Blind Collaborative Justice
Testing the Impact of Expert Blinding and Consensus Building on the Validity of Forensic Testimony

C. Wong, Ph. D.

International Forensics Symposium, Washington D. C.

20 – 24 July 2015
Background

• Scientifically invalid testimony on forensic evidence is a cause of wrongful convictions

• Novel techniques needed to address this problem
  – Experimental investigations to demonstrate proof of concept

• National Institute of Justice funded study, 2013 - 2015
Study Purpose and Objectives

• Examine the effects of two potential techniques improve testimony by experts
  – Blinding experts to their party representation
  – Consensus feedback from a panel of experts

• Results of study experiment to help define strategies, policies, and procedures for presentation of expert testimony
  – Reduce probability of wrongful convictions
Approach

• Develop a hypothetical criminal case with forensic evidence

• Generate consensus interpretation of evidence with panel of relevant experts

• Conduct between-subjects survey experiment with >300 scientists in relevant fields
  – Random assignment of party representation
  – Random assignment of consensus feedback

• Analyze experiment results

• Draw conclusions, formulate recommendations, and document study
Study Procedure

Test Case

Forensic Testimony Questionnaire

Consensus Exercise

Survey Experiment

Expert Panel → Initial Responses → Intermediate Responses → Consensus Response used as Feedback in the experiment

Survey Participants
- Defense Experts
- Prosecution Experts
- Blinded Experts

Pre-Feedback Responses
- Defense Responses
- Prosecution Responses
- Blinded Responses

Post-Feedback Responses
- Defense Responses
- Prosecution Responses
- Blinded Responses

Summary of Hypothetical Case

- **Charges:** Criminal trespass and grand theft larceny of property belonging to a private business

- **Forensic Question:** Probability defendant used the stairwell

- **Facts:**
  - Perpetrator used stairwell equipped with cameras
  - Facial recognition software places defendant in stairwell
  - Of all personnel who occupied the building, 10% of those people were estimated to have used the stairwell during the time period in question.
  - Of those personnel in the stairwell, the software correctly identifies that they were in the stairwell 99% of the time.
  - Of those personnel NOT in the stairwell, the software falsely identifies them as being in the stairwell 11% of the time.
Eligibility Criteria

• Advanced degree or equivalent experience in a relevant scientific field
  – Examples fields in social sciences include psychology, economics, criminology, law
  – Examples fields in physical sciences include statistics, mathematics, chemistry
  – Experience in science-based analysis
  – Experience as expert witness in legal cases
Expert Panel

• 12 RAND employees who hold doctorates in relevant scientific fields
  – Behavioral decision theory
  – Biostatistics
  – Clinical psychology
  – Criminal justice
  – Economics (2)
  – Experimental forensic psychology
  – Industrial and organizational psychology
  – Social psychology
  – Psychology
  – Statistics (2)

• Diverse areas of research
  – Criminal and civil justice
  – Economics
  – Environment
  – Defense
  – Health
  – Social communications

• Experience
  – 4 associates, 1 full, 7 senior
Consensus Exercise Design

Round 1: statistics and justifications

Round 2: statistics and minority arguments

Round 3: final assessments and justifications

Legend
- Feedback
  - Not conducted in real time
  - Conducted in real time
Consensus Exercise

• Conducted over a ten day period

• Only two rounds required before panel arrived at unanimous response
  – Correct answer along with correct reasoning argument for answer

• Third round and oral discussion periods were not held because panel had reached a unanimous response backed by same reasoning
Participating Professional Societies

- American Academy of Forensic Sciences
- American Association for the Advancement of Science
- American Society of Criminology
- American Statistical Association
- Association of Forensic Quality Assurance Managers
- Psychonomic Society
- Society for Judgment and Decision Making
- Society for the Psychological Study of Social Issues
Experiment Design

Random assignment will result in

33.3% split in blinding conditions

and

50%/50% split between feedback conditions

No consensus feedback condition

Assuming the defendant has the same initial probability as the other authorized personnel of being in the stairwell, what is the percent probability that the defendant used the stairwell during the time in question?

Please enter the best answer as a whole number between 0 and 100 in the box below.

Consensus feedback condition

Study investigators asked a panel of 12 scientists with doctorates in relevant fields to discuss and arrive at a consensus about the best answer to the probability question above. ... The panel’s final unanimous consensus response was 50%.

Assuming the defendant has the same initial probability as the other authorized personnel of being in the stairwell, what is the percent probability that the defendant used the stairwell during the time in question?

Please enter the best answer as a whole number between 0 and 100 in the box below.
Sample Supplemental Questions

• How confident are you in your response?
• In what field is your most advanced academic degree?
• How many times have you served as an expert consultant for the plaintiff or prosecution?
• How many times have you served as an expert consultant for defense?
Justice Experiment Data Collection

• Justice Experiment on SurveyMonkey to collect study data

• Justice Experiment Opt-In on SelectSurvey for compensation

• Goal: Collect at least 300 usable submissions
  – Participant answers required questions

• Simultaneous activation on April 9 with formal launch on April 16
  – Continuously monitored for usable responses
  – 700 distinct accesses of Justice Experiment
  – 685 consented to take survey, 15 declined
  – 580 usable submissions
Data Collection Progression

Number of Submissions by Day

Number of Submissions
Findings

• 88 percent of pre-feedback responses incorrect

• Higher education level not associated with greater accuracy

• Higher levels of consulting experience not associated with greater accuracy
  – Though more experienced responders more confident their answer was correct
Conclusions

• Expert consensus feedback resulted in performance improvement
• No advantage due to blinding

Conclusion
Expert consensus feedback could potentially improve the validity of expert testimony.
