### PROPORTIONATE LAUNCHER

#### WHAT IS THE “PROPORTIONATE LAUNCHER”?

“Proportionate Launcher” is a customized version of [RTD](#) that automates the repeated launching of the [proportionate app](#) with varying parameters. It was developed and tested on Android version 2.2 using a Motorola DROID X.

#### WHAT DOES IT DO?

The proportionate app is for one of the experiments appearing in the forthcoming technical note, “Estimation of uncertainty in application profiles.” The launcher launches each individual test in its own thread, allowing more precise tracing of the code of interest. Using Android’s Debug class, the observed results from function-level profiling of self time can be collected to determine the effect of self-time fragmentation on the measurements made in this way.

### USING THE “PROPORTIONATE LAUNCHER”

#### TOOLS NEEDED

##### HARDWARE

COMPUTER WITH LINUX (INSTALLED OR VM)

ANDROID PHONE (TO GET PHONE ACTUAL MEASUREMENTS)

##### SOFTWARE

JAVA SE DEVELOPMENT KIT 7 + (JDK) [\[HOW TO\]](#)

ANDROID SDK (ECLIPSE + ADT + ADB) [\[HOW TO\]](#)

##### OPTIONAL

IA32-LIBS (IF LINUX OS 64-BIT) //SOFTWARE [\[HOW TO\]](#)

GRAPHVIZ (TO OUTPUT GRAPHS WITH DMTRACEDUMP) //SOFTWARE [\[HOW TO\]](#)

GETTRACEFILES (IF USER WANTS AUTOMATIC FETCH AND CONVERSION OF TRACEFILES) //SOFTWARE [\[HOW TO\]](#)

### INSTALLING “PROPORTIONATE LAUNCHER”

#### INSTALLING FROM SOURCE

Because we released the source code of “Proportionate Launcher”, you can easily download, modify and compile the .apk and install it in your device. In this report, that process is not going to be explained.

For a tutorial on building apps from source, please visit:

<http://developer.android.com/training/basics/firstapp/index.html>

#### INSTALLING THE .APK

1. A prebuilt .apk file is also included for easier installation. To install the .apk, you can download it and install it directly from your phone or via adb commands. To install it via adb commands, connect your phone to your computer and ensure that your device is recognized by typing “adb devices” on a Linux terminal:

```
$ adb devices
```

If your device is connected, it should appear under “List of devices attached”.

Note: This and other “adb” commands will only work if you did a perfect “[Computer Setup](#)” by following the set of instructions found inside this manual. (See “[Computer Setup](#)” to verify)

2. Once you know that your device is ready, proceed to type “adb install /path/to/app.apk” on a Linux terminal:

```
$ adb install /path/to/app.apk
```

If all was run correctly, your application should be ready to run and play on your device’s app list.

### RUNNING THE PROPORTIONATE EXPERIMENT

To run the proportionate experiment, make sure you had installed both the [proportionate launcher](#) and the [proportionate app](#). Once you have done that, go to your app drawer and start “Proportionate Launcher”.

### RUNNING THE EXPERIMENT

1. Start “Proportionate Launcher”.

2. Indicate the name of your experiment's trace files. (Remember that trace data will be sent to /sdcard/Traces.)

ProportionateLauncher

Trace Name  
traceName

Total Loops  
3162280

Trace Size (in bytes)  
209715200

Proportional tests.  
☒ a (1) ☒ b (3)

- Set the value of Total Loops for your experiment.

Experimental long tests.

Tests need more space in memory and a fast device.

☐ m (1000000) ☐ n (3162278)

--Warning!!! Super slow and needs much more space in memory.

☐ o (10000000)

Repeat

1

Start Clean Exit

8. When it's done, a message box will appear and a toast notification will inform you of the time it took to complete the tests.

9. Done. The trace files named after the traceName you set are on your device's sdcard, in `/sdcard/Traces/`.

## FETCHING THE TRACEFILES

### USING THE CUSTOM LINUX SCRIPT "RUNME"

The script "RunMe" can be found under the util directory.

"RunMe" will permit the user to automatically gather and convert a batch set of trace files stored in the `/sdcard/Traces/` directory of our Android device. "RunMe" calls "getTraceFiles", the main Linux script that will permit the user to automatically gather and convert individual trace files or a batch set of trace files, with the appropriate key values of all the proportionate test cases in an automated execution. (More notes and warnings are embedded in the script.)

Note: This script will only work if you did a perfect "[Computer Setup](#)" by following the set of instructions found inside this manual. (See "[Common Errors](#)" to check for common errors.)

### FETCHING THE TRACEFILES WITH RUNME

1. Connect your phone to your computer.

- Go to USB connection.

- Select Charge Only.

- Ensure that USB debugging is on, that you have a proper installation of adb and dmtracedump in your PATH variable, and that your phone is being recognized by the terminal command "adb devices". (See more on ["Path for Computer Setup"](#).)

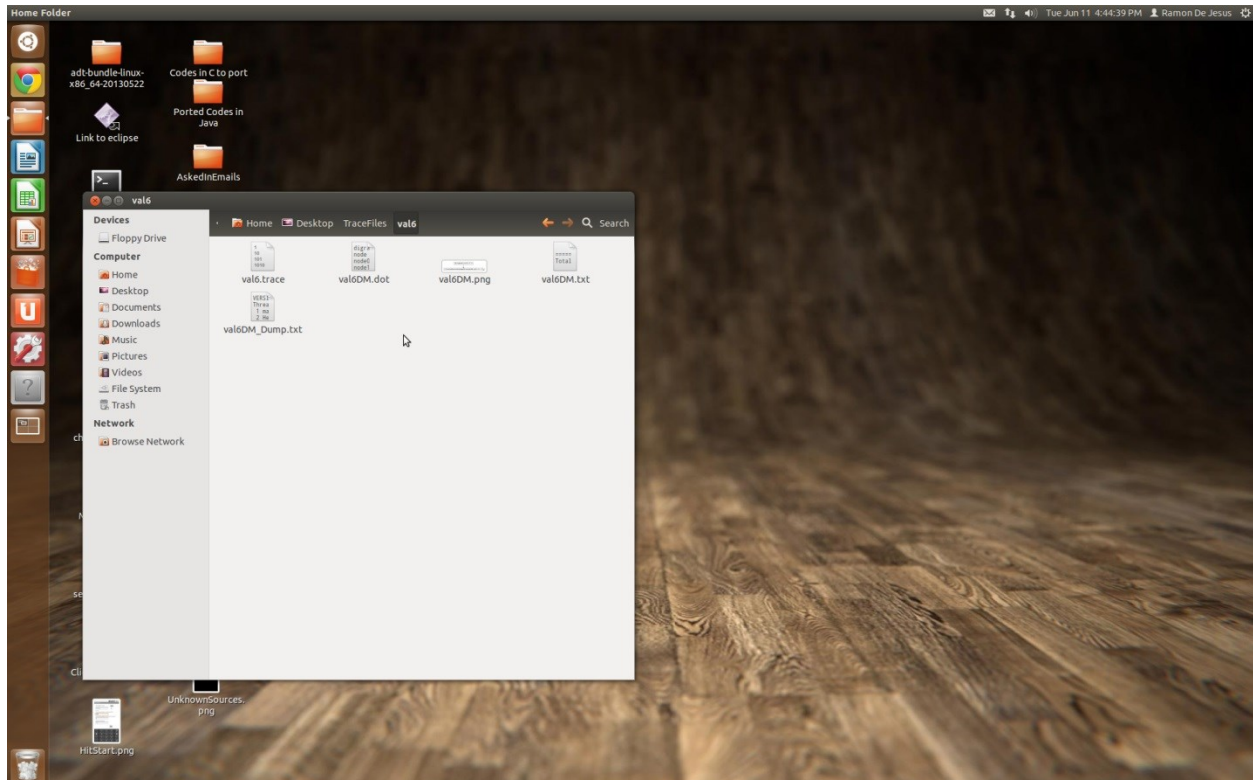

5. Open a terminal, move to the script directory using `cd` command and run it. Just fill in the prompts and enter.

Basic usage of "RunMe" script could also be done on a terminal by typing:  
 RunMe [traceName] [numberOfTraces]

```
$ RunMe [traceName] [numberOfTraces]
```

- If everything was good, a folder named TraceFiles with all of your trace files and their outputs should be on your desktop.

## PLOTTING THE TRACE

### USING THE CUSTOM LINUX SCRIPT "PLOTDATA"

The script "plotData" is available in the util directory.

"plotData," an R script caller, will permit the user to automatically convert individual .csv files stored in the ~/Desktop/TraceFiles/[traceName-DATA] directory of the PC to graphical plots. (Notes and warnings are embedded in the script.)

Note: This script will only work if you did a perfect "[Computer Setup](#)" by following the set of instructions found inside this manual and the folder [traceName-DATA] exists in ~/Desktop/TraceFiles/ directory. (See "[Common Errors](#)" to check for common errors.)

All of the R scripts that plotData uses can be found inside the extra folder.

*Good to know about the plots:*

- *Scatter plots and density plots omit the top 1% of data while the histogram shows the entire range of the trace.*

## PLOTTING THE TRACEFILES WITH RUNME & PLOTDATA

---

1. If you were using “RunMe,” the process to convert those “.csv” files to plots should be relatively easy: just fill in the prompts in the terminal and you are done.
2. Else, if you didn’t finish using “RunMe” and you have your “.csv” files inside the ~/Desktop/TraceFiles/[traceName-DATA] directory of your PC, simply double click on the script “plotData” inside of the “util” directory and fill in the prompts.

*If you are running plotData by itself and not RunMe in this experiment, remember that you need to include in the [traceName] the key value of your test.*

*For example:*

*If you wanted the plot from Test C (Test #3), at prompt you should write in the traceName field “[traceName]\_c-”, in contrast to that if you preferred everything automated just run and finish the RunMe script.*

## ERASING OLD TRACEFILES

### ERASING THE FILES WITH YOUR COMPUTER

1. Connect your phone to your computer.

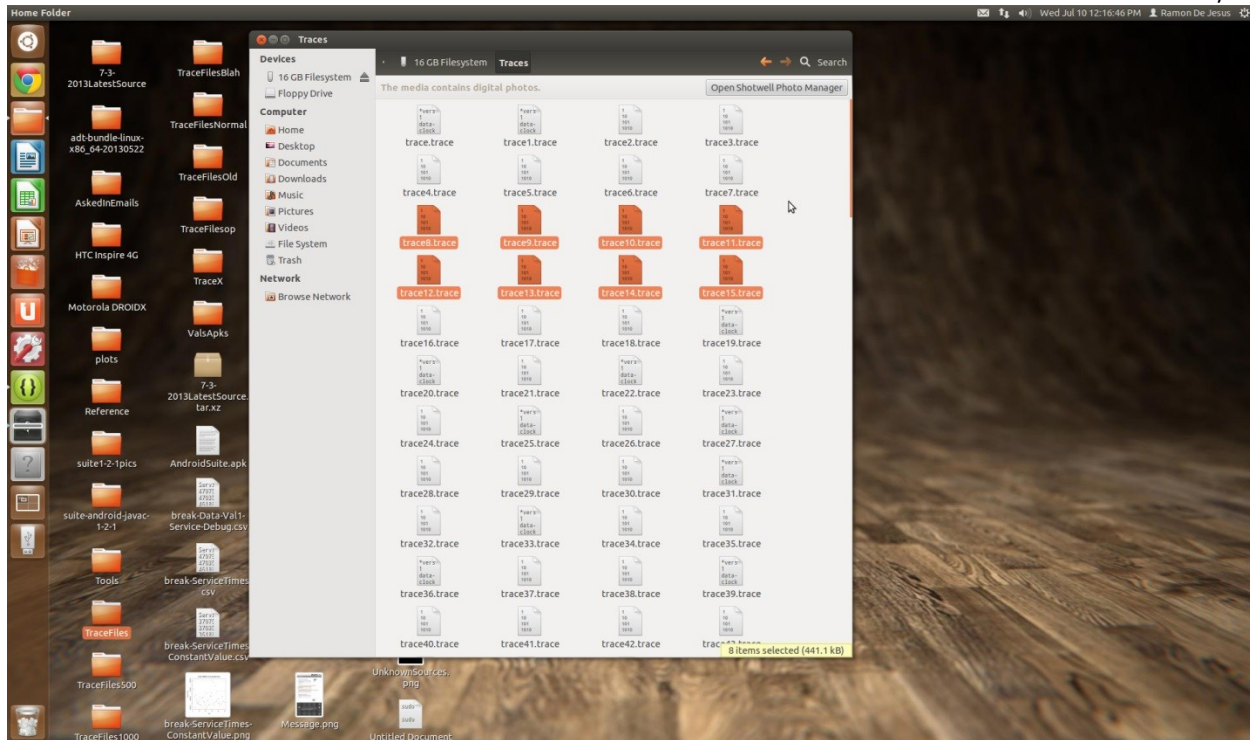

2. Go to USB connection.

3. Select USB Mass Storage and hit OK.

4. Once in the computer it should pop up like a normal USB drive. Select the traces you want to delete, inside the /sdcard/Traces folder.

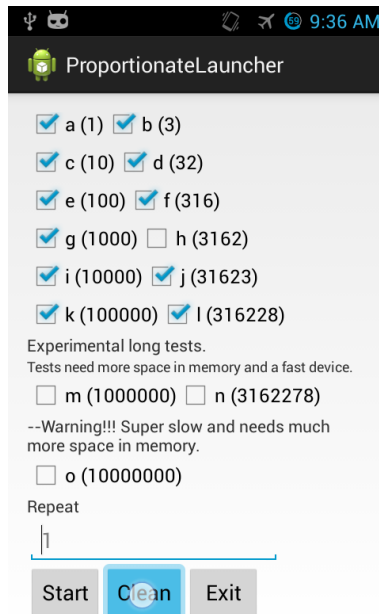

5. Delete them and you're done.

### ERASING THE FILES WITH "PROPORTIONATE LAUNCHER"

1. Start "Proportionate Launcher".

- Hit the “Clean” button. This will delete the trace files automatically.

- Done!

### MISC

#### WHAT IS THE PROPORTIONATE APP?

The proportionate app, found also in the source code, is the Android application that needs to be launched with the proportionate launcher. This app implements the proportionate test, an experiment ported from C for the purpose of showing the effects of self-time fragmentation on variability. By itself this “.apk” can’t do anything and depends on the launcher for the arguments we want to test.

Once it’s started, the proportionate app runs the proportionate test according to the arguments the app received from the launcher.

*For this launcher to work, it needs the proportionate app.  
“proportionate.apk” contains the core experiment we want to observe.*

#### COMPUTER SETUP

This project assumes you are running on a Linux working environment.

Note: For this work, we use Ubuntu 12.04 LTS (<http://www.ubuntu.com/download/desktop>), mounted on VM Player (<http://www.vmware.com/go/downloadplayer/>), a virtual machine.

Other distributions of Linux could be used; please have in mind your processor type (32bit | 64bit).

More distributions: (<http://lmgfy.com/?q=Linux+distributions#>)

1. Download and install the correct "JAVA SE DEVELOPMENT KIT 7" for your OS (<http://www.oracle.com/technetwork/java/javase/downloads/jdk7-downloads-1880260.html?ssSourceSiteId=otnes>)
2. "If running a 32-bit OS, skip this step."  
As root install ia32-libs via the terminal.

```
$ sudo apt-get install ia32-libs
```

3. Download and extract Android SDK. Remember where you extracted it and don't change or delete any folders. (<http://developer.android.com/sdk/index.html>)
4. "If you want to output graphics with dmtracedump"  
Download and install graphviz. Take care of your distribution. <http://www.graphviz.org/Download..php>
5. "For easy later access of our terminal commands, adb and dmtracedump..."  
As root modify or create your "environment" PATH variable located on `/etc/environment`.  
from `PATH=""`  
to `PATH="<EXTRACTED_LOCATION>/adt-bundle-linux-x86_64-20130522/sdk/platform-tools:  
<EXTRACTED_LOCATION> /adt-bundle-linux-x86_64-20130522/sdk/tools"`
6. "If you want to use a phone for the profiling"  
As root modify or create your "51-android.rules" file located at `/etc/udev/rules.d/51-android.rules`. Add one line like the following for each phone that you have:  
`SUBSYSTEM=="usb", ATTR{idVendor}=="0bb4", MODE="0666",`  
`GROUP="plugdev"`  
Notice "0bb4", because that's where your device vendor ID should be and it's the only string we should be changing according to our phone.

This table provides a reference to the vendor IDs needed in order to add USB device support on Linux. The USB Vendor ID is the value given to the `ATTR{idVendor}` property in the rules file, as described above.

Company	USB Vendor ID
Acer	0502
ASUS	0b05
Dell	413c
Foxconn	0489

Fujitsu	04c5
---------	------

\*More devices on the next page.

7. Reboot your machine and the computer set up is completed.

## COMMON ERRORS

---

**“ADB” COMMANDS****1. COMMAND NOT FOUND**

- *Verify that you have correctly installed the Android SDK (Eclipse + ADT + ADB)*  
[\[Android SDK\]](#)
- *If you installed the Android SDK correctly, then your PATH environment variable may be set incorrectly.*  
[\[Setting the PATH\]](#)

**2. DEVICE NOT FOUND**

- *Please ensure that a clear connection between your device and your machine has been set. Did you plug in the USB cable?*
- *If your device is well connected to your computer and [USB debugging mode is ON](#), then your problem has to be with a non-valid signature of the drivers.*  
[\[Phone Drivers\]](#)

---

**“RUNME OR GETTRACEFILES” COMMANDS****1. COMMAND NOT FOUND**

- *For direct use of “RunMe” or “getTraceFiles” in a terminal, you either have to navigate to the file via “cd” and run “RunMe” or “getTraceFiles” commands, set the file location in your Path variable, or double click and select “Run in terminal”.*

**2. DEVICE NOT FOUND**

- *“getTraceFiles” and “RunMe” work by using adb and other Android platform tools commands for its output data. Please verify that your adb installation is in a working state and that all Paths have been properly set up in your environment file.*  
[\[ADB Errors\]](#)

**3. TRACE NOT FOUND**

- *Please ensure that you type the exact name of the trace file you want to gather. In addition, verify that it exists on your phone.*

---

**"PLOTDATA" COMMANDS****1. NO DATA FOLDERS FOUND**

- *Make sure that a folder named [nameOfTrace-DATA] is inside ~/Desktop/TraceFiles/*
- *Make sure you typed in the traceName of your trace correctly.*
