuttle; Colin Smith  
**DATE:** January 23, 2024  
**SUBJECT:** SMTC Travel Demand Modeling for Micron Scenario C

---

On behalf of the Syracuse Metropolitan Transportation Council (SMTC), RSG has conducted a series of scenario model runs, using the SMTC Version 6.0 travel model, to assist ongoing analysis for the proposed Micron facility in Clay, NY.

The latest runs examine network “Scenario C”, a set of roadway projects proposed to mitigate traffic linked to the Micron facility. Figure 1 illustrates the significant roadway projects included in Scenario C. These roadway projects are in addition to the roadway projects included in the 2040 No Build scenario (as discussed in the December 10, 2023, memorandum for Scenario A).

Scenario C includes a new interchange at I-81 and Sneller Road, as well as an extra lane in each direction along Route 11. The actual Scenario C proposal also includes a diverging diamond interchange (DDI) at I-81 and Route 31; however, the model runs for Scenario C include a single-point urban interchange (SPUI) at the I-81 and Route 31 interchange (the same as in Scenario A) since it was felt that coding the DDI into the SMTC regional model would not result in an important difference, relative to the SPUI. The model runs for Scenario C also include a connection from Pasubio Terrace to Lakeshore Road that is not proposed. This connection provides a link between Lakeshore and Pardee that otherwise would be provided by Carmenica Drive, which is not included in the SMTC model. A signalized intersection was coded for the Micron driveway to US-11, but not for the other access points, which is analogous to the coding for Scenario A.

FIGURE 1: SCENARIO C NETWORK PROJECTS

Two versions of Scenario C were created:

1. “SC1” – This scenario is analogous to the “CCs Equal” version of Scenario A, where the all the Micron centroid connectors have the same travel time.
2. “SC2” – This scenario includes the changes from the “SC1” version and assumes the node capacity at the SR-31 SPUI decreases from 6600 to 4400 and the (midpoint) link capacity of the I-81 NB to SR-31 WB ramp decreases from 1500 to 400 vehicles per lane. (Note: the SMTc model employs static assignment where volume can exceed capacity. If volume exceeds capacity, the travel time keeps increasing and the route becomes less and less attractive.)

## Summary of Results

Micron select link analyses were performed to help examine the results. Figure 2 and Figure 3 show the select link results for SC1 and Figure 4 and Figure 5 show the results for SC2. Key observations include:

- Demand from the north uses the new interchange at I-81 and Sneller.
- Demand from the south heavily uses the I-81 and SR-31 interchange. In SC2, which includes reduced capacity at the SPUI, some vehicles are diverted towards Caughenoy, Stearns, and US-11.
- The centroid connector along US-11 (connector 6) is significantly used by demand from the south and north.
- Demand from the west heavily uses SR-31.

**FIGURE 2: SC1 AM SELECT LINK**

FIGURE 3: SC1 AM SELECT LINK ZOOMED

FIGURE 4: SC2 AM SELECT LINK

FIGURE 5: SC2 AM SELECT LINK ZOOMED

## Analysis Outputs

The following output files are provided for the 2040 scenario runs:

- AM peak hour assigned link flows (*flowTable7.bin*)
- PM peak hour assigned link flows (*flowTable17.bin*)
- Loaded Model Network with select link flows (*NetworkOut.dbd*)
- Select Link Matrix

An assignment matrix ("hourAutoTrips.mtx") is also included for the "SC1" scenario. This assignment matrix should be nearly identical to the ones used in the other scenarios, and it can be used for general analysis of Scenario C.

# MEMO

**TO:** Jason Deshaies  
**FROM:** Stephen Tuttle; Colin Smith  
**DATE:** January 3, 2024  
**SUBJECT:** SMTC Travel Demand Modeling for Micron Scenario A

---

On behalf of the Syracuse Metropolitan Transportation Council (SMTC), RSG has conducted a series of scenario model runs, using the SMTC Version 6.0 travel model, to assist ongoing analysis for the proposed Micron facility in Clay, NY.

The latest model runs examine changes to the original Scenario A runs. Three scenarios were created:

1. “481Conn 50MPH” – This scenario includes a correction to the free flow speed of the proposed SR-481 to SR-31 connector. The speed between the roundabout and the Micron connector (access point 2) is now coded as 50 MPH.
2. “CCs Equal” – This scenario includes the changes in “481Conn 50MPH” and assumes the Micron centroid connectors (CCs) have equal travel times. This means vehicles will enter the Micron facility as quickly as possible, and will not consider the length of centroid connectors. Previously, vehicles had to drive along the centroid connectors at 15MPH to reach designated parking lots.
3. “SPUI LowCap” – This scenario includes the changes from the “CCs Equal” and “481Conn 50MPH” scenarios and assumes the node capacity at the SR-31 SPUI decreases from 6600 to 4400 and the (midpoint) link capacity of the I-81 NB to SR-31 WB ramp decreases from 1500 to 400 vehicles per lane. (Note: the SMTC model employs static assignment where volume can exceed capacity. If volume exceeds capacity, the travel time keeps increasing and the route becomes less and less attractive.)

## Summary of Results

AM flows were tabulated for a series of analysis links. The analysis links include all of the centroid connectors for the west and east zones as well as key routes that may be used for AM northbound travel to the Micron facility.

**FIGURE 1: ANALYSIS LINKS**

Figure 2 shows AM flows along the analysis links for the three scenarios and the original “SA15” scenario, which is the baseline scenario. Key observations include:

- Caughdenoy, Stearns, and US-11 are all used as access routes. In other words, not all the traffic diverted away from the I-81/SR-31 interchange goes to the new 481 connector.
- The speed increase to 50 MPH on the 481 connector induces some traffic, but the overall flow on this link is similar to before.
- The equal travel time assumption for Micron centroid connectors makes access points 3 and 4 much less attractive and access points 1, 2, 5, and 6 more attractive.
- The SPUI capacity decrease resulted in about 400 vehicles being diverted away from the I-81/SR-31 interchange. The SPUI LowCap scenario added about a minute of new delay at the SPUI (in addition to diverting 400 vehicles).

**FIGURE 2: AM FLOWS ON ANALYSIS LINKS**

| Link          | SA15  | 481Conn 50mph | CCs Equal | SPUI LowCap |
|---------------|-------|---------------|-----------|-------------|
| 481 Connector | 559   | 744           | 592       | 585         |
| Caughdenoy    | 761   | 734           | 354       | 457         |
| Stearns       | 606   | 562           | 327       | 512         |
| US11          | 993   | 963           | 1,060     | 1,083       |
| 81NB to 31WB  | 1,619 | 1,580         | 2,313     | 1,914       |
| W1            | 0     | 0             | 186       | 198         |
| W2            | 166   | 232           | 966       | 1,077       |

| E4            | 1,119 | 1,039         | 11        | 7           |
| E5            | 0     | 0             | 16        | 20          |
| E6            | 25    | 24            | 788       | 788         |

## Analysis Outputs

The following output files are provided for the 2040 scenario runs:

- AM peak hour assigned link flows (*flowTable7.bin*)
- PM peak hour assigned link flows (*flowTable17.bin*)
- Loaded Model Network (*NetworkOut.dbd*)

An assignment matrix ("hourAutoTrips.mtx") is also included for the "481Conn 50MPH" scenario. This assignment matrix should be nearly identical to the ones used in the other scenarios, and it can be used for general analysis of Scenario A.

SMTC Travel Demand Model Results: **Scenario A v2** (15 MPH Micron TAZ Centroid Connectors and Increased New Road Free Flow Speed to 50 MPH) – **AM PEAK HOUR CHANGE IN VOLUMES**

The graphic to the right shows the general assumptions for **Scenario A v2** →

Notes:

- All 2040 scenarios include projected future land use growth (including Micron)
- No Build in this document refers to no Micron related road network changes
- **RED** callouts note the revisions made to Scenario A

New road free flow speed increased to 50 MPH

The graphic to the right is an example of what is included in this document →

The map on the left displays the change in **AM** volumes between the 2020 existing conditions base model to the 2040 No Build (**2040 NB AM Volumes less 2020 AM volumes**). No Build in this case refers to no network improvements, the build future land use conditions are included (including Micron).

The map on the right displays the change in **AM** volumes between the 2040 No Build to the 2040 Scenario "X" Build (**2040 Scenario "X" Build AM Volumes less 2040 NB AM volumes**).

MAP NOTES:

- **Green** segments = positive change between identified scenarios
- **Red** segments = negative change between identified scenarios
- **Black numbers** = change in volumes by direction
- **Blue** segments = links that have changed or are new for that scenario therefore a change can **NOT** be calculated
- **Blue numbers** = modeled volume by direction on that segment for that scenario (change could NOT be calculated for that link)
- **Gray** segments = TAZ centroid connectors (general representation of access roads and driveways)

To get total future volume on a segment add up the numbers from both maps and then add that to existing traffic counts.

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario A network changes  
Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario A v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**

Build: All future land use and anticipated transportation projects with Scenario A network changes  
Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes

No Build: All future land use and anticipated transportation projects but no Scenario A network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

2040 Scenario A v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes

Build: All future land use and anticipated transportation projects with Scenario A network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**(TOP MAP) 2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**(Bottom MAP) 2040 Scenario A v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario A network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario A v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**

Build: All future land use and anticipated transportation projects with Scenario A network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario A v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes

**2040 Scenario A v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**

Build: All future land use and anticipated transportation projects with Scenario A network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario A v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**

Build: All future land use and anticipated transportation projects with Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario A network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario A v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**

Build: All future land use and anticipated transportation projects with Scenario A network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario A v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**

Build: All future land use and anticipated transportation projects with Scenario A network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

SMTC Travel Demand Model Results: **Scenario A v3** (Scenario A v2 and Equal Travel Time Micron Centroid Connectors) – **AM PEAK HOUR CHANGE IN VOLUMES**

The graphic to the right shows the general assumptions for **Scenario A v3** →

Notes:

- All 2040 scenarios include projected future land use growth (including Micron)
- No Build in this document refers to no Micron related road network changes
- **RED** callouts note the revisions made to Scenario A

The graphic to the right is an example of what is included in this document →

The map on the left displays the change in **AM** volumes between the 2020 existing conditions base model to the 2040 No Build (**2040 NB AM Volumes less 2020 AM volumes**). No Build in this case refers to no network improvements, the build future land use conditions are included (including Micron).

The map on the right displays the change in **AM** volumes between the 2040 No Build to the 2040 Scenario "X" Build (**2040 Scenario "X" Build AM Volumes less 2040 NB AM volumes**).

MAP NOTES:

- **Green** segments = positive change between identified scenarios
- **Red** segments = negative change between identified scenarios
- **Black numbers** = change in volumes by direction
- **Blue** segments = links that have changed or are new for that scenario therefore a change can **NOT** be calculated
- **Blue numbers** = modeled volume by direction on that segment for that scenario (change could NOT be calculated for that link)
- **Gray** segments = TAZ centroid connectors (general representation of access roads and driveways)

To get total future volume on a segment add up the numbers from both maps and then add that to existing traffic counts.

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**

SMTC Travel Demand Model Results: **Scenario C v1** (New I81 Interchange & SPUI @ Rt31 & I81) – **AM PEAK HOUR CHANGE IN VOLUMES**

The graphic to the right shows the general assumptions for **Scenario C v1** →

Notes:

- All 2040 scenarios include projected future land use growth (including Micron)
- **RED** callouts note the revisions made to Scenario C

Equal travel time for  
all Micron TAZ  
centroid connectors

The graphic to the right is an example of what is included in this document →

The map on the left displays the change in **AM** volumes between the 2020 existing conditions base model to the 2040 No Build (**2040 NB AM Volumes less 2020 AM volumes**). No Build in this case refers to no network improvements, the build future land use conditions are included (including Micron).

The map on the right displays the change in **AM** volumes between the 2040 No Build to the 2040 Scenario “X” Build (**2040 Scenario “X” Build AM Volumes less 2040 NB AM volumes**).

MAP NOTES:

- **Green** segments = positive change between identified scenarios
- **Red** segments = negative change between identified scenarios
- **Black numbers** = change in volumes by direction
- **Blue** segments = links that have changed or are new for that scenario therefore a change can **NOT** be calculated
- **Blue numbers** = modeled volume by direction on that segment for that scenario (change could NOT be calculated for that link)
- **Gray** segments = TAZ centroid connectors (general representation of access roads and driveways)

To get total future volume on a segment add up the numbers from both maps and then add that to existing traffic counts.

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario C network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**

Build: All future land use and anticipated transportation projects with Scenario C network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build AM Volumes - 2020 Existing Conditions AM Volumes = Change in AM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 AM Volumes - 2040 No Build AM Volumes = Change in AM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

SMTC Travel Demand Model Results: **Scenario C v2** (New I81 Interchange & Reduced Capacity SPUI @ Rt31 & I81) – **PM PEAK HOUR CHANGE IN VOLUMES**

The graphic to the right shows the general assumptions for **Scenario C v2** →

Notes:

- All 2040 scenarios include projected future land use growth (including Micron)
- **RED** callouts note the revisions made to Scenario C

Equal travel time for  
all Micron TAZ  
centroid connectors

REDUCED CAPACITY  
SPUI instead of DDI

The graphic to the right is an example of what is included in this document →

The map on the left displays the change in **PM** volumes between the 2020 existing conditions base model to the 2040 No Build (**2040 NB PM Volumes less 2020 PM volumes**). No Build in this case refers to no network improvements, the build future land use conditions are included (including Micron).

The map on the right displays the change in **PM** volumes between the 2040 No Build to the 2040 Scenario “X” Build (**2040 Scenario “X” Build PM Volumes less 2040 NB PM volumes**).

MAP NOTES:

- **Green** segments = positive change between identified scenarios
- **Red** segments = negative change between identified scenarios
- **Black numbers** = change in volumes by direction
- **Blue** segments = links that have changed or are new for that scenario therefore a change can **NOT** be calculated
- **Blue numbers** = modeled volume by direction on that segment for that scenario (change could NOT be calculated for that link)
- **Gray** segments = TAZ centroid connectors (general representation of access roads and driveways)

To get total future volume on a segment add up the numbers from both maps and then add that to existing traffic counts.

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**

No Build: All future land use and anticipated transportation projects but no Scenario C network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**

Build: All future land use and anticipated transportation projects with Scenario C network changes

Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**(TOP MAP) 2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**(Bottom MAP) 2040 Scenario C v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 Scenario C v2 PM Volumes - 2040 No Build PM Volumes = Change in PM Volumes**  
Build: All future land use and anticipated transportation projects with Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

**2040 No Build PM Volumes - 2020 Existing Conditions PM Volumes = Change in PM Volumes**  
No Build: All future land use and anticipated transportation projects but no Scenario C network changes  
 Blue segments: links in the model that changed or are new; Blue numbers: volume for scenario (NOT change)

## Department of Transportation

KATHY HOCHUL  
Governor

MARIE THERESE DOMINGUEZ  
Commissioner

DAVID P. SMITH, P.E.  
Regional Director

January 13, 2023

Mr. Gordon Stansbury P.E., PTOE  
GTS Consulting  
1396 White Bridge Road  
Chittenango, NY 13037

Dear Mr. Stansbury:

RE: PROPOSED LAKESHORE VILLAGE  
DEVELOPMENT TRAFFIC IMPACT STUDY  
TOWN OF CICERO, ONONDAGA COUNTY

The New York State Department of Transportation (NYSDOT) has completed its review of the July 2022 Traffic Impact Study (TIS) prepared by GTS Consulting for the subject project. Please see our responses to the proposed mitigation below.

### Route 31 @ I-81 NB/Pardee Road

#### Proposed mitigation:

- Restripe the northbound through lane to allow shared through and right turn movements.
  - **Disagree:** This could create a safety concern by giving motorists the chance to turn right on red from the middle lane, or it may show false capacity improvement as motorist would still utilize the right most lane and avoid being in the middle lane because they can't attempt to turn on red from the middle lane.

#### Recommendation:

- Extend the northbound right turn only lane to 350'.
- Widening to a point 400' from the stop bar to allow for the opening to two lanes (thru and left) in advance, to reduce the chance of blocking a lane by queues on another lane on this approach.

### Route 31 @ Lakeshore Road and Lakeshore Road Spur

#### Proposed mitigation:

- Install a 2-phase traffic signal with protected permitted eastbound left turn phasing and overlap southbound right turn phasing.
- Restrict the Lakeshore Road approach to NYS Route 31 to right turn only movements.

**Disagree:** After including the existing signal at Route 31 @ Lakeshore Road Spur, the traffic simulation results show significant queue lengths and delays. The results shown from Synchro analysis under the TIS alternative can be deceiving as each intersection is evaluated independently.

Recommendation:

- Install a new traffic signal at Route 31 @ Lakeshore Road and replace the existing signal at Lakeshore Road Spur. Both signals to be controlled by one controller.
- Convert the Lakeshore Road southbound approach to a one-way, two-lane segment between Route 31 and the spur to be dual right.
- Physically restrict turning left from Route 31 into Lakeshore Road by a narrow island that extends from the easterly edge of Saporì Restaurant driveway to the Lakeshore Spur intersection.
- Convert the Two-Way-Left-Turn-Lane (TWLTL) on Route 31 between Lakeshore Road and Lakeshore Road Spur to an exclusive left turn lane in the EB direction, to add storage to the existing EB left turn lane at the Lakeshore Road intersection.
- Widen the Lakeshore Road Spur NB Lane to become a free right turn lane and a short, left turn storage (stop controlled).
- Widen Route 31 WB between Lakeshore Road and to a point approximately 275' east of the Lakeshore Road Spur to add an additional lane for added capacity.
- Construct a short south-westbound left turn bay for traffic turning left into the spur.

Route 31 @ South Bay Road

Proposed Mitigation:

- Construct a 150-foot exclusive northbound right turn lane on South Bay Road.
- Optimize the signal operations periodically.
  - **Agree**

Additional Comments

- NYSDOT will optimize the traffic signal timing for the network based on field condition post build.
- The required mitigation must be completed in the initial development phase.
- Any property acquisition required to mitigate the proposed development is the sole responsibility of the developer.
- Future roadway improvements by others, i.e. Micron, may overlap or conflict with the recommended mitigation.

Any work within the state Right-of-Way (ROW) will require coordination with the NYSDOT to obtain a highway work permit. The developer should continue to coordinate with the regional Highway Work Permit Group. Any questions regarding the permit process or TIS review can be directed to Jeff Deep, Acting Regional Permit Engineer, at [Jeffrey.Deep@dot.ny.gov](mailto:Jeffrey.Deep@dot.ny.gov) or (315) 428-3233.

Very truly yours,

Scott R. Bates, P.E., PTOE  
Regional Traffic Engineer

Mr. Gordon Stansbury P.E., PTOE  
GTS Consulting  
1396 White Bridge Road  
Chittenango, NY 13037

Dear Mr. Stansbury:

RE: PROPOSED LAKESHORE VILLAGE  
DEVELOPMENT TRAFFIC IMPACT STUDY  
TOWN OF CICERO, ONONDAGA COUNTY

The New York State Department of Transportation (NYSDOT) has completed its review of the July 2022 Traffic Impact Study (TIS) prepared by GTS Consulting for the subject project. Please see our responses to the proposed mitigation below.

Route 31 @ I-81 NB/Pardee Road

Proposed mitigation:

- Restripe the northbound through lane to allow shared through and right turn movements.
  - **Disagree:** This could create a safety concern by giving motorists the chance to turn right on red from the middle lane, or it may show false capacity improvement as motorist would still utilize the right most lane and avoid being in the middle lane because they can't attempt to turn on red from the middle lane.

Recommendation:

- Extend the northbound right turn only lane to 350'.
- Widening to a point 400' from the stop bar to allow for the opening to two lanes (thru and left) in advance, to reduce the chance of blocking a lane by queues on another lane on this approach.

Route 31 @ Lakeshore Road and Lakeshore Road Spur

Proposed mitigation:

- Install a 2-phase traffic signal with protected permitted eastbound left turn phasing and overlap southbound right turn phasing.
- Restrict the Lakeshore Road approach to NYS Route 31 to right turn only movements.

**Disagree:** After including the existing signal at Route 31 @ Lakeshore Road Spur, the traffic simulation results show significant queue lengths and delays. The results shown from Synchro analysis under the TIS alternative can be deceiving as each intersection is evaluated independently.

Recommendation:

- Install a new traffic signal at Route 31 @ Lakeshore Road and replace the existing signal at Lakeshore Road Spur. Both signals to be controlled by one controller.
- Convert the Lakeshore Road southbound approach to a one-way, two-lane segment between Route 31 and the spur to be dual right.
- Physically restrict turning left from Route 31 into Lakeshore Road by a narrow island that extends from the easterly edge of Saporì Restaurant driveway to the Lakeshore Spur intersection.
- Convert the Two-Way-Left-Turn-Lane (TWLTL) on Route 31 between Lakeshore Road and Lakeshore Road Spur to an exclusive left turn lane in the EB direction, to add storage to the existing EB left turn lane at the Lakeshore Road intersection.
- Widen the Lakeshore Road Spur NB Lane to become a free right turn lane and a short, left turn storage (stop controlled).
- Widen Route 31 WB between Lakeshore Road and to a point approximately 275' east of the Lakeshore Road Spur to add an additional lane for added capacity.
- Construct a short south-westbound left turn bay for traffic turning left into the spur.

Route 31 @ South Bay Road

Proposed Mitigation:

- Construct a 150-foot exclusive northbound right turn lane on South Bay Road.
- Optimize the signal operations periodically.
  - **Agree**

Additional Comments

- NYSDOT will optimize the traffic signal timing for the network based on field condition post build.
- The required mitigation must be completed in the initial development phase.
- Any property acquisition required to mitigate the proposed development is the sole responsibility of the developer.
- Future roadway improvements by others, i.e. Micron, may overlap or conflict with the recommended mitigation.

Any work within the state Right-of-Way (ROW) will require coordination with the NYSDOT to obtain a highway work permit. The developer should continue to coordinate with the regional Highway Work Permit Group. Any questions regarding the permit process or TIS review can be directed to Jeff Deep, Acting Regional Permit Engineer, at [Jeffrey.Deep@dot.ny.gov](mailto:Jeffrey.Deep@dot.ny.gov) or (315) 428-3233.

Very truly yours,

## Proposed Lakeshore Village Development Lakeshore Road, Cicero, NY

The site is located at 6777 Lakeshore Road in Cicero NY and includes the property associated with the existing Lakeshore Yacht & Country Club on both the north and south sides of Lakeshore Road. The following provides a breakdown of the anticipated land uses within the development:

| <i>North Side Development</i> |                              | <i>South Side Development</i> |
|-------------------------------|------------------------------|-------------------------------|
| 266 Apartments                | 36,000 SF Clubhouse          | 123 Apartments                |
| 20,000 SF Office Space        | 120 Room Hotel               | 163 Single Family Homes       |
| 20,000 SF Retail Space        | 500 person Conference Center | 20 Townhouses                 |
| 26,000 SF – Restaurant Space  | 116 Berth Marina             |                               |
| 30 Condominiums               |                              |                               |

Access to the development will be to/from Lakeshore Road, to the east of South Bay Road.

# TRAFFIC IMPACT STUDY

Prepared in Accordance With  
Chapter 5 of the NYSDOT Highway Design Manual (HDM)

## 1.0 Summary of Traffic Impacts

- A. A capacity analysis was performed per the NYSDOT Highway Design Manual Chapter 5. (Refer to Section 3 of this report):

The capacity analysis of the build condition with the recommended mitigation and traffic signal/timing optimization indicates that the proposed development will have no significant impacts on traffic operations in the study area.

The following mitigation measures are recommended:

- Lakeshore Road @ Site Access
  - Install a two way center left turn lane between the middle and eastern full access driveways to provide 100 foot eastbound and westbound left turn lane at both locations.
  - Review traffic operations periodically as the development is completed to determine if a traffic signal is warranted at the eastern access location.
- NYS Route 31 @ South Bay Road
  - Construct a 150 foot northbound right turn lane on South Bay Road.
  - Optimize the signal operations periodically.
- NYS Route 31 @ Lakeshore Road
  - Install a 2-phase traffic signal with protected permitted eastbound left turn phasing and overlap southbound right turn phasing.
  - Restrict the Lakeshore Road approach to NYS Route 31 to right turn only movements.
- NYS Route 31 @ I-81 Northbound Offramp
  - Restripe the northbound through lane to allow shared through and right turn movements.
- NYS Route 31 @ Route 11, I-81 and Lakeshore Road
  - Optimize traffic signal operations and coordination parameters periodically.

With the proposed improvements noted above, traffic movements are generally projected to operate at levels consistent with the background condition at both the signalized and unsignalized intersections in the study area.

There is notable existing traffic congestion along NYS Route 31 between Lakeshore Road and NYS Route 11 under the existing conditions, with limited options to improve operations outside of major reconstruction of the I-81 interchange. The proposed mitigation, along with signal timing optimization, will offset the additional traffic generated by the proposed development without any significant impacts to existing traffic operations.

There are some potentially longer delays exiting the proposed development onto Lakeshore Road under the full build condition, even with the recommended widening to include a center left turn lane. Given that the proposed development will be completed over a number of years, it is recommended that operations be reviewed periodically at the site access to determine if a traffic signal or other mitigation is necessary to accommodate the site generated traffic.

- B. A crash analysis was performed per Highway Design Manual Chapter 5 on NYS Route 31 from NYS Route 11 to Lakeshore Road (east), on Lakeshore Road between both ends at NYS Route 31, and on South Bay Road between Thompson Road and Lakeshore Road. Refer to Section 4 of this report.

## 2.0 Operational Data – Existing Conditions

### 2.1 Travel Speeds

The posted speed limit on Lakeshore Road in the study area is 35 mph passing the site. 50 spot speed measurements were collected in each direction passing the site to determine the average and 85<sup>th</sup> percentile operating speeds. The posted speed limits and 85<sup>th</sup> percentile speeds, determined based on NYSDOT Highway Design Manual Chapter 5, Section 5.2, are shown in the table below.

| <b><i>Exhibit 1<br/>Speed Data</i></b> |                        |                            |                                               |
|----------------------------------------|------------------------|----------------------------|-----------------------------------------------|
| <b><i>Street Name</i></b>              | <b><i>Location</i></b> | <b><i>Posted Speed</i></b> | <b><i>Operating Speed<br/>Spot Speeds</i></b> |
| <i>Lakeshore Road</i>                  | <i>Passing Site</i>    | <i>35 mph</i>              | <i>EB – 44 mph<br/>WB – 46 mph</i>            |

### 2.2 Traffic Gap

Gap data was collected to assess the ability for vehicles to turn in and out of the proposed driveways on Lakeshore Road. In order for a vehicle to turn right out of the northern driveways, or left into the northern driveways, the vehicle only requires a gap in the westbound direction on Lakeshore Road. In order for a vehicle to turn right out of the southern driveways, or left into the southern driveways, the vehicle only requires a gap in the eastbound direction on Lakeshore Road. A vehicle requires a gap in traffic in both directions at the same time to turn left out of the northern and southern driveways onto Lakeshore Road. These gaps in traffic were observed and timed on Lakeshore Road during the weekday morning, weekday evening, and Saturday traffic count periods. The gaps were then converted to a number of vehicles that could turn left or right out of the site driveways during each gap and then totaled for the peak hour. For example, one vehicle can turn from a driveway with a 6-9 second gap in traffic, two can turn with a 10-13 second gap, 3 with a 14-17 second gap, 4 with an 18-19 second gap, etc.

Based on the gap data collected, there are sufficient gaps in traffic to accommodate approximately 600 vehicles turning right out of both the northern and southern driveways during the peak hours. There are sufficient gaps on Lakeshore Road to accommodate approximately 500-600 vehicles turning left out of the driveways during each peak hour. There are no concerns with existing available gaps in traffic.

### 2.3 Driveway Sight Distance

Sight lines looking east/west along Lakeshore Road from each of the proposed site driveways were collected for comparison to design standards in order to confirm that adequate sight lines are available for safe ingress and egress from the site.

The following table provides a summary of the recommended sight distances along Lakeshore Road from the AASHTO A Policy on Design of Highways and Streets as well as the available sight distances based on field measurements. Operating speeds of 45 mph on Lakeshore Road were used in the review.

| Sight Distance Summary                                                 |                 |                               |                                   |                          |
|------------------------------------------------------------------------|-----------------|-------------------------------|-----------------------------------|--------------------------|
| Location                                                               | Operating Speed | Direction                     | AASHTO Recommended Sight Distance | Available Sight Distance |
| Lakeshore Road @<br>Western Site Access (N. Side)<br>Turning Right Out | 45 mph          | Looking Left                  | 430 feet                          | 1,300 feet               |
| Lakeshore Road @<br>Western Site Access (N. Side)<br>Turning Left Out  | 45 mph          | Looking Left<br>Looking Right | 500 feet<br>500 feet              | 1,300 feet<br>525 feet   |
| Lakeshore Road @<br>Middle Site Access (N. Side)<br>Turning Right Out  | 45 mph          | Looking Left                  | 430 feet                          | 850 feet                 |
| Lakeshore Road @<br>Middle Site Access (N. Side)<br>Turning Left Out   | 45 mph          | Looking Left<br>Looking Right | 500 feet<br>500 feet              | 850 feet<br>660 feet     |
| Lakeshore Road @<br>Middle Site Access (S. Side)<br>Turning Right Out  | 45 mph          | Looking Left                  | 430 feet                          | 860 feet                 |
| Lakeshore Road @<br>Middle Site Access (S. Side)<br>Turning Left Out   | 45 mph          | Looking Left<br>Looking Right | 500 feet<br>500 feet              | 860 feet<br>870 feet     |
| Lakeshore Road @<br>Eastern Site Access (N. Side)<br>Turning Right Out | 45 mph          | Looking Left                  | 430 feet                          | 700 feet                 |
| Lakeshore Road @<br>Eastern Site Access (N. Side)<br>Turning Left Out  | 45 mph          | Looking Left<br>Looking Right | 500 feet<br>500 feet              | 700 feet<br>110 feet     |
| Lakeshore Road @<br>Eastern Site Access (S. Side)<br>Turning Right Out | 45 mph          | Looking Left                  | 430 feet                          | 1,100 feet               |
| Lakeshore Road @<br>Eastern Site Access (N. Side)<br>Turning Left Out  | 45 mph          | Looking Left<br>Looking Right | 500 feet<br>500 feet              | 1,100 feet<br>500 feet   |

There is more than adequate sight distance looking east/west along Lakeshore Road from each of the proposed driveway locations. There are no concerns with sight distances associated with safety for ingress and egress from the site driveway.

### 3.0 Capacity Analysis

#### Capacity Analysis Overview

Capacity analyses performed in this report are consistent with the most recent version of the Highway Capacity Manual (HCM). The software used to perform this analysis is Synchro10.

The HCM quantifies the quality of traffic flow in terms of levels of service (LOS). There are six levels of service, with LOS A indicating very low levels of delays and LOS F indicating high levels of delays associated with congestion. These represent a qualitative measure of operational conditions within a traffic stream, and the perception of conditions by motorists and/or passengers. Levels of service and capacity for signalized intersections are calculated for each lane group (a lane group may be one or more movements), each intersection approach, and the intersection as a whole. The intersection level of service is merely a weighted average of the individual approaches and may not be considered a valid

measure of the quality or acceptability of an intersection design since it can conceal poor operating conditions on individual approaches.

Levels of service at unsignalized intersections are only calculated for minor movements since the through movement on the major street is not affected by intersection traffic control. The level of service for signalized intersections and unsignalized intersections can be compared.

The corresponding level of service represents the congestion of the roadway.

#### LOS for Signalized Intersection

| Control Delay (s/veh) | LOS by Volume-to-Capacity Ratio (v/c) |          |
|-----------------------|---------------------------------------|----------|
|                       | v/c ≤1.0                              | v/c >1.0 |
| ≤10                   | A                                     | F        |
| >10-20                | B                                     | F        |
| >20-35                | C                                     | F        |
| >35-55                | D                                     | F        |
| >55-80                | E                                     | F        |
| >80                   | F                                     | F        |

HCM 2010, Exhibit 18-4, p. 18-6

#### LOS for Non-Signalized Intersections

| Control Delay (s/veh) | LOS by Volume-to-Capacity Ratio (v/c) <sup>a, b</sup> |          |
|-----------------------|-------------------------------------------------------|----------|
|                       | v/c ≤1.0                                              | v/c >1.0 |
| ≤10                   | A                                                     | F        |
| >10-15                | B                                                     | F        |
| >15-25                | C                                                     | F        |
| >25-35                | D                                                     | F        |
| >35-50                | E                                                     | F        |
| >50                   | F                                                     | F        |

**NOTE:** <sup>a, b</sup> For approaches and intersection-wide assessment, LOS is defined solely by control delay.

**2-way stop control - HCM 2010, Exhibit 19-1, p. 19-2**

### 3.1 Existing Volumes

2019 AADT traffic volumes on Route 31, Lakeshore Road and South Bay Road were obtained from the NYSDOT Traffic Data Viewer. New traffic turning movement counts were collected at the following 11 study area intersections on two weekdays and one Saturday between May 11<sup>th</sup> and May 21<sup>st</sup>, 2022.

- NYS Route 31 @ NYS Route 11
- NYS Route 31 @ I-81 SB Ramps
- NYS Route 31 @ I-81 NB Offramp / Pardee Road
- NYS Route 31 @ Lakeshore Road (West)
- NYS Route 31 @ South Bay Road
- NYS Route 31 @ Cicero Center Road
- NYS Route 31 @ Lakeshore Road (East)
- Lake Shore Road @ Mudd Mill Road
- Lake Shore Road @ South Bay Road
- Lake Shore Road @ Cicero Center Road / Van Antwerp Drive
- South Bay Road @ Thompson Road

The traffic counts were collected during the weekday morning (7-9am), weekday evening (4-6pm) peak travel periods on two separate days, and during the Saturday midday (11am-1pm) peak travel period on one Saturday to ensure that actual peak hours of the adjacent streets were captured. The traffic counts included separate heavy vehicle counts per direction and pedestrians. There was minor pedestrian

activity during the traffic count periods. Based on the traffic counts collected, the peak hours were identified as follows:

- Morning peak hour - 7:15-8:15am
- Evening peak hour - 4:30-5:30pm
- Saturday peak hour – 11:00am-12:00pm

The two weekday counts at each study area intersection were averaged. The count averages and traffic count data has been attached.

The 2022 existing traffic volumes collected in May were compared to historical counts taken from the NYSDOT Traffic Data Viewer Website to identify any adjustments to account for seasonal variations or any lingering impacts from the Covid pandemic. Specifically, the evening peak hour traffic volumes on the following roadway segments were compared to the AADT design hour and directional design traffic volumes:

- NYS Route 31 – NYS Route 11 to I-81
- NYS Route 31 – South Bay Road to Lakeshore Road (East)
- South Bay Road – Thompson Road to NYS Route 31
- I-81 Northbound Offramp at NYS Route 31
- I-81 Southbound Offramp at NYS Route 31
- I-81 SB Onramp at NYS Route 31

Based on the comparison of the total 2022 traffic volumes at these six locations to the total historical traffic volumes at these six locations, the 2022 traffic volumes were found to be 15% lower during the evening peak hour. In order to account for any reductions in traffic due to seasonal variations or the COVID pandemic, all of the 2022 traffic counts were multiplied by a factor of 1.15 for the weekday morning, weekday evening and Saturday midday peak hours.

AADT traffic volumes on the study area roadways based on the Traffic Data Viewer and a conservatively high 0.5% annual growth rate compared to actual historic growth trends are shown in the table below.

| <b>Existing Traffic Volumes for Study Area (No Build)</b> |                            |            |                       |            |                          |            |                          |            |
|-----------------------------------------------------------|----------------------------|------------|-----------------------|------------|--------------------------|------------|--------------------------|------------|
| <b>STREET NAME</b>                                        | <b>EXISTING<br/>(2022)</b> |            | <b>ETC<br/>(2032)</b> |            | <b>ETC+20<br/>(2052)</b> |            | <b>ETC+30<br/>(2062)</b> |            |
|                                                           | <i>AADT</i>                | <i>DHV</i> | <i>AADT</i>           | <i>DHV</i> | <i>AADT</i>              | <i>DHV</i> | <i>AADT</i>              | <i>DHV</i> |
| <i>Route 31<br/>Between Route 11 &amp; I-81</i>           | 34,901                     | 2,999      | 36,620                | 3,147      | 40,058                   | 3,443      | 41,778                   | 3,590      |
| <i>Route 31<br/>Between I-81 and South Bay</i>            | 12,971                     | 1,122      | 13,610                | 1,177      | 14,887                   | 1,287      | 15,526                   | 1,343      |
| <i>Route 31<br/>Between South Bay &amp; Lakeshore</i>     | 8,848                      | 809        | 9,283                 | 849        | 10,155                   | 929        | 10,591                   | 968        |
| <i>Lakeshore Road<br/>Between Weaver &amp; Maple</i>      | 4,320                      | 431        | 4,533                 | 453        | 4,958                    | 495        | 5,171                    | 516        |
| <i>South Bay Road<br/>Between Thompson &amp; Rte 31</i>   | 6,939                      | 754        | 7,280                 | 791        | 7,964                    | 866        | 8,306                    | 903        |

Lakeshore Road carries approximately 170 vehicles eastbound/153 vehicles westbound passing the site during the morning peak hour, 284 vehicles eastbound/212 vehicles westbound passing the site during the evening peak hour, and 259 vehicles eastbound/219 vehicles westbound passing the site during the Saturday peak hour.

The 2022 existing May traffic volumes are shown in Figures 1-3 for the three peak hours. The adjusted existing 2022 traffic volumes are shown in Figures 4-6.

### 3.2 Growth Rates

The proposed development is assumed to be completed over approximately 10 years, therefore 2032 was used as the design year for this study. In order to fully understand the impacts of the development on the adjacent roadway system, analysis of the operations immediately before the project opening must first be completed.

Historical traffic volumes along NYS Route 31 between the I-81 interchange and South Bay Road, along Lakeshore Road between Weaver Road and Maple Road, and along South Bay Road between Thompson Road and NYS Route 31, were taken from the NYSDOT Traffic Data Viewer website and reviewed in order to understand historical growth trends in the area. Long term growth rates in the area have been -0.2% per year on NYS Route 31 between 2009 and 2019, +3.7% per year on Lakeshore Road between 2010 and 2019, and -0.9% per year on South Bay Road between 2010 and 2019. It is noted that there was a significant jump in traffic on Lakeshore Road between 2010 and 2016 with negative growth between 2016 and 2019.

A positive value of +0.5% per year was chosen to grow the existing traffic volumes to the 2032 design year to maintain a conservative analysis of traffic operations in the area. The 2032 base traffic volumes with 0.5% growth per year (5% total) are shown in Figures 7-9.

In addition to unknown growth, specific approved trips were also included in the background traffic volumes. The Town of Cicero was contacted and indicated that the Lakeshore Marina Apartments, the Horner Farm Subdivision and the Lyons Runne Section 3 developments needed to be included in the background projections. Approved trips generated during the morning and the evening peak hours were taken from the Lakeshore Marina traffic impact study (GTS Consulting, March 2018), The Horner Farm traffic impact study and updated traffic review (GTS Consulting, January 2021 and September 2021) and the Lyons Runne traffic impact study (GTS Consulting, January 2017). The trips generated during the Saturday peak hour for each development were estimated using the ITE Trip Generation, 11<sup>th</sup> Edition. All trips generated were extrapolated through the study area based on existing traffic distributions during each peak hour. The approved trips generated by the Lakeshore Marina development are shown in Figure 10-12, the approved trips generated by the Horner Farm development are shown in Figures 13-15, and the approved trips generated by the Lyons Runne Section 3 development are shown in Figures 16-18.

The Town of Cicero also noted two minor approved developments, the Royal Car Wash on NYS Route 31 at NYS Route 11, and an auto repair shop on Route 31 @ Lakeshore Road. Given the minor trip generation characteristics for these two developments, additional traffic generated is assumed to be captured within the general background growth that was applied to the existing traffic volumes.

The 2032 background traffic volumes with 5% growth and the approved developments are shown in Figures 19-21.

### 3.3 Projected Trip Generation & Distribution

The proposed development includes:

#### North Side Development

- 266 Apartments (160 units in Mixed Use Buildings A-E, 106 unit in Residential Buildings D-E)
- 20,000 SF Office Space (Mixed Use Buildings A-E)
- 20,000 SF Retail Space (Mixed Use Buildings A-E)

- 26,000 SF – Restaurant Space (20,000 SF in Mixed Use Buildings A-E, 6,000 in Restaurant E)
- 30 Condominiums in the Main Building
- 36,000 SF Clubhouse in the Main Building
- 120 Room Hotel with 500 person Conference Center – Main Building
- 116 Berth Marina

#### South Side Development

- 123 Apartments (Residential Buildings A-C)
- 163 Single Family Homes
- 20 Townhouses

Trips generated by the proposed development were estimated using the ITE Trip Generation, 11<sup>th</sup> Edition, which is the industry accepted standard for estimating traffic generated by new developments.

The following Land Uses were used:

- Land Use 221 – Multifamily Housing (Mid-Rise) – Used for apartments and condominiums
- Land Use 710 – General Office Building – Used for office space
- Land Use 822 – Strip Retail Plaza (<40,000 SF) – Used for retail space
- Land Use 932 – High-Turnover (Sit-Down) Restaurant – Used for restaurant space
- Land Use 310 – Hotel – Used for Hotel & Conference Center
- Land Use 420 – Marina – Used for marina
- Land Use 210 – Single Family Detached Housing – Used for single family and estate lots
- Land Use 215 – Single Family Attached Housing – Used for townhouses

Individual trips were not estimated for the conference center as this use is specifically included within the hotel land use. Individual trips were also not estimated for the club house as this is an amenity for the residential land uses and not an independent traffic generator.

A portion of the traffic generation within the north side development will be internal trips that do not generate new vehicles on the adjacent roadways. For example, residents or people at the hotel/conference center will visit the retail or restaurant uses on the site. Likewise people that live on the site may work in the office spaces, or use the marina. A 15% multi-use reduction was applied to the north side trip generation estimate to account for these internal capture trips.

A portion of the retail and restaurant traffic generated by the development will be drawn from traffic already passing the site on Lakeshore Road and is referred to as pass-by trips. Pass-by trips are vehicles that are already traveling through the study area but will now stop at the development on their way to another destination, such as stopping on their way to or from work. Based on data from the ITE Trip Generation, the average pass-by trip percentage for Land Use 932 is 43% during the evening peak hour, and for land use 820 is 34% during the evening peak hour and 26% during the Saturday peak hour. A 10% pass-by trip percentage was assumed for the morning peak hour and a 30% pass-by trip percentage was assumed for evening/Saturday peak hours for the retail/restaurant uses. The credit was applied after the multi-use credit to avoid compounding credits.

The following tables summarize the trip generation estimate for the proposed Lakeshore Village development on Lakeshore Road in the Town of Cicero.

## Trip Generation Summary – North Side Development

|                                         | Morning<br>Peak Hour |            | Evening<br>Peak Hour |            | Saturday<br>Peak Hour |            |
|-----------------------------------------|----------------------|------------|----------------------|------------|-----------------------|------------|
|                                         | Entering             | Exiting    | Entering             | Exiting    | Entering              | Exiting    |
| Apartments / Condominiums – 306 units   | 25                   | 85         | 70                   | 45         | 58                    | 57         |
| Office – 20,000 SF                      | 26                   | 4          | 5                    | 24         | 6                     | 5          |
| Retail – 20,000 SF                      | 28                   | 19         | 66                   | 66         | 67                    | 64         |
| Restaurants – 26,000 SF                 | 137                  | 112        | 143                  | 92         | 148                   | 143        |
| Hotel – 120 rooms                       | 31                   | 24         | 36                   | 35         | 48                    | 38         |
| Marina – 116 berths                     | 3                    | 5          | 14                   | 10         | 11                    | 15         |
| <b>Total Individual Trips Generated</b> | <b>250</b>           | <b>249</b> | <b>334</b>           | <b>272</b> | <b>338</b>            | <b>322</b> |
| <i>Multi-Use Credit – 15%</i>           | <i>-38</i>           | <i>-37</i> | <i>-50</i>           | <i>-41</i> | <i>-51</i>            | <i>-48</i> |

| <b>Total New Trips Generated</b>        | <b>200</b>           | <b>200</b> | <b>237</b>           | <b>184</b> | <b>233</b>            | <b>221</b> |

## Trip Generation Summary – South Side Development

|                                 | Morning<br>Peak Hour |            | Evening<br>Peak Hour |           | Saturday<br>Peak Hour |           |
|---------------------------------|----------------------|------------|----------------------|-----------|-----------------------|-----------|
|                                 | Entering             | Exiting    | Entering             | Exiting   | Entering              | Exiting   |
| Apartments – 123 Units          | 10                   | 36         | 29                   | 19        | 24                    | 24        |
| Single Family Homes – 163 Units | 30                   | 84         | 96                   | 57        | 81                    | 69        |
| Townhouses – 20 Units           | 3                    | 7          | 6                    | 5         | 5                     | 6         |
| <b>Total Trips Generated</b>    | <b>43</b>            | <b>127</b> | <b>131</b>           | <b>81</b> | <b>110</b>            | <b>99</b> |

Many people expect that residential land uses will generate an average of 2 trips per unit during peak hours. The trip generation rates for standard residential land uses are generally less than 1 trip per unit for a number of reasons. The primary reason is that people work different times, some may leave for work at 6:30 in the morning while others may leave at 7:30 or 8:30. Subsequently, the arrival patterns home in the evening will also be staggered over multiple hours. Some people work evenings while others may stay at home or work from home. The rates contained in the ITE Trip Generation have been verified and provide an accurate representation of what may be expected for this development during the peak hours of the adjacent streets.

Overall, the entire development is expected to generate approximately 255 trips entering/349 trips exiting during the morning peak hour, 415 trips entering/312 trips exiting during the evening peak hour, and 397 trips entering/373 trips exiting during the Saturday peak hour.

The Syracuse Metropolitan Transportation Council (SMTTC) completed travel demand modeling and provided projected traffic volumes increases on select roadway links within a 6 mile radius of the proposed development. These volume increases were reviewed to develop overall distribution percentages traveling to/from the proposed development. The following provides a summary of the projected trip distribution based on the results of the SMTTC modeling:

- 32% to/from I-81 south of Route 31
- 25% to/from Thompson Road via South Bay Road
- 15% to/from South Bay Road south of Thompson Road
- 9% to/from the east on Lakeshore Road
- 7% to/from the west on Route 31
- 5% to/from the north on Mudd Mill Road

- 3% to/from the south on Route 11 via Route 31
- 2% to/from I-81 north of Route 31
- 2% to/from the southeast on Cicero Center Road

Overall, 89% of the traffic generated is projected to travel to/from the west of the site on Lakeshore Road or South Bay Road, and 11% is projected to travel to/from the east of the site on Lakeshore Road or Cicero Center Road. It is noted that the SMTD demand model projected that nearly all of the traffic traveling to/from I-81 or points west would use Lakeshore Road to access Route 31 versus using South Bay Road. Given the existing delays at the Lakeshore Road/Route 31 intersection, this distribution was adjusted to assume that one third of this traffic would use South Bay Road and two thirds would use Lakeshore Road.

The proposed arrival/departure trip distributions for the north and south side portions of the development are shown in Figures 22 and 23 respectively. The trips generated were assigned to the study area intersections based on proposed distributions as shown in Figures 24-25 for the morning peak hour, Figures 26-27 for the evening peak hour, and Figures 28-29 for the Saturday peak hour. The resultant full build traffic volumes expected when the development is complete are shown in Figures 30-32.

### 3.4 Internal Circulation, Parking, Deliveries

Traffic will circulate throughout the southern portion of the development via new roadways through the site. Each northern driveway will access a certain portion of the northern development with the eastern access serving the bulk of the northern development. There is no parking allowed on study area roadways and no on-street parking planned within the development.

### 3.5 Traffic Control Device Data

The signalized intersections of NYS Route 31 with NYS Route 11 (NYSDOT #3007), the I-81 southbound ramps (NYSDOT #3181) and the I-81 northbound ramp / Pardee Road (NYSDOT #3182) are part of a coordinated signal system with full actuation at each of the signalized intersections. The overall system operates at a 110 signal cycle length during the three peak hours, although the intersection of Route 11 with Route 31 operates at different cycle length during the evening and Saturday peak hours.

The signalized intersections of NYS Route 31 with South Bay Road (NYSDOT #3043), NYS Route 31 with Cicero Center Road (NYSDOT #3285) and South Bay Road with Thompson Road (OCDOT #33) are all fully actuated, uncoordinated intersections.

The unsignalized intersections in the study area (NYS Route 31 @ Lakeshore Road east and west, Lakeshore Road at Mudd Mill Road, and Lakeshore Road at Cicero Center Road / Van Antwerp Drive) are all side street stop sign controlled with free flow traffic operations on the main roadways.

### 3.6 Capacity Analysis for Existing No-Build Condition

Capacity analysis of the existing traffic operations was completed using Synchro10.

There is notable existing traffic congestion along NYS Route 31 between Lakeshore Road and NYS Route 11 under the existing conditions during all three peak hours reviewed. The following signalized traffic movements in the study area are noted to be operating at Levels of Service E or F:

- NYS Route 31 @ NYS Route 11
  - EB Through/Right – PM & Sat LOS E
  - WB Left – PM LOS E, Sat LOS F
  - NB Through – AM, PM & Sat – LOS E
- NYS Route 31 @ I-81 SB Ramps
  - EB Through/Right – AM LOS E

- WB Left – AM LOS F, PM LOS E
  - SB Left/Through – AM & Sat LOS E, PM LOS F
- NYS Route 31 @ I-81 NB Offramp / Pardee Road
  - Overall Intersection – PM LOS E
  - WB Through/Right – PM LOS F
  - NB Right – PM LOS F
- NYS Route 31 @ South Bay Road
  - Overall Intersection – PM LOS E
  - WB Left/Through/Right – Sat LOS F
  - NB Left/Through/Right – PM LOS F
- South Bay Road @ Thompson Road
  - EB Left – PM LOS E

The unsignalized intersections all have acceptable delays with Levels of Service C or better for all movements, with the exception of the Lakeshore Road westbound approach to NYS Route 31 which has failing level delays during all three peak hours.

The detailed Level of Service & queue summary, and capacity analysis printouts, have been attached.

### 3.7 Capacity Analysis for Background No-Build Condition

Capacity analysis of the background traffic operations was completed using Synchro10. Planned NYSDOT improvements at the NYS Route 31 / South Bay Road intersection, including left turn lanes on all four approaches with protected/permitted left turn signal phasing was included in the background conditions analysis.

The results of the analysis with the approved developments shows moderate increases in delay primarily at the signalized intersections in the study area. The following drops in Level of Service are noted:

- NYS Route 31 @ NYS Route 11
  - Overall Intersection – Sat LOS D to E
  - WB Left – PM LOS E to F
- NYS Route 31 @ I-81 SB Ramps
  - Overall Intersection – AM LOS D to E, PM LOS C to D
  - EB Through/Right – AM LOS E to F, PM LOS C to E, Sat LOS D to E
  - WB Left – PM LOS E to F
  - SB Left/Through – AM LOS E to F
- NYS Route 31 @ I-81 NB Offramp / Pardee Road
  - Overall Intersection – PM LOS E to F
  - EB Through – PM LOS D to E
- South Bay Road @ Thompson Road
  - EB Left – PM LOS E to F

All unsignalized movements continue to operate at acceptable Levels of Service with the exception of the Lakeshore westbound approach to NYS Route 31 during all three peak hours.

The detailed Level of Service & queue summary, and capacity analysis printouts, have been attached.

### 3.8 Capacity Analysis for Proposed Build Condition

Capacity analysis of the build traffic operations with no improvements was completed using Synchro10.

The following drops in Level of Service are noted at the signalized study area intersections:

- NYS Route 31 @ I-81 SB Ramps
  - Overall Intersection – PM & Sat LOS D to E
  - EB Through/Right – PM & Sat LOS E to F
  - WB Left – Sat LOS D to F
- NYS Route 31 @ I-81 NB Offramp / Pardee Road
  - Overall Intersection – Sat LOS C to E
  - EB Through – PM LOS E to F, Sat LOS C to D
  - WB Through/Right – AM LOS C to D, Sat LOS D to F
  - NB Right – AM LOS D to E
- NYS Route 31 @ South Bay Road
  - Overall Intersection – AM LOS C to D, PM & Sat LOS D to E
  - EB Through/Right – PM LOS D to E
  - WB Through/Right – Sat LOS C to D
  - NB Through/Right – PM LOS E to F
  - SB Through/Right – AM LOS D to F
- South Bay Road @ Thompson Road
  - EB Left – Sat LOS B to C
  - EB Through/Right – Sat LOS C to D
  - WB Left – AM LOS C to E, PM LOS B to C
  - WB Through/Right – AM LOS C to D
  - NB Left/Through – Sat LOS B to C
  - SB Left/Through – Sat LOS B to C

The following drops in Level of Service are noted at the unsignalized study area intersections:

- NYS Route 31 @ Lakeshore Road
  - EB Left – Sat LOS C to D
- Mudd Mill Road @ Lakeshore Road
  - SB Approach – AM LOS B to C, PM LOS C to E, Sat LOS C to D
- South Bay Road @ Lakeshore Road
  - NB Approach – AM LOS A to B, PM LOS B to D, Sat LOS B to C
- Cicero Center Road @ Lakeshore Road
  - NB Approach – Sat LOS B to C

The eastern site access on Lakeshore Road, northbound approach, is projected to operate at LOS E during the morning peak hour and LOS F during the evening and Saturday peak hours. The middle site access on Lakeshore Road, northbound approach, is projected to operate at LOS E during the evening and Saturday peak hours. The western driveway is projected to operate at LOS C or better during all three peak hours.

The detailed Level of Service & queue summary, and capacity analysis printouts, have been attached.

### 3.9 Mitigation Measures

The following mitigation measures are recommended:

- Lakeshore Road @ Site Access
  - Install a two way center left turn lane between the middle and eastern full access driveways to provide 100 foot eastbound and westbound left turn lane at both locations.
  - Review traffic operations periodically as the development is completed to determine if a traffic signal is warranted at the eastern access location.
- NYS Route 31 @ South Bay Road
  - Construct a 150 foot northbound right turn lane on South Bay Road.
  - Optimize the signal operations periodically.
- NYS Route 31 @ Lakeshore Road
  - Install a 2-phase traffic signal with protected permitted eastbound left turn phasing and overlap southbound right turn phasing.
  - Restrict the Lakeshore Road approach to NYS Route 31 to right turn only movements.
- NYS Route 31 @ I-81 Northbound Offramp
  - Restripe the northbound through lane to allow shared through and right turn movements.
- NYS Route 31 @ Route 11, I-81 and Lakeshore Road
  - Optimize traffic signal operations and coordination parameters periodically.

With the proposed improvements noted above, traffic movements are generally projected to operate at levels consistent with the background condition at both the signalized and unsignalized intersections in the study area.

There is notable existing traffic congestion along NYS Route 31 between Lakeshore Road and NYS Route 11 under the existing conditions, with limited options to improve operations outside of major reconstruction of the I-81 interchange. The proposed mitigation, along with signal timing optimization, will offset the additional traffic generated by the proposed development without any significant impacts to existing traffic operations.

There are some potentially longer delays exiting the proposed development onto Lakeshore Road under the full build condition, even with the recommended widening to include a center left turn lane. Given that the proposed development will be completed over a number of years, it is recommended that operations be reviewed periodically at the site access to determine if a traffic signal or other mitigation is necessary to accommodate the site generated traffic.

The detailed Level of Service & queue summary, and capacity analysis printouts, have been attached.

### 4.0 Crash Analysis

The purpose of this crash analysis is to identify safety problems by studying and quantifying accidents within and immediately adjacent to the driveway, and identifying abnormal patterns and clusters. An accident cluster is defined as an abnormal occurrence of similar accident types occurring at approximately the same location or involving the same geometric features. The severity of the accidents should also be considered. A history of accidents is an indication that further analysis is required to determine the cause(s) of the accident(s) and to identify what actions, if any, could be taken to mitigate the accidents.

A crash analysis was performed per Highway Design Manual Chapter 5 on NYS Route 31 from NYS Route 11 to Lakeshore Road (east), on Lakeshore Road between both ends at NYS Route 31, and on

South Bay Road between Thompson Road and Lakeshore Road.

### Existing Crash Data

An accident analysis was completed for the study area using history reports obtained for a three year period from January 2019 through December 2021. Over the three year period, there were 629 total accidents in the study area.

Fifty-Three (53) accidents occurred at the Route 11 / Caughdenoy Road intersection including 36 rearend accidents, 7 right angle accidents, 3 overtaking accidents, 2 backing accidents, 1 bicyclist accident, 1 right turn accident, 1 left turn accident, 1 head on accident, and 1 fixed object accident. The predominant accident type are rearend accidents which are indicative of the congestion at the intersection. The intersection accident rate is above the statewide average rate for similar facilities. The future cross connection between the site and the Wegmans property will reduce traffic queues and congestion on Route 11 at Caughdenoy Road, which should provide some reduction in accident frequency.

Seventy-seven (77) accidents occurred at the NYS Route 31 / NYS Route 11 intersection including 33 rearend accidents, 13 overtaking accidents, 12 left turn accidents, 10 right angle accidents, 4 sideswipe accidents, 2 right turn accidents, 1 head on accident, 1 backing accident and 1 pedestrian accident. The accident rate is above the statewide average for similar facilities.

Fifty-three (53) accidents occurred at the NYS Route 31 / I-81 northbound ramps / Pardee Road intersection including 21 rearend accidents, 12 right angle accidents, 9 overtaking accidents, 4 left turn accidents, 2 backing accidents, 1 sideswipe accident, 1 right turn accident, 1 bicyclist accident, 1 non-collision accident and 1 fixed object accident. The accident rate is above the statewide average for similar facilities.

Twenty-seven (27) accidents occurred at the NYS Route 31 / I-81 southbound ramps intersection including 12 rearend accidents, 7 right angle accidents, 5 left turn accidents, and 3 overtaking accidents. The accident rate is above the statewide average for similar facilities.

Thirty-two (32) accidents occurred at the NYS Route 31 / Lakeshore Road west intersection including 22 rearend accidents, 4 right angle accidents, 2 fixed object accidents, 1 left turn accident, 1 overtaking accident, 1 non-collision accident and 1 animal related accident. The accident rate is above the statewide average for similar facilities.

Thirty-five (35) accidents occurred at the NYS Route 31 / South Bay Road intersection including 19 rearend accidents, 6 right angle accidents, 3 left turn accidents, 2 fixed object accidents, 2 overtaking accidents, 1 sideswipe accident, 1 bicyclist accident and 1 animal related accident. The accident rate is above the statewide average for similar facilities.

Seven (7) accidents occurred at the NYS Route 31 / Cicero Center Road intersection including 4 rearend accidents, 1 overtaking accident, 1 sideswipe accident and 1 bicyclist. The accident rate is below the statewide average for similar facilities.

Other intersection accidents along Route 31 at intersections not included in the study were as follows:

- NYS Route 31 @ Thompson Road – 33 accidents
- NYS Route 31 @ New Country Road – 11 accidents
- NYS Route 31 @ Crabtree Lane – 12 accidents
- NYS Route 31 @ Lakeshore Spur Road – 10 accidents
- NYS Route 31 @ Button Road – 7 accidents
- NYS Route 31 @ Whiting Road – 2 accidents
- NYS Route 31 @ Eastwood Road – 2 accidents

- NYS Route 31 @ Doreen Avenue – 2 accidents
- NYS Route 31 @ Boyko Farm Road – 2 accidents

Along NYS Route 31, there were 172 total midblock accidents including 51 rearend accidents, 30 fixed object accidents, 28 right angle accidents, 26 overtaking accidents, 15 animal related accidents, 11 left turn accidents, 2 right turn accidents, 2 backing accidents, 2 other accidents, 1 pedestrian accident, 1 sideswipe accident, 1 head on accidents and 1 fire accident. The overall accident rate for NYS Route 31 is just slightly above the statewide average rate for similar facilities.

Three (3) accidents occurred at the Lakeshore Road / South Bay Road intersection including 2 fixed object accidents and 1 right angle accident. The accident rate is above the statewide average for similar facilities.

Two (2) fixed object accidents occurred at the Lakeshore Road / Mudd Mill Road intersection. The accident rate is above the statewide average for similar facilities.

Two (2) accidents occurred at the Lakeshore Road / Cicero Center Road intersection including 1 fixed object accident and 1 rearend accident. The accident rate is above the statewide average for similar facilities.

Other intersection accidents along Lakeshore Road at intersections not included in the study were as follows:

- Lakeshore Road @ Snowshoe – 5 accidents
- Lakeshore Road @ Belnor – 2 accidents
- Lakeshore Road @ Backstretch – 2 accidents
- Lakeshore Road @ Eldan – 2 accidents
- Lakeshore Road @ Button – 1 accident
- Lakeshore Road @ Whiting – 2 accidents
- Lakeshore Road @ Carmenica – 1 accident
- Lakeshore Road @ McDonnells – 1 accident

Along Lakeshore Road, there were 31 total midblock accidents including 12 fixed object accidents, 6 animal related accidents, 5 overtaking accidents, 3 rearend accidents, 2 right angle accidents, 1 bicycle accident, 1 pedestrian accident and 1 sideswipe accident. The overall accident rate for Lakeshore Road is below the statewide average rate for similar facilities.

Twenty-three (23) accidents occurred at the South Bay Thompson Road intersection including 14 rearend accidents, 3 left turn accidents, 2 head on accidents, 2 backing accidents, 1 right angle accident and 1 sideswipe accident. The accident rate is above the statewide average for similar facilities.

Other intersection accidents along South Bay Road at intersections not included in the study were as follows:

- South Bay Road @ Whiting – 8 accidents
- South Bay Road @ Daedalus – 1 accident
- South Bay Road @ Henryk – 1 accident
- South Bay Road @ Owasco – 1 accident
- South Bay Road @ Cicero – 1 accident

Along South Bay Road, there were 15 total midblock accidents including 6 fixed object accidents, 4 animal related accidents, 3 rearend accidents, 1 overtaking accident, and 1 pedestrian accident. The overall accident rate for South Bay Road is slightly below the statewide average rate for similar facilities.

There were 31 accidents in area parking lots and 3 accidents on roadways outside the study area included in the data.

Of the accidents, 500 (79%) were non-reportable or property damage only accidents. There were 129 injury accidents with no fatalities.

#### 4.2 Compare Rates to Accepted Values

The following table provides a comparison of the existing accident rates to the statewide average rate for similar facilities:

| Intersection and Link Accident Rates |                                       |                                                |
|--------------------------------------|---------------------------------------|------------------------------------------------|
| Intersection / Link                  | Calculated Intersection Accident Rate | Statewide Accident Rate for Similar Facilities |
| Route 31 @ Route 11                  | 1.93 acc/mev                          | 0.52 acc/mev                                   |
| Route 31 @ I-81 NB / Pardee          | 1.26 acc/mev                          | 0.52 acc/mev                                   |
| Route 31 @ I-81 SB                   | 0.76 acc/mev                          | 0.52 acc/mev                                   |
| Route 31 @ Lakeshore                 | 1.01 acc/mev                          | 0.18 acc/mev                                   |
| Route 31 @ South Bay                 | 1.55 acc/mev                          | 0.52 acc/mev                                   |
| Route 31 @ Cicero Center             | 0.55 acc/mev                          | 0.52 acc/mev                                   |
| Lakeshore @ South Bay                | 0.47 acc/mev                          | 0.18 acc/mev                                   |
| Lakeshore @ Mudd Mill                | 0.28 acc/mev                          | 0.18 acc/mev                                   |
| Lakeshore @ Cicero Center            | 0.31 acc/mev                          | 0.29 acc/mev                                   |
| South Bay @ Thompson                 | 0.96 acc/mev                          | 0.52 acc/mev                                   |
|                                      |                                       |                                                |
| Route 31                             | 2.25 acc/mvm                          | 2.23 acc/mvm                                   |
| Lakeshore Road                       | 1.70 acc/mvm                          | 2.23 acc/mvm                                   |
| South Bay Road                       | 2.22 acc/mvm                          | 2.23 acc/mvm                                   |

Acc/mev = Accidents per million entering vehicles

Acc/mvm = Accidents per million vehicle-miles

Route 31 @ Route 11 Intersection - Evening Peak Hour - 3,286 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 36,511 Vehicles  
 Route 31 @ I-81 NB / Pardee Road Intersection - Evening Peak Hour - 3,459 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 38,433 Vehicles  
 Route 31 @ I-81 SB Ramps Intersection - Evening Peak Hour - 2,905 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 32,278 Vehicles  
 Route 31 @ Lakeshore Road Intersection - Evening Peak Hour - 2,604 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 28,933 Vehicles  
 Route 31 @ South Bay Road Intersection - Evening Peak Hour - 1,853 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 20,589 Vehicles  
 Route 31 @ Cicero Center Road Intersection - Evening Peak Hour - 1,0526 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 11,689 Vehicles  
 Lakeshore Road @ South Bay Intersection - Evening Peak Hour - 520 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 5,778 Vehicles  
 Lakeshore Road @ Mudd Mill Road Intersection - Evening Peak Hour -580 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 6,444 Vehicles  
 Lakeshore Road @ Cicero Center Road Intersection - Evening Peak Hour - 522 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 5,800 Vehicles  
 South Bay Road @ Thompson Road Intersection - Evening Peak Hour - 1,971 Vehicles. Assumed PM Peak is 9% of AADT, AADT = 21,900 Vehicles

NYS Route 31 - NYSDOT Traffic Data Viewer - AADT = 34,385 Vehicles  
 Lakeshore Road - NYSDOT Traffic Data Viewer - AADT = 4,256 Vehicles  
 South Bay Road - NYSDOT Traffic Data Viewer - AADT = 6,836 Vehicles

**Intersection Accident Rates**  $\frac{\# \text{ Accidents} \times 1,000,000}{\text{AADT} \times \# \text{ Years} \times 365 \text{ Days}}$  Time Period = 3 years

#### **Route 31 @ Route 11 - 77 Accidents**

Accident Rate = 1.93 accidents per million entering vehicles  
 Statewide average for similar facilities = 0.52 accidents per million entering vehicles (Urban Signal - 4 Legged Intersection - 1-4 Lanes)

**Intersection Accident History is Above the Statewide Average**

#### **Route 31 @ I-81 NB Ramp/Pardee Road - 53 Accidents**

Accident Rate = 1.26 accidents per million entering vehicles  
 Statewide average for similar facilities = 0.52 accidents per million entering vehicles (Urban Signal - 4 Legged Intersection - 1-4 Lanes)

**Intersection Accident History is Above the Statewide Average**

#### **Route 31 @ I-81 SB Ramps - 27 Accidents**

Accident Rate = 0.76 accidents per million entering vehicles  
 Statewide average for similar facilities = 0.52 accidents per million entering vehicles (Urban Signal - 4 Legged Intersection - 1-4 Lanes)

**Intersection Accident History is Above the Statewide Average**

#### **Route 31 @ Lakeshore - 32 Accidents**

Accident Rate = 1.01 accidents per million entering vehicles  
 Statewide average for similar facilities = 0.18 accidents per million entering vehicles (Urban Sign - 3 Legged Intersection - 1-3 Lanes)

**Intersection Accident History is Above the Statewide Average**

**Route 31 @ South Bay - 35 Accidents**

Accident Rate = 1.55 accidents per million entering vehicles

Statewide average for similar facilities = 0.52 accidents per million entering vehicles (Urban Signal - 4 Legged Intersection - 1-4 Lanes)

**Intersection Accident History is Above the Statewide Average**

**Route 31 @ Cicero Center - 7 Accidents**

Accident Rate = 0.55 accidents per million entering vehicles

Statewide average for similar facilities = 0.52 accidents per million entering vehicles (Urban Signal - 4 Legged Intersection - 1-4 Lanes)

**Intersection Accident History is Above the Statewide Average**

**Lakeshore @ South Bay - 3 Accidents**

Accident Rate = 0.47 accidents per million entering vehicles

Statewide average for similar facilities = 0.18 accidents per million entering vehicles (Urban Sign - 3 Legged Intersection - 1-3 Lanes)

**Intersection Accident History is Above the Statewide Average**

**Lakeshore @ Mudd Mill - 2 Fixed Object Accidents**

Accident Rate = 0.28 accidents per million entering vehicles

Statewide average for similar facilities = 0.18 accidents per million entering vehicles (Urban Sign - 3 Legged Intersection - 1-3 Lanes)

**Intersection Accident History is Above the Statewide Average**

**Lakeshore @ Cicero Center - 2 Accidents**

Accident Rate = 0.31 accidents per million entering vehicles

Statewide average for similar facilities = 0.29 accidents per million entering vehicles (Urban Sign - 4 Legged Intersection - 1-3 Lanes)

**Intersection Accident History is Above the Statewide Average**

**South Bay @ Thompson - 23 Accidents**

Accident Rate = 0.96 accidents per million entering vehicles

Statewide average for similar facilities = 0.52 accidents per million entering vehicles (Urban Signal - 4 Legged Intersection - 1-4 Lanes)

**Intersection Accident History is Above the Statewide Average**

## Link Accident Rates

$$\frac{\# \text{ Accidents} \times 1,000,000}{\text{Link Length} \times \text{AADT} \times \# \text{ Years} \times 365 \text{ Days}}$$

Time Period = 3 years

Route 31 Link Length = 5.71 Miles

Lakeshore Road Link Length = 6.80 Miles

Route 31 Link Length = 3.01 Miles

### Route 31 - 484 Accidents

Accident Rate = 2.25 accidents per million vehicle miles

Statewide average for similar facilities = 2.23 accidents per million vehicle miles (Urban - Free Access - 2 Lanes - Undivided - All Accidents)

**Intersection Accident History is Equal to the Statewide Average**

### Lakeshore Road - 54 Accidents

Accident Rate = 1.70 accidents per million vehicle miles

Statewide average for similar facilities = 2.23 accidents per million vehicle miles (Urban - Free Access - 2 Lanes - Undivided - All Accidents)

**Intersection Accident History is Below the Statewide Average**

### South Bay Road Midblock - 50 Accidents

Accident Rate = 2.22 accidents per million vehicle miles

Statewide average for similar facilities = 2.23 accidents per million vehicle miles (Urban - Free Access - 2 Lanes - Undivided - All Accidents)

**Intersection Accident History is Equal to the Statewide Average**
