</table>

a. Gaussian units and cgs emu are the same for magnetic properties. The defining relation is \( B = H + 4\pi M \).
b. Multiply a number in Gaussian units by \( C \) to convert it to SI (e.g., \( 1 G = 10^{-7} T = 10^{-3} T \)).
c. SI (Système International d'Unités) has been adopted by the National Bureau of Standards. Where two conversion factors are given, the upper one is recognized under, or consistent with, SI and is based on the definition \( B = \mu_0 H + M \), where \( \mu_0 = 4\pi \times 10^{-7} \) H/m. The lower one is not recognized under SI and is based on the definition \( B = \mu M + J \), where the symbol \( J \) is often used in place of \( J \).
d. 1 gauss = 10<sup>5</sup> gamma (Gy).
e. Both oersted and gauss are expressed as cm<sup>-1</sup> GOe<sup>-1</sup> in terms of base units.
f. A/m was often expressed as "ampere-turn per meter" when used for magnetic field strength.
g. Magnetic moment per unit volume.
h. The designation "emu" is not a unit.
i. Recognized under SI, even though based on the definition \( B = \mu_0 H + J \). See footnote c.
j. \( \mu_0 = \mu_0 = 1 \) in SI, all in SI. \( \mu_0 \) is equal to Gaussian \( \mu \).
k. \( B, H \), and \( \mu_0 M \) have SI units J/m<sup>3</sup>, H/m, and T/4\pi have Gaussian units erg/cm<sup>3</sup>.
