

---

Below are some questions and comments that I have, thank you for taking the time to read them.

- Current large scale Ai language and image models have been trained using data gathered from public sources, how can it then be owned by one group, entity, corporation or institution? It seems logical and ethical that if an Ai model is trained using such data that the model itself would be openly accessible for all to use and that all technology and innovations resulting from these models would maintain that same open license.
- Shouldn't individuals be made well aware that their data will be used to train Ai and give full consent to that, additionally consent to waiving any rights to what the Ai will generate with that data?
- Lastly, I believe that a public system needs to be established that allows all humans regardless of country status or race have equal vote and say in policies around Ai. I think the responsibility of Ai should be put in the hands of everyone that it will effect.

Sincerely,  
James Keller
