Trusted Logic Voting Systems
with
OASIS EML 4.0
(Election Markup Language)

Presenter:
David RR Webber
Chair OASIS CAM TC
http://drrw.net
Contents

• Trusted Voting Logic
  – Needs, Approach and Implementation

• Using OASIS EML
  – History, Overview, Processes, Transactions

• Applying OASIS EML
  – Example process steps and actions
  – Supporting US-style elections

• Summary
Trusted Logic Voting Needs

• How can we ensure the voting machine does not cheat on the human operator who cannot “see inside”?
• How can we know that every vote is counted as cast?
• If you have two parties that you cannot trust, how do you create a process that works between the two – in a way that if either cheats you will know?
• How can you create an audit trail that allows 100% crosschecking while keeping voter privacy?
• Use existing work in the field on multi-party trusted logic process (e.g. MIT approach using the “Frog Principle”*)

*see: http://www.vote.caltech.edu/media/documents/vtp_WP2.pdf
Trusted Logic Concept

1. Take what Party A tells you
2. ask Party B to tell you what that information says
3. Compare the two
4. copies can be independently audited

Keep secure copy
Keep secure copy
Keep secure copy
Trusted Logic Applied to Voting

- First party creates record of the voters’ choices
- Voter selection information transferred to second party
- Second party then confirms what the first party did and displays that information for the voter to confirm
- Confirmation uses write-once technology
  - paper ballots (preferred medium today)
  - or “digital-paper” – liquid crystal plastic that machine “writes” to and human can read*
  - or write-once digital chips that insert into a computer slot (MIT “frogs”)
- Process completes with three records retained
  - What the first party said they did
  - The copy they passed to the second party
  - What the second party displays to the voter (printed as paper ballot)
- Auditor can compare all three records – to ensure they match

* too costly today – but maybe within fifteen years time will be as cheap and easy to handle as paper.
US Voting System Example

- Trusted Logic Voting in action -
Core Trust Principles

- Verifiable paper ballots
- Matched e-Vote electronic records
- Electoral roll of voter participation
- Private and anonymous
- Secure 100% tallying and crosschecking
- Easy for citizens to understand
Three Pillars of Trust

• Electoral Roll
  – managed by election officials and administered by voting staff
  – process designed to ensure anonymous vote

• Electronic voting records
  – generated by voter using voting system
  – digitally recorded and stored by voting system

• Matching Paper voting records
  – generated by voter using voting system
  – manually cast or mailed by voter
Fundamentals of Trust

• 100% audit and comparison every time of all three Trusted Pillar counts to produce a certified election result
• Separation required between each step of the process; the trusted logic process is applied between the electronic and paper vote handling
• No single system can control or access more than one of the Trusted Pillars processing – each has to be distinct
• Every paper vote record is scanned and counted; every matching electronic vote is stored and then separately tallied
Balancing information capture

- A trusted logic process allows the minimum effective information collection to effect a secure voting process
- Too much information compromises anonymous voting in subtle ways
- Too little information prevents effective audit trails
- Example: stamping votes with machine IDs – good idea or bad idea?
- Next we look at how OASIS EML 4.0 instructs on the information exchange details…
Quick Overview of EML

• History
  – Work begun in May 2001
  – Charter: To develop a standard for the structured interchange of data among hardware, software, and service providers who engage in any aspect of providing election or voter services to public or private organizations
  – UK government has implementations:
    • UK Local Election pilots held in May 2003.

• Council of Europe Endorsement
  – Council of Europe Ministers have endorsed the e-voting recommendations and with that the use of EML

• EML 4.0 is a committee draft for review and comment, other countries in Europe now exploring use
  – Overview of EML and processing: [http://www.idealliance.org/papers/xmle03/slides/spencer/spencer.ppt](http://www.idealliance.org/papers/xmle03/slides/spencer/spencer.ppt)
Category Overview of EML

One or more XML schemas series are provided to support each general process area:

- **Pre election**
  - Election (100)
  - Candidates (200)
  - Options (600)
  - Voters (300)

- **Election**
  - Voting (400)

- **Post election**
  - Results (500)
  - Audit
  - Analysis

Some functions belong to the whole process and not to a specific part:

- Administration Interface
- Help Desk
# Selected EML 4.0 Transactions

<table>
<thead>
<tr>
<th>Schema Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>EML 110 – election event</td>
<td>Information about an election or set of elections. It is usually used to communicate information from the election organizers</td>
</tr>
<tr>
<td>EML 210 – candidate nomination</td>
<td>Used to nominate candidates or parties, consenting or withdrawing</td>
</tr>
<tr>
<td>EML 230 – candidate list</td>
<td>Contest and candidates details</td>
</tr>
<tr>
<td>EML 310 – voter registration</td>
<td>Used to register voters for an election</td>
</tr>
<tr>
<td>EML 330 – voter election list</td>
<td>Details of actual voters for an election</td>
</tr>
<tr>
<td>EML 340 – polling information</td>
<td>Notification to voter of an election, their eligibility and how to vote</td>
</tr>
<tr>
<td>EML 410 – ballot</td>
<td>Describes the actual ballot to be used for an election</td>
</tr>
<tr>
<td>EML 420 – voter authentication</td>
<td>Used for voter authentication during a voting process</td>
</tr>
<tr>
<td>EML 440 – cast vote</td>
<td>Actual record of vote cast</td>
</tr>
<tr>
<td>EML 460 – votes group</td>
<td>Group of votes being transferred for counting</td>
</tr>
<tr>
<td>EML 480 – audit log</td>
<td>Documents access to voting records and reason</td>
</tr>
<tr>
<td>EML 510 - count</td>
<td>Results of election contest(s) and counts</td>
</tr>
<tr>
<td>EML 520 - result</td>
<td>Communicating specific result details on candidates and elections</td>
</tr>
</tbody>
</table>
OASIS EML 4.0 transaction use

• Electoral Roll  (EML 310, 330, 340)
  – managed by election officials and administered by voting staff
  – process designed to ensure anonymous vote

• Electronic voting records  (EML 440, 460, 480, 510)
  – generated by voter using voting system
  – digitally recorded and stored by voting system (EML 510)

• Matching Paper voting records  (EML 440, 480)
  – generated by voter using voting system
  – manually cast or mailed by voter
  – scanned electronically (EML 440, 480, 510)
EML and US Voting Example

- Using EML formats in action -

**Voting**

1. **Print process**
   - Actions: choose, print, confirm, complete, cast VVPB

2. **Digital ballot recorded**
   - Using EML formats: 440, 460, 480
   - EML formats: 440, 460, 480
   - Digital storage Media (write once)

3. **Print record stored**
   - EML formats: 440, 460, 480
   - EML formats: 440, 480, 410
   - e-Print record
   - Printing device

4. **Paper ballot cast**
   - EML formats: 440, 460, 480
   - Printed ballot
   - Voter Verified
   - Hand Cast
   - EML formats: 440, 460, 480
   - Digital storage Media (write once)

**EML formats:**
- 310, 330, 340, 410, 420
- 440, 460, 480
- 310, 330, 340, 410, 420, 440, 480
Reality of real-world voting

• Good solutions have to be adaptive and survive in a complex unpredictable world; they have to administer well
• Today’s paper-based voting have a culture around them and years of operational lessons learned
• Need to have formalized documented procedures
  – Council of Europe Ministers have endorsed the comprehensive steps for e-voting recommendations and with that the use of EML http://europa.eu.int/ida/en/document/3294/358
• Expecting 100% perfection is unrealistic; trusted system has to be a best case – that allows people to be able to diagnose events and occurrences, e.g.:
  – someone forgot a voting card left in a voting machine
  – the machine jammed; the disk is unreadable
  – someone keyed in the wrong setup code
  – the computer hardware failed
EU Procedures* (Processing Layers)

Items covered:

• Electoral roll and voter registration
• Voting process
• Counting process
• Verification and Certification
• Equipment deployment, setup and control

*see: [http://www.coe.int/T/e/integrated_projects/democracy/02_Activities/02_e-voting/01_Recommendation/default.asp#TopOfPage](http://www.coe.int/T/e/integrated_projects/democracy/02_Activities/02_e-voting/01_Recommendation/default.asp#TopOfPage)
EU Procedures – clarifying items (1)

These trusted logic items should be added:

1. Explicit reference to the importance of using write-once media for vote recording - either paper or digital
2. Need for voters to be able to physically verify their vote directly - via paper ballot or equivalent physical representation of an actual ballot - not an electronic ephemeral representation, and to cast that physical representation by hand
3. Need to separate the layers of the process - so the same component provider is not doing all vote creating, printing, and counting the total votes (no single solution provider)
4. Need to use trusted logic principle so that the voter can verify that the digital voting choice recorded matches the physical voting choice they selected
EU Procedures – clarifying items (2)

These ballot processing items should be added:

5. Need to compare 100% of all counts - electronic and physical ballot counts and electoral record counts to ensure they tally*

6. Explicit call-out of the need to avoid sequential processing information compromising vote privacy and anonymity

7. Explicitly call-out that overall election counts should be tallied independently for each of the sources - electoral roll, digital votes, and voter verified (paper) ballot counts (after scanning - EBI - Electronic Ballot Imaging**).

How OASIS EML views process steps and separations

Election:
• Candidates
• Ballot / Referendum
• Voters
• Voting
• Results
• Audit
Procedural requirements

• One implementer cannot supply solutions across more than one layer or process
• Each layer must be autonomous and passes information to next layer in open formats that can be inspected and verified
• Software involved must be published to open source
• Physical separation of layers and devices associated with them
## Process Overview

1. **Electoral roll and voter registration**
   - Confirm voter eligibility and verification
   - Maintain independent voter electoral roll
   - Provide lists of voters for access to polls

2. **Voting process**
   - Dual path: paper and e-voting records
   - Processing uses open exchange formats
   - Not sole vendor solution

3. **Counting process + audit logs**
   - Scans paper ballots; tallies e-votes media
   - Verifies e-vote signatures and status logs
   - Compares counts from all three sources: paper, e-votes, electoral roll

4. **Verification and Certification**
   - Artifacts storage to open public spec's
   - Each component lab’ tested for interop'
   - Version control and signature on software

5. **Equipment operational needs**
   - Guidelines for equipment behaviours
   - Access and deployment needs

-OASIS-
OASIS EML process details

• The OASIS EML provides details for each part of voting process (see specification for exact details)

• Next few slides show how these can be applied to a trusted logic voting process

Projected US implementation flow

1. Display ballot; make choices
2. e-Vote record
3. Printed ballot
4. Paper ballot cast
5. Polls close
6. Media delivered to tallying center
7. Reconcile votes
8. Results Declared

Actions:
- Choose
- Print
- Confirm
- Complete
- Cast VVPB

Precinct level consolidations (canvassing)

Digital storage Media (write once)

Print process

Storage process

E-Print record

Digital ballot recorded
Action Process: Voting

DRE entry

1. Dual-track trusted logic voting

Process A
- e-Vote capture
- e-Vote records
- Digital storage Media (write once)

Process B
- ballot printing
- Records of what printed
- Digital storage Media (write once)

2. Submit request

3. Confirm print done

4. Hand Cast Ballots (scanned to EBI)

Actions:
- choose
- print
- confirm
- complete
- cast VVPB

EML formats: 440, 460, 480
Action Process : Counting

Initial Counting

1. e-Vote records
   - e-Vote tallying
   - Provisional results

2. ballot scanning
   - Digital storage media
   - Retrieve from storage devices collected

Print ballot records

- Digital storage media
  - Retrieve from storage devices collected

Review Process

3. Compare Vote records and counts
   - Review / deferred ballots
   - Rejected ballots
   - Accepted ballots

Verified Results

Count Verification

- Electoral Roll
  - Ballot Tally (EBI*)

**Action Process: Voter Verification**

1. **Electoral Roll**
   - Provide random voting token
   - **Electoral records**
     - Digital storage media

2. **Token enabling device**
   - Recycle voting token
   - **Deposit ballot**
     - Digital voting records
     - Digital storage media

3. **Proceed to Voting booth**

4. **KEY FACTOR:** Avoid inadvertent sequential local information imprinting!
Creating an open marketplace

• Open trusted logic process that underpins voting in the digital age

• A healthy and open marketplace where a broad range of service providers can deliver solutions to citizens, using off-the-shelf cost-effective components, that support and enhance the voting system and experience

• Based on open specifications that have free use licensing and not encumbered by any specific proprietary technology

• Inform and guide legislators and administrators
Summary – What EML supports

- Allows implementation of trusted logic process combining paper and digital ballots
- Details of the core elements and their interactions, safeguards and cornerstones
- Mechanisms and separations to secure process and provide audit crosschecks
- XML required to run all the exchanges
- Open international public specifications
