

TEXAS TECH UNIVERSITY SYSTEM™

NIST Standards Services Curricula Development Cooperative Agreement Program Awardee Meeting

Emergency, Disaster, and Crisis Management Standards Education for Engineering Students: Needs Assessment and Delivery of a 3-week Module

Sep 10, 2025

Dr. Changwon Son

Dr. Mihwa Park

Dr. Wesley Wehde

Texas Tech University

This project is sponsored by

**NIST Standards Coordination Office
Curricula Development Cooperative Agreement Program**

PI: Changwon Son (public safety)
Co-Pis: Mihwa Park (STEM education)
Wesley Wehde (disaster policies)

Project period: 2024-2026

Outline

- **Introduction**
- **Background**
- **Motivation**
- **Objectives**
- **Method**
- **Findings**
- **Implications**
- **Ongoing Work**
- **Future Plan**

Introduction

■ Growing Threats from Emergencies, Disasters, and Crises

9/11 WTC Attack
(2001)

\$95B*

* Economic losses
without inflation
in US Dollar

\$125B*
Hurricane Katrina
(2005)

Deepwater Horizon
(2010)

\$145B*

\$180B*
Fukushima Daiichi
Nuclear Meltdown
(2011)

CA Camp Fire
(2018)

\$422B*

And the list goes on...

Background

- Engineers responsible for emergency, disaster, and crisis management (EDCM)

Different engineering training

Industrial engineering

Mechanical engineering

Civil engineering

Chemical engineering

Electrical engineering

Other Eng.

Engineering sectors

Emergency, disaster, and crisis

■ Complexity of EDCM

- **Limited education for engineering students on EDCM standards**

- Only 6.5% of over 5,300 US Higher Education Institutes offer emergency management programs [1].
- Existing safety courses in engineering departments are limited to engineering and technical safety:
 - Occupational safety
 - Chemical process safety
 - Construction safety
 - Industrial hygiene
 - Lab safety
- Previous standards education efforts were focused on teaching occupational safety and health standards such as ISO 14001 (environmental) and ISO 45001 (OSH) [2,3]

- **Overall Goal**

- To enhance engineering students' knowledge of emergency, disaster, and crisis management (EDCM) guidelines and standards

- **Objective of the current task**

- To identify educational needs for EDCM guidelines and standards among engineering students
- To develop and deliver a 3-week education module for engineering students

Overall Project Approach

■ Instruction Design: 'ADDIE' Model [4]

▪ Semi-structured interviews with three stakeholder groups

- Convenience sampling and snowball sampling methods
- In-person and virtual (e.g., Zoom, Teams) interviews

Engineering students

- N=13 (grad and UG)
- Recruited from Texas Tech

Faculty members

- N=3
- Recruited from multiple institutions

Public safety professionals

- N=4
- Recruited from public safety organizations (fire, EMS, emergency management)

- **Questions used in the interviews**
 - **Importance, Asset, and Needs approach [5]**

Dimension	Questions
Importance	• How important do you think it is to have an ability to manage emergency, disaster, and crisis as an engineer? • Why do you think it is important? • What emergency, disaster, or crisis made you think so?
Assets	• How much knowledge do you have of emergency, disaster, and crisis management (EDCM)? • What skills and knowledge of EDCM do you think engineering students (or engineers) are lacking? • What courses provided any of EDCM standards and guidelines? • What EDCM standards and guidelines did you learn (teach)?
Needs	• What specific learning elements do you want to see from the future courses? • What learning methods or learning environments do you think would be the best for the courses? • What skills and knowledge do you expect of engineering students when they graduate?

■ Analysis of Qualitative Data

- Interview recordings (audio) were transcribed by 'Rev', AI-based transcribing service
- Emerging themes were identified using Thematic Analysis [6] and 'Atlas.ti', a QDA software program

■ High importance of EDCM education

- All participants (20/20) stated that EDCM education among engineering students is important.

"As an engineer, I know that essential services that we provide to the whole society can't be interrupted. Basically, if your activity is so important, energy production for example, you need to be able to manage the crisis in an overall way." (FG#04-A)

"For us, engineers play a critical role as subject matter experts per se, and we rely heavily on them when we're in situations that we're unsure of the outcome because of either a structure or a chemical or something along those lines that would impact the safety of us doing our job."
(S#003)

- **Very limited existing EDCM assets among engineering students**
 - Little to no education on EDCM guidelines and standards in graduate and undergraduate courses
 - A few participated in rudimentary drills and training only
 - Fire drill, evacuation drill, active shooter drill
 - Only one (1/13) student took courses related to EDCM (=attended fire academy).

■ Huge needs for EDCM education for engineering students

• Thematic map for EDCM education needs

■ Basic emergency drills

- Evacuation from fire, hurricane, and wildfire
- How to conduct first aid and CPR (cardiopulmonary resuscitation)
- How to use AED (automated electric defibrillator)

© MAYO FOUNDATION FOR MEDICAL EDUCATION AND RESEARCH. ALL RIGHTS RESERVED.

■ Emergency actions to mitigate consequences

- Emergency shutdown of a hazardous process or the entire system
- Emergency communication
 - Common terminology
 - How to report an incident to public safety authorities
 - How to coordinate and collaborate with emergency responders

"That's definitely a good thing to be able to do because they show up and you're not exactly sure how to explain the situation. It might cause the responders to take longer to assess the situation and they may not be knowing exactly what to look for." (FG#02-A)

- **Incident Command System (ICS)**
 - **Understanding about core principles of the ICS**
 - Incident action planning process
 - Chain of command / transfer of command
 - Unified command
 - Resource management process
 - ICS structure

"I hope they have a plan. But if they don't incident action planning and how to implement it, it is probably one of the biggest needs I could think of." (S#007)

- **Engineering knowledge required for making systems safer**
 - Public safety professionals view engineers as a subject matter expert (SME)
 - How to design safer engineering processes, equipment, and systems
 - Understanding of fire science (e.g., fire triangle - heat, fuel, and oxygen)
 - Response to hazardous materials (HazMat)

“Engineers are taught how to design things, but they're not taught to think about failure, whether that's from a disaster or whether that's an accident, or whether that bad design. And so, he said, where's the science of failure?” (S#009).

■ Psychological aspects of EDCM

- How to control panic and maintain calmness
- How to deal with mental health problems

“You don't hear that Control. Panic control. Panic control. It is just apprehension of sorts that things are going terribly wrong, but the situation may be a little bit better than just perceived. So, to regain your own strength and conscience, I would think, “I can manage this situation. I've been trained for it.” (FG#04-B).

■ Financial aspects of EDCM

- Disaster insurance policies and reimbursement process
- Federal and state financial aids for disaster impacts
 - US Department of Housing and Urban Development (HUD) Community Development Block Grant – Disaster Recovery (CDBG – DR)
 - National Flood Insurance Program (NFIP)

Implications for EDCM Standards Education

- Importance of EDCM education for engineering students was clearly recognized.
- Very limited EDCM education exists in higher education institutes in the US
- Core components for EDCM education include:
 - Basic skills and competencies – evacuation, firefighting, first aid, and CPR
 - Emergency actions and communication
 - Incident Command System – Incident planning process
 - Psychological and financial aspects of EDCM
- Our findings justify the needs for incorporating EDCM guidelines and standards into engineering courses and curriculum.
- Our findings inform the design of future EDCM courses for engineering students.

3-week Education Module (slide 1 of 5)

■ Overview

- Semester: Spring 2025 (Jan – May)
- Course No. and Title: IE 4306/5306 Advanced Systems Safety Engineering
- Students Enrolled: 90 in total
- 12:30pm – 1:50pm, Tuesdays and Thursdays
 - IE 4306: UG, 35 students, in-person
 - IE 5306: Grad, 37 students, in-person
 - IE 5306D: Grad, 18 students, distance

What US OSHA says ...

‘OSHA strongly encourages employers to investigate **all incidents** in which a worker was hurt, as well as **close calls** (sometimes called "**near misses**"), in which a worker might have been hurt if the circumstances had been slightly different.

In the past, the term "**accident**" was often used when referring to an unplanned, unwanted event. To many, "**accident**" suggests an event that was **random**, and **could not have been prevented**. Since **nearly all worksite fatalities, injuries, and illnesses are preventable**, OSHA suggests using the term "**incident**" investigation.’

3-week Education Module (slide 2 of 5)

■ Course Syllabus

3-Week module for
EDCM Standards

Date	Topic(s) to be covered / Activity
Jan 16 (Thu)	1. Introduction and course overview
Jan 21 (Tue)	2. Safety terms and definitions
Jan 23 (Thu)	3. Systems safety process and safety management system
Jan 28 (Tue)	4. Safety standards and regulations
Jan 30 (Thu)	5. Safety indicators and incident statistics
Feb 4 (Tue)	6. Hierarchy of control
Feb 6 (Thu)	7. Major industrial incidents
Feb 11 (Tue)	8. Preliminary Hazard Analysis
Feb 13 (Thu)	9. Failure Mode and Effect Analysis (FMEA)
Feb 18 (Tue)	10. Fault Tree Analysis (FTA)
Feb 20 (Thu)	11. Event Tree Analysis (ETA)
Feb 25 (Tue)	12. Bow-tie Analysis
Feb 27 (Thu)	Midterm exam 1
Mar 4 (Tue)	13. Process Safety Analysis – HAZOP/LOPA
Mar 6 (Thu)	14. Human Reliability Analysis (HRA)
Mar 11 (Tue)	15. Emergency Management – A. Fundamentals
Mar 13 (Thu)	15. Emergency Management – A. Fundamentals
Mar 18 & 20	Spring Break, No Class
Mar 25 (Tue)	16. Emergency Management – B. Pre-incident Processes
Mar 27 (Thu)	16. Emergency Management – B. Pre-incident Processes
April 1 (Tue)	17. Emergency Management – C. Post-incident Processes
April 3 (Thu)	17. Emergency Management – C. Post-incident Processes
April 8 (Tue)	Midterm exam 2
April 10 (Thu)	18. Safety-I and Safety-II Approaches
April 15 (Tue)	18. Safety-I and Safety-II Approaches
April 17 (Thu)	19. Resilience Engineering
April 22 (Tue)	19. Resilience Engineering
April 24 (Thu)	20. Systems safety analysis method – AcciMap
April 29 (Tue)	21. Systems safety analysis method – FRAM

3-week Education Module (slide 3 of 5)

■ Major Components of EDCM Standards – A. Fundamental

- Terms & Definitions
- DHS Organization
- Major Events
- Vulnerability and Hazards
- Mission Areas
- National Response Framework
- Critical Community Lifelines

Terms and Definitions

❖ Continuum of Magnitude

increasing magnitude ↓

- **Emergency:** An event, usually of local significance, that requires a local emergency response. The response is directed by local agencies.
- **Disaster:** An emergency event for which local resources are not adequate to manage the event, requiring that the response be directed by state, federal, or international agencies.

Disaster Management Mission Areas

❖ Five Mission Areas

❖ Prevention: Avoiding, preventing, or stopping a threatened or actual act of terrorism. Within the context of national

Fundamental Framework

❖ National Response Framework (NRF)

- Foundational nationwide emergency management doctrine
- All-hazards approach – all types of incidents
 - Technical incidents
 - Natural disasters
 - Human-caused incidents

NRF's Foundational Components

❖ Critical Community Lifelines

- A community lifeline enables the continuous operation of critical government and business functions and is essential to human health and safety or economic security.

Safety and security Food, water, and shelter Health and medical Energy (power, fuel) Communications Transportation Hazardous materials

3-week Education Module (slide 4 of 5)

■ Major Components of EDCM Standards – B. Pre-Incident Processes

- Basic Preparedness
- Developing an Emergency Plan
- Principles of Emergency Planning
- Three Levels of Planning
- Planning Approaches
- Emergency Support Functions (ESFs)

Basic Preparedness for Disasters

- ❖ Common Strategies for
 - Getting informed about
 - Developing an emergency
 - Collecting and assembling
 - Learning where to seek
 - Identifying the community
 - Including information from
 - Learning what to do for
 - Practicing and maintaining

Emergency Planning

- ❖ Principles of Emergency Planning
 - Planning must be **community-based**
 - Represent the whole population and their needs
 - Consider vulnerable populations such as low socio-economic status (SES) people, people with disabilities, women, and children
 - Including
 - Planning
 - Plans
 - Including

Emergency Planning

- ❖ Three Levels of Planning
 - Planning should **be flexible enough to address both traditional and catastrophic disasters**

Emergency Planning

- ❖ Planning Approaches
 - **Scenario-based** planning
 - Building **potential scenarios** for hazards or threats to the community.
 - Analyzing **the impact of the scenario** to determine appropriate courses of action.
 - Considering **hazard- or threat-specific** assumptions.
 - **Function-based** planning (functional planning)
 - Identifying **the common functions that a jurisdiction must perform** during emergencies.
 - **Defining the function to be performed** and **assigning government agencies and departments** responsible for the functions.

- **Strategic planning**
 - Policy
 - Objectives
 - Priorities
 - Overall guidance
- **Operations planning**
 - Roles
 - Responsibilities
 - Tasks
- **Tactical planning**
 - Personnel
 - Equipment
 - Supplies
 - Resources

3-week Education Module (slide 5 of 5)

Major Components of EDCM Standards – C. Post-Incident Processes

- Government Financial Assistance Programs
- National Incident Management System (NIMS)
- Incident Command System (ICS)
- Fire Classification
- Hazardous Materials (HazMat) Response
- Psychological Aspects of Disasters

NIMS

❖ Three Major Components of NIMS

Resource management

Standard mechanisms to automatically manage resources

NIMS – 2) Command and Coordination

❖ Incident Command System (ICS) Structure

NIMS – 3) Communications and Information

❖ Example of SITREP

ACT Rural Fire Service Standard Operating Procedure 3.5 Situation Reports	3.5 Operational Management
Purpose This procedure relates to the communication of critical information by the first unit to arrive on scene at an incident, to allow appropriate follow-up decisions to be made regarding response to that incident.	Essential (final size-up) • SIZE: Meters or Hectors • SUSPECTED CAUSE: Lightning, Campfire, Smoking, Debris Burning, Equipment use, Incendary, Juvenile, Unknown
Operational Procedure The first unit to arrive on scene at an incident is to provide COMCEN with an initial Situational Report (SITREP), and should include the following information: Essential (final size-up) • EXACT LOCATION OF FIRE: (Street address or GR, & Handy map if applicable) • CONTROL POINT LOCATION: • STATUS OF FIRE: Gung, Being Controlled, Contained, Patch, Out • FIRE DIMENSIONS, FLAME HEIGHT: M, X, M, M High • FUEL TYPE: Grass, Scold, Forest • PROPERTY UNDER THREAT NOW: • DISTANCE TO PROPERTY THAT MAY COME UNDER THREAT: meters • ADDITIONAL RESOURCES NEEDED: size & quantity Optional (during control) • FIRE NAME: • MAP NAME: • FUEL LOAD: • TOPOGRAPHY: • FIREGROUND WEATHER: • COMMENTS:	Additional SITREPs should also be provided as the situation changes, when major benchmarks have been achieved or when additional information is known. For prolonged incidents, the Incident Controller, Divisional Commander or Sector Leader should provide timely sitreps back to either COMCEN or the IMT. These sitreps should include the above information as well as additional information on: • Incident progress • Local Weather • Updated strategic tactics • Incident prediction • Tasking of resources Maintained By: Manager, Operations Approved By: Andrew Stark Position: Chief Officer RFS Signature: _____ Date: 15/02/2011 Cross Reference SOPs: _____ Attachments: _____

Fire Classification

❖ NFPA Fire Classification

- Class A – Ordinary solids
- Class B – Flammable liquids
- Class C – Electrical equipment
- Class D – Combustible metals
- Class K – Commercial cooking or kitchen equipment

CLASS OF FIRE	TYPE OF FIRE	APPROVED FIRE EXTINGUISHER
A Ordinary Combustibles	Wood, paper, cloth	Type A; Type A-B; Type A-B-C
B Flammable Liquids	Gasoline, paints, oils, grease	Type A-B; Type B-C; Type A-B-C
C Live Electrical Equipment	Electrical wiring, fuse box	Type B-C; Type A-B-C
D Combustible Metal	Metals	Bucket of Sand; Type D
K Commercial Cooking Equipment	Commercial cooking oil, appliances	*Wet Chemical; Class K

*Class K extinguishers may require specific training, including when they should be used or not used. For example, the extinguishing agents in many Class K extinguishers are electrically conductive and should only be used after electrical power to the kitchen appliance has been shut off.

- **Analysis of Learning Assessment and Student Surveys**
 - Adapted Motivated Strategies for Learning Questionnaire (AMLSQ)
 - Public Safety Motivation (PSM) Survey
 - Learning Strategies Survey
 - Class-related Emotions Survey
 - Demographics

■ Spring 2026

- **2nd 3-week Module for students (IE4306/5306, Advanced Systems Safety Engineering)**
 - Updating course materials and assessment approaches
- **A full elective course for engineering students (IE 5331, Special Topics in Engineering)**
 - Course objectives
 - Learning outcomes
 - Teaching topics
 - Course materials (e.g., lecture slides)
 - Assessments

■ 2025 ASEE Conference Paper and Presentation

Preparing for the Unexpected: Needs for Emergency, Disaster, and Crisis Management Education Among Engineering Students

Mihwa Park, Texas Tech University

Dr. Mihwa Park is an Associate Professor of STEM education at Texas Tech University. Her research interests involve developing measurement instruments to assess students' understanding of scientific concepts and their emotions when learning science. She is also interested in teachers' emotions about teaching science and teacher identity.

Dr. Changwon Son, Texas Tech University

Dr. Changwon Son is an Assistant Professor in the Department of Industrial, Manufacturing, & Systems Engineering at Texas Tech University. Dr. Son is the principal investigator (PI) of a NIST-funded engineering education project that is focused on developing educational contents for emergency, disaster, and crisis management (EDCM) standards for engineering students. Dr. Son is the director of Safety, Human factors, And Resilience Engineering (SHARE) Lab at Texas Tech. He is the recipient of George T. and Gladys Abell-Hanger Faculty Award of Texas Tech University Whitacre College of Engineering.

Dr. Wesley Wehde, Texas Tech University

- A journal manuscript regarding the needs assessment is under progress
- Planning to submit abstract to 2026 ASEE Annual Conference

Preparing for the Unexpected: Needs for Emergency, Disaster, and Crisis Management Education Among Engineering Students

Changwon Son¹, Mihwa Park², and Wesley Wehde³

1 Department of Industrial, Manufacturing, & Systems Engineering, Texas Tech University, Lubbock, TX

2 Department of Curriculum and Instruction, Texas Tech University, Lubbock, TX

3 Department of Political Science, Texas Tech University, Lubbock, TX

Abstract

The risks of emergencies, disasters, and crises are continuously increasing and making detrimental impacts on communities, especially engineering companies. Thus, engineers are expected to possess necessary skills and knowledge for emergency, disaster, and crisis management (EDCM). However, educational efforts for engineering students, many of whom become engineers, have been lacking in institutions of higher education. As an initial effort, the current study aims to identify importance of EDCM standards and guidelines education, current assets among engineering students, and recommended learning elements for future EDCM education. Semi-structured interviews and focus group discussions were conducted with a total of 19 participants from three stakeholder groups: students, faculty members, and public safety professionals. The interviews and group discussions were audio-recorded and transcribed for a Thematic Analysis, using *Atlas.ti*, a qualitative data analysis software program. Findings indicate that all participants agreed with the importance of education on EDCM standards and guidelines among engineering students. In contrast, students received very basic safety training without having advanced understanding about EDCM standards and guidelines such as FEMA. Further, our study identified six learning elements recommended for future education and training: (i) basic drills, (ii) emergency actions, (iii) Incident Command System, (iv) engineering knowledge, (v) psychological aspect, and (vi) financial aspect. These findings will inform the design and provision of future courses and curricula to enhance EDCM skills and knowledge among engineering students.
