

Hello,

It's good to see the NIST framework being updated again. I would like to propose that there be more specifics about data itself. For example in the first function "Identify", data is buried in Asset Management and only lightly touched in the Resources section. Data assets should be discovered and classified with sensitivity levels assigned to all the corporate data assets. ID.AM-5 does allude to classification, criticality and business value but nothing is said on how this is determined, and that starts with discovery.

Happy to participate on any committee.

Thanks

Alan
