Title of research need: Validation of origin and cause determination protocols

Keywords: Validity, reliability, origin, cause

Submitting subcommittee(s): Fire/explosion investigation  Date Approved: 1/28/16

(If SAC review identifies additional subcommittees, add them to the box above.)

Background information:
1. Description of research need:

Reliability and validity studies need to be conducted on current methodologies used to determine origin and cause. New methodologies could also be proposed and tested. Existing guidance in NFPA 921 does not fully address uncertainty, repeatability, and limitations associated with current methodologies used to determine origin and cause. There is a need for comprehensive statistically sound assessments of current methodologies.

2. Key bibliographic references relating to this research need:

- Cox, A (2013). Origin Matrix Analysis: A systematic methodology for the assessment and interpretation of compartment fire damage. Fire and Arson Investigator, 64(1) 37-47.

3a. In what ways would the research results improve current capabilities?

The research would quantify uncertainty, repeatability, and limitations associated with current methodologies used to determine origin and cause. The research could lead to more consistent and accurate methodologies.
3b. In what ways would the research results improve understanding of the scientific basis for the subcommittee(s)?

The research would provide the scientific underpinnings to the subcommittee to allow a credible proposal to be submitted to the NFPA 921 and NFPA 1033 technical committees to enhance future editions of those documents.

3c. In what ways would the research results improve services to the criminal justice system?

Previous examples in fire investigations have led to erroneous conclusions and convictions owing to poor methodologies (Texas v. Willingham; New York v. Villabos, et al.). There is a lack of research on the validity of current methodologies. The research results will improve the reliability and scientific credibility of incendiary fire determinations.

4. Status assessment (I, II, III, or IV):

<table>
<thead>
<tr>
<th>Major gap in current knowledge</th>
<th>Minor gap in current knowledge</th>
